Strategy for Revolution

From the above papers [and CPI (M) documents] we have pieced together the following strategy for revolution in India. Since it is not yet election time, conduct limited struggles which will not alienate the liberals. For the next election have the following slogans: "Military training should be imparted to all able-bodied men and women." "Every citizen should be given the right to bear arms." Let "the Party organisation outside ... supplement this fight inside Parliament and State legislatures, by a powerful mass movement outside." [CPI (M) Election Manifesto, 1971.] When the slogans have been turned into laws, military training imparted and arms distributed to the people, then will be the time to surprise the ruling classes and launch armed struggle. This will, of course, be entirely peaceful and entirely successful. The people led by the 'revolutionary' party can then wrest all the mass media.

It seems unlikely that our 'Marxist' leaders who have been in the working-class movement all these years (and the intellectuals who advise them) could be such simpletons. That leaves only one possibility — that they are consciously deceiving the people. As Marx put it, "To delude others and by deluding them to delude yourself — this is: *Parliamentary wisdom* in a nutshell."

SOUTH

Kerala's Features

Mohit Sen

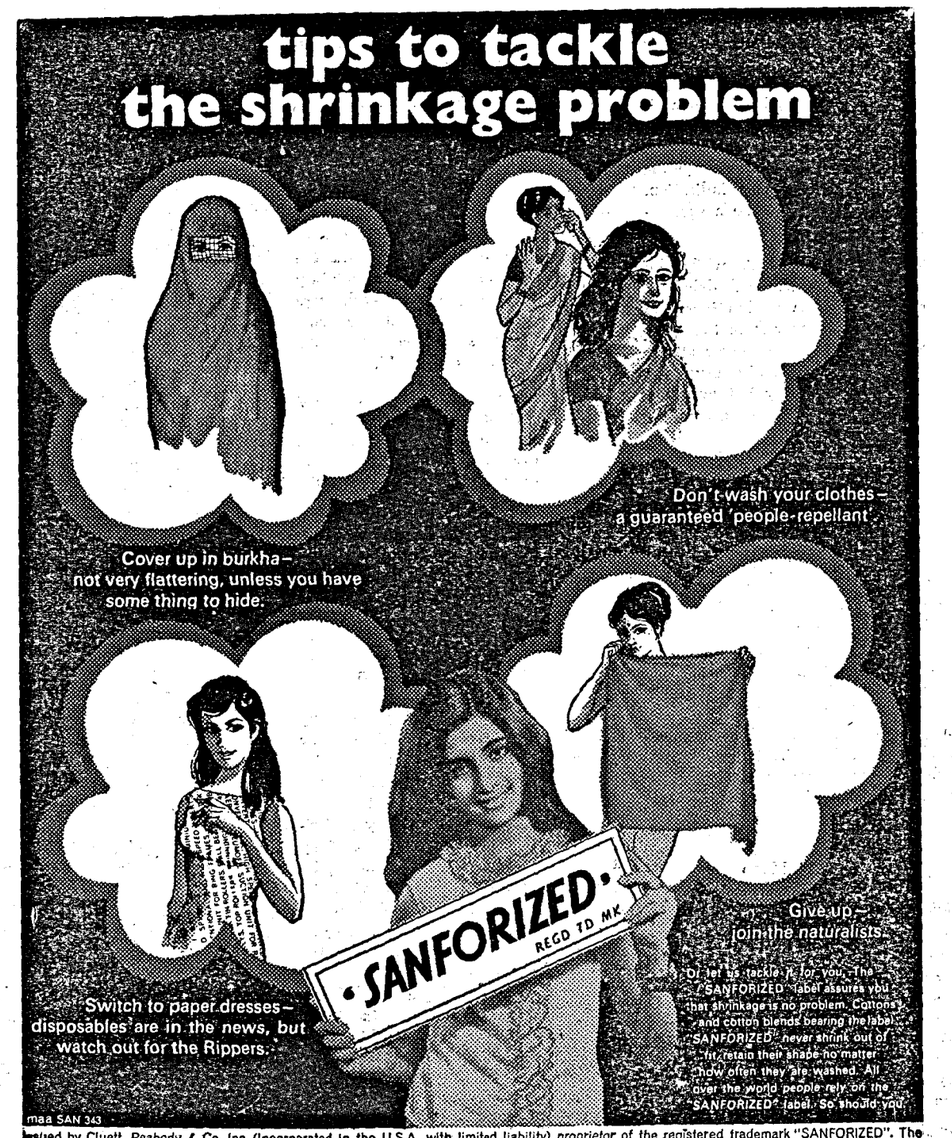
ON several accounts Kerala is considered a test case. It is so above all for the CPI. Consequently, as has been noted by many commentators, it was no accident that the ninth congress of the party was to be held in Cochin. If the success of the congress and the public mobilisation for it are any indication, Kerala may be claimed to be a successful test case.

Sceptics had stated that, while the CPI could mobilise fraternal delegates and put up arches and buntings, the masses would stay away from the spectacle to demonstrate their anger at the 'betrayal' of the communist cause by the CPI. Not only they but even the supporters of the CPI were dumbfounded by the massive public response on the concluding day of the CPI congress. Correspondents from Calcutta, who had also covered the Ernakulam congress of the CPI(M) and who had believed the gossip about the decline and disappearance of the CPI in Kerala, admitted that the CPI concourse was several times larger than that of the CPI(M) three years ago when the latter had been at the peak of its popularity. It was a thrilling sight on any account when, through the persistent rain, some 40,000 redshirt volunteers with gigantic red flags quickly stepped through the beseiged streets. The vitality of a party is demonstrated by its demonstrators in this still emerging land of ours!

Change in Mood

Going through some parts of Kerala after a lapse of some years and talking at random to the people, especially the young, one was struck by the change in mood. It is not despair here nor desperation but a sense of achievement leading to the expectation of bigger advance. It is something qualitatively different from what one encounters in many other parts of the country.

What, of course, was not new was the level of political intelligence. There is tremendous awareness of the issues and the controversies among a wide variety of persons. And the dominant theme is that the 'Indicate' (this term is most widely used precisely by the young supporters of the ruling Congress) has done well in not only accepting the full consequence of its support to the coalition but agreeing to accept a Communist as Chief Minister. This breaking down of the barriers between the Left nationalists and the Communists is one of the most important gains of the new constellation of forces that has come into being since the last quarter of 1969. There was the feeling that this coalition ministry would be able to push through more structural reforms and, at the same time, be able to secure more from the powers-that-be at New Delhi.



It is not the difficulties of the new coalition that are uppermost in these young minds but the new prospects. There is even a pride that Kerala could possibly set the pace for the rest of India. Not that the coalition is free from complications: it is the product of a complex situation and it is riddled with complexities. But what new experiment is not? And what is the alternative to going ahead with this experiment?

Centre-Left Coalitions

The coalition will certainly come up against the problem of attempts by sections of the Congress to establish their leadership over the coalition and to use their present position to secure for the Congress a single-party majority in future elections. It is precisely at this conjuncture that skill would be required to constantly keep in view the reality of the features of Kerala, as well as of India. The considerable degree of political articulation as well as the even more considerable amount of uneven political development dictates Centre-Left coalitions as the inevitable transitional political, even historical, bloc that can shape India. And the very recent past has demonstrated that the Congress cannot — in most areas of the country as well as taking the country as a whole — any longer itself fulfil this role. The very recent past has also demonstrated, however, that the new post-Independence forces with their thrusting aspirations have further expressed themselves by inducing changes in the Congress. A definite, stable trend has emerged in the Congress, reminiscent of the late 1930s, at a time when the most powerful Left party in the country has a proper appreciation of the limitations and the potentialities of this trend. Therefore, the complications inherent in the new coalition need not lead to confusion but can provide fresh foot-holds for the advance of the working people.

Different Predicament

The predicament of the CPI(M) in Kerala is different. Not one of its numerous mass agitations has really got off the ground, including the latest one against the increase of bus fares. It is not able to evolve any kind of political perspective or slogans for the state — it is even less able to do so than its West Bengal counterpart which, at least, can campaign for early elections. Many of its more intelligent and active cadres are quite perturbed by the manner in which China has taken new positions *vis-a-vis* the *status quo* in country after country, including the disgraceful support of the genocide in Bangla Desh. At the same time, these persons feel that the traditional forms of mass action and protest are no longer fetching the dividends they used to. Their thoughts are turning to more militant forms of struggle; but here, too, the debacle of Naxalism knocks their hopes. Some, therefore, are beginning to rethink their anti-CPI prejudices, and some of these pitch their hopes on A K Gopalan, who has already proclaimed his party's support for the Government of India in the eventuality of an armed conflict with Pakistan. These sections of the CPI(M) also realise that 1964 when the split took place is seven years in the past. And, in these fast-moving days, seven years has erased many memories as well as brought into the arena of active politics many who do not have these memories. And this multitude wonders as to why a Ministry should be so vehemently opposed which is only implementing a programme that the CPI(M) itself sponsored in 1967. Thus, pressures mount on the leadership of the CPI(M) in Kerala from both sides and lead to a kind of political paralysis. If the present coalition Ministry registers even a modicum of progress then the CPI(M) would split in Kerala as much as, if not more than, it has done in Andhra. And this would help to round off the Centre-Left unity not in Kerala only, and to the immense benefit of the working people of the entire country.

GUJARAT

Kadana Project: Exercise in Area Development

Pushpa Sundar

WHAT makes the Kadana Project on the Mahi river in Gujarat noteworthy is that it represents a macro approach to the development of an area, viewing provision of irrigation, supply of fertilisers, road building, setting up of agro industries, etc, as part of an integrated and concurrent development plan. To quote a government report on Kadana: "By the time Kadana water becomes available to the Mahi Canal system, all the arrangements should be made so as to transmit water down to the farthest field and agriculturist prepared to receive water and make its optimum use by resorting to more remunerative cropping patterns subject to the limitations of land and water. It has also to be ensured that the agriculturists get credit facilities for applying the optimum dosage of the right type of manures and that they put in necessary efforts for improvements and preparation of lands and that they resort to mechanised agriculture to the extent possible. Also feeder roads would need to be provided and marketing facilities improved."

Second Phase

The construction of a dam and storage reservoir at Kadana in the Lunawada taluka of Panchmahals district, with a direct channel on the left bank, is the second phase of the project. The first stage, which is over, began in 1954 and was completed in 1959 but progress on the distribution system was slow due to lack of funds, delay in construction of water courses and channels and lack of assured water uspply.

The command area of the Kadana project comprises of seven talukas of Kaira district and portions of Santrampur and Lunawada talukas of Panchmahals district. The reservoir will have a gross storage capacity of 46,000 cu ft. With the completion of the reservoir in 1973 some 669,000 acres of Kaira district and 40,000 acres of Panchmahals district would get the benefit of canal irrigation. Out of 629 villages in Kaira district 512 villages would be covered by canal irrigation and so would be 87 villages in Panchmahals district. Besides, the subsoil water resources would be increased due to seepage and this will make possible digging of additional wells in the unirrigable areas of the region.

From its inception in 1954 to its expected completion by 1975 the project is estimated to cost Rs 73.5 crores of which Rs 23.5 crores, or 32 per cent, had been spent by the end of 1969. For the remaining Rs 50 crores an agreement has been signed with the IDA for a loan of $ 35 mn or Rs 26.25 crores which will be re-lent by the government of India to the Gujarat government. The rest of the cost will be borne by the Gujarat government.

Though the dam is expected to be completed by 1973, it will probably be commissioned in 1974. The construction of the right bank distribution system is about 60 per cent complete, but the left bank system has not yet been taken in hand. In both the right and left bank areas, the irrigation distribution systems and outlets are scheduled to be finished by 1974. Water courses, field channels, and land levelling is expected to be completed by 1975. Normally it takes upto 10-15 years for the full agricultural development of an area after introduction of irrigation, but in this case the Gujarat government has optimistically set 1975 as the deadline. But the IDA, which sent a team to report on the feasibility of the project, feels that at least seven years will be required for full agricultural development.

Planning for Change

The Gujarat government asked the State Fertiliser Corporation to study and quantify the likely changes as a result of the Kadana project so that they could be planned and provided for. The GSFC study found that there would be a larger shift of area from paddy and tobacco to hybrid cotton, sugarcane, soyabean, banana and other fruit crops. The study further indicated that the intensity of cultivation in the rabi season would go up and cultivation of wheat would get a momentum. Similarly, there would be a threefold increase in the area cultivated in the summer season and cultivation of summer bajri would be taken up on a large scale. Old crop rotations would decline and new ones would be adopted.

Chemical fertilisers are at present not used in the desired quantities in the command area. But after the adoption of new crops and techniques, the annual investment in fertiliser would be between Rs 14.41-16.01 crores, supplemented by investment in organic manure of about Rs 5.75-7.16 crores. Also an estimated Rs 2.53-3.77 crores worth of seeds (improved and hybrid) would be needed. At present there is one tractor for every 300 acres in the command area. But after irrigation there would be at least a threefold increase in the demand for tractors and other implements like threshers, cultivators, etc. Intensification of agriculture would need additional labour input and the cost of labour would range from Rs 25.22-27 crores per annum.

Productivity to be Doubled

The intensification of agriculture is expected to double productivity per unit of land as well as labour. The GSFC study estimated that with full agricultural development, total agricultural production would range from 14.62 lakh tons to 17.49 lakh tons per annum. The additional agricultural production would be of the value of Rs 82.39 crores. On account of Kadana water alone (quite apart from the impact of other improved practices) the net incremental value of production was estimated to be Rs 20 crores by the IDA team. The team also estimated that because of import substitution of cotton and cereals, foreign exchange would be saved to the extent of $ 30 mn annually.

The GSFC study emphasises that there should be close co-ordination between credit supply agencies, input supply agencies and marketing organisations. The increased agricultural production will also require better storing facilities and generate opportunities for creation of different types of processing industries like sugar factories, fruit canning units, rice mills, etc. In addition, the huge increase in production of straw and fodder is bound to give an impetus to the dairying industry, already well established due to a good transport system and a developed infrastructure of milk collection, thanks to the efforts of Amul Dairy.

Simultaneous planning for all the parameters of growth requires an

agency to co-ordinate the various programmes. So a separate organisation has been created for the Kadana project. At the very top is the state co-ordination committee consisting of heads of concerned Departments and Secretaries to Government. The day-to-day co-ordination is done by a project co-ordination committee headed by a senior officer designated Project Co-ordinator.

Field Channels

The area development programme which this organisation is charged with implementing will involve construction of field channels and land levelling and preparing Kyari land for paddy cultivation. It was realised that construction of field channels by individual farmers could be the weakest link in the chain of integrated development. While there would be many farmers who would be prepared to construct their own channels many others would not be. Besides they may not construct the channels according to the proper specifications. So it was decided to permit the farmers who were willing to construct their own field channels provided the work was carried out under the technical advice and supervision of the Agricultural Department and provided they covered the entire block of land to be served by a permanent outlet from the minor system. About one third of the total area, i e, about 1.6 lakh acres is expected to be taken up by private farmers. The Agricultural Department will directly undertake the construction of field channels in the remaining 3.4 lakh acres. It will also carry out the remodelling of the existing channels which are faulty. The cost of construction of field channels would be borne by the Government which would later transfer the farmers' liability to the Gujarat State Co-operative Land Development Bank, which would reimburse the Government and collect the cash directly from the farmers in about 10 years on its regular terms for such work. Land levelling too would be done at the farmers' request by the Department of Agriculture for which the farmer could obtain credit from the Land Development Bank.

A second aspect of the agricultural support programme is the establishment of a centre at Thasra for training in the use and management of irrigation water and other improved agricultural practices. The trial-cum-demonstration farm at Thasra, started a few years ago, will organise training programmes for the farmers of the command area.

The agricultural support programme involves, thirdly, the establishment of new irrigation trial-cum-demonstration farms, one at Jinej in Cambay taluka on the Mahi right bank and two in Santrampur and Lunawada talukas on the Mahi left bank, as well as strengthening the facilities at the trial-cum-demonstration farm at Thasra. The idea is to undertake research on various aspects of irrigated farming so as to guide the farmers in different systems of irrigation and to work out the irrigation water requirements of crops. The research programme will be oriented to solving local problems.

To strengthen extension services, specialist water management extension officers will be appointed to act as advisers to the extension staff of the panchayats and to cultivators on irrigation utilisation, field layouts, irrigation intervals for new crops, etc. They would also train extension staff on water management. At present Village Level Workers are non-graduates. It is planned to replace them with agricultural graduates in the command area. All extension staff is to be given training in irrigated farming in specialised courses at Thasra.

The Kadana project has also planned for expansion of all types of roads. The emphasis will be on the construction and improvement of district and village roads, farm roads and village to mill roads in sugarcane producing areas.

Co-operative Ventures

To take advantage of the greatly increased production of crops and of by-products like straw and husk, it is proposed to set up a number of ancillary industries and agro-industries, both as co-operative ventures and by encouraging private entrepreneurs. Out of 25 rice mills planned, 6 rice mills on co-operative lines have already been organised and one sugar mill will start functioning soon. Six co-operative cotton ginning and pressing units have also been commissioned. Of the 475 co-operative societies in the command area, 383 are crop finance societies only and nearly half the societies need revitalisation. It is planned to make them into viable units by amalgamating weak societies, by giving subsidies to improve their financial viability and by liquidating the non-viable societies and forming new ones in their place.

The optimistic expectations of the state government of full agricultural development by 1975 are likely be realised only if all the parameters behave in the way the government envisages. In practice there are likely to be a number of bottlenecks and weak links which will retard full development both in terms of the time taken and in quantitative terms. For example the programme does not envisage lined channels, but these are essential because earthen field channels mean loss of about 30-35 per cent water. The lined channels will cost more but the cost differential will be made up by (i) less repair cost; (2) less land on the side of the canal being wasted due to percolation and water logging; and (3) increase of upto 75 per cent in the discharge in lined channels.

Secondly, the road construction programme is not priority-oriented. District and village roads are to be constructed first whereas priority should have been accorded to farm roads and farm approach roads and, in the case of sugarcane, farm to factory roads.

A third lacuna in the programme is that little thought has been given to setting up processing units other than some rice mills, 2-3 sugar mills and some warehouses. But bajri production will increase about three times and no details have been worked out as to how this could be used. For example it could be used to make bajri bread like rye bread. Similarly, there is scope for making more cattle feed, protein food and lemon products (lemon is widely grown in the area). So far progress on this front has been bogged down because of a controversy over the size of the units — whether a few big units should be put up or a number of small units dispersed over the area. With a little imagination a detailed programme can be worked out and the government could spearhead the development by starting such units and auctioning them later to interested entrepreneurs.

The Weakest Link?

But perhaps the weakest link retarding progress will be the co-operative structure. Of the 475 co-operative societies in the command area, only 280 do fertiliser and seed distribution work. Most of the co-operatives handle only sugar, kerosene and household goods. But to be really useful, all primary societies must handle all the inputs needed by the farmer. More than 50 per cent of the societies need revitalisation. Further, except for hybrid cotton and tobacco, the distribution of all other improved seeds is handled by the Gujarat State Marketing Co-operative Society. This society should have centres all over the state, but in fact does not. Ideally there should be a depot within five miles of a farmer's residence. It would be better if private initiative is encouraged in this field, but the government is unfortunately committed to promoting co-operatives.

Inevitably there are also the contrary political pulls exerted by rival regional claimants, arguing for and against so much money and effort being spent in an area already as well developed as the Kaira district.

Finally, it must be ensured that a part of the increment in income that comes about comes back to the government as a return on its investment. The IDA team estimated that the tax income could be expected to go up by Rs 2 mn per annum through the imposition of water charges, betterment levy and increased yields from the agricultural property tax as a result of increase in the value of land.

The Kadana project area development programme is an experiment that is worth watching. Its success could lead the way for similar planning in other parts of the country and in other areas of activity.

Tito and Brezhnev: Outward Cementing?

K Krishna Moorthy

THERE are several curious aspects to the visit of Soviet Communist Party chief Leonid Brezhnev to Yugoslavia between September 22 and 25. The Russians wanted to keep the visit 'unofficial' but Yugoslavia's President and Party chief, Marshal Tito, treated the visit as official —and the end result was an official joint statement. The latest joint statement is the third major declaration by the two countries concerning their tortured relationship during the past two and a half decades.

The June 1955 joint declaration was signed in Belgrade by President Tito and the then Soviet premier Nikolai Bulganin, with the late Nikita Khrushchev, then Party chief, looking on. The decision to try to make up with Marshal Tito was essentially Khrushchev's but the formalities were inter-State. The inter-party declaration was signed in Moscow by Khrushchev and Marshal Tito in June 1956. The latest joint statement has mentioned specifically that Marshal Tito has signed as President of State as well as Party chief while Brezhnev signed the document merely as Party chief.

Public Relations Visit

Brezhnev's visit was mainly a public relations visit, to cap the efforts made by the two countries, at the levels of Prime Ministers and Foreign Ministers, at repairing their relations which were rocked by the Soviet-led invasion of Czechoslovakia three years ago. True, Yugoslav-Soviet relations were at no stage ruptured as a result of the Soviet invasion. But what was lost was the intimacy which had developed during the early sixties, culminating in the total accord during the June 1967 Israeli attack of Arab States.

The Israeli attacks threw the UAR into closer embrace with the Soviet Union. For other reasons India too has entered into firm links with the Soviet Union. But the carrots offered by the Russians have not been juicy enough now for the consumption of the Yugoslavs. Yugoslavia remains the most non-aligned of the pace-setters at the Belgrade non-aligned summit 10 years ago. Marshal Tito's skill has been in cementing ties with the United States as well as with China which for more than a decade was the bitterest ideological critic of Yugoslavia. During his Belgrade visit, the Soviet leader this time attempted in vain to counter the growing influence of China in the Balkans, viz, on Albania, Romania and Yugoslavia.

The main Yugoslav gain was a reiteration of the principles outlined in the 1955 and 1956 declarations on the 'separate roads to socialism', a doctrine sacrosanct for the maverick communists of Yugoslavia. The new formulation reads: "The methods of constructing socialism, which reflect the experience of and specific aspects in the development of individual countries, are a matter for the peoples and the working classes in individual countries and need not contradict each other."

Yugoslav-Soviet differences, however, are too deep-seated to be eradicated by pious declarations, and Yugoslav commentators have frankly given publicity to their continued misgivings. Only time will show whether the Russians and their allies will resume their attacks on the Yugoslavs as 'revisionists'.

Brezhnev's compliments to the Yugoslavs were indeed mostly left-handed, and his right hand took away what was given by his left hand. Thus, while the joint declaration sought to reassure the Yugoslavs of their right to their separate road to socialism, in a major speech to Belgrade factory workers the Soviet leader made some ominous remarks. Brezhnev said: "To us, as Marxist-Leninists, it is a matter of primary interest that our two countries belong to the same socio-economic grouping, and this, in the long run, is the important thing." This certainly is the type of formulation which is resented by the Yugoslavs who maintain they belong to no Soviet-blessed grouping.

Denial and Reaffirmation

During a dinner toast, Brezhnev denied the existence of the "Brezhnev doctrine of limited sovereignty of socialist countries". He repeated the usual Soviet claim that the 'doctrine' theory is an invention of the West. At the same time, the Soviet leader reaffirmed the internationalist responsibility of the Soviet Union in defending socialism and communism. It was on this pretext that Czechoslovakia was invaded, or to put it in the Warsaw Pact phraseology, fraternal military intervention took place.

In his speech to the factory workers, Brezhnev said, "We as Marxists know very well that there are certain general laws of socialist construction and general principles and hallmarks of socialism without which there can be no socialism." What was left unsaid was the continuing Soviet conviction that the Russians alone can be the supreme arbiters on what these 'general laws' are. This is what the Yugoslav-Soviet quarrel has always been about.

A curious sidelight on Brezhnev's visit was the absence of any Croat in the delegation which received the Soviet leader and had talks with him. Croatia is the second constituent republic of Yugoslavia in terms of population and Party membership. Tito himself is a Croat by birth, but he is the only all-national leader amidst the rivalries among the various nationalities in Yugoslavia. The Croat leaders, among others, have not been enthusiastic about moves towards a settlement with Moscow. Their absence might indicate the disagreements within the country over relations with the Soviet Union.

Peking and Indian Maoists

Mohan Ram

PEKING'S year of puzzling silence on the Indian Maoists ended on October 7 when *Hsinhua* approvingly quoted chunks of an article on "armed struggle" in West Bengal from the CPI(M-L)'s clandestine journal *Liberation* (April-June issue). The last reference to the Indian Maoist movement in the Peking mass media was in October 1970. Radio Peking, reviewing the "flames of revolutionary struggle in South-East Asia" mentioned the CPI-(M-L)'s "peasant armed struggle with agrarian revolution as its centre" but maintained a studied silence on the party's one-year-old urban guerilla campaign in the slum jungles of Calcutta after its cadre had abandoned the countryside. The October 1970 reference to the CPI(M-L)'s activity implied disapproval of the "red terror" campaign in the city as also the controversial "annihilation tactic" in the countryside. For, the accent was on mobilisation and organisation of the peasant masses for guerilla warfare and not mere guerilla squad actions to kill landlords.

In May 1971, amidst a serious rift in the CPI(M-L) over its tactical line, Peking chose to ignore India altogether in its review of armed struggle in South-East Asia (two or three such reviews are put out every year) in which it reaffirmed China's open support for insurgent movements in Burma, Thailand, Malaya, the Philippines, Indonesia and North Kalimantan. The review said the people in these countries had "successfully persevered in developing their armed struggle in the past year". But India was a significant omission.

The omission of India was linked by some observers to Peking's desire for normalisation of Sino-Indian diplomatic relations. It was even suggested that Peking would be obliged to ditch the Indian Maoists once Sino-Indian relations at the state level improved. Subsequent developments however established that Peking's reluctance to mention India in its review had more to do with its displeasure with the CPI(M-L)'s tactical line than with any anxiety to convey to New Delhi that it would not back the Maoist movement in India once normal diplomatic relations were restored.

It would be well to record here that Peking, during the last year or so, has combined its new-look diplomacy (part of a peace offensive) with reaffirmation of its long-standing commitment to people's war in the Third World. This posture has been apparent in recent months towards a number of South-East Asian countries. In May, a semi-official trade team from Malaysia had an hour-long interview with Chou En-lai who said that no big power should interfere in the affairs of other countries. The team had barely returned from Peking when *Hsinhua* lauded the ambushes, mine warfare and other guerilla tactics of the Communist Party of Malaya. (Peking does not even accept the term 'Malaysia'.) Similarly, Chinese Foreign Ministry officials told a *Manila Times* correspondent that the Maoist insurgency in Peking was an internal affair of the Philippines. This did not however inhibit *Hsinhua* from praising the armed struggle of the Philippines communist party. Earlier, Peking returned its ambassador to Rangoon in March but in May *Hsinhua* was all praise for the Burmese communist guerilla successes in blowing up trains, intercepting government trucks and ships and "causing the reactionary troops and police to run hither and thither in terrible plight".

Therefore, from the point of view of Sino-Indian state level relations, the latest reference by *Hsinhua* to the CPI(M-L)'s activity is of little significance. But it has immense significance for the party's tactical line.

It would be relevant to remember here that sometime back the CPI(M-L) split vertically into two, Charu Mazumdar heading one faction and Ashim Chatterji heading the other. The latter has been the leader of the West Bengal-Bihar-Orissa Regional Committee of the party which has worked out its own tactical line. The *Hsinhua* report though dated October 7 quotes a *Liberation* article of April-June, i e, written before the split and before Charu Mazumdar disowned the Regional Committee led by Ashim Chatterji. The *Hsinhua* report not only made no attempt to delete the reference in the article to the successes of the Regional Committee but makes it a point to mention it with obvious approval.

The content of the excerpts *Hsinhua* has quoted needs to be examined. The reference is to the armed struggle in "entire West Bengal" being linked with mass movements in the countryside. "By confiscating and distributing the land and crops of the landlords, the revolutionary committees are unleashing powerful mass movements." The accent is on mass movement. The old tactic of "annihilating the class enemy" in the countryside to create a vacuum has been given up by the CPI(M-L). The only annihilations through squad actions referred in the *Hsinhua* report relate, significantly, to attacks on police and para-military personnel and not on landlords. The report also lauds the gun-snatching campaign of the party in several West Bengal districts.

Following serious internal differences (and possibly Peking's displeasure), there has been a gradual shift in the CPI-(M-L)'s tactical line. In the process the party itself has split. Charu Mazumdar's new theory of annihilation of the class enemy as the precondition to any mass action and his dogmatic assertion that guerilla warfare is the only form of revolutionary warfare and that mass participation was not a precondition for such warfare stand debunked. Patently anti-Maoist, Peking could not have approved of the tactic for long.

The contents of the *Liberation* article quoted by *Hsinhua* suggest that at least in theory the CPI(M-L) has reoriented its tactical line and that it is now closer to the line of the Revolutionary Communist Committee of Andhra Pradesh which has all along disapproved the annihilation line. The annihilation line in any case proved disastrous wherever it was tried because it bore no relation to mass movements. It liquidated the powerful mass movement in Srikakulam leadership of which was usurped by the CPI(M-L), in Midnapore district of West Bengal, in areas of Bihar, Orissa and Assam wherever it was tried. In fact it proved counter-productive almost everywhere. The CPI(M-L)'s retreat to Calcutta city in early 1970 was a measure of its failure in the West Bengal countryside.

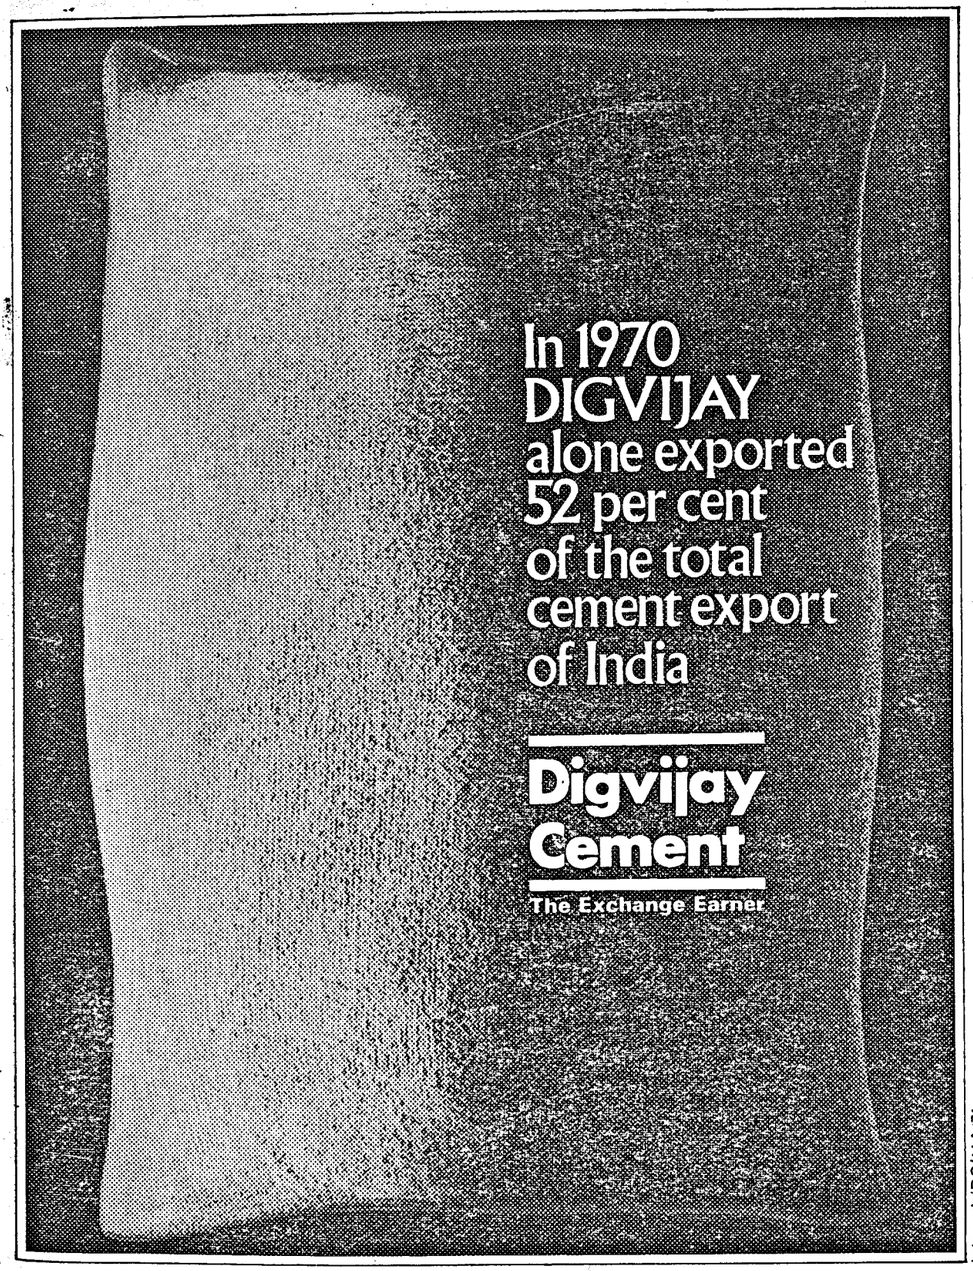
The reference in the *Hsinhua* report to the CPI(M-L) as well as the dissident regional committee (even after the former had disowned the latter) could mean that Peking is anxious to reunite the two factions on an agreed tactical line, so that the movement could be put back on the rails. Around June, the CPI(M-L)'s cadres were fanning out into the West Bengal countryside following Charu Mazumdar's directive. The urban guerilla phase was as good as over and 'Naxalite' tactics had turned a full circle.

Low Farce

Nireekshak

THE new Congress, it seems, is nothing but the old Congress in thin disguise. At least this is what everyone—well, almost everyone—is saying now after the party has shed its disguise in Simla. "The same mixture as before", was G K Reddy's comment in *Hindu*. "The basic characteristics of the Congress has not changed with the party split", he declared. "The class composition of Mrs Gandhi's massive majority in the present Parliament is in no way fundamentally different from that of the previous Congress Parliamentary Party. It suffers the same kind of dissonance as the undivided party before the split." Reddy, who had been a sympathetic chronicler of the Syndicate's quest for 'stability' in the days when it was still battling for supremacy with the 'dissident socialists', may be thought to be less than wholly impartial in his assessment. Indeed when he says that "the Congress(R) which has inherited the traditions of bossism from the much-maligned Syndicate [a bossism which "remains as rampant as before"] must learn the hard way that conformity is not the same thing as commitment, dissent is different from defiance and those who refuse to submit to regimentation are not necessarily raising the banner of revolt", his sympathies are not in any great doubt.

But the interesting thing is that, in one way or another, much the same view is now shared even by those starry-eyed special correspondents who had appointed themselves as unofficial ideologues of the 'new socialism' during the split. Listen, for instance, to A Raghavan of *Blitz*. After saying that the "Simla AICC session turned out to be an exercise in futility", he went on to explain how the "gap between promise and performance" had become the prinicipal drawback of the new party—presumably leaving it to readers to reflect that this was also the principal malady of the undivided Congress! "Members showed an appaling lack of interest—or intelligence", he wrote, and the debates "degenerated into mere slogan-mongering. The AICC sessions will fast lose their credibility if they are not held in a more businesslike atmosphere, with the Government and the party making precise formulations. These days they are merely political rallies of the party faithfuls."



Yet another friend of the 'socialists', Dilip Mukherjee of *Times of India*, had this to say about the Simla conclave. "Apart from the election [of the Central Election Committee] the Simla AICC did not get down to any serious business." Chandrasekhar's election to the committee, "brought to the surface the undercurrents of discontent building up within the party", but it should not be viewed as a "revolt of the left-leaning elements" against the leadership. "Such a crystallisation of attitudes on these lines has not taken place because of the divisions among the radicals fostered by the leadership by handing out rewards to those willing to toe the line." Shades of the Syndicate! About the debates on "burning issues", Mukherjee used such terms as "vague assessment", "flood of platitudes", "exercise in evasion", "confusing" and "disappointing" to describe the impact they made on him. It was a "dull and insipid session", he lamented, and the proceedings were "dreary and tiresome".

Editorial writers were, if anything, even more critical of the AICC proceedings than the correspondents. Most newspapers however singled out for special mention Swaran Singh's remarks on the prospect of a Bangla Desh settlement within the framework of Pakistan. This was a "basic departure from what had been understood to be India's position and something of which Parliament has not yet been informed", said *Statesman*. "Is the Government of India going back on its declared policy of supporting the struggle of the people of Bangla Desh for Independence?" asked *Searchlight*. And, according to *Tribune*: "It is immaterial whether it is for the first time he [Swaran Singh] has projected the idea of a settlement within the framework of Pakistan or the idea of an independent Bangla Desh. What is indisputable is that it is for the first time that he had publicly made any of these formulations and people will draw their own conclusions."

Almost at the same time the AICC was meeting in Simla, the CPI was holding its ninth congress in Cochin. The main resolutions of the congress were widely commented upon. The resolutions show, wrote *Hindustan Times*, that "the party continues to be under pressure to show two faces—one of a responsible democratic opposition and the other of a fierce revolutionary force." And "the result is somewhat comical". The CPI congress, the paper argued, "plumped for the predictable political line of a government of left unity". Logically this implied a "coming period of political polarisation with the radical elements rallying at one point and the reactionaries at the other". But what, it asked, does "polarisation mean for the CPI which, apart from the Congress(N) has for allies the DMK in Tamil Nadu and the Muslim League in Kerala?"

The CPI's dilemma is, observed *National Herald*, that "on the one hand it supports the progressive policies of the Congress; on the other it is keen on establishing its revolutionary credentials . . . The CPI's call for leftist unity can have meaning only if the party is prepared to adjust itself with other leftist parties. It is not in a position to dictate to them. In fact no leftist party should try to dictate to other leftist parties. They have a common cause". The underlying implication of all this presumably is that the Congress is a "leftist" party! "Blowing hot and cold" was how *Amrita Bazar Patrika* described the CPI's approach. Referring specifically to the resolution calling for "mass peasant action" for redistribution of land, *Patrika* noted that the "target of attack obviously is the Congress (R)". And if this was the party's assessment of the "progressive role of the Congress (R) . . . how does it expect to usher in a democratic revolution in partnership with that party? . . . The CPI indeed hopes to thrive on splits; it expects to create dissensions in the ruling Congress and force a further split. It is an excellent prospect indeed for Mrs Gandhi's Congress!"

If all this gives the impression that this was a fortnight of dull reading, let it be noted that much exciting diversion was provided by what has now come to be known as the 'Ganguli affair'. Of course, it was only Ganguli's air-conditioned 'dharna' that imparted a comic touch to the affair, some good photographs of the former Chairman of the Railway Board sitting in isolated splendour in his saloon or looking disconsolately out of it adding to the readers' merriment. On the whole, though, the Press took anything but a light-hearted view of the affair. *Free Press Journal*, for example, saw it as "a sordid melodrama" which has exposed the inefficiency of the Railway administration, while *Indian Express* thought it was "a low farce" which called for a full inquiry including a ministerial reshuffle to set things right.

Lay Information on Aluminium

D C Kale

Aluminium Industry in India by A G Majumdar; Economic and Scientific Research Foundation, New Delhi; pp 80+vii; Rs 10.

ALUMINIUM may be described as 'the metal for all seasons'. It can replace steel in structures; it can displace copper in electrical conductors; it can substitute for brass in cooking vessels; and it can do many things all by itself, without imitating others such as foils and paints. Such a versatile metal is bound to be interesting to many people and the Economic and Research Foundation has done well to bring out a study of the aluminium industry in India. The review is brief and to the point — only 80 pages — and is likely to be a standard reference work for some time to come.

It opens with a review of world trends in production and consumption; the uninitiated would wonder how, year after year, consumption can exceed production of a primary metal by substantial margins. The answer is that a good deal of the metal is recirculated. World output has increased spectacularly from 1.5 mn tonnes in 1950 to 4.5 mn tonnes in 1960, and further to 8.3 mn tonnes in 1968 — the last year covered by the survey. The author has estimated that output in 1973 would be 11.9 mn tonnes, which, judging by last year's performance, seems low.

Stable Performance

One reason for this spectacular growth undoubtedly is that aluminium alone among the major metals has maintained stable prices and supplies. In the 18 years prior to 1968, prices in the US fluctuated between 22 and 27 c per lb, while prices in the UK fluctuated within the range of £ 181 to £ 200 per ton. This is a remarkable record by any standards, and one has only to look at price variations for copper (£ 197 to £ 555 per ton) or tin (£ 735 to £ 1413) to appreciate aluminium's stable performance. Actually, aluminium prices have not been too stable after 1968, and today the London quotation is around £ 257 per metric tonne. The book tabulates prices for copper, lead, zinc and tin, giving the co-efficients of variation for no particular reason and without any explanation.

Plunging into the subject matter of the book, chapters 3 and 4 analyse the growth of the Indian aluminium industry, its prices, and costs, its profitability, and its problems. Production patterns are given only for Indian Aluminium and Hindustan Aluminium. Had all the companies been compared, it might have been possible to see a relation between product pattern and profitability. Profitability varies between 9 and 14 per cent, expressed as profits after tax to net sales. While three companies distributed 32 to 43 per cent of their net profit as dividend, Madras Aluminium has distributed Rs 1.21 crores out of Rs 2 crores in four years.

An interesting study is made of the cost of production over three years, under different cost heads. While total cost of production increased from Rs 2,187 per tonne in 1957 to Rs 2,649 in 1963, and to Rs 3,377 in 1967, the depreciation per tonne works out at Rs 197, 746 and 666 per tonne, respectively. This steep rise is sought to be explained by the commissioning of new smelters after 1957. It further transpires that, if no excise duty were levied in 1968, the Indian consumer's price would have been about the same as in America. Excise duty went up from 'nil' in 1957 to Rs 920 per tonne in 1968, forming about 20 per cent of the consumer's price.

Not All That Large

Aluminium is produced from bauxite, and one of the reasons for the success — indeed the conception itself — of the Indian aluminium industry is that we have large reserves of this ore. On re-examining the figures of ore reserves, however, it is seen that they are not all that large. High-grade reserves proved to date are about 67 mn tonnes, while the availability of all grades put together is placed at around 160 mn tonnes. Incidentally, the Indian Bureau of Mines's published estimates are slightly higher, but it is safer to assume the lower figure. Considering that the 1970 consumption of bauxite was 1.2 mn tonnes and that this figure is increasing by about 20 per cent per year, prospecting must be stepped up while at the same time the industry should think in terms of designing future plants to take lower-grade ore.

The State has not done anything to help or encourage bauxite mining, and has on the contrary increased royalty on ore from Re 1 to Rs 2.50 per tonne. By the book's estimate, duties on bauxite, alumina, etc, and other taxes and duties paid on inputs aggregated about Rs 1,734 per tonne of the metal in 1969: this is about one-third of the selling price of *ingots*. Considering that *ingots* are used as raw material for all subsequent processing, this clearly has a spiralling effect.

Going into the problems and prospects of this industry in India, the book makes many practical suggestions, including that the production of aluminium fluoride from fluorospar has to be pushed with vigour. This reviewer would like to suggest that this industry might offer good ground for experimenting with the 'value-added' tax — since relatively few parties are involved in production and processing through to the final product. The book might have used data for 1969 and estimates for 1970, as it was written in November 1970.

Tangential Rather than Direct

The author, acknowledged in small print as A G Majumdar, seems to have concentrated on producing a good source of data on the aluminium industry, and has not addressed the book to anybody in particular. The result is a book that will be most useful to people whose interest in the industry is tangential rather than direct — such as teachers and MPs. There is an excellent appendix. The next edition, when produced, should not only bring the data up-to-date but should also go a little deeper into the structure of the individual companies. Government seems to have a glimmer of policy these days in this respect, since it has reportedly told Indian Aluminium that, when that company goes through with its expansion plans the proportion of equity held by Alcan should be reduced to less than half the total. The other companies' capital structure and collaboration arrangements could do with some airing too.

Financing Growth

Apararka

Studies in Capital Formation, Savings and Investment in a Developing Economy, edited by P C Malhotra and A C Minocha; Somaiya Publications, Bombay, 1971; pp 256+viii; Rs 25.

THIS book is a collection of papers in the subject-matter indicated in the title. The subject-matter leaves scope for an interesting collection of articles dealing with practical aspects of financing growth. But what we have is a hotch-potch of assorted papers that range in quality from fair to poor. The contributors include P R Brahmananda, S G Tiwari, Anand Chandavarkar, D R Khatkate, Nigam and Panchamukhi. In what follows I will briefly analyse their contributions.

Brahmananda in his first paper assumes away all such appendages as a central bank or even a government! In a subject where applied work is important, such omissions leave any paper with little value. Brahmananda believes that modern growth theorists are Pigouvian rather than Keynesian: "The occurrence of unemployment can only be explained by the existence of a real wage higher than that necessary to yield the rate of profit required to obtain the full employment investment". This is exactly the sort of situation which Pigou and not Keynes visualised. The explanation of unemployment is therefore wholly Pigouvian if we drop the wage marginal product hypothesis of Keynes' "Central Theory". Actually the wage marginal product hypothesis is *not* a Keynesian innovation; it figures in the Classical Theories too. Also, Pigou moved very close to Keynes in his last stage (see his "Keynes' General Theory —A Retrospective View") and it is this later, Keynesianised Pigou whose assumptions conform to later growth models.

In his second contribution Brahmananda sets down some 'Classical' propositions on capital, interest and profit. The reader's patience is strained by the fact that a fixed taxonomy is not followed, and technical terms are often switched. This is combined with the fact of some of the 'propositions' being true in reverse! For example, 'Proposition' K VI(D) speaks of the total demand for labour being in equilibrium with the supply of labour at *any* wage rate. The wage rate *is* the equilibrator between the demand for and supply of labour. At a specific level wage rates may be too high or too low for an equilibrium at a given, desired employment level. It is only if we regard any employment level as an equilibrium one that Brahmananda's *'proposition' is true.* Some of Brahmananda's assumptions (as that of workers living on air! [K XI]) should never have been set down. Economics is a practical science and theory is important only insofar as it helps the applied economist to suggest cures for real problems. Theories split from practice are worthless to the science—a fact that is being increasingly recognised, with the corollary of the applied economist, in business and government, being given greater social ranking than the 'pure theorist' of the Universities.

S G Tiwari has written a text-bookish article that will be useful to college students interested in measuring capital growth. K Mukerji has written competently on the same subject, but has not taken cognisance of the efforts of accountants to sharpen their capital concepts—efforts that have led to replacement-cost depreciation and asset revaluation.

A G Chandavarkar posits the inapplicability of the Keynesian liquidity-preference hypothesis to countries with gold hunger, as an explanation of the hunger. However, liquidity-preference has as a determinant not merely the hope of *monetary* asset appreciation (or fear of depreciation), but *real* asset appreciation as well. In this gold hoarding plays a significant role. Also, Chandavarkar snaps the connection between gold and money and considers gold only as a commodity. This, together with his neglect of the fact that the 'esteem' he speaks of as a determinant of gold hunger is itself a direct function of gold price, robs his thesis of plausibility. His conclusion that gold hunger does not absorb real resources is untestable owing to data-scarcity, but a case for the prosecution (of gold) could also be easily made out.

Khatkate and Deshpande's outdated paper on savings and investment in India, by showing the importance of the household sector in saving, refutes Chandavarkar's Innocuity of Gold Hunger thesis indirectly. Of late economists have begun emphasising the importance of channeling household savings into investment outlets like equities and have suggested extension of stock markets to rural centres. This channelisation into productive avenues faces a competitor in gold, and to the extent that the funds of households get deflected from productive investments into gold, that represents a real loss to the economy.

Raj K Nigam takes fourteen pages to make the point that public sector companies should raise their own resources if they are to contribute to corporate savings. K C Gupta's conclusions on capital formation in the private corporate sector get vitiated by his failure to take account of inflation effects on his figures. C H Shah is another writer who has contributed a piece that may seem trite to economists, but will be useful to students. P R Panchamukhi attempts a computation of the losses due to illness. A valuable effort that would be better appreciated had he given us some idea of the price tag on any scheme that would *control* these illnesses.

In today's India, where a new vigorous group of applied economists is coming up, these writings in comparison with those of these modern competitors appear pale. It is time for the old guard to change. Or keep silent.

Content Analysis of India's Image among US Foreign Policy Decision-Makers

Joanne F Loomba

This analysis shows that the overall image of India held by US foreign policy decision-makers has been a positive one. India's foreign policy was found to be the most salient aspect of this image while perceptions of India's population and political leaders were few. Yet, evaluations of the Indian people and leaders were discovered to be far more positive than evaluations of either India's foreign policy or domestic circumstances.

Generally the US Administration expressed more favourable views of India's foreign relations, domestic conditions, leaders and people than the US Congress. The divergence of views between the Congress and the Administration is most pronounced as regards economic and social conditions within India — especially the latter.

Over the time-span, 1951-67, 55 per cent of US decision-makers' statements on India dealt with its international relations. Approximately 42 per cent of the themes were devoted to the domestic situation in India. Only 2.8 per cent of the remarks involved generalised comment about "the people" and mentions of India's political leaders by name.

INDIA began to receive relatively large allocations of US Government loans and grants in 1951. Over the years, the discussions in the US Congress and between the legislative and executive branches of the American Government regarding the allocation of these loans and grants have been occasions for considerable commentary on India's international behaviour and domestic situation.

The public record of these debates on US allocations to India has been utilised here to study the images of India held by American foreign policy decision-makers over the time period 1951-1967. The political leaders whose statements were subjected to analysis were selected on the basis of their close involvement in decisions concerning US aid programmes to India. These persons were: (a) Presidents and Vice-Presidents of the United States; (b) Secretaries of State and other pertinent Department of State officials; (c) US Representatives to the United Nations; (d) members of the Senate Committees on Foreign Relations, on Appropriations, and on Agriculture and Forestry; and (e) members of the House of Representatives Committees on Foreign Affairs, on Appropriations, and on Agriculture.

The documentary sources of the speeches of these key US office-holders were: the *Public Papers of the Presidents,* the Department of State *Bulletin,* the *Congressional Records,* and published *Congressional Hearings* before the six committees previously mentioned. A sample covering five years was examined. The years chosen, spaced four years apart, were: 1951, 1955, 1959, 1963 and 1967. 1951 was selected as the starting point for the study, because this was the first year in which the United States extended large-scale assistance to Independent India. 1967 became the cut-off point in conformity with the public availability of relevant data in the four documentary collections during the period in which the research was conducted.

In order to investigate the perceptions and evaluations of India among the specified members of the US Government in a precise and objective manner, the research method of content analysis was employed.[1] Content analysis refers to any procedure for systematically assessing the extent to which certain words, themes, or values appear in a given communication. The technique involves the use of distinct categories of reference and numerical descriptions of the frequency of occurrence of these specified types of references.

The classification of references into particular categories is on the basis of explicitly formulated rules and criteria, which enable two or more persons to observe the same expressions of images and values in the same documents. This insures against the subjective biases of the individual researcher, who is likely to have a psychological tendency to notice only those comments which he wishes to see in the statement. Moreover, through the necessity of providing a quantitative description of the findings, the researcher is protected against the possibility of placing too much emphasis on a few remarks and, then, inferring that this attitudinal orientation permeates the entire communication.

Content analysis has been employed successfully by numerous scholars to analyse a wide variety of symbolic material ranging from propaganda articles to dramatic literature. In the area of political science, for example, studies have been made of trends in American attitudes toward Japan and China in public statements by national leaders;[2] of biased newspaper reporting in election campaigns;[3] of differences in Indian and German press coverage of the Sino-Indian border conflict and the Cuban missile crisis in October 1962;[4] of the political, economic, and social values of the American Executive as expressed in statements concerning India;[5] and of divergences between Soviet and American foreign policy views appearing in the major journals of the two countries.[6]

An especially significant usage of the content analysis technique in the field of political science has been in connection with research directed toward understanding the psychological dynamics of international crises. This has entailed detailed study of both the public and private communications pro-

duced by the key national decision-makers involved. Some of the international crises toward which content analysis has contributed greater insight are the following: the Far Eastern crisis of 1930-32;[7] the European crisis following the assassination of Archduke Francis Ferdinand of Austria which preceded the outbreak of World War I;[8] the Cuban missile crisis;[9] and the several Arab-Israeli crises leading to fighting in West Asia.[10]

In this investigation, the unit of analysis was the 'theme'. A theme consists of one subject, one verb, and one object. Whenever sentences contained more than one of any of these component parts they were divided into as many themes as was necessary. Within a theme, there were three types of references which were coded into the specified content categories. These coding units consisted of mention of: (a) India's behaviour and attitude toward other countries; (b) India's domestic conditions and policies; (c) Indian leaders by name and the Indian people in general. Each of these broad classification categories comprised of several subcategories, as explained below in the analysis of the data.

The content analysis procedure involved three parts. First, a frequency count was made of the number of references to a given category. Second, the themes were examined to determine whether India was described as positive or negative with respect to the designated coding category. Third, the references (themes) were scrutinised to see whether a favourable, unfavourable, or neutral evaluation of India's relationship *vis-a-vis* that particular category was expressed by the speaker.[11]

For all five years taken together, the author recorded a total of 38,876 references to India. It was discovered that perceptions of India's international behaviour dominate American decision-makers' images of India. Over the entire period, 55 per cent of the statements on India dealt with the country's international relations. Approximately 42 per cent of the themes were devoted to the domestic situation in India. Only 2.8 per cent of the remarks involved generalised comments about "the people" and mentions of India's political leaders by name. In each of the separate yearly time periods, the American legislative body (the Congress) gave a greater degree of attention to India's international interactions than did the executive branch (the Administration) of the American Government.

Under the broad heading of India's international behaviour, Table 1 shows the relative attention given by US decision-makers to India's interactions with various countries. Table 1 reveals that, on the average, approximately 80 per cent of their verbalisations about Indian foreign policy have to do with relations with the United States. The remainder of the themes are divided almost equally among interactions with communist countries, with other Western nations, and with Pakistan. Although it is not indicated in the Table, it was apparent in the author's examination of the data that legislators are rather more preoccupied with Indian-American contacts than are executive officials.

TABLE 1: RELATIVE ATTENTION TO INDIA'S INTERACTIONS WITH VARIOUS COUNTRIES BY AMERICAN DECISION-MAKERS, 1951-1967

(In percentage of references)

	All Years	1951	1955	1959	1963	1967
Soviet Union	3.9	2.3	12.4	2.3	3.9	1.8
Communist China	3.4	1.3	4.1	9.7	5.2	0.8
United States	79.7	88.8	73.5	71.1	71.8	83.6
Other West	6.0	3.6	4.5	6.6	8.9	7.1
Pakistan	5.6	3.4	2.5	8.0	8.7	6.0
Others*	1.4	0.6	3.0	2.3	1.5	0 7

* Includes mentions of communist countries other than the Soviet Union and China and mentions of non-aligned countries.

TABLE 2: NET DESCRIPTIVE IMAGE OF INDIA'S INTERACTIONS WITH VARIOUS COUNTIRES AMONG AMERICAN DECISION-MAKERS, 1951-1967

(In net percentage of positive minus negative descriptive references)*

	All Years	1951	1955	1959	1963	1967
Soviet Union	9.4	17.3	—1.3	14.3	11.9	28.8
Communist China	—53.0	44.6	—17.9	—70.8	—80.4	—86.7
United States	15.5	21.8	11.5	17.4	8.4	13.1
Other West	10.9	13.4	12.0	22.5	2.9	17.4
Pakistan	—19.5	—3.3	—29.7	0.0	—26.0	—34.7

* Net description (percentage) = $\frac{\text{Number of positive references to a category}}{\text{Total number of references to a category}} \times 100$ minus $\frac{\text{Number of negative references to a category}}{\text{Total number of references to a category}} \times 100$

The comparatively small amount of attention given to India's relations with the Soviet Union and Communist China is suprising, since United States foreign policy leaders are generally thought to be preoccupied with assessing the position of other states in relationship to the Cold War struggle. Also interesting is the fact that there is little difference between members of the American Congress and members of the American Administration in this regard. The major difference in focus between the two branches of government is the slightly greater awareness of India's relations with other Western countries and with Pakistan revealed in Executive statements.

Interactions between the United States and India seem to dominate the discussions of foreign policy-makers most during the years in which high priority was given to food aid, 1951 and 1967. The sharp rise in interest in Indian-Soviet exchanges in 1955 relates to the visit of Khrushchev and Bulganin to India at that time. Furthermore, that year saw the initiation of the Soviet Union's foreign aid programme to India. Especially obvious to the American foreign policy elite was the agreement signed in February 1955 for Russian assistance in the construction of a million-ton steel mill at Bhilai.

Table 2 presents the image that US decision-makers have of India's orientation toward these countries. A net descriptive percentage was calculated in the following manner. First, the number of themes describing India as having positive (friendly) relations with the country(ies) designated by the category heading was divided by the total number of references to that category; the resulting ratio was then multiplied by 100 to give the percentage of positive descriptive references. Second, the number of themes describing India as having negative (unfriendly) relations with the country(ies) designated by the category heading was divided by the total number of references to that category; the resulting ratio was then multiplied by 100 to yield the percentage of negative descriptive references. Third, the percentage of negative descriptive references was subtracted from the percentage of positive descriptive references to produce a net descriptive image of India's orientation toward the country(ies).

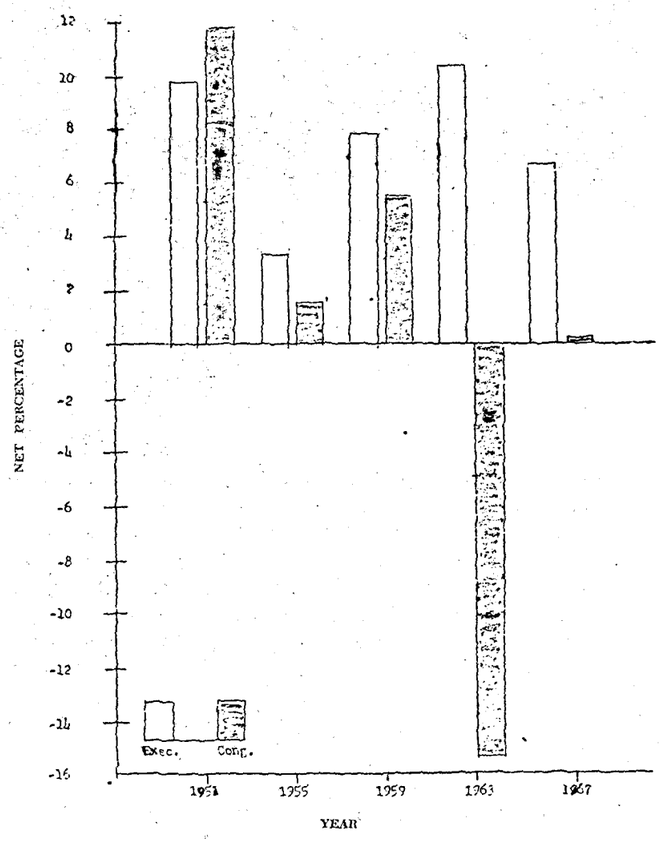
TABLE 3: NET DESCRIPTIVE IMAGE OF MAJOR DIMENSIONS OF INDIA'S INTERACTIONS WITH THE UNITED STATES AMONG THE AMERICAN EXECUTIVE AND THE AMERICAN CONGRESS, 1951-1967

(In net percentage of positive minus negative descriptive references)*

		All Years	1951	1955	1959	1963	1967
Political	Exec	19.1	20.6	0.4	27.4	22.8	16.7
	Cong	—2.6	7.7	—29.8	13.5	3.1	—29.5
Military	Exec	17.5	0.0	—50.0	30.0	22.5	—4.9
	Cong	—7.9	—4.3	—	—60.0	—2.1	—19.1
Economic and Social	Exec	27.6	35.0	24.5	19.8	18.7	36.9
	Cong	11.6	19.6	5.7	10.6	—1.8	6.9

Note: A dash indicates that no positive or negative descriptive references were recorded during that time period for the specified category.

* Net description (percentage) = $\frac{\text{Number of positive references to a category}}{\text{Total number of references to a category}} \times 100$ minus $\frac{\text{Number of negative references to a category}}{\text{Total number of references to a category}} \times 100$



It can be seen from Table 2 that US decision-makers describe India as having overall positive orientations toward the United States, other Western countries, and the Soviet Union. Conversely, India is perceived as having generally unfriendly relations with Communist China and Pakistan. It is interesting to note that India is pictured by American foreign policy leaders as having a net negative orientation toward the Soviet Union in 1955. This is a consequence of a great many pronouncements by US Administration officials to the effect that India's policy orientation was not becoming increasingly pro-Soviet. It reflects executive efforts to convince sceptical legislators that, although India might be receiving economic and technical assistance from the Russians, it was not any closer to the Soviet Union politically and diplomatically than it previously had been.

Further examination of the data revealed that, in all yearly time periods, the executive branch of the American Government perceived India's relations with the Soviet Union to be rather cool and formal. However, members of the US Congress described India as having a warm and friendly pro-Soviet orientation. This was especially true in 1951, 1955, and 1967. In 1951 and 1967, the descriptive themes dealt largely with the likelihood of India receiving military equipment from the USSR. In 1955, the legislators' focus was upon the increase in economic ties and diplomatic contacts between the two countries.

Legislators and US Administration officials share an image of India as being predominantly unfriendly toward both Communist China and Pakistan. The net negative description of Indian-Pakistani relations prevails for all years. The high point in 1955 is associated with Pakistan's acceptance, and India's rejection, of the CENTO alliance sponsored by the United States. US Senators and Representatives were particularly likely to let their dissatisfaction show through the heaping of blame on India for not having amicably settled the Kashmir dispute by this time. The large net negative descriptive percentage in

(In net percentage of positive minus negative evaluative references)

Milk co-operatives as an instrument for creating new jobs

Survey of two villages in Kaira* traces half their income to milk

Rearing milk cattle has become as important an occupation as agriculture in many villages in Kaira. In villages with milk co-ops, slightly over half the income is from milk, as against 20% in villages without milk co-ops.

Apart from raising village incomes, milk co-ops have created more jobs in villages, in collection centres, in cattle feed plants and in animal husbandry services.

With mechanisation of farming displacing people from agriculture, it is imperative that villages should offer alternative opportunities for employment. The traditional farmer is under-employed in any case. Dairying offers a part solution to both problems.

*This survey was conducted by the Department of Economics, Sardar Patel University, Vallabh Vidyanagar. The computed income included remittances from relatives in Africa.

Amul has shown the way.

ASP/ABF/SP-11

1967 records references to the 1965 fighting between India and Pakistan. Again the disapproval of the legislature was more pronounced than that of the executive.

American foreign policy-makers initially perceived India as quite positively oriented toward the People's Republic of China. According to the data, members of the US Congress retained this view until 1959—when the border fighting erupted between the two countries; whereas the executive image changed in 1955. By 1955, some members of the US Administration had become impressed with the essentially competitive relationship which existed between the two countries. A better understanding of non-alignment had developed, which permitted a few individuals to notice a political rivalry for leadership of the developing nations between India and China. The Bandung Conference was interpreted as supplying evidence to support this hypothesis. Furthermore, it was observed that both nations were trying to use centralised planning to modernise economically as rapidly as possible. Yet, while China used totalitarian methods, India apparently wished to demonstrate that it could be done under a democratic political system.

India's international transactions with the United States and other Western countries are generally portrayed as friendly by members of the American foreign policy elite. For both categories of interaction, the view of the American Administration is always more positive than that of the US Congress. Indeed, at no time is there a net negative description of either set of interactions by the US President and his appointed advisers.

Detailed analysis of the data indicates that, during the years studied, the legislature twice perceived India's transactions with other Western nations in a negative light. Moreover, two times the legislators expressed an image of India as being negatively oriented toward the United States. With respect to the former type of behaviour, in 1963 and in 1967, some legislators appeared resentful of the fact that aid agreements signed between India and European countries provided for shorter grace periods and higher interest returns than those negotiated between India and the United States.

As regards India's behaviour toward the United States directly, the legislature's net negative descriptive image in 1955 stems from a feeling that the warm welcome accorded Khrushchev and Bulganin, as well as the acceptance of Soviet economic assistance, were anti-American acts. The overall negative impression of Indian-American relations in 1963 reflects two attitudes in the US Congress. First, that India might misuse military equipment provided by the United States against Pakistan. Second, that India was asking too much in expecting large sums of American money for a steel mill at Bokaro, when comprehensive resource surveys had not yet been completed and Indian plans called for government ownership and operation.

Table 3 presents legislative and executive descriptions of India's interactions with the United States along three major dimensions: political, military, and economic and social. Overall, perceptions of military transactions between the two countries appear to be the most negative. Even generally more friendly officials belonging to the administrative arm of the American Government did not fail to take verbal notice of India's refusal to join the CENTO structure and its denunciation of the Pakistani-American arms agreement in 1955. The net negative descriptive percentage in 1967 indicates that they, too, expressed doubts about the correct use of US military assistance, following the 1965 war between India and Pakistan.

With respect to political relations, the American President and his assistants have always viewed India's behaviour toward the United States as more friendly than have US Senators and Representatives. The most positive net descriptive image of Indian-American interactions in this sphere occurs in 1959 for both sets of decision-makers. This, of course, is associated with Eisenhower's goodwill visit to India during the year. Finally, the executive has always depicted a more positive Indian orientation toward the United States concerning economic and social contacts than has the legislature. This is particularly obvious in 1963, when the debate between AID administrators and Congressmen was raging over the financing of the Bokaro steel mill.

As important for analysing the images of India among members of the American foreign policy elite, as their descriptions of Indian behaviour, are the personal evaluations they express of such actions. In order to investigate these verbalisations, a net evaluative percentage was computed. First, the number of references approving of India's relationship to a given category heading was divided by the total number of themes pertaining to that category; the resulting ratio was then multiplied by 100 to give the percentage of positive evaluative references. Second, the number of references disapproving of India's relationship to a given category heading was divided by the total number of themes pertaining to that category; the resulting ratio was then multiplied by 100 to give the percentage of negative evaluative references. Finally, the percentage of negative evaluative references was subtracted from the percentage of positive evaluative references to yield a net evaluative image of India's position *vis-a-vis* the particular category heading.

These data showed that not only do members of the US Administration hold a more positive descriptive image of India's orientation toward the United States than members of the US Congress; in their evaluations they also more warmly endorse interactions between the two states—in the future, as well as the past and present. For example,

TABLE 4 : NET DESCRIPTIVE IMAGE OF ASPECTS OF INDIA'S DOMESTIC SITUATION AMONG THE AMERICAN EXECUTIVE AND THE AMERICAN CONGRESS, 1951-1967

(In net percentage of positive minus negative descriptive references)*

		All Years	1951	1955	1959	1963	1967

* Net description (percentage) = $\frac{\text{Number of positive references to a category}}{\text{Total number of references to a category}} \times 100$ minus $\frac{\text{Number of negative references to a category}}{\text{Total number of references to a category}} \times 100$

We keep the nation moving on wheels

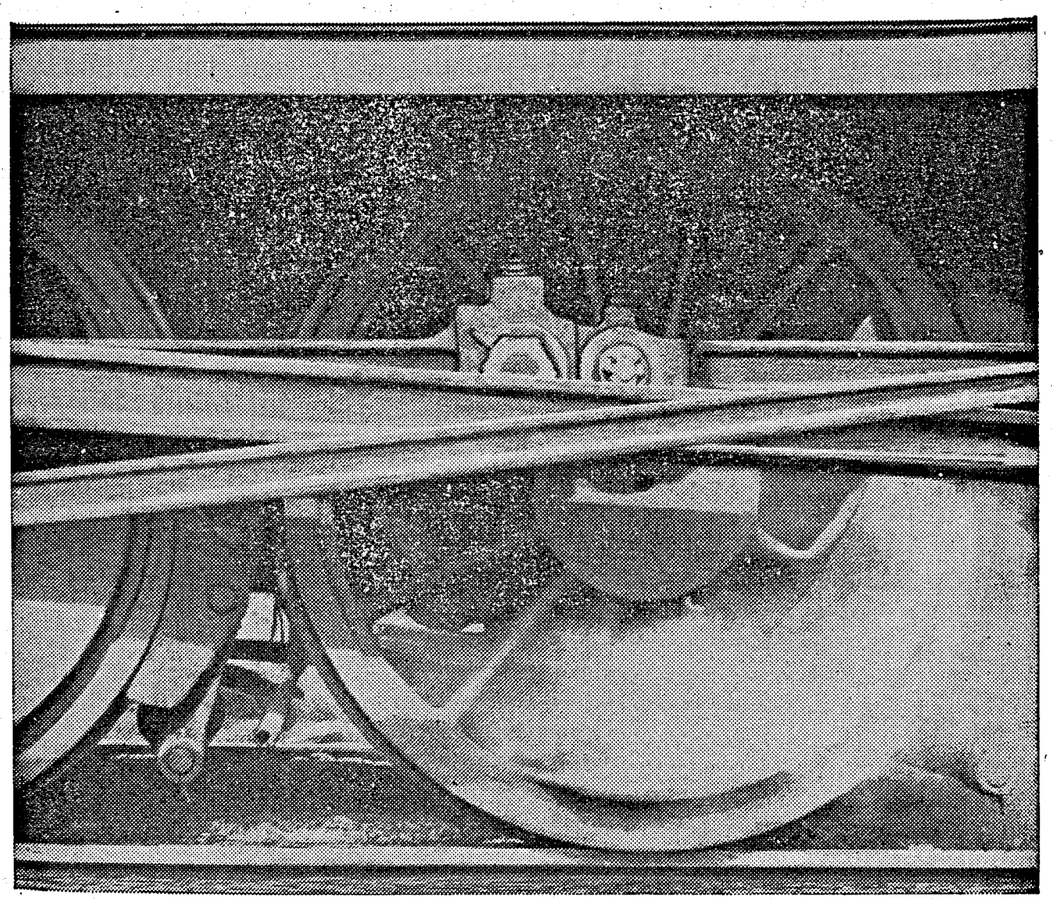
The wheel started a lot of things rolling. For example, the railways which connect villages to cities, products to markets and one region to another. Tata Steel rails, wheels and axles help to carry passengers and goods across this vast country.

Providing communications, steel is vital to the nation's progress. Nothing else combines such strength, versatility and value for money.

Which is why we spend a lot of time, effort and money on continuously improving what you get with the Tata stamp on it.

Tata Steel helps to give momentum to the Indian economy.

TATA STEEL



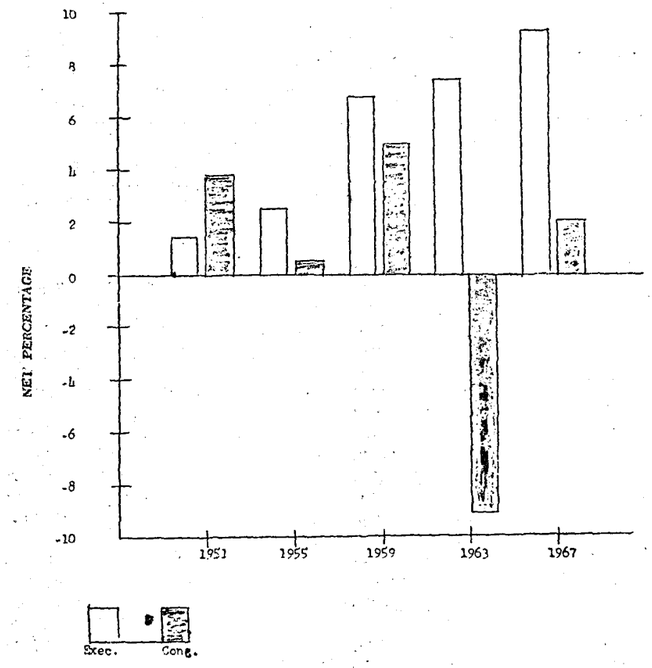


FIGURE 2: NET EVALUATION OF INDIA'S DOMESTIC SITUATION BY THE AMERICAN EXECUTIVE AND THE AMERICAN CONGRESS, 1951-1967

(In net percentage of positive minus negative evaluative references)

a net positive evaluation found along the military dimension in 1955 indicates that, despite acute awareness of India's disapproval of CENTO, the executive still strongly urged joint military co-operation between the two countries. The legislature tends more to associate negative perceptions of Indian behaviour with negative evaluations. The major exception in this regard occurred in 1951. At this time, high legislative praise for the fighting capabilities of the Indian soldier on the American side in World War II was coupled with pointed remarks about the failure of India to support the United States cause in Korea with troops.

American-decision-makers' evaluations of India's interactions with other countries reveal a pattern of cognitive consistency. This means that a perceived positive behaviour by India toward an ally of the United States is given approval; whereas an image of India as positively oriented toward an enemy of the United States elicits disapproval. For example, the content analysis revealed that beginning in 1955, when Indian-Soviet transactions became rather frequent, American foreign policy leaders have a predominantly negative evaluation of India's orientation toward the Soviet Union. Also, the positive description of Indian-Chinese interactions in 1951 is disapproved of; while the negative image of these exchanges thereafter is positively evaluated. Moreover, the consistently positive descriptions of India's international contacts with other Western nations by US policy-makers are associated constantly with net positive evaluations. Legislative and executive attitudes are quite similar in all of these aspects.

The only divergence between the cognitions of the two sets of decision-makers relates to Indian-Pakistani exchanges. Here the author discovered a net negative evaluation on the part of US Administration officials in 1967 alone. Legislators, however, expressed net disapproval of India's foreign policy toward Pakistan in all years except 1959. This is also the year in which they exhibited the least negative descriptive image of this dimension of India's international behaviour.

In order to summarise the total evaluations of members of the American foreign policy elite of India's international behaviour—as derived from the content analysis of statements concerning India's interactions with the Soviet Union, China, Pakistan, the United States, and other Western countries—Figure 1 was constructed. It can be observed that, with the exception of 1951, the executive branch of the American government registers more approval of India's international relations than the legislature. The higher net legislative percentage in 1951 is a consequence of a great many statements endorsing close economic and social exchanges between India and the United States. Indian-Chinese and Indian-Pakistani interactions were evaluated negatively by the US Congress at this time.

The previously noted discrepancy between executive and legislative cognitions in 1963 shows up clearly in Figure 1. The US Administration's most positive net evaluation occurred this year as the President, Secretary of State, AID Administrator and lesser bureaucrats all personally argued that India needed military equipment and the Bokaro steel mill, and was capable of using both wisely from an American point of view. The extremely negative legislative evaluation exhibits the scepticism in the US Congress toward these ideas, as well as its disapproval of Indian behaviour toward the Soviet Union and Pakistan. Moreover, in this discussion, members of the American Administration emphasised their pleasure at the hostile relationship perceived to exist between India and China to a far greater degree than the legislators.

Turning now to comments on India's domestic situation, which comprise just over 42 per cent of the references by American foreign policy-makers to Indian behaviour: for all years combined, approximately 9.3 per cent of these themes deal with political conditions; 7.9 per cent with economic policies; 55.5 per cent with economic conditions; and 27.2 per cent with social conditions. Among the years sampled, there is none in which economic conditions were not the primary focus of attention. Only once is concern with social conditions displaced as the second most interesting aspect of India's domestic behaviour. This was in 1963, when the Indian Government's socialis-

is no exception to this generalisation as regards the attitude of the Administration. However, with respect to the disposition of the Congress, there are deviations from this observation in 1955 and 1967. In these two years, legislative evaluations of both India's foreign and domestic behaviour were more favourable than their view of India's people in general and specifically named leaders.

In 1955, the negative feelings of Senators and Representatives consisted of disapproval of Nehru's visit to the Soviet Union, as well as his warm reception of Khrushchev and Bulganin on their subsequent visit to India, and of dissatisfaction with the words and actions of V K Krishna Menon as India's Representative to the United Nations. In 1967, the Legislators were expressing impatience with the Indian population for not having already achieved economic 'take-off' and a stable population growth rate, and for allowing traditional social and religious practices to interfere with the attainment of both these goals.

Except for the year 1959, which is associated with Eisenhower's goodwill visit to India, the Administration has always held a much higher opinion of specifically designated Indian leaders and of the Indian people than has the legislature. Another pattern in the perceptions recorded on this dimension is that: mentions of the Indian population in general terms appeared to be distributed throughout the five annual time periods studied and to be overwhelmingly favourable (except for 1967 among legislators). By contrast, comments upon Indian leaders by name were concentrated in 1951 and 1955 and were notably less positive.

One final aspect of the attitudes of members of the American foreign policy elite examined in this research was their overall net orientation toward India. This summary index of favourable/unfavourable orientation was computed in the following way. First, for each designated group of decision-makers, the author added: (a) all positive evaluations of India's international interactions; (b) all positive evaluations of India's domestic situation; (c) all positive evaluations of India's leaders and people; and (d) all positive descriptions of India's domestic situation. This sum was then divided by the total frequency of mention of India's behaviour in all contexts to yield a ratio of overall positive orientation.

Descriptions of India's domestic situation were included, because it seemed clear from a reading of the documents that personal evaluation was present in a speaker's choice of what to emphasise in describing domestic conditions within India. Moreover, various perceivers were discovered to exercise considerable latitude in reporting their observations within a neutral, a favourable, or an unfavourable context. Descriptions of India's international interactions were not included, since a positive or negative description has different evaluative meaning for an American decision-maker according to whether the category heading refers to a friend or enemy of India and/or the United States.

A ratio of overall negative orientation was computed in a similar fashion. A sum total was made of: (a) all negative evalutions of India's international interactions; (b) all negative evaluations of India's domestic situation; (c) all negative evaluations of India's leaders and people; and (d) all negative descriptions of India's domestic situation. The sum was then divided by the total frequency of mention of India's behaviour in all contexts. The overall net evaluation index was obtained by subtracting the ratio of overall negative orientation from the ratio of overall positive orientation.

Figure 3 plots the overall net orientation toward India of all US decision-makers studied, of members of the executive, and of members of the Congress. It can be observed that, in 1951 — when India was newly independent and the American foreign aid programme to that nation was small and consisted predominantly of emergency food relief—the two branches of the US Government shared a similar viewpoint on India. Through the years, though, their perspectives diverge increasingly.

Unlike the data on relative attention to various aspects of Indian behaviour, and on net evaluations of that country's international interactions and domestic situation, Figure 3 shows that executive and legislative overall net orientations toward India tend to move in the same directions from year to year. Impressions grow more favourable from 1951, to 1955, to an all-time high for all members of the American foreign policy elite in 1959. Contributing to these extremely positive attitudinal dispositions, in order of importance, were: evaluations of the Indian people in general and political leaders; evaluations of India's transactions with China; evaluations of India's relations with the United States; and executive descriptions of all aspects of India's domestic situation.

The 1963 dip in the upward trend in opinions concerning India, on the part of Administration officials, stems almost exclusively from a decline in the net positive descriptions of Indian economic policies and social and economic conditions. For members of the Congress, the extremely negative orientation exhibited derives from all four sets of cognitions included in the computation of this overall approval/disapproval percentage. Net evaluations of India's interactions with the United States, the Soviet Union, and Pakistan were all unfavourable. Descriptions of Indian economic and social conditions were negative, and those of political conditions and economic policies reached new lows. In addition, the legislature expressed net disapproval of both economic policies and economic conditions in India. Finally, legislative evaluation of the people and leaders plunged from a net positive 100 per cent in 1959 to 11.2 per cent in 1963.

The almost full recovery in 1967 of the Administration's positive attitude toward Indian behaviour is due to increases once again in favourable reports concerning the country's economic policies, economic conditions, and social conditions. The mild upturn in the legislature's outlook is associated with somewhat less negative descriptions of all aspects of India's domestic situation — plus an improvement in the evaluations of the nation's economic policies and conditions. Evaluation of India's international interactions, as well as of the people in general and specifically named political leaders, actually become more negative for legislators between 1963 and 1967.

In conclusion, then, it can be remarked that the overall image of India held by foreign policy decision-makers has, for the most part, been a net positive one. International interactions were found to be the most salient aspects of this image; while perceptions of India's population and political leaders were few. Yet, evaluations of the Indian people and leaders were discovered to be far more positive than evaluations of either India's foreign policies or domestic circumstances. Finally, it was observed that the executive generally expressed more favourable views of India's foreign relations, domestic conditions, leaders and people than the American legislature.

11 The author did all the coding herself. Prior to the content analysis, she tested the reliability of the coding rules by asking three other individuals to code several documents included in the sample. Computing intercoder reliability between the author and each of the other persons on a bilateral basis, by the formula given below, produced an average reliability of .81.

During the content analysis, the author made several reliability checks on herself to ascertain if there was consistency in the application of the coding rules. By the same formula, the author's across-time reliability was .93.

The reliability formula used was:

$$r = \frac{2(A)}{N_1 + N_2}$$

In this formula, A = number of items agreed upon, N_1 = number of items coded by the first person (or the first time), and N_2 = number of items coded by the second person (or the second time).

Consumer Prices and Per Capita Household Consumption in Rural India

Variation between States

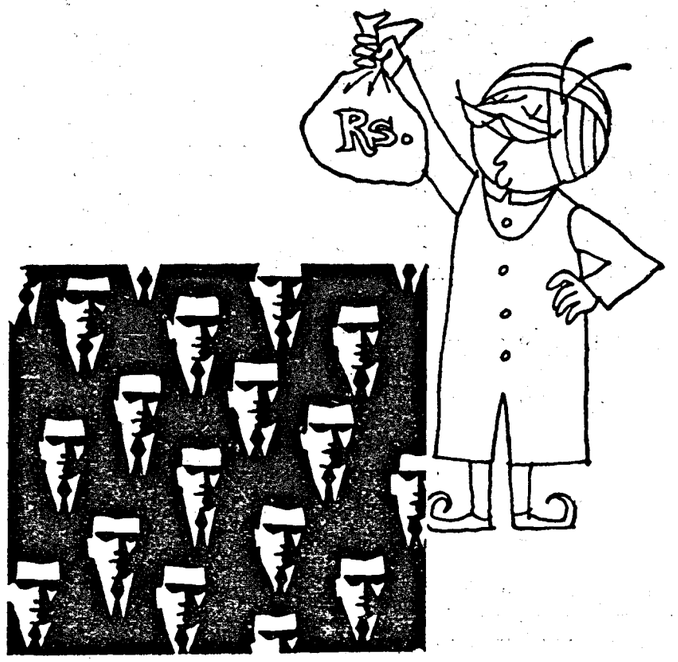
N Bhattacharya

G S Chatterjee

Budget data collected in the 18th round of the NSS has been utilised for constructing indices of consumer price variation among the rural areas of the different states of India. Consumer price indices, computed to compare the price level in each state with that in rural India as a whole, are also employed to compare the average per capita total household expenditure in the different states at rural India prices.

A major limitation of the price differential indices is the exclusion of item-groups like education and durables. Besides, there are inherent limitations of NSS household budget data which are not collected specifically for purposes of construction of consumer price indices. The findings may have been partly vitiated, therefore, by the unrecognised factor of quality variation. Finally, there are the intrinsic limitations of interregional comparisons of consumer prices owing to climatic or other environmental differences.

WE present, in this paper, some preliminary results of studies undertaken at the Indian Statistical Institute, Calcutta, based on household budget data collected in the 18th round (February 1963-January 1964) of the National Sample Survey (NSS). We utilise the material for constructing indices of consumer price variation between the rural areas of different states of India. The budget data are used for estimating weights as well as consumer prices of 56 items covering food, pan, tobacco and intoxicants, fuel and light, and clothing groups of the household budget. Consumer price indices are computed for comparing the price level in each state with that in rural India as a whole. These indices are employed for comparing the average per capita total household expenditure in the different states at rural India prices.[1]



More accurate comparisons of this nature would require indices comparing price levels in each pair of states. Such indices have been computed. Also, the analysis is being done separately for 5 fractile (quintile) groups of the population in each region, these groups being based on a ranking of the households in increasing order of per capita consumer expenditure. These results will be duly reported in a subsequent communication.

II

Construction of Indices

In earlier communications[2] we examined urban-rural differentials in consumer prices and per capita household consumption in India utilising NSS 18th round household budget data. Here we employ the same material in the same manner to investigate interstate differentials in consumer prices

Togetherness pays !

AL3005 A

If you travel in a group, you pay less, much less, under Air-India's Affinity Group Scheme.
Which groups qualify?
Your group must consist of at least 15 members. And you must all belong to the same school/college, institute, firm, club, society, corporation, association or organisation, for at least 6 months.

For what purpose?
Whether you travel to attend a conference or a convention or for pleasure, you can avail of the discount. And Air-India allows you to include your wife/husband and children as part of your group. This way you really save money— over Rs. 2,000 per fare on some sectors.

Ask your Travel Agent about GIT, too
Under the Group Inclusive Tour Scheme a group of 10 people who travel together get a group bargain on air fares, hotel bookings, sight-seeing tours. Yo Travel Agent may be able to arrange a 21-day trip to Europe for as little as Rs. 5,600.

See your local Air-India Office or your Travel Agent for full details. You'll find out that togetherness pays.

AIR-INDIA
the airline that loves you

* This includes Himachal Pradesh — 39 sample households.

and level of household consumption in rural India. The material covers the whole of rural India.

The data were collected from sample households by the interview method. Consumption includes consumption of goods and services (a) out of monetary purchases, (b) out of receipts in exchange of goods and services, (c) out of home-grown stock, and (d) out of gifts, loans, etc. Probability sampling was followed for selecting the households. The sampling design was complicated, but the sample comprising four independent and interpenetrating sub-samples providing independent and equally valid estimates of population characteristics. These sub-samples have been grouped here to get two independent half-samples of the NSS sample. The divergence between half-sample results points to the margin of uncertainty associated with the combined sample results.

The material was thoroughly scrutinised giving particular attention to the prices implicit in the entries for consumption in quantity and value terms. Entries with the implicit price too high or too low were rejected in the estimation of average prices.

The price data obtained from household budget inquiries are based on statistically valid samples of households and transactions covering specified sections of the population. Also, imputed prices of non-monetised consumption are reflected in the household budgets; the usual price inquiries, on the other hand, generally neglect the non-monetised part of consumption.

The state of Himachal Pradesh with only 39 sample households was included in the all-India estimates but left out in the interregional comparisons.

A large number of consumer items representing different areas of the budget was considered, but some of them were dropped in view of the small number of reporting households or the divergence between half-sample prices or other types of evidence on lack of reliability. Finally, 56 items covering food, pan, tobacco and intoxicants, fuel and light, and clothing groups of the household budget were included in the calculations. The weights of these items were the percentages of total household expenditure spent on them *plus* suitable allocations of weights of related items not included in the calculations.

Nothing could be done to cover subgroups like education, medicine, conveyance, services and durables. The total weightage of these excluded items is shown in Table 1 for the combined sample. Our calculations are based on the tacit assumption that the average price differential for these excluded items is the same as the average price differential for the included items.

Laspeyres' (L), Paasche's (P) and Fisher's (F) formulae were used for expressing the price level in each state as percentage of the all-India price level, separately for the two half-samples and the combined sample.

For some items, no average price was available for particular regions simply because no sample household reported the consumption of these items. In such cases, we tried the following approaches, in the order stated, for removing the gap in data:

(i) For items like *muri*, we assumed that the *price relative* of muri was the same as that of a closely related item, *viz*, rice.

(ii) If the price was not available for only one of the half-samples, then this price was taken as equal to the price for the other half-sample for the same region.

(iii) If approaches (i) and (ii) are not helpful, then we took the missing price quotation as equal to the (average) price in one or more neighbouring states for the same half-sample. (Sometimes it was necessary to employ a combination of these approaches.)

III

Price Differential Indices

The indices are presented in Table 1, along with relevant sample sizes and the weightage of excluded items.

Divergence between L and P: This is generally taken as a measure of the formula error. The divergence seems to be wide when the budget patterns of the regions compared are markedly different, e g, when comparing Kerala

TABLE 2: COMPARISON OF AVERAGE PER CAPITA TOTAL CONSUMER EXPENDITURE IN RURAL AREAS OF DIFFERENT STATES BEFORE AND AFTER DEFLATION*, BASED ON NSS 18TH ROUND HOUSEHOLD BUDGETS.

State	Average Per Capita Consumer Expenditure (Rs) Per 30 Days at Current Prices			Indices of Per Capita Expenditure (Base=All-India Rural)					
				At All-India Prices			At Current Prices

* The Fisher indices in Table 1 were used for the deflation.

with all-India. On the other hand, the divergence is small when the two budget patterns are similar, e g, for the comparison between UP and all-India. This is only to be expected. We may quote the Fisher indices as measures of price differentials, but the measure is imprecise when the state concerned has a budget pattern very different from the all-India one.

Incidentally, we may note that the Paasche index is consistently lower than the Laspeyres' index in Table 1.

Divergence between half-samples: The half-sample indices do not show considerable divergence except in a few cases, e g, for Kerala. On the whole, however, sampling errors of the indices seem to be less important than the formula error.

Inter-state differentials: Judging by the Fisher indices in cols 10 to 12 of Table 1, the states may be grouped as shown below. This grouping is not a rigid one. The indices have some amount of sampling error and the true position of a state may be somewhat different from the position in this grouping. However, the ranking of the states in ascending order of the Fisher indices is nearly the same for the two half-samples and the combined sample. The range of the indices is from 94 to 116. Broadly speaking, the price level was higher in the industrially advanced states.

Range of Index	State (Fisher's index with all-India rural=100)
90— 95	UP (94)
95—100	MP (96), Orissa (98), Mysore (99)
100—105	J and K (101), Rajasthan (101), Andhra Pradesh (102), Bihar (102) Punjab (105)
105—110	Kerala (107), Maharashtra (107), Assam, Manipur, Tripura (108) Madras (109)
above 110	Gujarat (112), West Bengal (116)

We may note here that the substitutions mentioned in paragraph 11 gave a significant upward push to the Laspeyres' index (L) in several cases (e g, for Kerala), while the Paasche's index (P) remained more or less unaffected. One cannot rule out the possibility that these substitutions introduced some bias in the values of L (hence F). This is evident from the fact that most of the statewise indices, L or F, are above 100. In fact, the weighted average of the statewise Fisher indices, with weights equal to the respective percentage shares in aggregate expenditure of rural India, came out as 102.3. The corresponding averages for Laspeyres' and Paasche's indices are 104.5 and 100.2 respectively. It is thus possible that our indices have tended to err on the high side by about 2 percentage points. It is believed that this bias has not varied among states so markedly as to vitiate the analyses made below.

IV

Comparison of Real Per Capita Household Consumption

We shall utilise the indices in cols (10)-(12) of Table 1 for comparing the level of living in different states. Table 2 shows in cols (2)-(4) the estimated average per capita total consumer expenditure per 30 days in rural areas of different states. These estimates are not strictly comparable between states in view of inter-state consumer price differentials demonstrated above. The comparability may be secured by deflating each estimated expenditure by the respective state index with all-India rural as base. These expenditure figures at all-India (rural) prices are omitted for reasons of space; we only present the indices in cols (5)-(7) expressing each state figure as percentage of the all-India average. Comparison may be made with the corresponding indices in cols (8)-(10) based on the undeflated statewise expenditure estimates in cols (2)-(4).

The deflation alters the picture in several cases. Thus, in Table 2, average per capita consumer expenditure at current prices is 28 or 29 per cent higher in Punjab than the corresponding all-India average; but if inter-state

price variation be taken into account, the difference seems to be smaller, about 22 per cent. In contrast, Madhya Pradesh seems to be further above the all-India level after the deflation. Madras and West Bengal are above the all-India level before deflation but are below the same after deflation. In general, the standing of high-price states, like Maharashtra, Gujarat and Assam, is lowered, while those of low-price states like UP improve, as a result of the deflation.

An interesting question arises at this stage. The statewise estimates of average per capita consumer expenditure present a certain picture of between states disparities. To what extent does the process of deflation described above alter this picture by lowering or raising the relative position of the more prosperous states? To answer this, we computed the proportionate shares of different states in the aggregate house hold expenditure in the whole of rural India (excluding Himachal Pradesh), using the statewise per capita expenditure estimates (i) at current prices and (ii) at rural India prices (Table 2). Denoting the share of the ith state by q_i and the share of the same state in the total population of rural India by p_i, we computed Kuznet's measures of disparity $K=\frac{1}{2}\sum_i |p_i - q_i|$, to obtain an overall measure of between states disparity. The value of K came out as 0.0348 for the distribution at current prices and 0.0367 for the distribution at all-India prices. This means that the deflation carried out in Table 2 slightly increased the magnitude of between states disparity.

Closer examination reveals some positive correlation between the average per capita consumer expenditure in a state and the level of consumer prices in the state. The correlation is, however, far from close. Jammu and Kashmir is a conspicuous case. One may also cite the instances of Gujarat, Punjab, Kerala and Madhya Pradesh.

V

Concluding Remarks

We have already noted a major limitation of the price differential indices, namely, the exclusion of item-groups like education and durables from the scope of the index. It is difficult to cover items representing these subgroups (e g, cinema tickets, school fees, domestic service) by collecting prices appropriate for interregional comparisons.

There are, besides, the inherent limitations of NSS household budget data, which were not collected specifically for purposes of construction of consumer price indices. The items in the schedule (e g, rice or milk) represent broad groups of varieties or qualities. To the extent the average quality of any item varies between states, the implicit prices in budget schedules would not be comparable between the states. Our computations tacitly assume that the average quality of each commodity is effectively the same in different states of India. This may not, of course, be perfectly valid. Accordingly our findings may have been partly vitiated by the unrecognised factor of quality variation.

Finally, we must remember the limitations of interregional comparisons of consumer prices (Beckerman, 1966).[3] We have made no attempt to overcome the problems created by climatic or other environmental factors leading to variation in consumer tastes and needs.

Notes

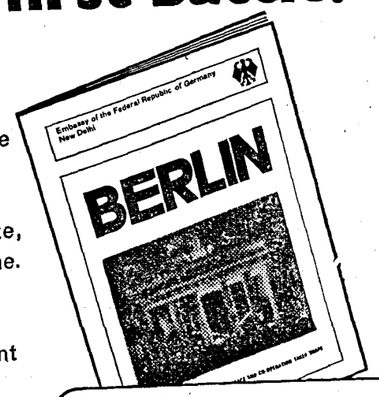
Training Methods for Social Research

Brij Raj Chauhan



A CONCRETE social reality has several dimensions. Understanding it calls for close looks at it from various angles. The division of labour among our social sciences provides different vantage points for such perceptions. By now, it has become almost proverbial to say that a real problem has an interdisciplinary character as social sciences insist not merely on the conclusions but increasingly on the methods of arriving at them. As all of them are trying to adopt a scientific frame of inquiry, it is possible for practitioners of different social sciences to interact with other fellow social scientists in the fashioning of tools of inquiry and methods of research.

The occasion for writing this paper is the experiences gained in handling a group of about 30 social scientists drawn from five disciplines and fifteen centres of learning, in a training programme in research methodology organised on behalf of the Indian Council of Social Science Research by the University of Meerut in June-July of this year. The organisers had experience of conducting 14 months pre-Ph D training programmes leading to a M Phil degree. This latter programme envisages training in research methods in the division of behavioural sciences and prepares students for taking up research problems in substantive areas spanning the three disciplines of sociology, psychology, and education. Experiences gained there were freely used for the ICSSR training programme. With this background, it is instructive to review the areas where such a group could work with some success. The difficulties in such ventures, such as the heterogeneity of the group, their non-awareness of one another and of the place of work, their problems of adjustment during a short period, etc, are all too obvious to need comment at this stage.

Strange though it may seem, the first lesson one can draw is that shared ignorance unites the workers easily. Persons coming from different places and meeting for the first time have normally to be introduced to one another. In a course on research methodology this was posed as a problem and the programme began with the words: "We have come from different places and would like to get introduced to one another. What questions or points would you like someone else to answer to introduce himself to you? Can you

The Strategy of Peace and Cooperation pursued by Chancellor Willy Brandt has won its first battle.

The successful outcome of the Berlin negotiations of the Four Powers proves that the programme of achieving detente and cooperation in Europe is not an illusion, but is about to materialize, although much remains to be done. This naturally takes time. The first results of this process have been facilitated by the patient and sympathetic attitude of third countries, including, as an important factor, India.

FRG-1889

write down the points on a piece of paper beginning for example with name . . . ?" The trainees wrote down the points and each paper was then handed over to a person in the opposite row for the answers. Some of the gaps began to appear, and three drafting committees were set up to consider the list of questions in the light of the answers and the gaps that remained unanswered. Discussions in the groups centred on two major approaches; (i) trying to get the information needed and (2) limiting the questions in number so that they could be answered without inconvenience, particularly on the first day, by a person joining the programme. A joint committee of the leaders of the three groups later drew up the agreed draft, thereby initiating the idea of preparing initial notes, discussing them, redrafting the questions, and giving further shape to them. In the process, they had constructed a selfadministered questionnaire. This was one case of problem-solving, involving all the participants, but without anything like an interdisciplinary effort coming into being.

Knowing about a new city could also be posed as a problem. Only two days before the programme started in MKP College, Dehra Dun, municipal elections had concluded and the results were announced on the second day of the training programme. The new city in the foothills of the Himalayas attracted attention particularly during the summer and the municipal elections were almost omnipresent. The occasion appeared suitable for introducing and practising exploratory research designs, wherein effort is made to use existing resources for obtaining the variety of ways of looking at things. The city has a couple of daily papers in Hindi and English, each, besides a few weekly publications. These and census reports began to be scanned. A senior sociologist and a political scientist talked about the varied facets of the city growing in heterogeneity through migrations.

The members of the training programme, forming teams of two investigators each, were instructed to conduct open-ended interviews of four to six persons drawn from different walks of life to ascertain the divergence of views on the nature of the city, its local government and elections. The accent of the exploratory studies was not on the counting of uniformities but on listing of varieties. The participants were further asked to note the phrases through which the interviews seemed to convey some essential characteristic of the city and answers like the following were recorded: "Dehra Dun is the valley of green bushes and grey hair", "Women may outstep the males", "City of fashions", "Lots of public schools", "Full of refugee population", "Where people talk nicely and are generally helpful". About political behaviour, different views were expressed: "Money is not a significant factor in seeking votes", "in some areas there has been group-voting", "retired military persons and the highly educated take little part in politics", "municipality has no meaning for big persons who can get things done directly from offices", "political realities are not so simple they lie hidden deep".

In the light of the preliminary experiences in interviewing people of different strata, the participants were asked to give their own impressions on the role of various factors likely to have improved the chances of the winning candidate. First, three preferences were scored and the results were analysed. These 'judges' thought that social service and political connections of individual candidates and their personal merits should have counted more than other factors like caste, or education, or formal candidature through a political party. Trade unions, played a significant role in certain areas. The 'judges' had used their own experiences of talking to people and to some of the candidates in different wards of the city. By this time, knowing about the city was a problem apparently solved, and the exploratory design seemed to have succeeded in its purpose of getting the members used to the varieties of city life. Further exercises in observations and interviews, in areas culturally different from one's own, were carried out in the jaunsar region of the district traditionally known for its fraternal polyandry. In the effort to explain these observations, a little anthropological explanation began to reach members. Still, these efforts could be called successful in enlisting the participation of most of the members at the level of getting used to the techniques — perhaps heard by many but left almost unused. Thus the operational part of handling the techniques appeared to bring out active participation; but, still, the unifying factor was not the interdisciplinary approach.

It became evident that further progress in training could flow from a proper selection and delimitation of a problem for inquiry. The recently concluded municipal elections had provided a case of complex social reality; exploratory studies of the town, and of the political behaviour of the people, had been attempted. Preliminary theoretical lessons in experimental methods were undertaken. It was then decided that the group could address itself to a few problems. These included

(i) Distinguishing the voting from the non-voting persons and finding out what factors could be associated more with one rather than the other.

(ii) Distinguishing the winning candidates from the non-winning contestants, and trying to find out the factors associated more with the one rather than with the other. It was further thought that interview-schedules should be prepared for persons having their names in the electoral rolls in the first case, and for the contestants in the second case. It was assumed that the first set of schedules had to be short and simple, and those of the second more elaborate. The exercise went into greater details and the import of every question for explaining the voting turnout had to be discussed thoroughly. It was agreed that no person would be asked whom he had voted for, the main interest of the inquiry having been defined as voting turnout and not voting preference. Three groups were asked to prepare drafts of the schedules, which were later discussed point by point.

The construction of schedules started with listing some introductory questions relating to the informant, then to his socio-economic background, his voting or non-voting, and a few other questions. The nature of the discussion through which each question had to pass was revealed. If the question was on age, the point was immediately raised: "How was age related to the voting or non-voting?". Different views were expressed. "New voters are more likely to vote" was one view, and "voting varies inversely with the age" was another view. Voting was less among retired persons was a third view. Divergence in views regarding the effect of age on voting and non-voting provided the situation in which alternative hypotheses could be tested. Then there was the question on sex, to be entered by the interviewer without asking it of the informants: "Its relevance to voting or non-voting". Participants thought of only one possibility "Men should be voting more than women". Should the findings confirm this, it was agreed that it would not be a major conclusion, but would confirm the earlier ones. Then came the question on educational levels: "How was education related to voting turnout?". A simple linear correlation was suggested by some through the proposition: "the more the education, the higher the percentage of voting"; yet, others responded that low-literacy groups were capable of show-

ing collective behaviour at the time of voting whereas highly educated people might abstain from them. Here again, the divergence of opinion provided an opportunity for testing a hypothesis becoming meaningful. Thus a few more questions were discussed. Eight teams of investigators were sent again to try out the schedules on the field situation. Experiences were discussed again as to the feasibility of the questions. Some divisions were suggested; e g, a column relating to the occupational categories was divided into two, providing the occupation of the respondent in one case and the respondent's guardian's occupation in the other case.

Of course, all questions were prepared in Hindi, so that some of the literate respondents could satisfy themselves, on the content and sponsorship of the programme. Discussions on the schedule were then brought to a different stage. At this point, students from different disciplines were constituted into subcommittees to say what their disciplines had to contribute to an understanding of the phenomena and whether any techniques practised in specific disciplines could be attempted in their studies. The anthropology group suggested that data on migration be collected for respondents from the voters list. Questions on caste and religion had already been included. In case of the winning and losing candidates, they wanted to know whether kinship ties had any role to play in determining political ties. They also suggested the preparation of genealogical charts for recording the kinship ties. Data on occupation and income partly satisfied the economists, and they wanted more data on past elections which found lack of support on grounds of feasibility. Sociologists suggested that whether non-voting had become habitual to a person or not needed examination. In regard to candidates they suggested inquiries into their political socialisation and the role of traditional and modern groups. Political scientists were more interested in candidates, their techniques, and a study of corrupt practices in the elections. Psychologists emphasised the perception of municipality as a problem-solving mechanism and found that this could affect the voting turnout. They discussed the relevance of personality tests, (introvert/extrovert type) for studying candidates. But the feasibility of standardising translations and testing different versions within a short period was ruled out. At this stage, statisticians helped us, explaining the rationale of the samples and the use of random number tables for selecting voters. Questions on alternative samples were discussed. Some exercises were tried out for each of the 13 wards of the city before finalising the schedules. Names from the voters' list, including the age and sex of the voters, the house numbers, and the mohalla, were taken; and then began the exciting task of locating the respondents so selected.

Field workers had lively reports to present on their experiences: the houses did not seem to follow the sequence in numbers and it was very difficult to locate them. Some mohallas bore similar names: some merged into the other; some of the respondents had passed away and others had gone out of town for business or employment while some were temporarily away. Where the respondents could be contacted, the husbands in some instances wanted to answer on behalf of the wives. In a few cases, the respondents thought that they themselves were not qualified to inform on the municipality and directed the investigators to more knowledgeable persons. The initial setback was overcome. One positive consequence was that the investigators became 'social educators', making nearly a thousand people aware of sampling procedures etc.

As the initial data started coming in, a statistician and a behavioural scientist from the staff commenced exercises in coding; and, once again, the relevance of the hypothesis and use of two-by-two tables began to be discussed. Two illustrative discussions will be enlightening at this stage. There was the question relating to caste: How could this be coded and of what use was it in answering the main question? Somebody suggested 'higher', 'medium' and 'lower' caste classification. Immediately the question was raised: Which group will vote more and which less? At this stage, the original designer was brought back into discussion, and the hypothesis suggested that, where persons on the voters list come from the caste of one of the candidates the voting turnout would be more. If the hypothesis could be considered relevant, further coding exercise was easy. Then classifications will lead to a person's caste on one side, and candidate's caste on the other, and the answer would be tabulated, as 'same' or 'different'. Here it is assumed that the caste of the candidate was independently ascertainable. Similar exercise was undertaken on the question of the region from which the voters came. In other exercises, it was found more meaningful to merge four categories into three, particularly on educational levels and income groups. Again, possibilities of inference were illustrated through the use of dummy tables and the entire effort could thereby result in a pilot project with possibilities of either being completed or replicated elsewhere. Only preliminary work was done on schedules for interviewing the winning candidates.

Experiences in the linking of training in research with an on-going project thus proved to be full of exciting possibilities. Training in the rules of research techniques involves selection of appropriate techniques for the purpose at hand. Clear formulation of the problem comes not necessarily at an initial stage of inquiry but along the way by the relevance of every procedure used. This may be true of research training in at least one branch of study. What is significant is the role of research methodology as a unifying channel for operation among people drawn from more than one discipline.

The experiences seem to indicate two paradoxical situations. It is comparatively easier for teams drawn from different sciences to operate together in areas where ignorance is common. Thus, when the philosophical basis of scientific inquiry is discussed, when principles of model building and techniques of sampling are explained, when new persons are to be introduced or a new place understood, common ignorance makes all apply their minds together to situations to which perhaps specific disciplines had not got ready-made questions before. Such collaboration, however, does not come from an 'interdisciplinary' approach — though its value cannot be denied since every educational effort has its task of equipping the mind for handling unfamiliar situations. The point is that, at the level of methodology and technique, different sciences have developed different focii and tools for operating therein; at these levels there is great scope for understanding their different angles as so many vantage points for looking at social reality. The possibilities of transferring skills, developed in one science to others, is now a distinct possibility. While a mastery in the use of such skills may not be attained in a short period, its possibilities and its need can be felt in approaching a common problem from different positions and making such exercises a part of training. The ICSSR is providing such an opportunity through a chain of training programmes in the country. As a first step in this direction such efforts are welcome; they do call for further thinking, however, with regard to greater institutionalisation of training in research methods.

Forever Amber!

THE reaction in this country to the US Senate's rejection of the foreign aid bill has been confused. The Prime Minister is reported as having said that "we have to accept it" (as if we had a choice); the minister for Foreign Trade is reported to be "perturbed"; other commentators have seen the development as "a spur to self-reliance". The country has been exhorted to put an end to black money, to improve the working of public sector plants, to gear up the whole administrative machinery for new tasks, and to mobilise the nation's physical and manpower resources — in short, to do all that is necessary for the economic development of the country. Prometheus unbound, at long last!

The plain fact is that the potential loss of the few million dollars of annual US aid is a disaster so far as this or next year's investment plans are concerned, and will substantially worsen the resource position of the government. Apart from doing all that the government should be doing any way in order to raise resources and expand exports (and, of course, improve the public sector), *in the short run* the best course for the country is to accept the fact that there is going to be a further cut-back in resources available for investment, and so worry all the more about the 'quality' of investment that does take place. The Planning Commission can do the country an enormous service by coming out with a list of projects or contemplated investments that should be postponed or pruned, rather than continuing to make believe that business is as usual.

And yet by some perverse logic, this is precisely the kind of investment planning which has come to be viewed as a luxury to be indulged in only when all is well with the economy. With every development which makes the economic situation more difficult, whether it be a couple of poor harvests in a row or the influx of refugees from Bangla Desh, the government is less and less inclined to take a total view of the economy and instead turns increasingly to *ad hoc*, partial measures. Naturally, these measures do not work; and even when one does, it turns out to have very limited impact. The outstanding case of the latter type is, of course, the so-called green revolution. After the agricultural failures of the mid-sixties, the government went overboard over the 'new agricultural strategy'. The result is that while some successes have been achieved in foodgrains production, the government has found itself completely incapable of turning them to advantage for overall economic growth. So we now find ourselves confronted with a situation of agricultural growth with industrial stagnation.

The most recent instance of the same kind of partial approach is the Ordinance issued this week to amend the Industries (Development and Regulation) Act to facilitate government take-over of 'sick' industrial units. The Ordinance has been issued in the name of "revival of industrial activity in the country" and already the Maharashtra and Mysore governments have taken advantage of it to take over the management of some more textile mills. But it is well known that textile mills taken over by the government have to be run purely as employment projects incurring continuous losses. This is inevitable since there is simply no room in the industry for all of the 600-odd textile mills and modernisation and expansion of some mills, which has been encouraged and financed by the government, must inevitably see the extinction of some others. The subsidies paid to meet the losses of the mills taken over are thus on par with the subsidies paid to, say, the khadi programme only they are threatening to become much larger. Is this the best use that the central and state governments can find for their admittedly shrinking investible resources? As for sick units in other industries, such as engineering, their state of health more often than not reflects the investment recession in the economy. Yet the government persists in its piecemeal efforts to revive industrial units even as it moves farther and farther away from any systematic planning to raise the level of investment according to some scheme of priorities. In this context, the shutting off of US aid far from persuading the government and the Planning Commission to worry about the quality or direction of investment will almost certainly speed up the drift into laissez-faire and economic chaos.

For the longer term, the US Senate's action has once again demonstrated the futility of a developing country planning on the basis of assumptions regarding continuity of aid — or, for that matter, international co-operation. The action comes close on the heels of the US import surcharge and the British decision to enter the Economic Community — decisions which are not calculated to increase the developing world's trade with the industrialised countries. For India, it raises the question, among others, of the usefulness of that holy of holies, the Aid India Consortium. It is nice to get together with the rich and

agree on India's poverty or India's needs, but beyond that what purpose does it serve to subject the country to this annual free-for-all? After twenty years of being advised and approved of, the time may have come for the developing countries to go home and build what they can with what they have.

This basic reality about the future course for the developing world will not be altered by partial or full restoration of US aid for this year or next, as is not unlikely. Economic co-operation between the rich and the poor — to the latter's unending advantage — has always been a bit of an illusion, but never more so than now.

The Cyclone

'Natural' Calamity?

TIME and time again cyclones have taken a heavy toll of lives in India's north-eastern coastal regions. Governments, both central and state, react like Victorian do-gooders with words of sympathy, aerial viewings and relief supplies doled out like charity — but without any sense of total responsibility. The newspapers dutifully feature the disaster as a 'natural calamity' and reflect the same unconcern despite the 'human interest' slant given to their reports, failing to question whether, with all our resource constraints, some measures cannot be planned and implemented to mitigate the terrible impact of the cyclonic winds and tidal bores.

India may be a poor nation, but it is served by a weather satellite that immediately gives photographic transmissions of weather movements. On last Friday morning (October 29) the weather satellite did give adequate warning of the possible storm in the region of coastal Orissa and West Bengal coming in from the Bay of Bengal. It is well known that lives in cyclonic attacks are lost not so much because of winds — strong though these are, with the latest in Orissa having reached speeds of 150 kmph — but because of the tidal waves that the ordinary village or small-town structures cannot withstand. Yet, adequate warning was not relayed by the authorities, as witness the boats and launches that were caught offshore and lost in what followed. As always, the tidal wave struck in the early hours of the morning, laying waste areas around the Mahanadi and Brahmani rivers along the coast comprising the two most populous districts of Orissa, Cuttack and Balasore. These are also the agricultural areas of the state and the rice harvest, the state's major crop which is grown in the kharif season, has been largely destroyed. Following the tidal ravage, the soil too will have turned saline and will be difficult to cultivate in future seasons. The trunk railway line runs through the coastal area, connecting it to neighbouring states, and this has been damaged as well. For nearly two days the stricken area was isolated. The state government, who estimated that it would take Rs 50 crores for relief-work, asked the local authorities to go ahead and give relief 'without waiting for sanctions'. The centre gave Rs 2 crores together with the Finance Ministry's soothing assurance that the suffering of the people would not be forgotten; and the state allocated Rs 1 crore on its own. The army, which could be most effectively used at such times, came in five days after the calamity had struck.

There are anywhere from one to four million now homeless, cropless, bereaved and without food. Cholera has predictably started to take its toll with nearly a hundred deaths reported already. Many more deaths will no doubt follow from starvation and disease. It is surely not a matter of finance, but of organisation and the will to help the hapless victims. Starvation at least there should be none. The large food stocks with the government must ensure that.

Foreign Collaborations

R and D Redundant

A Correspondent writes:

AFTER the March elections, we have witnessed in India the aggravation of a process of developments with very serious consequences for indigenous R and D. The political stability of the country has apparently reassured foreign vested interests and persuaded them to consider India to be safe for investments and for profitable exploitation of the country's manpower and natural resources in collaboration with the local forces.

There have been reaffirmations of assistance to India in various ways from various quarters, both from the capitalist and Soviet bloc countries. The latest in the process are reported to be offers from the industrially advanced countries (West Germany, UK and Japan to mention three) to shift large industrial plants and set them up in India in collaboration with the local entrepreneurs. The Government is understood to have expressed its willingness to offer prompt facilities for these industries which are labour intensive and whose operations in home countries are becoming very expensive. The plants proposed to be set up are of course second hand, but even so they are very modern compared to those already existing in India. The emphasis will be on exporting the products manufactured at these "transferred" plants.

The latest ventures could be part of a process on behalf of the world monopolies, cartels and corporations (private or social and state), in connivance and collaboration with the new elite of bureaucrats, entrepreneurs and professionals (see UNESCO, CSD report on Social Development in Asia, March 1971), for converting the large masses of India into a cheap labour force for agricultural and also for industrial production. These developments should give rise to serious concern in the scientific community in general and particularly CSIR and other establishments devoted to indigenous R and D for self-reliant industrial and economic development. In campaigns for improvements in economic, social and professional conditions, there has been a growing recognition among the scientific community of the need for positive directional changes in the purpose of indigenous R and D. Among the horde of obstructive factors, attention has been repeatedly drawn in recent times to the continuing obstacles from expanding foreign subsidiaries, investments and technical collaborations. The transfer of whole industrial plants, as part of investment and collaboration in new plans and policies of the world and local social-economic and political forces, would further reduce the need for indigenous R and D.

Steel

More Than Change in Style

WHAT will the latest major reshuffle of Hindustan Steel's management mean for HSL's operations? The new chairman, Hiten Bhaya, has had years of experience in steel and in the HSL. The two new general managers of Bhilai and Rourkela are technical people drafted from within these plants. And Bagaram Tulpule, who is to be general manager of Durgapur, has had long experience in trade union organisation and is distinguished for his comprehension of labour problems.

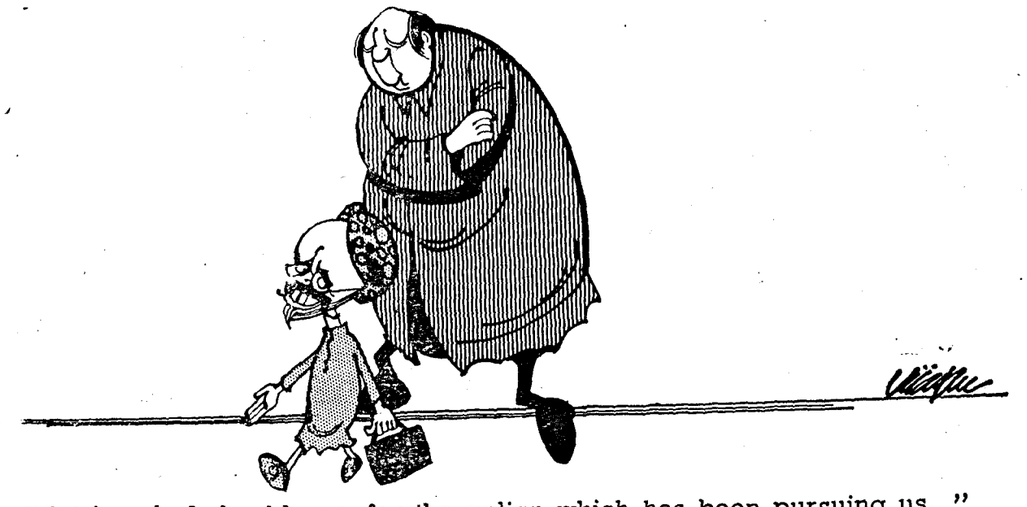
If HSL's problems so far stemmed from the fact of its top managers and chairmen having affiliations that were departmental or ministerial rather than

plant-level, these may now be on the way to being set right. After all, apparently technical failures are seldom purely technical. Rourkela's roof collapse signified the collapse not simply of plant maintenance but of a whole system of concern and group care. Durgapur's labour problems too are, as Bhaya recently underscored, not merely, or mainly, the result of wage discontent but the consequence of labour's feeling of non-involvement with the plant's management and success. It, therefore, needed a man with sensitivity to labour's aspirations and frustrations. Apart from that, Durgapur's early technical problems have by now been overcome and the Centre's stake in giving West Bengal's economy a chance to revive are high enough for it to want to minimise negative intervention in the plant's operations. From the public sector's point of view, the appointment of Bagaram Tulpule also signifies an important departure from the earlier adherence to strictly administrative or managerial solutions to production problems.

Whereas Bhilai has operated at around 90 per cent of capacity, Durgapur and Rourkela have worked at far lower capacities of anything upto 60 per cent. With the resolution of intra-plant difficulties in the next two to three years, therefore, hopes may be pinned on near capacity operation of these plants. This, in itself, might help infuse dynamism in the working of the plants where morale has been known to have steadily declined over the past decade.

Yet this is the best that may be expected. The constraints on overall steel supplies to industry and construction do not relate only to HSL's existing plants. If Rourkela and Durgapur hope, in the brighter future, to get enthused about expansion plans, it must be remembered that investment in steel in the near to medium future has already been committed elsewhere: at Salem, Hospet and Vizag. On their own, with the existing pricing systems, the plants will not be able to generate funds to expand. Moreover, reports have it that Bokaro will go into production even later than in mid-1972 — which was the latest but one commitment on its completion schedule. The massive investment of over Rs 700 crores locked in this long-gestation project would preclude any thought of further investment in steel.

Transport also will remain an effective bar on easier steel supplies. Even with the present low capacity utilisation, there are over 100,000 tonnes of steel stocks lying at HSL's plants. And railways have yet to commit themselves to a significant expansion programme.



There is also the final stranglehold of the bureaucracy and the ministries on HSL, as on other public sector plants. This cannot be wished away though it may be held in abeyance by the chance Minister or Manager. So long as the production patterns, pricing, and supply lines of public sector plants can be influenced by political or bureaucratic aspirations, HSL will always have to be wary to defend its autonomy. A beginning in this direction may have been made by the recent reshuffle.

Indo-UAR Trade

A Realistic Agreement

THE much awaited Indo-UAR agreement has been signed at last, putting an end to the uncertainty that has been haunting trade and industry circles. Though it has found some sort of a solution to the apparently intractable problem of Egypt's need for credit in trade with India, it is a solution not so favourable to India. It was only over the past two years that India's exports to UAR spurted, from Rs 21.8 crores in 1968-69 to Rs 34.6 crores in 1969-70 and to Rs 55.3 crores in 1970-71. Egypt's inability to export more to India meant that India had to grant unusually high technical credits for enabling the UAR to buy Indian goods. At one time, technical credits stood at Rs 23.0 crores whereas the agreed level was Rs 5.0 crores.

The new agreement, covering a 15-month period from July 1971 to September 1972, provides for trade worth Rs 36.5 crores each way, except for an allocation to cover dues from the UAR on account of deferred payment contract. In other words, the new agreement envisages each-way annual trade of Rs 29.2 crores — a level far below that reached by both countries in the recent past. It is proposed to shift the period of future trade agreements to October 1-September 30, since UAR's

"A triumph, I should say, for the policy which has been pursuing us..."

cotton trade gains momentum only from October. It is hoped that the shift to the new period might lessen UAR's dependence on technical credit. Under the new agreement, India would import cotton worth Rs 35.0 crores and rice, glycerine, and Kaslin worth Rs 1.5 crores. These purchases would be balanced through India's exports of tea worth Rs 6.7 crores, jute goods worth Rs 9.0 crores, and engineering goods and other items worth Rs 7.5 crores. No details were released about the manner in which Egypt's indebtedness to India, estimated at Rs 27.0 crores, is to be settled. As regards past UAR contracts for Indian goods, the two delegations exchanged letters acknowledging, in principle, UAR's responsibility for them and providing a committee to study each contract to work out the modalities of its execution. Meanwhile, it remains a fact that Indian exporters have suffered financially owing to differences of opinion with the UAR on goods worth several lakhs manufactured on contract by Indian exporters according to UAR specifications.

There was no mention of the possibility of export of crude to India, on which India was evidently keen earlier. During the UAR-Israel conflict, two main refineries at Suez were destroyed, leaving the UAR with only one refinery at Alexandria and a crude oil surplus. The impact of this on UAR's foreign trade has been to make it a net exporter of crude and a net importer of petroleum products. In 1966, over 60 per cent of the 130,000 barrels per day of crude petroleum produced in the UAR originated in the Sinai, now under enemy occupation. But successful exploitation especially of the off-shore fields of Morgan helped by mid-1969 to raise production to 250,000 barrels a day. There have also been other minor discoveries which have raised UAR's total production to about 400,000 barreis a day. The UAR has also conceived a highly promising investment plan of about $ 1 billion for further oil exploration. What about raw cotton exports? Possibilities of increased production of raw cotton are very much limited by the relative dearth of additional acreage and the already very high yields per acre. About half of UAR's cotton goes to the centrally planned economies with which it has bilateral trade agreements. In 1967-68, this proportion dropped to 38 per cent —it is said, to enable the UAR to export more cotton to Western countries with whom it faces large balance of payments deficits. Cotton exports to the centrally planned economies increased again to 47.4 per cent of UAR's total exports in 1968-69, after Western markets proved not so open. Availability of credits to finance imports from the centrally planned countries and the flexibility with which these countries conduct their relations with the UAR have encouraged the diversion of UAR's trade to them.

Exporters of engineering goods would be the main sufferers from the reduced volume of trade following the latest agreement. India's exports of engineering goods to the UAR amounted to Rs 15.7 crores in 1969-70 and Rs 16.2 crores in 1970-71. According to the "Action Plan for Export of Engineering Goods during the Fourth Plan", prepared by the Engineering Exports Promotion Council, exports to the UAR were planned to reach Rs 20 crores in 1971-72 and Rs 25 crores in 1973-74. During 1970-71, exports of transport equipment alone to the UAR were nearly Rs 6.8 crores. As against this, the new trade agreement envisages engineering exports of only Rs 7.5 crores for the 15-month period—or Rs 6 crores for the year.

The hurried way in which the problem of trade relations between the two countries was finally settled suggests that India was keen to arrive at some agreement even though it was not altogether satisfactory. It may be that India adopted a realistic approach in view of the changed political climate in the UAR towards India. Bilateral trade agreements have their own virtues but they cannot be nurtured without closer political understanding between the partners. But there is another side to the coin which our recent experience with Yugoslavia has exposed: *viz*, that while closer mutual relations can be helpful in trade relations they cannot fully supplant the need for economic complementarities which alone can stimulate greater trade between two countries. It is this point that needs to have attention focused on it.

BUSINESS

A Necessary Formality?

IT had been assumed when the 14 largest commercial banks were nationalised in July 1969 that this would lead to the formulation and implementation of a rational credit policy. Underlying the assumption was the hope that detailed regulation by the central bank would no longer be necessary—if only because detailed regulation cannot be effective beyond a point. The banks are in the field, in touch with industry, importers, exporters, the trade and so forth and are aware of the varying conditions within each segment of economic activity. Once broad policy indications regarding the volume of credit and its broad allocation were given, the banks, it was thought, could be entrusted with the task of giving detailed operational shape to credit policy.

None of this has happened, however. The Reserve Bank continues to operate its credit authorisation scheme—jute being exempted — for borrowing accounts of Rs 1 crore and over, prescribe minimum lending rates for credit against certain commodities and stipulate margins and credit ceilings. In addition, it operates a complex scheme of refinancing.

That the Reserve Bank has not been unjustified in not relying on the banks is borne out by, for instance, the manner in which export advances have been sanctioned. Manufacturers, caught in the Reserve Bank's credit squeeze of January 1970, were able to get credit on production of cables or letters purporting to be export orders. Similarly, in a bid to improve their statistics, banks have lent to agriculture practically with their eyes shut. No one expects banks to recover more than, say, 65 per cent of what they lent to agriculture in the first year or year and a half after nationalisation—and this has nothing to do with the economic viability of their borrowers so that the overdues cannot be regarded as business losses in any sense of the term. Bank finance has supported the sale of unusable pumpsets and the digging of non-existent wells by borrowers who, in extreme cases, have no land to begin with. Clearly, it is not the low recoveries that are a matter for concern, but the irresponsible manner of making loans and the absence of follow-up of loan sanctions. This is not a new phenomenon, however. Such abdication of responsibility had in the past marked bank support to industry and business, especially big business. What needs to be said is that nationalisation appears to have made little difference.

Default on this account is creating a major policy problem. Should the credit policy continue to be detailed? In that event, fresh details need to be introduced almost every other day. Thus should not the overall level of credit be curbed in an inflationary situation? Then should not exemptions be made in favour of economic sectors which are operating below capacity? But within such sectors there are firms which are operating at full capacity; should they too be covered by the exemption? Should credit to priority sectors be extended irrespective of the fact that such credit makes up for credit deficiency on other counts? In seeking to take care of these considerations, the Reserve Bank issues policy directives from time to time, which are either reinforced or weakened by supplementary letters of advice: a series of exemptions to exemptions have been devised to general and selective credit control regulations. Clearly, their sum can hardly be called a policy.

During the 1970-71 busy season, a credit policy of sorts was announced. It was basically restrictionist. Exemptions were introduced from time to time—with respect to advances against various commodities as well as to industries not faring well and, in the slack season, for food procurement operations. The policy as it has evolved is far from restrictionist today and allows banks sizeable refinance at the Bank rate. This, together with additional deposits between now and April—deposits are booming — would enable the banks to support a credit expansion of Rs 450 to Rs 500 crores during the 1971-72 busy season, which technically opened this week. In the 1970-71 busy season, banks expanded bank credit by Rs 392 crores, including food procurement advances of Rs 70 crores.

In assessing credit trends for the new busy season, the basic question would be by how much should credit be allowed to expand? The answer to the question would be influenced by assessment of the relationship of bank credit to the general price level and equally, if not more importantly, assessment of credit needs. Now, steel-based industries are operating below capacity; sugar output is down; cotton textiles are not selling well; and cotton and oilseed prices are declining.

Unless it is argued that credit demand needs to be induced, credit requirements would not be very much more than in the last busy season. The estimated expansion of banks' loanable resources would then be seen to match the expected seasonal demand and refinance could very well be kept to a minimum. But this broad policy direction cannot be pursued by the Reserve Bank because the banks are just not capable of operating the policy flexibly. They would straightaway deny credit to all and sundry—as the State Bank had done not long ago—and turn borrowers and their pressure groups to the Reserve Bank. As a result, there would follow a series of exemptions in the name of flexibility, undoing the very basis of the original policy. On the whole, it would thus make not much difference whether the current credit policy—expansionary in the prevailing context—is continued (because of the uncertainty in Indo-Pak relations!) or the Reserve Bank goes through with the formality of announcing a credit policy for the busy season.

HMT

Expansion with Diversification

FOLLOWING the lead given by State Trading Corporation, many public sector enterprises now publicise their activities. Hindustan Machine Tools, the biggest among the country's machine tool manufacturers, has always been fairly active in its publicity efforts, though this year it has also published in the Press its Chairman's Statement to Shareholders, for the first time perhaps. The year 1970-71 was a good one for HMT; after being in the red for three successive years, the company showed an operating profit of Rs 31 lakhs. Production and sales rose by nearly 24 per cent, reflecting the recovery made by the machine tools industry in general. (The industry had a record output of Rs 32 crores in 1970-71, 14 per cent higher than in the previous year.) HMT's share of the industry's output as also exports is about 50 per cent.

Unlike in the past S M Patil, HMT's chairman, is optimistic about the company's prospects. The large orders on hand, the growing share of the indigenous manufacturers in the market for machine tools in the country, and the favourable market conditions in the EEC area after the introduction of the Generalised System of Preferences, are among the factors making for this optimism. HMT is well poised to expand its annual output from the present level of Rs 20 crores to a level of Rs 60 crores. It has plans of expansion and diversification during the seventies involving a capital outlay of over Rs 20 crores. These consist of (a) the tractor unit at Pinjore with Czechoslovak collaboration for production of 12,000 tractors per annum; (b) the printing machinery unit at Kalamassery with Italian collaboration; (c) the heavy duty press unit at Hyderabad with American collaboration; (d) the die casting and plastic injection moulding machines project at Bangalore in collaboration with Interfonda of Switzerland; and (e) the new wristwatch unit at Srinagar as well as expansion of the existing unit at Bangalore. Besides, a triangular arrangement with American Tool Works and Yamazaki of Japan would help HMT to prepare new designs to cater to the international market for machine tools. HMT already spends about 4 per cent of its total expenditure on design and development.

In his statement Patil raises the issue of the multiplicity of decision-making centres which hamstrings the chief executive of any public sector project. After dwelling at length on the various agencies which advise and control public sector enterprises on various subjects, he nevertheless thanks the Industry Ministry and other Government agencies for their encouraging support to HMT's schemes of expansion and diversification. Multiple centres for decision-making are not a peculiar problem faced by public sector units only; what is a drag on the public sector is the shifting of responsibility for decisions taken or not taken. However, Patil's remedy of broad-based guidelines or objectives—in respect of, for example, labour policy, investment policy or rate of return—so as to ensure to the managements more operational autonomy may not be as easy to work as it sounds. And if at present there were no such objectives or guidelines, formal or informal, how else could HMT go ahead with half a dozen new projects? Should there really be guidelines on the rate of return for a near monopolist unit like HMT? In any case, it would be interesting to know something about HMT's price policy, be it Government-directed or its own.

Glaxo

How Much Is Enough?

IN their annual statements to shareholders company chairmen must speak their set pieces. Thus statements on behalf of pharmaceutical companies

must perforce create the impression of an industry whose profits, always modest, are now threatened with virtual extinction. Take the recent statement of J S Raj, chairman of Glaxo Laboratories (India), who tells shareholders: "The uncertainties resulting from government pronouncements during the previous year affected not only the business of the industry but succeeded in creating an entirely false impression in the minds of the people that pharmaceutical companies have been making extortionate profits... Far from generating unconscionable profits, the ceilings on selling prices, controlled so vigilantly by government, are required, year after year, to absorb the unchecked increases in the cost of materials and wages." What relationship, if any, does this statement bear to the actual situation in the pharmaceutical industry?

Take the case of Glaxo. The directors of the company have proposed payment of a final dividend of 8 per cent for 1970-71, in addition to the interim payment of 6 per cent already announced, making a total of 14 per cent. On an equity capital of Rs 7.20 crores, this works out to approximately Rs 1 crore. Of the equity, Rs 5.40 crores are held by Glaxo Group (UK) whose share of the dividend would thus be about Rs 76 lakhs. This may not appear too much on an investment of Rs 5.40 crores, but the point is that the figure of Rs 5.40 crores does not by any means represent the Glaxo (UK)'s actual investment in Glaxo (India). The figure is made up of Rs 3.60 crores worth of shares issued to Glaxo (UK) as bonus shares and Rs 1.50 crores worth of shares given to it in consideration for trade mark user rights, leaving an actual investment of Rs 30 lakhs. If the dividend income of Rs 21 lakhs on the Rs 1.50 crores of capital issued in consideration for trade mark user rights is regarded as compensation to the Glaxo (UK) on this score, there remains a profit remittance of Rs 55 lakhs from Glaxo (India) to Glaxo (UK) for a single year, 1970-71, to be set against the latter's investment in this country of Rs 30 lakhs.

The Indian chairman of Glaxo (India) may sincerely believe that the Government of India and the Indian consumer should have been even more bountiful to Glaxo (UK), but Glaxo (UK) would surely acknowledge that the investment it made in India has been and remains among the wisest and most profitable made by it anywhere, including in the UK. It needs to be added that in addition to the Rs 76 lakhs proposed to be paid out to Glaxo (UK) by way of dividend, there are other payments by the Indian company to its British parent. The accounts for 1969-70 (those for 1970-71 are not yet available) showed a payment of Rs 57 lakhs as 'technical services fee'.

The other perennial grievance of the pharmaceutical industry in this country is that the large expenditures which it allegedly incurs on research are not adequately appreciated by either the price fixing authorities or the industry's critics. To quote J S Raj again: "with the increasing involvement of the pharmaceutical industry in local research and development, large investments will be demanded year after year for an activity where there is little possibility of adequate return over a reasonable period of time for the prolonged expenditure and hard work put into it." And yet one scans Glaxo (India)'s profit and loss account for 1969-70 and the schedules thereto in vain for an idea of the expenditure on research and development incurred by the compay during the year. The 'review of company operations' appended to the annual report and accounts for 1969-70 did mention that a new Research and Development Unit was nearing completion at Thana "at a capital cost of Rs 36 lakhs". This investment of Rs 36 lakhs in a research and development set-up after almost half a century of operation in this country has to be seen against the payment of Rs 57 lakhs as technical services fee to Glaxo (UK) in a single year.

None of this is to deny that the pharmaceutical industry has genuine problems which call for serious discussion. But such discussion is certainly not facilitated by the foreign-dominated drug companies' attempts to mislead everyone on such subjects as their profitability or their attachment to research and development in this country.

Electric Motors

Crucial Elements in Growth

DEMAND for electric motors has been rising rapidly with both industry and agriculture showing increasing preference for them over the traditional oil engine. What has helped this shift in demand is the relatively greater power supply in rural areas together with certain technical advantages of electric motors over oil engines such as that they are easier to start and control, cleaner to operate, require less space, and are cheaper. The result has been very quick growth of this relatively recent industry started after Independence. Today, it manufactures not only the standard motors but also such sophisticated models as flame-proof and explosion-proof motors, fraction motors, etc.

But the overall demand has proved to be 'erratic', according to the President of the All-India Electric Motor Manufacturers' Association, and this seems to be agitating the industry. What could this signify? In 1970, the output of electric motors, at 31.9 lakh HP, was considerably higher than the installed capacity of 25.7 lakh HP at the year-end. In the previous two years, the industry had been hit badly by the recession. The industry blames the state governments' monopoly purchasing of electric motors for distribution among farmers for the instability of demand. The co-operative marketing federations, set up by the various state governments to do the job of purchase and distribution, are according to the industry ill-placed to do the necessary marketing efforts or to render the crucial after-sales service. The industry thus recommends close co-ordination between the co-operative federations and the manufacturers.

Left to itself, the Indian Electric Motor Manufacturers' Association estimates the demand for electric motors of all types to be 3.0210 million HP by 1970-71 and 4.4550 million HP by 1973-74. However, the going may not be all that smooth. Demand increase in electric motors is partly a function of the addition to the power generating capacity. A shortfall in the latter could pull down the demand trend for electric motors. The latest assessment of the Union Ministry for Power and Irrigation has revealed a shortfall of 3.5 million kW in power generation capacity by 1973-74. This could have an adverse effect on the demand for certain electric motors.

Yet that need not spell disaster for the industry. Scope for diversifying the industry's output is vast. The country is still importing certain special types of motors. Chemical and fertiliser factories, steel plants, etc, need large-sized motors of above 450 HP. Requirements of these are not adequately met today. Moreover, since motors upto 50 HP are delicensed and their demand is normally met by the small-scale sector (of about 200 units), the bigger units could concentrate on the production of the large-sized motors where, today, a sizeable portion of the demand for small HP motors is met by the larger units themselves. By and large, however, the domestic market must continue to be the only effective outlet for the industry. Indian electric motors are expensive, which inhibits their export. Export prices of Japan, Italy, and West Germany, are less than 15 to 20 per cent of the Indian electric motor's price in the overseas markets! Shortage of essential raw materials, like copper, electrical steel sheets, and electrical grade aluminium, has, it is claimed, led to the high cost of production. Yet, development of substitutes could help to overcome this difficulty. While the industry has made a modest beginning in this, using aluminium to replace copper for instance, dependence on copper is still too heavy. The industry could encourage use of squirrel cage motors instead of slipring motors, for example, as the requirement of copper in the former is 30 per cent lower than in the latter. There is scope, too, for efforts to be made for better design and standards control of the products. Such efforts might pay off by helping the industry to lower its high cost of production — at present one of the major hurdles in the way of its growth.

LETTERS TO EDITOR

Indo-Soviet Treaty

MOHIT SEN'S article on the Indo-Soviet Treaty, or rather his comments on the critics of the Treaty (September 25, pp 2047-8), were very interesting. It would seem that they deserve analysis.

Sen begins by saying that "it would be quite wrong to imagine that there is a national consensus around the Indo-Soviet Treaty". Later he challenges the critics who, in his view, "talk glibly" of "elites" to "organise a campaign against the Treaty in India anywhere". Sen is certain of the response they would get. I would agree with him that the response would be poor. What beats me is to imagine that this can happen without there being a national consensus on the Treaty! Pray, what, then is the national consensus?

Secondly, it has been very hard for Sen to find in the "monopoly press" strong criticisms of the Treaty. He naturally had to confine himself to a single editorial title — "Was it really necessary?". I can give him a good bibliography of articles defending the Treaty which have appeared in what Sen calls the "monopoly press". One daily, in fact, carried an article well in advance of the Treaty commending an alignment with the Soviet Union. If these papers do not any longer form a part of the "monopoly press", then, of course, it is a magnificent illustration of peaceful transition. One does not know of whom, though!

Thirdly, such a sophisticated analyst as Mohit Sen should not advocate the argument that he has: if so and so would have been the Prime Minister and so on, the Treaty would never have been signed. Does Sen really believe that the reactionaries (even going by the CPI definition of the term) would never think of signing a treaty with the Soviet Union? Has he forgotten that way back in 1954 Savarkar had advocated a pact with the Soviet Union? And Savarkar would not quite qualify as a progressive — or would he?

Likewise Mohit Sen seems to have forgotten that on August 14, 1945, Chiang Kai-shek signed a Treaty of Friendship and Alliance with the Soviet Union. I do not know what Sen thinks of the Generalissimo today. However I hope he does not deny his reactionary credentials. If he could and did sign a Treaty of Friendship with the Soviet Union, how can Mohit Sen seriously rule out an Indian reactionary doing the same? Mohit Sen could always retort that Chiang Kai-shek is retrospectively a better man than Morarji Desai because Chiang, visionary as he is, fought the ugly Maoists, but Morarji Desai fought (did he really?) the progressive and socialist Indira Gandhi!

Finally, it may be comforting to believe that the Soviet Union will use its power "to shield India from US imperialist pressure and subversion". American economic and political interests are well protected and well entrenched in this country. They have nothing to fear either from this Treaty or from this "progressive" ruling party. Mohit Sen's arguments are not enough to reassure us that the Soviets would use their power to shield us from "US imperialist pressure and subversion". Let us wait and see. Rather let Mohit Sen wait and see.

G P DESHPANDE

New Delhi

Rural Works Programme

RANJIT Gupta has emphasised the need for scientific planning and a flexible approach in the implementation of the Rural Works Programme ("Rural Works Programme: Where It Has Gone Astray", May 15). He has further suggested that the developmental activities of the programme may be entrusted to autonomous bodies, not tied down "to out-moded and oppressive rules and procedures characteristic of governmental functioning".

While the need for a scientific and flexible approach is unquestionable and the use of autonomous bodies for the implementation of such programmes may be of advantage where such autonomous bodies are available and are willing to undertake this programme, it would appear that the author contradicts himself when he suggests that autonomous bodies may be set up at the District level in each and every District selected for the programme. It is difficult to see how autonomous bodies could be set up by the Government. They have to exist; their origin and growth has to be spontaneous and basically self-reliant. Voluntary bodies set up by Government will have neither the discipline of Government agencies nor the inner strength of voluntary organisations and will suffer from the worst of both worlds, as is seen from some of our experience in the past.

It is also surprising that the author wants all the District and Block Development officials, at present working in the Department to be attached and placed under the proposed District bodies. Having condemned their working, he seems to be seeking their support! There could be no merit in the so-called autonomous bodies if they are mere creatures of Government and are filled up with Government officials. It would be far better to rely on the Governmental machinery itself and introduce such innovations as will make for delegation, decentralisation and initiative.

Despite the Obvious?

Hansavivek

CHOWGULE STEAMSHIPS has concluded contracts for construction of one bulk carrier each with a Belgian shipyard and Hindustan Shipyard. The former vessel is to be of 64,200 DWT and the latter of 21,450 DWT. Both vessels, and another for the construction of which a contract was earlier given to a Rumanian shipyard, are all expected to be delivered in 1974. V D Chowgule, chairman, points out that a new hurdle in the way of the company's expansion is being put under the MRTP Act. While approving the applications for construction of Belgian and Rumanian bulk carriers, Government has sought to give retrospective effect to any change it might make in future on conversion into equity capital of loans already granted, or agreed to be granted, by the Shipping Development Fund Committee. He adds that approval has been made conditional under the MRTP Act, even though it is conceded by Government (i) that the company's proposals for expansion would not lead to concentration of economic power to the common detriment, (ii) that it would be expedient in the public interest to approve the proposals; and (iii) that the scheme for financing the expansion was satisfactory. Chowgule feels that the approval should have been unconditional and based on the merits of the company's proposal. He adds that the application to construct the 21,450-DWT bulk carrier at Hindustan Shipyard is still pending with Government for approval under the MRTP Act.

Owing to heavy recurring losses incurred in operating the Konkan passenger services and the steady fall in the passenger traffic, the company had sought permission to rationalise the sailing schedule, but the Director General of Shipping directed continuance of four sailings a week in the Bombay/Dabhol-Jaiged sector (including ports of Janjira, Shriwandhan and Harnai) and seven sailings a week on Bombay/Panaji line during the current season—once again compelling the company to continue operation of uneconomic services. The chairman has urged that Government examine the problems associated with the running of these services with a "fresh mind". Apart from suggesting the desirability of a rationalised schedule, he has also pointed out the need to undertake dredging and provision of better facilities at various ports. The company had to cancel some 45 voyages to Malwan last year. There is a steady fall in the number of passengers travelling to and from Malwan by sea, because ships have to anchor far away from the jetty, which makes the journey from the ship to the jetty appear hazardous to the passengers. Against an average of 250 passengers per voyage during 1967-68 and 1968-69, only 150 travelled during 1970-71. The aggregate loss to the company, owing to cancellation of voyages and fall in traffic, was some Rs 3 lakhs, according to the chairman.

Chowgule finds it difficult to predict the prospects for shipping during the remaining year, but feels that it is not going to be an easy period. Stagnation and inflation, he says, are the maladies from which most countries are suffering. Crude oil prices are on the rise and this would be reflected in higher costs of petroleum products. Operating costs of ships are likely to rise, and there is no possibility that these would be compensated by higher earnings. The tramp freights are currently at their lowest level and are likely to continue so for at least the next 12 months. More and more ships are being laid up as owners are not able to recover the bare running costs —not to speak of depreciation and interest. The international monetary crisis and the imposition of a 10 per cent surcharge on imports by the United States have injected an element of uncertainty in world trade, observes Chowgule.

BURN AND COMPANY complains that the Railway Board has been imposing on the wagon builders "manifestly uneconomic prices" and that taking advantage of the continuing recessionary conditions in the industry the company was again offered for the current year a small order at grossly uneconomic prices which it has not accepted. The company has been successful in securing substantial export orders for providing work for its underutilised capacity in rolling stock and structural steelwork manufacture. It is currently manufacturing bogie tank wagons for an order from the East African Railways valued at Rs 1.13 crores. It has also secured another order for rolling stock from Yugoslavia valued at Rs 9.83 crores. This contract involves offering deferred credit terms approximately 90 per cent of the contract value for a period extending over 10 years. The company is arranging with IDBI and one of its bankers for grant of a post-shipment medium-term credit for 90 per cent of the value of the contract. Burn has also made its first shipment of structural steelwork for a 600 MW power station at New Plymouth, New Zealand. Burn showed some improvement in its 1970-71 results when, with a marginal improvement in sales, trading deficit was reduced from Rs 65 lakhs to Rs 14 lakhs. After necessary provisions, there was a net loss of Rs 47 lakhs which lifted the accumulated net deficit from Rs 96 lakhs to Rs 1.43 crores. This was reduced to Rs 72 lakhs by transferring the entire amount lying in the general reserve. The refractory and ceramic group of works continued to operate satisfactorily as a whole, although some units in West Bengal continued to operate at a loss. As most of the unremunerative contracts have been completed, or are nearing completion, the working results for the current year are expected to improve.

JAGATJIT SUGAR could crush only 10,22,969 quintals of sugarcane during the year ended April 1971, compared to 13,62,534 quintals crushed during the preceding year, because of shrinkage in the area under cane. As sugar factories could not pay higher than the minimum price, of Rs 7.37 per quintal, fixed for sugarcane, farmers in Punjab found it more lucrative to switch over to other crops. The directors feel that prospects for the current year will depend primarily on the prices of gur and khandsari as this will determine the quantity of cane the factory will get. Diversion of sugarcane to manufacture of gur and khandsari can be checked if the sugar factories are able to pay a higher price for sugarcane. Indian Sugar Mills' Association has recommended a statutory minimum cane price of Rs 9 per quintal. Despite increased sales realisation, Jagatjit earned a lower profit during 1970-71. The company is now looking forward to a "prosperous year" in view of the favourable trend in price of sugar. The entire land of the factory, which was gifted to the company by the Maharaja of the erstwhile state of Kapurthala and registered in the name of the company, and other land, has been valued and revalued at Rs 97 lakhs and Rs 4 lakhs, respectively, by an officially approved valuer. The value of total assets of the company now stands at Rs 153 lakhs.

NATIONAL INSULATED CABLE COMPANY is making efforts to diversify production and to improve efficiency by replacing old machineries and installing balancing equipment. In view of the long delivery periods quoted by suppliers of indigenous equipment and the delay involved in procuring import licences, however, the directors find it difficult to specify when these plans will materialise. These efforts have been made necessary by the falling margins. The management intends to step up turnover with a view to improving profitability. Owing to general conditions of unrest in the country and lack of imported raw materials during a substantial part of last year, NICCO's turnover had been almost the same as in the preceding year. Cost of working went up substantially, with salaries and wages alone increasing by about 9 per cent. In spite of reduction in incentives, the company was able to export materials worth about Rs 25 lakhs against Rs 23 lakhs in the previous year. Keen competition in international markets is also affecting the company's exports. From April 1971, the company terminated sole selling agency agreements with three parties. In order to maintain sales in these territories, sales depots have been established at Hyderabad, Gauhati and Cuttack. A sales depot in Madhya Pradesh will also be established very shortly.

TRAVANCORE SUGARS AND CHEMICALS crushed 59,178 tonnes of cane during the year ended April 1971 — as against 51,439 tonnes crushed in 1969-70, 32,718 tonnes in 1968-69, and 30,214 tonnes in 1967-68. The quantity each year has been far below the crushing capacity of the factory, which could have easily worked about 150 days in a year and crushed not less than 1,50,000 tonnes. H V R Iengar, chairman, says that crushing less than this quantity is uneconomic and this is why, in spite of higher sugar prices realised on the free-market sugar, the company has not been able to make a profit. The presence of a co-operative factory practically next door makes matters worse; neither factory gets adequate cane supplies, and both incur losses. He says the co-operative factory has accumulated 'huge losses' in spite of substantial government aid. The magnitude of the problem of adequate cane supplies is such that, without 'massive' aid from Government to explore and develop new areas for growing cane, it will be difficult to carry on indefinitely. The Kerala government is seized of the problem, but the chairman points out that large-scale development of a new area takes time, effort and a large input of finance. Commenting on cane prices, Iengar says the central government fixed the price for the 1970-71 season at the unchanged level of Rs 73.70 per tonne for a recovery of 9.4 per cent or below. The company had to pay this price, although the average recovery in its case was only 8.22 per cent. The levy price for sugar in Kerala is fixed on the basis of average recoveries within the state and in the states of Orissa, West Bengal, and Assam, where recoveries are normally higher than in Kerala but lower than in the rest of India. When the average is higher in other states, factories in Kerala that get a lower recovery suffer from this grouping. Iengar has decided to relinquish office of chairman. The board has decided to appoint in his place a nominee of the Kerala government which has a substantial holding in the company.

FROM OUR CORRESPONDENTS

From Independence to Political Settlement

G S Bhargava

THE Prime Minister's current tour of Western countries marks another phase in India's diplomatic efforts to find a 'political' solution to the Bangla Desh crisis. If some Indian political commentators are to be believed, everything now hinges on President Nixon. He has only to snap his fingers, plug the built-in loopholes in the US Administration's suspension of military supplies to Pakistan, go along with the other members of the Aid Pakistan Consortium in refusing credits to that country and publicly admonish the Yahya regime for its brutalities in Bangla Desh. Cumulatively these steps are expected to chasten Yahya Khan to such an extent that he will at once release Sheikh Mujibur Rahman and begin negotiations with him for 'a political solution acceptable to the elected representatives of East Bengal'. And so Bangla Desh will come into being, the refugees will troop back, the Mukti Bahini will be reintegrated into the country's defence forces and everyone will be happy ever after.

Notwithstanding the onus this scenario places on the US, it should be flattering to Washington because it credits America with leverage *vis-a-vis* Pakistan which it does not enjoy even in some of the client States of Latin America. It also presents the sorry spectacle of the non-aligned world, the Soviet Union and everyone else looking to the President of the US to deliver the goods. At the same time, it raises two questions: does it mean the Soviet Union is no more than a silent spectator in the matter? And why should India have borne the burden of the refugees, suffered disruption of its development plans and entered into a long-term treaty with the Soviet Union when the key to the problem was in an altogether different direction?

This is not the only contradiction in the Bangla Desh situation as it confronts India. By a series of acts of commission and omission the policy makers in the External Affairs Ministry, if they can be so called, have so confounded the picture that today even India's aims in Bangla Desh are not clear, not to talk of the means of achieving them. When the Pakistan army went into action in East Bengal on March 25 last it was a clear case of the generals forcing a national liberation struggle to assume the shape of armed action so that their military superiority could undo the outcome of the December 1970 general election and the people could be cowed into subjugation. India could have reacted to the development in one of two ways. It could have joined most of the other countries in expressing moral support to the struggling people, taking exception to the repressive policies of the Pakistani regime or it could have reacted differently taking into account the security implications of Pakistan's action for India. The Western countries, fed by reports of journalists expelled from Dacca by the Yahya regime, voiced horror at the army's action and made gestures of disapprobation against Islamabad. The Soviet Union, as revealed by President Podgorny's message to General Yahya Khan and a comment published at that time in the *New Times*, Moscow, provided a slight variation to the theme by condemning Pakistan's repressive policies and urging political accommodation. India, on the other hand, took the lead in putting the Bangla Desh movement in its correct perspective as a liberation struggle and in lending full support to the aspirations of the people of Bangla Desh. The Prime Minister, it seemed, was out to recapture the elan and dynamism of Nehru's first decade of foreign policy management. The Soviet idea of a 'political' solution was alien to India's thinking at that time, as revealed by the resolution unanimously adopted by the Lok Sabha.

In this context it should be pointed out that the Soviet reaction, too, would have been different, at least verbally, if the anti-colonial overtones of the Bangla Desh struggle had been adequately projected or if there had been an element of a different kind of competition with the West or China. Though some US and British newspapers began to speculate in terms of an independent Bangla Desh neither Washington or London was sympathetic to the proposition. Surprisingly, China also viewed it as an Indo-Soviet 'conspiracy' to undo the territorial integrity of Pakistan and adopted the posture of a defender of the *status quo*. Even then Moscow did not have second thoughts on what the *New Times* had earlier denounced as 'imperialist moves' to bring about secession of East Pakistan.

In other words, the competition among the Big Powers was, if anything, not in favour of Bangla Desh but of what was advertised as the territorial integrity of Pakistan. The effort all round was to bail Pakistan out at different levels and in a variety of ways. While Washington and Peking maintained covert or overt material support to Pakistan, Moscow went to work at persuading India to acquiesce in the preservation of Pakistan as a single entity. But Indian policy still seemed unchanged either as a result of misreading of the signals or because of the Prime Minister's attempts to retain the initiative.

But soon the initiative was allowed to slip away. The totally unfounded expectation that the people of Bangla Desh with a few thousand regular troops at their head would be able to drive away the Pakistan army and liberate the territory was naturally belied. Reports of Pakistani atrocities shocked people everywhere except in West Pakistan where the military action was presented as a crusade to preserve the territorial integrity of the country. But to assume on the basis of this, as did some innocents in South Block, that the Yahya regime was up against a solid wall of world public opinion which would make it, through open denunciation and economic sanctions, acquiesce in the independence of Bangla Desh was wishful thinking. Scores of Indians went round the world stoking the conscience of governments. Volumes were published recording the anger and torment of newspapers and public men in the different countries. If the weight of world opinion could undo a military regime the one in Islamabad would have died a thousand deaths.

The accent in Indian pronouncements at that time was not so much on a 'political' solution, because an independent Bangla Desh was still on the cards. The settlement visualised was on the basis of withdrawal of Pakistan troops from Bangla Desh. The only difference was that what was earlier expected to be accomplished by the unarmed people of Bangla Desh was now assigned to that amorphous entity called world opinion.

Meanwhile arose a serious complication. The Pakistani propaganda line that the Bangla Desh struggle was secessionist began to evoke response in many Asian-African capitals. The Soviet Union succeeded in making India, perhaps unwittingly, accept a 'political' solution as the ultimate aim as was clear from the joint statement which Swaran Singh signed in Moscow on June 9. As for the US it continued its backing for Yahya Khan rationalising this as necessary for building up its leverage in Islamabad to accomplish what the two super powers were already agreed on achieving. In other words the erosion of India's will to strive for an independent Bangla Desh was matched by a fortification of the Islamabad regime's determination to prevent it.

It was then clear that if India endorsed the Bangla Desh people's urge for independent existence it would have to strive for it on its own, at least initially. That would have required active and energetic support to the Mukti Bahini to the point of giving open military aid in dislodging the Pakistani regime and establishing a popular government in Dacca. It would have meant a long-term commitment with implications of defying the super powers. It was not necessary that such a policy would inevitably lead to an Indo-Pakistan war or conversion of the Bangla Desh movement into another Indo-Pakistan dispute. But the risk was undoubtedly there.

Apparently the Government of India was not prepared to take the risk. It sought the easier, or what seemed to be the easier, course. It decided to concert its policy with that of the Soviet Union which, unlike the US and China, was not siding with Islamabad and which was, on the other hand, for a 'political' settlement within the framework of a single Pakistan. This would have the saving grace of Moscow exerting itself for the type of solution it stood for by impressing on both Pakistan and the US that it would be the best way out of the impasse. Just as in West Asia while the US tries to influence Israel in favour of a negotiated settlement the Soviet Union keeps Egypt under check, here too the US would pressurise Pakistan to go in for a political settlement which the Soviet Union had already made India acquiesce in.

The only uncertain factor is China. In 1966 Peking had denounced Tashkent and endeared itself to Pakistani leaders like Z A Bhutto. A similar uncompromising posture by China now would be more effective. So putting through the 'political' solution would have to wait until China made its position clear and the hope was that Peking, too, would play the game. But what about the refugees? Will the proposed 'political' solution be 'acceptable' to them to the extent of persuading them to return to their hearths and homes? Enabling India to absorb ten million people is not an impossible task, if the international community gets down to the task. Generous help towards refugee rehabilitation should also enable President Nixon to live down his record of support to the Islamabad regime in the teeth of opposition from the US Congress. In short, there is no reason why everyone should not be happy ever after.

WEST BENGAL

Government-Supported Terror

ONE of the peculiarities of the colonial capitalist evolution in India is that, while it has led to the birth of monopoly capital and Rightwing social democracy, it has not produced any sturdy stream of bourgeois liberalism. Its absence has never been so conspicuous as in relation to the recent developments in West Bengal. While every detail of Gestapo storm-trooper atrocities is being re-enacted in this state, there is hardly any protest or concern voiced by any section of liberal democracy, within the state or outside.

Although some of the top journalists in the national newspapers are known to have a red or 'fellow-travelling' background, they are content to let the sleeping dog lie and to make do with police hand-outs of the type: 'shot while trying to escape'. Even events like the Barasat mass murders or the Baranagar-Cossipore atrocities, which are totally incompatible with the democratic pretensions of a bourgeois democratic set-up, are being permitted to lie buried inside the dusty files of old newspapers; and so are the unfulfilled promises of judicial inquiries.

But why blame the poor pinkish journalists who have, after all, their cushy jobs in the big business newspapers to lose for any excessive addiction to 'conscience'? It all really started with the purest reds themselves. When the Naxalites were being systematically liquidated on the streets and inside the jails, CPI(M) hardly bestirred itself to protest against the ominous developments. It took the party more than a year and atrocities on the scale of the Baranagar-Cossipore bloodbath to realise the gravity of the phenomenon. But when CPI(M) was at last ready to call for resisting these offensives with militant mass actions, CPI had hardened itself to a position of firm supporter of the ruling party and, correspondingly, disrupter of all Left actions. What is more, this party has been able, taking advantage of some omissions and commissions of CPI(M), to hold back other Left parties, like SUC and Forward Bloc, from any joint mass actions with CPI(M).

Thus, stage by stage, the situation in West Bengal has reached a point when:

(i) anyone suspected to have Naxalite links is an outlaw — be he a respected middle-aged teacher with a foreign degree or a tender school boy;

(ii) the same is also the case with the younger cadres of CPI(M), suspected to be part of its self-defence apparatus; but,

(iii) strong-arm brigades of Congress, partly absorbed in officially sponsored 'Resistance Groups' or 'Resistance Parties' which are reported to be three lakhs strong, have complete 'diplomatic' immunity.

In the circumstances, besides arrests, tortures and some liquidations under suspicious circumstances, miniature Baranagar-Cossipores are happening almost daily in scattered parts of greater Calcutta. Threats of full-scale enactment of Baranagar-Cossipore are hanging over some other parts of the city — partially paralysing the normal life of the locality for days together. Besides, hundreds of innocent and politically untouched persons, within a particular age-range, accidentally caught in suddenly cast police dragnets are having to pass through the mill — unless promptly released through the influence and affluence of their guardians.

Against this background of white terror, the state and union governments have launched their offensives against CPI(M)-led trade unions. The private sector employers, though not yet fully reassured, have started flexing their muscles and there is already a perceptible change in their attitude to their employees. The less-than-usual success of the Bangla *bandh* on October 13 has further emboldened the government and the private employers.

While the rather too frequent use of the *bandh* weapon, particularly on a local scale, may have irritated and antagonised a section of public opinion,

the indifferent success of the *bandh* on October 13 was due to three main reasons :

(i) Large-scale use of terror — official and semi-official. Army, CRP and local police in battle array, threat of administrative actions against the absentees and deployment of Congress (R) squads under police protection, all combined to wean away from the strike and hartal the more vulnerable periphery of the broad mass of supporters of the Left.

(ii) The unconscionable delay in and unseemly haggling over the call of a united action against the mass dismissals of the state and central government employees robbed the call of much of its solemnity and reduced it to a formal ritual when it ultimately came.

(iii) To the two more substantial causes noted above was added the relatively fortuitous factor—the panicky reaction of a top CITO leader who had in a public statement on the eve of the *bandh* directed the ranks to desist from even peaceful picketing. Loyal and disciplined as CPI(M) ranks are, they took it to be a directive from the High Command and fully abided by it. As a result of this, bullying squads of Congress had a walkover even in some of the areas where CPI(M) enjoys wide mass support.

While the recent offensives by Congress, openly backed by the state machine, have scored some initial successes in terrorising and disorganising CPI(M) bases in certain areas, deeper down things are moving in an opposite direction.

First of all, all inter-party clashes within the Left, including the CPI(M)-Naxalite clashes, have almost totally stopped. Deep concern is being felt by the entire Left base, including even considerable sections of CPI, at the wide-fronted offensive by the government and the violent attacks by Congress. This has already resulted in a certain estrangement between CPI and Forward Bloc leaderships. The latter has sharply attacked the CPI's political stance of firm support to Congress, adopted at the recently concluded Cochin congress of the party, as a betrayal of the Left.

Secondly, the stigma of 'gangsterism', which the establishment press and other mass media had been able to fasten on CPI(M) in the earlier phase, is today increasingly attaching to Congress(R) despite the eloquent silence of the mass media. People in different affected areas are drawing their own conclusion from their own personal experience.

Thirdly, direct and open collaboration between the state machine and Congress brigades in the violent attacks on the Left bases are steadily exposing the democratic pretensions of the regime and helping the people to understand the Marxist interpretation of the basic character of the state power.

LUCKNOW

Political Uses of Backwardness

UP is one of the 'underdeveloped' states in the country. Its population is one-sixth of India's and whereas the density of population is 182 per square km for the country as a whole, in UP it is 300 per square km. The growth rate for the economy as a whole at constant (1960-61) prices during the period 1960-61 to 1967-68 was 3.14 per cent; that for UP was 2.28 per cent. India's per capita income at 1960-61 prices is Rs 307; the per capita income for UP is Rs 245. UP occupies the eleventh position among the states in power generation.

These and similar indicators of economic backwardness have always been used by politicians for election purposes. Recently the Thinkers' Forum, started by Congress(O) leader C B Gupta, has been using them, with the help of present or retired civil servants, to oppose radical programmes. In the thirties, forties and even fifties, clubs such as the Forum used to be formed for disseminating Left thinking. In fact, soon after Independence, a Thinkers' Forum was started to bring together academics, civil servants and politicians to promote radical policies. The end of these earlier efforts coincided with the failure of the socialist and radical movement in the state. Now the Right seems active, using the very techniques the Left had employed.

On October 9 and 10, the Thinkers' Forum organised a seminar on the industrialisation of UP. At the seminar, Ram Sahay, member of the Board of Revenue and a former Agricultural Production Commissioner of the state, made a frontal attack on the socialistic policies professed by Prime Minister Indira Gandhi. He said: "Singapore had 10 times UP's per capita income and a growth rate 50 times that of this state. This was because there were no constraints on free enterprise there" (*National Herald*, October 11). Nothing less than the traditional courtesy of Lucknow could tolerate such estimates being aired in public. P N Srivastava, former PWD Chief Engineer, assumed an imperialist attitude and ascribed UP's economic backwardness to the laziness of the people! Reforms in the educational system and the need to expand village industries were commonplace suggestions.

Baljit Singh emphasised the need to create an adequate infrastructure: power, transport, communications, financial institutions and a leading sector industry such as the timber industry in Sweden or coal in the UK. Such an industry for UP, he visualised, could be manufacture of agricultural implements and machinery or heavy chemicals. Baljit Singh advocated that these be in the public sector which would have to invest at least Rs 200 crores in them. For administrative convenience he favoured the division of UP into four separate parts: the Hill Region, the Bundelkhand, the Western Region and the Eastern Region.

T G Charlu, a former Director of Industries, spelt out the 'constraints' as he saw them: area-wise UP was the largest state in India; it lacked raw materials and was land-locked, being 700 miles from the nearest port. Continuing the story of economic backwardness, Charlu told the audience: "The foreign exchange position has tightened, transport cost has risen, and the socialistic overtones in Central Government policies have dampened private capital investment" (*National Herald*, October 10). He, too, advocated more concessions for the private sector. Charlu went on to stress that, out of 30,000 small industrial units in the state, 65 per cent were being run by non-UP entrepreneurs.

Why are such entrepreneurs numerous in neighbouring Haryana and Punjab, but not in UP? The answer is not simple but is to be found in the complex of what British rule left behind. This comprised the entrenchment of the Zamindari system coupled with caste barriers; the lack of socio-religious reform which made the social and economic system rigid and did not permit the emergence of an entrepreneurial class from the farming, manufacturing and trading castes. After Independence hardly anything significant—except abolition of Zamindari—has been done to energise and activise the potential small entrepreneurs in various sectors of the economy. The interests of politicians have been closely tied to those of big business and the big landlords. Only a democratic movement can liberate the productive classes from the semi-feudal shackles and take the economy on to a growth path.

MAHARASHTRA

New Posture on Land Ceilings

MAHARASHTRA's Chief Minister, V P Naik, recently startled his critics, both within the Congress and outside, by announcing the state government's intention to lower the ceiling on agricultural land holdings and to change the unit of holding from the individual to the family. The government, he said, would promulgate an ordinance to give effect to these proposed changes. However, there was no commitment as to when the ordinance would be issued. And though there was an assurance that it would be issued by the present government, this was taken to mean that the amendments to the state's land ceiling act would be the responsibility of the new government after the elections in February 1972.

The announcement ostensibly marked the reversal of the earlier firm stand that Maharashtra would wait and see what other state governments intended to do in the matter of land ceilings. It also came as a surprise since Naik is known to be one of the staunchest opponents of land reforms among state chief ministers. He has frequently argued in public that any changes in the agrarian structure would adversely affect agricultural production in the country.

Why the change of posture then? Clearly, the new land policy has much to do with the power struggle in the state? The announcement was evidently meant to silence the Chief Minister's critics who seem to be out to brand him as a 'reactionary' opposed to the progressive policies of the Congress. It has been known for some time now that in the power struggle in the state Naik did not exactly enjoy the support of Indira Gandhi. Is the proposed new measure meant to allay her fears and correspondingly to take the wind out of the sails of the other aspirants to chief ministership?

Reports suggest that N K Tirpude, Minister for Housing and Forests,—who had left the government in 1960 and was in political wilderness for eight years till Naik brought him back into government in the face of strong opposition—was the main spirit behind the Chief Minister's move. The change in Naik's stand apparently occurred after Tirpude met D P Misra and was told by the latter that the Prime Minister would oppose Naik's continuance as Chief Minister since he had failed to toe her line. If Naik would change his posture on land ceilings, matters might be helped and Mishra could be of some help to Naik in his fight for continuance in power. Thus, Naik and Tirpude, with their old Madhya Pradesh contacts with D P Misra, are aligned in battle against politicians of western Maharashtra and Marathwada. Men like Uma Shankar Dixit and D P Misra cannot, after all, let Naik down since he represents the strongest rightist section in Congress.

Till now, Naik depended on Y B Chavan for his continuance. Evidently, with the changed equation at the Centre between Chavan and the PM, Naik has realised that the Union Finance Minister will leave him in the lurch if pressures against his continuance seem inconvenient to him. Naik has therefore entered the arena with ideological weapons in an attempt to add a new dimension to the power struggle. The newly reorganised Congress Forum for Socialistic Action, which is meeting in Poona on November 9, must have added to the pressures on Naik. The Forum, presided over by the State Party General Secretary, Sharad Powar, has launched a campaign against Naik's continuance. Naik, according to the Forum, is a "reactionary, opposed to the progressive policies of the state Congress". Mohan Dharia, Union Minister of State for Planning, who is known for his radical postures, is a prominent member of the Forum.

Another attempt on behalf of the Chief Minister to muster forces against his adversaries, notably Shankarrao Chavan and Y J Mohite, seems to have come in the form of an inspired story in a section of the press that Naik was proposing to drop some of his colleagues to prune administrative expenditure. The report, which was subsequently denied, seems to have been an attempt at warning some of the junior ministers in the government that their wholehearted support and loyalty were expected by the Chief Minister.

MANILA

Another Tottering Model

(From a Special Correspondent)

PHILIPPINES presents a picture of political strife and economic deceleration. The only ray of sunshine is the breakthrough in the production of rice.

The country is passing through an acute period of political strife following the bombing of the opposition Liberal Party rally by some unknown persons. An opinion poll has shown that the majority of people believe that the bombing was carried out at the instigation of the ruling party, if not of President Ferdinand Marcos himself. The curious failure of the administration to round up any of the assassins involved weeks after the incident heightens the worst suspicions of many people. The President has done little to sooth popular restlessness. Instead, he has suspended the writ of *habeas corpus* claiming that the city of Manila is in danger of being burnt down by communists. This has enabled him to goal a number of left wingers, including several university professors, without having to bring them to court.

There is a widespread feeling in Manila that the President is using his position to enrich himself. Under the present constitution there is no way of bringing him to book, short of impeachment by the congress (on similar lines as in the US) which appears an impossibility as he gets richer and richer and acquires the power that goes with money in a society where electioneering is associated with expending of large sums of money. Marcos himself is debarred from contesting for another term as president under the constitution, but it is rumoured that his wife, Imelda Marcos, will contest for the supreme post. A majority of the delegates to the constitutional convention, which is in session now framing a new constitution, have reacted to this by proposing that the family of Ferdinand Marcos should be debarred by the constitution from contesting for the presidentship.

There are some intellectuals, like Father Piron, a distinguished priest and teacher, who attribute the ills of the country to the presidential system. The argument is that there is often no harmony between the president and the congress — as is the case now — and this makes it difficult to have speedy planning and legislation. Further, in a country where the electorate is not

sufficiently educated in the issues on hand, it might elect a president on irrational grounds whereas a group of legislators like the congress might be in a better position to choose a prime minister. The argument is that the supreme executive authority, whether we call him president or prime minister, should be elected indirectly and be responsible to parliament.

The root cause of the present situation in Philippines is, however, deeper than this. It is that the parties representing the very poor, like the communists, have been debarred from democratic participation, so that the only parties left in the field are ones which basically represent the interests of the rich. These have to scramble for the votes of the poor who are alienated from them. The result is an attempt to win the votes of the poor through bribery and expensive electioneering. This, in turn, makes political corruption an inbuilt feature of the system. Unless a politician spends money he can't get elected, and if elected he must not only recover his 'expenses' but also accumulate wealth for the next round!

Perhaps one should not despair too much. Philippines, due to an excess of law graduates, has a very legalistic urban elite, who are quick to notice even minor infringements of the law — though they may look rather puzzled if the police dump students secretly in the river without leaving any trace of evidence. The press is vocal as it caters to this urban community of sophisticated intellectuals, some of them sporting very long hair. And the country is fortunate in having articulate and public spirited scientists like S R Gonzalez who when he is not engaged in solving problems in mathematical logic is exposing political corruption to rallies of hippie-like students, sons of the rich burdened by their adolescent consciences.

Meanwhile the economy is in the doldrums. Following an excess of public spending in the pre-1969 election period, financed by minting of new money, prices rose viciously. The economic growth in the last two years has been poor. It is difficult to get hold of reliable statistics, but all the indications point to this. Let us examine the record before 1970.

Philippines' national income grew at a respectable rate of 5.4 per cent per year at constant prices during 1960-69. In the latter half of the period, 1965-69, the rate was above the average — it rose to 6 per cent per year. The higher growth in the latter period was achieved in spite of the deceleration in the growth of the manufacturing sector; only agriculture and mining expanded at above the average rate after 1965. This is partly due to the fortunate breakthrough in rice production using the new hybrid varieties developed at the world-famous Rice Research Institute at Manila. Foodgrain output had been rising at the rate of 6 per cent per year — a circumstance which makes the growth of population, at 3.1 per cent per year, seem less alarming.

The growth of manufacturing was highest during the period of import controls in the early fifties — it was as high as 13 per cent per year in 1950-54. But it decelerated to 9.8 per cent in 1955-59 and to 4.4 per cent during 1960-69. Economists believe that the initial spurt provided by protection has worked itself off and now the manufacturing sector faces sluggish market conditions. There is reported to be much excess capacity in industry. One can't fail to notice the intensive advertising — more than half of the time on television and radio seems to be devoted to it. It is a paradox that in a developing country, which is supposed to be short of resources and needs to encourage saving, there is such intensive advertising to promote consumption.

Indeed, the malaise is very deep rooted. It stems from a series of circumstances. Firstly, foreign ownership is still important and foreign investment is relied on heavily. One consequence is that a number of manufacturing plants established in the period of protection were of the assembly type with most of the manufacturing taking place in parent plants abroad. Growth of this "jump over the tariff wall" type of manufacturing has led to little addition to the talents of the country, apart from some small contribution to incomes. Moreover, the spectacular growth of foreign investments has enlarged the stream of investment income flowing out. Secondly, the income distribution is highly skewed. About 57 per cent of the families are reported to be receiving income less than 1500 pesos (approximately $ 375) a year, which means that the task of selling manufactured goods becomes difficult beyond a point. Indeed, it is arguable that the structure of incomes associated with capacity creation in manufacturing is such that the capacity seems to outstrip the demand generated from the associated growth of income.

The economy continues to depend on a few countries and on a few exports. In 1969, 80 per cent of Philippines' exports went to two countries — USA and Japan. Primarily commodities like abaca, sugar, coconut and lumber constituted more than 90 per cent of exports. The implication is that export performance is closely tied to the pace of economic growth in a few countries and upon production conditions in a few commodities.

What are the planners doing to tackle these problems? The joke is that when Professor G Sicat, a Harvard product and author of an OECD-sponsored volume on the Philippines, was appointed the president of the country's supreme planning body, the only idea he had to regenerate growth was that better national accounts be prepared! More seriously, Sicat seems to think that a public sector is not really the answer, and in any case it seems to be politically unacceptable. Hopes seem to lie in attracting more foreign investment. But this really depends upon providing a thriving market, and in the absence of large public investment, it is difficult to see how market conditions are going to improve. Jose E Romero, Jr, Director-General of the Congressional Economic Planning Office, seems to be more optimistic and appears to support a more vigorous public investment policy.

One problem that does not receive adequate attention in Philippines is family planning. Access to means of birth control does not seem to be widespread, and in a predominantly Catholic country there seems to be some reluctance to publicly airing views supporting family planning. The politicians are afraid of risking the support of Catholic priests, even though among the priests themselves there is a strong movement in support of birth control. It is one of those instances where an individual politician can't gather enough courage to advocate a beneficial policy because he is afraid of risking some support, whereas if he keeps quiet he does not lose anything. So in the end no politician advocates family planning seriously while everyone of them is convinced of the need for it. Controlling population growth is not all that practical nor is it the panacea to the country's poverty, but it is important to provide an adequate number of clinics to advise on birth control.

Can Institutional Reforms Do the Trick?

Shivram

INSTITUTIONAL reforms — i e, reforms of the institutions governing the mode of ownership of the means of production or method of distribution of resources — have been tried on a sizeable scale in only a few countries of Asia. The most widely known attempt is that in land reform. Even this has been attempted in a limited way and its achievements are even more limited. Co-operative development is yet another attempt at institutional reform which has hardly succeeded in many Asian countries outside communist China, Taiwan, Japan, and parts of India (e g, Maharashtra and Gujarat). Attempts at state trading (either through nationalisation of existing agencies or *de novo* organisation of state-owned agencies) have been made in specific circumstances (outside communist China) and the results thereof are difficult to assess. State ownership of industrial plants (proverbially associated with public or state-owned sector in contrast to private sector) has been tried in a few areas, and here again the achievements are uneven.

The reasons for this relative failure of institutional reforms are diverse, and they vary according to the stage of historical development of the country's socio-economic structure. In parts of India, Burma, and other South Asian countries, where the customary form of tenure prevails, any rapid development has obviously to follow rather than precede monetisation of the agricultural economy and its integration with the wider national economy. In countries with remnants of feudalistic systems, the political power of the landed estates is clearly the main limiting factor. Fortunately this type of agrarian structure has been replaced in many Asian countries by peasant proprietorship. In the countries having peasant proprietorship and a semi-developed industrial economy (these constitute the majority of the Asian countries), concentration of land-ownership and control over credit, marketing, and processing facilities, have made it possible for the upper classes of the rural sector to dominate the State apparatus in collaboration with urban industrial interests. Individual or corporation farming in rural areas side by side with a corporate industrial structure or industrial conglomerations, has not yet been evolved to any significant extent in this region. The socialist type of economy, with an emphasis on centralised planning, exists only in North Korea and North Vietnam. A socialist economy, with an emphasis on communal ownership of all means of production on a scale never witnessed before in human history, is being evolved in communist China. The problems in that country are of a different kind and are not included in the present discussion which is confined to problems of countries with peasant proprietorship and semi-developed industrial structures, that are making attempts at transforming the social structure within the Western type of democratic set-up.

Admittedly, some institutional reform or the other is taking place in most Asian countries. The question is, whether the scope, content, speed, and extent of these reforms are adequate for rapid and sustained economic growth and for reducing sectoral, class or regional inequalities. To put it more precisely, successful institutional reforms should ensure: (a) that capital formation is sufficient to create a rising standard of living for a growing population; (b) that the rate of growth in the country is comparable to that in the communist countries; (c) that the gap in technological development between Western industrialised countries and Asian countries is reduced; and (d) that the security of expectations among the masses (resulting from sustained increase in living standards) is strong enough to encourage wider adoption of family planning methods.

As of now, the toiling masses of rural Asia have no real incentive, or propensity, to accept limitations on family size. The hazards of living, the lack of adequate employment opportunity for the educated, and the limited opportunity for vertical mobility, have all encouraged a feeling of insecurity and resignation. It is not surprising, therefore, that family planning propaganda has not succeeded to the extent considered desirable. To conclude, institutional reforms, together with other forms of planning, should create objective conditions in which the choice between a larger family and higher living standard is real for the common man. In this sense, the institutional reforms attempted so far have certainly failed.

At the operational level, it is neither necessary nor desirable to draw an artificial distinction between institutional reforms and general economic planning. While this statement would be strongly objected to by Western-oriented economists, trained in classical and neoclassical schools, the experience of practical planners over the past few years has conclusively exposed the dangers of distinguishing between social and economic planning. The relative failure of institutional reforms in the past may, in fact, be ascribed to this sort of artificial distinction as much as to various allied factors. Firstly, production processes and production structures are often studied in isolation from the social structure. Secondly, the planners, apprehensive of political upheavals, have often resisted the demand for changes in the mode of ownership of the means of production. Thirdly, the outdated State apparatus, inherited from colonial days, is called upon to attend to new duties, involving value determination, price fixation, and modification of income-flows, far beyond the capacity of the present administrative structure. Fourthly, institutional arrangements for ensuring the desirable rate of capital formation —

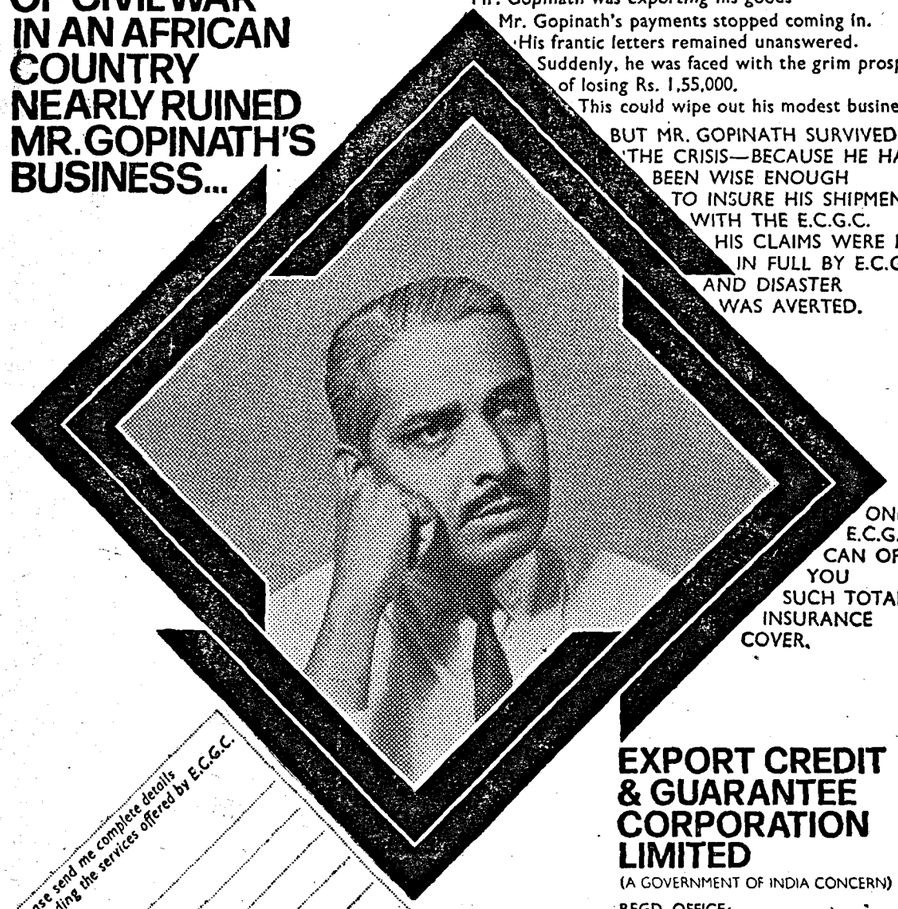
A SUDDEN OUTBREAK OF CIVIL WAR IN AN AFRICAN COUNTRY NEARLY RUINED MR. GOPINATH'S BUSINESS...

For years Mr. Gopinath has been doing a very successful export business with a reliable buyer in Africa. The buyer was prompt in his payments and Mr. Gopinath never had any cause for complaints.

Then came the fateful day when the newspapers carried a news item relating to an outbreak of civil war in the country to which Mr. Gopinath was exporting his goods



Mr. Gopinath's payments stopped coming in.

His frantic letters remained unanswered.

Suddenly, he was faced with the grim prospect of losing Rs. 1,55,000.

This could wipe out his modest business.

BUT MR. GOPINATH SURVIVED THE CRISIS—BECAUSE HE HAD BEEN WISE ENOUGH TO INSURE HIS SHIPMENTS WITH THE E.C.G.C. HIS CLAIMS WERE PAID IN FULL BY E.C.G.C. AND DISASTER WAS AVERTED.

ONLY E.C.G.C. CAN OFFER YOU SUCH TOTAL INSURANCE COVER.

Please send me complete details regarding the services offered by E.C.G.C.

if necessary through forced savings — have never been properly planned. This has resulted in appropriation of additional income, generated by the investment, for additional consumption by the more favourably placed groups — thus widening the gap beween the rich and the poor.

A review of institutional reforms of many Asian countries reveals that institutional reforms have not been given proper attention or that they are at best treated as a social or ameliorative programme of no central importance. Institutional reforms have rarely been considered as an integral part of the planning process. The consequently limited achievements of planning in the last two decades have therefore created grave doubts in the minds of many people as to the feasibility of achieving rapid growth through planning in a democratic set-up.

Except in Japan, and in some parts of other countries such as India, institutional reforms are rarely attempted on an integrated basis. The success of land reform and the co-operative development scheme in Japan is in no small measure due to the integrated approach of the government. Similarly, in Maharashtra and Gujarat, the success of land reforms and co-operative schemes may be ascribed to the integrated way in which these schemes were attempted. No doubt, the favourable political situation — in that the states were not dominated by rural vested interests which had been effectively replaced by urban interests — was also a contributory cause.

Thus the relative failure of the institutional reforms in most Asian countries can be ascribed largely to the inadequacies of scope and content of the reforms attempted so far. Vested interests, which dominate the legislative wing, effectively prevent passing of any legislation aimed at radical transformation of the social structure. Much of the land reform legislation in the past has made little provision for effective distribution of land. While preambles and declared aims are laudatory, the operative paragraphs have built-in clauses for ensuring their failures. With regard to co-operative development schemes, too, the vested interests have almost always succeeded in either modifying the schemes to suit their purpose or in effectively sabotaging the entire scheme if it is found detrimental to their narrow interests. The usual practice is to adulterate the scope and content of the scheme to such an extent that it loses much of its potency.

In a class-ridden hierachical society, of the type prevailing in most Asian countries, transactions are almost always governed by market forces. The relative bargaining power of the weaker sections has generally declined with the growing population pressure. With the growing concentration of wealth and consequently of political power, it has become increasingly difficult to ration and allocate scarce resources.

Rationing transactions, in order to readjust the value of payments between unequal bargaining parties, assume critical importance in this situation; yet the State machinery finds it increasingly difficult to handle these functions because of political pressures. Allocation of scarce resources in order to safeguard the interests of the weaker groups and of the undeveloped regions, may be frequently declared as the main objective of planning, but it has become virtually impossible owing to political pressures. The situation is so critical that, except in a few countries with effective democratic control, the State has practically ceased to perform this function. The domination by a small number of industrial magnates, or by career bureaucrats with close affinities with the industrialists, or by the well-to-do urban interests from developed regions has often meant the neglect of the interests of the poor and the weak particularly from the backward regions.

While the success of institutional reforms is dependent on the efficiency and power of the State, unfortunately it is true that the State apparatus itself in many Asian countries is incapable of introducing the reforms successfully. Except in a few countries the legislative wing is dominated either by the landed gentry or by the urban vested interests. The personnel employed in the judiciary and executive wing often align themselves with the interests of the ruling classes; the position is not very much better in regard to the newly created State-owned autonomous agencies, such as the State Trading Corporation, State-owned banks and State-owned factories. Only a few examples should suffice to prove the point.

The fifth Report on Progress in Land Reforms, prepared by FAO, UN and ILO, contains numerous examples which prove that almost all the wings of the State apparatus align themselves with the richer classes. Various reports on rural credit — particularly the follow-up rural credit surveys in India — have proved that the State, which was originally expected to support the weak in their bargaining against the strong, often aligns itself with the strong. State officials, who were appointed on the managing committee as a part of the scheme for State participation in the share capital of the co-operatives, were either ineffective or incapable of withstanding the pressure from the rich. Even after the nationalisation of private commercial banks in some Asian countries, a large part of the credit resources are still offered to the rich and the powerful by bank officials who are under the hegemony of the industrial magnates represented in the banks' directorates. Officials of the State Trading Corporations often find it safe to operate in league with the private trade rather than in competition with them. Bureaucrats managing the State-owned plants are more interested in ensuring their promotion or getting better jobs in the private sector after retirement, rather than in defending the national interest. Officers empowered to decide about licences and permits are vulnerable to bribes and other forms of corruption. Members of the judiciary in many countries, if not all, are prone to seek favours from the powerful industrial corporations while seeking employment opportunities for their sons and their relatives; it would be surprising if they actually decide judicial problems keeping in mind the welfare of the vulnerable groups.

In the context of the inflationary economy and the stagnation of the ridiculously low government-salary scales, even an honest government official often finds it difficult to survive. With the steep rise in the pay scales in the private sector and the growing volume of unaccounted money in the nation's economy, any sensible monetary management for ensuring higher savings and greater capital formation has become virtually impossible.

Thus, while in theory the State is the main instrument for carrying out institutional reforms, in practice it has become an important institution in many countries. The growing imbalances, both sectoral and regional, have made it still more difficult to distribute the element of sacrifice equitably among classes, sectors, and regions. Sacrifices have to be imposed on various groups and areas if savings are

to be accreted and a high tempo of investment is to be maintained. But inequity in distribution of sacrifices among different sectors, regions, and classes, has undermined the confidence of the people in the ability of the State to undertake institutional reforms successfully. There is a growing realisation that, while the private sector, steeped in its own narrow interest, is incapable of effecting rapid capital formation, the performance of the public sector and the co-operative sector *as they are actually constituted at present* does not show much promise either. What should be done to enable the public sector and the co-operative sector to perform more fully the role expected of them by the masses, is the principal question. Unless these two sectors are mobilised to step up capital formation, there seems to be little hope for peaceful transformation within a democratic set-up. The problem in this regard is as much an economic one as it is a social, political, administrative, or management problem.

The Koreans Begin to Talk

R R Krishnan

EXACTLY one month after the first meeting, the representatives of the South and North Korean Red Cross Societies held further talks to discuss the problem of families separated by the partition of Korea at the truce village of Panmunjom. The first meeting which took place on August 20 at Panmunjom was indeed the most important event in the Korean peninsula since the end of the Korean War in 1953. The meeting lasted for only four minutes but the fact that such a voluntary exchange could take place at all, made it a truly significant event. It was a formal occasion to exchange the texts of the South Korean proposal and the North Korean reply on the issue of locating separated Korean families. The contents of the proposal and the reply had been broadcast earlier by Seoul and Pyongyang radio stations. The President of the South Korean Red Cross Society who took the initiative suggested to his North Korean counterpart at the August 20 meeting that further talks between the South and the North be held in Geneva before October this year to discuss the procedural problems. In the carefully worded text, he was allowed by his government to use the words "North Korea" instead of "Northern Puppet", the official South Korean nomenclature for the Pyongyang regime. North Korea accepted the South's proposal within 48 hours. It suggested that the scope of the talks be widened and that Panmunjom should be the meeting place—on Korean soil rather than abroad. South Korea agreed to the venue but refused to widen the scope of the talks. Since then four meetings have taken place in a cordial atmosphere.

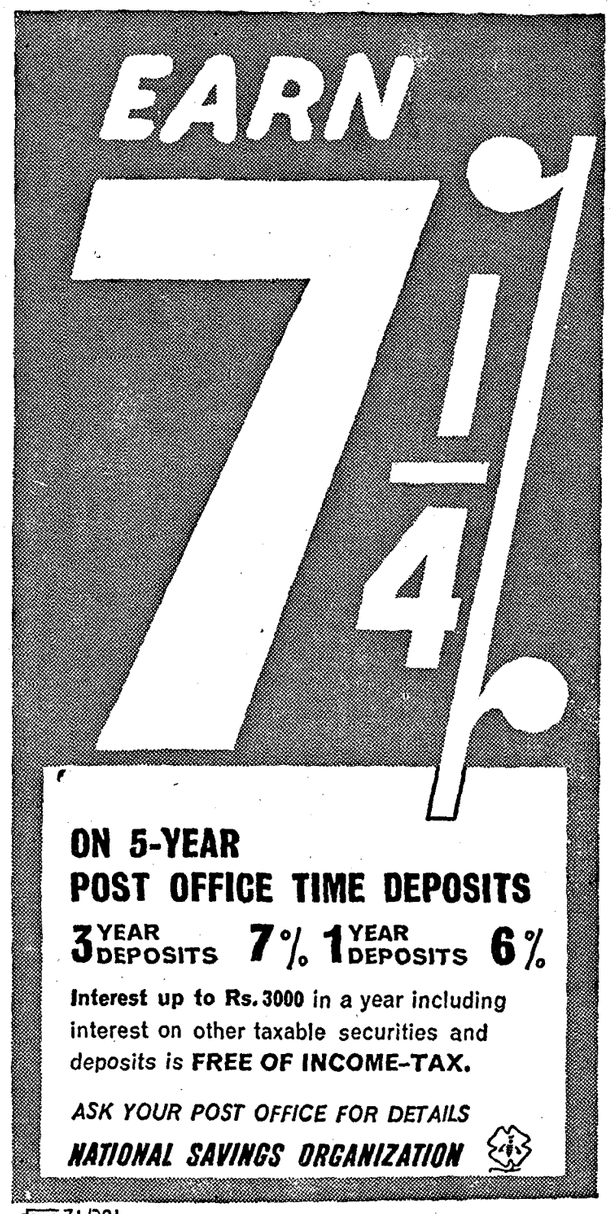
Justifiably and predictably the recent parleys at Panmunjom have aroused intense excitement and have rekindled the hopes of reunification among many of the 40 million Koreans living in that tragically torn and tension ridden peninsula. Almost 26 years ago similar hopes were aroused in Korea when Japan's surrender was announced. The defeat of Japan meant the end of 35 years of Japanese colonial rule and the beginning of a new era in which the Koreans hoped they would shape their own destiny. But these hopes were shortlived. For Korea was separated into two zones in August 1945. Soviet troops occupied the area north of the 38th parallel and American troops moved into the south after the War ended. When these two powers departed in 1948 they left behind a divided nation; Korea had fallen victim to the cold war. However, the Korean people continued to look forward to the reunification of their country.

In June 1950, the Korean War broke out. If the purpose of the war was to end the artificial division of the country, the three years of fighting did not achieve it. The Armistice Agreement that brought the war to an end in 1953 provided for the establishment of a military demarcation line 151 miles long. A demilitarised zone extending across the peninsula was also created as a buffer between the two belligerents. A Military Armistice Commission (MAC) composed of ten members, five appointed by North Korea and China on one side and five appointed by the United Nations Command on the other, was set up to supervise the implementation of the truce terms and to settle through negotiations any violations. The senior member of the UN component is always an American officer of two-star rank and it is he who does the talking with his counterpart from North Korea. The MAC's meetings in Panmunjom are invariably acrimonious with both the parties levelling charges and countercharges of truce violations. But the MAC has, somehow, managed to preserve 'peace' in the peninsula, however uneasy and fragile it might be. One important provision of the Armistice Agreement was that until such time as a political settlement could be reached, the relative military combat strength of the two opposing sides was to be maintained at the same level as on the day of the cease-fire, July 27, 1953. This provision has been violated by both sides.

It is not particularly relevant to determine who was the first to violate this important provision. What matters is that in the last eighteen years both the North and the South have constantly added to the stipulated number of soldiers, engaged in an arms race and thereby have increased tension. Today, the Korean peninsula is one of the most militarised regions in the world. It has about one million armed men in an area of 85,000 square miles and in a population of only 40 million. Apart from 40,000 American troops stationed in South Korea and the regular South Korean forces, there is the Homeland Reserve Force of 2,000,000. North Korea has no foreign troops on its soil, but has well-trained and equipped armed forces of 400,000 and a strong People's Militia of 1,300,000, all in a population of about 12 million.

Further, for various reasons, both real and imaginary, a whole generation of Koreans, in both parts, live in fear and suspicion of the regimes across the border. The spectre of the 'rabid' communism of North Korea and its close relations with the Soviet Union and China haunts the Seoul regime. Similarly, the presence of large numbers of American soldiers in a stridently anti-communist South Korea, having cordial relations with Japan—the former colonial master of Korea—alarms North Korea.

So acute and pathological is the mutual fear and suspicion that no contact whatsoever has taken place between the South and the North for the last 18 years. Even an exchange of post-cards telling a southern wife whether her husband and children are dead or alive has not been possible. In this respect the situation in Korea is vastly different from that between the two Germanies and in some respects even worse than that between the two Vietnams. A Korean from the South is not allowed to meet his brother or sister from the North even in a third country. The partition of Korea is a total human tragedy without any redeeming features.



Now at long last there are hints of significant developments inside and outside Korea which promise a lessening of tension in North-South relations. Last autumn the United States carried out a partial withdrawal of its troops from South Korea thereby removing albeit partly, one element of tension in the peninsula. Subsequently during the presidential election held in April 1971 in South Korea, the opposition candidate forcefully demanded a lessening of tension and exchanges between the North and the South; he demanded that postal communications be restored and visits by journalists, athletes, be encouraged. A few months earlier, a retiring American chief of the United Nations Command had also mentioned the desirability of the "Koreans talking with the Koreans" at Panmunjom and about the possibility of the headship of the UN Command being transferred to South Korea. This would have enabled the Seoul and Pyongyang regimes communicating directly with each other, instead of operating through an intermediary.

Non-Ideological Gesture

It is not absolutely clear as to what brought about a change of heart in the South. Perhaps, the significant economic growth and the increase in its own military capability during the last decade, the growing cordiality between Tokyo and Seoul and the belief that the United States will not totally abandon its interests and commitments in South Korea, were considerations that, taken together, prompted the Seoul regime into adopting a more conciliatory posture towards the North. Above all, Nixon's proposed visit to China and the 'thaw' in Sino-US relations must have provided that extra impetus to make the Seoul regime adopt a new policy toward the North in the form of a non-ideological gesture.

So far as the formal record goes, it is Seoul and not Pyongyang that has stood in the way of North-South contacts. North Korea on its part has repeatedly declared that it seeks a purely "Korean solution" to the reunification problem. Pyongyang has often asked for an "exchange of letters at least", to be followed by "economic and cultural interchange and visits by individuals between North and South Korea." But at the same time it has refused formal negotiations with President Park Chung Hee and his government. South Korea has also persistently rejected the North's proposals as a "hoax" and a "cover" for North Korea's "attempts to communise the South by force."

It seems it was North Korea which modified its attitude towards the ruling party of the South first. Kim Il-Sung, North Korea's leader, while welcoming Prince Sihanouk to Pyongyang, last August, declared that he would be prepared to talk to any political party in the South including the ruling party of Park Chung Hee. This time South Korea responded differently. Within one week of Kim Il-Sung's announcement, it allowed the South Korean Red Cross Society to agree to meet the representatives from the North. The ice was broken. As the first concrete step on the difficult road to reunification and as the first move towards relieving the agony of separated Korean families, the parleys at Panmunjom should be welcomed by all.

Loss of Credibility

Nireekshak

WITH the armies of India and Pakistan facing each other along the entire border in the west and the east, newspapers like *Times of India* and *Hindustan Times* have been paying special attention to such things as rice harvesting in Chhamb and the road traffic out of Ferozepore. Some other strictly military information — such as the strength and position of the Pakistani forces and the various steps they are said to be taking to ready themselves for battle — is also being given to readers. The Defence Minister's various pronouncements in border towns, giving advance intimations to the 'enemy' of what looks like the Indian General Staff's plan of battle, are of course being given great prominence.

All this is the work of a special species of reporters that has made its appearance "somewhere on the Indo-Pakistan border" or, less mysteriously, "somewhere on the Rajasthan border" — the same species, incidentally, which, not long ago, identified itself by the dateline "somewhere in Bangla Desh". A map purported to be a scale drawing of "Pakistan's defence canals" has also made its appearance in some newspapers. It must remain a matter of no small wonder to intelligent readers how any reporter could go to any border anywhere to say, as a *Times of India* scribe did, "Pakistan has moved all its troops to the border without keeping any reserves"; or how anyone could come upon such "reliable reports" at a tiny border outpost of all places. And is it really necessary for the *Hindustan Times* to send a reporter to Jaisalmer and Barmer in order to be able to publish the following: "According to the latest reports, there is a heavy concentration of the Pakistani troops very near the Barmer border. The prominent places garrisoned are Hatango, Gadra city, Khisar Chachro and Badin. The troops are supported by Mujahids."

Surely, 'reporting' of this kind will lose none of its value, and may gain added credibility, if it is made from relatively more prosaic observation points like Srinagar or Amritsar or even Delhi. For all the talk recently about the lack of professionalism in the press, it would appear that few newspapers are yet ready to enforce recognised or recognisable standards. If there is an "eyeball to eyeball" confrontation of the armies, as some scribes say there is, (why not "teeth to teeth", by the way?) the least that they and other reporters could do to justify their intervention is to show clearsightedness by sticking to observed and verifiable facts.

While the 'special reporting' of the confrontation has been confined to two or three newspapers, editorial comment on it has been widespread. And Yahya Khan's broadcast, calling for an Indo-Pak 'dialogue,' followed by Indira Gandhi's reply, were the subject matter of the most recent comments. "This mischievous suggestion [for a dialogue] is a trap set for India by the wily President of Pakistan", wrote *Hindusthan Standard*. "For India to agree to a talk would amount to an admission that the struggle for freedom in Bangla Desh was waged at India's instigation and it could be called off at her behest. The suggestion does not indicate the Pakistan President's peaceability.... On the other hand, there is every possibility of Pakistan going berserk if its aggressive posture does not bring off the desired intervention by friendly countries on its behalf."

Load of Rubbish

To which *Hitavada* added: "greater danger than war" would be "another Tashkent". The acceptance of any proposal for an Indo-Pak dialogue, it said, "would imply acceptance of the Pakistani charge that India was involved in the East Bengal uprising. It would also mean permanent acceptance of a crore of refugees by India, because they would not return to autonomous East Pakistan under the tutelage of West Pakistan rulers.... As far as the Indian people are concerned, they would welcome war in preference to another Tashkent." Much the same thing was implied by *Deccan Herald* when it wrote: "It is time that Pakistan's 24-year itch was ended" for, as the paper wrote in an earlier editorial on the same subject, "India cannot ignore the continuing influx of refugees nor the provocative and belligerent posture expressed in General Yahya's broadcast and the movement of Pakistani troops on India's western borders".

According to *Mail*, Yahya Khan's proposal for a dialogue was "another load of rubbish... for the whole point of the present situation is that there should be a dialogue between Yahya Khan and Mujibur Rahman, not between Yahya Khan and Mrs Indira Gandhi".

Tito's visit to India and Nixon's proposed visit to Moscow were two other events which attracted editorial interest. In its editorial, 'A Whiff of Fresh Air', *Tribune* remarked that Yugoslavia's "forthright support to the oppressed people's freedom struggle" [in Bangla Desh] and "reaffirmation of solidarity with India at a crucial hour" were in sharp and welcome contrast to the international community's general reluctance to face the realities of Bangla Desh. The Indo-Yugoslav communique "reads interestingly" in the context of the plea by the Big Four for restraint, said *Indian Express*. "An intriguing feature of the joint communique is New Delhi's oblique rejection along with Belgrade of the Brezhnev doctrine of limited sovereignty. This was not India's attitude when Russia overran Czechoslovakia.... Can it be that India has now decided to be more non-aligned on the side of Yugoslavia than of Soviet Russia?" the paper asked. As an "old and consistent friend of this country", commented *Indian Nation*, Tito has "come here at this crucial hour" not just to pay a courtesy call. "If he is enabled to understand the trends in this part of the world in their correct perspective, he can make valuable contribution towards the solution of at least some of the problems...."

As for Nixon's summitry, "It is important", said *Hindu*, "for Mr Nixon to improve relations with China without whose co-operation he cannot hope to implement his plans for American withdrawal from Vietnam... [and] it is even more important for him not to allow relations with Russia to be soured particularly now when big decisions are impending in Europe and West Asia.... The world has now entered an era of negotiation and summit diplomacy and three countries share the balance of power." In the opinion of the *Free Press Journal*, "President Nixon intends not merely to win the Presidential elections next year, but to establish a style of diplomacy that will be associated with his name."

Credit Needs of Farmers

A Seshan

Report of the Expert Group on State Enactments Having a Bearing on Commercial Banks Lending to Agriculture; Reserve Bank of India, Bombay; pp 190; Rs 6.00.

THE 'social control' and subsequent nationalisation of 14 leading commercial banks was a landmark in the economic history of India giving a new direction and orientation to the operations of banking companies. The adoption of the 'multiple credit agency approach' in financing agriculture has triggered what may be called the Agricultural Credit Revolution, second in importance only to the Green Revolution in agriculture. At the end of March 1971, the total amount of farm credit (directly lent to cultivators) outstanding to commercial banks was Rs 235 crores. Thus, within the short period of 3 years, the banks achieved a position which took more than half a century for the credit co-operatives in the country to reach.

Among the host of problems which have arisen in the wake of the decision to give priority to agriculture in the lending operations of the banks are the impediments posed by various administrative lacunae and legislative enactments in the field of land reforms, money-lending, debt relief, etc. They relate, first, to restrictions on transferability rights in land, as a result of which many farmers cannot offer to a commercial bank their lands as security for loans, and second to provisions for regulation of money-lending activities and fixation of maximum interest rates, protection of certain class of assets of cultivators from attachment in execution of decrees, etc, which will apply to commercial banks, if they are not specifically exempted from their purview. Similarly, debt relief legislation, enacted in several states, has provided for moratorium on debts, scaling down of debts, repayment of scaled-down debts in instalments, and compulsory reduction of interest and principal. Wherever such provisions have not been made applicable only to past debts, the banks are likely to be adversely affected. Besides these restrictive features in legislation, there are a few provisions in state enactments which give privileged treatment to co-operatives. Most state enactments confer a first charge on crops and land in favour of co-operatives for recovery of loans due to them from the members. This naturally places commercial banks at a disadvantage *vis-a-vis* co-operatives.

In view of the multi-agency approach adopted in agricultural credit and the need to quicken the pace of banks' operations in lending to farmers, the need was felt for a comprehensive look at various state enactments to locate the hurdles in the way of banks and suggest their removal. It was in this context that the Governor of the Reserve Bank of India appointed, in September 1969, an Expert Group under the leadership of R K Talwar to identify the inhibiting factors arising out of legal enactments and to make recommendations on the extent to which, and the manner in which, these enactments would require to be modified to facilitiate the operations of commercial banks in the provision of finance to agriculturists.

The Expert Group has brought out a business-like report, containing 7 chapters and a number of appendices. In Chapter 1 the genesis of the Group and their terms of reference are indicated. Chapter 2 gives the background to the problems under consideration and the Group's approach towards their solution. Each major problem is taken up for detailed consideration in each of the succeeding Chapters. Thus the restrictions on land alienation rights of farmers and the modifications to be made there are dealt with in Chapter 3. The problem posed by the provisions relating to 'priority of charge' is tackled in Chapter 4. Chapter 5 discusses the recovery and other operational difficulties of commercial banks. Chapter 6 deals with facilities like waiving of stamp duty, registration of mortgages, etc, to be made available to farmers borrowing from commerical banks. A summary of the recommendations is provided in Chapter 7.

Since amendments to various enactments would be a time-consuming process, the Group has taken the pains to prepare a model Bill ['The Agricultural Credit Operations and Miscellaneous Provisions (Banks) Bill'] to carry out an omnibus modification of all the restrictive provisions in different enactments. The passing of this Bill by state legislatures, is expected to make it unnecessary to carry out amendments to individual enactments. It was indeed thoughtful on the part of the Group to have prepared such a comprehensive Bill and saved the labour and time of state governments. In the appendices, besides the questionnaire issued by the Group, there is *inter alia*, a wealth of (state-wise) information on existing enactments having a bearing on commercial banks' lending to agriculture.

The Group has emphasised the need to provide rights with regard to land alienation or interests therein to all those farmers who do not have them now—such as backward classes, tenants, fragment holders and share-croppers. It is pointed out that most of the laws on land alienation, money-lending, and debt relief, were passed in a bygone period with a view to protecting farmers from usurious money-lenders. By their very nature these laws were never intended to be made applicable to institutional credit agencies. Further, at the time they were enacted, besides the Government only one institutional credit agency, *viz*, the co-operatives, had been engaged in the provision of finance to farmers. It was logical, therefore, for exemptions from the legislation to be provided only in respect of co-operatives. With the entry of commerical banks into the field of agricultural finance, it is but fair and equitable, for the purpose of these laws, that commercial banks should be treated on a footing of equality with co-operatives rather than get bracketed withe money-lenders. The Group has, therefore, recommended amendment of these laws to provide for exemptions also in favour of commercial banks.

While appreciating the amount of labour and thinking that has gone into the Report, a reader may perhaps feel that the Group's approach is rather security-oriented. This may appear to be out of line with the recent reorientation of credit policies with its emphasis on production rather than on security. However, this impression is not really warranted as may be seen from the following extracts from the Report.

> "It would be observed that most of the recommendations of the Group are aimed at removing the difficulties in creating a valid charge/mortgage on land in favour of commercial banks and the realisation of such security. These recommendations are based on the assumption that it would be necessary for commercial banks to

take land as security in regard to advances granted by them to agriculturists. It is, however, being pointed out that commercial banks are essentially purveyors of short-term credit and there should not be any occasion for them to insist on security of land in addition to hypothecation of crop and pledge/hypothecation of inputs... Co-operative societies normally provide only short-term loans and the cultivator needs unencumbered land to borrow from land mortgage banks for his development requirements. In the case of a commercial bank, however, the entire productive needs of the cultivator (short-term and long-term) can be provided by the bank and the cultivator will not normally seek any other institution for meeting his credit requirements for approved purposes. To leave an unencumbered asset with the cultivator in such circumstances would not only be unnecessary, but would also offer needless temptation to the cultivator to resort to avoidable unproductive borrowings. In any case, the retention of security of land with the bank would ensure that such borrowings, whenever they become necessary, are resorted to with the knowledge and concurrence of the bank. While, therefore, a loan need not be denied to a person on the ground of his inability to provide land as security, where land is available, it would be legitimate for banks to seek security therein even in regard to short-term loans. In fact, this is the reason why several Co-operative Societies Acts make it obligatory on the member of a society to create a charge on his land or interest in land by means of a declaration for loans taken by him. We are recommending provisions for the creation of similar charge in favour of commercial banks".

The Group is anxious to ensure that the multi-agency approach to agricultural credit does not lead to over-financing of farmers. The real essence of the production-oriented 'crop loan system' is that the credit needs of a farmer for production purposes should be met irrespective of the value of landed security he can offer. Adequate care is taken of this principle in the Report. The Group's recommendations regarding the financing of 'oral tenants' and share-croppers—the really vulnerable and disadvantaged sections in the farm population—further reflect its concern for the observance of the basic principle of the crop loan system. The Group's suggestion, that a provision be made for the splitting up of a security between a co-operative and a commercial bank, shows its awareness of the need which may, at times, arise—where a farmer may have to approach more than one institutional credit agency. The ideal long-term objective should, of course, be for one institutional credit agency to meet all the credit requirements of a farmer. If such an ideal were ever achieved, many problems connected with 'prior charge' on security, over-financing, etc, will become redundant.

The Group has done its job. The ball is in the court of the state governments. It is up to them to move quickly in the matter.

DAMODAR VALLEY CORPORATION

5 3/4 PER CENT BONDS, 1983

OF RS. 450 LAKHS

Subscriptions will be received at the office of the State Bank of India at No. 1, Strand Road, Calcutta-1. Prospectus and application forms will be available at the above office and the office of the Chief Accounts Officer, Damodar Valley Corporation, Bhabani Bhawan, Alipore, Calcutta-27.

Issue Price	..100 per cent
Rate of Interest	..5¾ per cent per annum
Currency	..12 years
Brokerage	..6 paise per cent to Banks and recognised Brokers on allotments made in respect of applications bearing their stamps.
Underwriting Commission	..38 paise per cent to every applicant subscribing Rs. 25 lakhs or more.

Payment of interest and Repayment of the principal guaranteed by the Government of India.

Bonds will be TRUSTEE SECURITIES under the Indian Trusts Act, 1882 and APPROVED SECURITIES for the purpose of the Insurance Act, 1938 and the Banking Regulations Act, 1949.

Proceeds of the Bonds will be utilised in financing the power expansion programme during the Fourth Five-Year Plan Programme.

Subscriptions will open on 9th November, 1971 and close on 11th November, 1971, or earlier without notice on being fully subscribed.

Regional Disparity and Economic Development of Pakistan

I: The Facts

Arjun Sengupta

In the years after Independence, the Western wing of Pakistan developed much more rapidly than East Pakistan in almost all the major areas of economic activity. But if one looks into the details of the initial conditions of Pakistan's development — in terms of factor endowments, resource position or growth potential — one cannot seriously maintain that it was in the nature of things that West Pakistan would come to dominate the East or that a different set of policies could not have achieved quite a different pattern of regional development. Between 1947 and 1950, the total regional income of East Pakistan was almost certainly higher than that of West Pakistan.

One cannot, therefore, explain the subsequent growth of regional disparity in terms of initial differences in the infrastructure of the two parts of Pakistan.

This article, which studies the growth of regional disparity in Pakistan, is published in two parts. In this, the first part, the author examines available evidence on the growth of disparities between West and East Pakistan. The second part of the article, to be published next week, will present some hypotheses to explain the growth of disparity with the purpose of isolating the factors that contributed the most.

WHEN Pakistan was created in 1947, there was little in the nature of its economy which could have indicated the way its Western wing would grow to dominate its Eastern part. It was almost completely an agricultural economy, with the East as the world's largest producer of raw jute and the West a major exporter of raw cotton and between them practically self-sufficient in food. There were only 34 factories in the whole of Pakistan with a total employment of about 26,000 people. Three years after independence, West Pakistan had only three textile mills, and the East, still producing about 75 per cent of the total world output of jute, had virtually no capacity to produce any jute manufactures. There were just a few plants for sugar refining, tea processing and manufacture of cement. Virtually all the manufactures used in Pakistan were imported.

Nor was it true that natural resources or geographical conditions favoured the Western wing more than East Pakistan. Rapid growth in agriculture would have required large expenditure in any case, but the potential for East Pakistan was definitely no worse than for West Pakistan. It had a much larger area of fertile land and plenty of rainfall. To increase output and productivity, it needed investment in coastal embankments, flood control measures and low-lift pump irrigation, and the supply of fertilisers. But that would hardly have cost more than what was required in West Pakistan, given its relatively barren lands, problems of water-logging and salinity and the resulting necessity for an expensive network of irrigation canals. Indeed, a recent study has shown that even tube-wells — the one factor that is regarded as the centrepiece of the agricultural prosperity of West Pakistan — had a very substantial potential of return in East Pakistan, at a not much greater cost.[1] They probably could not have been financed by private farmers as they were in West Pakistan and the government might have had to come forward in a much bigger way. But in terms of social cost, there was nothing in the nature of the agriculture of East Pakistan that could have made its potential for growth any lower than that of West Pakistan. In fact, in a study of 1963, Mahbub ul Haq, one of the architects of economic policy under President Ayub, gave an edge to East Pakistan over the West in the agricultural field, and wrote: "If proper steps are taken, the eastern wing is destined to become the granary for the whole of Pakistan."[2]

For the potential growth in industries, both the regions were on equal footing. Both were poor in industrial raw materials and minerals. Except for raw cotton in the West and raw jute in the East that allowed a very rapid growth of the respective textiles manufactures, the availability of other agricultural materials was not so large as to permit any significant growth of modern industries. While West Pakistan had some potential for sugar, paper board and possibly edible oil, East Pakistan had the potential for leather, paper from soft wood and tea processing. Some tobacco was grown, more in the West than in the East. Mineral resources in Pakistan are not substantial, and most of them have been discovered only in recent periods. Large deposits of natural gas were discovered at Sui in West Pakistan only in 1952 and their productive use started in 1955. Subsequently, several other sites with deposits of gas and small amounts of other minerals were discovered in both the wings of Pakistan. But all these could hardly explain any comparative advantage in industrial growth for West Pakistan.

Not Due to Initial Differences

It is important to emphasise this point to dispel the widely held misconceptions about Pakistan's economic development. Over the years of the history of this country after independence, its Western wing developed much more rapidly than East Pakistan in almost all the major fields of economic activity. But if one looked into the details of the initial conditions of Pakistan's develop-

ment, in terms of factor endowments, resource position or growth potential, one could not seriously maintain that it was in the nature of things that West Pakistan should dominate the East or that a different set of policies could not have achieved quite a different pattern of regional development. Between 1947 and 1950, the total regional income of East Pakistan was almost certainly higher than that of West Pakistan. Availability of power was negligible, and the contribution of transport and communications to provincial income was somewhat larger in East Pakistan than in the West. Income generated from services was larger in West Pakistan but the number of scheduled banks in East Pakistan was 111 in 1948 as compared with 89 in the West.[3] West Pakistan had a large irrigation network that was developed over several decades in the past, but considering the vast territory of the province and conditions of the soil and the climate, they were very inadequate to push through a rapid growth in agriculture. One could not therefore explain the growth in regional disparity by initial differences in the infrastructure of the two provinces.

It was said above that in the initial years the regional income in East Pakistan was *almost certainly* higher than that in West, for it is very difficult to have a definite picture of the growth of national income of Pakistan on a regional basis. For the first time in 1964 official estimates of regional incomes were given by the CSO and that also only for the years 1959-60 to 1962-63. Khan and Bergan[4] worked on the raw data of CSO and produced two series of gross provincial product (at 1959-60 factor cost) for the two wings of Pakistan. A summary of these is given in Table 1. But there are other scholars who attempted to estimate regional incomes and their disparity. Their methods of estimation were different both in terms of definition, i e, whether they are gross or net, at factor cost or market prices, etc, and in terms of items included or excluded or how they were allocated to different provinces. But still the differences in the estimates of regional incomes in the initial period were all in the same direction. For example, Khandkar[5] found for 1950-51 that regional income of East Pakistan was 10 per cent higher than that of West Pakistan. Haq's estimates show higher regional income in East Pakistan in relation to West Pakistan from 1949-50 to 1952-53. In 1951-52, East Pakistan's income was 5 per cent higher and in 1952-53, it was 8 per cent higher than West Pakistan's. Papanek's estimates[6] were for regional GDP at market prices, and in 1949-50 the income of East Pakistan was more than 10 per cent higher than that of West. The regional incomes, according to Papanek, became just about equal in 1954-55.

Khan and Bergan's estimate, as seen in Table 1, also reveal a higher provincial product for East Pakistan than for West in 1949-50. They also show that East Pakistan's income remained higher until 1953-54. From 1954-55, the picture changed and West Pakistan's income exceeded East's for the first time that year, after which the gap continued to widen throughout the period. It will also be seen that in the value added in transport and communication, the share of the two wings was very similar. The value added in electricity, gas and water in the initial years was very small in both the provinces. Until about 1953-54, West Pakistan's edge over East in trade was very small, hardly exceeding 7 to 8 per cent.

Despite the higher regional income of East Pakistan in the initial years, the per capita income of East was lower than that of West from the beginning. This was the conclusion of all the available estimates for regional incomes. Khan and Bergan's estimates show that the per capita GPP of East Pakistan was not only lower than that of West, but was also declining more or less steadily till about 1959-60. This is also corroborated by other available estimates. The extent of disparity, defined as the excess of West Pakistan's per capita income over East's, was of course different for different estimates, since this depended on the differences in the estimates of both gross provincial product and regional population. Khan and Bergan's figures for population are close to the official. They assume equal average annual compound rates of growth of population for both the wings — 2.4 per cent for the period 1949-50 to 1959-60, and 2.6 per cent for 1959-60 to 1964-65. These figures follow the estimates of the Planning Commission which adjusted for under-enumeration of the figures of 1961 Census according to which the average rate of annual increase was 2.36 per cent for West and 1.91 per cent for East Pakistan. If West Pakistan's population actually grew at a faster rate than East Pakistan's, the per capita disparity figures, computed from Khan and Bergan, would of course be overestimates. But it should be noted that population growth rates have been used for estimating the output of some sectors, e g, fish in East Pakistan and small-scale industries and services in both the wings. So an overestimate of population would affect both the numerator and the denominator of per capita income figures.

Releasing Today

THE RAPE OF BANGLA DESH

"SORT THEM OUT" was Yahya's code message that spelt death and destruction for millions in East Bengal.

Anthony Mascarenhas saw it all. Taken on a conducted tour he was to report "the great job the army was doing".

What he saw was shattering. He smuggled himself out of Pakistan to expose to the world the devastation unleashed by Yahya's blood-thirsty terrorists.

An insider, he reveals the devious methods of Yahya and his henchmen to throttle democracy in East Bengal. The blockade of the press. The "disposal" of men. The dramatic disappearance of Mujib. The desperate, behind-the-curtain struggle for power in West Pakistan.

Read for the first time the details of the dramatic events that shaped the most startling political crime in history.

TABLE 2 : DISPARITY IN REGIONAL INCOMES

[Gross Provincial Product (in crores of rupees) and Per Capita GPP (Rs)]

	Khan and Bergan		From Bose *		Papanek **	
	East	West	East	West	East	West
1949-50	1237.4 (293)	1209.1 (342)	1205.2 (285)	1242.1 (352)	1313 (305)	1183 (330)
Disparity	1.17		1.24		1.08	
1954-55	1381.6 (290)	1410.6 (354)	1343.8 (282)	1448.2 (365)	1432 (298)	1431 (356)
Disparity	1.22		1.29		1.19	
1959-60	1497.2 (278)	1646.7 (366)	1456.8 (270)	1687.1 (375)	1559 (288)	1679 (373)
Disparity	1.32		1.39		1.29	
1963-64	1867.1 (313)	2009.0 (403)	1817.1 (304)	2059.1 (413)	1999† (327)	2379† (464)
Disparity	1.29		1.36		1.42	

Note : Disparity refers to the ratio of per capita GPP of West Pakistan over that of East Pakistan. The estimates of Khan and Bergan and of Bose are at 1959-60 factor cost. Papanek's figures are of gross domestic product at market prices, at constant 1959-60 prices.

Figures in brackets represent per capita GPP.

* Calculated from Bose's figures for East Pakistan GPP.

** Papanek uses trend data for major crops, and a partly arbitrary allocation of indirect taxes and subsidies. He mentions "these data are not reliable".

† Refers to 1964-65.

Sources : Khan and Bergan (4), Bose (8), Papanek (6).

But there are other considerations which suggest that the Khan and Bergan estimates of regional incomes understate the extent of disparity. The CSO estimates of national income provide a regional breakdown of about 97 per cent of total national income. A regional breakdown was not attempted for the remaining 3 per cent of incomes originating in banking and insurance, inter-wing communication and central government and defence activities. Khan and Bergan, working with the CSO data, extended the regional incomes series from 1949-50 to 1963-64, by allocating these incomes to the two wings on a fifty-fifty ratio. This procedure has been challenged by Anisur Rahman.[7] He suggests a regional breakdown of incomes originating in banking and insurance based on the provincial distribution of deposits and advances of scheduled banks which showed a proportion of 73:27 in favour of West Pakistan. And for incomes originating in central government and defence, he suggests an allocation of 74.6 : 25.5 on the basis of the distribution of the labour force in public administration for the year 1955. S R Bose[8] in another context provides an estimate of gross provincial product of East Pakistan by allocating to the East 37 per cent of the value added in transport and communication, 33 per cent of banking and insurance and 30 per cent of central government defence. Except for these items, for which Khan and Bergan allocate 50 per cent to East Pakistan, Bose's estimates are similar to Khan and Bergan's. The percentages used by Bose, as he mentions, "were estimated by the CSO and used by a group of experts in Transportation Survey of East Pakistan".

The second column of Table 2 has been calculated from Bose's figures for East Pakistan and Khan and Bergan's figures for the whole of Pakistan. It will be seen that these estimates considerably increase, throughout the period, the extent of disparity as measured by *the ratio of per capita gross provincial product of West Pakistan to that of East Pakistan*. This confirms our statement that Khan and Bergan figures may be regarded as underestimates of the extent of disparity.

YEARLY COMPARISONS NOT VALID

Lest one is carried away by these statistics of yearly disparity, I must add that one must not make too much of the absolute figures of gross domestic products, especially their regional breakdown. For many sectors, the estimates are based on assumptions that are subject to unknown errors, the size of which for some years may be quite large. For example, in agriculture, the estimates use a variable called "normal" yields which are based on official crop-cutting experiments of questionable reliability. In West Pakistan, a number of crop-cutting experiments based on probability sampling for wheat and cotton showed that the official figures generally underestimated the yields by 10 to 15 per cent. Official estimates also tend to overstate production in a poor crop year and understate it in a good year. Similarly, a recent CSO study showed that the CMI figures for 1959-60 of the value added in large-scale industry were underestimates to the extent of 9.5 per cent in East Pakistan and 5.8 per cent in West Pakistan.[9]

In such a situation yearly comparisons of per capita GPP may not make much sense. One can place some reliance only on the picture that emerges from the trends over a number of years, hopefully expecting that some of the large errors would be cancelled out. The end year figures of disparity as given in Table 2 upto 1959-60 give a picture that corresponds to the trends fitted to annual figures of disparity between 1949-50 and 1959-60. There is a distinct impression of widening disparity with time, especially during the First Plan period. For the Second Plan period after 1959-60, the end year figures of disparity calculated from Khan and Bergan and estimates based on Bose, as given in Table 2, would suggest that per capita disparity declined from 1959-60 to 1963-64. But the annual figures for these five years do not reveal any trend whatsoever.

Column 3 of Table 2 presents estimates of gross provincial product made by Papanek and the disparity figures calculated from them. The estimates are included for two reasons. First, Pa-

TABLE 3 : GROSS PROVINCIAL PRODUCT FOR EAST AND WEST PAKISTAN
(Estimates for 1964-65 to 1968-69 at 1959-60 Factor Cost)

	West Pakistan		East Pakistan		Disparity*
	Total (Rs crs)	Per Capita (Rs)	Total (Rs crs)	Per Capita (Rs)	
1964-65	2244.05	443	1861.75	301	1.47
1965-66	2243.15	459	1953.65	303	1.51
1966-67	2459.60	461	2053.70	315	1.46

Performance Statistics of West Pakistan, April 1969, Government of West Pakistan.

panek's attempts are theoretically much more in conformity with the index of structural change and regional development than the official estimates. Trend figures are used for major crops to reduce random fluctuations, giving typical rather than actual value-added in crop production. For manufacturing, Papanek uses the results of a survey conducted by him rather than the CMI figures, which generally give a larger value added and a larger growth rate than survey data. Furthermore Papanek's figures are in market prices, while the official estimates are at factor cost. With a rapidly increasing amount of indirect taxes accompanying the growth of industry and also agriculture, domestic product at market prices are much better indicators of the physical increase in output than GDP at factor cost. Unfortunately, given the paucity of information, in actual practice the allocation of indirect taxes and subsidies to different sectors is very difficult and subject to significant errors.

Secondly, Papanek's estimates show for the initial years, a much larger gross provincial product for East Pakistan than the official estimates. Also Papanek's figures show a widening disparity of the per capita GNP with time, not only upto 1959-60 but also during the Second Plan upto 1964-65, contrary to the estimates based on official figures. In his academic honesty, Papanek observes: "These data are not reliable. By some plausible changes in assumption, East Pakistan's domestic product can be shown to have grown more or less rapidly than West Pakistan's in the 1959-60 to 1960-65 period". In view of the fact that the official estimates are also very largely based on guesses and *ad hoc* assumptions, one cannot very easily form a judgment about the relative reliability of Papanek's estimates *vis-a-vis* the official figures. So I have presented in Table 2, Papanek's figures, side by side with the official figures.

No Estimate for Third Plan

For the Third Plan, no estimate of the regional breakdown of the gross national product of Pakistan is available. In Table 3, I have presented some estimates of gross provincial product of East and West Pakistan from secondary sources, but following as far as possible the procedures of Khan and Bergan. A West Pakistan document, published by the Planning and Development Board, Bureau of Statistics, Lahore, called Performance Statistics of West Pakistan, April 1969, gives a series of gross provincial (domestic) product of West Pakistan for the period 1964-65 to 1968-69 and of unallocable income between the two wings upto 1967-68, all at constant factor cost of 1959-60. To make it comparable with the Khan and Bergan procedures, I added the net factor incomes from abroad to the unallocable incomes, and allocated 50 per cent of that to West Pakistan. The total figure for West Pakistan for every year was deducted from the GNP figures at 1959-60 factor cost for the whole of Pakistan as given in Pakistan Economic Survey 1965-70, to get the gross provincial product for East Pakistan. For the year 1968-69, for which figures of unallocable income between the two wings is not available—mainly because of no separation between the central public administration and defence and total public administration figures—5 per cent of the total GNP for that year was taken out and 50 per cent of that was allocated to West Pakistan. (The unallocable incomes with the net factor incomes constituted about 5 per cent of the preceding few years.) For the year 1969-70, a clue was taken from the Fourth Plan document, p 535, stating that provisional estimates for 1969-70 indicate that the gross regional product of East Pakistan has increased only by 22 per cent over the base year figure for the Third Plan. This gave the figure for East Pakistan's GPP for 1969-70 over 1964-65, and West Pakistan's figures were obtained by deducting this from the overall GNP figures. The population estimates are rather rough, taken from the all-Pakistan figures from the Economic Survey and allocating 45 per cent to West Pakistan—following approximately the ratio of the last few years of Khan and Bergan estimates.

Again, one should not attach too much weight to the yearly figures of disparity. But one cannot escape the conclusion that over the years of the Third Plan there was a definite tendency for sharply widening disparity. So, even though during the Second Plan period, there was no trend in the figures for disparity—it was neither rising nor falling—during the Third Plan it was clearly increasing. This is corroborated by other estimates of the rates of growth of gross provincial product. During 1959-60 to 1964-65, the Second Plan period, the GPP of East Pakistan grew at 5.3 per cent a year (compound rate) and that of West Pakistan grew at 5.4 per cent a year.[10] But during the Third Plan, according to Pakistan Economic Survey, 1969-70, the annual average growth rate in East Pakistan was 4.1 per cent as against 6.1 per cent for West Pakistan. Assuming the same growth rate for population of the two regions, as we have done, it is clear that the disparity was widening during the Third Plan.

The measurement of disparity based on a comparison of the per capita gross provincial product at constant factor cost of the two regions—a procedure followed by Khan and Bergan and all others that we have mentioned so far—is open to another more fundamental criticism. The regional GPP's are calculated as quantities multiplied by same base year prices and generally indicate the value of money income in terms of base-year purchasing power of money. But if one rupee in East Pakistan had a purchasing power in the base period different from that in West Pakistan, the ratio of per capita GPP at constant prices of the two regions could not reflect the disparity in terms of per capita real income. Anisur Rahman makes this point forcefully.[11] He quotes from the Second Five-Year Plan (p 59): "Prices of similar goods have generally been higher in East Pakistan than in West Pakistan, the difference sometimes far exceeding the cost of transport and distribution." An examination of the data would reveal that price differences widened during the Second Plan period and the subsequent years, which means that if the base year was chosen from a more recent period, the differences in the purchasing power of money between the two regions would be greater. In such a situation the disparity in the per capita constant price GPP would definitely understate the disparity in real income.

The problem is to find an index which would show the regional income of East Pakistan when the value added in different sectors are calculated at West Pakistan's prices relative to the regional income of West Pakistan calculated at West Pakistan's prices. It is almost certain that this index would have been much lower and hence our measure of disparity (*i e*, per capita GPP of West Pakistan/per capita GPP of East Pakistan) is much higher than what is indicated by the constant price per capita gross provincial product. Unless one does the full exercise, one cannot really say anything more precise or quantitative than this. But it may be of some interest to note the exercise done by Mahbub ul Haq. He finds that in East Pakistan both rice and wheat were very much more expensive than in West Pakistan, and that in West Pakistan rice was more costly than wheat. He then claims that one ton of rice has the same nutritional value as one ton of wheat, and so they should be treated as similar goods. (Incidentally, that rice and wheat should be treated as the same commodity has been pleaded also by Papanek and Anisur Rahman.) He then values East Pakistan's total rice production at the price of wheat in West Pakistan, and also adjusts the value of rice production in West Pakistan by the same price of wheat. This lowers East Pakistan's regional income very substantially, but West Pakistan's income rather marginally. As a result he finds that in 1959-60, the estimate of disparity becomes double the figure obtained from constant price per capita incomes.

Similar exercise can be done easily for other years also as regional estimates of average prices of rice and wheat are available. The price of rice in East Pakistan is generally double the price of wheat in West Pakistan, and since this commodity has a very large weight in East Pakistan's total income, these exercises would definitely show a drastic fall in East Pakistan's regional incomes. No such attempt is made here as it is not quite legitimate, and it is not even an approximate substitute for the full exercise mentioned above.

TABLE 4 : PER CAPITA CONSUMPTION OF SOME COMMODITIES
(per year, in lbs)

	1969-70		1959-60		1951-52	
	East Pakistan	West Pakistan	East Pakistan	West Pakistan	East Pakistan	West Pakistan
(1) Wheat	33.10	231.63	9.1	221.8	2.3	225.8
(2) Rice	334.70	53.93	365.0	38.8	335.3	31.9
(3) Pulses (excluding gram)	6.68	8.08	6.8	4.5	11.4	4.5
(4) Fats and oils	6.44	13.99	—	—	—	—
(5) Milk	21.04	228.12	—	—	—	—
(6) Meat	6.00	7.97	—	—	—	—
(7) Fish	24.60	4.49	9.3	3.5	3.9	2.4
(8) Vegetables	80.75	77.78	—	—	—	—
(9) Refined sugar	5.60	15.89	2.6	6.5	2.7	8.0
(10) Tea	0.23	0.92	0.1	1.0	0.1	0.5
(11) Cotton cloth (yds)	10.86	13.22	3.0	9.0	1.7	1.4

Higher Cereal Consumption

There was another consequence of the high price of rice in East Pakistan that should be noted. The cereal food of East Pakistan has always been mostly rice. In 1951-52 per capita consumption of rice was about 14.7 ounces a day while that of wheat was 0.1 ounce and of other cereals, mainly gram, another 0.1 ounce a day. In 1959-60, which was a very good crop year, per capita availability of rice went up to 16 oz a day, and of wheat to 0.4 oz. Ten years later, in 1969-70, by the time wheat consumption became fairly widespread, per capita consumption of rice was still about 14.6 oz a day with wheat consumption about 1.4 oz a day. In West Pakistan, on the other hand, although wheat was the main cereal, its per capita consumption hovered around 9.5 to 10.5 oz a day and per capita consumption of rice increased steadily from 0.4 oz a day in 1951-52 to 1.4 oz in 1959-60 to about 2.4 oz in 1969-70. These cereals were supplemented substantially by other items like jowar, bajra, maize, barley and gram. In general, per capita consumption of all cereals was almost stable in both the regions throughout the period but was generally higher in East than in West Pakistan. The result was an overwhelming portion of East Pakistan's per capita income which was substantially lower than that of West Pakistan, was absorbed in the consumption of cereals which were again relatively more expensive in East than in West. It was natural that per capita absorption of other consumer items would be much smaller in East Pakistan compared to that in West Pakistan. This feature was present throughout the period after independence; and in 1969-70, when per capita income at constant prices was much higher than in 1951-52, per capita consumption in East Pakistan of milk was less than a tenth of that in West, of fats and oils less than a half, of refined sugar about a third, often about a fourth, and of meat about 30 per cent of the per capita consumption in West. In 1951-52, per capita consumption of cloth was slightly higher in East than in West. But in 1969-70 per capita consumption of cotton cloth in East Pakistan was only 10.86 yards compared to 13.22 yards in West Pakistan[12] (see Table 4).

Pledged to serve people engaged in all vital sectors of the economy

DENA BANK

gives high priority to helping small industries progress and prosper

DENA BANK is an active partner in the development of the vital sector of Small-scale Industries. Through its large network of branches DENA BANK is giving financial assistance to a large number of enterprising entrepreneurs, thereby helping them to produce more goods,to employ more people and to accelerate the pace of our country's all-round progress.

Please visit the nearest DENA BANK Branch and enquire how DENA BANK's Small-scale Industries Finance Scheme can help you also.

The Police in India

David H Bayley

In September this year, for the first time since Independence, the National Commission on the Police was set up. While police commissions were appointed in most states in the sixties and they did fairly exhaustive studies of the situation in the states, there was no integrated all-India survey of the functioning of the police.

The point is that, though the existing police system functions reasonably well within the terms of its operations, its achievements are less than adequate for the requirements of a vital democracy. It is not enough for the police to enforce law and order after an outbreak of violence. They must have a living contact with the people whose trust they must earn.

What historical, organisational, and conceptual factors have prevented the police from shaping up for this task? This article outlines the general background of conditions in which, and goals towards which, the police in India have been functioning to date.

A SIGNIFICANT but generally unnoticed announcement was made by the Government of India in September. For the first time since Independence, and for only the third time in the history of India, a national commission has been created to study the functioning of the police. During the 1960s, police commissions were appointed in most states. Their reports have been completed, though they have not been widely publicised, and a few have yet to be released in full to the public. The national commission is the capstone to almost a decade of serious and penetrating examination of police problems.

India is by no means the only nation that feels compelled to re-examine its police arrangements. Nor is it the only nation that has recently experienced a growing incidence of public disorder and indiscipline. The need to secure order and to enhance civility has been felt worldwide. This is one area where the imprecise distinctions between rich and poor nations, modern and traditional societies, and developed and underdeveloped countries, have no application. Indeed, considering the disarray among the police in many Western countries, such as the United States, the customary direction of technical assistance and advice might well be reversed.

The purpose of this article is to determine what problems confront the Indian police and what features most need to be improved. It should be clearly understood that, though the police has its defects, as any active force has, it nevertheless has much to commend it. For example, the structure of the national system has been intelligently devised—allowing for state direction while avoiding paralysing fragmentation and providing all-India legal codes and standards without entailing monolithic centralisation. The Indian Police Service is composed of able, carefully selected, well trained, and dedicated men. The police have played a neutral role in partisan politics; they have never sought to take political initiative into their own hands. Police operations are by and large accountable to law and to the institutions of representative democracy. Finally, considering the persistence and seriousness of social violence since Independence, the police have demonstrated remarkable tact, restraint, and imagination in coping with crowds and civil disorder. For these and other reasons, India may be justly proud of its police service.

Appraisals of the police are frequently crippled by adopting, at the outset, a too narrow and limiting perspective. Police officers, civil servants, and lay consultants, are often preoccupied with day-to-day problems of police work. Their frustrations are immediate; so their advice and testimony are mundane, focusing on matters of routine and practice. Police reforms, however, should not be considered simply as a technical problem of improving the performance in containing crime or securing law and order. Though the police do have a specific, unique, and critically important function, they play a much larger social role which must not be lost sight of. The police are not just one agency of government among many; they are its most common and awesome representative. The police are ubiquitous, powerful, and intrude on human lives at moments of enormous emotional importance. They are also the most visible agents of the rule of law. Consequently, if public attitudes to law and government are important to a nation, then an appraisal of the police role must take into account the impact upon larger political structures. Furthermore, the effectiveness of the police in curbing criminal activity—their specific charge—is determined largely by their relations with the surrounding society. A police force both shapes, and is shaped by, the society it serves. Police organisations must not be looked upon as interchangeable parts in a social machine; they are part of a society's very character. In order to understand fully what a police force is, and what it can become, it must be examined in its social role—both how it impacts society and how society affects it.

A Colonial Police

The most surprising feature of the contemporary Indian police is that its activity remains so largely colonial in mould. Reference, here, is not to overall organisation of the police, which was largely established by the Police Act of 1861. Of greater importance is the persistence of behaviour patterns and philosophy. The primary function of the police continues to be containment of trouble once it occurs—whether it be mob violence or individual criminal activity. It reacts to threats to law and to government, but it does not actively seek to serve the peculiar security needs of individual citizens. From the citizen's point of view, the police are largely a passive force, difficult to energise, bureaucratic in working, impersonal and offhanded in operations. The national commission might examine whether the followmg hypothesis is true: the majority of contacts between individual policemen and citizens involve the actual or implied enforcement of law; very little time is devoted by policemen to non-enforcement mediation, when criminal sanctions are not involved, or in responding to calls for general assistance. The explanation for this situation is the same as it was under the British. The Indian police continue to be shaped primarily by the requirements of

public order; the overriding preoccupation of officials responsible for the police is with threats to law and order. Let us examine the evidence in support of this diagnosis.

First, there are, by conservative estimate, about 600,000 policemen in India today. Of the total, at least half and possibly three-fifths belong to the armed police. It is difficult to be precise, because government has not released statistics on police strength for almost a decade. It is safe to assume, however, that over half the total number of policemen are not engaged in station-house duty, investigation of crime, street patrolling, traffic regulation, or responding to the needs of individuals. They live in cantonments, train to function in groups, handle firearms, and are seen by the public exclusively as armed guards or in crowd-control duty. Counting armed and unarmed policemen together, there is probably about one policeman for every 800 persons; excluding the armed police, there is approximately one policeman for every 1,600 people. The proportion of armed policemen to the total is growing, and will continue to grow in the near future.

Police are chronically a 'non-Plan' department; they will find money increasingly scarce, except perhaps in states like West Bengal. What little new resources are available will be used to build up police formations capable of directly coping with public disorder. The armed policemen, stationed at Calcutta street corners, are harbingers of the times. Moreover, the functional division between armed and unarmed police is likely to become even more rigid. Police officers fear that unarmed police will be stigmatised if they are used for riot duty. To safeguard their reputation, it is therefore considered more prudent to import armed police—outsiders, as it were—if violence has to be employed against crowds. Thus it is most unlikely that emphasis in the near future will be put on unarmed, as opposed to armed, police.

The point is that the law and order problem is real. It is a threat that government can *ignore only at its* peril and at enormous cost in suffering to its people. The point here is not that law and order is not a significant issue, but simply that, as in British times, it is an enormous constraint on the structure and behaviour of the police. It will also act as an enormous constraint on the ability of the new police commission to recommend significant reforms: conscious of peril and knowing the police to be hard-pressed, the commission may feel compelled not to burden it with disorienting innovation.

Secondly, rural India is terribly under-policed. This is a function of deployment, not of shortage in total numbers of men. In the cities, there is about one unarmed policeman for every 600 people—a figure that compares favourably with large cities around the world. In the countryside, the figure is one for every 1,800 people. There is greater disparity between rural and urban areas with respect to police per unit of population in India than, for example, in Great Britain or in the United States. India neglects its non-urban population. It may be argued, of course, that there is much less crime in rural areas, therefore there is less need for police there. This is certainly what official crime statistics indicate, but the conclusion drawn is false. Crime statistics are an artifact—i e, they reflect as much about the organisation collecting them as they do about the real world. Crime statistics show what comes to the official attention of the police. Consequently, the more policemen the more crime, and this has nothing to do with the honesty of policemen. The police commission could make a great contribution by studying the true incidence of crime in rural areas. In this way, deployment of police could be effected without relying on specious arguments from official statistics.

Contrary to what one might think, there is enormous latent demand for police in rural areas. A public opinion survey conducted in 1965-66 showed that 79 per cent of rural people interviewed would prefer to have a regular police officer stationed in the village than the local chowkidar.[1] Attempts to transfer police stations from one village to another invariably raise protests from people living near the existing station. Considering the low opinion so many people have of the police, these expressions indicate a serious need for enhanced protection and service.

Thirdly, opinion surveys bear out what people generally suspect about public regard for the police: police are not perceived as responsive, sympathetic, and trusted servants of the people.[2] People generally hesitate to approach the police; they do so only when their need is acute or contact unavoidable. And the police of independent India do not appear to have significantly transformed the public's suspicion. The view of a former police commission is probably as true today as it was in 1903: the police ". . is generally regarded as corrupt and oppressive; and it has utterly failed to secure the confidence and cordial co-operation of the people".[3]

All in all, since 1947, government has not seized the opportunity to create an effective, responsible, citizen-serving police force, covering the length and breadth of the country. It has focused pre-eminently on the containment of group-violence, and it has done so in those parts of the country where such violence is most visible and possibly most unsettling, *viz*, in large towns and cities. By default, rather than design it has neglected important sections of the populace and has failed to demonstrate that police protection and assistance can be obtained speedily and willingly through the initiative of individual citizens. This is not to suggest that policemen should do 'social service' work. Such activity would detract even further from performance. It means that the police should minister much more to the security needs of individuals. Physically they must be available close at hand and psychologically they must be primed to respond resourcefully to such requests. They must be attuned to out-reaching preventive action rather than be waiting passively for crime to occur. In short, policemen have failed to become as sensitised to requests for service from below as they have been to commands from above.

As for the influence of the police on attitudes to government and law, their effect has not been wholly negative. At the same time, it has not been very supportive. The police represent an opportunity, which is going unexploited, for developing a higher level of citizen-regard for government, its institutions, procedures, personnel, and the rule of law within which it works.

A Proposal

The size of the armed police should be reduced by shifting manpower to the unarmed constabulary. Prevention should play a larger role relative to containment. In this way, a more pervasive police presence could be created, especially in rural areas. Patrolling could be more active and solicitation of the needs of citizens less episodic. At the same time, alternative methods of meeting the requirements of law and order should be explored. Characteristically, with arguments involving security, precise measures of the magnitude or imminence of threats cannot be constructed. Dispositions are, therefore, made by reference to the worst possible situation. Understandable anxiety, especially among district officers, produces cautiousness in making dispositions and this undermines attempts to use manpower in less passive ways.

There may be one way in which weight can be shifted from armed to unarmed police formations without jeopardising public order. The traditional separation between police for armed riot duty and police for unarmed non-riot duty should be reconsidered. Training can be given to unarmed policemen, whose numbers will be expanded, in the use of weapons and in the tactics of riot work. A much reduced district armed police, or a reserve force consolidated for several districts, could provide an immediate striking force in the event of unforeseen disturbances. If trouble escalates, or if there is warning of greater impending trouble, unarmed policemen can then be collected from their normal posts and assigned to armed police formations. In this way, manpower does not stand idle awaiting public disorders. This proposal will require improved communications and transport. The benefits customarily attributed to separating unarmed from armed police, in terms of effects on public opinion, are overstressed. As surveys have shown, all police are generally regarded as faceless; most people do not recognise policemen as individuals.[4] This is especially true in riot duty, where ranked uniforms obscure individual personalities. Considering the already low reputation of the police, it is doubtful whether armed crowd-control duty would significantly reduce the utility of the unarmed police assigned to it. Surveys also show that, of people who have experienced police crowd-control work—firings and lathi-charges—, as great a proportion approved the police action, finding it justified and restrained, as were critical of it.[5] Beyond doubt, there is great merit in not arming policemen who do routine patrolling and station-house work. The example of the British police is compelling. But there is no equally compelling reason why unarmed policemen should never take up arms and do riot work.

The advantage of this proposal is that a vast reservoir of manpower can be tapped to provide an effective police presence throughout the country in non-emergency times. Such a shift cannot occur overnight; many of the armed police, even when retrained, will not be suited for more intimate police work. But, over several years, police manpower could be shifted from the cantonment to the station-house without deterioration in control of public violence. It is quite likely, moreover, that a pervasive police force attuned to prevention could stifle at birth many of the incidents that lead to riot and disorder.

The feasibility of this proposal ought to be tested in the field. This could be done by means of controlled experiments in the new deployment in selected districts. Proposals for reform of administration are often accepted or rejected *en toto* on the basis of *a priori* argument alone. The Indian police establishment is sufficiently large and the country sufficiently spacious, so that proposals of many sorts could be tested in the field without diminishing the efficiency of the whole. The police commission might consider establishing a central unit to encourage, monitor, and financially support experiments within the states with regard to alternative police arrangements and practices.

The way to win the respect of the population for the police is to utilise manpower so it can be genuinely responsive to individual needs. Crime prevention and public co-operation are won by deeds, not by exhortation and special events tacked onto already demanding workloads.

Start at the Bottom

Any significant attempt at reform of the police must begin with the men at the bottom, not at the top. The quality of police performance can improve only if the constabulary is changed. Moreover, the quality of police work is hampered far more by deficiencies in human performance than by legal impediments. Neither legal tinkering nor adjustments in leadership can offset the defects on the job of the personnel at the bottom of the police hierarchy. The gravest problems of police practice can only be solved by reshaping the Indian constable.

What is the evidence to support this assertion?

Firstly, approximately 93 per cent of the entire manpower of the police is composed of constables and head constables. These men are ill-educated, poorly trained, and miserably paid. They have been given little authority. They display little initiative, looking to superior officers for direction. The disparity in human quality and hence in performance is enormous between the men at the top and the men at the bottom of the police establishment. In this, the police reflect the gaping inequalities of Indian society generally. By contrast, the police of Britain or the United States are not nearly so well led; it is rare to find officers in these countries with college degrees, let alone the sophistication of Indian officers. On the other hand, the constables or patrolmen are vastly superior to Indian constables or patrolmen. They are given all the power and responsibility possessed under law by any police officer. Promotion in the United States and Britain does not endow an officer with greater police power; it simply raises his pay and gives him new jobs — usually administrative ones. In India, initiative and responsibility are concentrated in a very narrow segment of the police establishment; the bulk of the force, accounting for most of the contact with the public, is not permitted to display these qualities, precisely because it does not possess them. The Indian police systematically puts its worst foot forward.

Secondly, wage rates are so low for constables and head constables that corruption is virtually assured. A police constable's wage is equivalent to the lowest salary for the most unskilled central employee. The peon who opens the door or carries messages in government offices in New Delhi makes more than the constable patrolling the street in Patna. Though wage rates differ among states, they are generally not high enough to permit a constable to eat what is required for a person doing even light or sedentary work.[6] A constable cannot perform adequately and support his family even minimally on the wage he is paid. Coupling modest authority with poverty wages in an invitation to venality. Over nine-tenths of all policemen are in exactly this position.

Thirdly, and as most state police commissions found, the level of criminal investigation leaves much to be desired; this opinion is prevalent even in official police quarters. At the same time, rates of conviction and arrest in India relative to known crimes compare favourably with most countries. Officers have forthrightly testified in several forums that investigation malpractices are common, delays substantial, and supervision inadequate. Instances have been reported of constables and head constables undertaking criminal investigations — a practice which is contrary to law.[7] Many of the state police commissions have concluded that case-loads are much too

high for officers of investigating rank. If this is true — and it is a point the police commission should check — it would again argue that too much manpower is being concentrated at non-decision-making levels.

Fourthly, police officers complain frequently about the suspicion with which the judiciary views them. It is certainly true that courts have been strict. Police activities, especially criminal investigations, are hedged in with a bewildering array of rules. Police officers chafe under this burden, not only because it demeans their self-image, but because it complicates and slows down their work. They testify eloquently that these constraints should be loosened. Why, they ask, should two independent witnesses from the neighbourhood be required when searches are made? Why cannot confessions voluntarily given before an officer of IPS rank be made admissible in court? Why is such enormous weight attached to 'first information reports' that they become the heart of many cases and the bane of every investigating officer's existence?

Police and judiciary are caught in a reinforcing cycle of suspicion and recrimination. Judicial distrust, rendered into rules and laws, makes convictions more difficult for the police to obtain; the police become frustrated and, since they are judged to some extent by their record of 'convictions obtained', are tempted to 'cook' evidence; the judiciary, faced anew with evidence of malpractice, finds its suspicions reinforced and looks with an even more jaundiced eye at police evidence. To break this cycle, there needs to be improvement in the men who do the mundane work of criminal investigations. The remedy for distrust between police and judiciary is not repeal of these offending rules. Such rules can, and will, be repealed only when the quality of police work has so improved that such rules become superfluous. Once again, reform must come from the bottom up — rather than from the top down. An expanded corps of investigating officers, more highly trained, perhaps better paid, and abolition of their obtruding subordinates, the police constable, is the first and necessary step.

Fifthly, impressionistic as well as survey evidence indicates that the public believes that favouritism and political influence play a large role in determining how the police act. Granting this is true — and many state police commissions concluded it was — the problem is unlikely to be met by stricter rules administered through a thinly-spread officer corps. Superior police officers are in relation to their subordinates what the judiciary is in relation to all the police. They suspect them of wrongdoing and rely primarily on formal rules to curb it. The result among the lower ranks is frustration on a myriad niggling rules and a sense of being inevitably in the wrong. The existing system, of exhortation and surveillance from the top, has not been particularly successful. This suggests that improvement must come from within the lower ranks, not from without. The capacity, and the willingness, of lower ranks to resist appeals for special treatment can be created only by generating an *esprit de corps* among these men. This requires raising the professional quality of this stratum and making it respectable in its own eyes.

A Proposal

The 'police peon' should be abolished. Supernumerary ranks of constable and head constable should be exchanged for an expanded cadre of inspectors, sub-inspectors, and assistant sub-inspectors. The lowest ranks of the police should be capable for the first time of being given and taking independent initiative and discharging all the essential duties of the policeman. The lowest ranking policeman must be allowed to do work which he can be proud of and must be supported at a standard of life sufficient for his needs. Autonomous in authority, proud in ability, sufficient in income, he could then begin to break the traditional suspicion that has tarnished police relations with the public, judiciary, politicians, and even superior police officers. Implementation of this proposal would cause a decline in the total number of police bodies. Constables would be traded for a smaller number of more qualified men. The gain in goodwill, efficiency, and respect would be more than recompensed. In this way, policemen would begin to appear capable and worthy of discharging their obligations.

Conclusion

Two broad conclusions emerge from this analysis of the contemporary Indian police: firstly, less emphasis should be placed on containment and the maintenance of passive forces, and more emphasis should be given to creation of a police presence which is pervasive and preventive; secondly, the most serious and chronic problems of the police can be traced to the status and failings of the lowest ranks. If these conclusions are correct, two fundamental reforms are called for. First, armed police should be exchanged for unarmed police, thereby making available a greater number of unarmed police for patrolling and station-house work. Secondly, a greater measure of functional egalitarianism should be created among police ranks by raising the lowest level of police personnel in responsibilities, pay, and respect. This can be accomplished by abolishing the post of constable and head constable and devoting the resources freed to increased recruitment at higher ranks. The effect of both these reforms will be to reduce the total number of police. However, the range of effective police coverage will not be sacrificed but should improve because a larger number of unarmed policemen will have substantial decision-making capabilities.

Furthermore, the national police commission should not be content with scrutinising technical and administrative problems related narrowly to crime and the maintenance of order. The work done by the state police commission has generally been well done, but the national commission should be prepared to supplement these studies when it finds that data needed for its deliberations are not available. The commission should also encourage experimentation on a limited scale with promising innovations, so that their merits can be decided in the future on the basis of hard facts.

Evidence of paternalism and the posture of reacting to specified problems rather than assuming initiative to prevent novel ones are found in many places. The transformation of a sharply non-egalitarian administrative structure, by raising the bottom manpower levels, thus requires struggling against the nature of Indian society itself. The fact is that the police fit so well a society based upon elaborate status differentials, on the one hand, and a colossal labour surplus, on the other. Creation of a new police will be uphill work against a resistant environment. If it is any consolation, the same was true a century and a half ago when Robert Peel created the now-renowned 'Bobby'. Significant reform will be even more difficult to achieve at a time when conditions of law and order appear to be deteriorating. It will be easy to find excuses for doing what is familiar.

The existing system functions reasonably well. This is true enough, but the achievement is less impressive when measured against what a vital democracy requires. The police exert enormous influence upon a people, especially as in India, where so many are young and learning to accommodate themselves to the institutions of a more egalitarian democracy founded on the rule of law. The police can protect these institutions and aspirations not only by arresting criminals but by what they choose to do and not to do in daily life, by the manner they adopt and by the example they constitute as an organisation in society. There are few countries that have attended adequately to the social and political dimensions of enforcing the law. India has an opportunity to show the way.

Capitalist Development in Agriculture

Reply

Ashok Rudra

UTSA Patnaik in her article "Capitalist Development in Agriculture" (September 25, 1971, pp A-123-A-130) has made plenty of references to me. I suppose I have to thank her for the attention she has given to the study jointly made by A Majid, B D Talib and myself of large-scale farming in Punjab, even though the epithets she uses very freely and abundantly are far from flattering: "unhistorical and incorrect method of analysis", "idiosyncratic way", "formulation of the statistical problem ... quite incorrect", "methodological mistake", "superficial and incorrect", "some understanding of the post-colonial agrarian structure is absolutely essential", "very poor Marxist", etc, etc. As a corollary, in her positive assertions about what is methodologically correct, historically correct, statistically correct, etc, she does not suffer from any hesitations or doubts at all. It is indeed refreshing to come across so much self-assurance; whether so much self-assurance is better than having any doubts is another matter. One should be grateful for being taken so seriously as to be pointed out so many errors. After all, it is possible that Utsa Patnaik is right. But then it is also possible that she is wrong!

Utsa Patnaik does not stop at just pointing out all my superficialities, errors and gross ignorance; she proceeds further and gives me plenty of directions as to how to improve my work: "it would be useful if Rudra could retabulate his data ..."; "if Rudra could give us the results of carrying out this exercise" —referring to a certain exercise she recommends; "Rudra should be careful not to confuse ...", etc. As Utsa Patnaik feels so free in using the verb "should" in connection with me, may I be permitted to tell her that while she has every right to criticise my work and call it wrong and superficial and what not, such directions as how to tabulate or retabulate data or such advice as to whether the mean or the median is a better statistical average she might with advantage reserve for any students she might have working under her? Pearls of wisdom, after all, should not be thrown at poor statisticians and poorer Marxists!

Utsa Patnaik has made so many criticisms that it is neither possible nor necessary to reply to all of them. Let us look at the most important one. She finds it unhistorical, incorrect and idiosyncratic that I should have tried to find positive associations between a number of variables each of which I expected to take high values for capitalist farmers. The fact that most of the variables taken in pairs fail to reveal strong positive association indicate that there has not yet been among the farmers of Punjab any strong *polarisation* and I have expressed doubt whether it serves any important purpose to talk about capitalist development before polarisation has reached a sufficiently high degree. In the long classroom lecture which Utsa Patnaik has given about the slow process of capitalist development she ends up with the observation that a "simple and basic fact which Rudra ignores" is that there will not be overnight transformation of non-capitalist farmers into a readily identifiable group of pure capitalists". Even Rudra will agree to this quite unexceptionable proposition. The point that I emphasised was that it does not help much to talk as if such a readily identifiable group has already made its appearance when it has not.

I find that Utsa Patnaik does not find much fault with the variables I have chosen to study. In a situation of capitalist development one should expect to find a polarisation developing such that not only would the values of the variables tend to increase among the farmers undergoing the transformation but increase *conjointly*. As long as such conjoint movement has not taken place to a considerable extent — that is, as long as there is no polarisation — we cannot say that capitalist development has taken place. I would say that the changes that have taken place are largely of a quantitative order, within the framework of the production relations and class structure as has been existing from before. The emergence of a new class would imply that the transformation of *quantity into quality* has taken place. I would suggest that such a transformation has yet to take place.

Let us now look at the statistical criteria Utsa Patnaik suggests after disposing of mine as "idiosyncratic". The criterion for being a "pure capitalist" is to have higher than average value ("either the mean or the median, preferably the latter"!) for each of my five variables and another two variables she suggests. Now whenever there are two or more observations on a variable, there is an average and there are some observations above and some below the average. The above criterion will have it that whenever a farmer has a more than average value for any one of the variables, he is a bit of a capitalist farmer; and he is a pure capitalist farmer when he has got more than average value for each of the variables. Let us go to a village consisting of all very small farmers, say an Adivasi village. For each of the variables concerned there will be some average and there will be some above the average. All these farmers should be regarded as capitalists of a certain degree, whatever be the absolute value of these variables, however low the averages and, therefore, however low the observations falling above the average. The richest peasant in the village might conceivably have higher than average value for each of these observations. He must then be treated as a pure capitalist farmer. What meaning idiosyncrasy!

Let us now proceed to Utsa Patnaik's reaction to my talk of discontinuities in connection with the question, how to demarcate rich, middle and poor peasants. I am afraid, she will discover to her

horror that while talking of the correct Marxist definition of these classes she has been talking of nothing but discontinuities, just as Moliere's bourgeois *gentilhomme* discovered to his great elation that all his life he has been speaking "prose". Thus, let X be the size of farm and Y the proportion of hired labour to family labour employed in farming. Then the Marxian's definition suggests a discontinuous fuction $y = f(x)$ such that for $x < x_1$, y is positive, for $x > x_2$ y is negative and for $x_2 \leqslant x \leqslant x_1$, y is 0. The function has got two discontinuities, one at x_1 and the other at x_2. If, on the other hand, there are no discontinuities, then f(x) would intersect the x axis at some point, say x_0. In that case there would not be a class of middle peasants. It is of course true that if one takes actual observations, one will obtain a scatter and no function, other continuous or discontinuous, will fit the data.

With such observations how to decide from what point onwards to consider peasants as rich peasants, especially as it will be found that in most size groups (however one measures size) some peasants hire in labour, some hire out and and some do both? To answer this question one will have to set oneself the statistical problem: given observations on y and x, what are the best estimates of the points of discontinuity x_1 and x_2, assuming now that there are two such points such that $Ef(x) > 0$ for $x > x_1$, $Ef(x) < 0$ for $x < x_2$ and $Ef(x) = 0$ for $x_2 \leqslant x \leqslant x_1$? I have, however, not talked of the particular variable — proportion of hired labour employed to family labour. Instead, I have talked of there being discontinuities in all the important variables relating to farm economies. The justification is this. If indeed there are three classes among peasants, then there must be certain qualitative differences between farms belonging to the three classes. As soon as one talks of classes based on size (however one defines size) as one does in Marxian literature one implies that this size variable x, while changing in quantity terms gives rise to quality difference, once at x_1 and once again at x_2. If therefore z be any variable relating to farm economies one should expect a qualitative difference in z's relation with x in the three classes, that is, for $x < x_2$, $x > x_1$ and $x_2 \leqslant x \leqslant x_1$. That is the same thing as saying that z regarded as a function of x has got discontinuities at x_1 and x_2. If indeed the variables dependent on x did not have any discontinuities at the same points x_1 and x_2 then it would not be analytically useful to talk of three classes. It goes without saying that classes cannot be demarcated with razor's edge precision at mathematical points x_1 and x_2; in general there will be one zone around x_1 and another around x_2. But the essential point is of the variables y, z, . . etc, being discontinuous if not at the same point as x_1 and x_2, at about the same points.

I suggest that the concept of discontinuities is the direct translation of the Marxian concept of "quantities into qualities". Marxism claims to be a science; if so, its adherents ought not to remain content by merely repeating the very letters of Marx, Engels and Lenin. If one has to undertake measurements and test hypotheses arising from Marxian analyses, one will have to undertake such translations as I have done. And for me, the Marxian concept of three classes in agriculture remains a hypothesis to be tested. If in actual statistical analysis one fails to discover discontinuities one will have to give up the idea that there indeed are three classes. (Utsa Patnaik will also have to do so, for if there are no discontinuities it would mean there are no middle peasants.) I would not accept any hypothesis, even if it were propounded by Marx or Lenin, unless it passes the test of empirical verification.

After defending my positions, I may now turn to some of the statistical propositions of Utsa Patnaik. I find it very curious the way she talks about "scale effects". What does she mean when she says "more capitalist scale of operation"? She argues that "the effect of aggregation on the basis of size is to blur the scale effects(?)" and that "much better indicators of scale of operations than size, are (a) the value of capital stock, and (b) the annual value of output". Whatever be the scale of operation, it is difficult to understand how if grouping by size blurs something, grouping by annual value of output will not. Grouping by size is bad she says, because one will lump together an 8 acre farm which is run on intensely capitalistic lines with another farm of 8 acres that is run on traditional lines. How is the problem of such lumping together avoided when one takes annual value of output? In that scheme of classification will one not lump together a farm that had an annual output of Rs 50,000 out of a cultivated gross acreage of 11 acres with another farm that also had annual output of Rs 50,000 but out of a gross acreage of say 53 acres?

Utsa Patnaik also advises me to go in for calculating the rate of profit on capital advanced and the rate of surplus value appropriated and quotes her own results. She is indeed a brave statistician. I wonder how she satisfied herself on the following points:

(a) How does she calculate surplus value created by wage labour considering that where there is inevitably a large proportion of family labour going into production side by side with wage labour? How could the ratio of surplus value be a measure of the exploitation of workers, considering that the value is not all produced by wage labour?

(b) How does she calculate profit, given that, as is well known, much of outputs and inputs are non-monetised? (I did not calculate profit but dealt only with the "monetised part of profit" and therefore did not take the trouble of taking its ratio to either working capital or to fixed capital.)

(c) What is the justification for thinking that the rate of profit on working capital is a good index for comparing the relative profitability of two lines of investment? What about fixed capital? Of course, the expedient of forgetting fixed capital is taken recourse to in much of model making just because it makes life simpler. If one is working with algebra, taking profit as a constant proportion of turnover or a constant fraction of turnover (implying the same turnover period in all sectors) yields nice and convenient simultaneous equations. If one is trying to quantify, forgetting fixed capital does away with the problem of measuring fixed capital, all the more difficult in Indian agriculture where much of fixed capital is formed by direct application of non-monetised labour to land improvement.

Photo Copying Machine

A HIGHLY economical electrostatic photo copying machine will be introduced in the market by Advani-Oerlikon. The company has already manufactured 20 such machines. The process for these machines was invented by the National Physical Laboratory and was licensed to the company by the National Research Development Corporation. The process does not involve use of any wet chemicals, being a direct positive-to-positive reproduction of any written or printed material on any type of paper or any other material having a reasonably smooth surface. Finished permanent prints in any of the four colours — black, blue, green and red — up to fullscape size can be obtained in about a minute's time.

Time for Cool

THE Prime Minister is about to complete her three-week tour of six Western countries. Whatever might have been the calculations when the tour was planned, as it has turned out, the developments in East Bengal, the exodus of refugees into India and the mounting military tension between India and Pakistan have come to be at the centre of the Prime Minister's talks with the leaders of the countries on her itinerary. It is difficult to say, on the basis of newspaper reports, what has been achieved by these talks. The Prime Minister is expected to give her own assessment to Parliament early in the winter session. Broadly, it might seem that, with one conspicuous exception, all the countries visited by her agree to a lesser or greater extent that, first, a political solution has to be sought for the situation in East Bengal; second, such a solution should come about through negotiations between the West Pakistan authorities and the leaders of the 'democratically elected representatives of the people' of East Bengal; third, military suppression of the East Bengalis by the Pakistan Government should end; fourth, arms supplies to the Pakistan Government would be suspended; and, fifth, the exodus of refugees into India has cast a heavy burden on India which needs to be shared by the international community.

The one conspicuous exception is, of course, the United States. On the face of it, the differences between the Indian Prime Minister and President Nixon might appear to have been not so much on the basic issues as on the immediate measures to be taken to reduce tension between India and Pakistan. President Nixon reportedly stuck to the US position that India should agree to a mutual withdrawal of troops and to the stationing of international observers on both sides of the Indo-Pak border. However, what this means by implication is that the US sees the developments in East Bengal as primarily, or at any rate substantially, as an issue between India and Pakistan, the resolution of which calls for equal and matching action from both sides. More basically, the US approach to the Indian subcontinent continues to be dominated by the urge to prevent the break-up of Pakistan and the consequent accretion of strength to India. But in this is the US position so different from that of the other five Western countries visited by the Prime Minister? Is not the accent on a 'political settlement through negotiations' perfectly consistent with an urge to preserve Pakistan more or less in its present form? And did not Soviet Prime Minister Kosygin himself assure his Algerian hosts recently that even his country stood by the 'territorial integrity' of Pakistan?

Now that we have acquired, through the Prime Minister's extended tour and through the earlier perambulations of sundry ministers, a first hand idea of the views of almost all countries and certainly of those that matter (with the exception of China, whom we appear to have written off as being irrevocably committed on the Pakistani side) what does it all mean in terms of the immediate course of action for the government? There is a general expectation that some decisive steps will follow the Prime Minister's return, among them the declaration of a state of emergency. In the last few weeks the Indian and Pakistani armies have taken positions along the entire border between the two countries; shelling, air violations and other 'incidents' have become regular occurrences; and Pakistani saboteurs have stepped up their activity in the north-eastern states and in Kashmir. Against these developments, there can be no question about the need for the utmost vigilance on the part of the government.

At the same time, there already exists in the country, including within the government, a considerable section of opinion which is convinced of the case for a war with Pakistan at this juncture. The reasons extend all the way from deep-seated hostility to Pakistan which has very little to do with the developments in East Bengal to the simple and straightforward argument that it would be cheaper to fight a war with Pakistan than to maintain ten million refugees indefinitely. But what sort of a war will guarantee the return of the refugees? And more important, our elaborate efforts to Gallup Poll the countries of the world have, as mentioned above, made clear that any attempt by India to militarily alter the political balance in the subcontinent through a war with Pakistan would almost certainly fail—given the international straitjacket within which we function. Fortunately, our options are not so limited. It is in fact the regime in Pakistan which is under intolerable stresses just now and it would be wise to allow these stresses to work themselves out. With the Pakistani army in East Bengal almost entirely drawn to the border, it has been possible for the Mukti Bahini to step up its operations in the hinterland. The regime's calculation that while the regular army moved up to the border, razakars and irregulars would be able to take care of the Mukti Bahini are

being fast proved wrong. And in West Pakistan itself there are rumblings of impending political developments. Yahya Khan's plans of rigging up some sort of a civilian government in East Bengal through the 'elections' promised for next month might very well be defeated by opposition from certain political parties, such as the People's Party of Bhutto. The time is for keeping our cool.

Industry

Growth by 'Liberalisation'!

IF the speech of the Minister for Industrial Development opening the meeting of the Industrial Advisory Council last week is any index, this ministry of government appears to be totally lacking in economic expertise of any sort. The Minister repeated the by now well known fact that industrial production in the first five months of the current year rose by a mere 1.8 per cent as against 6.6 per cent in the corresponding period of last year. Of course, he did mumble the usual excuse about the index not fully reflecting the actual growth of industrial production, especially the alleged 11 per cent growth in the small industries sector. Apart from this there was no attempt to examine in which types of industries the shortfalls in production actually have been and what these might have been caused by.

Instead the Minister went on to the subject of the supposed slackening of private sector investment in industry, even though this premise itself was hardly borne out by his own statistics of industrial and capital goods licences issued. According to the Minister, 510 licences and 752 letters of intent were issued up to October 23 this year compared to 363 licences and 438 letters of intent last year. Similarly Rs 100 crores worth of capital goods imports were licensed between April and August this year as compared to Rs 65 crores in the same period last year. Is this a picture of slack private sector investment in industry?

Of course, it suited the industrialists present very well that the discussion should centre on private sector investment and what could be done to accelerate it. This gave them a chance to air their well known complaints against industrial licensing and particularly against the Monopolies and Restrictive Trade Practices Act. The official response to this was cringing. The Secretary to the Ministry of Company Affairs assured the meeting that only 3 applications had been rejected under the MRTP Act (two of them presumably from private sector shipping companies for acquiring the controlling interest in Jayanti Shipping). But surely there can be no virtue in approving practically every application under the MRTP Act; over a period of time this can only suggest that the government is not serious about enforcing the provisions of the Act. In which case, why have the Act at all? The Minister for Industrial Development similarly went into a fit of breast-beating about how while he was keen to speed up the issue of licences, the various administrative ministries were holding up decisions on applications. Surely, the Cabinet and not the Industrial Advisory Council was the forum for raising issues of inter-departmental co-ordination within the government such as this!

The entire discussion at the Advisory Council meeting had an air of unreality about it. This was inevitable for two reasons. First, no one, certainly not the Minister, referred to the factor most responsible for the slack in industry — the failure of public sector investment to pick up for the third successive year in the Fourth Plan period. Second, even in respect of private sector investment, the Minister could say nothing at all about where such investment was wanted. Clearly, the government no longer has any notion of industrial priorities. In the circumstances, it is reduced to thinking and acting in terms of 'liberalisation' of various sorts — industrial licensing, capital issues control, foreign collaboration, restrictions on tse big houses, and so on. At the end of it all, the government wakes up to find that none of this is attracting investment into particular industries where investment is most needed, such as paper — only to make itself look even more ridiculous by threatening nationalisation, as the Minister for Industrial Development did at the Advisory Council meeting.

Communists

Concentration on Each Other

SERIOUS debate on party priorities and policies can only be applauded. And there had been much self-examination and discussion at the ninth congress of the CPI held last October at Cochin and at the deliberations of the Central Committee of the CPM in Bangalore last August. A fiery controversy also seems to have been going on in the CP(ML) about revolutionary tactics and, if news agency reports are to be believed, was resolved last month with the expulsion of Charu Mazumdar from the party. But one begins to have strong doubts about the relevance and value of the debates within the CPI and the CPM on noticing that the discussions have tended to get bogged down by harping on two issues: (1) Indira Gandhi and (2) how to attract the followers or "mass base" of other political parties. The CPI is morbidly fascinated by the idea of attracting to itself "progressive" Congressmen and secondarily, the CPM's mass following.

The CPM is also most concerned about mesmerising the CPI's lower rung cadres and at the latest meeting of its Central Committee last week, the spectre of Indira Gandhi made an appearance once again. At Bangalore, the Central Committee had again identified Indira Gandhi and her party (although with some difference in emphasis on the relative culpability of the two) as "representing the landlords and the bourgeoisie" and therefore the focus of the CPM's struggle was to be the overthrow of the Congress party and Government. Last week's discussions, however, indicate a shift in the CPM's stance towards the Congress and Indira Gandhi. This shift might be due to the increasing political and police pressures which the CPM is facing in West Bengal and also, though to a lesser degree, in Kerala. These pressures may have moved the CPM towards seeking an easing of tension between itself and the Government in New Delhi and through the latter, the Congress-CPI Government in Kerala and the Central Government's agent in West Bengal. The Central Committee continues to regard Indira Gandhi as "the spokesman of the bourgeoisie-landlord combination" and therefore to be resolutely opposed, but at the same time it has chosen to indicate that it will back this very same spokesman of "the bourgeoisie-landlord combination" when she adopts progressive measures or chooses to fight extreme reaction.

While there is some basis for understanding this contradictory policy, what is totally inexplicable is the peurile desire of both the CPI and the CPM to examine policies and issues on the basis of whether they would entice each other's members. This method of examining issues is particularly facile when the large mass of people still remain politically unconscious (in the Marxist sense) and unmobilised. Instead of seeking a following among the large numbers of unpoliticised and unmobilised people the CPI and the CPM appear to be greatly concerned about weaning away each other's membership. Clearly, the parliamentary way of life with its constant toppling and floor-crossing has affected the ideological vision of both parties.

Correction

In the editorial "Forever Amber!" (November 6) para 2, line 1, for "The plain fact is that the potential loss of a few million dollars of annual US aid..." please read "The plain fact is that the potential loss of a few hundred million dollars of annual US aid ...".

Group of 77

For Home Consumption

THE two-week meeting of the so-called Group of 77 in Lima which ended on Monday has been described, with unwitting appropriateness, as an 'economic Bandung conference'. The appropriateness of the description arises from the fact that the time for Bandung conferences has been gone some decade and a half. In the early and mid fifties the picture of the ex-colonies, poor but proud in their independence, coming together to demand rightful retribution from their erstwhile colonisers and exploiters carried a measure of credibility. Not any longer. The ex-colonies are still very poor, of course, but no more have they anything to be proud about. Their rulers rule over divided, bedraggled peoples with the help more or less of the very apparatus of repression built up by the former colonial regimes. And the brave postures they strike against the rich countries ring hollow since at other times they have all, almost without exception, individually accepted formal and informal arrangements implying varying degrees of subordinateness to these very countries.

The final communique adopted by the Lima conference repeated the worn-out cliches about the rich countries setting aside 1 per cent of their national incomes for the development of the 'third world', making the terms of aid easier, granting preference to the exports of the poor countries, facilitating the transmission of technology, and so on. But to what purpose have the countries represented at Lima used such aid as they have so far received? Or, again, how many of them have framed policies and programmes to make the best use of technology received from abroad? Indeed, even those countries which had started with rudimentary efforts at national economic planning are now in the process of abandoning the experiment. India is a conspicuous case in point. In this context the cry for more aid and trade on easier terms is part of the effort on the part of the rulers of these countries to continue to avoid the 'hard' options of raising internal rates of saving, achieving a minimum of efficiency in allocation of resources, evading basic institutional reforms and so on.

Striking a more aggressive note, the Lima communique condemned the rich countries for their large armaments expenditures and for the vestiges of colonialism and racialism among them. But, once again, what about the mounting expenditures of the developing countries themselves on military and para-military forces which divert resources from economic development and are aimed more often than not at containing internal disaffection—the result, invariably, of socio-economic stagnation?

Who did the spokesmen of the countries assembled at Lima think they were impressing? Surely, not at all the rich countries towards whom their communique was ostensibly directed. Indeed, the only purpose of such get-togethers appears to be the propaganda value they have back in the participants' home countries. The lionising by our Press of our Foreign Trade Minister for his alleged achievements at Lima seems to bear this out.

BUSINESS

Perils of Smallness

AFTER visiting Japan, Australia and Thailand, a technical mission of the Indian Pulp and Paper Technical Association is reported to have come out strongly in favour of licensing small paper mills. The mission has further suggested import of second hand paper machines and also that small paper mills should combine lumber business, as hardwood could be used as lumber and saw-wood for pulping, thereby enabling many small-scale pulp mills to come up.

It is not known what exactly the technical mission was after in going on its South-East Asian tour, but it is to be hoped that the suggestions made by it would be weighed very carefully before any decisions are taken. While shortages are currently felt in both cultural (writing and printing) paper and industrial paper, the immediate necessity is to raise the output of cultural paper. Much remains to be done in this regard and a host of problems ranging from equipment availability, resources and raw materials have to be tackled with a long-term perspective both by the industry and the government. One would have expected the IPPTA mission to have said something in this regard, especially since despite all that has been said about the problems being faced by the industry, no concrete steps have been taken to raise output and bring down prices. Paper prices have been going up — as had been predicted in these columns some time ago. The current ex-mill price of cream wove paper is Rs 2,300 per tonne against Rs 1,900 per tonne in May 1968, around the time of decontrol.

Since the mission has come out strongly in favour of small paper mills, it is necessary to examine the economics of small-sized units in the paper industry. The incentives given to establish small-scale paper mills in India during Manubhai Shah's regime had not only economic but also social and political overtones. In the early sixties licences were granted to 120 applicants for setting up paper plants with capacity ranging from 2 to 20 tonnes a day. These units were designed to produce speciality papers which were outside the purview of control. The apparent justification for this was "the need to disperse industries and to provide increasing employment opportunities. ... also, the undergrowth of a middle class entrepreneurship in very large numbers is the sure guarantee and foundation for an industrial democratic society". As events turned out, however, only 34 out of the 120 units licensed were established; of these 21 have capacities of less than 10 tonnes per day and 9 between 10 and 20 tonnes per day. Four of the units with less than 10 tonnes per day capacity have remained closed. Most of the units were not operating profitably till 1969-70, mainly due to technical and managerial inadequacies. With decontrol of paper prices and the prevalent conditions favourable to sales of

almost any kind of paper, it is hardly surprising that all the units are making profits now.

Nevertheless, the small units continue to suffer from various handicaps. Some of them do not have pulping facilities or chemical recovery or processing plants; as a result the element of wastage is higher and production costs are high, especially with prices of bought out pulp continuously rising. A variety of acceptable substitutes in the form of cereal straw, waste paper cuttings, cotton waste, etc, which have some cellulosic content, have helped to sustain output.

Given the necessity to raise output of paper, it seems justifiable to bring the existing small units nearer economic sizes of, say 50 to 60 tonnes per day capacity. However, the deficiencies in the capital structure of these units and the managerial inadequacies are bound to render the process of expansion very slow and, in any case, when it comes to production of writing and printing paper in integrated mills, the situation is much less favourable to the small-scale units — mainly because chemical pulp (and hence writing and printing paper manufacture) is subject to greater economies of scale. It seems, therefore, that the country stands to gain if the contemplated import of second hand paper machines is used to increase the output of writing and printing paper in the larger units. This is not only expedient but necessary before a long range raw material development plan for the industry is conceived of and accepted.

Forward Trading

More Senseless Curbs

A Correspondent writes:

IT is difficult to understand the rationale behind the recent Government curbs on commodity markets. Last month, the Government amended the Forward Contracts (Regulation) Act through issue of an Ordinance which provided that all ready delivery contracts in which either delivery of goods or payment of price is dispensed with shall be deemed as forward contracts. Soon thereafter trading in non-transferable specific delivery (NTSD) forward contracts in groundnut and groundnut oil was prohibited throughout the country. Later, the Forward Markets Commission (FMC) suspended futures trading in cottonseed, coconut oil and gur.

True to its methods of working, FMC has not cared to explain the circumstances which prompted the Government to resort to these successive curbs. Or, is it that FMC has no valid explanation to offer? FMC virtually abandoned its statutory functions under the FC(R) Act many years ago and has accepted the status of a subordinate department of one or the other of the Central Ministries under which it is obliged to function from time to time.

If it has been reduced to this pathetic position, FMC has only itself to blame. Throughout its two decades of functioning, it has never conducted any systematic, scientific study of the working of forward markets. Lacking the competence and expertise to carry out such studies, it chose the bureaucratic path of resorting to regulations to justify its existence. The result was a plethora of needless controls on forward markets which reduced the utility of these markets without any compensating benefit to the economy. As the Dantwala Committee observed, such action "served only the limited purpose of reducing the volume of trading and open position in the forward markets. It did not check the rise in ready prices, if that was the intention".

That the Central Ministries do not consult FMC on major policy issues concerning forward contracts and forward markets is an open secret. And New Delhi, without even an elementary understanding of the working of forward markets, has shown a fondness for prohibiting forward trading in the naive belief that this would somehow curb unhealthy speculative activity and arrest inflationary trends in commodity prices. In fact, independent research studies both here and abroad have time and again shown that far from aggravating commodity price trends, futures trading exerts considerable sobering influence on ready prices. Past experience of the behaviour of prices of several commodities like cotton, groundnut and groundnut oil, mustardseed, etc, has supported this conclusion. But the authorities in New Delhi have neither the time nor any wish to learn from their mistakes. The ban on futures trading in cottonseed, coconut oil and gur seems to be one more link in this unending chain of mistaken policies.

The ban on NTSD contracts (which provide for delivery of goods and payment of price after 11 days) in groundnut and groundnut oil was perhaps long overdue. In the absence of countervailing futures trading, NTSD contracts in these commodities have exercised undue pressure on restricted, available physical supplies. Representatives of the trade and industry in oilseeds have raised a hue and cry against this ban. They have also been quick to point out that the NTSD contracts in groundnut and groundnut oil were always by and large fulfilled by actual delivery. This might have been so. But the fulfilment of a large proportion or even all of such contracts by physical deliveries hardly redeemed them. In fact, the statutory provision for compulsory delivery has been the major weakness of these contracts. It has often encouraged manipulation in these contracts, especially in times of acute scarcity of deliverable supplies. The frequent payments crises in the oilseeds markets during the past few years bear witness to the truth of this statement.

The misuse of NTSD contracts notwithstanding, the ban on them will cause some difficulty to the groundnut crushing and vanaspati units, as these contracts served to ensure uninterrupted supplies of raw materials. In their absence, these units would be constrained to rush in for available ready supplies and would more often than not decide to hold large stocks. The desired objective of the Government of containing the ready prices of groundnut and groundnut oil would then be defeated.

Paradoxical though it may appear, so long as the Government does not wish to take over the ready trade in groundnut and groundnut oil, the proper course for it would have been to revive futures trading in these commodities. This would supply the requisite hedging facility to the industry. More importantly, unlike the narrow NTSD contracts, the broad and competitive futures contracts would have offered better guarantees against unscrupulous manipulation of ready prices. Instead the authorities have chosen to impose curbs on ready delivery contracts for fear that these contracts would be misused for speculation following the ban on NTSD contracts. Are the authorities more concerned with speculation than with prices? In their effort to curb paper speculation, they have been unwittingly encouraging speculation in physical commodities with more disastrous consequences for prices and price fluctuations.

But even the paper speculation may not be ended so easily. Illegal speculative trading is already reported to be rampant in the country. The curbs on commodity markets would give it a further shot in the arm. In the end, it appears, the only beneficiary of the recent curbs would be the Enforcement Directorate of the Forward Markets Commission.

Sugar

Time for Full Decontrol

SUGAR prices have moved up with the beginning of the new season. The 1970-71 season ended with prices around Rs 185 per bag; at the time of writing, prices have touched Rs 212 and traders believe that prices will go up further. By the end of 1971 prices are expected to touch Rs 240 per bag. The cavalier fashion in which Government is handling the industry is amazing. Final figures of area under sugarcane and sugarcane production for the 1970-71 season have not been published yet. If the industry has to be competently handled, the first forecast of area under sugarcane for the current season should be issued before October every year; and the final forecast must be issued before the monsoon begins. But no expert body has bothered about this so far. As is well known, sugar statistics are not issued by Government but by the industry which issues them as and when it suits it. Statistics for July were issued on September 27, for August on October 12 and for the entire season on November 6. Industry must be compelled to issue these figures within two to three weeks of the end of the month.

During the season 1970-71, total despatches ranged from 275,000 to 439,000 bags per month. The maximum despatch took place in the last month of the season, September. The last season had opened with a stock of 2,088,000 tonnes; the current one opens with a stock of 1,444,000 tonnes which is, incidentally, the second highest opening stock between the seasons 1961-62 and 1970-71. As is well known, interests connected with industry including some state governments, canegrowers and millowners have been pressing for higher cane prices. Simultaneously, industry has now brought down its estimates of the current season's production to 3,200,000 tonnes. On this estimate, total availability in the season will be 4,666,000 tonnes. Total requirements are placed at 4,300,000 tonnes, so that the current season would end with only 36,000 tonnes, i e, only a month's requirement. In order to avoid such a calamity, cane prices must be raised—so the argument goes.

Meanwhile, on October 12 government announced an excise rebate of Rs 17 per quintal on sugar produced in October-November in excess of 80 per cent of production of the corresponding period of the previous season. A rebate of Rs 16 per quintal is to be allowed on production of the remaining 10 months of the season on the same basis. The offer of a higher excise rebate on production in the first two months does not make much sense. As a matter of fact, most mills in the north commence crushing only from November 15 onwards. In any case, the rebate should enable the industry to pay at least a rupee more to growers. Current reports show that gur and khandsari units are buying cane at Rs 7.50 to Rs 8.00 per quintal. The millowners are in a position to easily offer Rs 8.50 per quintal. Thus it would appear that by providing the rebate, government has sidestepped the issue of increasing the price of cane.

What the government could have done, had it been inclined to act in a more forthright fashion, was to give up altogether the fixing of the minimum price for sugarcane as well as quotas for monthly releases of sugar. Industry should have been left completely free so that the more efficient units as well as the more efficient zones could have been put in better position to exploit their advantages. Simultaneously, licensing of sugar factories and the preference shown to co-operative units at the expense of the exchequer should have been abandoned. As for the cost of cane in various parts of the country and the returns from cane and other alternative crops almost nothing is known, though there is much kite-flying on the subject by pseudo-experts.

'Amul'

Co-operative Success Story

THE Kaira District Co-operative Milk Producers' Union, Anand, popularly known as 'Amul' celebrated its silver jubilee last week. An important feature of the celebrations was the presentation of Rs 10 lakhs by the federating milk co-operatives to Amul, as a token of their gratitude. The funds are to be used for making available nutritious food for children through a trust to be created.

'Amul' can rightfully feel proud of its activities and achievements during this period, particularly during the last 15 years. Beginning modestly in 1946 with just two village milk producers' societies, Amul has matured into the most successful co-operative venture in the country. Today there are more than 700 affiliated milk co-operatives (with 1,80,000 farmer members) in Kaira villages. The share capital of the co-operative union has increased from Rs 3.2 lakhs in 1955-56 to Rs 34.7 lakhs by 1970-71. The quantity of milk collected from farmers has increased from about 11 million kgs to 118 million kgs during the same period. The value received by sale of milk and milk products has increased from Rs 7.4 million to Rs 273.9 million. The dairy complex of Amul has been expanded to handle 5,00,000 litres of milk per day.

Product diversification has been another important feature of the growth of Amul. The products of Amul include Amul butter, milk powder, baby food, casein and cheese. Cheese has been manufactured from buffalo milk for the first time in the world on a commercial scale, by Amul, using a formula devised by CFTRI, Mysore.

'Amul' has helped Kaira farmers in several ways. It has raised and stabilised milk yields through the spread of scientific dairy farming and supply of 'Amuldan'—a quality feed, manufactured by Amul's own feed factory near Anand. According to some village studies, dairy income accounts for 45 per cent of total farm income in Kaira villages. Amul not only pays stable prices for milk (115 paise per litre), it shares part of the profit with the member co-operatives. Amul has helped develop Kaira villages through its extension work and creation of village level infrastructure, e g, rural roads, dispensaries, village water works, schools libraries, etc. During 1968-69 Amul spent nearly Rs 3.5 lakhs on such activities.

An even more significant contribution of Amul is its 'spread effect'. Several other districts in the state, like Mehsana, Baroda, Surat, Rajkot, Ahmedabad, etc, have been inspired by Amul's achievements and are actively guided and supported by it in organising and developing dairying in their respective areas. Further, Amul's experience is being utilised for dairy development all over the country through the National Dairy Development Board, located at Anand.

Dairies in other areas can depend upon the rich experience of Amul. But some of the factors such as the timely and generous assistance from agencies like FAO, UNICEF and OXFAM and even the Government of India, which were so vital to the accelerated growth of Amul, may not perhaps be available to the other dairies. While these advantages of its early start enjoyed by Amul may not be available to the new dairy units, the benefits of the experience and consultancy services of Amul should be utilised to the full.

PERSPECTIVES

China, India and Japan

Dhananjoy

THE voting on the restoration of China's legitimate rights in the United Nations hides a few realities regarding the attitudes of member States towards Peking. Not all among those who voted for the Albanian resolution are friends of China and some among those who voted against it are not as hostile to Peking as appears on the surface. The Chinese Foreign Office may, therefore, not regard the list of those who voted for and against (and those who abstained) as the basis on which it will evolve relationships in the United Nations. For example, Israel voted with the Arabs for Peking but it would be difficult for Tel Aviv to expect any benefit in terms of Chinese attitudes to the Arab-Israeli question. Similarly, Thailand's abstention and Malaysia's support may mean very little of difference for Chinese purposes.

Changed Attitude

There are two votes, however, which truly reflect attitudes to China within two of Asia's important Governments. While India voted wholeheartedly for the admission of China, Japan opposed it. It is not so much the Indian vote as the changed Indian attitude to China which is likely to impress Peking. Faced with the crisis in Bangla Desh, India has rediscovered the importance of having good relations with China.

Of course, the attitudes on which India's policies before 1962 were based had begun to give way to greater realism more than five years ago. The essence of the Nehruite view of India-China relations was that both India and China were large Asian states entitled to important roles in world affairs and co-operation between them would be equally beneficial to both. A sense of equality lay at the root of Nehru's initial friendship towards China and his later aversion to it. By the mid-sixties, equality with China became a mirage and it was quite evident that without a fundamental change in the nature of Indo-Pakistan relationship, the real competition of India would be with Pakistan rather than with China. In Nehru's view, Pakistan was a nuisance but it was utterly wrong for India to make it the central problem of its foreign policy. The situation has now changed. The powerful nations of the world have helped Pakistan to strive towards equality with India, thus making Indo-Pakistan relations the major concern of this country.

We may go on saying that China's attitude to India has changed but what is even more important is that our attitude to China has undergone a sea change. We have now begun to accept that China is a super power with which India cannot compete and as a neighbouring super power, it could be either beneficial or harmful depending on the state of Sino-Indian relations. There is no longer the myth of Sino-Indian rivalry nor the dream of equality between India and China nor the fantasy that China is more expansionist or aggressive than any other power of the world.

New Friendliness

It is in this light that the Indian vote in the UN and the subsequent steps taken by India to convey to the Chinese a sense of new friendliness towards Peking ought to be viewed. However humiliating it may appear to some Indians, a large majority of people here would have no interest in abandoning this method of improvement of relations with China. As for the Chinese, it is precisely this assurance that India had given up its highly ambitious goal of emerging as a power equal to China that they may have been waiting for all these days. In this sense, those who welcome good relations with China and then ask India to become "the fourth Great Power of the world" may be indulging in a self-defeating exercise.

The conditions for this change in India have been prepared by a number of developments. India's economic performance has been much poorer than China's; its military capability has been built up with external support; Pakistan has started giving it a great deal more of trouble than before; and the world outside has no illusions now about the relative status of India and China in the world. Above all, Bangla Desh poses such a grave challenge to India that it can have no such foreign policy as defeats its objective of ensuring a satisfactory solution of the problem there. It is not the clamouring of the traditional friends of China who have made a difference to the official policy but the inability of the Indian Government to sustain its old attitudes to China in the face of these grim realities.

Opposite Trend

An entirely opposite trend has been in progress in Japan. The economic miracle achieved by that country, the technological progress made by it, the world-wide feeling that it might emerge as one of the world's economic super powers and the praise showered on its performance by friends and foes alike have all liberated Japan from its sense of inferiority in relation to the victorious powers of the Second World War. The mood in Tokyo even a year ago was of triumph and the ambition was of an impending Japanese breakthrough in political terms.

It was not long ago that Japan had demanded a permanent seat in the Security Council and it has been fed for quite a long period on the belief that it was entitled to a much bigger status in international politics. Apparently, Japan had maintained a degree of aloofness towards the political problems of the world and rebuffed all Western attempts to make it a dominant South-East Asian power. It had done so because it viewed itself as a country engaged in a global economic competition with the most developed parts of the world. To the extent that a special Japanese interest in South-East Asia would cut down its capacity to compete with the United States in the technological race, it was imperative for it to refuse to play such a role.

However, in the course of the last two years, particularly since Sato's visit to Washington, the Japanese had clearly begun to regard South Korea and Taiwan as areas of special interest for themselves. The acceptance of China as a super power by the world community comes precisely at a time when Japan might have been getting poised to play that role. And if there is a power which has been thrown into utter confusion by the developments of the last few months, it is Japan

The Japanese vote in the UN, therefore, has to be taken as seriously by Peking as the Indian vote. In one case, it reflects the readiness to accept China as a super power; in the other a refusal to do so. How the Japanese will reshape their foreign policy is going to be a major international question in the years to come. There will be many powers to fan the flame of Japanese ambition and internationally Japan may not find it very difficult to pursue certain ambitious goals.

The answer to the question as to what is a proper role for Japan will however be provided by developments in Japanese domestic politics. Indeed, this is a crucial problem. The left-wing in Japan will try to reverse the course adopted by successive Japanese Governments to project the country in a major international role and to nurture a new kind of Japanese nationalism. The right-wing will move further towards the adoption of more open nationalistic postures. A confrontation within Japan is, therefore, a distinct possibilty. Not only China but other powers of the world will watch Japan with considerable anxiety and interest in the years to come.

COMPANIES

Lower Margins but Doing Well

Hansavivek

CROMPTON GREAVES is acting as technical consultant to State Electrical Industries of Iraq for establishing a factory in that country for manufacture of ceiling fans to its designs. The Indian company is responsible for planning and guiding the project to the stage of full production, for provision of designs, knowhow, and training, as well as for supply of equipment, tooling, assemblies, components, and raw materials. The agreement with the Iraqi company will not only give a further boost to CG's exports, but will add valuable experience to the company in overseas manufacturing operations. Export sales during the year to June 1971 were about Rs 5 lakhs less, at Rs 68 lakhs, but new export orders were over Rs 130 lakhs against Rs 45 lakhs in 1969-70. With large orders for plant products on hand, this year's export invoicings are expected to be substantially higher than the past year's. The company also expects to complete this year a realignment of product groupings, as substantial additional factories and facilities have been completed.

Demand from Electricity Boards for plant products continues overall at a satisfactory level, despite some imbalance; but the same is not true of demand from industry or agriculture, especially for non-plant products like motors and pumpsets. The directors feel that government policies are restricting capital and development expenditure in both these sectors. They also complain that shortages of certain materials continue to be a powerful cause of the rising costs, and this is likely to affect manufacturing, distribution, and financing costs as well. These adverse factors notwithstanding, they hope it will be possible for the company to maintain 'satisfactory progress' by appropriate redeployment of resources and efforts. CG's working results for the 34th year ended June 1971, show diminution of margins as reflected in a lower gross profit despite a 16 per cent rise in sales. This, however, was attributable mainly to the inclusion, in the latest year, of the benefit of only one year's tax credit certificates whereas last year the accumulated benefit of the preceding 4 years had been included. It is also due to increased costs of financing. Tax credit certificates received for 1970-71 were less than Rs 6 lakhs while in the preceding year's accounts they were about Rs 37 lakhs. Interest and commitment charges increased by approximately Rs 28 lakhs over the year.

DEMPO STEAMSHIPS has placed firm orders for two new ships—one of 66,000 DWT with a shipyard in Belgium and the other 21,450 DWT on Hindustan Shipyard, Visakhapatnam. The latter is expected to be delivered by March 1974 and the former by February 1975. Financing arrangements for Rs 13.06 crores have been made with the Shipping Development Fund Committee. Meanwhile, shareholders' approval has been sought for raising the directors' borrowing limit from Rs 25 crores to Rs 40 crores. In terms of various loan agreements entered into with SDFC, a net sum of Rs 2.32 crores was outstanding as at the end

of the company's sixth year to March 1971. Subsequently, a further sum of about Rs 39 lakhs was received. The company has repaid a little over Rs 83 lakhs. In terms of the agreement with ICICI for one ship, a sum of about Rs 125 lakhs was outstanding as at the end of March last. Repayment is to commence from this month. The 1970-71 results of Dempo reflect the benefits of adding one ship to its fleet in November last year, of full utilisation of another taken on a time charter in April 1970, and of the world-wide boom in the freight market during part of the year. However, operating expenses also continued to increase owing to the inflationary trend all over the world. The company had also to contend with increase in cost of repairs and stores. Cost of repairs at American ports, it is pointed out, are much higher. Bunker prices have, moreover, almost doubled since 1969. Reviewing the conditions in the freight market, the directors say that a fair increase in freight rates was noticeable from the beginning of 1970. The upward trend was accentuated till mid-June 1970, and freight rates were rather steady till early October. They began to decline thereafter, and by December were back to the February-1970 level. With the continued decline, they are at present "rather on uneconomic level". The continued pressure on the dollar and the subsequent 10 per cent surcharge on most imports into the US and non-covertibility into gold, may have a dampening effect, the directors feel, on the company's performance in the current year.

INDIAN DETONATORS has through research, developed new products for use in underground gassy mines. The government has permitted their manufacture and sale. In collaboration with Jugoimport of Yugoslavia, the company had undertaken phased production of half-second and milli-second delay detonators in 1969. The final phase of the indigenous manufacture of the complete product was commenced in October 1970. The unit set up at Hyderabad, for the manufacture of PETN—an important raw material used in the production of detonators—, detonating fuse, and boosters, was commissioned in early 1970 and is yielding satisfactory results. Production of ordinary detonators, electric detonators, detonating fuse and safety fuse was satisfactory during the 10th year to March 1971. Although both turnover and profit were higher than in the preceding year, profit-margins diminished owing to rise in costs. The recommended dividend of 10 per cent, against 12 per cent paid last year, will absorb Rs 3 lakhs more at Rs 15 lakhs since it is payable on an enlarged capital. In December 1970, the company also issued by a prospectus, 10,000 eight per cent mortgage debentures (1980-84) of Rs 1,000 each. The subsidiary, Mysore Industrial and Testing Laboratory, is seeking renewal of the import licence for the malt project that expired in June 1969. Mysore Government has sanctioned continued purchase of the products manufactured by this unit for hospitals and dispensaries, till the end of March 1973. During the year ended March last, MITL's sales looked up from Rs 51 lakhs to Rs 52 lakhs, but its pre-tax profit dropped from Rs 9 lakhs to less than Rs 3 lakhs. This was attributed mainly to the increase in wages and salaries, settlement of all outstanding labour disputes, and payment of gratuity to employees who voluntarily retired.

Conflicts in Tamil Nadu

Mohit Sen

CONFLICTS are developing in Tamil Nadu. Though these are conflicts at present mainly centred on the question of the DMK's entry into the trade union field, in reality the issue involved is far more important. And a study of how this issue is shaping and is being accentuated as well as how it is sought to be resolved would be of use to those who believe that in India today we need a united front if the Left is to achieve its democratic victory.

What Kind of Petty Bourgeoisie?

The DMK leadership is essentially petty bourgeois in character. But this analysis is not sufficiently concrete. We have to go deeper and ask what kind of petty bourgeoisie? The peasant petty bourgeoisie being rooted in production has somewhat more of a possibility of retaining a character in itself, even if not for itself. It has less chance, particularly these days, of becoming a vehicle for the interests and aspirations of other classes. This is not to say that the peasant petty bourgeoisie cannot act as the camp follower of some other class. It is not the peasant petty bourgeoisie as a camp follower that is presently under discussion. What is more interesting to analyse is what it is able to do when it acts with independence and initiative. In a way its very petty mode of production, its narrowness and the conservative obstinacy with which it does its production battle with nature gives it a certain hardiness and makes it somewhat impervious to the aspirations of other strata or classes. The opposite is the case with the petty bourgeois intelligentsia. It is true, of course, that in the new conditions of today it is possible for the petty bourgeois intelligentsia to play more of an independent role than in the past. At the same time its very "method of production" or earning its income makes it the representative par excellence. It can take on the role of others, espouse the interests of others and, indeed, articulate the aspirations and moods of others even better than its own proneness to fluctuation and instability. And it is from this kind of petty bourgeoisie that the bulk of the DMK leadership at different levels is drawn.

The DMK today is caught up between espousing the interests of the vast sections of the oppressed and downtrodden who have voted it so strongly back to power in the hope of achieving dignity, equality and some chances of a decent life and standing forth as the battering ram of the powerful bourgeois interests in the state, both indigenous and foreign. Its behaviour on the trade union front is indicative of the fact that strong elements in its leadership are not at all averse to adopting the latter course. And it is at this level that the DMK would have to be opposed and is being opposed.

It should be realised that it is not as if the DMK is moving into some kind of vacuum. The workers of Tamil Nadu are among the best organised in the country and they have been organised by the Communists and, to a lesser extent, by the INTUC. Thus, the DMK moves into a field which is not only reasonably cohesive trade union-wise but also politically. One could understand it if the DMK moved in there as a force to the 'Left' of the Communists, with more radical slogans and demands as well as advocating more militant forms of struggle. The DMK action is quite the opposite. It moves in not only as a disruptor but also, often enough, as direct agents of the company. What is worse is that it has behind it the power of the administration. And it is not as if the administration only helps on specific issues. It is increasingly taking to a policy of preventing a settlement between the workers and the owners if the union is not to its liking and if there is the slightest chance of the DMK being able to establish its own union.

It is against this policy of the DMK that the trade union movement and the parties who lead the working class in the state are offering resistance, not piecemeal but all along the front. And the DMK will find that in this field it would be difficult for it to have its way.

Another odd business has been the nationalisation of passenger transport by the DMK. Under its scheme no private operator who already holds more than ten stage carriage permits would be granted a new permit or allowed to renew the existing ones. Excess permits above a ceiling of fifty would be taken over by the state and entrusted to a corporation. This would affect five operators including the powerful TVS and Simpson groups. While it is to be welcomed that this important service would no longer be dominated by powerful capitalist interests, it is quite intriguing to learn that compensation is to be paid at the market value which is to be fixed by mutual agreement in each case; and where there is no such agreement a High Court judge would arbitrate. What makes it all the more curious is that when, after being introduced in June-July, the earlier Bill on the subject was withdrawn by the Government, the argument advanced was that the 25th amendment of the Constitution would enable the Tamil Nadu exchequer to avoid a heavy burden of compensation. Yet the present Bill, reintroduced in October with some minor changes, precisely provides for compensation at the 'market value' as if to overcome any difficulties in paying out compensation! What is the reason for this shift? And is there a pattern in this shift and the approach to the trade union question?

Grist to the Syndicate Mill

At the same time it must be borne in mind that the attitude to the DMK has to be one of unity as well as struggle. It would be quite wrong to imagine that the DMK has now shifted over to the camp of reaction or that there is nothing to choose between it and the Syndicate. The DMK is a democratic and middle-of-the-road party the struggle against whom is also for the purpose of maintaining, consolidating and developing the united front. It would be inadvisable to go in for forming any kind of "third front" of those other Left and democratic parties who are opposed to the Syndicate and who might feel that the DMK is a lost cause as far as forging democratic unity in the state is concerned. This, after all, is only another variant of the equidistance theory and would, in the given balance of forces in Tamil Nadu, only bring grist to the Syndicate mill.

It is precisely because of this fact and because of the complex nature of the forces at work that the conflicts in Tamil Nadu have a relevance far beyond its border.

Bhutto Goes to Peking

G P Deshpande

PRESIDENT Wilson once said that "a nation could not put its strength into a war and keep its head level". President Wilson's own successors have already demonstrated the truth of this statement in Vietnam. Bhutto, in his turn, is trying to imitate his patrons. He has talked of the waters of the Ganga and the Indus flowing red in the event of an Indo-Pak war. It will be a house-to-house war, he roared, little realising that he was giving away a part of his own game. There are his counterparts in this country too. One need not, therefore, take the rhetoric too seriously. It is an old trick, a little worn out. It seems to have become an accepted practice on the subcontinent that when foreign tours fail in their objectives, the pill should be sweetened with bold and brave talk of war. The sophistry can deceive people in Islamabad but it usually does not deceive the more hard-headed people in Peking.

Nobody knows whether Bhutto realises this or not; but the fact is that the waters of the Ganga are indeed red already and a "house-to-house" war is going on in Bangla Desh. Peking at any rate seems to be increasingly aware of this. This is the reason why Chi Peng-fei, the acting Foreign Minister of China, talked of the "Pakistani people". He said the problem has to be settled by "the Pakistani people themselves". This emphasis on the people was not only meant to satisfy the visiting People's Party leader; the chances are that the Chinese have probably reminded Bhutto that the problem in Pakistan is a people's problem and has to be solved by them and their representatives. Some representatives are, of course, free to travel around the world, while some are in custody and some others dead.

Chi Peng-fei, speaking at the luncheon given in honour of the visiting Pakistani leader, said that he believed that the Pakistani people were patriotic and wanted "to safeguard national unity and unification of the country". There is nothing wrong in expressing such beliefs, for such expressions mean precious little. That is probably the reason why Chi went on to say that the Pakistani people should solve their problem themselves. How? Would the people of Pakistan necessarily want a united Pakistan? Didn't the Awami League leadership ride on a tide of Bengali nationalism which was a fact already? Chi has nothing to say on the matter. He does not even castigate the Awami League, as presumably Bhutto would have liked him to. Nor does he even seem to be in a hurry to talk about the "reactionary" nature of the Awami League or about Sheikh Mujib's well known anti-communist views.

The reason for this silence may well be the crucial fact that the contradiction between the Western and the Eastern wings of Pakistan is antagonistic. In other words, it is not a creation of the Awami League but rather the Awami League is its creation. Under such circumstances, it does not become meaningful to talk about the Awami League or any other party. You can talk only about the social forces—that is, the people. Let them decide. If Bhutto would like the Chinese to believe that the people in East Pakistan do not share the views of the Awami League on the future of Bengal, he has to demonstrate it. Therefore, this emphasis on people settling their affairs. The ball is clearly in Bhutto's court or rather in General Yahya's court where Bhutto basks in his imperial glory as the *de facto* foreign minister.

It would be unfair to Bhutto, though, to say that Bhutto has deceived himself. Bhutto seems to have no illusions about his talks in Peking. In his speech at the luncheon he talked only about Indo-Pakistani tensions and a possible Indian attack. He did not respond to Chi's remarks about the Pakistani people settling their problems. One cannot attribute such a naivete to Bhutto as to say that he does not recognise the existence of the problem at all. It is, therefore, significant that he did not (or could not?) reassure his hosts in Peking that the Pakistani people will solve their problem. Later in Islamabad President Yahya talked of a possible Chinese involvement in the subcontinent. Bhutto did not sound optimistic on that score. He also stated in Islamabad that it would be "premature to seek in a panic" a solution in the UN Security Council. Evidently Chi himself does not seem to have been very enthusiastic about the Security Council. Hence Bhutto's emphasis on doing everything with "our own efforts".

II

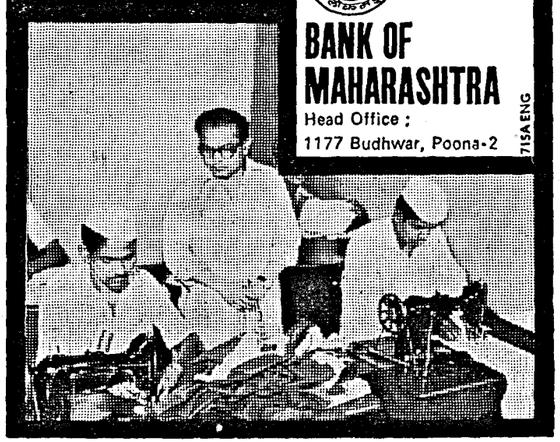
Bhutto's failures are not necessarily our victories, however much our national Press might give us the impression. Bhutto's failure was not a personal failure. It is a failure which has stemmed from the structural weakness of Pakistan which the nimble-footed diplomacy of Bhutto could not cover up. Our failure, on the other hand, is all the more glaring and unintelligible.

We began with our standard fixation with China. China was and is with Pakistan, and so on. It has not yet dawned upon us that given the state of Sino-Indian relations and India's relations with USA and USSR, the Chinese have maintained a remarkable balance in their approach to the problem in Pakistan. We have sent emissaries all round the world to explain our position on Bangla Desh. The Prime Minister herself has gone to the cheerful and sunny lands of Europe and America to explain, to entreat, to beg. She is on her way back with nothing but loads of sympathy. One would have thought that it is the East Bengali people more than Indians who deserve and need sympathy. Nobody even refers to the East Bengali people.

Ironically, it is the Chinese who have been talking of the Pakistani 'people'. We should have talked to the Chinese about the problem. Little do we seem to realise that normal relations between India and China would be very useful during the difficult times that we are going through. We have been talking of exchange of ambassadors for easily over a year now. The Prime Minister has again reiterated that in Paris on November 9. But action does not seem to follow.

This is not to suggest that it is a panacea. The ambassador would go there finally in the typical lethargic Indian way. But the issue is what we want our approach to China to be. Ironically Bhutto seems to succeed in underlining the importance of the Indo-Soviet Treaty. Chi Peng-fei referred to "certain persons" who are interested in aggravating tensions in the subcontinent. Chi may well have Sino-Indian tensions in mind; and the certain persons he referred to may well be the comrades from Moscow who seem to have taken quite a fancy for New Delhi lately.

It would appear that the net result of Bhutto's pilgrimage to Peking has been to underline for us China's reservations about the recent confabulations between us and our Russian friends. As Chi Peng-fei put it there are certain people who are "exploiting tensions in the subcontinent in a wild attempt to achieve their ulterior motives". The Foreign Minister did not specify these ulterior motives. But it should not be difficult to appreciate the Chinese apprehensions about them. Our efforts (if we have made any) to dispel these seem to have been unsuccessful. Bhutto's failures are not our victories. But his own success, for whatever it is worth, has indeed emphasised our failure.



You may be one of those with skill but no money. You'd better come to us we will finance you

We have schemes. quite a few of them for people just like you. Schemes which will help you set up your enterprise, make a decent living.. and march towards prosperity.

GUJARAT

Majur Mahajan Asserts Its Identity

Ajay Oza

THE Majur Mahajan was started way back in the second decade of this century by Mahatma Gandhi. It is today the largest trade union in Gujarat and has its base among the textile workers in Ahmedabad. It may be said to be a unique experiment in trade unionism in that it was intended to operate on the principle of safeguarding working class interests through class-harmony rather than class-struggle. Gandhi wanted the Mahajan to remain independent of political parties — even the Congress, of which he was then the leader. Today, after some half a century, the leaders of the Mahajan are reasserting their political independence. They have chosen to opt out of the INTUC, remain aloof from both Congress(O) and Congress(R) and field their own candidates in the next Assembly elections.

In fact, the Majur Mahajan had never been formally integrated with the Congress as the latter's labour wing in Gujarat. In retrospect one can see that, as with his other social reform programmes, Gandhi had mingled social idealism with political good sense in the founding of the Majur Mahajan. On the one hand, a trade union movement would help create a mass base for the nationalist movement in Gujarat. At the same time, with Ahmedabad's millowners being prominent members of and suppliers of funds to the Congress party it was necessary for Gandhi not only to talk to workers in terms of class-harmony but to keep the Mahajan and the Congress party as separate entities. And, in fact, the Majur Mahajan has so far been able to secure handsome economic benefits for the workers with a minimum of industrial unrest.

Yet, in one way, the Mahajan's independence of the Congress was only formal. Throughout its life it has supported the Congress in all elections — local, state and national. Not only that but leaders of the Mahajan, like Nanda, Vasavada and Khandubhai Desai, contested elections as Congress candidates and served as ministers in Congress governments. With this history of association between the Mahajan and the Congress, it was natural that when the Indian National Trade Union Congress (INTUC) was established in 1947 the Mahajan was affiliated with the INTUC. Moreover, since the Ahmedabad textile (and other) workers constitute the predominant section of industrial workers in Gujarat, the Majur Mahajan in effect became the Gujarat unit of the INTUC. No Leftist party has so far managed to get a foothold in the rapidly expanding industrial sector of Gujarat and the Majur Mahajan has continued to control the labour votes

in the state.

It is against this background that the recent decision of the Executive Committee of the Majur Mahajan to sever its connections with the INTUC acquires significance in Gujarat politics. The arrangement between Majur Mahajan and INTUC and between the Mahajan and the Congress party worked smoothly till the Congress split in 1969. Then the INTUC at the all-India level came under the sway of Congress(R). In Gujarat, however, Congress(O) was still a force to reckon with; also, Congress(R) was and remains unstable as a result of the intense faction-fighting among its leaders. Further, the Mahajan leadership consists of old Gandhian Congressmen who are sympathetic to Congress(O) as a party. Vasavada, the leader of the Mahajan, is still a member of Congress(O). It was becoming increasingly difficult for the Majur Mahajan to continue its alignment with INTUC after the Socialist Forum of the state Congress(R), with the help of Indulal Yagnik, extended its influence over the Gujarat wing of INTUC. The Forum's aggressively socialist programme — which, *inter alia*, includes nationalisation of textile industry — is certainly not acceptable to the Mahajan. It is not surprising, therefore, that Vasavada and other Mahajan leaders should argue that the INTUC had come under the influence of communists and that as Gandhians they could not continue to be part of INTUC. It was then only a matter of time before the INTUC in Ahmedabad split and the Mahajan declared its independence of it, although INTUC too is generally acceptable to Ahmedabad millowners.

However, the formal break with INTUC had to wait till the two bodies disagreed on a labour issue. The Khadilkar proposal to raise the minimum bonus from 4 to 8.33 per cent provided such an issue. The Mahajan refused to support the proposal on the ground that the industry was not in a financial position to meet the higher bonus. If payment of the higher bonus was insisted upon some more mills might be forced to close and the result would be further unemployment. As it is, the level of unemployment in Ahmedabad is already high on account of the large number of 'sick' mills. The Mahajan, therefore, refused to join the other trade unions in the struggle for increased bonus. In a bid to secure the labour votes for Congress(R) in the forthcoming Assembly elections, the non-Mahajan faction of the INTUC in Ahmedabad has, however, supported the struggle started by other Leftist parties. The Mahajan was thus provided with the excuse that INTUC had brought party politics into labour affairs and thus endangered the workers' long-term interests.

The non-Mahajan faction of INTUC is not in a particularly happy position. Having joined the struggle for higher bonus, it is now riding a tiger. Many mills in Ahmedabad have only just begun to recover from the recession with financial help from the Government and it is doubtful that they can right away bear the burden of the higher bonus. This faction of INTUC has already lost face over it efforts to bring about the reopening of the closed Jupiter Mills. It put pressure on the management and persuaded it to reopen the mill one day after Diwali, even arranging a widely publicised inaugural function attended by the Governor. But after the formal opening ceremony was over, it became obvious that the mill was in no position to resume production and so to this day it remains closed. Nor has the INTUC-inspired strike in Calico Mills been quite a success. All these have been setbacks to the INTUC as well as to the Socialist Forum. The Mahajan's cautious approach may eventually pay off in the face of the failures of INTUC and given the Mahajan's own goodwill with the millowners.

The Majur Mahajan's decision to put up its own candidates for the Assembly elections is an interesting side-issue. The Mahajan leaders say that their candidates will fight the elections as independents and representatives of a pure labour organisation, but its decision may be of greater significance than that. After all, given the Mahajan leaders' continuing association with Congress(O), many regard its independence at the elections to be only formal. It is thus suggested that the Mahajan is entering the election fray in the hope that it can use its mass base to win block votes for its candidates and, having secured its separate position, then bargain with the majority party, probably Congress(R), from a position of strength. Vasavada has claimed that the Mahajan wants to contest the elections only to represent labour interests as, according to him, no political party in India can truly claim to represent the workers' interests in the legislatures. But whatever the Mahajan's motives, its split with the INTUC will adversely affect the election prospects of Congress(R) — in the labour constituencies of Ahmedabad in particular and Gujarat in general.

Co-operatives Are Not Insulated

K K Taimni

FOR all the clap-trap that one periodically hears on the working of the co-operatives in the country, the fact remains that over the years they have come to occupy a significant place in the national economy and have rendered useful services particularly to the vulnerable sections of the community. What is not appreciated is that the co-operatives have had to operate in hitherto unexplored, and at times 'hostile', areas. Moreover, they have been subjected to external pressures from the socio-political structure in which they have to operate. What needs to be remembered is that the phenomenal expansion of the co-operative structure in India took place in response to the demands made on it by the State. From this stems both its strength as well as its weakness.

Enactment of legislation by various state governments debarring office-bearers in co-operatives from holding offices after a stipulated period, induction of proteges into the management of co-operatives under the guise of giving representation to 'weaker sections' or other interests in the community, and similar other changes in recent years, have aimed at capturing the controlling points in these organisations. These steps have given a severe jolt to the traditional leadership of the co-operatives, who now loudly talk of 'self-reliance' and 'de-officialisation of the movement'. Yet, until recently, this very leadership was merrily enjoying State patronage and State expense. It had thus failed to chalk out a programme for the planned development of the co-operatives in the country. If it finds itself today in a tight corner as a consequence of the wider political conflict which is impinging upon the co-operative structure, it has nobody to blame but itself.

This is the setting in which the seminar, organised recently in Poona by the Vaikunth Mehta National Institute of Co-operative Management, assumes specific significance. The purpose of the seminar was to review the present modes of planning for co-operative development and to focus attention of policy-makers on the need to have a perspective plan for development of co-operation. It was nevertheless inevitable, given the wider setting, that the discussions and speeches would inadvertently bear the mark of what has marred the co-operative movement's management.

In a highly posturing inaugural address, C Subramaniam called for "diffusion of controlling interests in the co-operative organisations so that they may adequately reflect the needs of the underprivileged and the poor". He drew attention to "what I regard [as] three major areas of deficiency in the working of our co-operative institutions". These were: (i) failure to draw into the co-operative fold the underprivileged and weaker sections of the community, (ii) failure of the co-operatives to take initiative in modernising agriculture and allied occupations; and (iii) failure to develop a competent managerial cadre for manning the co-operatives. He suggested that co-operatives should work on 'integrated local development' in the rural areas. But he quite conveniently left out any analysis of the reasons for the failure of the co-operatives. Who, indeed, as was pointed out by a participant later, has been responsible for the present state of affairs? Co-operatives in India have been controlled and managed by the state bureaucracy and, if these have failed to come up to expectations, would not the political leadership and the bureaucracy be responsible for it?

Connoting the same amorphousness of purpose, the general discussions that followed did not flow from any of the 32 papers that had been circulated for the seminar.

Planning for co-operative development has, in fact, always been a governmental activity — with a limited role in this being assigned to the Reserve Bank of India and the National Co-operative Development Corporation. The co-operatives themselves were often just passive witnesses to the entire process. Leaders of co-operatives, who were consulted while formulating the plans, quite often presented only their own individual views, so that there was no effective institutional involvement of the co-operatives at any stage of the planning.

A number of participants at the seminar, therefore, underscored that the various working groups and the consultative committee of the Ministry of Agriculture (Department of Co-operation) were a mere eyewash and were by no means a platform for the articulation of the aspirations, needs, and requirements of the co-operative movement. The annual conferences of the Registrars of Co-operative Societies and the Ministers for Co-operation — which were cited as the other forums for consultation with the co-operative leadership — were similarly dismissed as rituals, primarily employed for putting the co-operative rubber stamp on the decisions already made within government departments.

Predictably, the environments in which co-operatives actually functioned and within which the alternative process of planning would have to be evolved were sidetracked at the seminar. Yet the unpleasant truth is that co-operatives have become politically important and have proved handy to a section of the community for asserting its dominance over the entire community. Both of these factors have determined the shape and direction of the movement as it exists today, and in the circumstances no independent planning worth the name is possible for the development of co-operative movement. Real institutional planning is possible, ironically, only in those sectors that are politically expandable and socially harmless.

Weeraman made a determined effort in his paper, "The Need for Planning for Co-operative Set-Up", to focus attention on the need to correct the "unco-operative position that obtains at present in the co-operative movement before planning for future development" is possible. Among the 'unco-operative' aspects, he included "the powers of the Registrar to nominate office-bearers and directors, to supercede management itself, and even to impose by-laws on a co-operative society". He rather dramatically summed up the situation in the words: "The co-operative is now to them [the community] only a facility to be availed of when necessary, similar to a train being used only when a journey has to be made. The society, like the train, is the concern of the State. The co-operative movement which has been deprived of its co-operative character under the law could not become co-operative unless that law is changed". This also summed up the feelings of almost all the non-official participants in the seminar.

The process of planning for co-operative development, it was noted, would be affected by two sets of factors — external and internal. Among the external factors were listed policies and attitudes of the ruling political party, role of the state administration, and the competitive behaviour and social and economic aspirations within the community. The internal factors listed were: quality of leadership, structural integration within the particular sector, availability of expertise, and past performance of the individual units. No process of planning could possibly escape the impact of these important factors. In fact, the feeling was that the quality of the planning process would be determined solely by these factors.

On the alternatives to the existing process of and agency for planning co-operative development, there was near unanimity. Everybody seemed to favour federal organisations for each sector. Many supporting arguments were put forward; resources available at the primary level were inadequate, there was need for perspective planning, expertise could be developed and retained at the federal level only, a national view was imperative if an integrated development of the entire movement was to be achieved, etc.

Even government officers who were present fell in line with these arguments, though they felt that, before federal organisations could take up the task, the movement should become self-sustaining and self-reliant. Only then could it survive political interference; or else history would repeat itself. Two major resources, *viz*, managerial and financial, came in the way of the co-operatives becoming self-sustaining; the leadership would have to devote its attention to these aspects, they felt.

As for co-ordination between the process of planning for general economic development and the co-operative movement's development, it was felt that, though the objectives of the State and the co-operatives were the same — restructuring of society socially and economically on more egalitarian lines — difficulties were bound to crop up, because of the different perception of these objectives by the co-operatives and by the political leadership, and because of the distinct strategy of each in achieving these objectives. Once a conflict arose between the two, the will of the political leadership would prevail. Co-operative leadership would, therefore, be better advised to consider management of such conflict before starting to plan for the development of co-operatives in the country.

The seminar was useful insofar as it succeeded in highlighting the lacunae in the present State-dominated and State-directed planning process; but it could not offer an effective alternative agency, strong, healthy, and capable enough to withstand the onslaught of the other external forces that would come into play once co-operatives are insulated from the State agencies and deprived of State patronage.

Businessmen in Blinkers

S Srinivasan

YET another occasion for our industrial magnates to display their undoubted flair for mouthing well-worn cliches and avoiding awkward issues — that was what the recent seminar, held in Bombay on October 8, on "Business and Business Associations in the Changing Environment" turned out to be. The organisers of the seminar, the Indo-American Chamber of Commerce and the All-India Association of Industries, had prepared a background paper which had raised some significant issues.

"The first and major step in effective management", the background paper pointed out, "is achieving cost reduction or a higher level of productivity". And yet, not a word was spoken about the imperative need to cut costs. Bharat Ram, who incidentally had a word of praise for the background paper, went on to affirm that the entrepreneur in the present circumstances is not free to work towards a price reduction. He tried to explain away the industry's lapse on the cost front by saying, "initiative, resources and results have been taken out of its (industry's) hands, and all these are being dominated and influenced by the politician and the bureaucrat". His swipes at sections of society other than the business community — trade unions, the government and the bureaucrats — reminded one of the fond mother who, while watching her son on parade, exclaimed, "Everyone in the line is out of step except my dear John".

The cost reduction issue merited only a passing reference at the hands of Harish Mahindra. "Business," he said, "should be continually concerned with quality improvement and price reduction". However, it was not for him to admit that this precept is being honoured in the breach than in the observance. Nor did he care to outline the specific steps that should be taken to achieve cost control. He left it all to modern management techniques. While the latter can certainly keep costs to the absolute minimum, the community as a whole does not stand to benefit by the exercise unless at least a part of the cost reduction is passed on to the consumer in the form of lower prices. Here it is a question not so much of modern management techniques as of an enlightened outlook on the part of the entrepreneur. Neither Mahindra nor Bharat Ram appeared to be interested in this aspect of the problem. As for D C Kothari, another speaker, he did not even bother to mention the question of cost control.

Evaded Responsibility

Raising productivity levels was another issue that was successfully fuddled, if not altogether evaded. Bharat Ram was at pains to pass the 'buck' on to trade unions; after repeating the familiar plan that wages needed to be linked to productivity, he said "the trade unions cannot absolve themselves of their responsibility in this area". Surely, Bharat Ram knows that almost every increase in productivity is the direct result of managerial innovations like optimum use of human, material and monetary resources, improvement of production processes, upgrading of sub-standard raw materials through research and development, better planning, purchasing and packaging, finding out ways and means of reducing the cost incurred by suppliers of raw materials and distributors of finished goods, etc, and that has little to do with the workers, except to the extent of their co-operation in implementing changes designed to achieve a higher level of productivity. What the participants in the seminar knew full well, but did not like to speak out, is the fact that inefficient management and not obduracy of labour is the real reason for the failure to achieve higher productivity levels.

If industrialists like Bharat Ram are really that earnest about relating wages to productivity, how come there was no suggestion at the seminar that employers should work out specific norms of productivity and come out with a formula which will offer labour a specific quantum of wage increase for, say, every five or ten per cent increase in productivity? Also, what prevented the employers from proclaiming that it would be their policy to share productivity gains with the employees and the consumers? (A higher productivity has no significance to society, unless its gains are shared by employers, workers, consumers and the general public.) And where was the warning to business houses that cannot resist the temptation to mask productivity gains (by appointing their friends and/or relatives either as purchasing agents of sole selling agents) to avoid their having to share it?

Mahindra cited two brilliant examples in productivity bargaining — one between the management and the employees of Esso's Fawley Refinery in England and a more recent productivity deal concluded by British Oxygen. Why is it, then, that our employers find it difficult to emulate the example of their opposite numbers in Britain? Have our managements really applied their minds to this kind of bargaining? Such questions were neither posed nor answered.

The subject of imaginative industrial relations policy, which is an essential feature of enlightened management, was scrupulously avoided by the speakers — except Mahindra who too was content with the statement that, as a profession, personnel management in India is not as attractive as purchase or sales management and that there is a tendency to shy away from it. It was not for him to appeal to his fellow industrialists to eschew reactionary or pussilanimous or paternalistic attitudes in dealing with the workers and their unions; to warn them about the risks of not recognising majority unions, of failure to adopt a neutral role in inter-union wrangles and of by-passing their personnel managers by referring industrial disputes to political busybodies whose only interest is the publicity they secure for themselves.

In dealing with the problem of presenting the image of the business community to the public, D C Kothari appeared very much concerned with projecting it in every nook and corner of the country. He did not pause to inquire whether the image, as it appears today, was worth projecting. When someone in the audience asked Kothari what were the contributions of the business community that could be publicised, he mentioned "the taxes we pay, the employment we provide, etc". And this, in spite of the pointed reference in the background paper: "Businessmen's activities that will have a favourable impact on the public mind are precisely those that are not directly connected with the pursuit of profit".

Kothari was the only speaker who dealt at length with the role of business associations in the changing environment. Strangely enough, he did not talk about the need for these bodies to learn to look at economic problems from a broader perspective, instead of confining themselves to submitting representations to the state and central governments. He was worried that the membership of the Federation of Indian Chambers of Commerce and Industry was not as representative of the business community as it should be. How a mere increase in the number of members will enable FICCI to raise its sights and "study problems in depth and present an objective case" was a mystery that was left for the audience to sort out. Bharat Ram pleaded dearth of secretarial services capable of collection of information and statistics and of anticipating the results of alternative policies. One would have thought that FICCI's Secretariat had enough expertise to tackle all this and more. There was, of course, no hint about the real snag — which is lack of vision on the part of the managing committees of business associations and their reluctance to identify themselves actively with national interests to some extent at least, even if totally as in the case of Chambers of Commerce in Japan described in detail by Takahashi who spoke on government-business relations in Japan.

It has become the fashion these days for industrialists to equate growth with development. "...the most powerful solution for resolving the contentious problems of poverty and unemployment," said Mahindra, "is not more of social welfare programmes or more government intervention or more foreign aid or more awareness of one's social responsibilities, but it is simply faster economic growth." Is it really that simple? No one can dispute the imperative need for economic growth. However, the assumption that once growth is ensured, prosperity surely and steadily percolates until it reaches the lowest income groups has been proved to be a dangerous myth. If economic growth is capable of bringing about distributive justice, there should have been no islands of poverty in countries with high growth rates. The fact, however, remains that the poor continue to be with us, and socially desirable, projects are starved of finance, rapid economic growth notwithstanding. It is surprising that this truth should have escaped Mahindra, who mentioned Marcuse, Sartre, Edward Mischen, Salvador Allende, Reich and Lindberg — all in one breath.

A rather amusing feature of the seminar was the intellectual posturings of some of our industrialists. Bharat Ram, for example, said that competitive business and co-operative endeavour are not antithetical and followed it up by saying, "I refer to the precept of thesis, antithesis and synthesis". What exactly this was supposed to convey, was not quite clear. Mahindra went into a brief dissertation on 'value premises' in his address. He attributed the failure of most discussions to the fact that individuals do not bother to ascertain their 'value premises' at the very outset. Continuing, he asked "when, for example, a person who has faith in enlightened capitalism as conceived by the school of Ayn Rand gets together with another who subscribes fully to the exploitation theory of Marx ... we cannot expect them to be talking to each other". It was difficult to appreciate this reference to the importance of establishing value premises in a discussion between thoroughly respectable, dynamic conservatives where there was no danger of the capitalist and the communist confronting each other with their rival sets of values. In any case, the seminar was concerned not with the evaluation of the merits of alternative ideologies; its objective was the lot more modest one of finding ways and means of making the enlightened capitalist move with the times and become a little more enlightened.

One really worthwhile suggestion that came from Mahindra was that an independent body of businessmen, consumers, trade union leaders, government officials, and other prominent individuals, might conduct a social audit of business houses covering such areas as price policies, industrial relations, and social welfare activities. The idea is sure to be given short shrift by industrialists. If by a miracle it survives, and is given concrete shape, what an opportunity it will provide for exposing the yawning gap between profession and practice among the members of the business community!

BANGKOK

By the Grace of the GI

(From a Special Correspondent)

THERE is a curious similarity in styles of planning between Thailand and Britain. In Britain the overall constraint has been the balance of payments, and much of the 'planning' consists of demand management. Talking to planners in Thailand, one gets the impression that 'demand management' is their style of operations as well. In the newly released third five-year plan, which came into force on October 1, (the English version of the plan is not yet out), the growth targets for all sectors except agriculture and banking are lower than what had been achieved in the last five-year plan period (see Table 1). These growth 'targets' are really nothing more than 'forecasts', and it is forecasted that the economy would grow at a less rapid rate than in the preceeding five-year period.

The growth of income had been fairly rapid in the last five years. The GNP grew at a rate of 8.1 per cent per year, one of the highest achieved in this part of the world. No doubt this is due partly to the large military expenditures of the US government in Thailand. Estimating the contribution of US government expenditures to Thai economy is beset with all sorts of problems, chief among which is that many items of military expenditure are directly linked to imports, so that in one sense a part of the expenditure is direct transfer of military equipment from America to Thailand. After eliminating such clearly identifiable imports, the United States Embassy has put the figures as follows:

	(Million US $)
1965	30
1966	130
1967	215
1968	214
1969	186
1970	160

Source : The Investor, April 1971, p 318; published by Thailand's Board of Investment. (One US $ is equal to 20.825 Baht.)

Thus US military expenditures reached a crescendo in 1967 and 1968, constituting about 5 per cent of national income. As a result of this, Thailand was able to import 60 per cent more goods than it exported and at the same time build up its reserves, which have however begun to decline by small amounts since April this year. In addition to the large US military expenditures, Thailand had also been lucky in experiencing a decline in its import price index.

In spite of the high growth rate of income in these favourable circumstances, there is little evidence that the character of the Thai economy has changed. The share of manufacturing output has fluctuated beween 14 and 15 per cent of GDP. The sector which

TABLE 1: TARGETED GROWTH RATES DURING THE THIRD FIVE-YEAR PLAN PERIOD

Sector	Growth Rates Per Year 1967-71 (Actuals)	1972-76 (Targets)
Agriculture	4.1	5.1
Mining and quarrying	8.1	6 0
Manufacturing	9.2	8 0
Construction	8.4	6.5
Electricity and water supply	20.7	15.0
Transportation and communication	7.5	6.0
Wholesale and retail trade	7.7	7.0
Banking, insurance and real estate	14.4	15.0
Ownership of dwelling	4.1	2.5
Public administration and defence	10.0	6.0
Services	8.8	7.0
Gross domestic production	7.2	7.0

has boomed the most is residential construction. This does not get adequately reflected in national income data due to statistical problems, but anyone can see the extent of new construction in Bangkok in the last few years—large numbers of new hotels as well as residential houses.

Indeed this is the sad aspect of economic growth in Thailand. Large military expenditures have flowed in, often tying up domestic resources as well for military purposes. These in time have created a demand for various kinds of services—some of them valuable like engineering, but mostly for residential accommodation, massage bars and hired wives. In some areas it has also led to substantial additions to employment, but the chief spillovers have been to residential construction and massage bars.

It is particularly sad, therefore, to see that the planners have made little attempt to increase the productive potential of the economy in the third plan period. They seem to be operating under two constraints. Firstly, the relatively free trade policy should not be interfered with and the growth of money incomes has to be controlled in such a way that the balance of payments is not in deficit. Secondly, a public sector other than for creating infrastructure is considered undesirable; so growth has to be engineered through the private sector.

These two constraints together have left little scope for a bold attempt to restructure the economy. Added to all this, the private *industrialists in this* country operate as a cartel, in association with and with the connivance of the army which is the seat of real political power. The cliquishness of private industrialists has been noted by several observers. One of the consequences of this is that many industrial houses are unwilling to go public so that the savings of the general public are given a chance to participate in industrial development. These frustrated savings go in time into other accessible investments such as in small shops, urban speculation, etc, in spite of the fact that large manufacturing is sometimes highly profitable.

An example of cliquishness is that no one is allowed by a government decree to open a new bank. Further, the existing banks are unwilling to increase their paid-up capital by a public issue of shares (even though some of the banks have been highly profitable) because of their fear of losing control. The Siam Commercial Bank, for example, declared a dividend of 160 per cent in 1968, which rose to 187.50 per cent in 1969, and 235 per cent in 1970 (see Table 2). Other banks which have not declared such high dividends have been able to retain large profits and thus accumulate reserves. For *example, the Siam City Bank has a* paid-up capital of one million baht, but has added over the past three years 51.15 million baht to its reserves and undistributed profit which at the end of 1970 amounted to about 119 million baht (see Table 3).

In the context of the unwillingness to have a public sector, such cliquishness on the part of private industrialists has serious consequences for industrial growth. The industrial growth rate then comes to be determined by the savings rate of this elite group and the extent to which others are willing to let their savings be channelled to this elite at unattractive rates of interest compared to the rates of return on capital.

Due to the above reasons, there is increasing political disenchantment with the present set up in the country. Accusations of corruption at high levels abound. Recently a group of legislators have signed a petition to the Prime Minister suggesting that the government *should investigate, in collaboration* with the Swiss government, the secret accounts held by Thais in Swiss banks. One of the newspapers, however, has added wryly that it is not likely that the Prime Minister would take any action for fear of embarrassing *many high officials!*

The common people are also getting restless at the American presence in Thailand. In a letter to a Bangkok *newspaper entitled "what are the Ame*ricans really doing in this country?", a Thai, who has been working with a GI, recaptures a dialogue he had with the GI at a farewell dinner. Extracts from the letter are worth quoting:

> "After dinner we sat and talked about many subjects... At one point, during the conversation the GI asked about the reason behind and the reaction of Thai people to allowing the United States to establish military bases in this country.
>
> My friends and I told him what we personally thought as best as we understood the situation. We mentioned the co-operation agreements between Thailand and the United States. We explained that the United States requested *permission* to build military bases here and asked for the co-operation of Thailand, in order to transport bombs to go and destroy North Vietnam. The military bases play no role in suppressing insurgents in Thailand.
>
> We noticed that he began to show signs of misunderstanding. He said things to the effect that the US wished to set up military bases in

this country and Thailand had no choice but to comply. The US can and does establish military bases anywhere it chooses all over the world. Besides, the Thai government and the leaders of this country have benefited a great deal from the American presence. They are well aware of the fact that as a result this country has made great strides economically. It was only after the establishment of the military bases in Thailand that modern shops, movie theatres, good hotels, etc, began to make their appearance here.

We tried to argue and explain that although he was correct to a certain extent about the benefits we have received from the American presence — this was only a very small percentage, affecting a small group of people such as the hired wives, and a small number of towns where the bases are situated — on the whole, however, the government is facing many problems created by the American presence.

We, the Thai people, have lost our most valuable customs, manners and traditions, which we held dear before they came to this country. Not a small number of Thais are now most dissatisfied with the situation and want the US to dismantle their bases and take all their people out of the country.

He then asked what the Thai people could possibly do? All that was needed was for the leader of his country to issue an order to the US troops in Thailand to take possession of everything in this country and it would happen with no difficulty whatsoever. He compared Thailand's present situation to that of the 51st state of the United States of America.

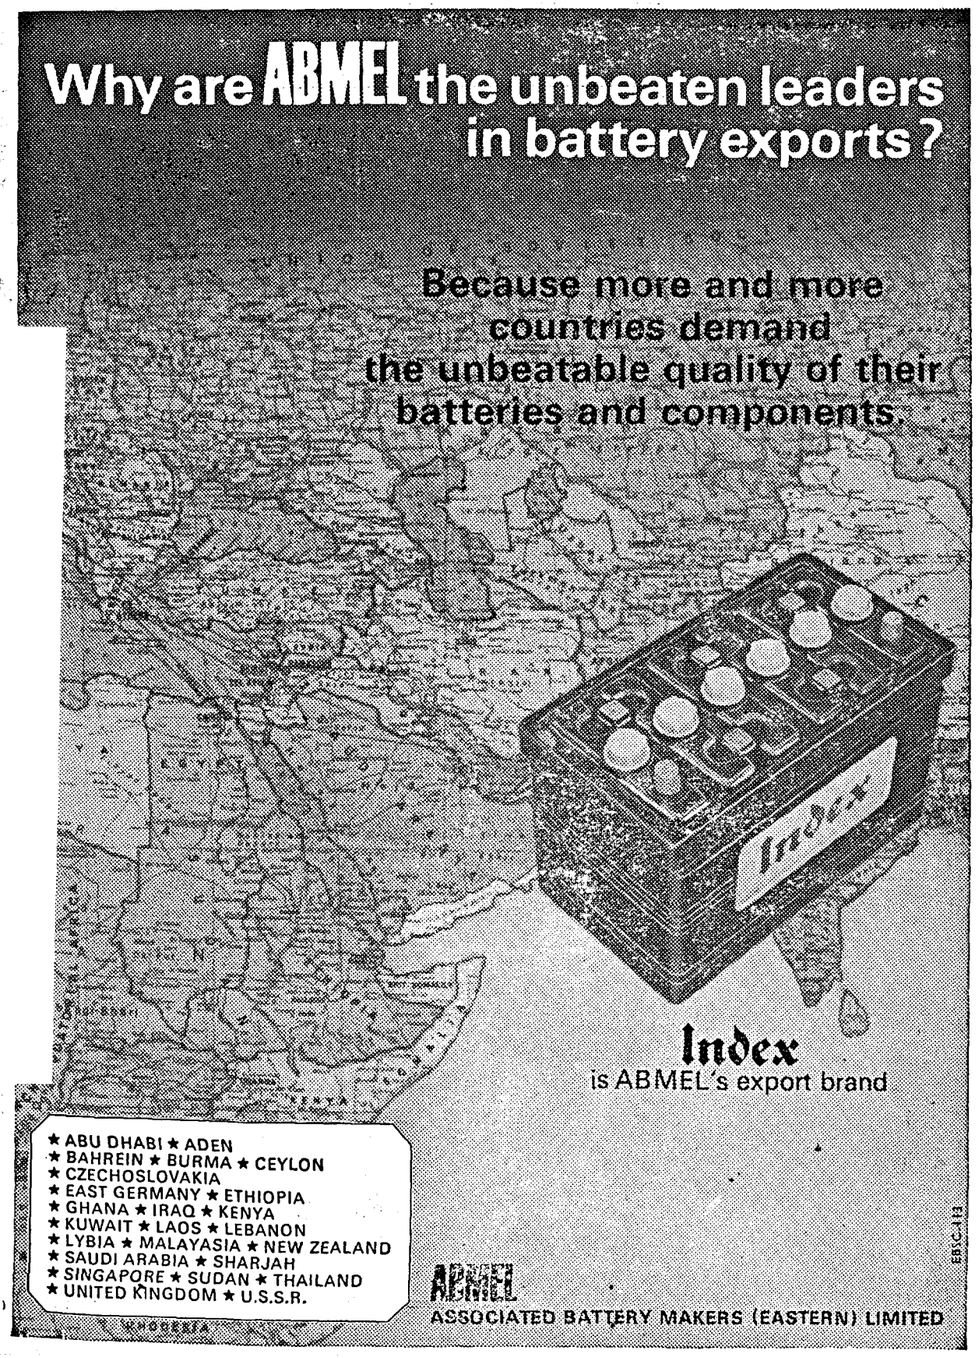
We then pointed out his ingratitude. This country is after all offering Americans a home where they live in peace and comfort.

His answer indicated that he felt Thailand had no choice in the matter. He said that every baht and satang which we are receiving in the form of aid was not much different from selling our country to the United States on the hire-purchase plan. All this, he said, was obvious from the fact that every policy decision on the part of the Thai government followed the American lead.

We really felt sad and at the end of our tether, but all we said was that he was different from us. We had different customs and different feelings. Thailand and the Thai people are peace-loving and generally look upon other people in a friendly light. From now onwards, however, we Thais will have to realise that our friendship, and the loving kindness which we have shown to foreigners, and especially to Americans, are all utterly worthless to them. The GI probably understood the way we felt, for he changed the subject and took his leave soon after.

After he left we stayed up and talked about this matter for a long time. It will be a long, long time before we can forget what we heard and experienced that night. The feelings we have will remain with us as long as there are Americans and American military bases in Thailand.

LONDON



Prospero Is Stunned

Farrukh Dhondy

ANGELA Davis says, and every colonial knows its true, that all black trials are political trials. In the programme of the Black Panther Party of America they have a clause demanding that all black people in state and federal prisons be set free because the constitution of the United States guarantees every citizen a trial by a jury of his or her peers, and all those people are behind bars at the behest of white juries.

Three weeks ago, in London, at the Old Bailey, the trial opened of nine black people charged with conspiracy to riot. As it began, the defendants made a representation to the court to be tried by an all black jury. Their demand, which would have necessitated a change in the law if it had been granted, was thrown out of court after two days of legal wrangling by their barristers. "I need give you no reason", said Judge Edward Clark, summing up his categorical refusal.

There wasn't a person in that court, official, defendant, or member of the public, who didn't in some way understand the unstated reason. The least part of which was, of course, that before a black jury, the charges would never have stuck. The defendants, characterised by the prosecution as nine dangerous people who are attempting to subvert the State through their leadership of black political organisation in

London, would walk out of that court free men and women with the support of their community openly displayed.

The demand, if granted, would have subverted British 'justice' by asking it to comply, in spirit and letter, with what it pretends to. The defendants pointed out that they were asking for no more than the Magna Carta promised to the commoners of the State; they were asking to be tried by a jury of their peers and they were making some assumptions about the nature of British society. They were assuming, correctly, that in real terms the society is racially divided, a division which white and black feel, a division which will be enshrined in law once the 'aliens' bill is put on the book, a division which the police are conscious of, a division which schools, employers, landlords, political parties and the government exploit.

The division of opportunity, significant as it is, makes the experience of a black Britisher different from that of a white one. It makes sense, then, that the blacks refer to each other as 'brother' and 'sister', and to the exploiting agent as 'the man'. Words incarnate the reality; for there to be justice according to the letter of the law, the Mangrove Nine ought to have been tried by their peers, ought to have had a black jury.

By refusing them their right, Britain declared that theirs was a society which could not afford justice. But in the words of one of the defendants, "they chose the wrong set of niggers this time". I feel, that much to their regret, the British courts are going to learn how substantially true that statement is. Britain is, at this moment in history, experimenting with ways in which to control the dissent which the crisis of their economy has caused (and I don't feel it's grandiloquent to pull history into the argument because the resolution of the forces at this particular time will have far-reaching consequences). Northern Ireland, sick at heart for years has broken into the recurring allergy of guerilla warfare. Four large firms, including the Upper Clyde Shipbuilders and BSA, have been occupied and are being run by the workers, defying the Tories to accept it or send the troops in; the unemployment in the country, now at the million mark, is generating the rhetoric of the thirties once again; the Angry Brigade, an unidentifiable organisation, has started bombing the homes of Industrial Ministers and police stations.

All this and the blacks too. The escalating discontent of the black population is giving rise to very hard-headed political organisations — movements around which black anger will gather, as fingers belonging to a hand gather in a fist. "They shit scared, man, they shit scared", a demonstrator said to me as 10,000 black people marched against the Immigration Bill earlier this year and the police came in their hundreds to escort them. A nation that can afford democracy doesn't need the torture and internment camps of Northern Ireland, it doesn't need the political trials of political black people.

It is only over the last two years that the British government decided that part of the game was up; it was no good holding political defendants on charges like obstruction and assault, but they could deepen the divisions between black and white workers by charging black people with conspiracies of one sort or the other. The Mangrove Nine, seven 'brothers' and two 'sisters', were all arrested at various times in the year following a demonstration of black people in Notting Hill Gate in West London to protest against the brutality of policemen to black people and to expose the victimisation of black clubs and organisations in the area. The defendants get their collective name from the Mangrove restaurant, a black restaurant in Notting Hill Gate, which has been raided several times by the police because the owner refused to pay bribes to the local policemen and because the place is a central spot for the community in the area. None of the raids had any positive results for the police, none of the charges they tried to pin on the restaurant and its owner, Frank Critchlow, ever stood up in court. On August 9, last year, the demonstrators gathered outside the Mangrove restaurant, about 400 strong, and marched past the three police stations which control the community. Brother Darcus Owusu, one of the defendants in the trial, made an opening speech. "Brothers and Sisters", he said, "we have complained too long to the police about the police and nothing has been done, we have complained to the courts about the courts and nothing has been done, we have complained to parliament about parliament and nothing has been done, it is time the people did something for themselves." He went on talk about the attitude of police to that community of black people, and understanding Caribbean voices shouted back "Rock away Brother D, fire some heavy shots, sock it to them Brother D", etc. The policemen, who later broke up the demonstration and are now being used in evidence as prosecution witnesses, claim that he started the speech with the statement "Kill the white pigs" and was met with answering shouts of "Kill the white pigs".

As in all these trials, the prosecution is relying not on hard facts, but on the general psychological insecurity it can create in the white jury by characterising the demonstrators as savages irrationally attacking the police force. The defence have consciously eschewed the policy of attempting to fight the case on non-political grounds, and are making it clear that they understand the status of such legal persecution in the State's corpus of control. Two of the defendants, Althea Jones Lecointe and Darcus Owusu (charged under his slave name of Radford Howe) are conducting their own defence. Predictably, the judge picks up for the jury the points the prosecution has missed in cross-examining witnesses, harries the defence lawyers when they seem to be making nonsense of police testimony, and persistently attempts to whitewash the political complexion of the trial. The prestigious national newspapers follow the trial, but report it only when they can support the prosecution's contention that nine 'dangerous' political adventurists have been caught attempting to make political capital out of the dissatisfactions of the black community and deserve to be sent down.

The jury — 10 white, two black — are by now aware that more is at stake than the personal liberty of nine young black people. The galleries of the court are full each day of their supporters, and the radical press is full of the issue. This trial, like the black trials in America, will measure in a sense the attitude of white Britain to its Achilles heel. Though black people are tried in Britain's courts for one thing or another every day, this particular trial makes one feel that an ironic force of historic justice is at play. It has something to do with the sight of so many black people queueing to get into the public gallery, day after day, outside the Old Bailey in the business citadel of London. It has something to do with the eloquence of the descendants of the slaves on whose blood this empire was built, with their standing up in a British court and perceptibly frightening it. If Britain is using this as a test-case for their post-Immigration Bill generation of blacks, then Britain can see that it has met with the will and the organisation to resist. Prospero is stunned that Caliban speaks, his loss on it now is that the rest of the island can hear him.

In the News-Maker's Absence

Nireekshak

WITH the Prime Minister away, the focus of political and journalistic attention was bound to shift, as it has done, to points in Europe and America. For a brief moment it appeared as though New Delhi had not much grist to provide for the mills of its special correspondents. This may have been an inconvenience in normal times, though never much more than that, as the native ingenuity of the special correspondents is known to have survived greater obstacles. But these are not normal times. And in any case, before any inconvenience could be felt by anyone, there came some windfalls which newspapers avidly picked up. The windfalls came in the form, first, of the new tax levies and, second, the Soviet Deputy Foreign Minister's visit to the capital. China's admission to the United Nations, again, found the correspondents busy. There has been much animated editorial discussion also.

Statesman, for example, which had never concealed its distaste for the Indo-Soviet treaty, used N P Firyubin's visit and talks here to throw fresh doubt on the usefulness of the treaty. "Soviet friendship is by no means a matter to be despised", it allowed generously, "and the implied assurance of aid, should it be necessary, is indeed welcome. Yet highly dramatised exchanges with the Soviet Union convey the impression of an extravagant dependence on Moscow with expectations on New Delhi's part which there is no reason to believe will be inevitably fulfilled." Referring further to the activation of Article IX of the treaty and the explanation furnished by officialdom that this was a "natural consequence of cordial relations with Moscow", the paper asserted it was still "obscure" in what sense the treaty could be regarded as "natural". In fact it was far from clear, said the paper, whether the treaty was made necessary by New Delhi's foreign policy or whether policy is now being shaped in the light of the treaty".

This view was however hotly contested by *National Herald*, which said that the treaty had cast a responsibility on the Soviet Union "to foil Pakistan's aggressive designs on India, and it is certain that she [the Soviet Union] will fulfil her obligations". The Soviet Union, *Herald* noted, was "a dependable ally" of this country and "this friendship is of great value to her... when her security is being threatened by Pakistan". Alone among all newspapers, *Herald* asserted that "there are indications that the Soviet Union will help India in a big way" though what these indications were it did not feel called upon to explain. Without going as far as the *Herald* to uphold either the treaty or Soviet friendship, ***Hindustan Times*** conceded that the "invocation" of Article IX of the treaty has "added a new dimension to the bilateral talks between the two Governments". Even though the invocation of the article may have been "premature" in some respects, "politically it is a pregnant gesture". Yet all this does not mean, the paper cautioned, "as some supporters of the treaty imagine that the Soviet Union is committed to go the whole hog with India in the unfortunate event of an outbreak of hostilities between India and Pakistan...".

It was perfectly true, commented *Free Press Journal*, that "the treaty does not impose any obligation on either party automatically to go to the assistance of the other in the event of an attack or threat of attack against it". However, it added, "the treaty does not preclude such assistance and in any clear case of attack the moral obligation to assist will be found irresistible". As for Firyubin's talks in Delhi and the joint statement issued after it, they make clear, *FPJ* said, that "the treaty has successfully met the first test to which it has been put".

The discussion on China's admission to the United Nations turned on familiar lines. India has always been an advocate of China's entry in the United Nations, the general argument went, and it has therefore reason to welcome the General Assembly's decision. The delay in admission was universally attributed to American intransigence—"a twenty-three-year old absurdity created by American refusal to see reality squarely in the face", as *Amrita Bazar Patrika* put it. However, opinion differed on the possible impact of China's admission on the United Nations itself. As *Patrika* saw it, "it is easy to see that the UN would not remain hereafter what it has been till now, but which way it would move is a question to which an answer is unpredictable at this stage". *Deccan Chronicle* however took a more positive stand on the question. "The UN as a forum for imperialist intrigues can be expected to undergo a vast transformation", it said. "It will now make China to act in a responsible manner and strive to strengthen the UN as the true conscience-keeper of the world. Its presence should contribute a great deal to the furtherance of peace and understanding among nations."

Hindu, like most others, saw the decision as "historic". The decision "is perhaps the most important step the UN has taken since it authorised collective military action to repel the North Korean communist aggression in 1950... What the UN will be, once Peking comes in, will naturally depend on its global aims. It is certain to be a third centre of power... From whatever angle one may look at it the UN will no longer be the same, once Peking takes its rightful seat." And according to *Indian Express*: "China's entry into the UN marks a revolutionary step, more far-reaching than many who voted for her admission realise... There is no doubt that China will now assume the leadership of the Afro-Asian bloc." What is more, while a "Sino-American rapprochement... signifies a nightmare for the Kremlin... China's entry in the UN could ultimately also signify that for the White House".

The new levies met with a mixed reception. While most newspapers conceded that the levies were unavoidable in the circumstances, not everyone was sure of their impact or whether they would be the last of such imposts. "Inevitable", commented *Times of India*. "The new levies are just the beginning of a long haul. The cost of providing even a modicum of relief to the nine million refugees will push up the budgetary deficit this year... More taxation is inevitable and all sections of the people will have to share the consequent burden."

In the context of the "crisis on our borders... there are no two opinions on the Government's action to mop up resources", remarked *Deccan Herald*. However, it added, the levy on newspapers and periodicals can scarcely be "considered either fair or equitable". If sufficient attention has not been paid to the effect of the new taxes, "there is still time for the Government to make changes so that the levies are not harsh on the weaker sections of society".

Indian Experience in Urban Planning

Ardhendu Bhattacharya

Urban Government, Finance and Development by Abhijit Dutta; World Press; pp 171; Rs 15.

THIS book is a collection of 15 papers presented by the author to various seminars and journals. Broadly, the book deals with Indian experiences in the field of urban and regional planning. Financial and administrative inadequacies of most urban local bodies have been studied in the perspective of centre-state relations. A diagnosis of fiscal proposals embodied in the Basic Development Plan for Calcutta Metropolitan Area, and the economic implications of rent control Acts in India, are also analysed.

The first two papers are general and present the evolution of the concepts. The author has highlighted the growth of a large number of urban planning and development bodies, their financial inadequacies, the absence of inter-unit co-ordination, and the lack of governmental support. The regional planning difficulties assume wider dimensions when the planning area extends beyond the territory of just one state. Dutta, in paper three, has discussed the plan for the National Capital Region, which covers 12,647 square miles of area extending over the four states of Delhi, Haryana, Uttar Pradesh and Rajasthan. He finds there is inherent apathy among the states involved in such joint planning effort. Dutta is, therefore, right in suggesting that, since the concept of inter-state planning is yet to take shape in India, planning efforts initially should be directed towards inter-state co-ordination of a few selected functions, such as water management, power system, transportation, etc.

In his paper, 'Financing Municipal Services', Dutta has drawn the observations by the Zakaria Committee with regard to the existing gap between the actual and desired levels of municipal expenditures in most Indian municipalities. He has discussed possibilities of raising revenue from various sources, including better administration of property taxation, a tax on commuters to the cities, and a tax on urban land values. However, he finds inherent limitations in most such tax efforts and other internal resources to finance urban development. He, therefore, suggests a reorientation of financial relations between the state and local bodies, and proposes the creation of a municipal finance commission in every state for revenue devolution by way of tax sharing and grants. It is generally agreed that the funds for urban development should increasingly come from central or state governments; but at the same time, we must ask the local bodies to shake off the present inertia for additional taxation and tap the existing sources more fully. The reasons for apathy are political, sheer inefficiency, and/or outdated methods of property income valuation.

For financing urban development, Dutta has suggested the creation of a central loan agency with regional offices. The recently created Central Housing and Urban Development Corporation, with its headquarters in New Delhi, is a step in the direction which Dutta has emphasised.

In paper 10, Dutta has suggested some modifications in the system of general purpose grants now being granted by state governments on per capita basis instead of on a performance basis. Similarly, such factors as population density, settlement pattern, type of workforce, the economic base, age structure, sex-ratio, topography, etc, are not considered in determining the size of grant. Dutta, however, has not suggested any specific formula for guiding the size of such a grant.

The author has discussed in paper 12 some of the fiscal and administrative proposals contained in the Basic Development Plan for Calcutta. The BDP correctly rejected the idea of an all comprehensive general purpose planning and development authority and, instead, suggested an apex planning body at the top, more than half a dozen functional agencies, and consolidation of fragmented municipal units. It was felt that the proposed arrangement would be consistent with the spirit of local self-government, would be economically viable, and would simultaneously remove the usual ills of general purpose single metropolitan-wide local government.

Dutta's plea for a single metropolitan government as a means to prepare a metropolitan capital budget is untenable. It is possible to enforce inter-unit co-ordination through the creation of a high-powered capital budget division within the apex planning body. Such a division should be entrusted for carrying out cost-benefit studies of various urban development schemes with a view to fixing the overall priority. Dutta has very subtly pointed out the following demerits of BDP proposals: (i) lack of economic appraisal of various schemes put together in BDP and hence inadequacy of information about the apportioning of priorities to various schemes; (ii) absence of bold suggestions and lack of analysis for boosting internal revenue; (iii) the non-including of major findings and conclusions of expert bodies like rural-urban relationship committee; and (iv) the suggestion to create a Rs 10-crore revolving fund—without mentioning the sources for such a revolving fund.

Dutta has discussed, in paper 14, the pros and cons of the present rent control method *vis-a-vis maintenance of* housing stock. He thinks that the present method of rent control of old structures, in particular, is not conducive to their maintenance. Existing rent control Acts provide for permitted rent increases and rent control holiday periods only to relatively new houses, i e, those built in the post-War years. However, his suggestion for gradual relaxation of rent control Acts on old houses is debatable since its adoption would mean preferential treatment for old houses. A general reorientation of the entire rent control policy may instead be suggested which would take into account, among other factors, the ability and willingness of house owners to repair and maintain, trend in land prices, etc. The experience of the Bombay Building Repair Board, as Dutta highlights, deserves serious consideration. The Act seeks to shift the maintenance of rent controlled buildings primarily onto the tenants through the levy of a cess. The cess varies inversely with the age of a building. Tenants of old houses are made to pay more. The fund of the Board is also supplemented by loans from government and municipal authority.

The book is, indeed, a very good collection of papers on what may be called Indian experience in urban planning and development. It would be of particular interest to researchers, fiscal analysts working for urban planning, administrators, politicians, and municipal decision-makers.

From Tambu Consciousness to Modern Capitalism

E A Ramaswamy

Capitalism, Primitive and Modern : Some Aspects of Tolai Economic Growth by T Scarlett Epstein; Canberra, Australian National University Press; pp xxiv + 182; $ 6.50.

THIS book is about economic development among Tolai, a people of Melanesian stock living in the Gazelle Peninsula of New Britain. Cannibals till the turn of the century, the Tolai are now little different from entrepreneurs anywhere.

The turning point in Tolai economic development came with contact with Europeans. The Germans established trading stations in the peninsula to purchase copra from the natives. The continuing international demand for copra familiarised the Tolai with cash cropping. Later, at the end of the Second World War, the Tolai eagerly took to cocoa cultivation when the Australian administration introduced the crop. Considerable cash income accrued to the Tolai as a result of cash cropping. But most of their consumption needs could still be met with subsistence production. As a result they could accumulate large sums of money. What enabled the Tolai to accumulate and invest their savings rather than expend it on consumption was their traditional predisposition to hoarding. Even in pre-contact days the Tolai had a shell money called Tambu. Almost everything, including human flesh, could be bought with Tambu. Stockpiling Tambu was every Tolai's dream. Large quantities of Tambu were given away as marriage payment and during mortuary rites. The culmination of Tambu consciousness is seen in the belief that when after death the soul arrived at the gates of heaven, the ghost at the gate asked, Where is your Tambu? How much Tambu was distributed during your mortuary rites? Admission to heaven was conditional upon satisfactory answers to these questions.

It became a matter of prestige for the Tolai to invest their savings in such productive enterprises as copra driers, retail ships and trucks. With the emergence of permanent and substantial assets in the form of tree crops and service industries, many Tolai began to question the traditional system of inheritance. The Tolai were matrilineal with patri-virilocal residence. Property was owned in common by the matrilineage and passed in the matriline. The system worked well so long as cultivation was subsistence. Land was plentiful and the Tolai practiced shifting cultivation. But when a man invested considerable resources in planting perennial tree crops, often with the help of his sons, he did not want to see the fruits of his labour go to his sister's sons. The Tolai devised devious methods to pass on property to their sons. Some even talked of a shift from matriliny.

This unique study of a primitive people's response to opportunities for development is a significant contribution to the growing literature on economic anthropology. It is evident from Epstein's discussion that it was certain features of the traditional social structure which enabled the Tolai to respond so massively to these opportunities. This once again raises the familiar question of the relation between economy and society and of the suitability of some social structures for economic growth.

Twice Chewed and Tasteless

J A Naik

Soviet Relations with India and Pakistan by Devendra Kaushik; Vikas Publications; pp 119; Rs 15.

DOING research in a contemporary or historical problem is a laborious task. It requires hard work and patience, if not necessarily an objective attitude and an analytical approach. If, however, anyone wants to find out a shortcut to authorship, the writer of the book under review has shown how simply this could be done. He has simply copied down, with slight changes here and there, a work already published on the same theme and has presented a paraphrased version with some significant changes to the readers. Of course, the author has taken sufficient care to retain original footnotes in the book under copy and has not mentioned anywhere — either in the preface or in a footnote — the book that seems to have supplied him the bulk of his material. The only significant contribution that Kaushik seems to have made is that he has taken the trouble to present the Soviet official line to his readers.

The book is divided into five chapters. The first deals with 'pre-independence ties'; the second with Soviet policy from 1947-52; the third with Soviet policy during 1952-55; the fourth, during 1955-65; and the last deals with the 'Tashkent' period. Although the chapters contain a chronological treatment of the theme, the real treatment, however, is not confined to the chronological order and the author tries to present a very consistent, benevolent, picture of Soviet policy towards India. Whatever 'complications' arose in the Kremlin's relations with India, such as during the days of Stalin, were, according to Kaushik, largely due to 'anti-Soviet designs' of the 'Western imperialists' and the 'national bourgeoisie' at home. He dismisses as 'not true' an interpretation of Soviet policy on Kashmir as 'indifferent' and 'non-committal' in the beginning, and does not see Russia's 'own national interests' in its subsequent pro-India phase.

Although Soviet writers themselves are showing, during the post-Stalin period, appreciable wisdom and freedom in criticising Stalin's 'incorrect' policies towards India, for Kaushik the difference between Stalin's and Khrushchev's policies towards India is only one of degree. He, therefore, terms the phase under Stalin as the 'misty dawn' and the early Khrushchev period as the 'clearing sky'. Stalin was less friendly and Khrushchev was more friendly, but nevertheless it is all a story of friendship alone!

It is not the intention of this reviewer to suggest that a work on Soviet-ology or Sinology should necessarily contain cold-war terminologies of most of the Western writers to give it an appearance of scholarship and objectivity; but, surely, a study of the foreign policy of a seasoned, global power such as the Soviet Union would demand a more analytical and searching treatment than the *druzhba* model permits.

A more pertinent question in this connection is whether Indian scholarship can contribute anything either to Sovietology or to Sinology by copying the Western models of approaches or by bringing studies of foreign policy issues within the framework of the 'party line'. Indeed, it seems that, an understanding of the real nature of the foreign policies of communist countries has been more badly damaged than communism itself has been because of the experts who have deliberately or unwittingly chosen to be partisan observers of the scene. Cannot Indian scholarship contribute something of its own in this respect?

Regional Disparity and Economic Development of Pakistan

II: Some Hypotheses to Explain Growth of Disparity

Arjun Sengupta

This article, which studies the growth of regional disparity in Pakistan, has been published in two parts. In the first part, which appeared last week, the author examined the available evidence on the growth of disparities between East and West Pakistan. In this the concluding part, are presented some hypotheses to explain the growth of disparity with the purpose of isolating the factors that contributed the most.

It is difficult to find any systematic explanation of this growth of regional disparity in Pakistan. Several factors operated together and their interrelations gave rise to the disparity, but which factor or combination of factors were principally responsible for this pattern of growth is difficult to specify.

In this part of the article some hypotheses will be presented with the purpose of isolating the factors that contributed most to this growth of disparity. They cannot be considered established, however, with the nature of evidence that is available. They have to be regarded only as tentative hypotheses, indicating lines of further research needed to settle this question with some confidence.

THE picture that emerges from the analysis given in Part I of this article is that, although initially there was nothing much in the economic conditions of Pakistan that was noticeably favourable to West Pakistan, the gross provincial product of West Pakistan was growing much more rapidly than its population relatively to East Pakistan. As a result, the difference between the per capita income of West and East Pakistan widened over the years, and even in the late 1960s there was no indication of a reversal of that tendency. The figures of per capita consumption of some of the major consumption items in the two regions, as given in Table 4, corroborated this evidence of the increasing disparity of per capita income during the period 1950 to 1970.

For the purpose of isolating the principal factors responsible for the disparity, it is fruitful to divide the whole of Pakistan's experience in economic development into two subperiods: one up to 1959-60, i e, the end of the First Five-Year Plan, the other after 1960-61, the years of the Second and Third Five-Year Plans.[13] Such periodisation for Pakistan's economic development is a general practice now, mainly to stress that there was a breakthrough in Pakistan's growth process with the beginning of the Second Plan period — which incidentally also happened to be just a couple of years after the installation of the Ayub regime. The period of 1949-50 to 1959-60 was a period of relative stagnation of per capita GNP — a rate of growth of 2.4 per cent in GNP being almost neutralised by a 2.3 per cent growth in population. Khan and Bergan estimates showed a decline of per capita GPP by 1 per cent a year for East Pakistan with a 1.1 per cent increase in that for West Pakistan. In the Second Plan period of 1959-60 to 1964-65, Pakistan's GNP grew at about 5.5 per cent, which was nearly double the growth rate of the preceding decade. And during the Third Plan, the overall growth rate of GNP was about 5.7 per cent. Throughout the decade of 1959-60 to 1969-70, per capita GPP of both the wings increased noticeably, though, as we have seen, it increased faster in West than in East.

But this discontinuity in growth performance is not the principal reason for this periodisation in our present context. For, although the per capita GNP was stagnating during 1949-50 to 1959-60, there was a substantial expansion in the industrial activity in Pakistan. The growth rate figures are not very useful here, since with a negligible base they show an exorbitantly high rate of growth of industries. But there is no doubt that rapid industrialisation was going on. For our purpose, these are two main characteristics of this periodisation. During the period 1949-50 to 1959-60, the growth of agriculture was very small in Pakistan, about 1.3 per cent a year. But since 1959-60, there has been a sharp increase in agricultural output, with a growth rate of 3.4 per cent a year during the Second Plan and of about 4.5 per cent a year during the Third Plan. Secondly, since 1959-60, there has been a sharp rise in foreign assistance inflow into Pakistan. During the whole period, 1950 to 1960, the total foreign assistance, including grants and loans, flowing into Pakistan was about $ 1,362 million. During the Second Plan, 1960-65, alone, this inflow was $2,365 million, and in the next five years another $2,306 million.

The rate of growth in agriculture was low in both provinces during the first decade; but even then the growth rate in West Pakistan, which was 2 per cent a year, was about four times the growth rate in East Pakistan. This alone should go a long way to explain the widening disparity between East and West Pakistan during this period, especially when one considers that agriculture accounted for about 60 to 70 per cent of the regional product of East Pakistan, compared to about 45 to 51 per cent in West Pakistan. But, in addition, there was an interesting factor about relative price movements which further aggravated the problem for East Pakistan.

At the time of the establishment of Pakistan, most of the consumer goods manufactures absorbed in Pakistan were imported from India — a source that

was very quickly closed within a few years, so that all such goods had to be imported from abroad. During the Korean boom, Pakistan's export earnings from raw jute and cotton increased very substantially, even though Pakistan did not devalue in 1949 together with India and the UK. But this Korean boom was short-lived, and when it collapsed there was a drastic fall in Pakistan's exports. The policy that was followed in response to this was not devaluation, but a severe system of import controls by which imports of consumer manufactures were practically forbidden. Since Pakistan's exports were overwhelmingly agricultural, the result was a sharp fall in the terms of trade for agriculture.

Lewis and Hussain[14] have made a detailed study of this phenomenon and found that, although in the initial years the terms of trade for agriculture fell in both the wings, they fell much more sharply in East Pakistan than in West. The falling terms of trade in agriculture and the rising terms of trade for manufactures have been rationalised later in Pakistan's economic literature as transfer of resources from a 'low' savings sector to a 'high' savings sector and has been described by, among others, Lewis, as a major contributory factor to Pakistan's industrialisation. In the case of East Pakistan, a sharp fall in agriculture's terms of trade took away resources from there which were hardly transferred to industries in that same region. We have, therefore, to explain why the resources from agriculture were not transferred to industries in East Pakistan itself, to which we shall come shortly. In any case, it is clear that a relatively sharper fall in the terms of trade for agriculture in East Pakistan as compared to that in West Pakistan reinforced the effect of the relatively lower growth of agriculture in widening the disparity between the two wings.

From around the mid-1950s, the terms of trade for agriculture started rising in both wings. In West Pakistan, it is explained mostly by the rapid expansion in supply of industrial output in the face of a low rate of growth of agriculture. In East Pakistan, expansion of industrial output could explain this only to a limited extent. The major explanation is provided by a rapid increase in interregional trade, where East Pakistan's imports from the West became increasingly those of manufactures. Items like cotton textiles, manufactured tobacco, rape and mustard seed oil, provisions and oil man's stores, sugar, chemicals and drugs, cement, paper board, boots and shoes, and salt, accounted for between 47 and 50 per cent of total imports of East from West Pakistan, during 1955-56 to 1959-60 — but only for about 23 per cent of that in 1948-49. The value of total imports of East from West Pakistan increased by 140 per cent between 1948-49 and 1955-56, and by another 85 per cent between 1955-56 and 1959-60.[15]

All these calculations and transactions were made in terms of domestic prices. But the policies of import control, overvaluation of the currency and discrimination against primary exports in the 1950s had differential effects on the relative prices in the two wings. Lewis, in another recent study, has calculated "the ratio of the terms of trade each province's agricultural sector received relative to what it might have received in world trade for the period 1951-52 to 1963-64". He finds that "not only did East Pakistan farmers receive lower prices for their products than did West Pakistan farmers, but they also paid higher prices for their manufactured goods."[16] This is, of course, a notional problem, but it makes clear that the effect of import controls was felt more strongly in East Pakistan, where the agricultural sector was squeezed much more than in West Pakistan.

It should be noted that, although East Pakistan's agriculture was relatively more squeezed than West Pakistan's, it does not follow that the actual amount of transfer of resources from agriculture to industry was greater in East than in West. The value of that amount depends on the portion of the output marketed, and since West Pakistan's agriculture was more commercialised than East Pakistan's, it was quite possible that the amount of tranfer of resources from agriculture to industry was larger in West than in East Pakistan. Lewis thinks this was so, saying that in the mid-1950s, per year, West Pakistan's farmers marketed about $ 500 million of agricultural goods against $ 200 million worth of manufacture resulting in $ 300 million transfer, while East Pakistani farmers marketed $ 300 million of goods against $ 100 million worth of manufactures, having $ 200 million of transfer of resources from agriculture to industry. The evidence here is scanty but, if it is true, this would be a partial explanation of slow growth of industry in East Pakistan, even if all the resources transferred from agriculture in that province were invested within itself.

The pattern of industrial development in the two regions is much more complex. In Table 5, we have presented the estimates of value added in large-scale industry in the two wings of Pakistan taken from Papanek's survey data, and it clearly reveals a much higher rate of growth in West Pakistan than in East Pakistan. In the first few years, the rate of growth of industries was very high in both regions as it started from a very low base — consumer goods having expanded at the highest rate — and, except for tea and some matches, most of the industries like sugar, edible oil, tobacco and cotton textiles, came up in West Pakistan. Intermediate and investment goods industries also expanded at a rapid rate during this period and in the period 1954-55 to 1959-60, their growth rates were almost 70 per cent higher than those of consumer goods industries. A large number of different kinds of industries turned up and, except for jute and paper products, most of these in-

2 S Lewis, "Economic Policy and Industrial Growth in Pakistan", page 114.

termediate goods industries were established in West Pakistan.

Table 6 presents a picture of the pattern of industrial activity around the end of our first sub-period of 1949-50 to 1959-60. The census of manufacturing industry of 1957 showed that East Pakistan shared only 18 per cent of the total number of establishments, 30 per cent of their average daily employment and 26 per cent of their gross output. Except for the jute industry, which was entirely in East Pakistan, and paper, the overwhelming part of the output of most other industries originated in West Bengal. Three other industries, which had very high growth rates, were sugar, edible oils, and tobacco manufactures or cigarettes. The share of East Pakistan in the physical output of these industries in 1959-60 were 35 per cent, 6 per cent and 11 per cent, respectively.

It will also be seen from this Table that most of the industries in the intermediate and investment goods sector — such as chemicals, basic metals, machinery, electric machinery, transport equipment, metal products — which showed very high rates of growth in 1954-55 to 1959-60, and had a negligible share of production in East Pakistan, were heavily dependent on imported raw materials.

It is interesting to note this as it reveals the importance of availability of imports in influencing the pattern of industrial development in Pakistan. Capital goods for most of the industries had to be imported anyway, and, assuming that they could be availed of in either wing, the location of the industries would have depended very much on the availability of raw materials. Location of industries heavily dependent on imported materials would have been neutral as between the two wings but for the import policy and the licensing policy of Government and the facilities of social overhead services. Industries dependent on domestically produced materials—like cotton textile, sugar, edible oil, food, tobacco, footwear, jute textile, tea and paper—would be expected to be established in the regions of the supply of raw materials. But here, also, the availability of imports and public policy, together with the availability of social overhead services, played some role in the location and rate of expansion of these industries, because their plants had to be imported. There is also evidence that several of these industries would have been as efficient in East as they were in West Pakistan, had they been operated in East Pakistan with materials imported from West.

The greater availability of imports in West Pakistan than in East Pakistan and the related question of transfer of resources from East to West Pakistan through foreign trade, are well known facts, which are most frequently discussed in the literature on Pakistan's economic development. We do not have to deal with this problem in great detail; presenting of some bare facts should be sufficient. The average annual imports of West Pakistan from abroad during the period 1950-51 to 1954-55 were about Rs 105.31 crores, and during 1955-56 to 1959-60, Rs 152.5 crores. The corresponding figures for East Pakistan were Rs 43.94 crores and Rs 62.48 crores, respectively; East Pakistan had a surplus on foreign trade account, of Rs 42.4 crores a year, during the pre-Plan period, and of Rs 35.5 crores per annum during the First Plan period; at the same time it had a deficit in inter-wing trade with West Pakistan throughout the period. Still on the combined balance of trade, including both foreign and inter-wing trade, East Pakistan had a total surplus for 1950-51 to 1959-60, of about Rs 166.6 crores. West Pakistan, on the other hand, had a total deficit on foreign trade account of about Rs 554.5 crores for this whole period. It had a surplus on account of the inter-wing trade of Rs 229.9 crores, but in the combined trade account during this whole period it had a total deficit of Rs 331.6 crores.

Two things emerge from all this. Throughout 1950-51 to 1959-60, there was a net outflow of resources from East Pakistan. It was exporting abroad much more than it was importing, and although in its trade with West Pakistan it was getting more than it paid the deficit was not sufficient to compensate it for the loss of its resources through foreign trade. West Pakistan was selling more to East Pakistan than it was buying, but it was importing so much more than it was exporting abroad that there was a very substantial net inflow of resources to West Pakistan. This net inflow was financed to the extent of 50 per cent by the surplus of trade accounts in East Pakistan. The mechanism was simply that the exporters of East Pakistan surrendered whatever foreign exchange they received to the central bank in exchange of rupees and this foreign exchange they earned was spent very largely by importers of West Pakistan. The remaining part of West Pakistan's net deficit on trade account was financed by foreign aid and loans.

Secondly, although during the pre-Plan period there was a foreign assistance inflow of $ 74.4 million a year, and during the First Plan period, of $ 198 million a year, throughout this period there was no net inflow of aid to East Pakistan. A net inflow of aid is always reflected in an equivalent deficit on trade account and the trade surplus of East Pakistan reveals that, even if some actual disbursement of foreign aid resources was made, the

disbursement was more than matched by the outflow of resources through exports.

By bringing in the questions, such as the foreign exchange rate, one could show that the resource transfers from East Pakistan were even larger. For instance, since Pakistan's currency was very much overvalued during this period, the value of trade surplus in foreign exchange from East Pakistan should have a much higher value in terms of domestic resources than the nominal value in terms of the official exchange rate. The deficit in inter-wing trade account taking place in Pakistan currency should be deducted from a much larger total of surplus on foreign trade account, which would give a correspondingly higher figure for the net resource transfer. Theoretically, this point is correct; but a quantitative measure of this enlarged transfer cannot be given unless one finds out the shadow rate of exchange which would depend on the actual use of foreign exchange in all the different activities. With some foreign aid funds actually flowing in, the problem is even more difficult; for, one dollar of foreign aid may have a quite different shadow value from another dollar of foreign aid, depending upon the source of aid and the nature of the tying in of such aid.

In any case, it is clear that a substantial part of the resources generated in East Pakistan during this period, which could have been used within that province, were transferred to West Pakistan to finance a large fraction of the total absorption of resources in West Pakistan over and above what was generated in that region. This definitely contributed to the expansion of West Pakistan's economy at a higher rate than that of East Pakistan. But still, it does not explain our problem of growing disparity; for, the question remains: why was it that a much larger import surplus could be generated in West Pakistan but not in East Pakistan.

A similar point can be raised about the volume of private investment in the two wings. Estimates of private investment are very difficult to get—particularly as a time series with a regional breakdown for the period before 1959-60. Mahbub ul Haq estimates a series on the basis of the use of inputs, and this is probably the most reliable of the generally unreliable estimates and information on this point,[17] and can be used to indicate the broad order of magnitudes. Haq shows that, in 1949-50, total private investment in East Pakistan was about Rs 14 crores, while that in West Pakistan was about Rs 38 crores. In 1954-55, the corresponding figures were Rs 20 crores and Rs 55 crores, and in 1959-60, they were Rs 37 crores and Rs 77 crores. These estimates were in current prices, and show that, even in 1959-60, private investment in East Pakistan was less than in West Pakistan a decade earlier in 1949-50. Total private investment in West Pakistan, throughout the period, was about 2 to 2.7 times that in East Pakistan. If these figures are roughly representative of what actually happened, then they, together with regional distribution of public investment, should go a long way to explain the higher growth in West Pakistan than in East Pakistan. But it still begs the question: why did private investment flow so much to West Pakistan and not to East Pakistan? In other words, why was it more profitable to invest in West rather than in East Pakistan.

This leads us to examine in greater detail the nature of government policy in Pakistan—first, in terms of public expenditure, and then, in terms of import policy. It should be noted at the beginning that, although public development expenditure in Pakistan was quite substantial its main aim was to aid the private sector in its process of development. During the pre-Plan period, i e, between 1948-49 and 1954-55, public development expenditure was about Rs 50 crores per year, and over 80 per cent of that went to West Pakistan.[18] A Six Year Development Programme was adopted in 1950, under which about Rs 250 crores were spent upto 1954, mostly on the development of the infrastructure facilities. In 1952, was established the Pakistan Industrial Development Corporation (PIDC) which was supposed to develop industries, with or without private participation, in areas where private investment was not forthcoming. Its head office was located in Karachi, and it was immensely successful in promoting industrial development in West Pakistan through its pioneering activities and diversification of industries among various lines of consumer and intermediate goods—such as woollens, sugar, fruit canning, chemicals, telephones, cement, fertiliser and so on. PIDC also initiated the exploitation of the reserves of natural gas at Sui. Some attempt was made to start jute and other manufacturing by PIDC in East Pakistan, but this was far less than was required to generate a momentum. Besides, little was done to develop infrastructural facilities.

The formulation of the First Plan, 1955-56 to 1959-60, it is generally accepted, was guided mostly by the structural changes that had accrued in West Pakistan in the pre-Plan period. About Rs 400 crores of public development expenditure during this plan went to West Pakistan compared to only Rs 113 crores to East Pakistan. The overwhelming part of this expenditure in both the wings went to water, power, transport, and communications. The absolute amount, of Rs 187 crores, going to these two sectors in West Pakistan, was about three times the amount of Rs 64 crores that went to East Pakistan for the same two sectors. The amount for agriculture was Rs 34.9 crores in West Pakistan compared to Rs 22.1 crores in East Pakistan. But manufacturing and mining absorbed about Rs 75 crores in West Pakistan, as against only Rs 3.3 crores in East Pakistan.

It is not very easy to appreciate the reasons why planned public development expenditures were so much lower in East Pakistan than it was in West Pakistan. Even during the Second Plan, only about Rs 631 crores of public development expenditure went to East Pakistan, compared to Rs 763 crores to West Pakistan. It is not true that the problem of disparity went unnoticed in official circles. The First Plan document states (p 74): "The problem of regional development is specially acute between East and West Pakistan. Because they are more than a thousand miles apart, there is very little movement of population between the two wings. Even the movements of goods cannot be as free and smooth as in contiguous areas. This means that, so far as possible, and subject to other objectives of the programme, economic opportunities should be moved to the people, rather than people to the opportunities". Yet the plan allocations and their implementation do not reveal any attempt to follow this dictum in practice.

Was it that the planners thought that the potential for growth was much lower in East than in West Pakistan? The First Plan (p 75) stated that there was not "any significant difference in the magnitude of potential economic opportunities between the two wings". But in the Second Plan, the lower allocation to East Pakistan was justified by stating that the regional allocations were guided by the need "to maximise

development in the less developed parts of the country without prejudicing national development as a whole" (p 398). The implicit assumptions were, of course, not made clear as to why there should be this conflict between the growth of East Pakistan and the overall growth of the country.

In any case, the major impact of public development expenditure was a very rapid development of infrastructural facilities. The way these were differentially developed in the two regions during 1949-50 to 1959-60 was definitely responsible for any substantial difference in the productivity of investment which was implicitly referred to in the Second Plan. The rate of installing generating capacity during 1947-60, was about 16 per cent a year. The net availability of electricity in East Pakistan in 1951-52 was 20,225 thousand kwh and in 1955-56 43,969 thousand kwh, while in 1959-60 it went up to 77,226 thousand kwh. The corresponding figures for West Pakistan were 295,474 thousand kwh, 705,982 thousand kwh and 1,198,779 thousand kwh. In 1959-60, the figures for the numbers per million persons of railway wagons were 6 for East Pakistan and 166 for West; of buses and trucks, 85 in East and 495 in West; of post offices, 83 in East, 186 in West; miles of high-type roads per million persons was 28 for East and 225 for West; and the number of branch offices of banks was 110 in East compared to 286 in West.[19] Such a public development expenditure policy created social overhead facilities much more rapidly in West Pakistan than in East, and consequently had an external economic effect of stimulating private investment through increased profitability.

The exchange control policy, on the other hand, created a mechanism which effectively allocated much of the total import capacity, i e, export earnings plus foreign aid, in favour of West Pakistan. In the beginning of the period, when Pakistan had to depend on foreign trade for most of the commodities supplied at home, a policy of open general licensing was followed, according to which those who had the capacity and resources to import could become importers. It is at this time that the trading activities of Pakistan were virtually monopolised by a few trading groups—mostly immigrants from India and operating in and around Karachi. They already had long experience in trading with a well-developed nexus of communications and organisation, and they had substantial resources in the form of liquid capital.[20]

With the collapse of the Korean boom, Pakistan Government introduced stringent quantitative controls on imports; and from 1953 to 1959, about all imports into Pakistan came under one or other form of import licences which regulated imports both by type and value of commodities as well as by destination to specific regions. The predominant licences were commercial and industrial licences. Commercial licences allowed imports of commodities that could be resold, and were highly profitable as the prices they fetched in the domestic markets were well above the c i f prices with duties. The allocation of these licences and amounts of imports of each commodity were determined by the amounts the licenseholders had actually imported during 1950-52. Industrial licences, on the other hand, allowed the manufactures to import specific quotas of machinery and equipment, spare parts, and raw materials, for their own use; and these were legally non-saleable. Quotas were fixed in terms of installed capacities, and once an investment was sanctioned and capacity was installed, quota holders became regularly entitled to imports in the following years.

Both these licences—which accounted for about two-thirds of all imports to the private sector throughout 1950 to 1964—favoured the trading communities in Karachi. Because they were predominant importers during 1950-52, they got most of the share of commercial imports, and enormous profits as windfall gains during the period of stringent restrictions on imports. The overwhelming portion of these commercial licences—between one-half and two-thirds—were used to import raw materials.[21] Naqvi has shown that, in 1959, 95 per cent of raw materials for capital goods and 44 per cent of raw materials for consumer goods were imported under commercial licensing.

Imports of raw materials were highly profitable, because alongside the strict control on final consumer goods imports the rapid expansion of highly profitable consumer goods industries essentially depended on raw materials. Further, although capital goods imports were more freely allowed, as we have already noted above, industries in this sector expanded at a very rapid rate raising the profitability on the raw materials for capital goods.

This also suggests that, for traders who were importing raw materials, it would be increasingly attractive to move into direct production of final goods. Indeed, although profits earned on trading activities were large, since the accounting units of imports were more or less fixed, there was little scope for further expansion of these activities; compared to that, investment in industrial activities become highly profitable. Papanek talks about a 50 to 100 per cent profit in the initial years. While these figures may not be reliable, there is evidence provided by Papanek that industrial investment was about 30 per cent more profitable during 1947-55 than in 1956-58. So the traders with capital resources could enter the industrial field and reap the advantage of the profitabilities of the initial years.

Papanek provides figures to show how the traders, who converted themselves into industrialists, came to dominate the field of industrial investment and activities during this period. For our present purpose, what is relevant is, first, that by becoming industrialists the groups which controlled the commercial licences, also tended to dominate industrial licences; secondly, that since they were traders operating mostly in and around Karachi, there was a built-in bias in their activities in favour of Karachi and of West Pakistan—a bias which was also reinforced by the excellent social overhead facilities of that city which even before Partition was one of the most modern port-cities in the subcontinent. Further, since Karachi was also the capital, the rate of development of overhead facilities was high and the sanctions for industrial investment there were much easier to obtain. The result was a quite phenomenal increase in industrial activity in Karachi during this period. In 1954, of the total value added in large-scale manufacturing in Pakistan, of Rs 68.8 crores, 31 per cent was in Karachi as against 49 per cent in the rest of West Pakistan, and only 20 per cent in East Pakistan. The corresponding figures for 1959-60 were 30 per cent in Karachi, 45 per cent in the rest of West Pakistan, and only 25 per cent in East Pakistan—out of a total of about Rs 155 crores.

Thus, the factors that tilted the balance of supply of imports to West Pakistan were as follows:

(a) the traders, who dominated the field of private imports, belonged to West Pakistan and particularly to Karachi and they had their trade connections and organisational channels developed mostly in West Pakistan. Their operation in East Pakistan would have to be attracted by considerably higher profit margin to compensate for their breaking into new lines of venture.

(b) As the traders themselves become industrialists or closely associated with them, and as these industries cropped up mostly in West Pakistan and particularly Karachi, the availability of imports tended to get concentrated in West Pakistan.

(c) Industries developed in the Western region because of (i) profitability of particular lines of activity, (ii) enormous expenditure on and development of social overhead facilities by the government and (iii) the availability of imports through established traders.

The factors (b) and (c) are interrelated. The most profitable line of activity during the early period was cotton textiles, which accounted for more than a third of all value added by industry in 1958. Papanek has shown that, until 1954, there was a very large excess demand for cotton textiles and prices charged were "what the traffic would bear". During 1951-54, wholesale cloth prices rose by 20 to 30 per cent, while the general wholesale price index fell sharply by about 30 per cent. Raw cotton prices also declined by one-third. All this would indicate very high profitability in this line of activity.

The result was that, of the total imports channelled by commercial and industrial licences a much smaller fraction went to East Pakistan. In 1959-60, East Pakistan received 36 per cent of commercial licence imports and about 35 per cent of industrial licence imports, while Karachi alone received 45 per cent of the former and 37 per cent of the latter, and the rest of West Pakistan received only 19 per cent and 28 per cent, respectively.

It is interesting that the regional distribution of government imports followed almost the same pattern as that of private imports. In the pre-Plan period, government imports were less than one-fifth of total imports but in the First Plan period, they amounted to almost one-half; so a deliberate policy on government account imports could go a long way to compensate for market-guided private imports biased in favour of West Pakistan. But during the pre-Plan period East Pakistan's share in Government imports was only 30 per cent and during the First Plan, only about 36 per cent.

The growth of disparity in our second sub-period, between 1959-60 and 1969-70, is much easier to explain. By 1959-60, a whole decade of development and policy led to the building of capacities and assets, trade and production organisations, and social overhead facilities, decisively in favour of West Pakistan. So any additional rupee of investment would be attracted more to West Pakistan than to East. If matters were left entirely to market forces, the disparity would have widened far more sharply than it did during the Second Plan period of 1960-65. There was a sharp rise in public expenditure during this period — almost six times as much as in the First Plan. Although the total of Rs 631 crores was still about 18 per cent lower than public development expenditure in West Pakistan, the step-up was quite substantial for East Pakistan. Expenditure on water and power increased almost four times and that in transport and communications rose more than five times. Expenditure in agriculture was almost the same as in West Pakistan, but in manufacturing and mining it was about 33 per cent higher. Obviously, this was not sufficient to reverse the trend in disparity; in fact, private investment at the end of the Second Plan in East Pakistan was only 20 to 30 per cent of that in West Pakistan. But still, for the first time, a substantial boost was given to the per capita GPP of East Pakistan.

The relevance of the sharp rise in foreign aid during this period — which we chose as a criterion for dividing the sub-periods — should become clear at this point. During the Second Plan, there was a marked fall in the export surplus of East Pakistan indicating a sharp rise in the imports to that region. The annual average of imports rose to Rs 122 crores during the Second Plan compared to Rs 62.5 crores in the First Plan. At the same time, West Pakistan's import surplus increased very significantly from Rs 91 crores annually during the First Plan to Rs 191.5 crores during the Second Plan. Obviously, the transfer of resources from East Pakistan could not contribute much to finance this import surplus of West Pakistan. So, this sharp rise in imports of East Pakistan simultaneously with continued increase in the import surplus in West Pakistan was possible only because of a very large increase in foreign aid inflow.

This increase in foreign aid also enabled the government to start liberalising the imports. In 1960, open general licensing was reintroduced to promote the entry of newcomers to import trade, and this helped very much the entrepreneur in East Pakistan. Bonus voucher imports started rising from 1959-60, and in 1969 the Free List was introduced with a total of 51 items.

The point to note is that, when the availability of foreign exchange as well as the command over resources that planners could distribute between the regions increased, the Government chose not to force the diversion of resources to East Pakistan but to liberalise control and rely more on market incentives. But as we have seen, the market was already biased against East Pakistan. Besides the already-installed overhead facilities and other factors in West Pakistan which made investment relatively more profitable in this wing, the very fact that this province was growing at a faster rate reinforced its growth. Lewis made some calculations to determine the source of growth in manufacturing industries and found that, in 1959-60 to 1963-64, about 87 per cent of growth in the value added in manufacturing was explained by the growth of domestic demand as against only 2 per cent from import substitution. In fact, he showed that, over time since the First Plan period, the growth of domestic demand was increasing in importance as a source of growth of manufacturing.

It was only in the Third Plan that public expenditure in East Pakistan exceeded that in West Pakistan. East Pakistan should have got 53 per cent of the target expenditure total of Rs 3,000 crores. This proportion was more or less achieved, but the actual total expenditure was only Rs 2,186 crores — 27 per cent less than the target.[22]

As one would have expected, however, given the circumstances, actual private investment was totally different from what was expected. The target of private expenditure during the Third Plan was Rs 2,200 crores, expected to be equally distributed between the two provinces. The realised private investment in East Pakistan was about Rs 544.3 crores which was about one-third of Rs 1,620.3 crores invested in West Pakistan. It is clear that the market still favoured West Pakistan.

Notes

more backward than the Meghs who enjoy various benefits to which Scheduled Castes are entitled. Some educated Barwalas are trying to get themselves categorised as a Scheduled Caste.

Most Meghs claim to be Arya Samajists in terms of their rites of passage. However, many of them also visit non-Arya Samaj places of worship. One Megh household practices Sikh rites and considers itself Sikh by religion. Arya Samaj has practically no following in other castes. The upper caste Hindus in the Camp do not like to be associated with Arya Samaj, as it is identified with the Meghs — a low caste. The Arya Samajists are the most important religious group in the Camp because, besides being numerically preponderant, they constitute the only religious group which openly participates in politics.

There are two local Arya Samaj centres in BG Camp which I refer to as Neta and Virodhi. Neither of them has a large membership. Virodhi has 110 registered members, while Neta does not have any registered member. The number of registered members is, however, no indication of the popularity of an Arya centre. Both the centres are regularly visited by a large number of people, and both are deeply involved in politics. Their platforms are widely used by political parties for campaigning in the various elections.[3] While Neta has been associated with the Congress since its inception in 1948, Virodhi has been changing loyalties from one party to another. In the 1967 elections, it supported the Jan Sangh.

The Meghs were converted to Arya Samaj around 1910. They were then promised the status and privileges of the twice-born. Arya Samaj gave them the right to wear the sacred thread and to read the sacred *Vedas*, which were forbidden to them earlier. Like other low castes, the Meghs saw this religious conversion as an opportunity to raise themselves in the social hierarchy. They hoped it would mitigate the stigma attached to their birth. This has not materialised, however.

Although they now wear the sacred thread and perform all other rituals performed by the higher caste Arya Samajists, they have not been able to attain equal position with the latter. The upper caste Hindus, whether Sanatan Dharmists or Arya Samajists, look down upon the Meghs and treat them as a low caste. The Meghs feel frustrated, because even the most educated and highly employed among them are unable to get brides from outside their caste.

It is not surprising that the Meghs feel closer to the other Scheduled Castes, whether Arya Samajist or not, rather than to caste Hindus, including Arya Samajists. The Meghs' status as Arya Samajists and their status as a Scheduled Caste are not always compatible, and there is often a conflict of loyalties. Consequently, the Meghs stress one status in one situation and the other in another situation. For instance, they acted as Arya Samajists when they actively participated in the agitation against cow slaughter; but during the elections, they acted as a Scheduled Caste and did not hesitate to disregard the dictates of Arya Samaj.

In the past, the Arya Samajists, high as well as low caste, were by and large pro-Congress. The Meghs' support for Congress was reinforced by their status as a Scheduled Caste. During the 1967 elections, however, they were in a predicament because of the Arya Samajists' decision to boycott the Congress; they had to choose between Arya Samaj and Congress. Their interests as a Scheduled Caste demanded that they should continue to support the Congress, but their interests as Arya Samajists demanded that they should support the Jan Sangh.

Megh Caste: Unity and Diversity

The Meghs are themselves differentiated in terms of their educational qualifications, occupational status, political affiliation, and commitment to various leaders, both in the Camp and outside. Neta and Virodhi reflect these differences clearly. While most of the members of Neta are illiterate and unskilled labourers, the members of Virodhi are mostly educated and work as skilled and semi-skilled workers, and some even own flourishing business concerns. While Neta supports the Congress, Virodhi supports Jan Sangh.

The differences in the political leanings of the two centres are mainly due to the rivalry between Budha Mal and Sardari Lal, the Secretaries of Neta and Virodhi, respectively. The two are sworn enemies and have always opposed each other in elections. Sardari Lal is the leader of the young and educated section of Meghs. Although he has not had much education himself, he is a great champion of the cause of education for the Backward Classes and Scheduled Castes. Just recently, on his insistence, a primary school was started in Virodhi. He is widely acclaimed for his 'wisdom', 'organisational capacity', and 'largeheartedness'. All the young Meghs in Jullundur (for that matter, most of the Scheduled Caste people there) regard him as their leader and look to him for counsel. In spite of his popularity, he has not been a success in the elections. He made two unsuccessful attempts to defeat Budha Mal in the municipal elections. The latter was a municipal commissioner[4] for three consecutive terms before he was defeated by a CPI candidate in 1964. Sardari Lal rejoiced over his defeat, although he was not happy about the CPI victory. Budha Mal continued to enjoy an important position in the Camp even after his defeat because he was associated with the then Food Minister of Punjab, Yash Pal. Moreover, he wielded great influence on the older section of Meghs who regarded him as their leader.

Notwithstanding their personal rivalry and different political commitments, Budha Mal and Sardari Lal agreed to unite for the 1967 elections — provided the Congress agreed to nominate two Meghs to the Legislative Council. The demand for Megh representation in the Legislative Council was made through the Megh Sudhar Sabha, the Megh Welfare Association.[5] The Sabha was activised and fresh elections were held to choose the office bearers. Budha Mal, the Secretary of the Sabha for over two decades, agreed to the elections on condition that he would be recommended for representation to the Legislative Council. Sardari Lal was elected the Secretary of the Sabha and one of his close associates, the President. Budha Mal was elected one of the Directors. The Sabha decided to send a five-member deputation to the Chief Minister to press their demand for representation on the Legislative Council. It was resolved that, if the Chief Minister conceded their demand, the Meghs would support the Congress candidate in South Jullundur. The resolution was signed, among others, by Budha Mal and Sardari Lal.

On January 18, 1967, the deputation consisting of Sardari Lal, Budha Mal, and three other prominent Meghs from BG Camp, went to meet the Chief Minister. The deputation was informed by Yash Pal, the Congress candidate from South Jullundur, that the Government could not consider their demand before the elections. He promised to do his best, however, once the elections were over. Sardari Lal, disbelieving Yash, demanded a written assurance, which was refused. The deputation returned without meeting the Chief Minister. With this, the dissension between Sardari Lal and Budha Mal once again came into the open. Sardari Lal, dissatisfied with the Congress and its candidate, persuaded the Megh Sudhar Sabha to field Milkhi Ram, a Megh from the Camp, against Yash. Budha Mal, arguing that votes could not be cashed against any gains, announced his support for the Congress.

TABLE 1: CASTE, RELIGION AND PARTY AFFILIATION OF CANDIDATES IN SOUTH JULLUNDUR ASSEMBLY CONSTITUENCY

Name of Candidate	Caste	Religion	Party
Yash Pal	Khatri	Arya Samaj	Congress
Man Mohan Kaliya	Khatri	Sanatan Dharam	Jan Sangh
Milkhi Ram	Megh	Arya Samaj	Independent
Mela Singh	Megh	Sikh	Independent
Jaswant Singh	Adharmi	Sikh	SSP
Jaswant Singh Khambra	Adharmi	Sikh	Independent
Heera Singh	Jat	Sanatan Dharam	Independent

It must be mentioned here that Sardari Lal committed Virodhi to the Jan Sangh because of his opposition to Budha Mal, rather than on any ideological considerations. Sardari Lal's decision was also influenced by Virender, an important Arya Samaj leader and influential politician from Jullundur who had pledged himself to the Jan Sangh. Much of Sardari Lal's popularity was due to his intimate association with Virender.

The Candidates

There were seven contestants for the Assembly seat from South Jullundur — two of them belonging to BG Camp. The real contest, however, was between the Congress and the Jan Sangh candidates. Table 1 shows the caste, religion, and party affiliation of the candidates.

Yash Pal, the sitting Congress member from this constituency, is a prominent Arya Samaj leader. He owns a press and publishes two daily newspapers, one in Hindi and the other in Urdu. His *Hindi Milap* was the first Hindi daily to be published from Jullundur after Independence. This fact was greatly publicised during the elections as proof of Yash's love for Hindi. He started his political career at an early age during the freedom struggle. His student life was marked by frequent terms in prison. He joined the Congress after obtaining his Master's degree, and is proud of his unquestioning loyalty to the party. He was the Food Minister of Punjab at the time of the elections.

Man Mohan Kaliya, the Jan Sangh candidate, had been associated with his party for almost a decade. Before that he was a member of the RSS (Rashtriya Swayam Sewak Sangh). A lawyer by profession, he came from a middle class family in Jullundur city. At the time of elections, he was president of the Jan Sangh in Jullundur and also a municipal commissioner.

The local Jan Sangh leaders were unhappy about their party's choice for opposing Yash. The latter was a seasoned politician with considerable experience in contesting elections. Kaliya got his nomination because he was a native of Jullundur. The leadership of Jan Sangh in Punjab is in the hands of people indigenous to East Punjab, and the refugees rarely get a chance to come up. Many Congress supporters claimed that the Jan Sangh had agreed to field a weak candidate in South Jullundur so as to help the Congress to win in exchange for Congress support in North Jullundur.

Milkhi Ram was supported by the Megh Sudhar Sabha, because he was the least controversial figure in BG Camp. He was not associated with either of the two Arya centres in the Camp and was, therefore, acceptable to all the Meghs. Moreover, he was an influential person and a sitting Municipal Commissioner from BG Camp.

Jaswant Singh Khambra, the SSP candidate, was promised support by the CPI as well as by the Sant-Fateh-Singh and Master-Tara-Singh factions of Akali Dal. Mela Singh — the Megh candidate from BG Camp — and Heera Singh contested as Independents.

The Campaign

Both Yash and Kaliya had two offices, each, in the Camp. These offices worked round the clock for about a month before the elections. Yash, in particular, attached great importance to the Camp as it was considered a Congress stronghold.

Budha Mal was the manager of one of the Congress offices in the Camp. He arranged for Yash to meet small groups of people who were persuaded to speak out their problems to him. Budha Mal had a band of workers who went from house to house to assess the reactions of the voters to the Congress and to Yash. These house-calls helped to establish the strategies for winning over the different categories of voters. Many who were apparently anti-Congress could be induced to cross over. Some needed only persuasion, others money, and still others jobs and licences to sell some scarce commodity. These were then individually contacted by Yash who tried to satisfy their demands.

Yash showed great familiarity with the people of BG Camp. He ate with them, milked their cows, and joked with them, as if he was one of them. His informal manner helped him to project himself as a friend of the poor and the depressed. In addition to door-to-door canvassing, he organised two public meetings in the Camp. Prominent Congress leaders, who addressed the meetings, praised Yash for his commitment to the ideals of democracy and socialism and stressed that the Congress was the only party which stood for the interests of the poor. Yash asked the voters not to listen to the propaganda of some fanatics in the name of Arya Samaj. If at all any one deserved the votes of Arya Samajists, it was himself, an Arya Samajist.

Budha Mal cautioned the voters to beware of Sardari Lal's clever propaganda in the name of Arya Samaj. Sardari Lal had amassed wealth by unlawful means and was now trying to pose as a *suvaran*, a clean caste man. It was, therefore, not at all surprising that he should join forces with the caste Hindus and support the Jan Sangh — a party which stood for the interests of caste Hindus. He added that it was only the Khatris, Aroras, and Rajputs in the Camp, who supported the Jan Sangh. Even the Barwalas had pledged their support to the Congress.

The Jan Sangh which had no high hopes in the Camp adopted the strategy of splitting Congress votes. It, therefore, financed the campaigns of Milkhi Ram and Mela Singh. It hoped that these two candidates, both Megh, would cut into the Megh support for Congress.

The Jan Sangh campaign in BG Camp was organised by Sardari Lal. He went from door to door, urging people to vote for Kaliya. Those voters who were against Jan Sangh, or against Kaliya, were asked to vote for Milkhi Ram, the candidate of the Megh Sudhar Sabha. He organised a number of meetings in Virodhi which were addressed by prominent Arya Samaj leaders. The Congress, they said, had betrayed the Punjabi Hindus by conceding the Sikhs' demand for Punjabi Suba and by relegating Hindi, the sacred language of the Aryas, to a secondary position. They also condemned the Congress Government for its failure to ban cow slaughter.

Sardari Lal made ample use of the resources of Virodhi to campaign for Kaliya. Members of Virodhi were deployed to stick posters, distribute handouts, and to make announcements regarding Kaliya's visits to the Camp. Virodhi was thrown open to Kaliya, where he addressed meetings whenever he visited the Camp. Sardari Lal himself addressed several meetings at Virodhi. He mocked Yash's claims to

TABLE 2: VOTES POLLED BY CANDIDATES IN SOUTH JULLUNDUR ASSEMBLY CONSTITUENCY

Candidate	Number of Votes Polled in Constituency	BG Camp
Man Mohan Kaliya	19,138	881
Yash Pal	14,222	2,067
Jaswant Singh Khambra	3,260	441
Mela Singh	1,013	622
Milkhi Ram	778	386
Heera Singh	149	17
Jaswant Singh	140	23
Total	41,399	4,439

being an Arya Samajist. "How could he, a friend of the Sikhs and a beef-eater, be an Arya Samajist?" he asked. Sardari Lal warned the people against Budha Mal's propaganda in the name of Scheduled Castes and depressed classes which, he alleged, was a mere vote-catching device. In fact, it was the Scheduled Caste label which had made it impossible for the Meghs to move up in the social hierarchy. He challenged the people to name even one Congressman who was prepared to marry a Megh girl. No good had come out of the Meghs' loyalty to the Congress over the previous 18 years. Only the Arya Samaj could help the Meghs to move up socially. He warned that the Meghs would go down as an ungrateful people in the history of Arya Samaj, if they failed to use their discretion at this crucial moment. They must prove that they were worthy of the honour accorded to them by Arya Samaj.

A prominent Arya Samaj leader and a local journalist poured out editorials highlighting Yash's misdeeds. These related mostly to his refusal to support causes which were dear to the Arya Samaj—such as the ban on cow slaughter and the demand for Hindi, and the Hindus' rightful place in the state.

A significant aspect of elections in BG Camp was that neither Kaliya nor Yash committed themselves openly to any of the Lok Sabha candidates. Kaliya had been assured support by Sardari Lal on the understanding that the latter would support the Republican candidate for the Lok Sabha. Kaliya could not do this, however, without disregarding his party's commitment to support the Swatantra candidate. While Sardari Lal campaigned for the Republican candidate, Kaliya himself maintained a discreet silence. Yash did not mention, even once, the name of Sardar Swaran Singh, the Congress candidate for Lok Sabha: he could not have claimed to be an Arya Samajist and asked for Arya Samaj support while campaigning for a Sikh.

The other five candidates appealed for votes mainly in the name of caste and kinship. As already mentioned, Sardari Lal did not directly campaign for Milkhi Ram. His name was suggested only as a substitute for Kaliya. Sardari Lal had proposed Milkhi Ram as the candidate of the Megh Sudhar Sabha, just to prevent all anti-Jan Sangh votes from going to the Congress. Milkhi Ram did not mind this arrangement, because he expected that contesting for the Assembly would help him at the time of the municipal elections.

The Results

Of the 53,335 voters in the South Jullundur constituency, 41,399 (78 per cent) exercised their franchise. The invalid votes aggregated to 2,699. Man Mohan Kaliya, securing 19,138 votes, was declared elected. Yash Pal, with 14,222 votes, came second. All the other candidates forfeited their deposits. In BG Camp, 4,941 out of 6,042 (82 per cent) voters exercised their franchise. There were 502 invalid votes. Although Yash lost the elections to Kaliya, he secured 1,186 more votes than Kaliya in BG Camp. The distribution of valid votes among various candidates is shown in Table 2.

Most of Kaliya's 881 votes came from the Khatris, Aroras and Rajputs. In spite of Sardari Lal's efforts, he was able to get only a few Megh votes. In the city, most of Kaliya's votes came from caste Hindus. Yash polled substantially among the Meghs, besides securing both Hindu and Sikh votes. No Sikh candidate was able to win an appreciable number of votes. The Congress was able to poll most of the Sikh votes in the constituency, because the Akali party did not put up any candidate of its own. Its support to Jaswant Singh Khambra was only nominal and it did not make any serious effort to campaign for him.

Conclusion

The election results indicate the Meghs' clear preference for the Congress. This is significant, particularly in view of the decision of the Arya Samajists and the Megh Sudhar Sabha to boycott the Congress, as well as of Sardari Lal's open support to the Jan Sangh.

The most important factor which influenced the electoral behaviour of Meghs was their status as a Scheduled Caste. They were acutely aware of the distinctions which separated them from the caste Hindus. They felt they were structurally too far removed from the latter to have any common economic and political interests. They were proud of their association with Arya Samaj, but also felt that their social position rather than sectarian affiliation should decide their choice of political party. Budha Mal was reiterating the same point when he declared that religion had nothing to do with their political commitments. Moreover, the Meghs, like other Scheduled Castes, associate the Jan Sangh with the caste Hindus and believe that it represents only their interests. It is natural, therefore, for them to have the same resentment towards it as they feel towards the caste Hindus. Added to this was their apprehension that the Jan Sangh, if it came to power, would do away with the special privileges to which the Scheduled Castes were entitled.

On the positive side, it was the image of the Congress as a friend and well-wisher of the Scheduled Castes which helped Yash to poll Megh votes. The Meghs' association with the Congress for 18 years, and the marked improvement in their socio-economic position since 1947, had reinforced this impression. It was generally felt that the Meghs owed their improved social position to the Congress. This is not to suggest, however, that the Meghs were complacent about their social position. On the contrary, their 'improved social status and their increased awareness of their rights and privileges made them impatient and disgruntled. They strongly resented the wide gap between the promises made to them at the time of elections and their implementation later. Yet they did not want to dissociate themselves from the Congress which, they expected, would continue to help them rise in the socio-economic hierarchy. Closely associated with this hope was an uncertainty about the programmes of other political parties. As one of my informants put it, "At least we are familiar with the policies and programmes of the Congress Government; who knows what the other parties would do once they are in power?"

Notes

1 This paper is part of a project on the General Elections of 1967 undertaken by the Department of Sociology, University of Delhi, with the help of a grant from the University Grants Commission. The project was directed by M N Srinivas and A M Shah, and the papers were edited by them and E A Ramaswamy. This author studied the elections in the same place where she has been doing fieldwork for her Ph D dissertation.

2 In Punjab, the Jains generally align themselves with the Hindus against the Sikhs. This identification was further intensified at the time of the 1967 general elections because of their common support to anti-cow slaughter movement.

3 For an analysis of the relationship between local Arya centres and political parties, see my paper 1970 b.

4 Municipal councillors in Punjab are known as municipal commissioners.

5 The Megh Sudhar Sabha is an organisation formed specially to look after the education and welfare of the Meghs. It was formed soon after their conversion to Arya Samaj in 1910.

Competitiveness of Indian Steel Exports

Reply

Samuel Paul

I AM grateful to S A Dave and S K Subramanian for their comment ("Competitiveness of Indian Steel Exports" May 29, 1971). Dave and Subramanian have proposed some extensions to my long term criterion for judging the competitiveness of products, and questioned my formulation of the short term criterion. Let me, to begin with, take up the points on which I agree with them.

First of all, Dave and Subramanian are right that in my article I had referred only to the use of criteria for ranking products in terms of competitiveness. I agree that when the domestic resource cost (D_i) of a product exceeds the shadow rate of foreign exchange, it would not be worthwhile (in economic terms) to export that item. Thus the cut off point in the selection of products is given by the shadow exchange rate. I did not refer to this point in my article as its focus was on a comparison and ranking of steel products.

Secondly, in formulating the long term criterion, there is a case for splitting capital costs into their indigenous and import components provided this pattern is supposed to continue in the future. I did not incorporate this distinction in my formulation mainly because I was not convinced that the imported component of capital cost would continue to be significant in the future. I think my assumption is reasonably valid in regard to our steel industry which was the subject of my paper. Let me, however, add that d_i given in my formula refers to depreciation cost per unit of product i. It does not distinguish between indigenous and imported capital equipment and other assets.

In view of my definition of d_i, equation (2) of Dave and Subramanian suffers from some amount of double counting with respect to capital costs. If capital costs on account of imports are expected to be significant in the future, the proper procedure would be to redefine my d_i and r_i as referring only to the domestic components of depreciation and returns. In that case, we should restate the long term criterion as follows:

$$D_i = \frac{\sum_j X_{ji} + d'_i + W_i + r'_i}{F_i - \left(d''_i + r''_i + m'_i + m''_i \right)}$$

where d'_i = depreciation cost on account of indigenous machinery and other assets per unit of i;

d''_i = depreciation cost on account of imported machinery and other assets per unit of i;

r'_i = return on the indigenous component of investment and other assets per unit of i; and

r''_i = return on the imported component of investment and other assets per unit of i.

I have serious differences of opinion with Dave and Subramanian on the short term criterion. On this subject they have made three points. (1) The short run criterion would not be substantially different from the long run criterion except that some of the terms in the formula would assume a value of zero. If, however, general recessionary conditions do not exist, current import costs should be regarded as cost for a given industry. Even labour cost can be a real cost if workers can be laid off. Other inputs can be exported and their foreign exchange earnings represent their true opportunity cost. Since I have ignored such inputs, my criterion does not reflect the true cost of all factors involved in production. (2) Life of the capital assets may exceed the short run period of two years assumed by me. If so, sufficient funds must be kept aside for depreciation. Depreciation should, therefore, be a part of the short run cost. (3) I have not taken into account any domestic cost in my short run criterion. This may not matter when allied products are compared, but not in other cases. On the basis of the foregoing comments, Dave and Subramanian define the short run criterion as follows:

$$D'_i = \frac{\sum_j X_{ji} + W'_i + d_i}{F_i - \left(d'_i + m'_i + m''_i \right)}$$

where W'_i = current wage costs, and other terms are as defined in their equation (2).

I thought I had fairly clearly explained the concept underlying the short run criterion. Let me quote from my article: "In the short run, when idle capacity exists, the real cost of increasing output up to the capacity limit is the cost of the variable inputs (indigenous and imported) required for producing the additional output. In fact, if the variable inputs themselves have no opportunity cost, then, from a national point of view, the real cost of the extra output will be zero. On the other hand, if the existence of idle capacity is due to input supply bottlenecks, the variable inputs themselves may be in shortage so that their opportunity cost will be positive."[1] I do not, therefore, know how Dave and Subramanian concluded that "Paul has assumed the existence of idle plant capacity and that the real cost of producing the additional output is only the imported variable inputs."[2] I suspect that Dave and Subramanian have mistaken the assumption I used in my empirical analysis of steel exports for the criterion I offered for measuring short run competitiveness. It is true that in my analysis of selected steel products, I used the FOB realisation less the cost of direct imported inputs per tonne of product as the criterion for measuring short run competitiveness. Dave and Subramanian should have asked whether this approach made sense given the conditions prevailing in the steel industry and the country for the period for which the study was made.

First of all, let it be noted that the "FOB realisation" criterion I used is not the same thing as the domestic resource cost criterion. I employed

in production, employment, exports and the advance of technology in general and import substitution in particular would have been made in the absence of these arrangements for import of capital and knowhow—a different kind of terrain altogether".[5] Despite this disclaimer it must be pointed out that the Bank is in an enviable position as far as access to data and information and ability to muster and deploy the necessary administrative and research skills needed for the job are concerned. Though the factual data presented by the survey report provides data on the extent of payments made to the foreign collaborators, the various kinds of restrictive clauses stipulated in the agreements and the nature of foreign financial participation, the data are not adequate enough to make any quantitative assessment of the impact of foreign collaboration on Indian industry.[6]

Insufficient Empirical Evidence

The main thesis of Kidron's study is that there has been an excessive import of technology and capital into the country imposing a net burden on the economy. At the end of the book, he attempts to assess the cost of foreign capital and technology to the Indian economy.[7] On the basis of available published data on outflows of profits, dividends and royalties and the supporting cases of particular industries he cites, Kidron concludes that there has been an excessive dependence on foreign capital and technology, resulting in a net burden to the economy. By comparing the inflows of foreign exchange with the outflows generated by foreign private investment, he concludes that in the fourteen-year period ending in 1961 foreign investors had taken out of the general currency reserve three times as much as they contributed directly.[8] Though it is plausible that foreign investment has been a net drain on the foreign exchange reserves Kidron's conclusion is not supported by sufficient empirical evidence. A comparison of the fresh inflows of foreign capital with the outflows by way of royalties and dividends, with the latter being in excess of the former, alone does not justify the conclusion. The effects of imported technology and investment on productivity, savings in foreign exchange occurring due to import substitution, the impetus it provides to exports and the other external effects of imported knowledge and investment on the economy need to be considered in arriving at such a conclusion.[9] Some of the indirect effects of foreign investment are hard to

its variability or lack of it in response to changes in output. Viewed thus, it is difficult to justify the proposal of Dave and Subramanian to regard depreciation as a relevant cost in the short run unless depreciation varies directly with output. Is depreciation a real cost similar to material or wage costs which could have been avoided if output was reduced?

(2) Having treated depreciation as a short run cost, Dave and Subramanian have proposed that the annual charge on capital may be ignored in the short run analysis. The rationale underlying this distinction is by no means clear. Does it make sense to say that depreciation should be recovered, but not the return on investment? The confusion has arisen because Dave and Subramanian have misinterpreted the economic distinction between the short run and the long run.

In my article, when I referred to a period of two years as the short run, I did not imply thereby that the productive life of capital was two years as Dave and Subramanian seem to have understood. I took this period only because for the steel industry two years seemed to be a reasonable definition of the short run. Rerolling capacity could be increased given two years or investors may pull out of such business in two years. Further, I said that it might take at least two years before existing capacity could be fully utilised. I chose this period deliberately to show that we need not attribute any cost to capacity (depreciation) in the short run. All of us would like to provide for depreciation, overheads, etc. But the fact of the matter is that we would be willing to produce and sell in the short run even if these costs are not fully recovered because by doing so our total losses could be minimised. As far as the short run is concerned, capital costs are sunk costs and short run decisions should not be misguided by treating them as "relevant costs."

In the Indian context, there is the special problem that though idle production capacity exists, production is held up by other supply bottlenecks and not by demand. Given this situation, is it proper to consider the true domestic resource costs of exports as equal to the marginal costs of production? The answer is, "certainly not". Instead of exporting the extra unit of output produced, it could well have been sold in the domestic market. If it could have been sold internally, all marginal costs as well as depreciation and return on capital could have been recovered. In other words, the full cost of the extra unit is the relevant domestic resource cost of the export even in the short run because there is an opportunity to sell it in the domestic market, unless, of course, it is argued that the opportunity cost of denying the extra output to the domestic market is zero. Note that there is no sanctity about recovering depreciation and not the annual charge. The domestic price may be such that all costs can be recovered. In the short run, it is all a question of what the feasible alternatives are, given the limited flexibility. If the domestic price level is so low that the annual charge on capital cannot be recovered, then, that sets the limit to the domestic resource cost in the short run. It is easy to see that domestic resource cost both in the short run and the long run approximates the full cost of the product (socially valued and adjusted for various factors as shown in our formulas) when domestic demand is high and input bottlenecks co-exist with excess production capacity. In these circumstances, the distinction between the short run and long run criteria for measuring competitiveness does become rather thin. The same kind of problem arises when firms are working up to full capacity and are required to divert some part of the output for export. Clearly, the domestic resource cost of export in this case is the full cost of production including the return on investment, since that is what is being sacrificed by diverting output in the short run from the domestic to the export market. It is extremely important, therefore, to ask the question, "What is the social opportunity cost of export?" before formulating both short run and long run criteria for measuring competitiveness.

Summing up, let me say that Dave and Subramanian may have been misled into making certain comments on my article through a misunderstanding of what I attempted in terms of the analysis of steel products. But more important than that is a misinterpretation on their part of the meaning of the opportunity cost in the short run which is reflected in the formulation of their short run criterion. The observation that the shadow exchange rate provides the acceptable upper limit for domestic resource costs when products are ranked is one with which I wholly concur.

Tata Chemicals Limited

Statement by the Chairman, Mr J R D Tata

THE following statement by Mr J R D Tata, Chairman of Tata Chemicals Limited, dealing with the Company's working for the year ended June 30, 1971 has been issued to the shareholders:

To The Members,

The Year's Working

Shareholders will, I hope, have noted from the annexed accounts that for the ninth year in succession the profits before tax were higher than in the previous year. With the project for the further expansion of our soda ash producing capacity from 600 to 1000 tonnes a day finally approved by Government, we may now look forward over the next three years, including the current one, to another period of growth towards significantly higher levels of production, turnover and profit.

It is because of these encouraging prospects that your Directors decided to maintain the dividend of 15 per cent on ordinary shares on the enlarged capital, even though the total amount available for distribution this year was less than in the previous year owing to the much larger allocations to depreciation and development rebate reserve.

Dividend Policy

There are, I know, some shareholders who consider that in these uncertain days, when investors have little to look forward to but further assaults on their interests by Government, Companies should distribute in dividends the bulk of the profits instead of ploughing back substantial amounts into modernisation and expansion. This is a defeatist and short-sighted view to take for it assumes that never will good sense prevail and economic realities bring about a change in Government policies. It is also clearly against the long term interests of shareholders. Apart from the fact that, private sector industries, however difficult life may be made for them by Government and Parliament, have a duty to the country to increase their output and efficiency, it is in fact the only way in which they can survive and prosper, despite all the difficulties and obstacles placed in their way.

A cursory study of the financial and profit standing of a representative section of the private sector shows clearly that those companies which, for any reason, have been unable or unwilling to modernise and expand, have either stagnated or fallen back, whereas those companies which were able to invest the necessary resources in money, and effort to achieve growth and improved efficiency have produced good financial results.

Your Company is a typical example of the latter, and I, for one, hope that subject only to limitations imposed by Government, it will continue to take every opportunity to expand and improve its plants, processes and efficiency, to diversify its products and, generally, to contribute to the growth of the country's economy and welfare.

Restrictions on Growth

I have referred to Government curbs on growth. These unfortunately continue to be the most serious obstacle to progress so far as the private sector is concerned, and the main cause of the present slow-down in industrial growth. Once the country had decided many years ago to base its future development on a planned and controlled mixed economy, it was inevitable, and right too, that the freedom of action which private enterprise had enjoyed in the past would be restricted in the future so as to conform to the new pattern, but it was reasonable to hope that Government would exercise the tremendous economic powers it had secured from Parliament in such a way as to promote the maximum growth of both sectors and would draw fully on the large and growing resources in initiative, experience and managerial skills available in the private sector.

It was to be expected that, in Parliament's anxiety to see the public sector develop quickly some temporary restrictions would be imposed on the growth of the private sector in certain fields, but subject to that caveat one could have hoped that all economic decisions would be results-oriented and free from ideological bias. Such hopes, which in my innocence I myself shared, have been belied in practice.

Failure to Discriminate

That Government have had reason, in recent years, to be suspicious of big business in India, is to be admitted in the light of the greed and lack of ethics demonstrated in the last two decades by certain elements in the private sector. No one could object therefore to Government imposing restrictions on such elements or even outright denial of further growth to them until they proved deserving of public confidence. What is, in my view, highly unfair and unjustifiable as well as detrimental to the public interest is Government's insistence on tarring the whole of the private sector with the same brush and denying or delaying growth even for those with an unimpeachable record of efficiency, fair dealing and sense of social responsibility.

Frustrating Delays

Superimposed on the crippling effect of Government's licensing policies on growth now based largely on an obsessional hostility to any large-scale enterprise in the private sector, unending delays have plagued projects for expansion, diversification or modernisation submitted to Government for approval. Our own Company, in recent years, has provided its quota of examples of frustrating delays and obstacles strewn along the path of every project submitted to Government, however urgently needed and beneficial to the country.

Fertiliser Project

Today, a full four years after it was submitted in response to Government's own invitation to the private sector to help raise fertiliser production in the country, the magnificent fertiliser project we put forward in November 1967, remains undecided. If it had been quickly approved, as it deserved to be, we would by now have been about half way through its execution and already in production of some Rs 50 crores worth of fertilisers a year. Instead, unable to reconcile themselves to such "bigness" in a project mooted by one of the so-called larger houses, Government, after two and a half years of procrastination, compelled us to re-

duce the project to about a third of its original size. Even after this was agreed to, a fresh objection was raised in connection with the import, in the initial years, of phosphoric acid instead of sulphur for making phosphoric acid with imported or indigenous phosphate rock. The import of phosphoric acid in the initial period was a fundamental element in our project, which was aimed, insofar as the manufacture of phosphatic fertilisers was concerned, at the total elimination of sulphur through a process, still under development abroad and at Mithapur, using hydrochloric acid instead of sulphuric acid.

We have informed Government that the proposed change in the Letter of Intent effects a fundamental and unacceptable change in the project and that if it is insisted upon, we would prefer to abandon altogether the phosphatic part of our project until it can be undertaken without importing sulphur. Discussions are continuing on the subject and, at the rate at which this project has moved in the past, I can only hope that I shall be able to announce in my Chairman's Statement next year that some further progress has been made.

Soda Ash Exansion

I am happy to say that our application for the expansion of our soda ash output from 600 to 1,000 tonnes a day has not led to the type of stalemate experienced by us upto now in regard to our fertiliser project, and we are grateful to Government for their clearance of the project in May this year. But even here we have a striking example of the serious delays caused by Government's cumbersome and time-consuming licensing process, now further complicated by the administration of the MRTP Act.

The fact that a serious shortage of soda ash would develop unless capacity was quickly increased, and that it would inevitably lead either to a heavy outgo of foreign exchange on imports, or a set-back to production in consuming industries, accompanied by large-scale black marketing, became evident over two years ago. It was in recognition of this impending shortage that we submitted our project for the expansion of our capacity to 1,000 tonnes per day in May 1969. Yet it took two full years for Government to give its final approval to our application, although it was recognised by Government themselves as providing by far the quickest and most economical means of ensuring continued full supplies of this essential product.

Such delays caused by the excessively complex procedures adopted by Government to process applications from private industry are a serious hindrance to the country's industrial growth. Although this has been known and repeatedly ventilated for many years no change whatever has taken place in the attitude and policies of Government in the matter.

On the contrary, whereas some years ago the issue of a letter of intent, let alone the industrial licence which usually followed it almost automatically, provided a virtual assurance that the project applied for would go through fairly smoothly thereafter, today, even an industrial licence, often a conditional one, merely permits the recipient to launch himself on an obstacle course in which the clearance of half a dozen Ministries may be involved. When one of the "larger Houses" is concerned, the matter is even subject to Cabinet approval which, naturally, may take months, to obtain.

Monopolies Commission

Amongst the prime hurdles in such an obstacle race is the newly created Monopolies Commission. Anti-monopoly laws and commissions are, in many countries, well known and accepted legislative and administrative devices to ensure that a monopoly or dominant control of a market does not operate in a manner detrimental to the public interest, and no objection could therefore be raised on principle to the creation of this new measure in India. In fact, by setting forth sound and reasonable criteria or guidelines, a Monopolies Commission could, if anything, help to simplify and expedite existing procedures. I regret to say that our Monopolies Commission is hardly likely to fulfil this expectation. On the contrary, judging from its performance upto now, there is every reason to fear that it will provide a further and grievous source of delay and confusion.

Shareholders of Tata Chemicals will be surprised to know that in the last few weeks little else has been done in the Head Office of your Company and of other Companies in Bombay House than to answer a host of questions and submit a mass of documentation to the Monopolies Commission, not in regard to a project even remotely concerning us but to a project of the Tata Engineering Locomotive Company! Even more surprising is the fact that most of the information sought from us is totally irrelevant to the Telco expansion project itself, and certainly irrelevant to our own activities. Most of the information sought was, in any case, already well known and available in published materials.

Irrelevant Enquiry

The Monopolies Commission's extraordinary action in involving a large number of companies totally unconcerned with the Telco expansion project, in their examination of the latter's application is not only an inexcusable waste of the time of Government and corporate officials but a form of undeserved harassment of companies and officials who try to do a good and honest job and serve their company and their country to the best of their ability.

Company's Record

One would have thought that, in the eyes of Government and its Monopolies Commission, what was significant about Tata Chemicals was not that it had participated in an industrial exhibition, and shared a common building, minor services and a common telephone exchange with other Tata Companies — all, evidently considered as glaring proofs of an alarming concentration of economic power but that the Company's pricing policies were such that in the past year alone it had voluntarily forgone nearly Rs 50 lakhs of profit by selling its products at prices below those of its competitors. The total amount so forgone since price control was withdrawn has amounted by now to well over Rs 2 crores.

That a Company with such a record of efficient, honest and socially conscious service to the country, the community and the consumer, should be subjected to this kind of pointless harassment and waste of time and energy, cannot but fill one with despair at the evidence it provides of disregard or ignorance of national priorities, of the lack of a sense of urgency, and of the heavy cost of delays to the nation.

I have reason to believe that our Prime Minister is greatly concerned at the current slowdown in the economy, is anxious to remove road blocks in the path of economic progress and to simplify and expedite the industrial licensing process. I take this opportunity of drawing, with great respect, her attention to one of the most flagrant examples of such road blocks to

progress, resulting not from the passage of regulatory laws but from their misapplication to purposes clearly outside the intent and scope of the law.

Bright Future...

Having taken so much space and time in discussing the impact of Government's policies on industrial growth in general and on our Company's activities in particular, I shall conclude by saying once again that your Company remains in good shape, that it is fully geared to the achievement of continuous improvement both in its output and efficiency and that the morale of its organisation remains high despite the frustration of the delays and inaction mentioned earlier. The future of the Company and your own as its owners, is therefore assured provided it never departs from the basic policies — perhaps philosophy would be the better word — which have enabled it, after so many years of struggle and effort, to reach its present technical, financial and organisational strength, all of which along with its reputation, are today at their peak.

If Only...

If only Government would permit us to deploy fully our great material and human resources, and our managerial skills, we could make a striking contribution to the economic growth of the nation.

J R D Tata
Chairman

Dated, 1 November, 1971.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

Dempo Steamships Limited

Speech of the Chairman, Shri Vasantrao S Dempo

THE following is the Speech of Shri Vasantrao S Dempo, Chairman, Dempo Steamships Limited, delivered at the Sixth Annual General Meeting held on November 5, 1971:

Ladies and Gentlemen,

I have great pleasure in welcoming you to this Sixth Annual General Meeting of the Company. The Audited Accounts and Directors' Report for the year ended 31st March, 1971, have been in your hands for sometime now and with your permission I shall take them as read.

Since we met last certain events have taken place which have national and international significance. The political strife simmering in our neighbour country on the eastern border has culminated in untold human misery which has also created a tension in our border states and claimed a large share of our national budget. The imminent entry of the UK in the European Common Market may perhaps affect adversely our export of traditional items. By far the most important development is the possible revaluation of European and Japanese currencies and/or devaluation of the US Dollar which would necessarily have far-reaching consequences in the financial world.

On the national scene, the signal success achieved by the Congess Party, led by our Prime Minister, by securing a dominating majority in the Lok Sabha, is a healthy sign inasmuch as it has offered the country a strong Central Government which can take its decisions without wavering and much loss of time. This has also improved the image of our Government in the international field which, I hope, will result in smooth conclusion of economic deals with the countries abroad.

A welcome feature of the labour-management relations is the initiation by the Central Government of a dialogue between the representatives of management and labour. Our country now needs a long and uninterrupted period of industrial truce to strengthen our national economy and achieve the goals set forth in the Fourth Plan.

Results

You will have noticed from the Annual Report and the Accounts that during the financial year under review the Company's gross freight and charter hire earnings jumped up to Rs 5.58 crores from Rs 3.06 crores last year. The rise of about 182 per cent in earnings lifted up the net profit from 33 per cent of the paid up capital to 144 per cent, i e, almost 4-1/3 times. The major contributory factor was the boom in the world freight rates which, till October 1970, helped us retain a sizeable margin after meeting the equally spectacular rise in operating costs.

The tables have turned, the charter market has slumped to the bottom unknown for 20 years, and many shipowners have been obliged to lay a part of their fleet either for survey work or otherwise in order to save themselves from uneconomic working. A reversal of the trend is no doubt inevitable; but the international political and economic conditions are uncertain and it would be hard to say when it would happen and whether the worst would fall before the tide turns. The situation demands a cautious approach to distribution of profits and I trust, you will excuse your Directors for recommending a dividend of 10 per cent.

Doubts have been raised in certain quarters as to the taxability or otherwise of the dividend. Your Company has sought clarification from the Central Board of Direct Taxes. The Company also made an application to the Income-tax Officer for exempting the dividend from tax. This legitimate request has been rejected and therefore, as advised, we have filed a writ petition before the appropriate Judicial authorities to obtain redress. The dividend will be paid out of the General Reserve when it is declared.

Development

Your Directors have been able to finalise an order for 66,000 DWT bulk carrier with BOELWERF Naamloze Vennstschap, a well known firm of shipbuilders in Belgium. The Shipyard has agreed to extend to us credit in terms of which a fifth of the price has to be paid in four equal instalments of which the last instalment falls due at the time of delivery in February, 1975 and the balance in instalments extending over eight years.

Your Directors have placed another firm order for a new bulk carrier of 21,450 DWT with Hindustan Shipyard Limited, Visakhapatnam. The payment is to be made under a phased programme coinciding with the delivery of the ship in March, 1974.

Arrangements have been made with the Shipping Development Fund Committee for financing the purchase of these two new ships. The total loan

would be of the order of Rs 13.05 crores.

With the acquisition of the two ships, the Company's tonnage will rise from 1,26,700 DWT to 2,14,000 DWT.

To finance this expansion, it is necessary to raise the powers of your Directors to borrow. Your approval to the proposal will, therefore, be sought at the Meeting.

PROSPECTS

The world shipping is currently in troubled waters on account of the heavy shrinkage of the international movement of cargoes and the resultant excess of tonnage and the consequential fall in freights. Any improvement in this situation has to wait for the solution of the currency crisis and the end of the recession in industrialised countries. Although it is a capital intensive industry involving a long gestation period, it has got to provide efficient service at an economic cost at all times. As such, undeterred by erratic fluctuations in the freight market, it has got not only to expand but also to improve its services. In this process the current type of general cargo ships may be rendered obsolete and their replacement by bigger and better ships is inevitable even though their initial costs are high. The rapid containerisation in a case in point. No maritime country can afford to brush aside this trend except at its peril.

India cannot ignore this reality. Thanks to helpful policies of the Government, Indian shipping has made rapid strides during the past two decades and is able to carry 18 per cent of the cargo. But the goal to lift 40 per cent of the cargo at the end of the Fourth Plan is still far off. The mere fact that there has been a big increase in the prices of new ships and operating costs and an equally big fall in freights should not be a deterrent to efforts commensurate with the task of achieving the targets of growth. The Indian shipping industry has no doubt to execute this job irrespective of what happens to the freight market; but it can do so only under conditions which are in no way disadvantageous *vis-a-vis* its overseas competitors.

Viewed in this light, the Government's decision to withdraw the development rebate with effect from May 31, 1974, has come as a shock. The magnitude of its impact may be gauged from the fact that it has till now enabled the industry to finance two-fifths of the cost of newly acquired ships by augmenting internal resources. The Finance Minister has hoped that the advance notice given by him would quicken the tempo of investment. It is not, however, realised that many of the ships ordered during the past two years will not be delivered before the deadline. The press has reported that a fresh policy for pricing and subsidy in respect of ships indigenously built is under consideration. Apart from the quantum, the capacity of the Indian shipyards is limited. It would, therefore, be a sad mistake to presume that the contemplated measure would provide an adequate substitute for the development rebate.

Another feature of the Budget proposals is the change in the system of calculating profits eligible for the tax holiday. The conventional method of calculating it on the basis of the written down value of the ship has been changed in favour of adjustment of Government loans against the capital base before arriving at the tax-free quantum of profits.

The two measures are not conducive to the future growth of the Indian shipping industry of which your Company is a part. The proposed abolition of the development rebate would be disastrous to companies which have placed orders for new ships on the basic assumption that the shipping companies will continue to be allowed to build funds out of current earnings to finance replacement and expansion of their fleet. I earnestly hope that the Government will at least come to the rescue of those who might not get the ships ordered before May 31, 1974 so that they do not fall victims to changes in the Government policy in respect of past actions. This is the minimum expected of the Government though it would not be enough to stimulate growth.

It has been my lot to emphasise every year the need for rapid development of port capacities; but the financial constraints have widened the gap between intentions and achievements and have further inflated our operating costs over which we have hardly any control. On the other hand, attempts to transfer a portion of the burdens to our patrons have run into difficulties, partly because they constitute a threat to our exports. In this context, I would urge the creation of a strong mechanism for periodical consultations between shippers and shipowners. May I also venture to suggest that UNCTAD, due to meet in Santiago in April next, should evolve a code of conduct in order to discipline the Conference system?

Against this background, the outlook for Indian shipping will have to be viewed cautiously and the desire for growth has to be restrained on the basis of international developments and domestic handicaps. In the case of your Company, the heavy financial outlay on its new building and the prospects of the development rebate being not available in the event of the new ships being not able to jump over the Budget proposal, superimposed on cost inflation and falling freights, point out to a profit squeeze in spite of the best effort of the management to minimise its gravity and the possibility of the dividend being pruned. It is, therefore, prudent to consolidate the position of the Company instead of planning for expansion. Your Board's decision to maintain the dividend is in that direction.

GENERAL

Shri P C Bhattacharyya and Shri S Rajagopalan have resigned from the Board since they have completed their terms as Government Director and Deputy Director respectively on behalf of the Shipping Development Fund Committee. The Government has requested the Company to appoint Shri A K Srivastava as Government Director and he has joined the Board in August this year.

It is gratifying to note that Shri Raj Bahadur has been appointed as Minister for Shipping and Transport, with Cabinet rank. Shri Raj Bahadur, you know, has played a prominent role in the development of Indian Shipping and we look to him for assistance in our effort to achieve the national goal. I also take this opportunity of requesting you to join me in expressing our grateful thanks to all the Officers of the Ministry of Shipping and Transport, Port Authorities, Mercantile Marine Department, Shipping Development Fund Committee, other Government Departments, and in particular to the Transport Secretary, Shri S K Datta, ICS, Jt Secretary, Shri R Tirumalai, and the Director General of Shipping, Shri R Doraiswamy, for their valuable assistance and guidance. I would like to record our appreciation to our Agents and Brokers, both at home and abroad, and convey our thanks to our staff on the shore and on board for their co-operation in our effort to build your Company.

Domesticating Foreign Policy

FOREIGN policy, especially towards Vietnam and South-East Asia, was a major issue in both the 1964 and 1968 American Presidential elections. If Johnson was elected in 1964 at least partly because the campaign noises he made over Vietnam were less strident than those made by Barry Goldwater, he was also forced to retire from the 1968 race as he had not been able to disentangle Vietnam from the web of American domestic politics. When Nixon took over in 1968, it was difficult to visualise how even an admittedly astute political operator like him could lessen the US enmeshment in Vietnam without losing face internationally and without causing a domestic uproar about all those years of wasted American blood and treasure. Yet, through a series of well-calculated moves Nixon has not only defused Vietnam as an issue in US politics and consequently, in the 1972 election, but has managed to do this without arousing much passion at home or abroad.

This does not mean that the Nixon Administration has done anything as radical as to change the objectives of US foreign policy or lead the country into a new isolationism. Even if it wished to do anything so drastic, the constraints exercised by America's wide international economic-commercial network, its nuclear-military power status and its complex institutionalised relationships with most countries of the world would make it next to impossible for the Administration to change significantly America's foreign policy objectives or to opt out of the international economic-political-security system which the Americans themselves have had such a large hand in creating. All that Nixon and his advisers have done is to realise — and it has taken the Americans two and a half decades to do so — that these foreign policy objectives can be met without an obviously pugnacious display of political and military might. These objectives — namely, maintaining US economic influence (a euphemism for economic exploitation) over much of the globe and at the same time guarding the home country from any possible military threat from the other two major nuclear powers, Russia and China — it is now seen, can be achieved without propping up all kinds of dubious and shaky 'anti-communist' regimes and without reacting instantly to vaguely Leftward changes of government in distant parts of the globe. The idea that a communist takeover in a far-flung region was a military threat to the United States was given up more than a decade ago when Kennedy and McNamara came to power in 1960 and revised American ideas about military security. But the idea that such a takeover was a serious political threat directed at the United States has withered away only with the advent of Nixon.

Nixon has brought about this transformation most smoothly by a variety of moves, some deliberately dramatic and others quietly unobtrusive, which have altered the style of US foreign policy but have left its substance basically unchanged. The most dramatic of these moves was his successful attempt to get invited to Peking. The relative easing of tension with China has helped towards removing the China bogey from the minds of Americans; it has thereby oiled the process of disentanglement from Vietnam and has also to some extent reduced the fears of several South-East Asian regimes about US disengagement. All this has been managed without in any way changing any US policy objective. (Of course, the Chinese have also not fundamentally changed any of their policy objectives.)

Concerning Latin America, the United States has not made any dramatic gesture, but nor has it reacted violently or precipitately to the nationalisation of large American oil and other holdings by the Velasco Ibarra government in Peru or to the consolidation of a Marxist-Communist government in Chile. In fact, in an unprecedented move it has agreed to give Chile a credit of over three million dollars to buy military supplies from the United States. Even the widespread successes of the Tupamaros in Uruguay have not needlessly alarmed the Administration. A cool assessment of the Latin American situation has probably made clear to the Administration that the events in Chile, Peru and Uruguay affect the bulk of US investments — which are in Brazil, Venezuela, Argentina and Central America — only marginally.

In Europe, the United States has taken good care to see that it in no way hampers Brandt's and Western Europe's reconciliation with the Soviet Union. Nixon's impending visit to Moscow, the Four-Power Berlin Agreement, the steady progress of the Strategic Arms Limitation Talks in Vienna, all point to the fact that both the United States and the Soviet Union have a stake in improving relations with each other and so maintaining the *status quo* over wide areas of the world. They are both as interested in retaining the *status quo* and peace in West Asia as in South Asia. In that sense both are also interested

in the integrity of Pakistan, but are unlikely to interfere directly if Pakistan does break up, as this eventuality will not vitally affect the economic or security interests of either of them. Finally, it is this calmer assessment of the foreign interests of the United States that has given the Nixon Administration the confidence to impose the ten per cent surcharge on goods from abroad. It knows that the irritation caused among its friends and allies can lead to no tangible trouble for itself.

Credit Policy

All Options Open

THE Reserve Bank this week announced what it described as its 'policy' for the 1971-72 busy season. The preamble to the policy, as set out in the Governor's letter to commercial banks, runs as follows: "The overall economic situation warrants a cautious approach so as not to aggravate the inflationary factors in the economy but to provide all possible assistance for achieving a step up in industrial production and meeting the requirements of financing food procurement, priority sectors and defence-oriented production". The letter also urges banks to be alert to the requirements of industrial units assisted by the Industrial Reconstruction Corporation of India.

The phrasing of the preamble gives the impress that the policy measures which follow are based on clear-cut priorities for commercial bank lending. This impression, however, proves to be entirely baseless. Banks are expected to finance food procurement and agriculture, export and small-scale industry and defence-oriented production (which could mean anything from sulphuric acid to vanaspati) and industries in trouble as well as all "traditional borrowers" in general. In sum, practically every segment of the economy is to be given credit on a priority basis!

The Reserve Bank 'estimates' the seasonal credit expansion to run to Rs 500 crores against Rs 390 crores in the 1970-71 busy season. Food procurement would absorb Rs 125 crores against Rs 70 crores, leaving Rs 375 crores for the rest, against Rs 320 crores. The point is not that the residual is larger, but that the Reserve Bank gives no basis for its arithmetic. Has industrial output been held down by credit shortage? If so, in which sectors? What precise areas of the economy would benefit from an additional dose of credit and yield a higher output: engineering units which do not get enough steel, cotton mills which cannot sell thier output at the present high prices, the jute industry which is too hide-bound to arrive at a settlement with labour and take advantage of the slack in Pakistani supplies to the export markets or the sugar industry which is going in for a smaller output?

The Reserve Bank expects banks to funnel in deposits of the order of Rs 500 crores during the busy season. This likely accretion to their resources should be seen against the fact that the banks started the busy season with a credit-deposit ratio of around 73 per cent which was a clear 6 points below the ratio at the beginning of the last busy season. The increase in deposits (which could actually turn out to be even larger than the Reserve Bank's estimate, given the high level of deficit spending — Rs 609 crores between April and October this year against Rs 70-odd crores in the corresponding period of last year) would be sufficient for meeting the credit needs of the busy season, food procurement excepted. Yet the Reserve Bank has chosen to allow the banks sizeable access to Bank rate refinance, in the name of continuing the credit policy initiated in the last busy season.

Thus banks are expected to have a Bank rate refinance quota of Rs 200 crores against their lending for food procurement, export, small industry and agriculture. And to take care of any difficulties that particular banks may face on account of shortfalls in lending for these purposes, the Reserve Bank has allowed banks access to unlimited amounts at the Bank rate against trade bills of exchange right till the end of October 1972. But should some wretched bank lack such eligible paper, it will be taken care of by the decision to keep alive the old Bill Market Scheme officially claimed to have been killed. And as if all this is not enough, banks have been told that in "very exceptional cases" they would get discretionary finance at the Bank rate.

Why this concern about refinance when the banks are so highly liquid? Ostensibly this is being done because credit demand and deposit growth do not always match and peak requirements tend to exceed deposit resources. But it is not peak demand alone that the Reserve Bank is worried about, for it has in effect told the banks that their outstanding borrowings at the end of the busy season could be as high as they were at the end of the last season, namely, Rs 191 crores. Considering that banks started the season with borrowings of only Rs 19 crores as against Rs 150 crores last year, this is an invitation to them to expand their borrowings by over Rs 170 crores as against Rs 40 crores in the last season. Clearly, banks are being given sufficient room to expand credit well beyond Rs 500 crores, if they wish to.

The "cautious approach" thus arrives at a veritable credit surge! This charge too has been anticipated by the Reserve Bank — while permitting the banks sizeable access to refinance, it has told them not to use the available limits. In other words, should credit demand prove to be slack and deposit growth larger than expected, the Reserve Bank can claim to have prevented banks from tapping refinance. On the other hand, should bank credit expand rapidly, this would be hailed as the fruit of a promotional policy. Clearly, the Reserve Bank is keeping all options open.

Bangla Desh

Interlude for Diplomacy

THE Prime Minister's statement to Parliament on Monday on her recent tours of six Western countries did not throw any new light on the outcome of her talks in these countries. The countries visited by her, "as well as others", realise that "it will not help to deal with peripheral problems without finding a political solution in Bangla Desh through negotiations with the already elected leaders of the people of Bangla Desh and in accordance with their legitimate wishes". Further, "most countries also realise that the release of Sheikh Mujibur Rehman is essential and intend to impress this upon the military regime of Pakistan". What the Prime Minister left unsaid was that without any exception the political solution envisaged by all these countries is very much within the framework of Pakistan.

The Prime Minister also expressed the hope that the "joint or several efforts of the statesmen whom I met will make the military regime in Pakistan realise that no good can come of sabre-rattling or by forcing a military conflict on India". This expectation on our part fits well with the approach of these countries who have on the whole taken the position that the issue calling for immediate action by the international community was the mounting tension and the threat of war between India and Pakistan. The government's efforts to keep the Bangla Desh issue separate from the Indo-Pak issue do not appear to have succeeded.

To sum up the outcome of our diplomatic efforts of the last few months, then: the governments of the major powers, including the Soviet Union, have offered to exercise such influence as they have over the Pakistani regime to persuade it to work for a political

settlement of the Bangla Desh issue while the Government of India has undertaken that in the meanwhile it would do its part to prevent Indo-Pak tensions from erupting into a war. That some such informal understanding has been arrived at is plain enough from the Prime Minister's statements since her return. The accent has shifted from Pakistan's military build-up on the borders and the possibility of that country wanting to internationalise the Bangla Desh issue by starting a war with India to Pakistan's total isolation and the severe pressures on it which would inevitably force it to seek a political settlement.

The government has, of course, categorically rejected the demand that India (along with Pakistan) withdraw its troops from the border. But on a couple of other issues the government has amended its earlier position. Thus the Prime Minister has replied to the UN Secretary-General's month-old letter offering his good offices to India and Pakistan over what he described as "this potentially dangerous situation" along the Indo-Pakistan frontiers. Instead of rigidly adhering to the position that what required international mediation was not the situation on the Indo-Pak borders but the one in Bangla Desh, the Prime Minister has offered support to the Secretary-General's initiative provided he was "prepared to view the problem in perspective". Similarly, the Prime Minister reportedly told the executive committee of the Congress Parliamentary Party that the government would not be averse to a US commission visiting India and Pakistan provided it was prepared to look into the Bangla Desh problem in its entirety. Neither of these may amount to a major reversal of policy but they do give an idea of the government's approach to the problem. And as the government waits for international pressure on Pakistan to work, there can be obviously no question of recognition of Bangla Desh. Recognition would put the government at loggerheads with the other countries on whose diplomatic effort we are depending. As mentioned above, these countries have left us in no doubt that they are thinking of a political settlement within the framework of Pakistan.

Rourkela

Why the Secrecy?

A Correspondent writes:

THE roof collapse at the Rourkela steel plant was no accidental mishap. It merits attention not only because it has meant a drastic curtailment in indigenous steel availability at a time when the steel shortage was already palpable and so necessitated even higher imports of steel, but because it underscores inherent weaknesses in the management of the steel plant which have been there since its very inception in 1959. Repairing and recommissioning the steel melting shop, therefore, may not solve Rourkela's problems unless steps are taken to correct some of the imbalances in the plant's design and operations. Several of Rourkela's units, especially those that came up under State II, such as the sintering plant and the coke ovens which have been giving trouble, have not been working to capacity. It may be time for the Union Ministry for Steel, if it means business about putting this Rs 390-crore project in order, to undertake a comprehensive study of the problems of Rourkela.

As a first step, it may be worthwhile for it to release the Loomba committee report on the roof collapse. There is no special merit in keeping secret the four-member committee's report which was submitted within the stipulated time at the end of August — especially since the magnitude of loss has been so great and 'drastic' steps have had to be taken by the Ministry to put through an overhaul of the top management of the plant: the plant's erstwhile general manager, R P Sinha, has been asked to retire prematurely; some others have been shunted to other units of Hindustan Steel. All this makes it a matter for public concern. Why then has the report been withheld?

The collapse of the entire 1,500-tonne tin and steel roof of the steel melting shop was blamed on improper maintenance. Government spokesmen, including the Union Minister for Steel, Mohan Kumaramangalam, attributed the mishap to the accumulation of iron dust on the roof. True, but how could this happen when the plant has a gas-cleaning unit set up during 1967-69? If the gas cleaning plant had been working to specifications, 99.5 per cent of the iron dust from the ld converters should have been precipitated away. Had the plant stopped functioning, or did the cause lie elsewhere?

Steel Express, a weekly published from Rourkela, has claimed that the superintendent of the steel melting shop had given the plant authorities warning of the impending 'accident' four weeks before it actually took place. In a letter on June 10 to the Manager, Civil Maintenance, he reportedly said: "Immediate action from your side is absolutely essential if serious roof collapses are to be avoided". Why was action put off till after the monsoon?

In the absence of knowledge about the Loomba Committee's findings, one has only independent reports to go by. Evidently, the Loomba Committee concluded that the roof of the steel melting shop was designed to take a load of 120 kg per square metre (psm) without the point-load. Yet the roof collapsed with a weight of 65 kg psm. Designers of the plant, IGKD, however claim that the roof was designed to take a maximum point-load of 100 kg psm only and that the roof should take a dust load of 30 kg psm. The *Steel Express*, on the other hand, suggests that the original tender papers had called for a roof capable of taking 300 kg psm, not 30 kg psm. It is alleged that after a tussle with the German designers and Voest of Austria, who put up the steel melting shop, the Rourkela management altered their records to have a roof to withstand only 30 kg psm. How are these discrepancies of specification explained?

One must also view July's disaster against the fact that a similar, but minor, mishap had occurred in the steel melting shop as early as in August

1963. What steps did the plant management take at that time to avoid such future mishaps? Apparently, none. In fact, this year's collapse affected a much wider area of over 10,000 square metres out of a total area of 38,000 square metres.

Andhra Pradesh

Countering Regionalism

THERE is little doubt that one of the notable results of the March Lok Sabha elections was the reassertion of Central authority over the vagaries of state politics. Mohan Lal Sukhadia, Rajasthan Chief Minister for 17 long years, was summarily made to depart giving way to an outsider, Barkatullah Khan. In Kerala, the rejuvenated state Congress was given the 'go ahead' from New Delhi to join the CPI-led ministry as the dominant partner, although the CPI man, Achutha Menon, remains the Chief Minister. In Andhra Pradesh, the reassertion of Central authority was complicated by the demand for separate Telengana, but this very issue was skilfully used by the Prime Minister to oust a Chief Minister whom she did not trust — after his double game in the last Presidential election — and at the same time de-fuse the Telengana issue, at least for the moment. The alienation of the Telengana voter from the Congress had to be righted before the coming state elections. Since Chenna Reddy's animus was as much directed against Brahmananda Reddi as against the concept of Andhra Pradesh, it was not too difficult to persuade the Telengana Praja Samiti leader and most of his followers to come back to the Congress fold once Brahmananda Reddi was ousted from the Chief Ministership.

Yet, while the heat over the separate Telengana demand might have been temporarily turned off, the feelings of economic and administrative neglect which engendered the demand cannot disappear with the appointment of another Chief Minister, Narasimha Rao. It is in this context that the composition of Rao's ministry assumes significance. The exercise of their powers of patronage by former chief ministers of the state have left their flotsam of factions who owe allegiance to Sanjivayya, Brahmananda Reddi and (a much smaller group) to Sanjiva Reddy. Since the Sanjiva Reddy group shifted with him to Congress(O) it lost its influence and is now trying to get back into the main Congress party. The Brahmananda Reddi faction is still a force and so could not be entirely disregarded. But a number of members of this faction have found themselves without a ministerial seat. The Sanjivayya faction is the one which has been more carefully accommodated, in view of his position as Congress President. Chenna Reddy's followers have, of course, been accommodated.

But the Congress High Command, i e, Indira Gandhi, was not satisfied with this sort of ministry formation and the deft hand of political sophistication can be seen in the relatively large number of Scheduled Caste and other formerly ill-represented minority groups' representatives who have been included in the Rao ministry. Apart from the obvious goal of giving the Congress a new, radical image in the state, these representatives in the ministry from outside the usual Congress factions can be regarded as a means of further shifting the regional issue of Telengana into the background by bringing the problems of the minority groups to the fore. One basis of differentiation has been replaced by another. At the same time, the more relevant basis of differentiation — that of economic privilege and deprivation — has been pushed aside once again.

BUSINESS

Forcing a Slow Pace?

IT seems inconceivable that the jute industry, exporters, and the government have all failed to grasp the opportunities of what should have been a breakthrough year for jute. Yet missed them they have. Jute goods are the single most major item of India's exports, accounting for nearly 15 per cent of export earnings. If in the past the industry has been riddled with problems, such as unstable and costly supply of raw jute, stiff competition from Pakistan and a shrinking market in the face of synthetic substitutes, this was a remarkably favourable year for it. The Indian jute crop has been excellent, not to speak of the large quantities 'smuggled' from Bangla Desh. Pakistan's exports of both raw jute and jute goods have been choked off by the strife in Bangla Desh. Why, then, have exports failed to rise? The industry has tried to pin the responsibility on labour troubles and on conditions in the 'problem state' which is West Bengal — power sheddings, dock troubles, etc. But these are conditions of fairly long standing.

The jute mills have reportedly bought Rs 80 crores worth of East Bengal raw jute which is, even in normal times, far cheaper than Indian jute. The government has turned a blind eye to this, no doubt in the expectation of a boom in jute exports. In the excitement about export prospects the government appears to have gone back even on its commitment to support the price of indigenous raw jute. Since August the Union Minister for Foreign Trade has been assuring purchase of raw jute by official agencies like STC and Jute Corporation of India but to date support operations by neither have been in evidence (though one report has it that STC, in the course of its commercial operations, purchased Bangla Desh jute in Assam!). Acreage under jute can be switched over to rice and this has been partly responsible for fluctuating jute output and prices. Clearly, the failure this year to lift raw jute at reasonable prices will have repercussions on next year's crop.

But the availability of cheap raw materials has not persuaded the industry to step up production and take full advantage of the export possibilities. On the contrary, the industry has shown supreme unconcern towards the prospect of disruption of production as a result of the threatened strike in the third week of next month. Prominent jute mills have also been dropping hints that they would have to move to other states if West Bengal labour 'continues to pose problems to the industry'.

It is not, however, labour problems which have stood in the way of larger jute goods exports this year. The US, our major market, has had port strikes on its east and west coasts. Also given the far quicker responsiveness of synthetic substitutes to changes in market conditions it is likely that these have stepped in to fill the gap before our muscle-bound industry made any moves of its own. The other major market, the USSR which takes mainly hessian, requires central negotiations. And Africa, which could be a growing market, requires special marketing initiative. Neither the industry nor the Ministry of Foreign Trade has cared to make the extra effort.

Chemical Plants

Room for Vertical Strengthening

WITH development of industries such as fertilisers, chemicals, petrochemicals, refineries, dyestuffs, and pharmaceuticals, the chemical plant manufacturing industry has also grown. There are by now a large number of units manufacturing diverse types of plants—like sulphuric acid plants, superphosphate plants, and water treatment plants, besides miscellaneous equipment such as pressure vessels, heat exchangers, distillation columns, sulphitation vessels, neutralisers, and condensers. Firms like Larsen and Toubro, APV Engineering, Dalal Engineering, KCP, Garlick, and Anup Engineering, manufacture more sophisticated and complicated products including reaction vessels, mixers and blenders, extractors, vapourisers, dryers, scrubbers, etc.

Till now, 54 units have been licensed, out of which 49 are in production. Current output almost equals installed capacity, indicating full capacity utilisation. Production of chemical plants during the four years, ending 1970, has recorded an annual growth rate of over 20 per cent.

However, a considerable gap exists in equipment designing for high pressure vessels, heat exchangers (especially of the high pressure type), waste heat boilers, super heaters, instrumentation, and certain specialised equipment. Since technological development in chemical engineering is rapid, it would be desirable for India to import the know-how for equipment design from advanced countries, so that equipment to the latest design can be made here. At the same time, efforts will have to be made to co-ordinate the activities of local R and D and chemical plants manufacturers for undertaking equipment studies for different projects. At present India relies on imports for the more complicated types of chemical plants.

One of the critical operations in fabricating chemical-process equipment is welding. Yet not much progress has been made in developing knowhow here. The much talked of Industrial Research Institute for welding has not received serious attention from either government or industry. The standard complaint is that the quality of equipment supplied by certain firms is poor and that where quality is reliable prices are very high and delivery periods very extended. Some of the units do not have modern methods and techniques of inspection to ensure structural stability, dimensional accuracy, and workmanship, to the tolerance required for each type of equipment.

With the significant expansion of the chemical industry in India—especially in the three basic fields of fertilisers, petrochemical fibres, plastics and elastomers—the demand for chemical plants will increase substantially. The country, therefore, will have to break new ground in the design and manufacture of different equipment.

There are also substantial export opportunities for certain types of chemical plants to various parts of the world—especially to West European countries which are going in for large investments in chemicals. Developing countries in South Asia, Africa, and South America, also offer good export prospects. Since India would have to face keen competition from countries like Japan, a cost comparison study should be undertaken to gain a clear idea about international price trends and possible points for entry. Organisations such as STC and TDA could play a major role in identifying the overseas market potential for chemical plants.

Tata Chemicals

Making the Most of It

FOR the ninth year in succession, Tata Chemicals has shown a higher profit before tax in 1970-71. The expansion from 600 tonnes to 1000 tonnes per day of soda ash, for which clearance was given a few months ago, is already under way and the plant is currently capable of 700 tonnes per day.

Tata Chemicals is thus comfortably established on its growth curve; and conditions — both in the market and at its works — are such that it is bound to do well. Soda ash, a major alkali, is the company's main product to date, and it has generally been in short supply. Early this year, government decided to import 6,000 tonnes to relieve the shortage. In its attempt to disperse production geographically and from the point of ownership — since Tata Chemicals and Saurashtra Chemicals of Birlas between them account for some 85 per cent of output — a number of licences had been issued, but implementation of these had made no progress. Later, Tata's expansion scheme which had been pending before the Monopolies Commission was hurriedly cleared to cover part of the persistent gap.

It will be yet some time, however, before self-sufficiency is achieved in the growing market. Nor will self-sufficiency ensure soda ash at prices comparable to international levels. Only competition, as J R D Tata would himself recognise, can ensure the cheapest price possible by efficiency criteria. And here there is no sign of progress. It is interesting that, over the past six years, all three major units (the third largest is Dhrangadhra Chemicals accounting for 10 per cent of output) have raised prices about three times — more or less in alignment. The last time prices were raised by all three was early this year (Tatas were the last to follow in May), when the shortage was acute and when it became quite clear that no newcomers would tread this long-gestation, capital-intensive field although the market prices — reflecting the room for additional production—were 100 per cent higher than those charged by producers.

Nor is there external pressure for lowering prices. While protection was formally withdrawn with decontrol in the mid-sixties, indigenous soda ash still enjoys a completely protected market because of import control and because the price of such small imports as are occasionally allowed is higher than indigenous prices after all the duties have been paid. Soda ash thus sells in a highly protected market and is evidently highly profitable for the two well-established units, even when their ex-works prices are far below the open market prices. Tatas also have a more diversified base in chemicals manufacture and fabrication at Mithapur, which should give them a head-start in the economies of joint costing once an element of competition is induced. But, as yet, this has not been materially relevant. Tata Chemicals' price, ex-works exclusive of excise duty, is of course 11 per cent lower than Saurashtra Chemicals', while Dhrangadhra's price is marginally the highest.

Tata Chemicals is also on the way to diversifying into complex fertilisers. Their scaled-down, Rs 50-crore project, aims at process innovations — including one for by-passing the use of imported sulphur, supplies of which have been less than stable in the past. Immediate use of Rajasthan's newly established rock phosphates, in place of temporary phosphoric acid imports, required by government is objected to on grounds both of their high-cost unreliable availability and of the import of sulphur which will be entailed at

this stage if phosphoric acid is produced by the older process.

Dyestuffs

Crying Wolf

THERE have been scary reports suggesting that the dyestuff industry is heading towards a financial crisis due to a slump in prices following lower offtake from the major consumer of dyes — the textile industry. The small-scale units in the industry are being forced to resort to distress sales, according to these reports.

Closer examination of the structure of the industry would, however, suggest that this is yet another instance of an industry crying wolf. The fall in prices is reported to be of the order of 15 to 20 per cent in certain varieties as a result of some pruning of inventories by the crisis-laden textile industry. But this is nothing to get alarmed about. After all, the dyestuff industry, more particularly its dealer network, is known to have exploited the market during times of shortages in the past — as witness the spate of complaints before the Tariff Commission.

The reported decline in prices is, if anything, to be welcomed. The dyes industry has grown in size and range on the strength of the dual protection of import restrictions and tariffs (on intermediates) for well over sixteen years now. Selling prices of most of the dyes have generally moved in only one direction in the past — upward — and, as a result, profits in the industry have been way above the general levels attained by the industrial sector as a whole.

Even during the current year the performance of the major units in the industry is understood to be highly satisfactory. The alarums and excursions about the industry moving towards a crisis are apparently completely false. One suspects that this is but another attempt by some interested parties in the trade to raise prices. It is only to be hoped that the Standing Committee appointed by the Tariff Panel to look into the problems of the industry will examine this matter in detail.

Hindustan Shipyard

Late Coming of Age

THIS year Hindustan Shipyard ('Scindia Shipbuilding Yard' prior to Government takeover in 1951) completes 25 years of shipbuilding. Although HSY's Chairman does not refer this fact in his address to the annual general meeting, it deserves mention because it was owing to the foresight and pioneering effort of the late Narottam Morarjee that India now has a shipyard worth the name. Between 1946 and 1971, the HSY has built a total of about 340,000 grt for Indian shipowners. It proposes in the near future to build 14,000/16,000 grt cargo liners/containerships as against the existing capacity for 9,000/12,000 grt vessels or the initial capacity for 5,000 grt ones.

Past achievements and promises of rapid progress in future do not, however, compensate for current pedestrian performance. From the point of view of the country's requirements for building up a powerful merchant navy, HSY's contribution is still minimal. Although Indian shipping has been adding about 2.3 lakh grt per year, HSY's capacity remains two ships of 9,000 grt each per year. Its Rs 8-crore development programme has gone haywire and, according to the Chairman, has slipped back by at least two years for want of particular types of cranes. The Chairman laments: "Even today we are not in a position to know when these cranes will be shipped and commissioned for effective use. This, indeed, is a sad story." HSY will not, therefore, be in a position to deliver six ships a year (aggregate 80,000 dwt) by 1974 as planned; whether it will be able to do so even by 1976 is anybody's guess.

During 1970-71 HSY seems to have effected some streamlining of its various operations such as materials handling, planning, etc, but there was no substantial improvement in financial performance. The yard's total production—including ship construction, repairs, miscellaneous jobs, capital works executed and stores manufactured departmentally—amounted to about Rs 851 lakhs in 1970-71 as against Rs 491 lakhs in 1966-67. Over the same period sales increased from Rs 284 lakhs to Rs 592 lakhs. The increase in value of output and sales was largely the result of a rise in rupee values rather than in physical output. Net profit, which accrues mainly on account of repair jobs, was up from Rs 3.08 lakhs in 1966-67 to Rs 5.70 lakhs in 1970-71. In relation to total capital employed, however, net profit showed a 50 per cent decline over this period. Although the capital formation has increased from about Rs 16 crores in 1966-67 to about Rs 30 crores in 1970-71, it is significant that current asset formation has contributed as much as Rs 9 crores to this. (An analysis of the structure of assets as at the end of 1970-71 shows that book debts accounted for Rs 4 crores and loans and advances for Rs 5 crores in a total asset value of Rs 22 crores.) The capital-turnover ratio is shown to be 5 : 1.

State subsidies to the extent of 15-20 per cent are common enough in most shipbuilding countries; taking this into account the yards the world over are expected to make a profit on ships sold. The HSY, however, has been operating on a no-profit-no-loss basis and budgetary allocations both for development programmes and for meeting its deficits have been a normal feature. The cumulative subsidies provided to the yard by the government increased from Rs 13 crores in 1966-67 to Rs 18 crores in 1970-71, though the annual subsidies seem to be gradually declining. Despite the subsidies, the yard's cash generation has been nominal over the period.

It is in this direction therefore that HSY appears to be making a determined bid to improve its operations. For the first time, the Yard's orderbook position was satisfactory and stood at 14 ships in 1971. It was not so long ago that the HSY was frantically searching for orders when the world shipbuilding industry was booming. There was even talk of exporting ships for want of domestic orders. It is common knowledge that now the Transport Ministry has made it obligatory—though informally—for Indian shipping companies to place an order with HSY for each ship ordered abroad. Simultaneously, efforts were made to arrive at a mutually acceptable pricing formula. The pricing policy announced in August 1971 adds up to an average of the international prices prevailing in selected countries plus a 5 per cent addition towards partial cost of import substitution and any escalation in prices from the date of placing the order. At the same time, the government would assist the yard to the extent of 5 per cent of the international price of the ship and would also compensate it for the price differential between major indigenous components used and the international cost of similar components. The new pricing formula would come into operation for ships delivered in 1973-74.

Sailing Strong

Hansavivek

GREAT EASTERN SHIPPING acquired, last year, two second-hand ships of 14,730 DWT and 14,801 DWT at a total cost of Rs 5.96 crores. The OBO carrier of 1,00,600 DWT, for which order was placed with the Swedish yard, is expected to be delivered in June 1972. The shipyard had run into serious financial difficulties which were overcome following negotiations between the shipowners of various countries who had placed orders, the shipyard, and the Swedish government. Under the reorganisation scheme, GES will have to pay a price higher by about 9.575 per cent and will have to bear some additional interest charges on a loan, repayment of which has been guaranteed by the Swedish government. When delivered, this vessel will be the largest OBO carrier on the Indian registry. GES has also placed an order for 4 ships of 21,610 DWT each with Hindustan Shipyard. These ships are expected to be delivered in 1973 and 1974. With the change in the accounting year, the latest set of figures covers a full 12-month period while that of the previous year relates to 9 months. The two sets of figures are, therefore, not strictly comparable, but even so both operating earnings and profits show visible improvement. GES carried out 58 overseas voyages but no coastal voyage during the 12 months ended March 1971, as compared with 51 overseas voyages and 2 coastal voyages during the preceding 9-month period. The voyage-days of vessels on time-charter with others were 1,323 days (759 days). Cargo carried amounted to 10,57,000 tonnes (9,40,000 tonnes). Freight earnings and charter hire brought in Rs 9.98 crores and Rs 2.55 crores (against Rs 6.91 crores and Rs 99 lakhs, respectively).

In the current year, there has been a fall in the freight rate and in the cargo availability in the international market. GES, however, has a long-term freight contract for the carriage of iron ore from India to Japan. But this cushion too is partially unreliable because export of iron ore from the east coast of India to Japan is at present considerably hampered by the various difficulties in MMTC. The strike by dock labour on the west coast of USA, moreover, has prevented ships from berthing for carriage of cargo from American ports to India. Meanwhile, some of the company's ships are being placed in the coastal and nearby trades. In view of these uncertainties, the directors are hesitant to forecast the current year's earnings. Commenting on government's proposal to abolish development rebate from 1974, the directors say that it would adversely affect Indian shipping in international competition.

BAGALKOT UDYOG (formerly Bagalkot Cement) appointed Shree Rishabh Investment, doing business in the name and style 'Shree Rishabh Vanijya', as sole selling agent for the sale and distribution of cement on a commission of Rs 1.25 per tonne for five years from July 1970. On a representation by the selling agent for a review of the rate of commission, the board entered into a supplementary agreement in March 1971, raising the rate of commission to Rs 2 per tonne retrospectively from July 1970. It is stated that none of the directors has any interest in the resolution for this purpose proposed at the company's annual meeting. The balance sheet, as at March 31, 1971, showed that, among its investments in shares, the company held as 'other than trade investment' 1,67,500 equity shares of Rs 10 each in Jaipur Udyog valued at Rs 17,31,601 (against Rs 12,49,501 a year ago). These shares were 'partly lodged as security as per contra'. One of the notes appended to the accounts discloses that delivery of the purchased shares had been carried forward on settlement dates on payment of charges as per the stock exchange rules and that such charges had been added to the cost in respect of the shares for which delivery had been taken. A sum of Rs 68,858 (previous year Rs 78,182) has been carried forward to be added to the delivery cost in respect of shares not taken delivery of upto March 31, 1971. Bagalkot produced 2,27,325 tonnes of clinker and 2,21,740 tonnes of cement in 1970-71, against 2,21,256 tonnes and 2,07,845 tonnes, respectively, in the preceding year. Cement despatches were also higher, at 2,21,499 tonnes (2,07,737 tonnes), but gross profit turned out to be lower. This outcome was attributed to the increase in manufacturing costs. The Union Government filed an appeal before the Division Bench of the Madras High Court against the judgment quashing the Cement Control (Amendment) Order 1969 which fixed the uniform retention price of Rs 100 per tonne payable to cement manufacturers. The appeal has since been disposed of in favour of government. The company's writ petition, filed before the Bombay High Court, challenging the validity of the Cement Control Order, 1967, has not yet come up for hearing; nor have the writ petitions filed by other companies at several High Courts yet been disposed of. The company has filed a writ petition before the Mysore High Court challenging the increase in royalty on limestone from 75 paise to 125 paise per tonne. The writ petition has been allowed, and the relevant notification of the Union Government quashed. The directors point out that increase in the current year in electricity tariff rate in Mysore, will entail an additional burden of about Rs 2 lakhs per annum.

ORIENT PAPER is setting up a research institute at Amlai for conducting research on various aspects of the paper industry, including research on plantation and utilisation of various fibrous materials. Initially, Rs one crore have been set aside for construction of buildings and procurement of machinery and equipment. The company has undertaken to supply technical knowhow for manufacture of paper in and outside the country. Work for setting up an integrated pulp and paper mill in Kenya by Panafrican Paper Mills (EA), in technical and financial collaboration with Orient, has started. The equipment in the pulp section and power plant at Brajrajnagar, being old, is to be renovated and modernised in stages — at a cost of about Rs four crores. During the year to March last, Orient maintained production of paper and board at around 1,39,000 tonnes. Exports of paper amounted to Rs 67 lakhs, against Rs 76 lakhs in the preceding year. Exports, the directors say, could have been better, had there been greater cash incentive to offset increase in cost of production. Although net sales looked up by Rs 128 lakhs, gross profit turned out to be Rs 48 lakhs lower than in the previous year, in spite of additional income of Rs 28 lakhs by way of knowhow and services fees. But the

latest profit figure has been arrived at after providing as much as Rs 143 lakhs for gratuity for the past years as also for 1970-71, whereas no amount had been provided previously for this purpose. Net profit is substantially lower compared to in the previous year, because of the provision for tax liability estimated at Rs 120 lakhs; there had been no tax liability for the past few years on account of the large amount of development rebate and depreciation in respect of capital assets of the paper mills at Amlai and equipment installed at the Brajrajnagar factory. The directors say that amenities and facilities for employees have been "considerably increased" and construction of quarters for workmen and staff, involving large expenditure, has been undertaken; but they complain that the Union has put up 'fantastic' demands including for increase in wages which is pending before conciliation authorities. During the current year, the power plant at Amlai remained shut for overhauling for over a month, and the factory could be run partially with power obtained from the Electricity Board at a 'much higher cost'.

ESTRELA BATTERIES is going ahead with its replacement and balancing of equipment and the 60-million cell expansion. Construction work is in progress and machinery has started to arrive. An agreement has been concluded with IFC for a loan of Rs one crore to finance the expansion. A rights issue of equity shares has already been made to raise part of the additional finance required for expansion. During the 32nd year, ended March 1971, Estrela's working results—with a trading deficit of Rs 2 lakhs against a surplus of Rs 40 lakhs previously, despite increase of Rs 20 lakhs in turnover at Rs 4.91 crores—made a dismal showing. This outcome has been blamed on increases in costs and on the restrictions on selling prices of products. It has been stated that the company suffered "very heavy loss" on exports. The report, however, does not mention the quantam of exports nor the loss suffered on it. In spite of the disappointing results, equity dividend is maintained at 12 per cent, which is also paid *pro rata* on the amount called up on the new equity shares.

GUEST KEEN WILLIAMS is increasing its shareholding in Sankey Wheels by purchasing 1,77,800 equity shares of Rs 10 each at Rs 6.88 per share from Commonwealth Development Finance Company of the UK. GKW already holds 21.4 per cent of the subscribed capital of Sankey Wheels. Besides, GKN Sankey — a wholly-owned subsidiary of Guest Keen and Nettlefolds of the UK — also holds 21.6 per cent of the subscribed capital of Sankey Wheels. Performance of Sankey Wheels has been much below expectations, so that GKW's investment in Sankey Wheels has become unproductive although it is felt that there is ample scope for improvement in the company's business. With its wide experience and technical knowhow in the engineering industry, GKW intends to assist in the development and growth of Sankey Wheels. At the close of its eighth year, ended January 2, 1971, Sankey Wheels had accumulated deficit of Rs 31 lakhs, against the subscribed capital of Rs 1.78 crores.

Industry Grinding to a Halt

Arthagnani

THE growth of industrial production has shown a marked tendency to slow down over the last two years. The rate of increase of the industrial production index (1960 = 100) which had been 7.1 per cent in 1969 declined to 4.5 per cent in 1970 and to 1.8 per cent in the first five months of 1971. Available indicators suggest that this slow-down has continued in the subsequent months of 1971.

*

Bad carpenters quarrel with their tools; the Minister for Industrial Development, Moinul Huq Chaudhury, (who is new to the job and may, therefore, feel that he need not take responsibility for the past) has been vigorously expounding the briefs handed to him by his bureaucrats to explain away (or rather, correct) the dismal statistics of industrial output. Thus the index does not reflect the true growth in production as the base of the index (1960) is outdated; also, the index does not reflect the country's industrial structure fully in that it does not cover the small-scale industry.

Let us take the second point first. It was the Economic Survey, 1970-71, which first referred to an impressive growth in production in the small-scale industry sector. "The Reserve Bank of India has estimated that output in the small-scale sector registered an impressive increase of 11.2 per cent in 1969-70 as compared to 8.2 per cent in the previous year" (para 48). Attempts to trace the basis of this particular figure have, however, shown that it does not relate to production at all but to *registration* of small units with the Government and that the present figure is only a convenient bureaucratic extrapolation of much earlier data.

It is unfortunate that the Ministry of Finance and the Reserve Bank should have given currency to such suspect data. Purely on *a priori* reasoning, it is obvious that there are no specific factors making for a much faster growth of small industry, particularly as between two consecutive years. In any case, now that banks claim to be providing finance to more than 2 lakh small units, it should be possible to determine, on the basis of data from these units, the actual growth of production of small units. This is assuming that banks call for monthly returns of production from their borrowers. Or is it now the case that, as in the old days when they used to lend to large industry on the strength of their commercial judgment (a euphemism for decision by hunch) without any data, banks now lend to small industry without asking for any data, purely on the basis of RBI directives?

We are then left with Moinul Huq Chaudhury's first excuse, regarding the weights in the index. It is true that considerable capacity was established, particularly in non-traditional industries, in the sixties and the index weights do not reflect this. Yet significantly, as will be shown later, it is exactly in this sector that the index is lagging; in other words, if the index truly reflected to-day's industrial capacity, the lag would be equally well marked. For example, if the weight of 21.18 points currently given to cotton textile were redistributed to the extent of 12 to 13 points for cotton textiles and the balance for basic metals, engineering, chemicals and so on, the final outcome is unlikely to be much different from the present figure.

In any case, are we really concerned with esoteric arguments such as those relating to coverage and weights of a statistical index? The matter to ponder over is the existence of considerable unutilised capacity, particularly in the newer industries, and changes in policy needed to activate this capacity. Irrespective of what is happening in the small-scale sector and the weights attached to different industry groups, we are faced with the facts that production could be much larger in the organised sector and that the existing idle capacity reflects a waste of invested resources.

*

The industrial production situation is markedly uneven. The 1.8 per cent rate of growth in the first five months of the year is a composite result of two trends: a lower output (negative growth) in some industries counterbalanced by more rapid growth in other sectors. The two main sectors in which output has been lower are iron and steel and cotton textiles; these need to be examined in greater detail.

Output of steel has hovered around 4.8 mn tonnes for the last four years. The roof collapse at the Rourkela plant in May is expected to have reduced the figure still further, though this is expected to be set right by December 1971. Steel output is likely to have declined by 4 to 5 per cent in the first 9 months of 1971 as compared to the corresponding period in 1970.

The Government has sought to make good the deficiency in steel supply by increased imports. The estimate of the value of likely steel imports in 1971-72 is Rs 190 crores which should enable almost 2 mn tonnes of steel to come in. Moreover, steel from arc furnaces is available to make good some of the shortfall in the output of the large plants. However, imported steel is much more expensive and steel from arc furnaces also costs almost 25 to 30 per cent more than steel from the large plants.

The shortfall in supply of steel from the large plants is thus sought to be made good by imports and by domestic supplies from arc furnaces, though at a price. None of the user industries has reported cut-back in output due to steel shortage. In a shortage situation there is a tendency to exaggerate the shortage and to over-stock raw materials and it is not certain that increase in steel supplies would necessarily lead to growth in the output of steel-using industries.

Steel price is an important factor in the working of engineering units. At international prices plus import and excise duties, imported steel costs almost 50 to 60 per cent more than local steel. It is evident that if the Government is to ensure equity between users of local steel and imported steel, it will be necessary to operate a price equalising scheme or to ensure proportional supplies of local and imported steel to all users. The Government does not seem to have woken up still to this need.

The rush for setting up electric arc furnaces and concast units has continued in the meanwhile. Such steel production is based on availability of cheap scrap (or sponge iron) and a high (scarcity) price for the final product. Under pressure of demand, prices of scrap have been rising and, typically, there has been a demand for control (or even ban) on scrap exports. Arc furnaces would become uneconomic at a steel price of Rs 900/1,000 per tonne. Once HSL gets back on its feet and Bokaro supplies begin to come on the market, the arc furnaces would, therefore, have to shift over to special compositions of steel to

survive in the market.

Steel and engineering account for a total of 24.09 points of weightage in the industrial production index. The largest extent of unutilised capacity exists, significantly, in steel-using industries, mainly castings, structurals, machine-tools, transport equipment (railway wagons) and diesel engines, among others. Among the major engineering industries which have shown declines in output so far in 1971 (as compared to the corresponding period of 1970) are steel pipes and tubes, steel castings, diesel engines and power-driven pumps, electric motors and cranes.

Cotton textiles is the second category in which the index of production has shown a decline — of perhaps 7.8 per cent in the first nine months of 1971. Significantly, while both cotton and cotton prices have risen, the market absorption of cotton textiles has slowed down, with a consequential impact on cotton prices. The duty on cotton, imported to make up for the supposed shortfall in cotton supplies, has had to be reduced from Rs 450 a bale to Rs 250 a bale to improve the offtake of cotton by the mills. In the meanwhile cotton mills' profitability is being squeezed by high cotton prices, low production and a sluggish market for products. Even the buoyant sector of the textile market, that for artificial fibres, has begun to lose its lustre. As in most other cases, there is likely to be a glut when the new polyester units go into production during the next two years.

As against these two groups, production in the other groups is patchy, with only a few industries being buoyant. As the working of Hindustan Machine Tools shows, demand for machine-tools is picking up, though production still remains much below established capacity. This is also the position with machine-tool manufacturers in the private sector.

In aluminium, both Hindustan Aluminium and Indian Aluminium have recently increased their capacity; yet imports continue to be made, showing the strong demand for the metal. Some capacity expansion (particularly by Aluminium Corporation and Madras Aluminium) is now under way. Meanwhile, the Government-owned Korba aluminium project continues to make its somnambulistic progress towards completion.

The demand for electrical goods seems to be faltering again, after an upsurge in the last two years. The two heavy electrical units in the public sector have to put up with the erratic ordering procedures of state electricity authorities. Demand for power cables and electric meters has also slackened, and meter manufacturers are trying to maintain high prices by uniform tendering practices.

In the road transport equipment field, the picture is again uneven. Cars and scooters remain in short supply and these shortages will continue till the promised capacity, in the public and private sectors, materialises. On the other hand, in commercial vehicles, while Telco and Ashok Leyland face a strong demand situation, Premier Automobiles and Hindustan Motors still have excess capacity, thanks to their neglect of quality in the past. In the meanwhile, Telco's application for expansion seems to have got bogged down in the Monopolies Commission's inquiries.

The buoyant demand for automotive vehicles has created demand for automobile tyres and State Industrial Development Corporations have emerged as entrepreneurs in this field. The buoyancy in tyre demand has been felt in markets such as those for carbon black and rubber chemicals, capacity for which is now being increased.

Chemicals, which had withstood the recession, seem to have been less buoyant in recent months. Fertiliser growth has slowed down during the last three years. Caustic soda demand has benefited from a buoyant paper industry, and soda ash continues to be allocated by producers. Paper, recovering from the stagnation caused by price control, is enjoying a sellers' market. The Government has sought to prevent the buoyant demand for caustic soda, soda ash and paper from being reflected in their prices by formal or informal control. The result has been a flourishing grey market in all these goods, leading to tax-evasion and black money.

Price control is leading to an exactly similar situation in cement. Reimposition of price control has led to a pruning of cement expansion programmes, with consequent slack in capacity utilisation by cement-plant manufacturers. Yet on present indications, it is likely that a shortage of cement will occur within a year or two. At the same time, some big houses, fearing possible blocking by the Monopolies Commission, are attempting to obtain cement licences under the 'carrying on business' category, on the ground that they had taken 'effective steps' during the de-licensed phase.

*

In the five years between 1966 and 1970 the index of industrial production increased by 20 per cent, from 152.4 in 1966 to 180.2 in 1970. This is approximately the same rate of growth as in agriculture. It is evident that the slight push given to the economy four years ago by rising agricultural production has worked itself off, and there are no inherent factors operating to replace the initial momentum. The question to ask then is: what is needed to resume industrial expansion and to give it sustained stimulus? This is the question which the Planning Commission needs to ask. Unfortunately, the Planning Commission's work priorities appear to be as inverted as the Plan priorities.

[For statistics of industrial production please see pp 2366-8.]

HARDWAR

Abodes for the Almighty

WHO says that the taxes in the country are driving the rich to step up consumption rather than save for purposes more conducive to the nation's health? For people to whom He has been exceedingly kind, God, in His infinite wisdom, has provided a way of repaying His kindness — a way which, besides assuring them a place in the upper echelons of the other world, also saves the fruits of His bounty from the odium attaching to 'consumption' as well as from the taxman's evil eye. If you are in doubt, visit holy Hardwar for enlightenment.

To the north of the ancient town, a stretch of over 10 kilometres of the right bank of the Ganges, which till recently had seen no masonry, is now marked with lofty structures in an almost unbroken chain. They are all abodes for the Almighty — marbled monuments to His munificence.

Temples are by no means new to Hardwar. From Kankhal in the south to Har-ki-Piyari in the north, this sprawling haunt of pilgrims is literally dotted with shrines, both big and small. From Vishnu to Manasa, there is scarcely a divinity of any consequence in the Hindu pantheon who does not have a structure in his or her honour in Hardwar. Of course, Mother Ganga and Lord Siva receive somewhat special attention — which is but natural. To Ganga, the place owes its spiritual pre-

eminence as also its other name Gangadwar ('Gateway of the Ganges') as in the coiled locks of Siva she nestles before descending to the earth. Moreover, it was here that Sati, the devoted wife of Siva, had renounced her life in protest against his humiliation by her father, King Daksha.

Brahmkund alone, the flowing pool at Har-ki-Piyari, is ringed by more than a dozen shrines, dedicated to a number of major godheads like, Ganga, Gayatri, Lakshmi and her consort. Of course, the Kund possesses unique qualities. Its holy water, wide waterfront and fearless fishes attract bathers and tourists — and, inevitably, beggars and vendors. Localities of lesser charms, too, have not been overlooked. Every mahalla, indeed every lane and by-lane, is hallowed by His visible presence in one form or another.

Despite the pilgrims' generous patronage, however, the shrines in the town show signs of age. By contrast, the temples beyond its northern limits wear a distinctive look of glossy newness. Most of them, in fact, have burgeoned in the last one decade or so. Next to newness, what strikes most is their number which is growing. Some of these have yet to throw off their scaffolding. Quite a few are in clusters, though commanding spacious compounds. Some are dedicated to a whole line of a god's incarnations — e g, Vishnu's—each in an immaculate glass case with its legend elaborately inscribed in stone, while some others salute the Sapta Rishis — the seven sages who embody the seven streams into which the Ganges splits itself after entering the plains to re-unite soon after. To delight the devotees, some have panels of parallel mirrors on their sanctum walls such that the idol's image appears reflected in an infinite array.

Naturally, attending to the daily and, on some days, hourly chores, is no easy task. A large retinue of priests with apprentices to assist them is, therefore, provided for.

Visiting worshippers are looked after too. Many establishments have suites for them, with the best ones being reserved for the establishment's own dignitaries. In fact, in some instances, the residential part predominates with its imposing size and modern layout. Away from the din and dirt of the town, 'guests' here can contemplate Divine Grace in idyllic peace and airconditioned comfort, while the mute idol witnesses from a corner of the precincts. Nearly all proclaim to be 'ashramas', centres for practising austerity and, often, yoga — and not merely the mundane variety which helps keep fit, but the real discipline. Some are attempting to teach Sanskrit or to run schools for the blind; but those are exceptions.

All this obviously means money, and a lot of it. Ask any tongawallah or teastall owner, and they will tell you where it all comes from. But that is beside the point. Construction, whether of temples or of towers, is an activity that economists could not hesitate to bless, as long as it sets off 'the multiplier' and 'the accelerator'. Expression of piety, in any case, needs no apology — nor does the source of its sustenance require one. It would be sheer heresy to be sceptical on that score.

Just one nagging doubt. The wide choice open to Him notwithstanding, is the Almighty comfortable in His new abodes?

Priorities in Higher Education

(From a Correspondent)

IN the present times of unrest on the university campuses, it is rare indeed to see a retiring university official being given a warm send-off by the university community. In fact, in the first instance, one does not even very often see a vice-chancellor completing his term of office. What with the current fashion of appointing superannuated politicians or judges or civil servants as vice-chancellors, the mortality rate amongst them is pretty high. Then there is another tribe of vice-chancellors, those who take on the job only so that they can rub shoulders with the mightiest in the land. As soon as they find another berth higher up in the establishment, preferably in New Delhi, they quit the university "to serve the nation in a wider sphere". Finally, with student power manifesting itself on many campuses, and the faculty power too on some, it is not very rare to see some vice-chancellors ignominiously being forced to resign by agitations and strikes.

Certainly, this last event comes about more frequently than a public eulogy on a vice-chancellor. But when one looks at the situation closely, more often than not, it is found that the abuse heaped upon him is generally undeserved. Often, the campus activists hold him responsible for the situation over which the poor soul has little control. Further, even if he leaves, the change-over to another equally hapless individual does not improve the situation one bit.

However, when even a section of a university community acclaims an outgoing vice-chancellor for dynamic leadership and for being instrumental in recording significant progress and so on, such claims certainly deserve very careful scrutiny. In almost all such cases, it is found that the kind words of praise are even less deserved than the more usual bitter parting between the vice-chancellor and the university. For one thing, a person has to be an incurable optimist to believe that much can be done in the present situation to improve the working of our universities significantly. But actually, even in universities, one encounters far too many persons living in a Panglossian world where everything is best in this best of all worlds. They are not even prepared to concede that anything is wrong in the present set-up. It is, therefore, worthwhile to first of all define what are the foremost priorities in higher education today and then judge this or that individual against them before either praising him or debunking him.

As was said a moment earlier, it is futile to expect any revolutionary changes in the universities in the present context. But even within the existing set-up, some significant improvements can be made by an honest and capable leadership. Thus, for example, take the question of reforms in the system of examinations. Practically everyone is agreed upon its importance and also its urgency. The Education Commission, in its thousand page wisdom, says that "what is lacking is not the knowledge [of the necessity for reforms and the methods of improvement] but will, courage and perseverance to work out its implementation". However, although all universities and state governments formally swear by the report of the Education Commission, not one university has so far implemented its suggestions for reform in this vital matter. In this respect, it is interesting to note that almost all universities have enhanced the pay of the faculty as per the recommendations of the Commission, one reason for which was the loss of the remuneration from examinerships envisaged by the reforms.

It is not necessary to plead once again for the reforms in the system of

examinations because in theory everyone concerned is convinced of their necessity. It is the first step towards checking truancy on the part of the majority of our students and teachers. Moreover, the situation has deteriorated very much even in the past few years after the publication of the report of the Education Commission.

Examination Games

Even if the present rules and procedures regarding examinations are applied honestly, it will mean a considerable change for the better. As it is, the scandals and malpractices connected with every stage of the examinations, from the setting of the question-papers to the final declaration of the results, are enough to put even the worst department in the government to shame. And if a university does not hit the headlines in this respect, almost always it only means that either its officials have good relations with the press, or that the press has grown *blase* about the scandals in universities. Having former judges or civil servants as vice-chancellors has not made any difference even in this respect, although the least one would expect of them is to try and enforce the existing rules honestly.

As in the case of examination reforms, the case for reforms in the syllabi and the organisation of the various courses is equally pressing, if less obvious at first glance. What passes for education in most courses of study in our universities has no relevance either to the cultural or intellectual enrichment of the student or to his ability to land a job later. Thus, for example, even though almost all bachelors of arts study English for at least a couple of years, very few of them can write out a proper application for a job, let alone handle routine correspondence on their own in an office. The teaching of other languages is no better.

Recent work in subjects such as economics, psychology, sociology makes extensive use of mathematical methods, but our students studying these subjects are still exposed to a very minimal amount of mathematics, with the result that they start with a built-in handicap when they try to understand modern work in these subjects. As future research workers, this handicap is even more serious for them in the long run. While studying economics or politics or sociology, very little effort is made to study any theories other than those fashionable in Western liberal circles two or three generations ago. In fact, the social sciences which our universities generally teach are not at all what a country like India needs.

In the scientific and technical subjects, the situation is no better. In many subjects, the syllabi have not been revised for decades, so that what a student learns in his university has first to be unlearnt if he goes to a good post-graduate or research school. If he starts working, his firm has to arrange a training course for him which runs to two or three years in some cases.

Very few universities provide facilities for inter-disciplinary studies, such as bio-chemistry, geo-physics, mathematical physics or mathematical economics and so on. Nor is there any worthwhile effort towards organising comprehensive studies of a region or of a country. In fact, hardly any university has shown a penchant for developing any novel sphere of activity by itself, nor does any one have plans to be particularly daring in any respect. This failure is at least as much that of the leadership of the university as that of its faculty.

Perhaps, it is not even worthwhile to write about the administrative inefficiency and the general indifference to the students and teachers endemic in all our universities. It is unrealistic to expect any more efficiency in a university than in say the postal service, even though the university community is supposed to be more sophisticated than the public at large. But it is worth noting that students have to go on a strike in some universities for getting books in the library or equipment in the laboratory or a teacher in the classroom. One would think that a university would at least look after these basic requirements. If there is any attempt to find out how the students live and work on the campus, it is well concealed from the public. It was claimed recently on behalf of a retiring vice-chancellor that he and 'his' students lived as one community on the campus; he in an air-conditioned house furnished by the university and the students three to a room in the hostel. In his term of over five years, there was not one instance of his sharing 'potluck' with the students in their mess.

No great perspicacity is needed to spot any of the shortcomings listed above. What is needed is only a common awareness of the normal functions of a university and particularly of its leadership and a will to do one's job honestly and well. In fact, in a university of even moderate academic attainments, these problems ought not to arise at all in the first place. The tragedy of Indian universities is that without even attempting to tackle such problems, a vice-chancellor is apt to claim a place in the academic sun on the strength of having organised a brotherhood camp or a peace padyatra or for collecting funds for a worthy cause or two.

In the present times, when practically everyone is eager to establish his socialist bonafides or, at the very least, exhibit his smooth felicity in mouthing socialist slogans, one need not be surprised too much if someone claims to have brought a university "out of its proverbial ivory tower" and made it conscious of its social responsibilities. As remarked earlier, such a claim would have some justification if the university at least tailored its courses and the training programmes to meet the needs of the country. But our universities do not even have a vague idea as to how many students may seek admission next year to their various courses; nor have they any inkling as to how many jobs in various categories are likely to be available in their vicinity in the next few years.

No Attempt at Integration

There is no attempt to integrate work and study in the curricula, a procedure which is being tried out more and more often in both the liberal and the socialist countries. In China, for example, an engineering college works as an integral part of some industrial undertaking. Medical colleges and public hospitals work as an integrated unit even in India but the obvious moral of this is lost upon our planners. In this country which is desperately short of teachers in the countryside, there is everything to be said for making teaching in a school for a year or two an integral part of the curriculum in arts and science courses. But apart from desultory declarations every now and then about the need for introducing a year of social service in colleges, nothing is being done about it.

Not many of our universities have studied the problems of their neighbourhoods, whether they be of economic development or of the best use of natural resources or of housing or of clean air and water. What is even worse, no university has a perspective plan for the next five or twenty-five years of its own development. Presumably the University Grants Commission is expected to do the thinking for them and also provide the funds. Even in a rich city like Bombay, with

a string of well known public figures as the vice-chancellors of its university, there has been no attempt to collect funds for development by any other way than waiting for the UGC and the state government to dole out the money.

Change within the System

The various shortcomings discussed above can all be remedied within the existing framework of the universities and of society. The same is true of the few innovations suggested above. A person who has a strong interest in the preservation of the existing order, and a typical vice-chancellor is precisely that, ought to realise that a system has a better chance of survival if it works at least moderately well. So our liberal, socially conscious bourgeoisie, for the survival of their own values and mores, should strive to end the shabby state of affairs in our universities. It is true that to attempt to change the universities in isolation from the rest of the nation would be the height of naivete. But if one has to make a beginning at some place, universities form the best starting point. A university is reasonably isolated from the mainstream of our public life and is also sufficiently big an institution to have an impact on society in the long run.

But it is futile to hope for any such action with the kind of vice-chancellors and deans we continue to find for our universities. In nine cases out of ten, by the time a person assumes a vice-chancellorship, he is so old and of such meagre accomplishment in his life till then, that he has time only for devising a way to create at least an illusion of some long-lasting achievement on the campus, since he has neither the imagination nor the energy actually to accomplish anything significant. So he looks for a quick and easy way to achieve a permanent place of honour on the campus. If he is one of the crasser ones, he goes in for erecting his own statue or a building named after himself on the campus, while one with a veneer of sophistication collects LI Ds from his fellow vice-chancellors or gets his cohorts to start an endowment or a scholarship in his name. Meanwhile, if with luck and fortuitous circumstance, he lasts out the course, he, like Talleyrand when asked after the French revolution, what was his achievement, can always reply, "I survived".

Export Processing Zones: Gains at the Margin

Angus Hone

EXPORT processing zones (EPZ) have worked remarkably well in a number of small countries which have followed flexible economic policies designed to give maximum assistance to their exports and their exporters. Often, the conditions inside the processing zone and outside of it have not been very different: import of raw materials for subsequent export is freely allowed, capital goods do not require licensing, repatriation of profits and capital is comparatively uncomplicated. The main difference is that bureaucratic procedures, within the zone, are kept to a minimum and decisions from government on zone investment are usually quicker.

What, in fact, are the possible advantages and disadvantages of such zones? What are the underlying theoretical and administrative causes of their success or failure? What possible contribution can they make to India's export development? An attempt is made here to examine these questions and to set out a rational development scheme for export processing zones in India.

The great success of the export processing zone in Kaohsiung in Southern Taiwan is well known. The first products from Kaohsiung were exported in early 1967 — two years after the Statute for Establishment and Management of Export Processing Zones was passed in January 1965. By the end of 1970, Kaohsiung had 162 factories, representing a total investment of $ 40.9 million; exports in 1970 were $ 109 million; and 40,800 workers were employed at the end of the year. All the land at Kaohsiung had been exhausted and two new EPZ were being established at Nantze and Taichung. Similar developments have been going on since 1967 in bonded warehouse areas around Seoul in Korea and at the new free port of Masan. The government of Singapore has been actively promoting similar industrial investment on the Jurong estate. (Tatas have firm plans to establish a tool room to service the needs of the Singapore precision industries and to export throughout the region; production is to start in 1973.) In the Philippines, the Marieles free trade zone has been established, although very little investment has actually taken place. There are recurrent rumours that Malaysia, Thailand, Indonesia, and Ceylon, all plan to establish export processing zones or free trade zones as part of their efforts to attract foreign investment in export industries.

Indian discussion of processing zones starts from — and also suffers from — the fact that India' only example of EPZ, Kandla in Gujarat state, has been a disastrous failure. Though investment there has picked up since 1969, Kandla has not had any impact on exports, it has not attracted 'high technology' industries to India, and it has not provided significant employment. Why did it fail? First, it was in the wrong place: far from Bombay, far from any international airport, and it suffered from very bad communications and port living conditions. Second, there was no international campaign to promote the concept. Third, the Indian exchange rate at the time of Kandla's establishment (Rs 4.76= US $ 1) meant that India was extremely uncompetitive in all the likely manufactures from such a zone such as electrical and electronic goods, garments, wigs, plastics, rubber products, and toys. Finally, procedures for investment, capital goods import, raw material imports, capital remittance and sale of second-quality goods in India, were still hopelessly complicated. It is hardly surprising that the concept failed given these disadvantages.

Recently, the processing zone concept has been revived in the Airport Electronics Scheme sponsored by the Trade Development Authority, which would allow foreign investors and their Indian collaborators to import raw materials and to export finished electronic components freely from a bonded site near Santa Cruz, and there is the possible development of a more substantial zone in the Twin City plans for Bombay.

It is important, however, to recognise at the very outset that export processing zones do not, and cannot, act as a major stimulus to the export economy. Kaohsiung in 1970 contributed less than 5 per cent in gross terms to Taiwan's exports. Masan and other zones contributed even less. It is advisable to calculate the net contribution as only 2/3 per cent; imported raw materials and components often run as high as 50 per cent of gross exports. Also, EPZ in Taiwan, Korea, and Singapore, could not have been a significant at-

traction had not the basic atmosphere there been strongly biased in favour of free trade and free entry of foreign private capital — even though location of zone, air freight, packaging and shipping facilities, all contribute their share to success. The bulk of investment is American and Japanese, and the US and Japanese markets are the target markets. (All the zones have thus been badly hit in the late summer and autumn of 1971, by the US west and east dock strikes, the 10 per cent surcharge, and finally the 'voluntary' textile quotas.) Finally, even the marginal gains to the export economy from any new zones are bound to be smaller because the earlier zones have pre-empted the more heavy investments from the large international companies who will have by now planned their long-term sourcing of components; these companies will not want to scatter management time on a number of small units spread around the Bay of Bengal.

Nevertheless, the contribution of processing zones in India could be worthwhile. A zone would allow certain industries — which are crippled by high material costs and inappropriate local machinery — to develop. The obvious industries are the garments, electrical fittings, electronics, plastics, toys, precision instruments, and preserved fruits and vegetable industries. All these industries are plagued by high cost of polymers, synthetic fibres, packing materials, etc. Yet, Indian labour costs and — far more important — Indian inspection, supervisory and management costs, are highly competitive. Moreover, such a zone would give foreign investors a chance to use the most modern and productive machinery freely. This would act as a "demonstration of new processes" to Indian producers outside the zone. And the zone might attract international companies otherwise kept at a distance by the usual bureaucratic tangles. A series of such zones could make a *net* contribution of $ 50 million by 1980. Admittedly, this would be only 2 per cent of Rs 2,000 crores or more of exports anticipated by then, but it might still be worthwhile for the 'high technology' products which, without such zones, would not be produced in India and are excellent for India's product image in world markets. The processing zones can also provide employment to labour, particularly semi-skilled labour, which is usually abundant near major airport and seaport cities where the zones would be most satisfactorily located. The zone wage rates can be set by the government, but should certainly not exceed the local (non-zone) average for similar grades of labour.

The legitimate concern of government authorities about the dangers of smuggling as a result of EPZ can be administratively minimised. The area could, of course, be policed and enclosed, but a far more potent weapon lies in the free zone's concentration on producing goods that are largely unsaleable in the domestic market, being usually produced as components for foreign products and to foreign designs and specifications. The items most commonly smuggled in India — synthetic yarns, special steels, automotive parts, consumer durables, gold, pharmaceuticals and garments — are rarely produced in free trade zones. Garments are the obvious exception but, usually, stringent rules for legitimate sale of 'rejects' can conveniently take care of this — such as that 'rejects' should not exceed 5 per cent of production.

India has some endowments for leading in exports from export processing zones in the 1970s, which are closely allied to excellent air communications and reasonable sea freight opportunities. The labour and management skill base here is substantial too; in addition, the local engineering supply base in terms of dies, jigs, tools, fixtures, and design and drawing office ability, is the most sophisticated in Asia outside Japan and is certainly the lowest in cost. The other essential ingredients of a successful zone could be established, once Government of India is convinced that such zones are worthwhile — wihtout radically altering the domestic economic policy options.

There is, in fact, a host of facilities required if a zone is to compete successfully with other zones located elsewhere in Asia for international company sourcing and export production. The zone would probably have to offer a liberal tax holiday (3 to 7 years). Repatriation of capital profits and interest would have to be free (for foreign companies) although domestic taxes and rules on capital retention may be applied to local company investments in the zone. There should be ready supplies of low cost labour subject to whatever productivity adjustment is required to bring local wages into line with those in Taiwan, Korea, Singapore, etc. Water and power supplies have to be *regularly* available at internationally competitive prices. It has to be made extremely easy and quick for a new investor to be able to acquire industrial land with access to drainage, roads, power and water. The country would have to attempt to provide standardised factory buildings designed for the industries the zone is supposed to attract. Import/export procedures would have to be adjusted to approximate to those of Hong Kong and Singapore. The system of transport within the zone must be simple and there should be adequate warehousing for finished products awaiting shipment. Finally, the international air and sea transport links should be regular, relatively cheap, and able to move the goods produced quickly to their markets. These conditions were not satisfied in the old free ports of Hong Kong, Singapore, Penang and Aden. Above all, the stress during the operation should be on accommodating the problem of the exporter rather than on strictly applying the letter of the law.

India could develop four major bonded zones close to the international airports at Delhi, Bombay, Madras, and Calcutta — although the Calcutta zone might be located at Haldia. At the same time, the government could examine the possibility of establishing subsidiary zones in Goa, Mangalore, Cochin and Trivandrum, to take advantage of the female labour force and the educated unemployed in these areas. Industries would include: electronics, electrical fittings, tools, dies, jigs and fixtures, plastics and garments as well as precision instruments, toys, jewellery, sporting goods and a number of other items, all of which could be manufactured most efficiently using imported machinery, techniques, fittings and components. In some areas, foreign investment or collaboration could be required and the import and export of capital and the repatriation of profits freely allowed. In other areas only domestic investors would be involved, but with permission to freely import machinery and raw materials (after furnishing satisfactory export guarantees). India would thus gain foreign exchange earnings at the margin, provide employment in or near the metropolitan cities and in Goa, Mysore and Kerala, and gain from the spread of advanced technology and advanced management and labour skills. The Airport Electronics Scheme at Santa Cruz might indicate the beginning of a re-examination by Government of its policy options and might produce a further detailed examination of the feasibility of export processing zones.

India's Trade Prospects in Latin America

Mohan Ram

INDIA and Peru signed a three-year trade and economic co-operation agreement on November 4 at Lima. The two countries will double their trade every year and extend most favoured nation treatment to each other immediately. Though India signed an agreement with Colombia last year, the one with Peru is the first of its kind and regarded as a major breakthrough towards similar agreements with other Latin American countries in coming months.

But it is undecided whether India will re-establish trade relations with Cuba, an underdeveloped, socialist country and the first Latin American one to have taken up a 'Third World position'. India's reluctance to trade with Cuba can be connected with the United States' attitude to such relations. Countries getting certain types of US 'aid' are barred from trading with countries like North Vietnam and Cuba. Worse, the United States has imposed an open embargo on all products which have Cuban nickel as one of their components. The US government has also imposed a boycott on ships trading with Cuba and at least two Indian ships were recently blacklisted for touching Cuban ports but their names were removed from the list after an assurance that they would henceforth not handle any cargo to or from Cuba. The United States has also arbitrarily refused even to recognise an indisputable fact—that Cuba is among the world's main sugar producing countries. It barred Cuba from the Fourteenth Congress of the International Association of Sugar Cane Technicians held in New Orleans earlier this month.

New Peruvian Trends

The breakthrough in Indo-Peruvian trade has been possible largely because of three new coherent trends in Peru's foreign policy, reflecting the changed correlation of forces in Latin America. Peru has been sharp in its criticism of the International Monetary Fund and has favoured calling an international monetary conference which may eventually reorganise the agency now serving the policies of the ten dominant countries, especially the United States. Peru, along with Chile and Ecuador, greatly influenced the Latin American vote in favour of China's admission to the United Nations. Peru voted against the United States move to declare the entry of China an "important matter" so that the decision could be put off by a year. Peru's vote in a sense proved decisive for the explusion of Taiwan and admission of China to the United Nations.

The Peruvian delegate to the UN focused attention on the problem of underdeveloped countries and their evident dependence on the United States and called for liberation efforts to be begun from those countries themselves. Above all, he called for a change in the attitude of these countries: no more denunciations nor pleas for aid.

The three trends emerged in the midst of a total change in the world scene and in the framework of challenging the imperialist power forms in the 'Third World'. This no doubt would

Expansion in Public Sector Oil Refining and Marketing

Indianoil Chairman M. Rama Brahmam's Statement

Gentlemen,

On the occasion of the 12th Annual General Meeting of the Indian Oil Corporation it gives me great pleasure to welcome you and utilise the opportunity to recapitulate the performance of your organisation for the year 1970-71. The report of your Directors and the Audited statement of accounts are already in your hands. With your permission I propose to take them as read.

I took over as the Chairman of your Corporation only a few months ago. But I am emboldened by the feeling that I am no stranger to the organisation or to the oil industry with which I have been intimately connected for over a decade. My association with the Corporation had a brief break when I was called upon to head a modern, sensitive and sophisticated refinery in the South in which considerable Indian technical skills and expertise had gone in to bring about the fruition of another enterprise with Government participation.

It gives me great happiness to lay before you the steady and phenomenal growth of your company, which, unmindful of the severe competition from established foreign oil companies, has come to be reckoned as the biggest oil refining and marketing organisation both in private and public sectors. The commissioning of the first public sector refinery in Gauhati in Assam in 1962 followed by a chain of public sector refineries, modern pipeline transportation of petroleum products and the nation-wide marketing net work to undertake distribution of vital petroleum products to far flung corners had all acted as catalysts in India's economic life over the past decade.

During the year, your refineries processed 6.34 million tonnes of crude oil. The turnover of the Corporation for the year amounted to Rs. 720.01 crores as against Rs. 634.41 crores during the last year resulting in an increase of 13.49% over the previous year. In terms of quantity, the total sales of your Corporation during the year was 11.61 million kls as against 10.64 million kls during the last year; thus recording an increase of about 9.1% over the previous year.

This brings the all India market participation to 51.6%. Both on the refining and on the marketing side your company has improved its position of leadership in the industry.

Your Corporation has laid a lot of emphasis on the service aspect of its operations. Provision has been made for trained staff to provide technical and sales service to the Corporation's vast body of Government and other customers spread throughout the length and breadth of the country.

Profit during the year before providing for depreciation and interest amounts to Rs. 31.32 crores as against Rs. 36.20 crores for the previous year. Profit after depreciation and interest amounts to Rs. 15.77 crores during the year as against Rs. 20.41 crores during the previous year. In spite of the higher production and highest turnover, the profits of your Corporation were reduced from Rs. 20.41 crores in the previous year to Rs. 15.77 crores during the year showing a reduction of Rs. 4.64 crores.

Prior years expenses increased from Rs. 2.06 crores to Rs. 4.55 crores showing an increase of Rs. 2.49 crores. Whole of this amount is on account of the retrospective increase in the price of crude oil since the inception of Gujarat Refinery, in respect of crude oil supplied by Oil and Natural Gas Commission; there is also an element of a higher rate for crude oil payable to Oil India for the period of January/March 1970.

The cost of crude oil as compared to the basis on which the payments were made in the earlier years was higher by Rs. 2.5 crores for the financial year 1970-71.

Thus the cost of raw materials accounted for reduction in the profit by about Rs. 5 crores.

The Corporation had to pay devaluation duty amounting to Rs. 97 lakhs which resulted in an additional burden during the year under review. There were also unavoidable losses totalling Rs. 2.89 crores resulting from under-recoveries of Inland Freight (Rs. 0.40 crores), Sales Tax (1.39 crores) and coastal transportation cost (Rs. 1.10 crores).

The foregoing reductions aggregate to a sum of Rs. 8.86 crores which would otherwise have been added to the over-all profitability of your Corporation. The outlook for the next year 1971-72 is promising and the Corporation will undoubtedly show better results.

Although the paid-up capital of your company is Rs. 71.18 crores, your Corporation has earned net profits aggregating to about Rs. 73.5 crores since the amalgamation of Indian Refineries Limited with Indian Oil Company in the year 1964. Your Corporation has also generated internal resources totalling about Rs. 119.88 crores and has repaid about Rs. 9.58 crores loan to the Government—thus reducing the loan capital to Rs. 44.15 crores. You will be pleased to know that the Haldia Refinery project estimated to cost Rs. 68 crores is being financed to a very large extent out of Corporation's own internal resources. Outstandings were substantially reduced and amounted to Rs. 33.57 crores as against Rs. 39.71 crores at the end of the last year. Outstandings at the end of the year represented 15 days' sale as compared to 22 days' sale during the previous year.

Your Directors have recommended to you to maintain the dividend at 7% on the paid-up capital of the Corporation. This will be the fifth consecutive year during which the dividend is being paid—the total amount of dividend paid during these years will be Rs. 23.87 crores, representing well over 33% of the paid-up capital of the Corporation, i.e. Rs. 71.18 crores.

May I now bring to your notice a few distinctive features of your Corporation?

In addition to the three operating refineries—which are working very satisfactorily—construction of Haldia Refinery is progressing satisfactorily and it is expected that the fuel part of the refinery will go on stream in the first quarter of 1973 and the lube complex in mid 1973. The three existing refineries at Gauhati, Barauni and Jawaharnagar achieved crude throughput of 6.34 million tonnes. While your refineries at Gujarat and Barauni continued to operate at levels higher than their designed capacities, there was a slight shortfall in the throughput of Gauhati Refinery mainly on account of frequent interruptions in the unit operation due to failure and unsteady power supply and the difficulties of uplifting of products of Siliguri and restricted availability of crude.

Shri M. Rama Brahmam

At the request of the Ministry of Petroleum & Chemicals, your Corporation has prepared feasibility reports for two new grass-root refineries, one at Bongaigaon in Assam and the other in North-West Region of India.

It is a matter of satisfaction to all of us to note that a start was made to produce LPG in Gauhati Refinery for the first time in March 1971 and the production will be stepped up accordingly as the demand for LPG in Assam develops. Again the Coking Unit of that refinery achieved a record run of 132 days, the highest so for achieved. In the matter of product recoveries in that refinery, a percentage of 90.1 was achieved against the anticipated recovery of 89.2%. The performance of Gujarat Refinery also continued to be impressive. During the year, 17,981 MT of LPG as against 11,087 MT in the previous year were marketed. Likewise, the Barauni Refinery has also recorded production above the installed capacity and the improved maintenance techniques has enabled the Phenol Extraction Unit of that refinery to achieve a record run of 327 days during the year which is the highest so far.

The performance of the Pipeline Projects has been equally impressive. The Barauni-Kanpur Section of the Pipelines achieved a record throughput of 1,03,318 MT of white oil products in the month of March 1971. For the first time, black oil product, i.e. LDO was also transported alongwith the white oil products through this sector of pipeline in April 1971. All the four major pipelines together account for the movement of 2.62 million tonnes of petroleum products during the year. In addition, two feasibility studies for laying pipelines, i.e. a product pipeline from Haldia to Rajbandh and a crude oil pipeline from a suitable port on the Western Coast to the proposed refinery in North-West Region together with off-shore facilities were prepared and submitted to the Government. The latter pipeline is expected to cost about Rs. 75 crores for transportation of imported crude to the proposed refinery in the North-West Region.

The foregoing programme impose a very heavy responsibility on your Corporation but I have every confidence that your staff and engineers who have now acquired adequate experience in handling new projects will live up to discharge these responsibilities in the most efficient and economical manner.

At the close of the year, your Corporation owned distribution facilities at 24 port and pipeline installations, 1 inland installation, 359 upcountry depots of all kinds, 68 aviation refuelling stations and 3004 retail outlets.

The Corporation has now developed sophisticated air refuelling facilities at 68 air fields and during the year the Corporation handled about 70% aviation fuel business in the country. During the year, the Corporation added 323 retail outlets-thus raising the number of retail outlets to 3004. The number of retail outlets, according to the planned target will be substantially increased by the end of 1974 which is the last year of the Fourth Plan. Indane marketing was extended to 13 additional towns during the year and presently the requirements of about 3.33 lakh Indane consumers are being met through 102 distributors in over 54 towns. It is also planned to extend marketing of Indane to about 100 additional towns during the course of next 18 to 20 months; thereby making available approximately 3.5 lakh additional Indane connections to customers. Your Corporation also continued export promotion and the value of products exported during the year amounted to Rs. 353 lakhs.

Alongside the development and growth of refining and marketing operations, attention has also been devoted to research and development in these spheres. Accordingly it has been decided to establish a Research and Development Centre at Faridabad at an estimated cost of Rs. 250 lakhs. This Centre will undertake the work of product development especially in the sphere of lubricants and will also render technical services to our esteemed customers. The Centre is expected to be operative by the beginning of 1974.

The phenomenal growth in the all-round activities of your Corporation has underlined the need for manpower development and training in productivity, inventory control and controls over revenue expenditure, working capital, etc. During the year, 119 training courses were conducted at your Corporation's training centre at which training was imparted to 984 officers and 716 other employees as well as 167 Defence Services Personnel. The Corporation also organised seminars for customers such as Railways, Steel Plants, etc. in the sphere of optimum utilisation of fuel and lubricants. Training Departments in the three operating refineries at Gauhati, Barauni and Gujarat continue to keep the refinery engineers and operators up to date with the refining and maintenance techniques.

It is gratifying to note that your Corporation has, by and large, maintained harmonious relations with the trade unions consequent upon which it was able to avoid any serious industrial strife. Your Corporation has also evolved a system of communications with staff at all levels to keep them informed of the Corporation's programmes and policies.

Your Corporation's investment in Indian Oil Blending Limited yielded a dividend of 20% whereas the Corporation received a dividend of Rs. 1.70 per share from Indo-Burma Petroleum Co. Ltd., a subsidiary of the Corporation. The return of your Corporation on the investment of Rs. 75 lakhs in IBP was 8.8%. Indian Oil International Limited, a wholly-owned subsidiary of IOC started its trading activities from 1st November 1970 in Nepal.

The Corporation's scheme introduced during 1969-70 for giving dealerships and agencies to unemployed graduates belonging to low income groups is being implemented with determination despite the hurdles being encountered in finding finances and sites for the selected dealers. In order to achieve the social objectives underlying this scheme, your Board of Directors have relaxed certain conditions in the selection of dealers and sanctioned extra funds to facilitate establishment of more and more retail outlets. Under this scheme 69 Indane distributorships, 275 retail outlet dealerships and 86 kerosene dealerships have been awarded so far. The Corporation also helped to rehabilitate ex-servicemen and their widows by granting dealerships and distributorships to them.

In the world today, oil is a source of power particularly for mobile units on land, water and air and has become the most important factor to keep the communications alive. It is, therefore, a matter of special importance to us, both during the normal times where economic development has to be speeded up and during the critical days such as the period which the country is passing through now, that every effort is made to keep the supplies adequate and available at various locations with the least possible delay. In this, the efforts made by your company assume special significance and it is hoped that with the cooperation of the officers and staff we shall continue to keep the line of communications in tact and efficient.

One of the essential efforts of Indianoil has been to reach a stage of self-sufficiency, particularly in the refining field. The progress made so far has amply demonstrated the ability of your company to deal with the rise in demands. However, the years ahead of us are likely to see greater and greater demands on our ability to cater to the needs of a rapidly developing economy. It is my hope that building on the experience gained during the last decade and keeping our technology abreast of modern developments abroad, we shall progress in the years to come with greater speed and efficiency and thereby serve the needs of our country and the society.

We are about to evolve a National Fuel Policy. Oil will continue to remain an important element in any such policy. To the extent that the increased use of petroleum products involves a drain on our scarce foreign exchange resources there is bound to be a constraint on our development. We can only hope that the intensified efforts being made for exploration both on-shore and off-shore will soon yield adequate quantities of crude oil to meet our growing needs. We on our side should press on with our efforts at expanding our refining and marketing activities so that your company will fulfil its role in the National Fuel Policy.

Exodus of refugees from Bangla Desh has caused a tremendous strain on the Nation's resources. Your Corporation, realizing the need for helping the refugees, contributed a sum of Rs. 5 lakhs to the Prime Minister's Relief Fund earmarked for refugees from Bangla Desh. Your Corporation also made contributions for the relief of flood affected people in the country.

In conclusion, I would like to thank all the employees, who by their sustained efforts and hard work, have contributed to the development and success of the Corporation.

With these observations, I now move that the accounts be adopted.

Dattaram-IOC-17

This is the speech delivered by the Chairman Shri M. Rama Brahmam at the 12th Annual General Meeting of the Company held on the 16th November, 1[illegible] at the Registered Office of the Company at Bombay. *This does not purport to be a record of the proceedings of the 12th Annual General Meeting of the Company.*

Attitudinising Galore

Nireekshak

INDIRA Gandhi's tour of Europe and the United States was probably the best publicised of all such journeys undertaken so far by any Indian Prime Minister or President. The press party which accompanied her from Delhi seems to have been a small one, consisting of a special correspondent of All India Radio and another of *Amrita Bazar Patrika* — and possibly a third of PTI as well. But this party was considerably reinforced on the road, as every resident Indian correspondent in Europe and in the US was ready and waiting to receive her. They kept a close watch on her movements, read the comments in the local newspapers, and filed thousands of words home. All this, buttressed by editorial comments on the progress of the tour, created the impression of high drama — which is probably what they were intended to create.

It must be said, though, that after the Prime Minister reached Washington, reporters and editorial writers allowed themselves a brief pause for reflection. And the only doubts about the 'success' of the tour that the press permitted itself to entertain were reserved for this occasion. Krishan Bhatia of *Hindustan Times* carefully noted, for example, that while "Mrs Gandhi admittedly made a good impression ... most of those who came to hear her were either Indians or friends of India who did not need to be convinced". If, however, "while wishing to clarify India's stand the Prime Minister had also hoped to prod Mr Nixon into a more meaningful role in Islamabad than what his administration has hitherto played", he added, "the visit seems, on the basis of available indications, to have been markedly barren".

And according to T V Parasuram of *Indian Express*, "the next few days will show whether the 'special relationship' and 'sunshine of Indo-American friendship' which President Nixon spoke of ... will last". Parasuram also noted that "in public speeches, at any rate, President Nixon and Mrs Gandhi seemed perpetually to be on different wavelengths ... (and) they seemed to be speaking to their own audiences and not to each other." An editorial in the *Express* on the same day even went a step further, dismissing as inconsequential or insubstantial the US decision to stop arms supplies to Pakistan. "Why wasn't it done earlier?", it asked. "With the clumsy obtuseness of which they have often shown themselves capable, the State Department and the White House presumably calculated on first confronting our Prime Minister with an olive branch carefully contrived between Washington and Islamabad, and then proceeding to twist her arms .... The lady reportedly stood up to the collective masculine arm-twisting." As for Nixon's reference to the "sunshine of Indo-American relations", *Express* retorted, "he would have been more correct had he referred to it as a lot of moonshine".

For many newspapers, the end of the Prime Minister's Washington visit signified not just the high-watermark of the tour, but the end of the tour itself. *Free Press Journal*, for example, thought it fit to sum up the tour after the conclusion of the US part of it. In Europe, said the paper, the Prime Minister had "one advantage, *viz*, that she was taking India's message to those who had been more or less converted to it already .... In the US, however, the Prime Minister was expected to face a more difficult task [and] it is difficult to say to what extent she has been able to make a dent in [the] wall of anti-Indian and pro-Pakistani prejudice" there. Anyhow, it added, "in the final analysis India must do what its national interest demands it to do ... irrespective of whether India's interests coincide with the interests of all its friends abroad."

As *Times of India* saw it, there was "no sign yet of any marked change in the approach of the US administration despite all the sunshine sentiments expressed by Mr Nixon". The US, the paper thought, "is not likely to deviate from the cynical policy it has pursued all these months". And as, in this manner, "few are willing to look at the issues in the broader context of democratic values", India will have to "make up its mind on how it can best avert the threat to its own integrity and sincerity, without recourse to subterfuge or make-believe .... Seen in this perspective, the task of mobilising the nation for the trying days ahead is far more urgent than that of canvassing international support."

Two other developments which attracted editorial attention during the period under review were Britain's decision to enter the European Common Market and the US Senate's vote against foreign aid. "The overwhelming vote in favour of Britain's entry into Europe", wrote *National Herald*, "signifies no more than acceptance of the principle and a long and hard road lies ahead of the Conservative Government before Britain is firmly inside the European Community". *Herald* then went on to analyse the prospect of the Common Market becoming a super power, wondering how this would affect the world power equation as well as the fortunes of developing nations. "Mr Heath is right when he says that the British Parliament's decision will vitally affect the balance of world forces in the modern world for years to come. Whether the effect will be good or bad remains to be seen", it pontificated.

The Tory decision was "right", commented *Mail*, and the "Labour dissidents were equally right to defy their party whip .... Undoubtedly Britain's future lies in Europe ... Fears that the Commonwealth may break up are probably unwarranted, but the British people ought to know that the Commonwealth is not what it was...." With the decision for entry, said *Searchlight*, "the centuries of its [Britain's] independent world power status seems to have ended .... So far as India is concerned, it now depends on our negotiators what favourable terms they can secure from the Common Market when the Commonwealth preferences disappear."

The US Senate's decision to end foreign aid was "unfortunate", said *Amrita Bazar Patrika*. And President Nixon is not "unreasonable" in describing the vote as "highly irresponsible." But, it added, "even if the programme is ultimately restored, it would be realistic for New Delhi to remain prepared for a drastic cut, in view of the current mood of the US Congress". It was a "rebuff to Nixon", commented *Hitavada*. "Although the Americans have continually talked of world peace, American foreign aid programme has been one of the most potent causes for disturbing world peace .... It augurs well if developing nations are required to think in terms of self-reliance as a result of the stoppage of American foreign aid.... There is the example of China which has gained strength through self-reliance ..."

Foreign Technology: Role and Control

Baldev Singh

Foreign Technology and Investment; National Council of Applied Economic Research, New Delhi, June 1971; pp 170; Rs 25.

THE task of any reviewer of this book would have been simpler if the purpose of the study commissioned by the Research Programmes Committee of the Planning Commission, on which the book is based, had been clearly stated. What are "the shrouds of conventional vision" (p v) that the study aims to remove? Was the study designed to evolve a more appropriate approach to imports of technology and foreign investment? Or was the Planning Commission's query how imports of foreign technology and foreign capital could be maximised to accelerate industrial and economic growth (irrespective of the country's political and economic objectives of self-dependence and self-reliance)? Divorced from a clear-cut objective, the study gives the impression of a rambling survey of a highly complicated field.

Planning in India has always suffered from a surfeit of economic wisdom and expertise in the abstract divorced from technological realities. This book goes one step further in the same direction, which only proves that in the field of technology the economist is a lost man unless he interacts with a technologist and the two as a team study the technological situation.

It is neither possible nor perhaps necessary to analyse the formulations of the authors chapter-wise or subject-wise. Most of them would not stand the scrutiny of anyone familiar with the evolution, growth and promotion of technological structures in an underdeveloped economy.

In the preface by Boothalingam it is well stated that "the main thrust of the policy of the Government has been towards keeping down the cost of imported technology ..." and that "the government's information base regarding the quality of technologies has been narrow" (p 4). One would have expected the authors to prescribe criteria on which to base judgments as to whether or not to import a particular technology and advise on a regulatory mechanism appropriate to these criteria. One would have also expected a positive recommendation to emerge on improving the competence of the government's information base. A chapter on the present role and function of the main technical advisers to the Government, *viz*, the Directorate General of Technical Development (DGTD), and how it could be made more effective as an instrument for selection of appropriate technologies for import would have been in order. As it is, DGTD is not even mentioned in the text of the book.

Side-stepping any measures for regulating import of technology based on technological scrutiny or evaluation, the authors end up by concluding that fiscal measures such as "taxation and capital issues control have been more effective in channelling investment as well as technology into directions desired by the Government than the control of collaborations" and that "we have tried to present a case for as well as outline the means of shifting emphasis from the latter to the former". At an administrative level the authors suggest that the "present requirement that all collaboration proposals must be approved by the Government should be removed, and replaced by changes in corporate taxes" (p 85). Further, proposals for technical collaboration without investment may be registered by the Reserve Bank of India according to predetermined conditions. Those involving import of capital within limits for capital participation could go to capital issues control. Only those where the capital participation is to exceed the general approved level would need the government's approval.

Simple Solution

The entire problem of regulation and control of foreign technology and investment has been reduced to a simple solution, *viz*, "shift the burden of policy implementation to automatically acting fiscal measures". This, in the opinion of the authors, "will attract the world's most advanced technology to India and induce Indian technology to rival it" (p 86). In the absence of a proper understanding of the growth of technology and its role in economic development in different countries, this recommendation, *viz*, technology import control through fiscal measures, suffers from the same lacuna as pointed out by Boothalingam, i e, absence of technological information and competence in the government's operations.

The method suggested in the study to enhance the role of foreign technology and investment in India is to dismantle the existing regulatory and control mechanisms (however limited) set up for purposes of making technological judgments, reduce development of indigenous R and D to the minimum and lower all barriers to a free inflow of foreign technology and investment. In short, India's philosophy in regard to foreign technology and investment should be that of open market and free trade with the traditional forces of demand and supply as the determinants of technological needs. The judgment on technological imports and their value should be exercised by the capital issues control authorities and Reserve Bank of India whose main field of specialisation is not technological but economic.

What is the role of foreign capital (and technology) in a country's political and economic policy? In India is foreign capital merely a neutral carrier of technology or has technology served as a channel for entry of foreign investment in areas of critical economic importance and maximum profitability? So far as the authors are concerned, they have reduced the role of foreign capital to a simple proposition, *viz*, "since proposals for foreign investment are mostly accompanied by technology imports, we have felt justified in treating foreign investment as a special form for payment for import of technology" (p 14). Using the same fiscal criteria the authors state that "investment represents the costliest form of payment for imports of technology". It would appear that the only objection to foreign investment or its quantum that a developing country may possibly have is that it costs more. One wonders if the implications of operation of foreign capital in developing economies could be reduced to so simple a formulation even by an ivory tower economist or technologist. The authors themselves should have noted to the contrary when they have stated elsewhere that Japanese policies of capital import are that "the liquid internal assets of the country must always be sufficient to pay off all liabilities which the country has undertaken to pay on demand" (p 11) and that the Japanese scrupulously avoid permitting control of technology through capital investment.

If control of technology is taboo in Japan, then import of technology with investment cannot be viewed simply in terms of cost and payments for India either.

A study of technology-based industry that generates the maximum amount of capital accumulation is one of the most fascinating fields for a techno-economist. The manner in which governments of developing countries can, through planned and deliberate measures, increase the technological content of their operations in administration, decision-making and policy-formulation is of vital importance to self-reliant economic growth. The attitude to foreign investment is to an extent a reflection of the political character and ideology of the host and recipient governments. The control on technology of a country through capital involvement can mean control of vital and important sectors of the economy itself. Thus the role of foreign capital investment, for which technology serves as a vehicle, cannot be discussed or accepted as innocent of political and economic implications and without relationship to the national goals and policies of the donor and recipient countries.

Several Erroneous Conclusions

The abstract treatment of technology transfer by the authors has led to several erroneous conclusions. Thus in the very first chapter, on the basis of "royalty payments" it is declared that "India is a minor buyer of declining importance in world market for goods as well as technology" (p 4), ignoring the fact that heavy imports of machinery and capital goods and increasing recurring expenditure on maintenance imports represent inbuilt payments for technology. Similarly, it is stated that India's share in capital imports and royalty payments is smaller (only 1.5 and 1.2 per cent) and that India receives only 3.2 per cent of the US investment in the developing countries (p 4). Since later in the study there is reference to "the increasing attractiveness of India for investment" (p 6) and it is a well known fact that the returns on foreign investment in India are amongst the highest in the world, the proportionately small share in investment is not explained. Among the motivations that determine the international movement of capital, political factors count for the most and profitability comes later. The governing principle is not different in regard to capital investments through the channel of technology. In considering the question of foreign investment, the social, political and economic goals of the country and their acceptability to the capital-exporting countries cannot be ignored.

A country has to make a policy choice on the manner, type and quantum of foreign investment and technology consistent with its socio-political and economic goals. If it desires to maintain directional control in its own hands, it would import capital only of a type which would not create compulsions in the economy and foreclose its political options. As stated earlier, the Japanese chose the path of self-reliance (despite pressures from USA and fellow OECD members) by permitting only such equity as did not adversely effect their economy. Japanese have permitted an influx of $ 4.4 billion of foreign capital investment but of this three-fourths was in the form of loan capital. Of the total equity, only one-third ($ 312 million out of $ 944 million) was with management participation (rigorously defined). Unlike India where upto 49 per cent is not considered as controlling equity, in Japan anything above 7 per cent for a foreign company or 20 per cent for unrestricted and 15 per cent of restricted indents are defined as constituting management participation.

In India by contrast subsidiaries of foreign companies accounted for 65 per cent of total foreign capital participation in 1963-64. Of the 432 firms in India which had foreign equity, 283 had equity above 30 per cent (Table 32). Thus by the Japanese definition, over 68 per cent of the firms were those with equity and management control in foreign hands. In the Indian industrial sector, major firms in significant sectors such as pulp and paper, chemicals, pharmaceuticals, glass, metal goods, machinery, electricals, automobiles and instruments are under foreign management control even today.

It is not only that investment is a costlier payment for imported technology but that technology imported into India has served as a vehicle for entry of foreign capital and for control of important sectors of the economy. This represents the hard reality of the role played by most of foreign equity investment and import of technology. A positive role of foreign investment would be to add to scarce resources of foreign exchange needed for capital goods import and to catalyse internal capital mobilisation for rapid industrial development. To what extent this role has been fulfilled by foreign investment in India is nowhere examined in the study. The authors are so much obsessed by the notion that foreign investments are only a form of payment of technology that this aspect is completely ignored.

False Argument

From foreign investment let us now turn to foreign technology. On the basis of interviews with some firms (names not mentioned) the authors come to the conclusion that import of technology is cheaper than indigenous effort at R and D (p 2). This statement may be acceptable within limits because it is not necessary to work out each technology *ab initio* in the country. However, when the authors apply this logic relentlessly to all aspects of import of technology, the picture becomes distorted and bizarre. The main orientation of the study, it appears, is that the progress of a country is directly related to its imports of technology. Japan and Germany are quoted as examples of outstanding successes in industrial progress because of their heavy imports of foreign technology (p 2). Flowing from this logic, every factor that stands in the way of import of technology is to be subjected to criticism. Figures are quoted of the number of agreements for import of technology during 1951-64 entered into by India (2,200) and Japan (6,400) to prove that India is backward, having entered into lesser number of agreements (p 8). This is a completely fallacious argument. For understandable reasons, frequency of transfers of technology is directly related to the industrial and technological level and sophistication of the countries involved. The frequency of transfer of technology between two developed countries is likely to be higher than between developed and developing countries. The study gives no consideration to factors such as the available industrial base, R and D potential, technological resources and character of industries in different fields in the concerned countries. Nor is the political factor of Japan's special relationship with US in the post-War period kept in view.

The argument that heavy imports of technology are a requirement for rapid growth runs as a refrain through all the subsequent formulations on the different aspects of the problem of import of technology. When discussing the question of quality of imported technology, the authors feel that there is no method of judging the quality of technology excepting by the cost per unit and the risk involved (p 18). The lower the cost per unit in production

the better the technology. Likewise, the lesser the risk, the better the technology. This over-simplification leads to the assumption that all you have to do is to study the cost per unit of production to arrive at a value judgment on quality. The cost per unit of production is related to capacity which in turn is determined by the available market. Thus a giant-sized unit in a developing country may be uneconomic though theoretically the cost per unit of production may be lower. It might be more correct to say that a technology will be more economic and hence superior if the cost per unit of production is lower for a specified capacity. In mentioning lesser risk as a determinant of quality, the study contradicts itself immediately afterwards when it says that all newer technologies which are likely to be more sophisticated are untried. Thus the criterion that a safer technology is superior is immediately rejected in the study itself. Still it is retained as a factor in assessment of quality, presumably because the authors would like India to import commercially tried technologies which by this judgment may be considered superior.

It would appear that the authors have not taken into account recent debates on the "appropriate technology" suited to the country's raw materials, level of technological culture, market capacity and needs. There is nothing like a superior or an inferior technology in the abstract. There is only an economic technology related to the conditions of the country or the market in which it operates. The judgment in regard to the selection of technology has to be techno-economic but the study merely quotes profitability as a factor to determine the type of technology to be imported. Since no techno-economic criteria are to be applied to evaluate the type of technology to be imported, the study comes to the conclusion that the only way in which a superior technology can be judged is on the basis of the price one has to pay for it. The better the technology, the higher the cost.

Taking cost as the criterion of quality has led the study to attack the ceiling fixed by government on royalty. It is critical of government's resistance to firms with majority foreign equity and subsidiaries of foreign companies. The authors consider this to be against the interests of import of better quality technology. At another place the study says that as an Indian industrial firm acquires better experience by negotiating a number of proposals for import of technology, it becomes better acquainted with the methodology of selecting the superior technology (p 37). This conclusion is drawn from data purporting to show that firms that have experience of negotiating collaboration agreements more than once (say, 5 or 6 times) have paid much higher royalties than firms with experience of negotiating fewer number of times (Tables 61-63). Thus the result of collaborative experience is payment of higher royalty!

Non-Technological Approach

One would agree with the authors that the government has no criteria on the basis of which to make value judgments on the quality of technology. The fixing of royalty product-wise and setting a ceiling of 3-5 per cent would normally result in the higher figure being accepted, particularly since it can be supplemented by negotiable lumpsum payments or payments through underhand methods as pointed out in the study. If the concerned departments of the Government of India have to function with any degree of technological competence and help industrial firms to acquire better quality technology, the information system of the government and the technological content of its administrative set-up would have to be substantially improved. However, this is not what the study recommends. It actually proposes to worsen the situation by eliminating the regulatory functions of the government altogether and leaving the judgment on quality of technology to the importing firms which are to be left free to pay any royalty they choose.

It is again this non-technological approach which is responsible for the suggestion made in the study that only the larger firms are capable of importing better types of technology. Since the majority of the firms that have imported technology in India belong to the small and medium scale sector, the conclusion drawn is that most of the technology imported is outdated, low in quality and cheap in price. It could not be a revelation to the authors of the study that a number of large firms and the monopoly houses have also sometimes imported outdated, low quality technology in the absence of competent technological personnel in their set-up. A number of small firms, particularly where they are engineer/technologist-run, have made valuable contracts for import of technology at lower cost by their ability to negotiate from a position of technological competence. The capacity to negotiate and pick up the best and the cheapest (the two are not necessarily contradictory) in technology comes not from the size of the firm or from its experience over a period in negotiating imports of technology but from its technological level and competence, its own R and D experience, etc, and its ability to offer technology in return. In short, it is factors such as availability of scientific and technical personnel in the firm, their own experience in developing technology and familiarity with the type of technology they want to acquire and their ability to appreciate the value of what they want to import which governs the quality factor in import of technology.

The authors' non-technological approach to import of technology goes to the extent of their becoming lyrical in praise of foreign subsidiaries in India which "plan their programmes" far ahead notwithstanding the vagaries of governmental rules and procedures. Subsidiaries maintain a uniform standard of quality linked with a trade name. They value their staff more and get better results out of their white-collar staff. What is perhaps not appreciated is that foreign subsidiaries are really responsible for creating islands of foreign technology mostly unrelated to the raw materials, market conditions and economic set-up of the country. The main link-up of the subsidiaries is with their foreign parent firms. Their planning is guided by the overall interest of their global investment of capital and their predetermined plans to move the capital from one country to another depending upon the policies of the foreign firms and the parent countries. Most of the time the subsidiaries do not enter into adaptive research and hence keep local R and D out of bounds. They are responsible for maintaining the standards and specifications of their parent companies and thus insist on import of raw materials and equipment even when they are locally available. It is their extra-national character and their estrangement from the mainstream of the national economy that is responsible for a country like Japan opting to keep out foreign investment to the extent possible.

One of the strangest contradictions in the study is that while in the very first chapter it holds out Japan as an outstanding example in respect of the methodology of import of technology, it later rules out this methodology as inapplicable to India. The study spells out the criteria laid down by Japan, i e,

Monthly Income Fixed Deposit Scheme

ENJOY INTEREST INCOME EVERY MONTH AT FIXED DEPOSIT RATES

All you have to do is to deposit with UBI Rs. 3,000/- or above for a minimum period of 3 years. You start getting the benefits from the very next month.

This is how it works

★ Draw interest every month ; no more waiting for longer periods.

★ Ensure regular income month after month...

★ Supplement your income.

★ Enjoy fixed monthly income keeping your principal intact.

DEPOSITS	MONTHLY INCOME ON DEPOSITS FOR		FIXED DEPOSIT INTEREST RATES	
	3 YEARS	ABOVE 5 YEARS		
Rs. 3,000	Rs. 16.25	Rs. 18.12	3 years...	6 1/2 % p.a.
Rs. 10,000	Rs. 54.17	Rs. 60.42	3-5 years...	7% p.a.
Rs. 50,000	Rs. 270.83	Rs. 302.08	Above 5 years.	7 1/4 % p.a.

hypothesise that the demand for deposits would vary directly with the maximum rate on deposits as fixed by the Agreement.

Since the deposits are supplied by banks, their demand must also depend upon the availability of banks. This factor is of great significance in a country like India, which has about 5.7 lakh villages, most of which do not yet have any banking offices. Not even all the towns are covered by banks. A study made by the Reserve Bank of India revealed that, in 1962, 1017 towns in India were unbanked. For the inhabitants of unbanked areas deposits are not accessible as a means for holding a part of their wealth. In such a situation, opening a branch or a new bank in a bank-lacking area would encourage its inhabitants to transfer a part of their wealth from other forms of assets (including idle cash balances) to deposits. Thus, it is postulated that the demand for deposits is a positive function of the availability of banks, which will be measured here by the number of banking offices in the country.

The ownership and regional distribution of deposits in India suggest that most deposits are held by urban and semi-urban areas and by non-agriculturists. Accordingly, we hypothesise that non-agricultural income would have a larger impact on the demand for deposits than would agricultural income. In order to test this hypothesis statistically, and in order to evaluate the separate contributions of the increase in non-agricultural income (Y_{na}) and of the increase in agricultural income (Y_a) on deposit growth, in a few regressions we shall use Y_{na} and Y_a separately instead of using their sum, viz, national income (Y), in our demand function.

Putting all the hitherto advanced hypotheses together, we have the following function for the demand for deposits:

(A) $D = f$ (Y or Y_{na} and Y_a, i_D, ig, iI, B)

$f_1, f_2, f_3, f_4, f_7 > 0 > f_5, f_6$

Where D = deposits of all scheduled commercial banks

Y = national income at current prices

Y_{na} = non-agricultural income at current prices

Y_a = agricultural income at current prices

i_D = interest rate on deposits

i_g = yield on government securities

i_I = yield on variable dividend industrial securities

B = number of offices of all scheduled commercial banks

f denotes an unspecified function and may be read as "a function of" or "depends on"

f_i denotes partial derivative of f with respect to the ith argument in f

Similar notation will hold for g, h, j, g_i, h_i, and j_i.

At this point, it is pertinent to recall that in India there are three kinds of deposits, viz, current, savings, and fixed. Current deposits are withdrawable on demand through cheques, but they earn no interest. They are, therefore, held largely to satisfy the liquidity motive and to ease the payments, and not for savings purposes. Corporations, whose business involves large sums of daily cash transactions, own the bulk of these deposits.

Like current deposits, most of the savings deposits are also withdrawable on demand through cheques—but, unlike the former, savings deposits yield positive interest. For this reason the number of withdrawals within a given period, which is unlimited for current deposits, is limited for savings deposits. Savings deposits thus serve both as a means of payment and as a store of value. Holding of assets in this form is appropriate for individuals whose cash needs are not foreseeable (or are foreseeable but are for short periods during which fixed deposits will not pay any more) and are not frequent.

Fixed deposits are illiquid, in that, they can be withdrawn only on the expiry of the stipulated period for which these deposits are made. They earn an interest rate, which varies positively with the length of their maturity.

These three kinds of deposits, therefore, are not perfect substitutes for each other. However, since each one of them constitutes an alternative form in which an individual or a corporation can hold wealth, we hypothesise a competitive relationship between

them. In other words, we postulate that the demand for current deposits varies inversely with the interest rates on savings and fixed deposits, that the demand for savings deposits varies inversely with the yield on fixed deposits, and that the demand for fixed deposits varies inversely with the interest rate on savings deposits.[1] Of course, the demand for each of these kinds of deposits is hypothesised to vary positively with its own yield.

In view of the problems associated with multicollinearity and data limitation, we shall consider only one maximum interest rate on deposits as fixed by the Inter-Bank Agreement, i e, that on fixed deposits. Changes in it, as argued above, will produce direct changes in the demand for fixed deposits. Since current, savings, and fixed deposits are postulated to be substitutes for each other, the maximum interest rate on fixed deposits will have negative effect on the demand for current and savings deposits. However, in order not to aggravate the multicollinearity problem, we do not allow the maximum interest rate on fixed deposits as an explanatory variable in the demand functions for current and savings deposits.

Because current deposits are largely held to satisfy the liquidity demand, government bonds and industrial securities can at best be only poor substitutes for them. Furthermore, since savings deposits are usually short-term, while government bonds are of a long-term nature, the two are not significantly substitutes to each other. Therefore, the yield on government bonds will be omitted from the functions for the demand for current and savings deposits. And the yield on industrial dividend securities will be considered to be irrelevant in the function for the demand for current deposits.

Incorporating all these hypotheses in function A, we have the following three demand functions:

(1) CD = g (Y or Y_{na} and Y_a, is, i_F, B)
$g_1, g_2, g_3, g_6 > 0 > g_4, g_5$

(2) SD = h (Y or Y_{na} and Y_a, i_S, i_F i_I, B)
$h_1, h_2, h_3, h_4, h_7 > 0 > h_5, h_6$

(3) FD = j (Y or Y_{na} and Y_a, i_S, i_F, i_g, i_I, i_M, B)
$j_1, j_2, j_3, j_5, j_8, j_9 > 0 > j_4, j_6, j_7$

Where CD = Current deposits of all scheduled commercial banks
SD = Savings deposits of all scheduled commercial banks
FD = Fixed deposits of all scheduled commercial banks
i_S = Interest rate on savings deposits
i_F = Interest rate on fixed deposits

The other notations have the same meaning as before.

In order to evaluate the interest sensitiveness of deposits, we need to estimate the demand for deposits functions (1), (2), and (3). The necessary data on all the pertinent variables are available in RBI and Central Statistical Organisation's (CSO) publications.

A few specific points may be noted: First, we are studying the deposits of all scheduled commercial banks, which include those of all Indian scheduled commercial banks and of all foreign banks. Second, there are more than one interest rates on deposits, depending upon the type of deposits and the period of maturity. On savings deposits there is only one interest rate and so there is no problem of choosing one out of more than one. The situation is not the same in respect of fixed deposits: there are interest rates on one month's deposits, on two months' deposits, on three months' deposits, on six months' deposits, and on deposits of 12 months and more. The maturity distribution of deposits is not published, and so it is not possible to arrive at a weighted average interest rate on fixed deposits. However, it is known that most fixed deposits are of three to six months' duration, so that it is perhaps reasonable to use either the interest rate on three months' deposits (i_3) or the interest rate on six months' deposits (i_6), as the representative interest rate on fixed deposits. We have estimated several regressions using i_3 and several others using i_6, and have obtained approximately the same results. To save space and not to overload the readers with regressions, only the results with i_3 are included in Tables 1, 2 and 3. Third, the Inter-Bank Agreement

on maximum interest rates on deposits came into force only from October 1, 1958. The highest interest rate on three months' time deposits, which has prevailed before this date, is assumed to represent the maximum interest rate on time deposits (i_M) for all periods before October 1, 1958. The actual i_M is taken for the later periods. This device will allow us to evaluate the effectiveness of the Inter-Bank Agreement with respect to the demand for fixed deposits.

All rupee-valued variables are denominated in millions of rupees and all interest rates are measured in percentages. The number of banking offices is in absolute numbers. All the regressions below are based on 20 annual observations, i e, from 1948-49 to 1967-68.

Only linear regressions have been attempted. Several slightly different combinations of the hitherto hypothesised explanatory variables were used to explain the demand for current, savings and for fixed deposits. The results of the successful regressions are reported in Tables 1, 2 and 3.

The format of Tables 1, 2 and 3 is standardised, so as to show the results of the ordinary least squares (OLS) estimates of alternative forms of one equation in one table, and of one equation form in one line of each table. The name of the equation and of the dependent variable appear at the top of each table. The first column contains the number assigned to the particular form of the equation. The last two columns give the co-efficient of determination (R^2) and the standard error of estimate (SEE). And each of the columns between the first and the last two columns contains the estimated co-efficient of the independent variable appearing at the head of the column, together with (in parenthesis) the t-ratio of the estimate to its standard error. A blank space in any independent variable's column means that the variable was not included in that equation form. The signs of the estimated co-efficient are given as if the dependent variable is on the left side of the equality symbol and all other terms, including the constant, are on the right side. The t-value of a co-efficient is marked by *, **, and *** if the co-efficient is statistically significantly different from zero at the 10, 5 and 1 per cent levels and beyond, respectively by the usual t-test.[2]

The results of the regressions are very encouraging. The explanatory variables in each and every form of all the three equations explain almost all the variations in the corresponding dependent variable. This suggests that any of these forms can be used to forecast the corresponding dependent variables with good results. Furthermore, as is evident from the t-values, the co-efficients of the important arguments are significantly different from zero at the different levels of significance by the t-test. Of course there are no *a priori* wrong signs.

The regression co-efficients, which represent the impact of a unit change in the corresponding independent variable on the corresponding dependent variable, have been translated into elasticities computed at the point of the sample means.[3] The so computed elasticities are reported in Table 4.

An example should suffice on how to read Table 4. In equation 1.1 the elasticity of demand for current deposits with respect to national income (Y) is 0.75. The various elasticities are different with different equation form. In these equations, the lowest and highest elasticities of demand for current deposits with respect to Y are 0.49 and 1.00; with respect to Y_{na} they are 0.94 and 1.03; with respect to Y_a they are 0.14 and 0.18; with respect to i_S they are 0.04 and 0.10; with respect to i_3 they are —0.27 and —0.38; and with respect to B they are 0.28 and 0.47, respectively.

The lowest and the highest elasticities of demand for savings deposits, with respect to Y, are 1.58 and 1.63; with respect to Y_{na} they are 0.75 and 1.63; with respect to Y_a they are 0.46 and 0.79; with respect to i_S they are 0.07 and 0.30; and with respect to i_3 they are —0.15 and —0.26, respectively.

The lowest and the highest elasticities of demand for fixed deposits with respect to Y are 1.59 and 1.87; with respect to Y_{na} they are 0.93 and 1.68; with respect to Y_a they are 0.36 and 0.73; with respect to i_3 they are 0.10 and 0.31; with respect to i_I they are —0.49 and —0.82; with respect to i_M they are 0.56 and 1.00; and with respect to B they are 0.04 and 0.16, respectively. They yield on government bonds appears only in one equation (3.2), where elasticity of demand for fixed deposits with respect to i_3 is —0.55.

Until we rationalise the choice of one form for each of the three demand equations, it is not possible to give one value to each of these various elasticities. However, these results do suggest that, in India, current, savings, and

fixed deposits are sensitive to interest rate changes.

Our experience with several alternative forms of the three equations has indicated that i_I and B are not useful arguments in the demand for savings deposits function; and that i_S is of no importance in explaining the demand for fixed deposits. Therefore, these variables do not appear in the selected equations.

Both on theoretical and statistical grounds, we choose equation 1.1 to represent the demand for current deposits, equation 2.1 to represent the demand for savings deposits, and equation 3.1 to represent the demand for fixed deposits. If we were interested in evaluating the individual impacts of changes in Y_{na} and Y_a on CD, SD and FD, we would have preferred equations 1.4, 2.3 and 3.4 — instead of equations 1.1, 2.1 and 3.1, respectively.

For easy reference, let us rewrite the selected equations 1.1, 2.1, and 3.1 in a more convenient form:

(1.1) $CD = 1428.85 + .0332\ Y$
$(3.01)^{***}$
$-572.78\ i_s + .4450\ B$
$(3.31)^{***} \quad (1.07)$
$R^2 = .94,\ SEE = 474.9$

(2.1) $SD = -2588.12 + .0387\ Y$
$(7.58)^{***}$
$+525.11\ i_S - 176.39\ i_s$
$(2.07)^{**} \quad (1.42)^{**}$
$R^2 = .99,\ SEE = 324.0$

(3.1) $FD = -7441.41 + .0873\ Y$
$(8.24)^{***}$
$+659.94\ i_s - 1082.18\ i_I$
$(1.79)^{**} \quad (3.55)^{***}$
$+1791.79\ i_M + .1956\ B$
$(1.67)^{**} \quad (0.86)$
$R^2 = .98,\ SEE = 947.4$

All the co-efficients in the above three regressions, except the co-efficients of variable B, are statistically significantly different from zero at the different levels of significance. Of course, these three regressions contain no *a priori* wrong signs. The equations indicate that

(a) a Rs 1 million increase in national income leads to a Rs 0.0332 million increase in the demand for current deposits, a Rs 0.0387 million increase in the demand for savings deposits, and a Rs 0.0873 million increase in the demand for fixed deposits;

(b) a 1 per cent increase in the interest rate on 3-months' time deposits causes a Rs 572.78 million decrease in the demand for current deposits, a Rs 176.39 million decrease in the demand for savings deposits, and a Rs 659.94 million increase in the demand for fixed deposits;

(c) an increase in all scheduled commercial banking offices by one, brings an increase in the demand for current deposits by Rs 0.4450 million and an increase in the demand for fixed deposits by Rs 0.1956 million;

(d) a 1 per cent increase in the interest rate on savings deposits causes a Rs 525.11 million increase in the demand for savings deposits;

(e) a 1 per cent increase in the yield on variable dividend industrial securities brings about a Rs 1082.18 million decrease in the demand for fixed deposits; and

(f) a 1 per cent increase in the maximum permissible interest rate on 3-months' deposits leads to a Rs 1791.79 million increase in the demand for fixed deposits.

DO YOU KNOW?

Rs. 5000/- Deposited for 37 months under

SOCIAL SECURITY DEPOSIT Scheme

will fetch you Rs. 29.15 every month for 37 months and the same amount deposited for 61 months will bring you Rs. 30.20 every month for 61 months.

K. K. PAI *Custodian*

In terms of elasticities (mean), the quantity of current deposits increases by 0.75 per cent and 0.28 per cent as a consequence of a 1 per cent increase in national income and the number of scheduled commercial banking offices, respectively, and decreases by 0.27 per cent as a result of a 1 per cent increase in interest rate on 3-months' time deposits. The quantity of savings deposits increases by 1.63 per cent and 0.30 per cent as a result of a 1 per cent increase in national income and interest rate on savings deposits, respectively, and decreases by 0.15 per cent as a result of a 1 per cent increase in the interest rate on 3-months' time deposits. The quantity of fixed deposits increases by 1.59 per cent, 0.25 per cent, 0.86 per cent, and 0.10 per cent, as a consequence of a 1 per cent increase in national income, interest rate on 3-months' time deposits, maximum permissible interest rate on 3-months' time deposits, and the number of scheduled commercial banking offices, respectively, and decreases by 0.82 per cent as a result of a 1 per cent increase in the yield on variable dividend industrial securities.

These results indicate not only interest sensitiveness of deposits but also the effectiveness of the Inter-Bank Agreement on maximum interest rates with respect to its impact on the demand for fixed deposits. Needless to say, the estimates do suffer from the simultaneous equation bias, because we have overlooked the supply side of deposits and hence have relied on single equation estimates.

Forecasting Deposits

Selected equations 1.1, 2.1 and 3.1 can be used to forecast current, savings, and fixed deposits, respectively. By calculating the average growth rates of each of the explanatory variables and adjusting them for the expected changes in the years for which the forecast is to be made, we can first give values to these explanatory variables for the years for which the deposits are to be forecast and then, by plugging these values in equations 1.1, 2.1 and 3.1, we can obtain the forecasts for current, savings and fixed deposits, respectively. However, we leave this for the future work.

Notes

1 Recall that the interest rate on current deposits is zero.

2 One-tail rather than two-tail t-test is used to test the significance of the regression co-efficient because the algebraic sign of the co-efficient is presumed to be known if it is not zero.

3 Mean elasticity of X with respect to Y is given by $\partial X / \partial Y \cdot \overline{Y}/\overline{X}$, where $\partial X / \partial Y$ is the partial derivative of X with respect to Y and $\overline{X}$ and $\overline{Y}$ are the mean values of variables X and Y, respectively.

Impact of Green Revolution on Landless Labour

A Note

Partap C Aggarwal

Studies have shown that thus far the demand for labour per hectare has not been significantly curtailed by the so-called Green Revolution. This is because increased use of farm machinery has also led to multicropping and more intensive agriculture. However, the nature of labour demand has changed. For instance, more talented labourers are sought after for year-round employment. Also, at peak periods, such as harvesting, labour demand has become more critical because of the need quickly to clear the land and prepare it for the next crop. This has resulted in high wages at harvest times, and in fact throughout the year. The farmers consequently are seeking harvesting combines and other machines to replace slow and increasingly expensive manual labour. It seems fairly clear that demand for labour will diminish as agriculture becomes more mechanised.

Large landowning farmers are becoming prosperous with the help of government agencies, banks, and co-operative societies. They are investing in capital intensive equipment in order to enhance their direct control over agriculture and also their income. The small cultivators and the landless labourers, on the other hand, are losing out in several ways. For instance, the demand for their traditional services has diminished, availability of land on crop-sharing basis is reduced, inflation has kept their real wages almost constant, and alternate employment opportunities have lagged behind need. Consequently, the two classes are becoming polarised and increasingly antagonistic to each other. At this early stage, the problem may not be difficult to solve. But before it deteriorates further, the situation must be carefully analysed and effectively remedied.

THE dictionary definition of the word "revolution" is abrupt and fundamental change. The phenomenon called Green Revolution has both these characteristics. For example, in less than a decade peasants in many parts of India have been transformed into farmers. They no longer carry on agriculture for subsistence with tools dating back three thousand years or more. Their aim now is maximum profits in the form of money, and to achieve their objective they employ tools and techniques of the industrial age.

Judging by examples of similar developments in Europe and America about the turn of the country, the change in India has come about with startling speed. So much so that even the most optimistic of the social scientists are taken by surprise, and their efforts fully to explain the phenomenon have not yet succeeded. In fact, most scholars, particularly those who characteristically examine agriculture at the all-India level, are yet to be convinced that something unusual has happened. This is quite understandable, for the Green Revolution has occurred only in small pockets in different parts of India. At

ANNOUNCES
the 9th (1972) session of the

3-TIER PROGRAMME FOR MANAGEMENT DEVELOPMENT

Tier I: **Middle Management Course (4 weeks) January 9 — February 5, 1972**
For executives in late 20s or early 30s with a minimum of 5 years work experience.

Tier II: **Senior Executives Seminar (2 weeks) February 6-19, 1972**
For executives around 40 with about 10 years of work experience, and preferably supervising the activities of executives attending Tier I.

Tier III: **Top Management Conference (2 weeks) February 20 — March 4, 1972**
For top management executives, such as managing directors, full-time functional directors or technical directors, general managers, and executives in positions of similar responsibilities. They should be over 40 years of age with about 15 years or more of work experience.

Course Content

Tier I: Marketing, Finance and Control, Manufacturing and Production, Organizational Behaviour, Procurement and Materials Management, Management Science, and Business Policy — aimed at the development of the participants as effective managers in their respective positions.

Tier II: Marketing Planning, Industrial Relations, Development of Control and Information Systems, Managerial Economics, Financial Assessment and Planning, and Business Policy — aimed at enabling participants to acquire necessary knowledge, skills, and attitudes involved with the management of managers.

Tier III: Will provide the top management executives with a forum to share their views on environmental and operational problems affecting their managerial performance and leadership styles. The theme for discussions will be "Planning for Corporate Growth in the Uncertain 70s." The potentials and limitations of recent concepts and techniques in management in the specific Indian context will also be discussed.

Faculty: Professors R. Balachandra, S. K. Bhattacharyya, Kamla Chowdhry, S. C. Kuchhal, G. R. Kulkarni, Ravi J. Matthai, S. C. Mehta, V. L. Mote, C. N. S. Nambudiri, Samuel Paul, Keshav Prasad, Suresh A. Seshan, Baldev R. Sharma, and N. R. Sheth.

Sponsorship: An organization may nominate one or more candidates for each tier. An organization's participation at all levels, while not a requirement, is exceedingly useful.

Fee: Tier I: Rs. 4,000; Tier II: Rs. 2,500; Tier III: Rs. 2,500.
The fee covers tuition, room, board, and case materials.

Location: Hotel Clarks-Shiraz, Agra.

Last Date for Applications: December 9, 1971.

Application & Enquiries: Please write to Programmes Co-ordinator, IIM, Vastrapur, Ahmedabad - 15.

best only 20 per cent of the total cultivated area in the country is affected. Gains in total national output of agricultural products are still modest and no one can say when the remaining 80 per cent of the cultivated area will be revolutionised. The power of Green Revolution can be best felt by closely examining a district such as Ludhiana, Punjab. Here, wheat production has quadrupled in six years, and many farmers produce 60 quintals per hectare — highest in the world. Other statistics are equally impressive; for example, 23-fold increase in fertiliser use in a decade, 15 times more tractors and tubewells in six years, 100 per cent adoption of HYV seed, all threshing by machine, 73 per cent area irrigated, and so forth. Farmers are now asking for harvesting combines, sprinkler systems and aerial spraying. Most scholars think that it all began with the 'miracle' seed combined with guaranteed minimum price. Also a great deal of credit is given to IADP for its sensible approach in providing a complete package of necessary inputs in selected districts. Obviously, the HYV seed, the price incentive, as well as the 'package' programme have been very helpful, but there is a great deal more to the story. For we know that before Borlaug developed the miracle seed Danish farmers produced 5 times as such wheat per hectare as their Indian counterparts. Furthermore, several non-IADP districts in Punjab, Haryana, UP, Gujarat, Tamil Nadu, and other states have done as well or better than the IADP districts, and many IADP areas have failed.

Economic, Social, and Political Changes

In my judgment the phenomenon of Green Revolution can be explained only by carefully examining the slow, but steadily cumulative developments in India since Independence. And in doing this we must consider economic, social, as well as political changes. For together they have brought about an environment suitable for a transformation. For example, the poor and illiterate Indian peasant who was powerless in relation to the traders and moneylenders before 1947, has since then gained considerable political power, financial support, and knowledge through education and mass media. Naturally, in the sixties he entered the market with confidence to take advantage of minimum guaranteed price offered by the government. With regard to the adoption of improved farming methods also it is the indigenisation of technology and establishment of infrastructure in the last 20 years that has made the crucial difference. Before Independence the peasant did not invest in modern inputs because their supply and maintenance facilities were meagre and undependable. A diesel engine gave the peasant more trouble than service because of lack of knowledge on his part and non-availability of spares, service, fuel and lubricants. But now, in an area such as Ludhiana farm machinery is manufactured, most sophisticated equipment easily repaired, and spares as well as fuel available even in some of the villages. Naturally, in districts where power relationship between various status groups has been equalised, and at the same time technology indigenised, Green Revolution has occured even without the IADP.

Impact on Landless Labour

In an Indian peasant village barring exceptions, the bulk of the land was owned by 10-15 per cent of the high caste families in relatively large, although often fragmented, holdings. A few small cultivators carried out agriculture on tiny holdings supplemented with land rented from big landowners on a flat rental, or more often, crop-sharing basis. The landless labourers, usually belonging to various castes, provided specialised economic and ritual services to the landowners in exchange for a fixed payment in grain at each harvest, under a system known as *jajmani*. In addition many of them worked as agricultural labourers for extra earnings. At periods of peak labour demand, such as harvesting, every adult in the village worked for compensation in kind.

With the advent of Green Revolution all this is changing. The first casualty seems to be the *jajmani* system. As market orientation increases, the demand for traditional services on barter terms is quickly eliminated. Price of land and rents shoot up. Landlords become reluctant to trust tenants with valuable land, and try to manage it themselves with the help of tractors. Small landowners are less able to extend their meagre holdings by renting. Furthermore, as they are less able to afford and economically employ modern technology, their viability as farmers is reduced.

Studies have shown that thus far the demand for labour per hectare has not been significantly curtailed. This is because increased use of farm machinery has also led to multicropping and more intensive agriculture. However, the nature of labour demand has changed. For instance, more talented labourers are sought after for year-round employment. Also, at peak periods, such as harvesting, labour demand has become more critical because of the need quickly to clear the land and prepare it for the next crop. This has resulted in high wages at harvest times, and in fact throughout the year. The farmers consequently are seeking harvesting combines and other machines to replace slow and increasingly expensive manual labour. It seems fairly clear that demand for labour will diminish as agriculture becomes more mechanised.

Still a Distant Dream

The socialistic bent of the prevailing government policy, and democratic decentralisation of political power since Independence have raised the aspirations and expectations of landless labourers. In the Green Revolution areas these aspirations are concretised by the demonstration effect of the rising consumption levels of the new-rich farmers. But in spite of some increase in wages, the purchasing power of labourers has not significantly improved. In any case, equitable sharing of newly generated incomes still remains a distant dream. The farmers have a tendency quickly to adjust to elevated levels of living for themselves and they begrudge the labourers even a modest wage increase. Some relief is provided by increasing opportunities for non-agricultural jobs, but not nearly enough to solve the problem of rural unemployment.

Apparently, large landowning farmers are becoming prosperous with the help of government agencies, banks, and co-operative societies. They are investing in capital intensive equipment in order to enhance their direct control over agriculture and also their income. The small cultivators and the landless labourers, on the other hand, are losing out in several ways. For instance, the demand for their traditional services has diminished, availability of land on crop-sharing basis is reduced, inflation has kept their real wages almost constant, and alternate employment opportunities have lagged behind need. Consequently, the two classes are becoming polarised and increasingly antagonistic to each other. At this early stage, the problem may not be difficult to solve. But before it deteriorates further, the situation must be carefully analysed and effectively remedied.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

Licensing Plus

CURRENT criticisms of industrial licensing have chosen such diverse targets that they might easily lead away from the main sights set for licensing. Generally, they have stressed the need for liberalisation and cutting of 'delays'; concessions for entering backward areas; easing licensing for projects below a certain size or not requiring significant foreign exchange; freeing expansion which is not substantial or is in non-core sectors; making entry easier for big houses to give rein to growth, etc. The most pointed expression of the approach underlying all these came recently in the rejoinder that industrial licensing needed overhauling because it had 'failed to take market forces into account'.

If the government were as committed to and clear on the purpose of industrial licensing as industry seems to be on what it would like from it, we might not perhaps have come to the high-cost slack in industrial growth that we have entered. If allocation of resources into certain lines of production is one of the principal aims of planning, then industrial licensing is a necessary tool. But it is, admittedly, a largely negative tool. It can, hopefully, stop the flow of investment into low priority activities, but it cannot ensure optimum levels of investment in the required purposes (for example, in paper of late or in fertilisers in the mid-sixties). Moreover, it acts on such proposals as may be available when the supply gaps become apparent. This has led in the past to handing out of licences in a hurry to the most obviously 'trustworthy' applicant who seems capable of quick execution—meaning, invariably, the already established producers, such as Tatas and Birlas in soda ash.

Partly as a consequence of such stop-go licensing, the aims of providing adequate production at lowest cost have not been achieved. But not for that reason only. As part of the effort to set up an industrial base, the Indian manufacturer has enjoyed built-in protection which, together with irrational cost-plus price control, has fostered a vested interest in high-cost operations in a marginally shortage situation. Indeed, it should be evident by now that neither of the two alternatives, of competition and of price control of the sort that has been practised, can be brought into play. External competition is conclusively ruled out by import control and internal competition is minimised by licensing. In fact, as has been indicated above, licensing could lead to further imperfection by consolidating the monopolistic hold of already established producers—and for good technical reasons, too, such as economies of scale and well-diversified manufacturing bases. The idea, tried out in the early sixties (in paper, for instance), that competition could be fostered by splitting licensed capacity among a number of claimants exposed the high costs of small-scale production. The earlier idea of the public sector offering competition or setting the norms—as in aluminium or in cement—has also foundered.

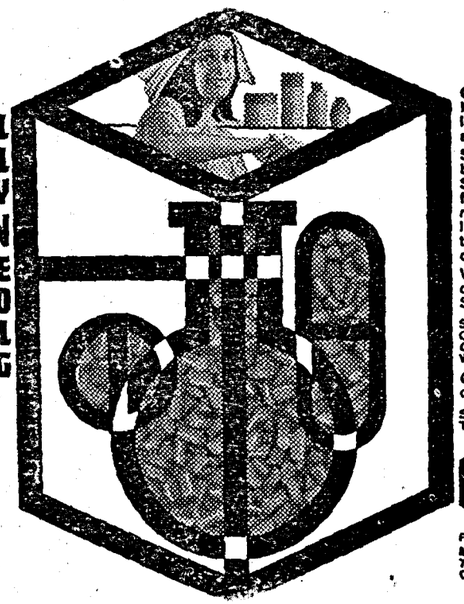
At the same time, price control has failed all round. In cement, where price has long been controlled, it simply meant mutually managed prices by a large cartel that prevented fresh entry by allowing shortages and having expansion programmes ready on the right occasions. In some of the major chemicals whose prices have not been controlled, it has meant pegging of prices such that entry is not attractive to new entrepreneurs even while profit margins are comfortably wide for the handful of existing manufacturers. Since such price control as has existed to date has been based on costs as given by industry and has fixed prices high enough to accommodate even the marginal producers, it has meant acceptance of existing levels of efficiency, non-elimination of the inefficient, and profiteering by the relatively efficient. Cost-control, reflecting itself in lower prices, may finally be a management function, but there has been precious little pressure, economic or other, for management to cut costs.

In the circumstances, rather than get into a slanging match with private industrialists over the frills of licensing, government needs to concern itself with the means of more purposive and specific control over capacity utilisation, expansion of capacity, costs and prices. In the Bureau of Industrial Costs and Prices the government has the instrument to keep continuing track of data on capacity and its utilisation, growth of demand, costs and prices in the major industries. This would make it possible for the government to have a more studied assessment of the evolving situation in particular industries and also to arrive at a more conclusive point of view on the many 'efficient' solutions suggested by the private sector.

Training Is Not All

Ishwar Dayal

Management Gap in a Developing Economy by M S Gosavi; Progressive Corporation, Bombay, 1971; pp 140; Rs 16.



FINISHING the last page of the book left me both gratified and dismayed. Gratified that an educator had undertaken to write 13 chapters on a wide range of subjects from management of co-operatives, small and large industry, to education, planning and the emerging social and economic order. Dismayed because the superior capabilities of the author do not show up to full advantage in the treatment of the subjects. The objective of the book, which is to examine the management gap in the developing economy in order to benefit managements, educational institutions, etc, remains unfulfilled.

There is a sad lack of opportunity in India for interaction with peers who can comment effectively on the initial draft of a book. This lack prevents many of us from improving upon our technical writing for publication. It seems obvious that the publishers of this book have failed to provide the author with a pre-publication review. Perhaps these are the reasons why Gosavi's book starts with an interesting promise but then indulges mainly in general statements found often in newspaper reports, lacking academic analysis and diagnosis.

An academic's contribution to the understanding of business in India cannot be based on statements of oughtness. It becomes valid when it is based on a rigorous system of analysis through which emerge the action choices. Gosavi's book seems to say that good management for economic growth being important, there should be more funds for education, more training for managerial jobs and more interaction between the educators and the people in industry. In the words of the author (p 130): "In a developing economy like India [therefore] the task is to create conditions in which living standards are kept reasonably high and all citizens have full and equal opportunity for growth and service. The economy has, therefore, not only to build up a productive machine but also to create social conditions for vigorous cultural advance." And later, "Education, knowledge, understanding and co-operation will constitute a prime force in all schemes of its development for their success."

There are very few people who would quarrel with these wishes. Indeed, speeches in chambers of commerce, press releases, letters in company newsletters, all echo these thoughts. The questions are: Why are these objectives not achieved? What prevents organisations or Government administration from achieving efficiency and growth of activities and persons? What is the dynamics of failure, or success, in Indian organisations? What processes, systems, patterns of organisational politics, etc, do we need to achieve what we often say we want to?

The academic may sometimes wish to summarise what the people in industry state, or do; but, for him, this can be justified only if it is the beginning and not the end of his inquiry. The search for solutions is composed of scrupulous analysis of

FOR THE VITAL PHARMACEUTICAL INDUSTRY
STYRON PROVIDES THE ANSWER TO PRACTICAL PACKAGING

Containers made from Styron Polystyrene have many advantages over conventional glass—less weight, fewer breakages, a more attractive appearance and shape.

Styron containers also score over metal because it eliminates the danger of corrosion. Styron is lighter in weight and offers greater freedom in design. Medicines packed in Styron retain the highest possible degree of purity for long prescribed periods. Important factors all—to an industry dedicated to the dispensing of good health.

With Styron, you have higher production output and lower transport expenses. Thus, Styron ensures higher profits.

STYRON IS MANUFACTURED IN THE FIRST PLANT OF ITS KIND EVER SET UP IN INDIA, WITH THE COLLABORATION OF THE DOW CHEMICAL COMPANY—WORLD LEADERS IN THEIR FIELD.

Our technicians will be glad to give you more detailed information about STYRON.

STYRON—THE FIRST PLASTIC MOULDING MATERIAL THAT STILL REMAINS UNMATCHED!

data, rigorous methodology for diagnosing problem situations and a set of concepts and theories to understand the situation and to derive action choices. The academic's contribution needs to be substantially different from the manager's. Many managers satisfy themselves by deriding theory, and explain away the ills of industry by pointing out how inhibiting is the environment or how frustrating are Government's policies; but the academic must seek out the reality in more systematic ways. Sometimes these factors become compelling constraints to action at unit level, at other times they become convenient rationalisation for avoiding hard choices.

In these terms, Gosavi's book makes little contribution to the understanding of the business situation. It appears to make a naive assumption that training would by itself solve the problems that beset management in India. I am reminded of the chief executive who seriously worried that the efficiency of his managers had hardly improved even after 40 per cent of them had been sent to one training course or the other, perhaps implying that training equals efficient management. This fallacy had best not be perpetuated. Management cannot improve unless they can answer why they do what they do by examining the total system including their own behaviour. Training is useful only if the top management have done their homework and found out what ails their organisation.

In my personal experience I have found that success and failure of a project depends on the willingness of the top management to examine their own behaviour and administrative systems as on the ability of a consultant to diagnose the situation. In one company, a new general manager readily accepted the diagnosis of the ailments of the organisation because they related to his predecessor but failed to accept the need to understand his own leadership style and how it was defeating his stated purpose of building team-work in the head office.

Without effort by the top management and a shared desire to improve organisational performance, training has limited use. I cannot share with the author the hope that more management training would improve the management of either the private or the public sector, or of Government administration. In many organisations, training seems to become a peg on which to hang the management's inability to diagnose the system's ills.

My comments so far refer to what I see as the author's main contention. Coming to more specific aspects, the data collected by the author in his research have not been shown, even though he mentions that the writing is based on a questionnaire survey. Nor does Gosavi indicate what his survey is all about, or where the survey was conducted. He provides no information about the sample, or the nature of the questionnaire, while saying that it contained a few open-ended questions. There is no reference to the results of the survey. There are passing references to what people in industry feel but these instances are not backed by data. In Chapter 5, for example, writing about personnel policies in public enterprises, there is brief reference to the kinds of work persons in personnel departments do. This cannot be said to provide survey data.

Not Hypotheses

In the introduction, on page xii, the author lists the important findings of his study. I quote at random from the book to illustrate the nature of these findings:

No 1: "Development in developing economies is a challenge to the social scientists and the planners, which must be accepted."

No 7: "The industrial relations problem, in a developing economy, can be solved if the management can really change the worker economically, mentally and socially."

No 15: "Expansion of management training facilities is necessary in all developing economies to bridge the management gap at different levels."

In the absence of data, or even a description of the nature of the survey, the 16 findings listed by the author are no more than statements of what the author considers necessary in the Indian business situation. These are not hypotheses for research, because they are not stated in terms that lend themselves to testing, nor is there discussion of previous data to support these statements.

Vague and general statements in the book leave me confused about the recommendations. Suggesting a positive role for the State in respect of integrated growth of co-operatives, the author says (p 6):

> "The role of the State for the success of 'co-operation' in this regard must be properly defined. The State should endeavour by all possible means to make co-operation based on an effort which must be integrated, co-ordinated and organic; and State assistance, participation and partnership must be so adjusted as to retain the essential character of the co-operation movement as the people's movement, making the movement, at the same time, sound, strong and effective in its action and results."

Surely the co-operator or the Government would not disagree with the sentiment; what should they, however, do to achieve this result? Similar statements occur with singular consistency in most chapters.

The 13 chapters of the book are written in the style of a text-book. It is hard immediately to see the rationale of their sequence. The author has not explained the sequence. Three chapters on different subjects provide partial information to those who need it: chapter 4 describes the major financial institutions in India and, broadly, their structure. Chapters 8 and 9 give some information about educational institutions in India and abroad. Since there is no indication of the dates on which these chapters were written, the information in the present context is incomplete. There are some careless errors which should have been avoided. Under the shoulder-heading Europe, a mention is made of institutions in USA although a separate section is later given for USA. There are also spelling mistakes: Harvard is spelt Harward.

Contrary to writing conventions, the author has referred to the works of other authors without providing book references; general references and index have also been omitted.

Like several others in India the publishers of this volume have been negligent. There are proofing errors on many pages (pp 17, 61, 71, 74, 75, 77 and 85, to list out a few). On page 100, the spacing of lines is wider than elsewhere. Throughout the book types are not uniform; spacing of lines and many little slips are evident that distinguish between good and poor production. Altogether the book suffers in the quality of its production.

The overall impression is that the value of the book either as a basic text or for other purposes is doubtful. Gosavi's competence is well known. Surely, a review prior to publication may have substantially increased the value of the book for its readers. Perhaps a revised version of the present volume could supply the omissions.

For the Eager Manager

S Srinivasan

New Techniques for Effective Sales Management by George B Wright, Rs 18; **Effective Management Techniques for Getting Things Done** by Lynn W Whiteside, Rs 16; **The Successful Manager's Guide** by William Wachs, Rs 16. All published by Vikas Publications, New Delhi.

THESE three books are in the nature of a 'do-it-all-yourself' kit, complete with check lists, for the manager who is eager to be more effective. The authors have naturally drawn on the American scene for illustrations for some of which it will be difficult to find parallel situations in the Indian experience.

"New Techniques for Effective Sales Management" is a ready reference manual for the sales manager on recruiting and training of salesmen, evaluating salesmen's performance, field supervision of salesmen, effective territory structuring, remuneration plans for sales staff, planning and conducting sales meetings, records, routing and reporting, etc. The author has also taken care to include charts, graphs, reports, routing forms, systems and techniques.

In applying the techniques and practices Wright has outlined in his book, the sales manager in India needs to do a bit of adaptation as well. In re-aligning sales territories, for example, the author has advocated the use of Buying Power Index (the BPI measures market strength for each county in the USA based on many factors like the number of telephones, retail sales by product category, population age 16 and over, family buying income, etc, and determining each country's percentage to the USA total. The most widely used BPI is that produced by "Sales Management Magazine"). In India we do not have such an index to help out the sales manager. The latter has to work out his estimates from past sales of his firm as well as that of the competitors and his own knowledge of the market, official census figures, etc.

Again, whether a sales contest organised on American lines which says, "Six weeks contest begins Monday April 6. Earn the vacation of your dreams for yourself and family", will have the same motivational impact in the Indian milieu is a debatable point. For all that he dreams, the Indian salesman might not be able to avail himself of a holiday with his wife because of the illness his sister's child.

These are, however, minor aspects that do not detract from the intensely practical character of the plans and methods outlined by the author. He has some perceptive observations on how not to waste the salesman's time by asking him to do espionage work on the competitor's activities. There is a tendency among our managements to use the salesman as an odd job man cum trouble-shooter cum collector of miscellaneous data. The practice not only affects the sales but also provides the salesman with a plausible alibi for not achieving the targets assigned to him.

The chapter on how to plan and conduct a sales conference deserves to become the bible of every sales executive in India. Far too many of our sales conferences tend to become expensive *tamashas*, a purposeless get-together where everyone meets everyone else without achieving results commensurate with the expenditure of precious managerial hours.

The other two books may be described as a cross between a TWI instruction pamphlet and Dale Carnegie's "How to Win Friends and Influence People", without the latter's flair for holding the reader's attention. Written in typical Americanese, these two books are, for the most part, a string of aphorisms with which everyone is familiar. "Work at being a better salesman", says Whiteside, "by (a) preparing yourself, (b) making the best use of your thoughts, (c) practise being a better persuader, (d) learn how to handle the handicapping difficulties", and so on.

In similar strain Wachs enumerates a number of success capsules that could be applied to given situations. Do you want consistently-high profitable productivity from your subordinates? Wachs would like you to see to it that they (subordinates) know exactly what is expected of them; know how to do this well; have all the facilities they need for this; really *want* to do the best and the most of which they are capable.

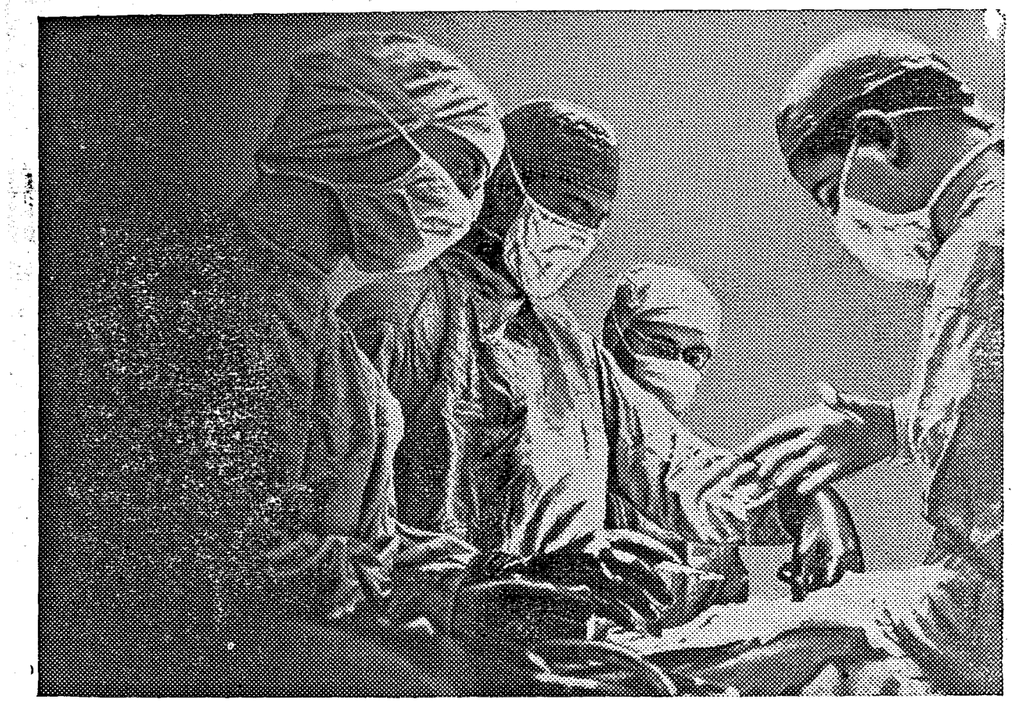
The publishers could have been more selective in re-printing American publications. Our managers and students working for a degree in management studies can do without catalogues of copy book maxims and that too at Rs 16 apiece.

Materials Management

N K Jaiswal

Essentials of Materials Management by P R Gokarn; Somaiya Publications, Bombay; pp 160; Rs 20.

THE concept of centralising all those functions of industrial management which affect the flow, conservation, quality and cost of materials under 'materials management', is of very recent origin. Some of these functions are materials planning and programming, purchasing, inventory control, receiving and warehousing, transportation, disposal of scrap and surplus. The main purpose of bringing these functions under a materials manager is to provide co-ordination and control. Since material costs form the bulk of the total cost of a manufactured product, efficient use of materials management techniques helps to reduce costs and thus increase profits.



The need for the application of modern concepts of materials management to Indian industries has been repeatedly emphasised, including by the ARC report on public sector undertakings, submitted in June 1967.

The first three chapters of the book under review discuss the scope, importance and benefits of materials management, the organisation of materials department and its relationship with other functional departments such as marketing, sales, design, etc. The remaining seven chapters explain various techniques and concepts. These include A-B-C analysis, value analysis, standardisation and variety reduction, inventory control, wastage control and materials handling.

While the book is of considerable interest, a little more emphasis on quantitative aspects of materials management would have enhanced its value. In particular, the chapter on inventory control should have included more discussion on the evaluation of various inventory operating policies. In its present form, this chapter goes very little beyond the classical EOQ formula. The bibliography at the end of the book is also too short and non-specialised.

The book will be primarily of interest to students of management and managers interested in making themselves *familiar* with materials management.

India Foils at work

The Safest Packaging For Vital Pharmaceuticals

Today, more than ever before, the pharmaceutical industry is making a greater number of products to protect a larger number of people. And protecting these products in turn is tamper-proof and moisture-proof foil packaging.

With the rapidly increasing demand for pharmaceuticals, the pharmaceutical industry's need for aluminium foil is also on the way up. That's where India Foils comes in, in a big way. Supplying foil for hygienically sealed packs for tablets, dragees and capsules. Foil not only keeps out dirt and dust, and preserves original medicinal properties, but also offers convenience in presentation. Foil packaging is light, easy to open and tamper-proof. Continuously fighting disease and ill-health—that's the pharmaceutical industry. Helping the pharmaceutical industry—that's India Foils.

Market Price, Shadow Price and All That

Ranjit K Sau

Despite all the suspicions that have been cast on its theoretical soundness and practical usefulness, the concept of 'shadow price' still lingers on in cost-benefit analyses.

In this paper it is argued that shadow prices as computed from linear programming models of development planning are far from satisfactory as an instrument of planning. Apart from the question of feasibility of solving a sufficiently large size programming problem, there are doubts whether the dual solution would be comparatively consistent, robust and stable. Besides, there are reservations as to the validity of the simplifying assumptions of economic relations implied in a programming model.

IT has been called impractical, indeterminate, circular, and *ad hoc*. Its very existence and stability have been open to doubt. Its operational usefulness has been questioned. All the same, in the literature of cost-benefit analysis, the so-called 'shadow price' still lingers on, much like the disembodied smile of the cheshire cat.

That the ruling market price as it exists in the Indian economy, for instance, does not have much normative significance for resource allocation is fairly well-established. The imperfection of the market mechanism in this respect is due to various reasons, such as monopoly elements, external economies and diseconomies, tax and subsidy, 'isolation paradox', and so on. Hence the ruling market price of a commodity does not necessarily measure its social cost or social usefulness.

That is why Jan Tinbergen, in 1958, emphasised the need to use a set of hypothetical prices, rather than the market prices, in evaluating investment projects. In his words: "A number of market prices, particularly those of the 'factors of production' (capital, labour, foreign exchange) often diverge from the 'intrinsic value' or 'accounting prices' that would prevail if (i) the investment pattern under discussion were actually carried out, and (ii) equilibrium existed in the market just mentioned".[1] To put it differently, 'accounting prices' in Tinbergen's view are the equilibrium prices "if the law of supply and demand operated freely, under perfect competitive conditions, with full employment of all resources and complete mobility of all factors".[2]

Recently, the concept of accounting price has been modified in several ways. Now, the determination of accounting prices does not necessarily relate to full employment of labour; nor does it fully accept prices as obtained under competitive market conditions. At the current stage of discussion, accounting prices are defined, in general, as indicators of social costs or social usefulness of commodities. Formally, these prices may be identified in the mathematical problem of maximising or minimising, subject to constraints, as the increase in the optimum value of the maximand (or decrease in the optimum value of the minimand) made possible by a unit change in a constrained variable.[3] Thus the accounting price is the Lagrange multiplier of the calculus or the value of the 'dual' solution to a programming problem.[4] This definition appears to be identical with that given by Tinbergen. But there is a fundamental difference between the two, especially when the rate of saving in the economy is suboptimal.[5] Then, it has special bearing upon the accounting prices of capital and labour in particular.[6]

Now a word on semantics. Occasionally, the terms 'accounting price' and 'shadow price' are used as synonyms.[7] Also, 'accounting prices' are sometimes defined as "better or worse approximations to shadow prices"[8], while the term 'shadow price' is reserved for what we have called 'accounting price' in the above paragraphs. By contrast, Little and Mirrlees use the two terms in completely different senses.[9] According to them, 'accounting prices' are the prices of "goods and services which *do* reflect their real costs to society (when they are inputs, i e, used up) and their benefits (when they are outputs, i e, produced)", whereas only the 'accounting price' of labour is given the special title 'shadow price' of labour, or simply 'shadow wage rate', because "in this important case, unlike in all other cases, the accounting price is not supposed to make the demand and supply equal".

For simplicity, we shall here use the two terms, 'shadow price' and 'accounting price', synonymously.

I

Shadow Prices of What?

A project uses up inputs such as coal, cement, machinery, and labour; and produces output, say, tractors. Labour is a very special type of input; its supply being abundant. Inputs and output, *viz*, coal, cement, machinery, tractors, etc, are, on the other hand, a different category of commodities compared to labour. Besides, if this project in any way involves foreign exchange, it deserves special consideration. Finally, the rate of saving and investment in the economy being suboptimal, the project's effects on capital formation should also be carefully evaluated. That is to say, we have to determine *four* sets of shadow prices corresponding to (a) inputs and outputs like coal, steel, cement, tractors etc; (b) labour, (c) capital, and (d) foreign exchange.

We have already dealt with the shadow prices of capital and labour elsewhere.[10] In this paper, we shall not go into the shadow price of foreign exchange, either; we shall take it to be given as a datum. Here our main object is to determine the shadow prices of *commodities* which are either used up in the project or are produced by it.

Evidently, shadow prices are relative to the objectives of the investment programme. Aggregate consumption, more equitable distribution, national self-sufficiency, and full employment, are usually considered to be the basic aims of economic development. Shadow prices are called upon to reflect these aims one way or another. However, the relative importance to be attached to these objectives is a matter in which a high degree of latitude may prevail. In other words, opinions may differ widely as to how much of one objective should be sacrificed, if need be, to gain one unit of another objective. In such circumstances, shadow prices would be devoid of operational significance unless they have what we shall term as the property of *consistency*—i e, unless there is some degree of invariance of the shadow prices in response to changes in the objective function of an investment programme.

An attempt to compute shadow prices from an overall programming model in a developing economy may founder on the rock of insufficient and inreliable data. Hence, another desirable property of shadow prices is what may be called *robustness*. That is to

say, shadow prices should not be too sensitive to small changes in the basic data—apart from the parameters of the objective function.

Thirdly, shadow prices should be relatively *stable* over time. If they change erratically through time, one has to recognise the possibility that the managers would indulge in arbitrage operations on their own between different time periods, and thereby upset all the calculations of the planners.[11]

These three properties—consistency, robustness, and inter-temporal stability—are desirable in shadow prices if these are to be meaningful as an instrument of planning.

II

Programming and the Dual Solution

In a path-breaking article in 1958, Chenery showed how linear programming can be used in selecting development projects. One of his interesting findings is that the simplex criterion of linear programming is logically equivalent to the criterion of social marginal productivity (SMP).[12] Since then, a long series of programming models have been constructed for development planning. Indeed, the dual solution to such a model is the set of shadow prices of inputs and outputs.

Highly illuminating in this context are the experiments conducted in Hungary around 1965. The deviations of shadow prices from the respective market prices are in most cases in the same *direction* when the following three alternative objective functions are tried:

(i) maximisation of final domestic consumption with 1959 foreign exchange prices;
(ii) maximisation of the balance of foreign exchange with capitalist countries, with 1959 foreign exchange prices;
(iii) maximisation of the balance of foreign exchange with capitalist countries, with 1963 foreign exchange prices.

In fact, the shadow prices with objectives (i) and (iii) turn out to be more or less identical. The differences between shadow prices thus derived and the actual market prices of 1959 were, on the other hand, about 19.5 per cent.[13]

Thus it seems that the shadow prices computed through a programming model are likely to be *consistent* in our sense. That is, they would remain relatively insensitive to a change in the objective function. But as yet the evidence on this score is rather inconclusive. Because an important deficiency in this Hungarian exercise was that the underlying technology matrix did not contain alternative processes, the scope of choice was severely restricted, from the very beginning.[14]

More recent experiments with two-level planning models, under the guidance of Kornai in Hungary, reveal that the shadow prices are a highly sensitive part of the model.[15] In fact, there is a theoretically well-founded suspicion that, the shadow price system in linear programming—being a discontinuous, non-analytical function of the preliminary data—will behave in a somewhat erratic manner. In other words, in response to a slight and common-sense change in the underlying data, shadow prices may answer with jumps of an unpredictable order.[16] Certain empirical works also tend to confirm this suspicion of what we have called the lack of robustness of shadow prices.[17]

Apart from all this, the sheer number of items for which shadow prices are to be computed is simply too large. There are so many commodities—and of such immense varieties in the various parts of the country. To compute the shadow price for each and every one of them is a herculean task.[18] Even the elaborate model of Eckaus and Parikh, for example, could give shadow prices for only a very broad category of goods which are of little help for evaluating investment projects.[19]

III

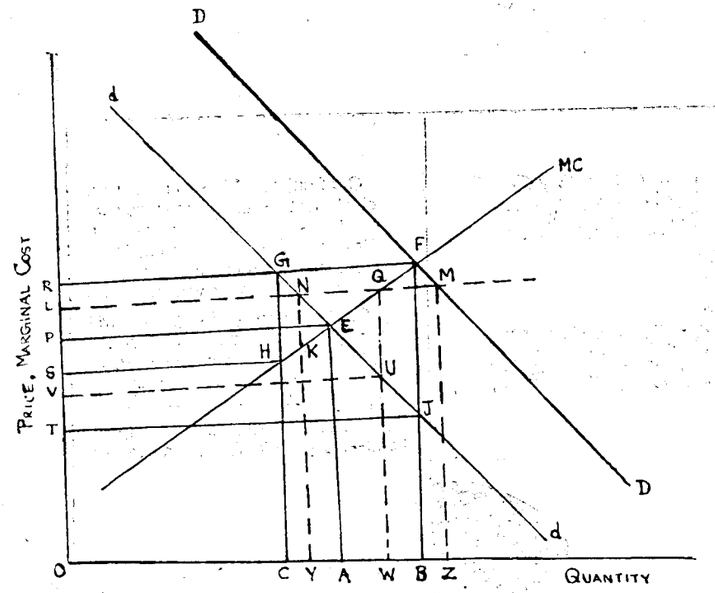
Market Price and First Approximation

In view of the above-mentioned limitations of a full-scale optimising model by programming to derive shadow prices, recourse is usually made to certain *ad hoc* adjustments of market prices—presumably to bring them in line with the social costs or usefulness of the commodities in question. Note that, in such exercises, a multiplicity of objectives such as aggregate consumption, distribution, employment, and national self-sufficiency, are *not* taken into account. Instead, the efficiency and Pareto-optimality of resource allocation are the sole concern. In the following, we shall examine some of these suggested corrections on the market prices, intended to bring about a first approximation to the shadow price.

We shall begin with the output that is being produced by the project, and then pass on to the inputs used by it. The case of inputs will be considered under two alternative market conditions, *viz*, perfectly competitive and imperfectly competitive.

Project Output: The shadow prices of the output of the project is supposed to measure its social usefulness. What does the ruling market price reveal about the benefit from the good derived by purchasers? If it is a consumer good, clearly the price measures the marginal usefulness of the commodity to the consumer; i e, it measures the marginal consumption benefit. The area under the demand curve, therefore, gives the sum total of consumption benefit derived from the marginal as well as the intra-marginal units. Hence it also indicates the consumers' willingness to pay for all those units together.[20]

Now take the case of an intermediate consumption good like irrigation water, or a capital good like a tractor or machine-tool. The demand for such goods is a derived demand—derived, in the last analysis, from the demand for ultimate consumer goods. As such, the producers' willingness to pay for such goods can be taken as a measure of their value to the ultimate consumers.[21] So, here also, the area under the demand curve represents the total consumption benefit.[22]



An investment project, in effect, adds to the existing market supply of its output. The relevant area under the demand curve for the product represents, therefore, the total consumption benefit generated by the project. Hence, the arithmetic mean of the market price of the product *with* the project and of the market price of the product *without* the project, is a first approximation to the shadow price of the product—provided the demand curve is linear.[23]

Project Input: The shadow price of an input of the project under review is to measure the opportunity cost of using it here rather than elsewhere in the economy. As we shall see below, market prices can hardly be of any help in this respect.

Industries which supply inputs for the project must be working under conditions of either increasing, or decreasing, or constant, unit costs. Here we shall examine the case of increasing unit costs only; the logic, however, can be applied to the other two situations as well.[24]

To begin with, it will be assumed that the industry which supplies an input is perfectly competitive; the assumption will be relaxed in due course. For convenience, demand and cost curves will be drawn as linear; but this

FIGURE 1

is not an essential part of the argument.

(A) Input industry competitive: Unit cost rising. Under competitive conditions, the marginal cost curve, MC in Figure 1, is also the market supply curve. Let dd be the demand curve for the input *without* the project. In equilibrium, price is OP and quantity is OA.

Suppose the project requires a certain amount of the input, measured by x The demand curve for the input then shifts to the right by a horizontal distance of x everywhere. In equilibrium *with* the project in operation, the price now is OR and quantity OB.

In this new situation, the quantity of the input engaged outside this project then shrinks to OC from OA of the previous equilibrium. The magnitude of this fall obviously depends upon the slopes of the demand and supply curves, and the amount x which is being used for the project.

The total cost of producing the required amount of input for the project is measured by area HCBF, which is the area under the marginal cost curve between C and B, in Figure 1. If the marginal cost curve is linear in the relevant range, then the unit cost of the input of the project is given by an average of OR and OS. So one possible candidate for the shadow price is:

½ (OR + OS) ... (1)

Now consider the opportunity cost of the input of amount BC; this cost is equal to the productivity of this input elsewhere in the economy, which is being sacrified by virtue of its use in this project. Referring to the demand curve dd, it is found that the productivity of BC outside the project is given by the area GCBJ, or the area under demand curve dd between B and C.

Again, if demand curve dd is linear within the relevant range, then the opportunity cost per unit of BC is measured by the average of OR and OT, in Figure 1. Thus another possible candidate for the shadow price of the input is:

½ (OR + OT) ... (2)

To be sure, candidate (1) measures the social cost of resources which go into the production of the input, while candidate (2) measures the productivity of the input elsewhere in the economy outside the project. Which one is the correct shadow price? In principle, the larger of the two is the shadow price.[25]

However, OP is the market price without the project, and OR is that with the project in operation. Clearly, OR overstates the shadow price of the input; so does OP as well, but to a lesser extent. In the circumstances, taking an average of OR and OP does not help in any way. Interestingly, the ruling market price of the input in the absence of the project is a better approximation to the shadow price, rather than either the market price with the project, or an average of the two market prices—while, of course, the larger between (1) and (2) remains the best approximation.

Now suppose that the input can be imported at price OL reckoned at the shadow price of foreign exchange. Again, the use of the input outside the project under review shrinks from OA to OY in Figure 1. The supply of the input to the project partly comes from domestic source (YW), and partly from import (WZ). The shadow price of the imported part is clearly OL. For the domestic part, the shadow price is given by the larger of the following two expressions.

(area YKQW)/YW ... (3)
and (area YNUW)/YW ... (4)

The shadow price of YZ as a whole is, therefore, a weighted average of OL on the one hand, and the larger between (3) and (4) on the other.

(B) Input industry imperfectly competitive: unit cost rising. Under imperfect competition, the marginal cost is no longer the market supply curve. For, the firms under such market conditions equate marginal cost to marginal revenue, rather than to the price. As such, the geometry would now get a little more complicated.

The demand curve is dd without the project. Suppose that the marginal revenue curve (not drawn in Figure 2) intersects the marginal cost curve at L, so that the equilibrium price and quantity are OP and OA, respectively.

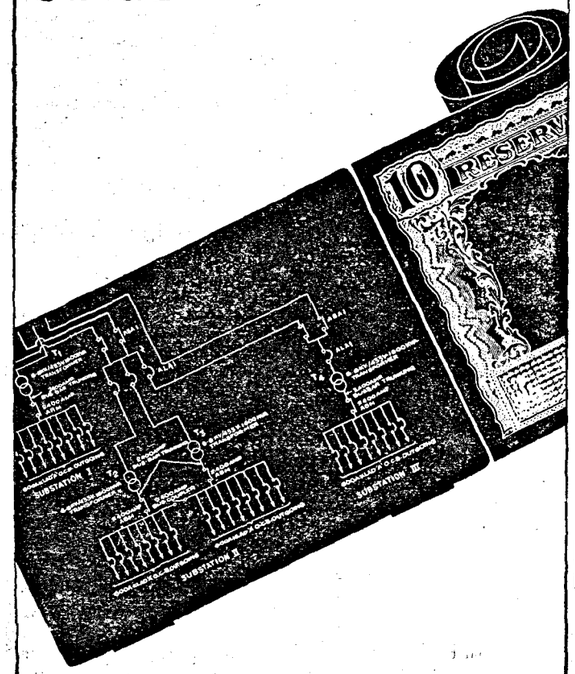
Now the project is introduced; it requires an amount x of this input. Consequently, the demand curve shifts to the right to DD by a horizontal distance of x.[26] The marginal revenue curve (not drawn) now intersects the marginal cost curve at J. Hence the equilibrium price and quantity are OR and OB, respectively.

Again, the amount BC is engaged in the project; and the use of the input elsewhere in the economy declines from OA to OC. In any event, the cost of producing BC is measured by area HCBJ, i e, the area under the marginal cost curve between B and C. If the segment HJ is linear, then the unit cost of production of BC amounts to:

½ (OS + OT) ... (5)

On the other hand, the foregone productivity of BC elsewhere in the economy is similarly measured by:

½ (OU + OR) ... (6)



What can be said about the relative magnitude of (5) and (6)? Of course, OR is always greater than OT, since

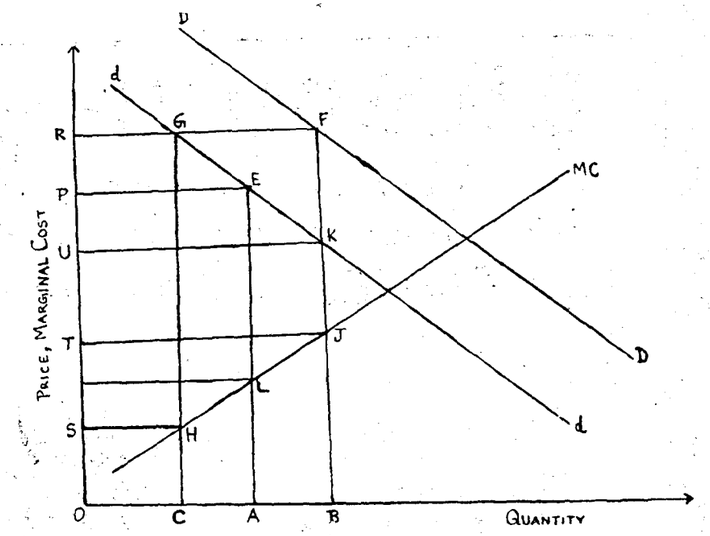
M-142

corresponding to quantity OB, OR is the price with demand curve DD, and OT is the marginal revenue to which marginal cost is equated in equilibrium. But the relationship between OS and OU varies with the elasticities of the demand and supply, and the amount of input required for the project. So (6) may be greater than, smaller than, or equal to, (5) in magnitude. The larger of the two is the first approximation to the input's shadow price.

The ruling market price of the input with the project denoted by OR in Figure 2 obviously by itself overstates the shadow price as given by (5) or (6). The market price OP without the project, on the other hand, is definitely lower than OR,[27] but it is not known as to how it compares with (5) or (6). Hence, the arithmetic average of the two market prices, with and without the project, is of no significance whatsoever in relation to the shadow price.[28]

IV

Indirect Tax and Subsidy



In connection with whether or not taxes and subsidies should be eliminated from the market price, one finds two opposite conclusions in the existing literature. According to one school, indirect taxes and subsidies affect market prices; but they are unrelated to the productive effort involved. They are transfer payments, not factor costs. It is argued, therefore, that indirect taxes such as sales tax and customs duties and subsidies if any, should be excluded from market price to arrive at the accounting prices.[29]

To be sure, such corrections of market prices do not imply disregard of the fact that the community must pay taxes for financing government activities. What it implies is that the comparative appraisal of projects should not be affected by the manner in which the tax burden is distributed.

The other school opposes the above view with the following argument. Since the commodity is being bought by people at the market price including taxes, it follows that the marginal usefulness or productivity of the commodity in the economy is commensurate with the market price including taxes. The uncorrected market price, therefore, correctly measures the opportunity cost of the commodity.[30]

The root of the controversy obviously lies in the fact that the two schools are looking at two different things. One considers the social cost of producing the commodity, while the other

FIGURE 2

counts its productivity or usefulness; one, so to speak, examines the commodity at its origin, the other at its destination.

For a clearer understanding of the issue, let us apply the method which we have developed in the preceding section. And let us confine our analysis to the case of perfect competition, with increasing unit cost.

In Figure 3, dd is the demand curve for a certain input without the project; and DD is that with the project in operation. The horizontal distance between them is x units, which is the requirement for the project. MC is the marginal cost curve which is also the industry supply curve under competitive conditions. Now, suppose that an *ad valorem* indirect tax at the rate of 100z per cent is imposed on the commodity. As a result, the supply curve then shifts up to MC'. The vertical distance between MC and MC' curves is: z (the marginal cost); FG, for instance, is equal to: z.BG.

Then E is the initial equilibrium point with price OP and quantity OA; in the wake of the project, it moves to F with price OR and quantity OB. Here, BC is the amount which is consumed by the project, leaving OC for the rest of the economy. The productivity of BC outside the project can be read off from demand curve dd; it is the area under dd between B and C. The opportunity cost per unit of BC, in this sense, is given by:

$$\tfrac{1}{2}\,(OR + OU) \qquad \ldots \quad (7)$$

The cost of producing BC amounts to area CKGB, or the area under the marginal cost curve between B and C. The cost of production per unit of BC then works out to be:

$$\tfrac{1}{2}\,(OS + OT) \qquad \ldots \quad (8)$$

Between (7) and (8), the larger is the shadow price of the input BC Note that (8) does not include indirect taxes in any way, whereas in (7), OR is the market price including tax.[31]

Let it be noted that, if for the sake of argument the shadow price is identified with the ruling market price without the project, corrected for indirect tax, then it is given by OV in Figure 3. It would be a pure coincidence if OV happens to be equal to (7) or (8).[32]

The above discussion specifically relates to an input used in the project. As for the project's output, its shadow price can be approximated on the basis of the demand curve, as shown in section III above. Whether or not the market price includes tax or subsidy is quite irrelevant in that case.

V

Concluding Remarks

Once the inputs and outputs of a project are identified and measured in physical terms, the next step is to express their values in monetary terms. For this, we need shadow prices of commodities.

The time stream of costs and benefits having been thus estimated, the

FIGURE 3

contributions of the project to capital formation deserve a special premium, so long as the saving and investment rate in the economy remains sub-optimal. Hence the need for finding the shadow price of capital which in turn is related to that of labour.[33] However, if the consumption benefit is the only objective, the shadow prices of capital and labour can be subsumed in the so-called synthetic discount rate itself.[34]

Intuitively, it seems that, if the commodity prices ensure the static efficiency and Pareto-optimality of resource allocation, and the synthetic discount rate brings about dynamic, inter-temporal efficiency, the entire investment programme consisting of projects evaluated with these parameters will be Allais-optimal.[35] This proposition still remains only a conjecture which can be rigorously scrutinised, we hope.

In any case, foreign exchange is a particularly scarce commodity in a developing country like India. And the official exchange rate does not necessarily reflect its shadow price. This shadow price is then another important parameter for project evaluation.

In the above discussion, we have seen that the shadow prices as computed from linear programming models of development planning are far from satisfactory as an instrument of planning. Apart from the question of feasibility of solving a sufficiently large size programming problem, there are doubts whether the dual solution would be comparatively consistent, robust and stable. Besides, there is some reservation as to the validity of the simplifying assumptions of economic relations as implied in a programming model.[36]

If a full-blown optimisation model cannot be solved to give us the shadow prices, the other extreme alternative is to use rule of thumbs without any explicit use of optimising methods or concepts. There is, of course, a cross between these two opposite approaches. One can take the position that while market prices have some extremely serious drawbacks, they do provide a useful starting point for calculating the shadow prices.[37] Accordingly, certain corrections are to be made to the market prices, and the prices thus adjusted are considered to be fair approximations to the respective shadow prices.

First of all, market prices in a partially planned economy like India's are determined by a number of factors, among which the consideration for static or dynamic efficiency of resource allocation is one of the least important elements.[38] Furthermore, it can be shown *a priori* that the very existence of monopolistic firms destroys the conditions of Pareto-optimality.[39]

Even if we ignore all these aspects, and even if it is granted that the ruling market prices are so determined as to allocate the resources efficiently, we have seen above that under imperfectly competitive conditions the market prices or any simple combinations thereof have no systematic relation whatsoever with the respective shadow prices.

Finally, as we have seen above, there are so far two approaches to the determination of shadow prices of commodities. One is a 'general' approach in the sense that it comprises a grand, economy-wide programming model. The other is a 'partial' model which seeks to correct the market price of an individual commodity on an *ad hoc* basis. Both approaches are deficient, in principle and in practice. As such, how to compute operationally meaningful and effectively optimising shadow prices of commodities still remains very much an open question.[40]

20 For a consumer good, the area under the demand curve may be a bad approximation to consumers' willingness to pay if the latter is a large fraction of their total income. See Friedman [10], pp 47-99; Hicks [12], pp 38-41; and Marglin [17], pp 42-44.
In the case of an intermediate consumption good or capital good, however, the area under the demand curve of a profit maximising producer is approximately equal to his willingness to pay. See Marglin [16], pp 20-27; and Marglin [17], p 42.
21 Marglin [17], p 40. For an interesting empirical calculation of consumers' and producers' surplus of fertiliser in India, see Tintner and Patel [30].
22 "Under full employment condi-

tions, with the marginal utility of income the same for all individuals, and with perfect markets and no external economies or diseconomies in production and consumption, prices are perfect measures of benefit. If a project is so large as to affect the prices of its outputs, a simple result is obtainable if the marginal utility of income is assumed not only the same for all individuals, but *also constant* over the range of variation. The area under the output's demand curve then constitutes a measure of benefits, and if the curves are assumed linear, an arithmetic average of old and new prices multiplied by the number of units will measure benefit. Another interesting case is the following: if the underlying individual indifference curves are assumed hyperbolic, Fischer's 'ideal' index number constitutes an indicator of benefit". Eckstein [8], p 226.

Note the conditions to be satisfied for the validity of the 'simple' *results*!

23 Flemming and Feldstein [9], p 166; and McKean [14], pp 168-70.

Incidentally, in national income accounting the entire project output would be valued at the new, lower market price, which clearly ignores the so-called consumers' surplus.

24 However, for the asymmetry between rising and falling cost situations see Flemming and Feldstein [9], pp 169-70.

25 See Flemming and Feldstein [9], p 170. The magnitude of the difference between (1) and (2), however, depends upon the slopes of the demand and supply curves in the neighbourhood of point E in Figure 1. If demand is more elastic than supply, OT is greater than OS; hence (2) is greater than (1). If supply is more elastic than demand, OT is less than OS; therefore, (2) is smaller than (1). If the elasticities are equal, (1) and (2) are numerically equivalent. The elasticity of demand around the equilibrium point E is measured by (BC/RT) . (OP/OA); and that of supply by (BC/RS) . (OP/OA).

26 Let Q=a—b. P be the demand function without the project; then Q=(a + x) — bP is that with the project. For any given price P, the quantities demanded are (a—bP) and (a + x — bP), respectively. Hence, the horizontal distance of the demand curves is x. To find the vertical distance, consider a given quantity Q. So we get Q = a — bP, and Q = a + x — bP' from the two demand functions; therefore, (P' — P) = x/b, which gives the vertical distance.

The marginal revenue curve also shifts up by x/b vertically. For with Q = a — bP, the marginal revenue, is (a—2Q)/b; while with Q = a + x — bP it is (a + x — 2Q)/b. The horizonal displacement is again by x. In order to have the same marginal revenue, we must have (a — 2Q)/b = (2 + x—2Q')/b; or Q=Q' — x.

Briefly, both the demand and marginal revenue curves are displaced by x horizontally and x/b vertically upwards, as a result of the project's demand for the input.

27 Given the displacements of demand and marginal revenue curves as shown in footnote 26, the market price would be unaffected if the marginal cost were constant. However, if the marginal cost is rising then the price will go up.

28 The impact of the possibility of importing the input can be analysed in terms of the method as developed in the earlier case.

29 See, for example, Little and Mirrlees [13], p 28; UN [31], p 203.

30 See Flemming and Feldstein [9], p 170; and Harberger [11], pp 242-43.

31 If the demand and cost curves are linear, then in view of results obtained in footnote 26, expression (7) can be computed as follows. The vertical distance between dd and DD being x/b, we get:
½ (OR+OU) =½ (OR + OR — x/b) = OR — BC/2b.
where x = BC and b is the slope of the linear demand curve.

32 Hence the blanket rule of eliminating taxes from the market price is without logical foundation. For example, see Adler [1], p 39; and UN [31], p 203.

As drawn in Figure 3, OV is definitely less than expression (7).

37 Sen [24], p 55.

38 See Bagchi [2], p 22; and Sau [22] for the conflicting objectives of pricing policy.

39 Sau [21].

40 No wonder, the originator of the concept of shadow prices, Tinbergen himself now believes that such prices are largely arbitrary. See Tinbergen [29]; also McKean [15] and Myrdal [18], pp 2031-39.

Little and Mirrlees [13] recommend that world prices, with appropriate adjustment for transport costs etc, be taken as shadow prices of commodities. This proposition has not at all been taken into account in this essay. We may return to it on another occasion.

Evaluating the Effectiveness of Management Planning and Control Systems

S K Bhattacharyya

This article attempts to relate the framework for management control and reporting systems developed by the author in two earlier articles to a planning and control system in use in an Indian system and, in the process, to evolve guidelines for the effectiveness of such systems.

The critical requirements for the effectiveness of a management planning and control system must finally relate to the following questions:

(a) Is the organisational structure such that it defines authority and responsibility in terms of jobs to be accomplished, the costs and revenues of which are controlled by the responsibility centre concerned?

(b) Are the corporate goals and objectives translated into time-phased statement of unit targets based on the input-output relationship prevalent in the unit operations?

(c) Is the reporting system such that it can quickly diagnose deviations from the desired results, particularly in those areas which represent key variables in operations?

(d) Is the follow-up mechanism such that it ensures prompt remedial action by proper analysis, review and co-ordinated action?

A management planning and control system must answer all these questions in the affirmative before it can be truly effective.

THE previous two articles in this series set out in some details the framework for management control[1] and reporting systems.[2] This article concluding the series will attempt to relate the framework developed to a planning and control system in use in an Indian company and, in the process, to evolve guidelines for the effectiveness of such systems.

The company operates a plant which uses imported as well as indigenous raw material for further processing leading to an intermediate product, which is thereafter transferred for further processing to two sub-plants — one producing packaging material while the other produces raw material for the textile and allied industries. The company's operations in relation to the packaging product have been extremely successful leading to generation of high profits while the performance of the textile-family product produced in the older plant has been relatively disappointing, as it has operated almost at a break-even point, except for periods of relative profitability due to price rises generated by periodic scarcities. The company operates two small ancillary plants producing chemicals required in its operations — sulphuric acid and carbon disulphide. The steam and electricity required for operations are produced by the company's boiler and power house. The company has also the usual supporting service departments like engineering and maintenance, laboratory, purchases, stores, transportation, etc, as well as staff departments like personnel, accounts, industrial engineering, general administration, etc. The plant is operated under the overall managerial supervision of a general manager with departmental managers heading the production, service and staff departments. The administrative and sales office of the company is located in a metropolitan city some 500 miles away from the plant. The administrative office is in the charge of the Managing Director supported by a Commercial Manager who has the overall responsibility for sales and distribution for both the products.

Prior to the initiation of a formal management planning and control system the administrative office relied on periodic, usually monthly, returns from the plant furnishing separately data relating to actual plant performance (quantities produced/technical operating efficiency/wastage, etc) as well as despatches from the plant to the sales office or to dealers. In addition to these returns, the plant accounting office prepared from the financial accounting records monthly profit and loss accounts which essentially set out the traditional income statement items like aggregate sales, costs and profits. The corporate management felt that the system then in operation did not provide for the required information relating to:

(a) assessment of relative profitabilities of the two product lines and the individual products in the two product lines;

(b) the effectiveness or otherwise of

A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.

There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

TATA CHEMICALS LIMITED

CMTC-10-254

the operations of the various departments — production, service and staff departments — for purposes of performance evaluation;

(c) bench-marks of desirable level of performance for the departments as well as the corporation as a whole; and,

(d) a basis for future planning and action.

Initially, the management was keen that a new management planning and control system should be designed and that it should have the limited objective of providing information to the top management alone. The thought was that the system should be essentially built around financial parameters, as the top management was primarily concerned with the profitability of the entire operation.

In 1967, after a series of meetings with the top management and the heads of operating departments, the systems designer was able to convince the top management that any attempt at building an effective planning and control system should take into account the following:

(a) The necessity of improvement in the performance of the company as a whole as well as identification of those units whose performance was not up to the desired level of achievement.

(b) The needs of information at operating levels for planning, decision making and remedial action (which was as critical as that of the top management, though the content, frequency and format of providing information would necessarily differ from one management level to another).

(c) The delineation of managerial responsibility broken up in terms of responsibility centres based on the following tests:

(1) significant size of operations,

(2) distinct input-output,

(3) demarcation of managerial boundary, by way of decision-making authority and responsibility for achievement of results, and

(4) uniqueness of operation, differentiated by technologies used or markets served or raw materials used or skills required, etc.

(d) The classification of responsibility centres into *cost of expense centres* (all staff and service departments which produced services or products entirely for the use of internal production departments and had no economic opportunities by way of sales to outside markets); *profit centres* (the production departments as well as the two ancillary departments producing sulphuric acid and carbon disulphide, which had distinct revenues measured in terms of sales volume and prices — or transfer prices for internal transfer — and variable cost of production, as well as distinct departmental overheads including salaries, wages, etc); and *investment centre* (the operations of the company as a whole analysed by way of profit — arrived at by aggregating the margins or surpluses of profit centres and deducting the costs of the cost or expenses centres as well as corporate overheads — as a percentage of investments).

(e) The introduction of an annual budgetary control system which was built up from targets of sales — based on past historical performance trends, the likely state of competition in future and the projection of the operations of end-users of the products of the company — followed up by development of targets of production, inventory, costs, profit and return on investment. These targets were then broken up in terms of monthly targets, appropriate to the profit or the cost centres, spelled out in terms of production and sales volume/quality mix/delivery schedules/variable costs based on consumption standards of raw material and stores/departmental and corporate overheads.

(f) The development of a management information system which monitored actual achievements in relation to the monthly budgets and threw up the extent of shortfall and highlighted the problem areas responsible for the shortfall (for instance, sales volume/price/production quantity/quality/standard variable costs of production/departmental or corporate overheads, etc, as the case may be). The system would require to be built from the operating departments upwards culminating in aggregate profitability statements for top management. The "mix" of the financial and non-financial information at various management levels would have to be tailored to the nature of operation. For example, there should be greater emphasis on operating efficiency indicators based on technical performance at the departmental level while the emphasis should be in terms of financial and econometric information for top management.

(g) The classification of revenues and costs in the reporting formats consistent with the needs of decision-making and evaluation of performance, e g, at the operating unit level, the relevant costs were product margins — based on product sales revenue and standard variable cost — while for departmental performance evaluation it was the aggregate departmental margins adjusted for identifiable departmental overheads.

The formulation of standards, identification of responsibility centres and their linkage with managerial authorities and responsibilities, the development of budgeting procedure integrating sales, production, purchase and personnel functions in an aggregate planning framework and the setting up of a management control cell manned by an industrial engineer supported by two cost accountants, took considerable effort and time. There were initial problems of compilation of departmental data, their collation and analysis, the follow up of shortfalls from budget but once the system was operational, it was recognised by all levels of management that the system significantly contributed to better planning, decision making, measurement of performance and remedial action.

The system designed was in many ways similar to the Anthony framework which distinguishes between strategic planning, management control and operational control and sets out the relative functions and objectives of each,[3] except that organisation structure was assumed to be a design variable. Furthermore, it emphasised the mechanics of systems implementation and administration as a key variable. The Anthony model has found substantial acceptance by control system designers in the last several years and has been critically acclaimed as providing new insights in the management planning and control process. A subsequent research study was conducted by Robert H Deming at the Harvard Business School in 1968 which analysed the management control system in operation in an US industrial organisation with a view to search for the characteristics of an effective management control system. The Deming study adopted the Anthony model as a frame of reference. Deming concluded in his research study[4] that the elements which provided for effectiveness in a management control system were as follows:

"a *Corporate Objectives*: Planning is facilitated where organisational objectives are carefully thought out, agreed to by members of top management, and explicitly stated in measurable terms... Once an objective is established it must be the focus of reports to top management and division management and it must be an important consideration in all decisions requiring investment of corporate funds.,

b *Long-Range Planning*: The planning process...is most useful when it includes fairly specific implementation

strategy for attaining the long-range plan.

c *Capital Budgeting*: The capital budget should be developed on the basis of an explicit examination of current investment opportunities and should not be based on a rule of thumb using historical ratios.

Economics of the Management Control System

d *Profit Plan*: A profit plan or budget emanating from the corporate objective and long-range plan is essential to effective management control of each organisational unit.

e *Planned Profit Improvement*: A planned profit improvement programme is an essential economic element of management control. One important part of the plan is the logical development of the profit plan and its continuous budgetary control process... A second major part of the plan is the systematic assignment of annual cost reduction.

f *Cost-Price-Volume Relationship*: These relationships underlie a profit plan or reporting system and must be understood and used by the appropriate personnel if management control is to be effective.

g *Flexible Budgets*: A flexible budget is essential; otherwise a change in the job to be done creates variances that destroy budgetary control.

h *Direct Costs*: The cost system should be designed so as to provide management with cost information as required in any of the types of decisions which it will have to make.

i *Profit Centre Control*: Measurement of costs and profits should be pushed to the lowest meaningful level in order to facilitate decisions that would maximise profit. It is desirable to treat a unit as a profit and/or investment centre whenever prices, costs and profits can be meaningfully determined and controlled by a given manager. When this is not feasible, control of costs through cost centres leads to more effective management control.

j *Budget Commitment*: To be effective, an approved budget must represent a commitment by the people who must carry it out, and unless they play a large role in setting it, there will be no such commitment.

k *Management Information System*: The main purpose of an information reporting system is to provide management with a framework within which the decision makers have the proper facts to cause them to react in a direction that will maximise profit... In such a system reports would be tied into one another as information flowed up through the organisation, and there would be a clear identification of the significant differences between actual and planned performance, with the reasons for these differences clearly discernible and with the responsibility pinpointed wherever feasible.

l *Zero Level Reporting*: [The data must be] captured at its most elemental stage... [otherwise] lower levels of management may not be able to answer questions asked by top management or provide the reports required.

m *Responsibility Centre Reporting*: The reporting system must reflect the responsibility assignment that allow the management to measure the performance against the assigned role.

n *Reporting by Exception*: A reporting system should bring to its (management's) attention only those things about which it should be concerned.

o *Reporting against a Standard*: In order to make reported information useful, some standards for comparison must exist. The two standards... useful are the budget and the last year's performance."

The Deming study suffers from the severe limitation of a collection of "motherhood" like statements, even though it had the benefit of the supervision by some of the most distinguished practising controllers, *viz*, Marshall K Evans of Westinghouse, R Burt Gookin of H J Heinz Company, Edmund Pugh of Columbia Broadcasting System, and Arjay Miller of Fords, and of course Anthony himself, who at that time was the Assistant Secretary of Defence (Comptroller) at Washington. Specifically, while the study substantiates criticality of already well-established components of the management planning and control process, it fails to develop an integrating framework of the principles listed in terms of effectiveness, particularly by way of design and implementation. It does not provide definitive answers in relation to two major issues relating to the planning and control process which have substantial bearing on the effectiveness of the management control systems:

(a) the criticality of the organisation structure variable in the design process, i e, the need for relating the management control and planning system to an optimal organisational structure tailored to corporate goals and objectives taking into account the desired "mix" between profitability and growth, technology and operating cost characteristics, economic characteristics of the market served by the products, values of the people in the organisation and the managerial climate in which the organisation operates. In other words, the Anthony model as well as the Deming study assume the organisational structure as a "given" and proceed to list the components that optimise the management planning and control process, though conceivably they might result in a system suboptimal in its totality due to dysfunctionality, arising out of the imbalance between the system and the organisational structure.

(b) The interrelationship of the implementation and administration process with the design framework of management control systems. The Deming study provides no insight regarding this relationship even though it is critical in determining the effectiveness of the system. (In recent years thinkers in the planning and control field like John Dearden have emphasised that the effectiveness of management control system is substantially dependent on the insights in the systems administration and implementation area.)

These limitations are dramatically highlighted in relation to the management planning and control system of the company described earlier. It was readily acknowledged by the company that the management control system introduced had resulted in many benefits to the company. Specifically, the company recognised that:

(1) For the first time, the expected levels of performance of the company as well as the operating units, including staff and service units, have been predetermined for annual and monthly performance evaluation. The actual results have been compared with expected targets highlighting the areas of deficiency which would require remedial action.

(2) It has been possible to accumulate individual unit and aggregate cost more significantly on the basis of standards developed, with the result that any departures from standards of consumption of raw materials and chemicals or non-utilisation of capacity or deterioration in the level of quality and cost performance, has been highlighted by the reports leading to appropriate managerial action.

(3) It is now possible to integrate the results of individual operating units with the total company performance in a significant manner in terms of the critical elements of managerial decision-making relating to allocation of resources, determination of product-mix, correlation of cost-profit-volume relationship for profit optimisation.

(4) The management have the required data for planning, performance evaluation and remedial action necessary for overcoming shortfalls from desired levels of performance.

However, in the opinion of the company the management control system has been less than optimal for the following reasons:

(a) Excessive detail leading to "too finely tuned" financial anlysis of performance (as distinct from managerial analysis for remedial action);

(b) Delay in completion of the reports for the use of various operating units;

(c) Organisational structure problems creating bottlenecks in planning, decision making and remedial action; and,

(d) Inadequacy of the follow-up mechanism in relation to shortfalls from desired performance thrown up by the management reporting system.

In 1971, a review of the system was undertaken by the designer, which indicated that the problem areas related primarily to the following designing deficiencies, notwithstanding the fact that it had all the technical components highlighted by the Deming study:

(a) In preparing the budget or the profit plan, the purchase department was not involved with the result that there were considerable problems of co-ordination, particularly relating to delivery schedule, quality of material, sources from which material had to be obtained and the quantity to be stocked, in spite of the fact that the total consumption of raw material had earlier been agreed upon and incorporated in the budget. The Purchase Manager used to report to the Administrative Manager, who was transferred to the head office subsequent to the introduction of the system to take up the job of the Commercial Manager. Thereafter, the Purchase Manager reported to the General Manager at the plant leading to two problems:

(i) the linkage of purchase function in the budget setting process was cut off with the departure of the Administrative Manager as the Purchase Manager was not asked to take his place in the Budget Committee.

(ii) Since the Purchase Manager was of lower managerial status and reported to the General Manager, co-ordination between the production and purchase functions required several "up-down-up" hierarchial references to ensure co-ordination between consumption of raw materals and chemicals and their purchase and storage.

(b) The Chief Engineer who was concerned with the maintenance function (which included preventive maintenance, renovation and installation) had the cost responsibility while the decision-making authority relating to what was to be repaired and when, was largely left with the production departments. The delineation of the authority for decision-making and responsibility for cost were not clear with the result that there was constant bickering about the reasonableness of maintenance costs, particularly "crash" maintenance jobs (which involved overtime activity and acquisition of the stores and material on an emergency basis). The problem was further aggravated by the fact that the Chief Engineer reported directly to the General Manager while the operating units were under the administrative control of the Works Manager.

(c) The demarcation of the responsi- about corporate policies, e g, whether of "distinct inputs-outputs" alone was excessively narrow resulting in generation of separate data relating to activities which had technological and process links with another department and was managed by a common manager. For instance, the maintenance department and the electric engineering department were set up as separate responsibility centres as was the case with carbon disulphide, water purification and sulphuric acid departments even though they were the common managerial responsibilities of the Chief Engineer and the Assistant Works Manager respectively. The incorrect delineation of the responsibility centres, emphasising distinction in terms of input-output rather than managerial boundaries, led to generation of overlapping data which defeated their use for purposes of managerial planning, decision making and remedial action.

(d) There was considerable haziness about corporate policies, e g, whether the packaging product was to be substantially exported or the company should consider continuous internal generation of power to prevent damage to machinery and deterioration in quality resulting from frequent stoppage of supply of power purchased from the State Electricity Board or whether in relation to the textile-family product, the company should continue to serve the lower quality spectrum rather than market premium products. The corporate policies in this regard were unclear resulting in problem areas for determination of the optimal revenue/cost/profit targets.

(e) The data generated by the management control system was made available only to the top management and the departmental heads. As a result first-line supervisory managers were not provided with data in respect of shortfalls in their operations and how such shortfalls tended to reduce total corporate profitability even though there was constant pressure on supervisory management to achieve budgeted results. This insistence on budget performance by supervisory management without participation in the management control process led to considerable problems of motivation as the control system was perceived by the first-line supervisors as essentially one for regulating their activities rather than providing help and support for optimising their own performance.

(f) The shortfalls in performances highlighted by the management control system were followed up by addressing memos to the departments concerned asking for their comments and communication of steps to be taken for remedial action. They tended to explain away such deficiencies on factors controlled by other departments, e g, when the solvent extraction efficiency was found to be going down from month to month, the reduction in operating efficiency was attributed to the lack of availability of imported activated charcoal, which according to the purchase department was not available because of import licensing policy of the government. The Purchase Manager and the Assistant Works Manager concerned reported to two different authorities, with the result that the exchange of memos between the management control cell and the operating department did not highlight the necessity of co-ordinating the purchase and production activities. In formulating remedial action, there was reluctance to discontinue protracted departmental memo writing between the management control section and the concerned departments by a "confrontation" of concerned managers for co-ordinating remedial action involving more than one management function.

(g) The staffing of the management control cell by executvies who had lower managerial status resulted in the lack of required "muscle" for follow-up action. This was also partly attributable to the fact that while the Managing Director paid a lot of attention to the reports, his comments were not recycled to the operating departments for purposes of analysis, review and remedial action.

On the basis of the systems review,

several recommendations were made by the designer. Some of these recommendations were:

(i) Re-delineation of the responsibility centres and merger of performance evaluation reports to reflect such re-demarcation of managerial boundaries,

(ii) Streamlining of the planning mechanism, ensuring that the organisational structure was in line with the sub-tasks requiring managerial effort. The structure now defined authority and responsibility levels in such a manner that budget accountability was limited to actions which were controllable by the managers of the responsibility centres,

(iii) Reporting formats were streamlined by merging data in respect of common managerial boundaries. Their content was substantially changed by altering the "mix' in favour of technical and operating information (as against financial information) at the operating levels,

(iv) Wherever corporate policies were hazy, the goals and objectives to be achieved were re-examined and the revised formulations were broken up in terms of departmental targets highlighting sub-tasks to be achieved and were integrated in the departmental budgets,

(v) Wherever remedial action involved co-ordination between different managerial functions it was stipulated that the management control cell would arrange for meetings for evolving joint remedial action rather than "up-down-up" references along the managerial hierarchy resulting in delayed decision making, and

(vi) Provision was made for communication of management control information to first-line supervisors, leading to their participation in the planning and control process and resulting in their acceptance of the system as a tool for better self-management.

In conclusion then it can be generalised that while the technical components of planning and control identified in the Deming study are correct, the critical requirements for the effectiveness of a management planning and control system must finally be related to the following questions:

(a) Is the organisational structure such that it defines authority and responsibility in terms of jobs to be accomplished, the costs and revenues of which are controlled by the responsibility centre concerned?

(b) Are the corporate goals and objectives translated into time-phased statement of unit targets based on the input-output relationship prevalent in the unit operations?

(c) Is the reporting system such that it can quickly diagnose deviations from the desired results, particularly in those areas which represent key variables in operations, and

(d) Whether the follow-up mechanism is such that it ensures prompt remedial action by proper analysis, review and co-ordinated action?

A management planning and control system must answer all these questions in the affirmative before it can be truly effective.

Net Present Value versus Internal Rate of Return

C Rangarajan

Paul Mampilly

As the net cash inflow generated during the lifetime of a project can be re-employed to earn further as and when they are realised, the exact point of time of occurrence of cash flows together with the size thereof becomes important in the process of evaluating the profitability of an investment project.

Net Present Value and Internal Rate of Return were evolved as tools to give proper weightage to these factors in making capital budgeting decisions. However, in evaluating projects, these two tools of analysis do not always lead to the same conclusion. The purpose of this note is to examine the circumstances in which divergent conclusions are reached and also to indicate which technique is to be preferred.

TRADITIONALLY both in India and abroad investment decisions have been taken on the basis of one or more of the following criteria: (a) pay-back period of the initial sums employed, (b) the average annual rate of return on the investment, and (c) net surplus in absolute amount generated by the project during its life-time. These measures are not considered satisfactory because they fail either to consider the entire life of the investment or to give adequate attention to the timing of the future cash proceeds. For example, the pay-back period method treats all proceeds received before the pay-back period as equal and ignores completely the proceeds received after the period. As the net cash inflow generated during the life-time of a project can be re-employed to earn further as and when they are realised, the exact point of time of occurrence of cash flows together with the size thereof becomes important in the process of evaluating the profitability of an investment project. It was to give proper weightage to these factors that the Net Present Value and Internal Rate of Return were evolved as tools to aid capital budgeting decisions. However, in evaluating projects, these two tools of analysis do not always lead to the same conclusion. The purpose of this note is to examine the circumstances under which divergent conclusions are reached and also to indicate which technique is to be preferred.

I

Meaning of Present Value and Yield

(a) *Present Value*

It is best to bring out the meaning of the net present value by means of two examples. Project A calls for an initial investment of Rs 100 and is expected to generate net cash inflows of Rs 80 at the end of year 1, Rs 30 at the end of year 2 and Rs 30 at the end of year 3, and nothing thereafter. Project B, however, yields Rs 30 at the end of each of the first two years and Rs 80 at the end of the third year with the same initial outlay of Rs 100. The situation may be tabulated as under:

	Initial Outlay	Cash Flow at End of			NPV	IRR	NTS
		Year 1	Year 2	Year 3			
Project A	Rs 100	Rs 80	Rs 30	Rs 30	Rs 20.03	17%	Rs 26.7
Project B	Rs 100	Rs 30	Rs 30	Rs 80	Rs 12.13	14%	Rs 16.2

Conventional accounting would suggest that either project generates the same cash flow (Rs 140) in the span of 3 years, and may accordingly treat both as equally profitable. Assume now that cash realised may be employed to generate income (earnings or avoidance of interest payments) at 10 per cent per annum. Then, under Project A, Rs 80 may be put to generate further income for 2 years more while Project B could provide only Rs 30. Thus at the end of the third year, the accounts of the two projects would look as shown in Table A.

The profitability of either Project is distinctly seen when the earning capacity of the flows generated during the life of the project is also taken into account. With Project A, the investor attains a Net Terminal Surplus (NTS) of Rs 26.7 while in the case of Project B, the NTS is only Rs 16.2. In this case, we made the comparisons by taking the cumulative effect of the flows to the terminal point. In like manner, we can bring down the flows to the initial point of time also. The principle applied is the same. The cash flow of Rs 80 at the end of the first year and the one at the end of the third year have, as we have observed, different connotations. Rs 80 received at the end of year 1 is as good as receiving Rs 96.8 at the end of year 3 or Rs 80 at the end of year 3 is as good as only Rs 16.12 at the end of year 1, for Rs 66.12 will appreciate to Rs 80 at the end of year 3. Thus, if we look at the flows generated by Project A, in terms of its present day equivalence, we find that it amounts to present day net surplus of Rs 20.03 while that of Project B is Rs 12.13. In other words, Rs 20.03 today is as good as Rs 26.7 at the close of year 3 and Rs 12.13 today is as good as Rs 16.2 at the end of year 3. Thus, Project A provides an opportunity to buy Rs 120.03 for Rs 100 and Project B to buy Rs 112.13 for Rs 100. This method then provides a meaningful way to analyse investment problems and is known in business economics as the NPV (Net Present Value) approach. The intrinsic assumption is that the flows generated are re-investible at a certain rate.

(b) *Internal Rate of Return*

Another way of looking at the profitability of the Project is by estimating what rate of return the flows generated over time effectively yields. We found that both in respect of Project A and Project B, there is a positive surplus at the terminal point (Rs 26.7 and Rs 16.2) under the assumption that the flows are re-investible at 10 per cent. Thus, if the investor were to borrow the initial outlay at 10 per cent, he would profit by the venture by Rs 26.7 or Rs 16.2, as the case may be, at the end, after retiring the debt with interest. In other words, the return from the investment is more than 10 per cent. We can see that at 17 per cent and 14 per cent rates of interest, respectively for Project A and Project

TABLE A (Rs)

	Project A	Project B
Year 1		
Initial outlay	(—) 100	(—) 100
Interest @ 10%	(—) 10	(—) 10
Total	(—) 110	(—) 110
Cash inflow at the close of year 1	80	30
Net to be carried over to year 2	(—) 30	(—) 80
Year 2		
Opening balance	(—) 30	(—) 80
Interest @ 10%	(—) 3	(—) 8
Total	(—) 33	(—) 88
Cash inflow for the year	30	30
Net to be carried over to year 3	(—) 3	(—) 58
Year 3		
Opening balance	(—) 3	(—) 58
Interest @ 10%	(—) 0.3	(—) 5.8
Total	(—) 3.3	(—) 63.8
Cash inflow at the close of year 3	30.0	80.0
Surplus at the end of the Project	26.7	16.2

B, the investor will be left with nil surplus at the end. At these rates, the net present value of projects will also be equal to zero. The yield can therefore be defined as the *rate of interest* that will make the present value of the cash proceeds expected from an investment equal to the present value of the cash proceeds required by the investment, and represent the maximum rate of interest that may be paid on the outlays. In business economics, this rate which equalises the cash flows to the present value of a project is called Internal Rate of Return (IRR), Discounted Cash Flow (DCF) return, yield, etc. This was termed as 'marginal efficiency of capital' by Keynes. In the present example Project A is adjusted superior in terms of NPV, NTS and IRR. The assumptions for estimating the IRR are worth repeating. Thus:

(i) The flows generated are re-investible at the particular value of the IRR, and

(ii) The borrowing rate or the rate at which funds are obtained is the same as the rate at which funds generated during the life of the project can be re-invested.

II

Cases of Conflict

(a) *Types of Decision Problems*

Broadly speaking, the following categories of decision problems involve application of either technique.

(i) To accept or reject a particular investment opportunity;

(ii) To select one or more from a given set of investment opportunities, where capital rationing is not called for, and

(iii) To ration capital among competing alternatives.

In an 'accept or reject' kind of situation, the Net Present Value would indicate the same decision as the Internal Rate of Return. For, if the NPV at a given re-investment rate (say 10 per cent) is positive, the rate at which the discounted net cash flow would be equal to zero must obviously be greater than that re-investment rate (10 per cent). Similarly when NPV is negative at a given rate, the IRR must be less than that rate. Thus in 'accept or reject' situations there cannot be a case where the two methods of evaluating project profitability will throw up conflicting decisions.

As far as rationing capital (item iii) among competing projects is concerned, either technique cannot conclusively spell out the optimum set of projects that need to be accepted. This, according to us, is a problem which calls for the application of integer or dynamic programming in addition to the NPV technique.

Conflicts, however, do arise in the case of item (ii) where selection is called for between two mutually exclusive projects. These conflicts, which we would see as we go along, arise directly out of the assumptions built in either method spelt out earlier.

(b) *Some Conflict Situations*

There can be a number of situations where the decisions indicated by the NPV approach is contradicted by the IRR approach. In order to bring out the differences effectively we take two such situations and discuss them in detail.

(i) Case I:

Where two mutually exclusive projects of the same economic life involve the same initial cash outlay.

Consider the following two projects

	Initial Outlay	Cash Flow at End of Year 1	Year 2	NPV @ 5%	NTS @ 5%	IRR
Project A	Rs 100	20	120	27.8	30.75	20%
Project B	Rs 100	100	31.25	23.58	26.00	25%

In terms of NPV/NTS, estimated at 5 per cent opportunity (reinvestment) rate of return, Project A is superior to Project B. In terms, however, of IRR Project B ensures a higher return. Which one is to be chosen then? The NPV/NTS method assumes that the outlays have an opportunity cost of 5 per cent and the flows generated by the outlay are reinvestible at that rate. If these assumptions are valid, nothing more than the figures shown under NTS should be left over with the investor when the projects are worked through to the end. The IRR of 20 per cent or 25 per cent assumes that the initial outlay has an opportunity cost of 20 per cent or 25 per cent and that the flows are reinvestible at that rate. The assumptions under NPV/NTS and the ones under IRR are thus incompatible.

The reinvestment or opportunity rate at which cash flows are discounted should depend on one or more of the following:

(a) the rate at which funds are borrowed, for to the extent of borrowing the surplus generated could be utilised to avoid interest payments;

(b) the shareholder's expectations rate or the cost of capital; and,

(c) specific alternate investment opportunities expected to arise from period to period.

Under Indian conditions, borrowing rates are fixed, and one could not imagine the existence of even a single firm which might not have outstanding borrowings. Therefore, the explicit re-investment rate may be taken as the one charged by the credit institutions for their lendings as the surpluses with the firm could always be utilised to reduce borrowing and save costs. If the IRR connotes a rate different from the established reinvestment rate, it loses its practical significance. In that situation the IRR cannot overrule the results obtained under NPV/NTS. At best the IRR indicates the theoretically maximum rate at which funds can be borrowed to finance a project. However, it would be incorrect to treat that rate automatically as the reinvestment rate.

Case II: where two mutually exclusive projects involving the same cash outlay have different economic lives:

Consider the following two projects:

	Initial Outlay	Cash Flow at End of Year 1	Year 2	Year 3	Year 4	NPV @ 5%	NTS @ 5%	IRR
Project A	(—) 1000	500	800	—	—	201.8	241	18%
Project B	(—) 1000	360	360	360	360	278.0	385	16%

Project A has an economic life of 2 years while Project B runs through 4 years. The NPV/NTS approach shows that Project B is more attractive while the IRR index chooses Project A. Some recent writers have observed that the NPV approach is biased in favour of projects of longer economic life, as the process ignores the possible utilisation of the surpluses at the end of the short run economic life. To be more precise they argue that the surpluses made available by Project A in a period of 2 years, viz, Rs 500 at the end of year 1 and Rs 800 at the end of year 2, could be put to earn further for two years or more which the NPV approach does not take into consideration.

When IRR approach indicates that Project A yields 18 per cent, it implicitly assumes that (a) at the end of the second year the funds can be re-employed on a project of equivalent profitability and (b) that the flows during the period of two years could earn at 18 per cent. Both these assumptions are questionable. If both the assumptions were true, then the NPV itself should be calculated at that rate in which case both methods will yield the same result. Further the assumption (b) would render the IRR of 16 per cent in respect of Project B meaningless.

It is not true to suggest that the NPV approach ignores what happens to the surplus at the end of the second year in the case of Project A. On the other hand it implicitly assumes that the funds left over at the end of the project's life are reinvestible at the same (discount) rate (5 per cent) at which the flows are brought to a common point in time.

The issue then is as to which assumption is true — 18 per cent/16 per cent or 5 per cent as appropriate reinvestment rate. Apparently only one could be true in which case either method would yield identical results.

The same issue arises when we compare projects of unequal initial outlays. The question that needs to be determined in such cases is at what rate the excess initial outlay of one project over another can be allowed to accumulate. The crux of the analysis in all these situations is therefore the determinations of reinvestment rate.

(c) *Multiple Rates of Return*

The Internal Rate of Return, as conceived in the earlier part of this discussion, is that rate at which the flows generated by the project and the initial outlay accumulate to the same sum at the end of the project's life. Alternatively it is the rate at which the discounted value of the flows generated equals the initial outlay. This method of computation leads to multiple rates of return in certain types of situations. Mathematically such a situation should arise whenever the stream of cash flow carries alternative signs, i e, some periods contributing positive flows and some others negative. Under Descartes' rule of signs, there can be as many solutions to such series of cash flow. Theoretically, therefore, the problem exists. Does this, however, have any economic significance or does this phenomenon disqualify once for all the application of IRR technique for capital investment decisions? We shall examine this issue by citing an example used by Ezra Solomon in his paper on 'Arithmetic of Capital Budgeting'.

An incremental investment of Rs 1,600 today is expected to yield a cash flow of Rs 10,000 at the end of first year with an attendant cash outflow of Rs 10,000 at the end of second year.

Initial Outlay (—) Rs 1600

Cash Flow

At the end of year 1 Rs 10000

At the end of year 2 Rs 10000

In this case the cash flow stream alternates in sign twice, and there could be two solutions, i e, two rates of return under Descartes' rule of signs.

At 25 per cent, the initial outlay accumulates to Rs 2,500 at the end of second year. The cash flow cumulates also to Rs 2,500 at the end of second year (10000+10000 x .25 —10000=2500) Similarly the present value of the cash inflow at the end of the first year and the outflow at the end of the second year discounted at 25 per cent come to Rs 1,600.

In like manner at 400 per cent IRR, the initial outlay and the cash flows generated accumulate to Rs 40,000 at the end of the second year. The present value of the flows discounted at 400 per cent come to Rs 1,600.

A conflict then arises as to which of these two rates is the correct measure of the investment value. Solomon answers this by stating that "neither of these rates is a measure of the investment worth", for, according to him, "any definition of profitability that leads to these absurd results must itself be in error. He, of course, does not waste time in locating what this error is. He solves the problem by arguing that the investment of Rs 1,600 helps only in preponing the cash flow of Rs 10,000 from the end of second year to the end of first year, and that the return of the investment of Rs 1,600 today should be linked to what the preponement of Rs 10,000 by a year could gain. If it is assumed that the earning rate of funds is 23 per cent, then the preponement of Rs 10,000 would mean an extra earning at the end of year 2 of Rs 2,300. This implies investing Rs 1,600 today to earn Rs 2,300 at the end of year 2, and is as good as earning 20 per cent, cumulative, on Rs 1,600. Solomon therefore concludes by saying that the right IRR is neither 25 per cent nor 400 per cent, but only 20 per cent.

In effect, Solomon solved the problem of the alternating signs (leading to the mathematical possibility of dual solutions), by putting a price on the flow at 23 per cent, and thus recasting it as:

Invest Initially (—) Rs 1600

Year 1 —

Year 2 2300

In such a case, of course, there is only one change of sign, and there cannot be more than one solution. But in the process of normalising the flow as one of single sign change, Solomon

TABLE B

	@ 10%	@ 15%	@ 23%	@ 25%	@ 400%
(1) Flow at the end of year 1	10000	10000	10000	10000	10000
(2) Return on funds at item 1 for the second year	1000	1500	2300	2500	40000
(3) Total	11000	11500	12300	12500	50000
(4) Deduct outflow at the end of year 2	10000	10000	10000	10000	10000
(5) Total cash at the end of year 2	1000	1600	2300	2500	40000
(6) Cumulative rate of return (IRR) at initial outlay of Rs 1600	—21%	0%	20%	25%	400%

made all the difference—namely, that the funds could be reinvested only at 23 per cent. If this assumption were right, it did not require any calculation to suggest that neither 25 per cent nor 400 per cent is correct. For, the assumptions under which the IRR is arrived at is that funds are reinvestible at that rate. If, instead of 23 per cent, Solomon had assumed 25 per cent as the possible opportunity rate of funds generated, then IRR will work out to be 25 per cent. Table B shows the IRR that results from assuming different reinvestment rates.

Therefore, it is the basic assumption built into the process of arriving at the IRR that makes the mistake. The solution of 25 per cent has the assumption that the flow at the end of year 1 could earn at that rate. This is invalid if Solomon's 23 per cent is true. And so, too, the solution of 400 per cent. Thus, if the investor is certain that the utilisation of the surpluses generated by the project is possible only at a specific rate, then any solution different from the rate must be wrong.

Viewed slightly differently, the profitability of any project is accounted by (a) the cash surpluses directly arising out of the activities under the project and (b) the financial gain accruing as a result of subsequent utilisation (reinvestment) of these surpluses. It is in respect of the second category of flow that more careful prediction may have to be made. To the extent of borrowings outstanding, the rate on these financial gains could be the same as the rate of interest paid on such borrowings. Theoretically, then, if the initial outlay (say Rs 1,600) is borrowed at 400 per cent, the reinvestment also could be 400 per cent, but such opportunity would have a ceiling determined by the amount of borrowing itself. Thus, Rs 1,600 becomes at 400 per cent Rs 8,000 at the end of one year which is fully paid out of the inflow of Rs 10,000 at the end of year 1 leaving a balance of Rs 2,000. In a uniform series of cash flows, the cash inflows at the end of each year never exceed the outstanding amount. But when the flows alternate in signs, the possibility of lending also makes its appearance and it is the dual possibility of repaying as well as lending that results in multiple yields. However, the critical question in our example is whether the balance of Rs 2,000 left at the end of the first year can earn 400 per cent. If this can fetch only 23 per cent, the terminal cash would amount only to Rs 2,460 against an outflow of Rs 10,000.

The conflict between internal rate of return and the net present value methods arises only where a choice has to be made between mutually exclusive projects. But different conclusions are reached primarily because of the differing assumptions relating to the rate at which the cash generated in the course of the life of the projects can be reinvested. If, however, a common assumption is made regarding the reinvestment rate, both methods will lead to the same conclusion. Since the rate used in computing the net present value is likely to be close to the feasible reinvestment rate, the net present value method is usually a better guide in the choice of mutually exclusive projects.

Corporate Policies on Bonus Share Issues in India

L C Gupta

Bonus issues in India are in the nature of 'stock-splits' rather than 'stock-dividends'. Increases in the total quantum of dividend distribution do not follow bonus issues quite as universally or automatically as is generally assumed. In fact, where dividend distribution has been increased, the quantum of increase has been usually less than in proportion to the bonus issue.

This paper is based on the findings of a specific inquiry. It argues from its findings that both to counteract the tendency towards laxity and wastefulness in the investment of retained earnings and to check undesirable speculation, a policy of an annual 'stock-dividend' paid concurrently with the retention of profits has distinct advantages over the present practice in India. The current practice amounts to capitalising past accumulations at infrequent and irregular intervals according to the whim of managements.

[The study was sponsored by the Research Programmes Committee of the Planning Commission. The responsibility for the views expressed is entirely that of the author.]

THE object of this article is to examine certain aspects of the practice of issuing bonus shares by Indian companies. The discussion is based on the findings of a specific inquiry.

Perhaps the most interesting fact brought to light by our inquiry is that bonus issues in India are in the nature of what the Americans call 'stock-splits' as distinguished from 'stock-dividends'. It was found that increases in the total quantum of dividend distribution did not follow bonus issues quite as universally and automatically as is commonly believed, and that in those cases where the dividend distribution was increased the quantum of increase was usually less than in proportion to the bonus issue.

We analysed the ratios of bonus issues for 919 cases of bonus issues made by quoted Indian companies, i e, companies whose shares were listed on any of the stock exchanges in India at the time of the bonus issue. The study covered the 20-year period, 1948-67. Table 1 shows the relative importance of the different ratios of bonus issues. It reveals that certain bonus ratios tended to be popular with corporate managements in India. The four most typical ratios, together with the percentage of the total number of bonus issues accounted for by each of these ratios, were as follows:

Bonus Ratios	Per Cent of All Bonus Issues	
	1948 to 1967	1966 and 1967
(a) 1:1 (100 per cent)	25.1	20.9
(b) 1:2 (50 per cent)	17.2	17.7
(c) 1:4 (25 per cent)	10.3	12.2
(d) 1:5 (20 per cent)	9.5	12.5
	62.1	63.3

For the period 1948-67 as a whole, the largest proportion (25.1 per cent) of bonus issues was in the ratio of 1:1, followed by the ratio 1:2 which accounted for 17.2 per cent of all bonus issues. The ratios of 1:4 and 1:5 were, between them, of about equal importance.

Bonus ratios over the period 1948-67 have generally moved down. The largest proportion (24.7 per cent) of bonus issues during the two years, 1966 and 1967, was in the ratios of 1:4 and 1:5 which may be taken together because they are close to each other.

A striking feature of this prevalent Indian corporate practice of issuing bonus shares is that bonus issues in the low ratios of less than 1:10 (i e, 10 per cent) have throughout been of negligible importance, forming only 1.8 per cent of the total number of bonus issues during 1948-67. The bulk (90 per cent) of bonus issues in India are in relatively high ratios, of 20 per cent and above, and are made by companies at irregular intervals without any consistent policy. This is an important departure from the practice among American companies. The ratios of bonus issues, or to use the American term, 'stock-dividends' to stock outstanding, are set in the United States typically at 2 per cent, 3 per cent or 5 per cent. An overwhelming majority of stock-dividends by American companies are of less than 10 per cent; slightly over half of them are of less than 5 per cent.[1]

A detailed examination was undertaken of the actual behaviour of dividends after an issue of bonus shares. The analysis of dividends covered 496 cases of bonus issues by Indian companies over the 18-year period, 1950 to 1967. The quantum of dividend distribution after a bonus issue did show an increase in the majority (two-thirds) of the cases examined for the period in question. At the same time, the proportion of cases in which no dividend increase occurred was also quite large (one-third of the total number examined). Further, the increase in dividend distribution was found to occur more in the case of low bonus ratios than in the case of high ratios. Thus, in the case of non-plantation companies, only 57 per cent of the bonus issues in ratios of 1:1 and over

TABLE 1: FREQUENCY DISTRIBUTION OF BONUS ISSUE RATIOS, 1948-67

Ratio of Bonus Issue to Outstanding Equity	No of Bonus Issues	Per Cent of Total
1:10	38(17)	4.1(4.9)
1:8	7(2)	0.8(0.6)
1:6	24(10)	2.6(2.9)
1:5	87(43)	9.5(12.5)
1:4	95(42)	10.3(12.2)
1:3	59(20)	6.4(5.8)
2:5	46(21)	5.0(6.1)
1:2	158(61)	17.2(17.7)
3:5	16(8)	1.7(2.3)
2:3	20(7)	2.2(2.0)
1:1	231(72)	25.1(20.9)
3:2	9(2)	1.0(0.6)
2:1	28(9)	3.0(2.6)
3:1	7(2)	0.8(0.6)
4:1	2(—)	0.2(—)
5:1	1(1)	0.1(0.3)
6:1	1(—)	0.1(—)
7:1	2(2)	0.2(0.6)
8:1	2(1)	0.2(0.3)
9:1	1(—)	0.1(—)
Sub-total	834(320)	90.8(92.8)
Ratios other than above	85(25)	9.2(7.2)
Total	919(345)	100.0(100.0)

Note: Figures within brackets give separately the data for the two years 1966 and 1967.

were followed by an increase in the quantum of dividend distribution. The corresponding percentage for low bonus ratios, of 1:6 and below, was 85. This finding too is contrary to the general belief among the public that the dividend increases would usually be more common and larger in the case of large bonus issues than in the case of small bonus issues.

The average percentage increase in the quantum of dividend for the year of bonus issue, as compared to the preceding year, worked out to approximately 18 per cent for bonus issues made during the period 1954 to 1964 and 14 per cent for those made during 1966 and 1967. However, a detailed analysis of the percentage changes in dividend distribution following a bonus issue shows a bewildering diversity of policy among corporate managements, so that, the average figures mentioned above cannot be regarded as representative. In roughly one-third of the cases examined, the increase in dividend following a bonus issue ranged between 10 and 30 per cent over the preceding year. In about one-fifth of the cases, the quantum of dividend distribution actually dropped after the bonus issue. The magnitude of increase in the dividend quantum had a wide range from a nominal increase of less than 5 per cent to very substantial increases of over 50 per cent.

Our findings indicate that it is misleading to consider bonus issues by Indian companies to be stock-dividends. Whereas the distribution of stock-dividends by American companies, in most cases, amounts to capitalisation of the retained profits *concurrently* (i e, in the year of retention), the issue of bonus shares by Indian companies in the great majority of cases represents capitalisation of the past accumulation of retained profits over a number of years. This is suggested not only by the low ratios of stock-dividends in the US compared to the generally high ratios of bonus issues in India, but also by the fact that stock-dividend in the case of a large number of American companies is a regular annual feature and is paid alongside the cash dividend while bonus shares by Indian companies are issued infrequently and at irregular intervals. The maximum number of bonus issues made by any Indian company over the 20 years 1948-67 was 10 and only one Indian company, *viz*, Arvind Mills, was found to have made 10 bonus issues. In all other cases, the number of bonus issues during the 20-year period was seven or less.

A policy of an annual stock-dividend along with a regular cash dividend, implies a gradually rising total cash distribution and places on the corporate management a kind of obligation to re-invest the retained profits remuneratively. Thus, a 3 per cent stock-dividend paid annually in addition to a uniform rate of annual cash dividend means a 3 per cent annual growth in total cash distribution. The distribution of a stock-dividend in these circumstances becomes an effective method of conveying to the stockholders an assurance about the profitable re-investment of retained profits. The stock-dividend represents a certificate indicating the amount of re-investment made on behalf of each shareholder. However, the practice among Indian companies — of giving bonus shares at infrequent and irregular intervals out of past accumulations — places no obligation at all on the managements to ensure that re-investment of profits yields a reasonable return.

Investment financed from external sources is subject to screening by outside agencies as to its relative profitability, but investment financed from internally generated funds is subject to no such check. Serious doubts have been expressed about the efficacy with which retained profits are invested by corporate managements. Some factual research investigations into this problem yield disturbing conclusions. Thus, I M D Little, inquiring about United Kingdom companies, arrived at the following conclusion:

> One seems to be left with the conclusion that these [companies] which retain a relatively high proportion of profits select relatively unprofitable investments. The present results, therefore, seem to lend some weak support to the view that institutional or fiscal arrangements which limit dividends are a relatively inefficient method of increasing investment.[2]

The position in India is likely to be certainly worse than in the UK because of the general lack of a professional bias among Indian corporate managements. Most investors entertain doubts about the retained profits being taken at their face value or being invested in sufficiently remunerative schemes. Witness the following observation by A J Merrett and Allen Sykes in a recent book:

> Moreover, unless there are special tax considerations (e g, an exceptionally high proportion of the shareholders are surtax payers hence making retained earnings especially advantageous) shareholders may be justifiably suspicious of companies which retain an exceptionally high proportion of earnings and thus decline to submit to the financial scrutiny and discipline involved in raising external equity.[3]

It is at least partly for the above reason that the market assigns several times more weight to dividends than to retained income.

The present practice of issuing bonus shares at irregular intervals in relatively high ratios also leads indirectly to unwarranted price fluctuations and undesirable speculation in the share market. Company managements usually give no indication to the public as to their dividend intentions after the bonus issue. Our data on dividend changes after bonus issues reveals an extremely erratic behaviour on the part of company managements. Bonus issues have generally been regarded by the share market as signals for a dividend increase in the immediate future, but very frequently, as our data showed, the signal proved to be false. Large bonus issues at irregular intervals thus cause unnecessary disturbance to the share market. They also provide opportunities to the 'insiders' to make large private profits by share-trading on the basis of inside information.

A practical objection against the policy of an annual stock-dividend at a low rate may be raised, however, on administrative grounds, *viz*, that it would require allotment of fractional shares, would create a lot of paper work, and would involve considerable postal expense. But these objections cannot be regarded as weighty. Fractional shares arise even now in most cases and cannot be said to give rise to any serious problem. The amount of paper work and postal expense can be minimised if the cash dividend and the stock dividend are declared together and are posted together. This will incidentally also have the advantage of minimising the occasions of disturbance to share prices.

Hence, both from the point of view of counteracting the tendency towards laxity and wastefulness in the investment of retained earnings and from the point of view of checking undesirable speculation which causes violent price fluctuations in the share market, a policy of an annual 'stock-dividend' paid concurrently with the retention of profits has distinct advantages over the present practice in India of capitalising past accumulations at infrequent and irregular intervals according to the whim of the management.

Foreign Collaboration in Indian Industry

V N Balasubramanyam

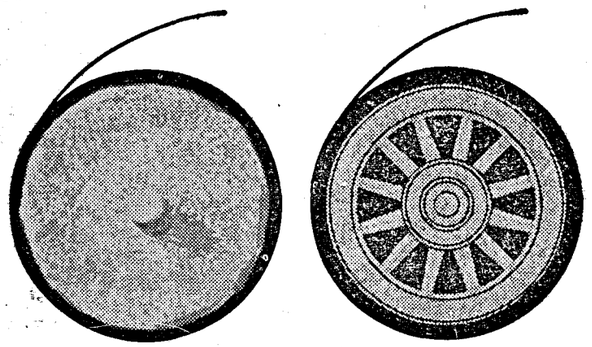
What has been the impact of imported technology and investment on Indian industrial productivity, exports and growth? As the Reserve Bank of India study on the subject puts it, "the major problem in this field is, for instance, whether, on balance, foreign collaboration arrangements have resulted in, or can be relied on to result in, a net gain to the country? Have those firms and industries which have relied more on technology fared better relative to the others in terms of productivity and growth?"

Central to the same theme are questions such as what exactly is the nature of knowledge imported under the technical collaboration agreements? Is the knowledge imported suited to Indian conditions and prevailing factor proportions? Has the implementation of foreign techniques resulted in a higher capital-labour ratio? Is the imported knowledge restructured to suit Indian factor and product market conditions? What has been the cost of such restructuring? How best to assess the quality of knowledge imported? Is the market for knowledge a perfect one? If not, what are the costs and benefits of operating in an imperfect market for knowledge?

Questions such as these are easily raised, but answers are hard to find, mainly because of the lack of reliable and comprehensive factual and statistical data on the subject.

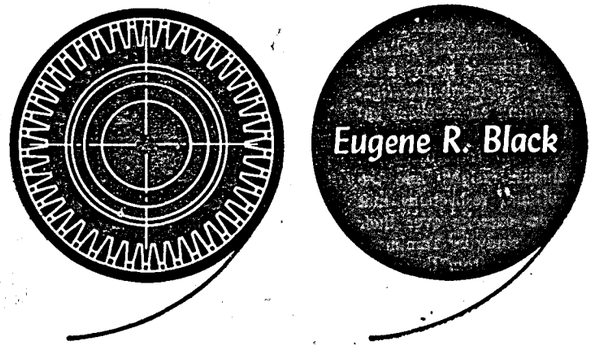
A benefit-cost analysis of foreign technology requires much more comprehensive information than is available from published sources. A sector-by-sector analysis of the problems or even micro case studies of selected individual firms with foreign collaboration in each of the industrial sectors would be a more fruitful avenue of approach than overall macro studies.

[The author wishes to thank A I MacBean and R Whittaker for comments on this paper.]



A NUMBER of studies differing in approach content and conclusions on the multi-faceted problem of the role of foreign technology and investment in Indian industry have appeared recently.[1] These studies have cast their net wide, employing the questionnaire method and interview techniques, to cull out information on a subject on which secondary data are scanty. The Reserve Bank of India study, based on replies to a comprehensive questionnaire sent to Indian firms with foreign collaboration, provides valuable data on dividends, royalties and technical fees paid by Indian firms to their foreign collaborators. It also reports on the contractual clauses embodying various types of restrictions that govern Indo-foreign technical and financial collaboration agreements. Kidron's study, a result of painstaking empirical investigations, besides providing an excellent annotated account of the evolution of Indian official policy on foreign capital also presents valuable insights into the aspects of control and restrictions that foreign collaborators exercise over their Indian partners. The study by Tomlinson approaches the problem from the viewpoint of the British partners and attempts to delineate the factors influencing their decision in entering into joint ventures with Indian and Pakistani firms. The recent study of the National Council of Applied Economic Research emphasises the link between imported and indigenous technology, analyses the implications of governmental policy for imports of technology and in general, presents a brief for a liberal policy towards imports of technology.

Crucial Questions Unanswered



The role of foreign capital and technology in the development process is a controversial one. Besides the thorny economic questions it raises, political factors permeate the subject and render the analyst's task doubly difficult. In assessing the net contribution of foreign investment and technology to the growth process, the actual and potential control and monopolistic power that foreign investors can wield over the economy have to be posited against the technological and other benefits that flow from foreign participation. Hirschman's[2] comment that foreign investment in developing countries shares the "very high degree of ambiguity of most human inventions and institutions; it has considerable potential for both good and evil" aptly summarises the position. The studies cited earlier have tackled a difficult terrain and provided hard-to-find information and insights on a timely and controversial subject. Yet, these studies leave crucial questions unanswered.

What has been the impact of imported technology and investment on Indian industrial productivity, exports and growth? As the Reserve Bank of India study puts it, "the major problem in this field, is, for instance, whether, on balance, foreign collaboration arrangements have resulted in, or can be relied on to result in, a net gain to the country? Have those firms and industries which have relied more on technology fared better relative to the others in terms of productivity and growth?"[3] Central to the same theme are questions such as what exactly is the nature of knowledge imported under the technical collaboration agreements? Is the knowledge imported suited to Indian conditions and prevailing factor proportions? Has the implementation of foreign techniques resulted in a higher capital-labour ratio? Is the imported knowledge restructured to suit Indian factor and product market conditions? What has been the cost of such restructuring? How best to assess the quality of knowledge imported? Is the market for knowledge a perfect one? If not, what are the costs and benefits of operating in an imperfect market for knowledge?

Questions are easily raised, but answers are hard to find, mainly because of the lack of reliable and comprehensive factual and statistical data on the subject.[4] The studies cited previously do dwell on some of these questions, but fail to provide any clear-cut quantitative estimates of the impact of imported knowledge on Indian industrialisation. The Reserve Bank of India study absolves itself of any such objectives by stating in the introduction to the study, "clearly an answer to this question cannot be given on the basis of just the factual data regarding dividends, royalties, technical fees and the like brought together in this report, since the problem involves, among other things, an assessment of what progress

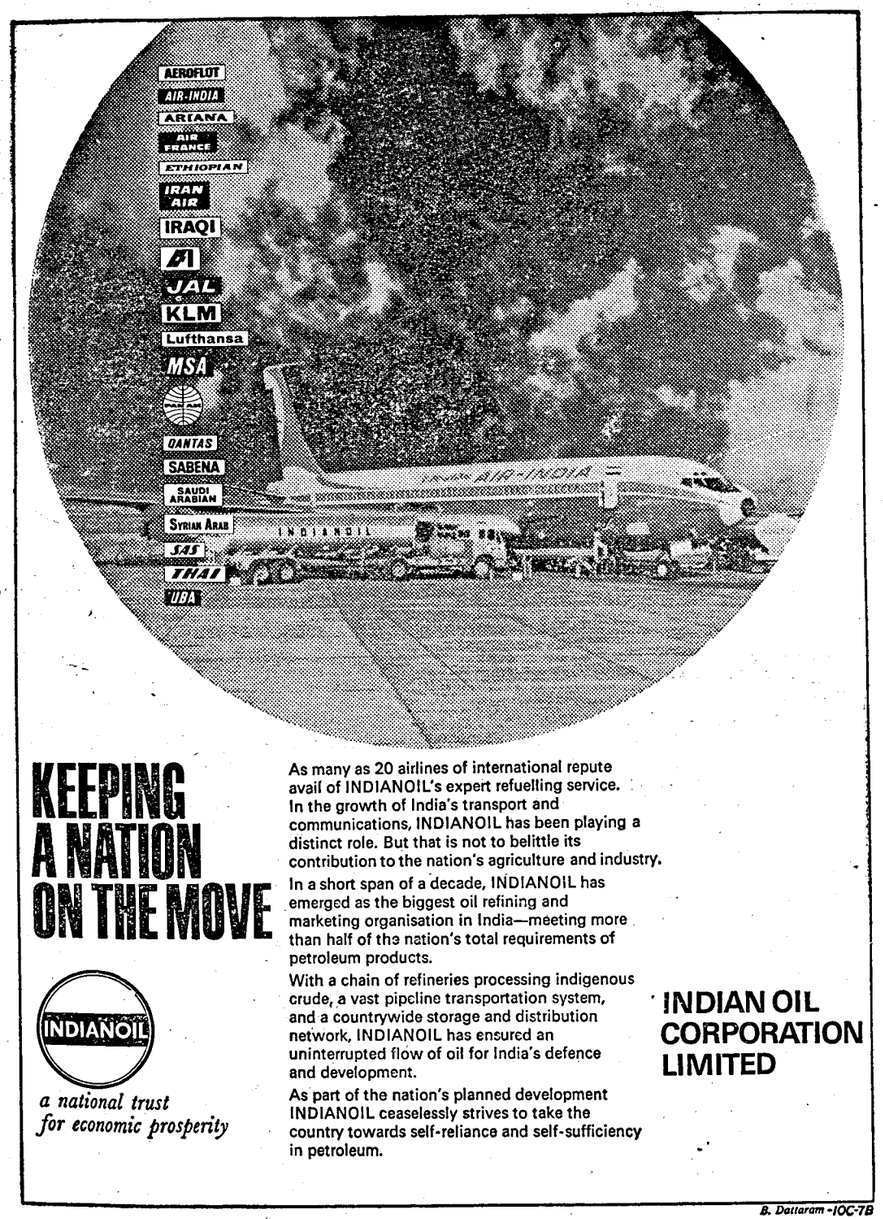
Development is proceeding in spite of the cultural attitudes, social institutions and political conflicts which sometimes seem to be such immovable barriers. It is not a smooth, uninterrupted progression, to be sure; rather, growth appears more as a series of fits and starts. "And yet," as Galileo is supposed to have said, "it moves!"

MAHINDRA & MAHINDRA LTD.
BOMBAY CALCUTTA DELHI MADRAS

PRESYN

in production, employment, exports and the advance of technology in general and import substitution in particular would have been made in the absence of these arrangements for import of capital and knowhow—a different kind of terrain altogether".[5] Despite this disclaimer it must be pointed out that the Bank is in an enviable position as far as access to data and information and ability to muster and deploy the necessary administrative and research skills needed for the job are concerned. Though the factual data presented by the survey report provides data on the extent of payments made to the foreign collaborators, the various kinds of restrictive clauses stipulated in the agreements and the nature of foreign financial participation, the data are not adequate enough to make any quantitative assessment of the impact of foreign collaboration on Indian industry.[6]

Insufficient Empirical Evidence



The main thesis of Kidron's study is that there has been an excessive import of technology and capital into the country imposing a net burden on the economy. At the end of the book, he attempts to assess the cost of foreign capital and technology to the Indian economy.[7] On the basis of available published data on outflows of profits, dividends and royalties and the supporting cases of particular industries he cites, Kidron concludes that there has been an excessive dependence on foreign capital and technology, resulting in a net burden to the economy. By comparing the inflows of foreign exchange with the outflows generated by foreign private investment, he concludes that in the fourteen-year period ending in 1961 foreign investors had taken out of the general currency reserve three times as much as they contributed directly.[8] Though it is plausible that foreign investment has been a net drain on the foreign exchange reserves Kidron's conclusion is not supported by sufficient empirical evidence. A comparison of the fresh inflows of foreign capital with the outflows by way of royalties and dividends, with the latter being in excess of the former, alone does not justify the conclusion. The effects of imported technology and investment on productivity, savings in foreign exchange occurring due to import substitution, the impetus it provides to exports and the other external effects of imported knowledge and investment on the economy need to be considered in arriving at such a conclusion.[9] Some of the indirect effects of foreign investment are hard to quantify and are in the nature of imponderables. Kidron dismisses such indirect effects too lightly by citing stray cases to the contrary.

Kidron's admittedly uncorroborated thesis on the deleterious effects of imported capital and technology on employment also calls for empirical testing.[10] The thesis that foreign investment competes for labour with other sectors rendering these occupations redundant seems theoretically appropriate for a fully employed economy. It is also argued that foreign investments are relatively capital intensive and hence displace labour. This again is an oft-debated knotty question with wide theoretical and empirical ramifications. Apart from opening up the issue of choice of techniques with a bearing on the question of short run maximisation of employment versus long run efficiency and productivity, it poses pertinent empirical questions. Firstly, is there a wide spectrum of techniques in the kinds of activities and industries that foreign investors are operating? Secondly, are the less developed countries with their endowment of entrepreneurial and labour skills able to perfect them and what are the opportunity costs of investing in research to design and perfect labour intensive techniques as opposed to importing technology from abroad? Finally, it is too often unquestioningly accepted that foreign firms operating in less developed countries necessarily adopt capital intensive techniques. Empirical evidence is scant on this question. Theoretical conjectures however suggest that one of the factors attracting foreign investors to the less developed countries may be the availability of low cost labour.[11] Foreign investors may be concentrating on sectors producing highly standardised products requiring significant amounts of labour in the production process.[12] Another important finding of Kidron in the labour field is that foreign firms in India pay higher wage rates relative to other firms in the economy.[13] But it is debatable whether and to what extent this can be construed as a criticism of foreign investment. The relatively higher wages may be efficiency wages commensurate with the higher standards of work efficiency and discipline that foreign firms are known to impose. Further, in judging the labour policies of foreign firms, the spread effects in terms of education and technical training that they impart to the economy also need to be considered. Many of the new breed of young engineer-entrepreneurs that are branching out on their own by establishing small-scale firms, specially in metal products and textile machinery that one encounters in India these days are ex-employees of foreign firms.[14]

The import of the foregoing is not to deny categorically the validity of Kidron's conclusions, but to point out that they emerge from hypothesis unsupported by sufficiently rigorous empirical evidence and hence are in the nature of reasoned conjectures rather than conclusions.

National Council Study

The study by the National Council of Applied Economic Research cited earlier is in a sense at the other end of the spectrum to that of Kidron's work. Arguing from the premise that for the individual firm the cost of imported technology is much less than that of indigenous research and development effort, the study states "Hence we find no reason to doubt that the comparative costs of research and development justify most of the imports of technology that do take place".[15] The individual businessman's view that indigenous research is more expensive relative to imports of technology may be basically correct. But would this permit the conclusion that for the economy as a whole imported technology is cheaper relative to indigenous research and development? An individual firm operating in competitive markets for final products is not likely to perceive the gains from a unit of resources devoted to research and development. This is specially so when the social rate of return to a unit of resources devoted to research and development exceeds the private rate of return. Research efforts are likely to generate substantial external economies. Individual firms producing a narrow range of products may not be able to capture all the benefits of their research effort. Individual firms looking at only the private rate of return to investment in research and development are not likely to invest substantially in such activities. As the Council Study itself acknowledges returns to scale are important in research and development. Individual firms perceiving only private profit opportunities may not be investing enough to reap such returns. It is because of this cleavage between the private rate of return and the social rate of return to research effort that the socially desirable amount of resources may not be drawn into indigenous research activities by private firms.[16] It is to be expected, under these circumstances, that individual businessmen

and firms should opt to import technology rather than devote resources to indigenous research and development. But, looking at the question from the viewpoint of the economy as a whole, it does not necessarily follow that technological imports are a relatively inexpensive alternative to indigenous research and development.[17]

In the absence of incentives to individual private firms to engage in research and development activity, positive public policy may be called for to foster such activity. But it is debatable whether non-profit-making government sponsored institutions would be the means to achieve this end. Private businessmen have often pointed out the shortcomings of such effort. Lack of initiative and enterprise on the part of these institutions, the non-applicability and/or non-usability of laboratory scale research designs and process to the scale demanded by industry and the absence of communication between industrialists and research scientists are often voiced complaints. Establishment of co-operative research organisations, supported and financed by all or a large number of firms in the relevant industries to undertake basic research and design suitable techniques may be an alternative to publicly supported research. Private industrialists, however may be reluctant to accept such a solution on the ground that it would eschew competition and eliminate incentives to growth, and that some firms would be able to capture the gains from research, whether or not they pay for it. But if co-operation among firms is ruled out, little research would be undertaken at all.

Nature of Market for Technology

It can hardly be denied that the market for knowledge is far from perfect. In a perfect market, the price facing the different buyers of a particular stream of technology would be the same. But the very nature of the factor being traded and the substantial disparities in size between the buying and selling firms renders the market imperfect. Technology is a collective input where more than one resource is involved. Even for a particular industry or product, there may be several streams of technology available involving differing combinations of the resources mix that make up a package called technology. Lack of information about
luct they are buying on the
the recipients would be a ma-
or rendering the market for
ge imperfect. Education and/
or information is required to cognise, decode, compare and negotiate for the acquisition of foreign knowledge. In the absence of such comprehensive information, monopolistic price discrimination becomes possible. It is price discrimination in the sense that either for the same stream of technology, different buyers may be paying different prices or for the same price, different buyers may be geting differing kinds of technology. As Constantine Vaitsos elegantly puts it a hypothesis can be formulated to the effect that a recipient's cognisance or information with respect to and for the acquisition of knowhow is inversely related to a monopolistic rent paid to the supplier under imperfect market conditions. More simply, the payments for receiving knowhow would be an increasing function of the recipient's relative ignorance.[18]

If there was a perfect market for knowledge, import of obsolete equipment and techniques unsuited to Indian conditions would be penalised by market forces. As Bhagwati and Desai state, the firm which bought inefficient technology would lose out to the smarter firm. But an imperfect market for knowledge, coupled with inefficient tariff and exchange rate policies, renders import of inefficient knowhow feasible.[19] The choice of the right foreign associate, both in the case of joint ventures and technical collaboration, is a hard one to make. There are no standard prices quoted for technologies on the international markets nor are there any information-disseminating bodies. More often than not, the decision regarding the choice of a foreign partner is made on subjective grounds and not on objective economic criteria. Favourable past associations, mainly previous trading contacts, are often cited as one of the main factors influencing the choice of a particular partner.[20] The decision is often made by a single influential individual in the organisation and is not the result of a collective decision made by the firm.[21] It is possible that bigger firms would have wider training contacts. But this does not ensure that they also possess the requisite knowledge about knowledge to be imported. Again, the size of the Indian firm relative to other firms in the economy does not ensure that it would be in a better bargaining position with the foreign firm. What is important is the size of the recipient firm relative to the other Indian firms. Larger Indian firms might have been approached with more proposals to supply knowledge, but this does not ensure that they have always been able to choose the best. Indeed, it is possible that previous trading contacts with foreign firms might be a factor acting against the recipient firms in their role as buyers of knowledge. Syed Ahmad has theoretically demonstrated that if a particular country supplies to another a good, and also the means of producing that good, it is likely to supply less of, and charge a higher price for the means of production.[22] This is because the supply of means of producing that good may be affected by the loss of profit resulting from a reduction in the demand for the good the country supplies.

Ceiling on Royalty Payments

In the absence of a perfect market for knowledge, the question as to whether imports of technology should be left to the free market forces becomes relevant. Is the overall ceiling imposed by the Government on the royalty rates to be paid on technology imports justified? The National Council Study, as well as many industrialists, think that it inhibits the buyers in choosing the best technology available and renders the supply of technology inelastic. Ceilings on royalties raises questions of both efficiency and equity. The absence of ceiling on royalties paid does not necessarily ensure that bigger firms with larger financial resources would be able to buy superior technology. This is because of lack of information and imperfections in the market for knowledge. Even if the market were perfect and the highest bidder could get the best, social policy objectives of catering to the needs of the smaller firms would get the axe in the process. It can, indeed, be argued that a ceiling on royalties may have some beneficial effects on both imports of technology and indigenous research and development. Insofar as royalty ceilings are specified as percentages of value added or sales, it may provide an incentive to the technology supplying firms to enhance these magnitudes. In other words, the supplying firms are motivated to be more concerned about the efficiency in operations on the part of the recipient firms. The larger firms, because of the limits placed on the royalties to be paid to the foreign firms, may divert some of their resources and energies to indigenous research effort, directed either at designing techniques of their own or perfecting the imported techniques to suit their needs. Further, such ceilings on royalties can easily be evaded. One means

of doing so is to pay marked up prices for components and equipment imported from the collaborators. Where the foreign firm acts as an export agent for the exports of the Indian firm, inflated commissions can also be paid for the services rendered by the collaborator.[23]

Under these circumstances, even the policy of levying a ceiling on royalties to ensure that such payments do not place an excessive burden on the balance of payments, seems to be self-defeating. If technology imports are deemed necessary, a more efficient set of policies designed to disseminate knowledge about knowledge to the prospective recipients would be necessary. The setting up of a centralised agency in the nature of a data bank, manned by experts in different fields, charged with the function of collecting and disseminating information about the various types and sources of knowledge available, may be a solution. This body could also arbitrate in the fixation of royalty rates. Private entrepreneurs, however, may be averse to such an idea on the ground that it eliminates competition. But in an imperfect market for knowledge such objections hardly arise. In any case, such a centralised body would be a better alternative to the present bureaucratic supervising of applications for technical collaboration.

Export Restriction Clauses

Another facet of the problem that has attracted attention is the various kinds of restrictions on exports imposed by the foreign firms on their Indian partners in some of the technical collaboration agreements.[24] Some agreements specify that the permission of the foreign partner is needed to export, some specify areas to which exports are allowed and some others stipulate a total ban on exports for a specified duration. One of the important criticisms of foreign collaboration made by Kidron relates to these restrictive clauses. But the National Council study makes a clean sweep of these objections by noting that such clauses are only in a minority of the agreements and that there are other important factors like exchange rates and trade policies that inhibit exports. Two points need to be considered in this context. First, the fact that such formal clauses are in a minority does not, in itself, mean that such restrictions are not actually being exercised. Business executives acknowledge that though such clauses are not actually written into the agreements in [illegible] to Government stipulations, they do have informal and gentlemen's agreements with foreign firms not to export to certain areas. Second, it is not so much the loss of exports in the initial years of manufacturing that matters, but the apathy and lack of effort in exploring export markets that such restrictions may induce that is serious. The effects of these restrictions on exports is a factor that needs to be considered in assessing the impact of foreign collaboration on Indian industry.

Japanese firms have been significant importers of foreign technology in recent years. Imported technology is reported to have contributed significantly to the growth in productivity and exports of Japanese industry.[25] It is however extremely doubtful whether the Japanese success story in the field of technological imports can be used as an argument for liberalising imports of technology into India. The two countries are at markedly different stages of development. They differ in the basic infrastructure available to absorb and adapt imported technology. The R and D activities of Japanese firms have enabled them to absorb foreign technologies and develop new techniques suited to Japanese conditions. The following example, of the shipbuilding industry cited by the *Economist*, London, attests to the creative and adaptive abilities of the Japanese. "They built the best foreign machinery under licence and quickly applied the most advanced techniques with strong Government support — the Ship Research Institute is a part of the Ministry of Transport — since the shipbuilders have improved on many of the designs they previously built under licence and now offer the rest of the world the highly effective result of their own original research".[26] Apart from the adaptive and creative abilities of the Japanese nurtured by indigenous research and development activities, the presence of a well integrated sector of small sub-contractors that can produce according to prescribed engineering standards and under tight production schedules also explains the Japanese success in the field of technological imports.[27] These basic ingredients are yet to take shape in India. Appeal to the Japanese success story hardly justifies the plea for more liberal import of technology. It only underlines the need to develop the capacity to absorb imported technology by means of broad based research and development activity within the country.

This essay has mainly taken an agnostic stand on the role of foreign collaboration in Indian industry. Although the available literature on the subject presents many insights into the problem, it does not provide a quantitative empirical estimate of the impact of foreign technology and investment on Indian industrialisation. The complex nature of the subject is compounded by data problems. A benefit-cost analysis of the problem requires much more comprehensive information than is available from published sources. A sector by sector analysis of the problems or even micro case studies of selected individual firms with foreign collaboration in each of the industrial sectors would be a more fruitful avenue of approach than overall macro studies. Inter-firm efficiency comparisons between the firms with foreign collaboration and those without, in each of the major industrial sectors needs to be done.[28] But here again the researcher is faced with problems of data and definition. The firms selected for comparison need to be producing identifiably similar products and must be publishing comprehensive data on capital structure, employment, sales and profits and their wage bill. Comparisons of performance as far as possible should relate to the same time period for the two groups of firms.

Magnitude and Quality

Further, there is the problem of measuring the magnitude and quality of knowhow imported by firms with foreign collaboration agreements. The number of agreements, entered into by these firms may not be an adequate measure of the knowhow imported. The number of agreements need to be weighted by the size of firms.[29] Instead of measuring the magnitude of imported knowhow by the number of agreements, the value of royalty and technical fee payments made by the various industrial groups could be used as a measure of the magnitude of knowledge imported by the firms. But, apart from the non-availability of such data in sufficiently disaggregated detail by industries and firms, the use of such a measure poses other problems. Acceptance of such a measure presupposes the presence of a perfect market for knowledge, where all buyers pay the same price for a specific technology. Though the problems are formidable, an attempt, at inter-firm efficiency comparisons can be made by piecing together available information and using both the number of agreements and royalty payments as proxies for the

nowledge imported.[30] The debate on ıe pros and cons of foreign collaboraon in Indian industry will be sterile ntil case studies and empirical research ın shed more light on the problem.

29 An attempt to assess the impact of imported knowledge on Japanese exports using the number of agreements weighted by value added of each industrial sector is made by T Ozawa, *op cit*.

30 A study incorporating such an analysis is under preparation by the author, 'International Transfers of Technical Knowledge to India', forthcoming in the Praeger series on special studies in International Economics and Development.

Gladstone Lyall

GLADSTONE Lyall's fibreglass reinforced plastics boat fabricating factory at Mangalore, the first in the country, is to go on stream by the end of this year. Set up in technical collaboration with Watercraft of the UK, the factory has an annual capacity to produce 150-200 boats. At present, fishing trawlers in the country are built of wood and steel, which have certain drawbacks. Fibreglass reinforced plastic is impervious to marine borers and it is claimed that it gives the trawler a life-span three times that of a wooden boat. Fibreglass reinforcement, the raw material, is manufactured by Fibreglass Pilkington.

Recruitment and Promotion Policies in Commercial Banks

V V Bhatt

The present procedures for recruitment and p·omotion in banks have evolved over the years in an ad hoc *manner. Yet a proper solution to these prob'ems is crucial for evolving a set of banking practices that are efficient and tuned to the attainment of nat·onal objectives.*

Recruitment is generally based on merit tested through competitive examinations for applicants drawn from all over the country. This method may be suitable for services such as the civil service and the judiciary, but for non-officer jobs in district bran·hes of banks which require local knowledge and trust and a modicum of accounting ability and reportive cl·rity, it would be far better to recruit from among local persons who have passed the school-leaving certificate examination. Such persons could even qualify for the officer cadre through a special banking examination. The branches could then be entrusted with greater responsibility and operate like subsidiaries of the lead banks.

THE present procedures with regard to recruitment and promotion in the banks have evolved over a period of years in an *ad hoc* manner. It is surprising that, on these crucial questions, not much creative thought is spent nor is there any general public discussion. It sometimes appears as though the intellectuals in this country are devoting their attention either to purely theoretical questions divorced from reality or to such problems as interest their peers in the UK or the US. While on the one hand, we have this intellectual tradition, on the other, persons in the field are far too obsessed with past precedents and with routine to rise above these and reflect on the challenge of the present. These two clearly defined traditions probably operate in all fields of national endeavour, and have created a rigid caste system which by its very nature cannot stimulate creative and efficient responses to emerging problems. The result has been that we by and large react to situations and problems as they arise rather than act now to eliminate problems of tomorrow.

Classic Recruitment Model

Our ideas on recruitment are governed largely by the classic model, evolved in Confucian China and adapted by the British in the UK as well as in India. The basic idea in this model is to tap the country-wide talents, for selection on the basis of merit tested through a competitive examination. The subjective element and various forms of nepotism in the selection process are to be, thus, minimised.

This model works well in services — such as the Civil Service and the Judiciary — in which merit can be easily recognised through an examination and where a certain degree of aloofness from the local environment is essential. Of course, even so, diversity of language and cultural characteristics may require some emphasis on regional recruitment for the lower category posts.

But services like banking are on a different footing. For the non-officers' jobs, all that is required is a minimum qualification relating to accounting and language. A basic qualification, similar to the School Leaving Certificate, should therefore suffice. Further, in these services, local contact and influence are essential for results; aloofness, which is a virtue for administering law and order, is likely to be a handicap for these tasks. Further, it is somewhat difficult to devise a competitive examination for the types of functions that are to be performed. Aptitude tests are known to favour only smart persons, and those really able to do the tasks are thus likely to get discarded.

A Model for the Banking System

In view of these characteristics of the banking service, it would be essential to restrict recruitment of non-officer staff — for the branch offices for which recruitment is being made — to persons in the relevant region or district. The maximum qualification to be insisted on should be the SSC. At present, for the jobs for which SSC qualification is good enough, there are applications from overly qualified persons such as graduates and post-graduates in various fields. Selection of such overqualified persons is detrimental to the interests of the institution as well as of the nation. From the point of view of the institution, such persons are less adaptable, more ambitious, and less disciplined, than those who have completed the SSC examination. From the point of view of the nation, recruitment of over-qualified persons involves a national waste. It induces persons to take to advanced education merely in order to qualify for a job and thus causes waste of the individual's time, money, and energy, which can be spent more effectively on other purposes. This waste is reflected in the growing numbers of university colleges, which the nation can ill afford to maintain.

The national waste could be avoided by restricting recruitment for non-officer jobs to matriculates only. For the officer cadre, it may be necessary to insist on a banking examination rather than on a graduate degree. At present, only bank employees can appear for these banking examinations (CAIIB); this needs to be changed so that all persons aspiring to a career in the banks can appear for these examinations. And the officer cadre should be recruited from such persons. Such a step would give a functional bias to their training right from the start and prevent persons from wasting their time in taking up university careers, in which they are not basically interested. This course of action would thus also contribute to the evolution of an appropriate educational system, if such measures of functional training are taken in the other fields also.

Ideal Solution

Regional/district recruitment has other advantages too. What is required of a bank in a lead district is the capacity to play a catalytic role in initiating a process of economic development. It has to function as a development bank *par excellence*. It is doubtful if the present branch banking would be adequate for this purpose. The ideal solution would be to have a

district bank. Since, however, it is too late in the day to reverse the evolution in the field, what one can do is to evolve a system combining the advantages of branch banking with those of small unit banks.

Towards Implementing the Lead Bank Concept

This can be easily done by the nationalised banks, if they establish wholly-owned subsidiaries in the lead districts.* Such a wholly-owned subsidiary should function as a full-fledged bank with initiative for policy changes resting with it; since it would be attached to the parent bank, it would thus have the advantage of its research results as well as its financial backing. Thus a system would be evolved, adapted for the purposes in view and combining the advantages of both systems.

One of the basic reasons why lead banks in districts have not been able so far to play any creative developmental role is that they are subservient to the head office in all policy matters. The head office cannot be in such direct vital touch with the local scene and would never be able to induce its branches, under the present system, to play the creative role envisaged for them. A branch manager in this system becomes a passive recipient of orders and does not initiate any new policies; it is common to hear from branch managers that they cannot do a certain thing because they have no orders from the head office. This system thus does not train people for developing initiative and for having the creative ability to introduce innovations in banking practice. The suggested system of wholly-owned subsidiary of a bank at a district level appears to be the ideal solution for the purpose.

District Recruitment, Salary Grades and Bonus

If such a development is to be initiated, regional/district recruitment would be essential. It would have the further advantage of demonstrating the employment effects of banking development in a district. Whenever a branch of a subsidiary is opened in a district, the people there would then see the advantage of this measure from the employment point of view also. There could be a tie-up, then, between the subsidiary and all schools in a district; the SSCs from the schools would know that they have this employment outlet. Further, they could even be recruited to the officer cadre if they pass the banking examinations (CAIIB).

The development of such subsidiaries and of local recruitment would simplify the problem of salary-grades. If the suggested solution is adopted, the salary grade would be fixed for a district and it would vary from district to district in relation to the local environment. It would thus be possible to keep within limits the wage-salary bill, and village branches could become much more viable than they are at present. The labour problem, too, would become manageable. For the bonus problem, a simplified equitable formula can be devised; this is very essential even under the present system, as recent experience has demonstrated. All post-tax profits should be equally distributed among their claimants — government, bank and employees.

Thus, all gross profits (GP)
=Net Profits (NP) + Tax (T)
=Bonus (B) + Share of Government (G) + Share of Bank (P) + Tax (T).

Now, since NP=f (B) and since B=1/3 NP, it would not be difficult to calculate the shares of each claimant. Some such formula is necessary to develop healthy industrial relations and a climate of equity, peace, and efficiency. This formula would apply to subsidiaries separately as it would to other accounting units.

Lead Bank Concept and Reorganisation of the Banking Structure

This system of district banks, as subsidiaries of the lead bank, will also help in the task of reorganisation of the banking system. If the suggested system is adopted, there is no case for creating either one or several banking corporations by an appropriate merging of the nationalised banks. The identity of each bank would be maintained in order to evolve a competitive spirit of innovations and to exploit the pride of belonging to a certain recognised institution. However, for each district, the lead bank would create a wholly-owned subsidiary to function as a full-fledged bank; and the non-lead banks would continue to operate their branches as they do now. The reorganisation of the banking structure that will then take place would be purposive and in line with historical development and with the national objectives set for the banking system. This task would be easier, more rational, less destructive of traditions, and more efficient than the present system or any other proposal for reorganisation of the banking structure on the lines of the LIC.

Promotion Policy: Problems

It has been generally accepted as a principle that promotion should be strictly on the basis of merit. But, in practice, it has been found difficult to measure merit; promotions, by and large, have been taking place on the basis of seniority. In some cases where promotions have taken place on the basis of merit, there has been some sort of a suspicion among employees as to the objective assessment made. In any case, it is true that a greater part of the employees prefer the seniority criterion to the merit criterion, and this is quite understandable as the really meritorious would form only about 10 per cent or less of the total employees in a given category. It is a case of the multitude against the meritorious. But that, at any rate, is a fact. And the insistence would continue to be on the seniority criterion for all jobs other than the top few jobs. One has, therefore, to reckon with this aspect of reality.

Dilemma Relating to Promotion Policy

The problem that arises then, is this: how to put really efficient people to do the appropriate jobs, while still adhering to the seniority principle for promotion. This is the dilemma. Strict adherence to the seniority criterion would result in complacency and inefficiency and would kill the initiative of the really able and efficient; on the other hand, the seniority criterion seems to be generally acceptable.

Elements of a Sound Promotion Policy

This dilemma can be resolved if the seniority-wise promotion in a salary grade is divorced from functional promotion. For example, a person would be promoted salary-wise and grade-wise on the basis of seniority — provided there are no consecutive adverse reports on his efficiency. However, such promotions would not mean that he would get a more responsible functional assignment. Any bright person can thus be put in a responsible position, without affecting *adversely* the salary-wise promotion of others and without affecting *favourably* his own salary grade. Much of the discontent now is due to supercession salary-wise; this discontent would disappear with the suggested solution. Further, a functional promotion would be a type of reward for the really deserving and he would be satisfied in being given more responsible work. For the top few jobs, which would be on a pure selection basis, the bank would have a choice from among the persons who would be really competent rather than from among those who have reached, on the basis of seniority, a certain scale.

The suggested promotion policy has been in operation as a historical accident in the Syndicate Bank. Such a policy can be purposively formulated in the light of present problems and challenges in the field.

Concluding Observation

A proper solution to these two problems — that of recruitment and that of promotion — is crucial for evolving a set of banking practices that are efficient and tuned to the attainment of national objectives. It is crucial in the other fields also. A constructive and creative discussion of the relevant issues is very essential in the search for a proper solution. It probably is a reflection of the poverty in the capacity for relevant thought that these and other such problems of vital significance are not discussed freely and creatively.

And such problems cannot be tackled in a creative way by committees and commissions. As John Updike has put it: "Intelligence is a function of the individual, and groups of persons are intelligent in inverse proportion to their size. Nations have the brains of an amoeba, whereas a committee approaches the condition of a trainable moron". The task is essentially for those individuals who occupy strategic positions and yet remain creative innovators and thinkers.

Determinants of Corporative R and D

K K Subrahmanian

The R and D record of Indian companies is mostly depressing. In this context the question what factors influence the scale of R and D activity by firms is of great relevance for analytical as well as policy purposes.

This paper reports the findings of a cross-section regression analysis of a number of determinants of R and D by firms in the chemical industry.

WHILE corporate R and D is an important source of technological progress of industry, the poor R and D record[1] of companies in Indian industries is depressing. In this context the question what factors influence the scale of R and D activity by firms is of great relevance for analytical as well as policy purposes. Surprisingly, very little work seems to have been done on an empirical plane to investigate statistically the differences in and the determinants of the scale of R and D activity among firms in Indian industries. In a paper dealing with "Market Structure and R and D Activity"[2] the author has analysed the differences in R and D intensities of a sample of firms in the Indian chemical industry in an attempt to seek empirical evidence for the Schumpeterian market-structure hypothesis; but size of the firm *per se* (both absolute and relative) was not found to be a significant factor explaining the R and D scale differences or the progressiveness of firms in even a technology-oriented industry in Indian conditions. This paper goes a step further and reports the results of a cross-section regression analysis of number of determinants of R and D by firms in the Indian chemical industry.

Model and Hypothesis

What motivates a firm to undertake R and D? How does a firm determine its R and D expenditure and achieve an equilibrium situation? These are the relevant questions. As economic motives seem important in the behaviour of a firm, it should be possible to explain and predict the rate of inventive (R and D) activity of firms in terms of economic variables. We make the traditional assumption of profit-maximisation as the goal of all business decisions. The profit maximising behaviour of a firm with respect to R and D may then first be explained in terms of the effect of R and D on its demand and supply functions. The expenditure on R and D can be regarded as analogous to advertisement expenditure aimed to shift the firm's demand curve to the right and also make it less elastic. R and D also affects the supply curve in a similar fashion. The results of R and D are generally cost-reducing and the reduced per unit cost of output can be expected to increase output-sales and thus cause the supply curve of the firm also to shift. The interaction of demand and supply curves puts the firm in a higher equilibrium situation.

Within the framework of the theory of the firm, we may thus introduce R and D expenditure into the firm's sales function as a shift parameter. We assume that profits are a residual function of sales revenue. Normal conditions for profit maximisation can then be explained in the conventional method of the theory of firm. Let the profit function of our firm be:

P(S, R)=F(S, R) — O(S) — C(R)
R(S, R)=total revenue as a function of sales (S) and R and D (R) introduced as a shift parameter
O(S) =cost of producing and selling each unit of sales
C(R) =cost as a function of the scale of R and D

As a profit maximiser the firm will vary its R and D expenditure in such a way so that P (S, R) is maximum. The equilibrium conditions will be:

PS=FS — O'(S)=0;
PSS=RSS — O"(S) <0
PR=FR — O'(R)=0;
PRR=FRR — O"(R) <0

In more general terms, it can be said that both the 'demand pull' and 'cost pull' hypotheses working together may be important to explain how a firm determines its R and D expenditure and achieves an equilibrium situation. In deciding upon the current expenditure scale for R and D, a profit maximising firm can therefore be expected to make some forecast of the revenue and costs associated with the expected results of R and D activity. The decision by a firm on the scale of R and D expenditure will be influenced by the magnitude of this net gain.

Sales

Prima facie, the scale of current R

and D expenditure by a firm can be said to be dependent on its 'willingness' as well as 'capacity' to engage in R and D. The firm's willingness seems to hinge upon its sales, current or immediate past. Sales should therefore be an important explanatory variable in a statistical model for R and D. To be more precise, it is the expected net increase in sales revenue as a result of R and D expenditure that influences the readiness or willingness of firms to allocate resources for R and D. Higher the expectation, higher will be the scale of current R and D. The expectation is normally built around past experience. In deciding upon the current levels of R and D the firm makes some forecast of the increment in sales revenue due to increment in R and D by projecting into the future on the basis of the past trend in the relationship between R and D and sales. We may say that

$$R_t = f(S^*_t),$$

$$S^*_t = w_1 (S_{t-1}) + w_2 (S_{t-2}) + w_3 (S_{t-3}) \ \ldots \quad \sum_{i=1} w_i = 1$$

where, R_t is current R and D expenditure, S^*_t is expected rate of increment in sales revenue due to R and D, S_t is realised increase in sales.

In the statistical model employed in this paper, however, we have considered current sales as the explanatory variable rather than expected incremental sales. This has been done because introduction of expected net sales due to R and D as a variable requires distributed time series data on R and D, sales and other variables which were not readily available. As an alternative, we have employed a cross-section analysis of the data on current sales and R and D of firms. We assume that realised sales in a given year approximate the sales expected by the firm and therefore should show up its relationship with R and D scale in that year. We thus postulate that R and D tends to be positively associated with sales; such association has been demonstrated in many studies.[3]

Although we have postulated the relationship between current R and D and sales as positive, there is nothing in theory to suggest that it could not be negative. A fall in the sales may motivate a dynamic firm to raise its R and D expenditure as a defensive measure to recoup its market. The fact that R and D departments of most companies concentrate on improvements to existing products or processes aimed at protecting the market[4] rather than on basic research or developing new products suggests the possibility of a negative relationship as a practical proposition. On the analytical plane also it can be shown that a negative relationship between R and D and sales is not inconsistent with the profit maximisation assumption of the theory of the firm.[5] In the statistical model, therefore, we have included sales as an independent variable representing the willingness of firms to spend on R and D as determining the current R and D expenditure with the expectation of either positive or negative sign for the co-efficient of the variable in the R and D regression equation.

Internal Funds

Another variable included in the model is the profit of the firm. Profit influences current R and D scale of a firm or its willingness to spend on R and D in the same way as sales do. Thus when profits are high a firm may expand its current R and D expenditure in anticipation of higher profits. It is also plausible that a falling profit may motivate firms to spend more on R and D as a defensive measure to increase sales and thereby to recoup the losses. Profit functions not only as an indicator of future profitability but, more significantly in the form of retained earning, as a source of finance and hence as a determinant of the capacity of firms to undertake R and D. Given the willingness of the firm to spend on R and D as reflected in sales, the scale of current expenditure is constrained by the adequacy of funds. The relevant factor is the internal sources of funds because firms are unlikely to receive or use borrowed funds to finance R and D activity, which is characterised by conditions of uncertainties. The internal funds of the firms comprise mainly (i) depreciation allowances and (2) undistributed profits (retained earnings). From the viewpoint of the capacity of firms to undertake R and D activity, these two variables can be regarded as influencing the current scale of R and D. The relationship between R and D and these financial variables invariably will be positive, for, higher the size of internal funds, higher will be the current scale of R and D and vice versa.

R and D expenditure is in fact an investment expenditure made with the expectation of pay-offs within a reasonable time period analogous to fixed investment expenditure on machinery and equipment. Both these investments in a sense can therefore be regarded as competitors for allocation from the firm's internal funds and thus stand in a substitutability relationship. It can also be argued that successful R and D generally stimulates fixed investment in future years so that the relationship is that of complementarity. A substitutability relationship between current R and D expenditure and current expenditure on fixed investment nevertheless seems plausible within the context of a budget constraint. It follows that current fixed investment outlays can be regarded as a variable influencing current scale of R and D with the expectation of a minus sign for the co-efficient of the variable in the regression model.

Past Scale of R and D

Finally, research is a continuous activity and has a tendency to feed upon itself. It follows that the current R and D scale will be strongly influenced by past R and D scale. Past R and D may tend to raise future R and D activity because R and D projects may be ongoing and have to be continued for fruition and past R and D opens up fields for new exploration. Some element of continuity and stability in expenditure outlay is a precondition for successful R and D programming; at the least, the stability consideration will place an approximate but somewhat elastic floor beneath current scale of R and D. In the statistical model, therefore, it has been postulated that past R and D represented by lagged R and D expenditure influences the current scale of R and D activity by firms and the sign of the coefficient in the R and D regression model can be expected to be positive.

On these *a priori* considerations, our hypothesis will be that R and D tends to be a continuous activity and business firms adjust their current scale of R and D in accordance with their willingness as reflected in sales and their capacity as indicated by the internal sources of funds and the competing demand for funds for fixed investment. For statistical investigation we postulate that

$$R = f(S, P, D, U, I, R'),$$

where R is current R and D expenditure, S is net sales, P is net profit, D is current depreciation, U is undistributed profit (retained earnings), I is gross investment and R' is one year lagged R and D expenditure. The attempt that follows is to give an empirical test to this statistical model on the basis of cross-section data of sample companies in the Indian chemical industry.

The Data

Initially, 45 companies with R and D as inter-mural activity from ICMA Survey[6] and used in our earlier study[7] on market structure and R and D were included in the sample. The relevant financial variables in respect of these companies were then collected from the Stock Exchange Directory in which process the original sample of 45 firms had to be reduced in number to 21. The scale of R and D was measured in terms of the current expenditure of R and D departments of the companies as reported in the ICMA survey. The data on sales were for net sales. The profit variable used in the analysis was profit after tax. The net concept was found to be the relevant one because net profit, which accounted for a sizeable part of cash flow, could as well be regarded as a financial variable. For other financial variables data on current depreciation provision were used. As for data on gross investment, the choice was the difference between the book values of plant and equipment between two points of time.

Invariably, large sized firms would tend to have large sales, profits, depreciation and other variables with the result that it would be difficult to regress a firm's R and D on the explanatory variables of the model. In order to minimise the difficulties created by heteroscadasticity, we adopted the conventional procedure of deflating the data by size variables (K) lagged one year in each case. In line with this procedure, the following models were specified for multiple least square regression:

$$\frac{R}{K}_{1968} = f\left\{\frac{S}{K}_{1967}, \frac{P}{K}_{1967}, \frac{D}{K}_{1967}, \frac{U}{K}_{1967}, \frac{I}{K}_{1967}, \frac{R}{K}_{1967}\right\}$$

The zero order correlation matrix of the variables[8] suggested multi-collinearity between two independent variables, viz, profit (P) and retained earnings (U). This was quite obvious for retained earning constituted a significant part of net profit. We therefore dropped retained earnings (U) as a variable from the model and took profit (P) as the variable relevant to our analysis. As between profit and sales variables, however, correlation of any significance was not observed to suspect otherwise plausible multi-collinearity problem. Introduction of profit as a variable in the model was aimed to represent both the willingness as well as the capacity of firms, in the sense of an indicator of future profitability and the availability of internal funds, to undertake R and D activity.

Empirical Results

Eliminating retained profit as a variable from the equation, we fitted empirical data on the other five variables by the method of least-squares. The estimated equation was:

(1) $R = -0.0432 + \underset{(0.0071895)}{0.024885S} + \underset{(0.05000)}{0.070110P} + \underset{(0.108347)}{0.483591{*}D} - \underset{(0.060116)}{0.129368I} + \underset{(0.061798)}{0.916664{**}R'}$

($R^2 = 0.96$)

* Significant at 0.05 level

** Significant at 0.01 level

Because there was nothing on a theoretical level to choose between sales and profit as a variable influencing the willingness of firm to undertake R and D, and further since profit could also function as a financial variable, we estimated least square regression with sales and profit as separate variables. The estimated equations were

(2) $R = -0.0409 + \underset{(0.00709)}{0.025285{*}S} + \underset{(0.111476)}{0.522764{*}D} - \underset{(0.063600)}{0.1267971} + \underset{(0.066174)}{0.922003{**}R'}$

($R^2 = 0.92$)

(3) $R = -0.0277 + \underset{(0.073708)}{0.078410P} + \underset{(0.14462)}{0.521377{*}D} - \underset{(0.078803)}{0.0954261} + \underset{(0.075226)}{1.006496{**}R'}$

($R^2 = 0.92$)

* Significant at 0.05 level

** Significant at 0.01 level

Conclusion

Throughout the analysis, sales, depreciation and past R and D appeared as three significant factors influencing the current R and D expenditure by the firms. Empirical results thus prove our hypothesis that R and D is a continuous activity and that business firms adjust their current R and D outlays in accordance with their willingness as indicated by sales and capacity as indicated by internal funds. The results of the lagged R and D variable have shown plus sign and suggest remarkably strong influence of past R and D on current R and D outlays. This emphasises the importance of continuity and stability considerations for R and D programming. The co-efficient of financial variable *per se*, namely, depreciation, has been positive as expected and is found statistically significant in all the three equations. In none of them, however, is profit found to be statistically a significant variable, although the sign of the co-efficient is consistent with our hypothesis. Nevertheless, the fact that the depreciation allowance has shown up significantly in all the equations suggests that in a given industry the financial variable (internal funds) influences strongly the scale of R and D by business firms.

Notes

1 The poor record of corporate R and D in India has been documented by many writers on the subject. See, for example, (1) A Rahmen, *et al*, "Research and Development in Indian Drugs and Pharmaceutical Industry", *Lok Udyog*, July and August, 1970. (2) ICMA "Preliminary Survey on the Status of R and D in Chemical Industry", Calcutta, 1970.

Yahya's Options

SUPERFICIALLY it does appear that the friendship of the People's Republic of China is a much sought after commodity just now on the Indian subcontinent. There was President Yahya Khan toasting a visiting Chinese delegation with the proclamation: "Let this be heard to the anguish of others — loud and clear — that we here have found always a friend in China." And in New Delhi Foreign Minister Swaran Singh was telling the Rajya Sabha that "our own interest itself demands that we should make distinct moves for normalising relations" with China and further informing the House that there was a possibility of India unilaterally sending an ambassador to China.

Of course, there is a world of difference between our approach to China and that of Pakistan. Pakistan is hoping against hope that in the event of a war with India it can count on something more than verbal support from China. The Government of India is, so to say, approaching China from a position of strength — having first secured its friendship with the Soviet Union with a twenty-year treaty of peace and friendship. We cannot even be trying to achieve a reduction in the warmth of Sino-Pakistan friendship with our diplomatic overtures since to expect that would be too simple-minded. What seems most plausible is that we are taking the opportunity to improve our relations with China at a time when this move would appear, to the people of this country as well as to other countries, the least like a retreat from positions we had taken in the past — at a time when the people's attention is focused on Pakistan as the arch villain and the country's main enemy and when otherwise the Government's foreign policy wears a confident look, after the Prime Minister's supposedly successful tour of Western countries. That our military superiority over Pakistan has been universally acknowledged also helps.

And yet does its diplomacy towards China tell us anything about what the Government of India might have in mind *vis-a-vis* Bangla Desh and Pakistan? China may have by and large maintained a non-committal attitude on Bangla Desh and it has made no special effort to pull Yahya Khan's chestnuts out of the fire there, but on one point it has made its position clear publicly on more than one occasion: it has made known that it would regard an attack on Pakistan by India, either in the east or the west, as aggression against a friend. Of course, there are valid doubts about China's willingness and even its ability to effectively come to the help of its friend in such an eventuality, but the fact remains that an armed action by India to liberate Bangla Desh would constitute a public affront to China. Would the Government of India be pursuing its efforts to improve relations with China so strenuously if it were planning to administer such an affront?

This is a point of some significance in analysing the likely course of events in Bangla Desh. Recently the newspapers have been full of reports of the successes of the Mukti Bahini, very often in pitched set-piece battles with the Pakistani army. These reports evidently have a greater basis in reality than similar reports of successes which were given currency earlier this year. And yet the fact has to be faced that guerillas with just a few weeks of military training, even if with a stiffening provided by the regulars of the former East Pakistan Rifles and even if armed with relatively modern weapons, cannot defeat a well trained and well armed professional army — such as that Pakistan has in Bangla Desh — in a matter of weeks or even months. Take, for instance, Jessore which is reported to be currently one of the major objectives of the Mukti Bahini, Jessore is one of the three major cantonments in East Bengal and is said to be defended by a brigade, well fortified and with the requisite artillery and armour support and with the possibility of calling in air support. It is plainly unrealistic to expect such a position to fall to the irregulars of the Mukti Bahini in a matter of days or weeks.

The point is that a *quick* military defeat for the Pakistani forces can be administered only by the open and full-fledged intervention of the Indian army on the side of the Mukti Bahini. If it is suggested, as has been done above, that for the present the Government of India does not seem to be considering such an intervention, the question may be asked as to what it is aiming at in Bangla Desh. Negatively speaking, it may be said that one thing is definitely not among the Government's objectives: the encouragement and support of a guerilla war in Bangla Desh which will wrest independence from the Pakistani army after a relatively long struggle. Now, if neither a quick liberation by the Indian army nor a long guerilla struggle is among the Government's objectives, then it would leave only one possibility: the Government sees the fighting by the Mukti Bahini with vastly enlarged support from the Indian army as well as the limited but bloody encounters between the Indian and Pakistani armies as still part of the effort to bring pressure to bear on

Pakistan to agree to a political settlement which will satisfy the two conditions which it has been insisting on — that the political settlement should be with the elected representatives of the East Bengali people and that it should lead to the return of the refugees now in India.

It is significant in this context that propagandist statements apart, even Pakistan has reacted with circumspection to the recent developments in Bangla Desh. There have been no desperate moves to raise the issue in the UN and also no evidence of anxiety to start a war in the west. Is it then likely that Pakistan as well as the other countries who could influence the course of events are aware of the limited nature of the military developments of the last two weeks in Bangla Desh? Of course, the major powers have promptly called upon India and Pakistan stay off each other's throats and asked Pakistan to redouble its efforts for a political settlement; this is precisely the kind of pressure which India is hoping will still work. In other words, war can still be avoided, as far as the Government of India is concerned, if Yahya Khan can get his army to swallow a political settlement with the Awami League — giving the East Bengalis autonomy just short of total independence. At this stage, when Yahya's options have more or less narrowed to a choice between such a settlement and a war with India, he might just choose the former, in spite of all his bombast, because as a military man he would know that a hopeless war with India would almost definitely result in the liberation of Bangla Desh by the Indian army.

Britain and Rhodesia

True to Form

WHEN Ian Smith, the Rhodesian Prime Minister, and his Rhodesian Front coterie declared independence in November 1965, they knew full well the tribal fellow-feelings of their brethren in Britain. Even before this declaration, Harold Wilson, with his ears close to the ground listening to the rumblings of domestic opinion, had found it expeditious to blurt out that no British Government could countenance the suppression of the white minority in Rhodesia by the British army, thus encouraging the trust of the white Rhodesians in the 'good sense' of their 'kith and kin'. But to buttress British investments in black Africa (in the circumstances, a pointless precaution, since most of these governments were and are tied too intimately to the apron-strings of the West to attempt anything as drastic as expropriation of Western holdings), to quieten the mandatory Afro-Asian uproar in the UN and to placate moralistic backbenchers and liberal opinion at home, the British Government in good Labour Party style thought up the economic sanctions game.

Although the British did stick to the rules a bit more than the logical French or Japanese and did impose a well-publicised blockade of the hapless Portuguese colonial port of Beira in Mozambique, sanctions were a gimmick right from their inception, since it is inconceivable that any British government could cut off commercial ties with one of Britain's most important trading partners, South Africa, which is also, of course, Rhodesia's main prop. So the symbolic sanctions continued; Britain did experience marginal losses in its total exports, but the main loser was Zambia. However, the British Government soon tired of the irritating and what is more important, unpopular (in Britain) tension with Rhodesia, and tried most conscientiously to arrange an agreement with the Rhodesian regime aboard a variety of naval cruisers and assault ships with pugnacious names. Wilson's terms for agreement were particularly generous at the talks held on board *Fearless* in November 1968. Principles pledged to the Commonwealth prime ministers and the UN were easily brushed aside —including the crucial 'no independence before majority African rule' (NIBMAR) pledge. Ian Smith was then in a comfortable enough position to ward off such overtures.

Douglas-Home, the British Foreign Secretary, and Smith have now agreed upon an intricate constitutional formula which bears a remarkable resemblance to Wilson's *Fearless* concoction, envisaging a parity of African seats with the number of European seats in Rhodesia's lower house of parliament in thirty to fifty years time or more, all depending on the good faith of the while colonists in Rhodesia. Smith has presently found it worthwhile to agree to this three-year old formula as the Rhodesian economy in order to maintain the living standards of the white ruling class requires more Western capital investment than it is at present getting. The mantle of respectability bestowed by the British is likely to increase, to some extent, the level of investment. Rhodesia's tobacco landlords, who are a vociferous group in Smith's Rhodesian Front party, are also demanding wider outlets for their crop, most of which is for export. The endir of sanctions is likely to benefit th group. As for Edward Heath and tl Conservative Party, the successful co clusion of the Rhodesian negotiatio will enhance his image and that of h party at a time when at home tl Conservatives have been coming und increasing attack for instituting me sures which have led to an unemplo ment figure of almost a million. Th dismissal of the Rhodesian problem wi also facilitate a closer rapport wit Europe.

The Africans in Rhodesia are unlike ly to wait upon the good faith of th white colonists to hand over powe after half a century or more. There ar signs that the hitherto ineffectual Afri can nationalist parties (ZANU an ZAPU) will be replaced by an ideo logically motivated liberation movemen Such a movement will take years t fructify, but the Anglo-Rhodesian agree ment will have accelerated the proces of liberation.

Andhra

Starvation amidst Plenty

A Correspondent writes:

THE price of paddy has nearly doubled in many parts of Andhra Pradesh compared to what it was at this time a year ago. In the villages I visited in Nuzvid, Gannavaram and Chintalapudi talukas I found several agricultural labour households facing semi-starvation conditions. In Chintalavalli village of Nuzvid taluk, for example, I was told that more than half the agricultural labour households had been having food only every alternate day.

Nor are the harvest prospects good. Due to the delay in the monsoon much of the land dependent on rainfall could not be cultivated. The untimely rains have also caused damage to substitute crops like maize. As a result, much of the labour force has remained unemployed even during the peak seasons, which partly explains why labourers are facing such hard times.

The harvest has just started, but this would not provide much relief as the area sown is small. Only a small portion of the labour force would find employment even in this peak season. Reflecting the low demand for labour, the real wage rate has dropped dramatically. While an adult labourer commanded a wage rate of nearly 2 kilos of rice during the harvest season last year, the rate now is only 1.25 kilos —a fall of about 37 per cent. This shows perhaps that, contrary to academic assumptions, the rural wage rate is neither fixed nor is perhaps even at subsistence levels.

The present famine also brings out the brutal relationship between nutrition, work-performance and wage rate. I am told that many labourers are coming to reap the harvest on empty stomachs—sometimes without having eaten anything for one or two days. This naturally affects their ability to work. A farmer told me that in place of 8-10 workers last year he now has to employ 10-12 workers to cut the paddy crop on one acre. I wonder in what sense we can measure underemployment in this context!

The government has initiated some famine relief (or, more accurately, post-famine relief) works but these are obviously not enough. In fact, there is a growing feeling that the government is partly responsible for the acute scarcity of food in this traditionally rice surplus state. Firstly, the government has stored a large quantity of foodgrains—I believe, somewhere near 10 to 11 lakh tons of rice—which it is not releasing in spite of the famine conditions. I suppose the government does not consider the present situation bad enough! Secondly, it is rumoured that a large quantity of rice has been taken surreptitiously across the borders with the connivance of high officials and to the benefit of millers and ministers. While there may be much to be said for free movement of foodgrains, the surreptitious movement that is taking place is not helping the farmer to get a high price; it is the millers and the corrupt ministers who are pocketing the profit. Their tactics have been to announce that price would be stabilised at a fairly low level and then induce farmers to sell their produce at that price. After this mopping up operation, they transport the rice outside the state—thus driving up the price and pocketing the profit.

Kerala

CPI(M)'s Miscalculations

THE CPI(M) in Kerala has again been made aware that there are limits to the success of policies based almost entirely on exploiting differences among the parties constituting the ruling coalition. It did appear at one stage that the party might be able to pose a fairly serious threat to the government with the agitations over, first, the demand of the teachers in private colleges for payment of salaries directly by the government; second, the state government non-gazetted officers' demand for withdrawal of orders which they felt interfered with their trade union rights; and, third, the raising of passenger fares by the government-owned state transport services. The CPI(M) had hoped to build up the momentum of the agitations on these issues so as to make possible an impressive Kerala 'bundh' on November 10. The party's calculations about the support it was likely to get from other quarters, however, went wrong and when the date for the 'bundh' arrived, it was left with only the weakest of the three issues, the bus fare increase.

The strike of the teachers of private colleges was to begin with supported by the youth wing of the state Congress which actively participated in the teachers' strike as well as in the sympathetic strike by students. The main issue involved in the agitation was a serious enough one. It is a well known fact that teachers in a large number of private colleges in the state (the bulk of whose recurring expenses is met by the government) do not receive their salaries on time; nor do they receive what they are entitled to and what they are on paper shown to be paid. The difference is siphoned away by the college managements. Of course, unemployment among the educated is so acute in the state that even given these and other forms of exploitation, college managements are often able to extract as much as Rs 10,000 from an aspirant for a lecturership. In the past the CPI always feigned sympathy for the fate of teachers employed in the private colleges, but now that it is heading a coalition which includes the representatives of the very interests which run the bulk of these colleges it had to sing a different tune. In a bid to evade the issue, Chief Minister Achutha Menon took the position that the government would be prepared to pay the teachers' salaries directly provided that it was also given control over appointment of teachers and admission of students — knowing very well that the college managements were hardly waiting to offer such control to the government on a platter! With this the CPI again proved that it would go to any lengths to placate other parties — Congress(R) and Muslim League, particularly — to cling to power.

The support that the teachers' strike initially received from the youth wing of the state Congress was an extension of the tussle within the Congress party which had earlier manifested itself in the youth wing's opposition to the party joining the communist-led ministry. From the youth wing's point of view its participation in the agitation was a success since it refurbished its radical, extra-establishment image. But clearly it had no intention of carrying on the agitation to the point where it posed a threat to the government. So it was not too difficult for the Chief Minister to appear to make some concessions which were grasped by the Congress youth wing to withdraw from the agitation and to dub the CPI(M)'s efforts to continue the agitation as being "politically motivated". Much the same sequence of events was repeated in the case of the agitation of the state government's non-gazetted officers. The non-CPI(M) Joint Council of state government servants' organisations withdrew its strike call, forcing the CPI(M) Non-Gazetted Officers' Union also to back out. Here again the government was able to prevail upon the non-CPI(M) Joint Council with largely formal promises including one for setting up machinery for redress of grievances and safeguarding the "freedom of organisation" of government employees.

Clearly, CPI(M)'s recent experience in Kerala (and also in West Bengal) should be cause for some rethinking on the party's basic policies at the forthcoming party congress.

Pakistan

The Arrangement

A Correspondent writes:

IT is obvious that Yahya Khan is trying to stage a Hamlet in Pakistan without the Prince of Denmark. His current efforts are to create a bipolar situation in the National Assembly with Bhutto and his People's Party pitted against a combination of Right-wing groups. The parity between the two poles is even arithmetically complete. The newly formed United Front of seven Rightist parties claims the loyalty of exactly 89 members of the National Assembly just as Bhutto has his 89 men. It is only the Awami League which finds no place in the Pakistan President's calculations. That creates some problem because neither the people of East Bengal nor the international community can have any use for a political set-up in Pakistan which totally ignores the party that won 167 seats in a 313-member National Assembly through straight electoral contests. Apparently, this is not the problem that Yahya Khan hopes to re-

solve through his new political manoeuvres. His entire purpose is to create a facade of some form of civilian rule in order to confuse domestic opinion in West Pakistan.

The seven-party front includes all the Right-wing forces from East Bengal and West Pakistan. The Jamaat-e-Islami is obviously the strongest component of this new United Front; others are the PDP, the three quarrelling factions of the Muslim League, the Nizam-e-Islam and the Jamiat-ul-Ulema-e-Pakistan. Not even Yahya Khan can hope that all these parties can remain united for any reasonable length of time if they are permitted to interact freely. But if the army can enforce some discipline on these groupings, it can be cleverly used to balance the party of Bhutto and to convince him that total power in Pakistan is not yet a legitimate objective for him to pursue. Nurul Amin lost no time after Bhutto's return from Peking to make it clear that he should not be made the country's Prime Minister. And Bhutto himself has now agreed that he may work under an East Bengali Prime Minister.

Bhutto perhaps calculates that no East Bengali who comes to Islamabad now will have any authority over his people. Power will in essence belong to him, no matter what permutation and combination is brought about by Yahya Khan. The General, however, may have other ideas; he is not bothered by the possible lack of moral and political authority of an East Bengali Prime Minister. What is vital for him is the retention of his own rule and the right to dismiss governments in Pakistan on the basis of his own judgment of political trends in the country. Thus, a Nurul Amin-Bhutto combination may well be brought about. Amin will accept it because he has nothing to lose in East Bengal but his life. Bhutto will welcome it because all others are discredited in Pakistan and this is bound to become a stop-gap arrangement before he finally takes over the Central Government. Yahya will arrange it because thus alone will he be able to transfer power to such civilians as are sure to hand it back to the army after a period of hectic quarrels among themselves.

[This was written before the declaration of a state of emergency in Pakistan on Tuesday. *Ed.*]

BUSINESS

Time for Discrimination

IT might suit the Minister for Foreign Trade to exaggerate the odds facing Indian exports if only because they help to throw into relief the successes in export performance. But at the fourth meeting of the Export Advisory Council recently, his underscoring of the adverse effects of the West's protectionist measures and his stress on the larger role for the public sector in exports as a corollary to the new need for trade expansion with the East European countries, was simply misleading as to the inhibitive factors in India's exports and the direction of effort required.

The problem areas in exports lie elsewhere and stem primarily from the indiscriminate way in which exports are sought to be promoted — so much so that, at the Advisory Council meeting, some members even ventured to suggest that the volume of export and not the value of foreign exchange earned should form the base of fixing incentives.

Traditional items still account for some 70 per cent of our exports and they are subject to fluctuations consequent to raw material supplies and world demand. Jute, tea and cotton textiles, which between them account for over 30 per cent of earnings, are moreover ridden with technological difficulties: the jute and cotton textile industry badly requires modernising, and the tea plantations replanting. Raw jute and cotton have yet to see a breakthrough. An export policy aimed at achieving these twin objectives has to be an essential ingredient of any long-term export strategy. At the same time, iron ore — exports of which have been shortsightedly undertaken under contracts with Japan, committing us to parting with a low-value raw material — shows signs of losing out against competition from new world sources of supply; besides Japan might cut its steel production targets.

True, we need to explore possibilities of pushing non-traditional exports — particularly engineering goods for which we now have a diversified base. But these account for about as much as cotton textile exports, their import component is large and the expansion in their exports has been largely directed to markets in Asia. What are we getting in return for these exports? The Minister for Foreign Trade hopes to have an idea soon of the scope for trade within Asia and with Africa. But he also would promote East European markets, "which have immeasurably assisted us on the realisation of our export objectives". For all the careful nurturing, bilateral trade with these countries accounts for less than a fifth of our foreign trade. Recently, it has also encountered the hurdle of trade balances, insofar as items cannot be found for trade. On occasion, therefore, we have had to import hard currency items for re-export after processing. What, then, is the special merit of indiscriminately promoting this outlet for export?

Much of our irrationality in the exports field arises from the fact that often we lose sight of the purpose of export, which must be to find markets abroad for items for the production of which we have special endowments, with the ultimate aim of finding the wherewithal for internal economic development. Where calculations down this entire line do not take place, where export promotion does not correspond to a pattern of priorities for internal supplies, exports tend to be uneconomic and effected at any cost. Schemes to allow industries to come up if they will undertake to export part of their production, to give incentives for export to a whole range of industries whose costs are otherwise out of alignment with international levels, and to promise scarce and imported raw materials to exporters without considering the net cost and benefit of the measures, reflect an *ad hoc* and undiscriminating approach to foreign trade which does not amount to any 'strategy'.

Indian Oil

Refining Priorities

THE new chairman of Indian Oil, M Rama Brahmam, describes the corporation's growth as 'phenomenal'; it could with almost equal accuracy be described as inevitable. So long as it is the government's policy not to allow the foreign owned refineries to expand, Indian Oil's share of the market for petroleum products will continue to go up. In 1970-71 it was 51.6 per cent. However, 1970-71 was not among the best years that Indian Oil has had recently.

The throughput of crude at its three refineries was only marginally higher than in 1968-70 (6.34 mn tonnes against 6.25 mn tonnes). Sales rose by about 9 per cent (from 10.64 mn kls to 11.65 mn kls), the result of larger production at the (public-sector, but non-Indian Oil) Cochin and Madras refineries and somewhat larger imports. Profit after depreciation was noticeably lower at Rs 15.77 crores compared to Rs 20.41 crores in 1969-70. This is attributed by the corporation to increase in the price of crude which raised crude costs in 1970-71 by Rs 5 crores (Rs 2.5 crores on account of crude processed during the year and the balance retrospectively for earlier years). Against this the change to refinery-based pricing of petroleum products recommended by the Shantilal Shah Committee saved Indian Oil Rs 3.9 crores by way of reduction in under-recoveries on various counts. The director's report claims, however, that this entire saving was wiped out by the reduction effected by the Committee in selling margins. The dividend on capital payable to the government is being maintained at 7 per cent. While this is a higher rate of return than what the government gets on most of its investment in public sector enterprises, it is still low not only by the standards of the petroleum industry but also in relation to the minimum return on capital prescribed by the Planning Commission for public enterprises. The chairman, however, points out that the corporation has generated internal resources totalling almost Rs 120 crores and that the Haldia refinery, estimated to cost Rs 68 crores, is being financed "to a very large extent" out of the corporation's resources.

The chairman's statement makes particular mention of Indian Oil's success in bringing down its outstandings to Rs 33.57 crores from Rs 39.71 crores at the end of 1969-70 (or from the equivalent of 22 days' sales to 15 days' sales). While this is all to the good, one wishes that the corporation would show some, if not as much, concern for what it owes to others. The schedules to its accounts reveal that sundry creditors have gone up to Rs 63.24 crores at the end of 1970-71 from Rs 48.50 crores. While it may not be altogether fair to single out Indian Oil for criticism in this respect, there must be some way of preventing large companies from using brute economic force to escape any sort of discipline in the matter of settlement of trade dues.

Indian Oil's plans for expansion of refining capacity raise one of two questions. The Haldia refinery has fallen behind schedule and is now expected to be commissioned by the end of the first quarter of 1973 (fuel part) and mid-1973 (lube complex). The impact of this is bound to be felt in an increase in import of oil products in the current year and in 1972-73. Second, it is clear enough that production of crude from the Assam oilfields is not enough to meet the demands of the two existing Indian Oil refineries at Gauhati and Barauni. Shortage of crude has necessitated a cut in the throughput of the Gauhati refinery as well as expensive modifications in the equipment of the Barauni refinery and in the network of pipelines serving it so as to enable the refinery to run partly on imported crude. And yet Indian Oil is going ahead with plans for setting up another 1 mn-tonne toy refinery in Assam, at Bongaigaon, and what is more this project appears to be taking precedence over the long talked-of refinery in the north-west the exact location of which has still to be decided upon.

Indian Oil will also have to decide what it wants to do with Indo-Burma Petroleum Company in which it acquired (at a cost of about Rs 75 lakhs) a majority interest early last year. Unlike Indian Oil Blending (a 50:50 venture of Indian Oil and Mobil Petroleum) or Indian Oil International (a wholly-owned subsidiary), there is no functional *raison d'etre* for Indo-Burma Petroleum which simply markets petroleum products acquired from Indian Oil and so is in effect a marketing subsidiary of a marketing company!

Taxation

Hunt for Incentives

A Correspondent writes:

OVER 350 tax executives from all over the country assembled at Vigyan Bhavan from November 18 to 20 to participate in the Sixth All-India Conference of Tax Executives organised by the Federation of Indian Chambers of Commerce and Industry. Apart from exchanging views and focusing attention on current tax problems, this annual event is also an occasion for some useful dialogue between the tax-payer and the tax-gatherer inasmuch as senior officials of the Ministry of Finance also participate in the proceedings. As a matter of fact, two of the sessions this year were chaired by the Chairmen of the Central Boards of Direct and Indirect Taxes. Although government has recognised the importance of this periodical dialogue, nothing concrete seems to have been done in this regard. At the last conference in November 1970 the then Minister of State for Finance, V C Shukla, had told the tax executives that a Tax Institute would be set up to provide an effective forum for such dialogue. Shukla has since been switched to defence production and one wonders what his successor, K R Ganesh, has to say in this regard.

Two of the more interesting subjects discussed this year were: (i) fiscal policy and industrial growth; and (2) taxation and new entrepreneurs. On fiscal policy and industrial growth, as expected, delegates were unanimous that the withdrawal of the development rebate after May 1974 would retard industrial growth. But surprisingly, except in one paper, there were no concrete suggestions about a possible alternative to the development rebate which would have the virtues of the development rebate without its vices. Some original contribution in this regard should have come from the tax executives, particularly since government thinking also appears to be in terms of introducing some alternative incentive in place of the development rebate so that the desired industrial growth rate can be attained.

The discussion on taxation and new entrepreneurs aroused a lot of interest among the participants. When one speaks about new entrepreneurs, one must be clear as to who can rightly be called new entrepreneurs. Since the objective of encouraging new entrepreneurs is to widen the entrepreneurial base, this group has to be necessarily carved out of those who are presently not entrepreneurs. A good hunting ground for such people is among the professionally qualified and trained managers. But at present levels of taxation this group has very little savings left for the nucleus capital required to start a new enterprise. In this context, the suggestion of an entrepreneurial allowance to be given to a professionally qualified person from his total income for a period of five years or so with a view to enabling him to build up the nucleus capital deserves attention. In view of the fact that a new entrepreneur has to necessarily start with a small enterprise, some of the suggestions such as that priority and basic industries be given preferential tax treatment or that the ceiling of Rs 5,000 for salary income be removed, etc, are really out of context so far as the nurturing of new entrepreneurs is concerned.

Trying Many Alleys

Hansavivek

TATA CHEMICALS received industrial licence to expand soda ash capacity from 600 to 1,000 tonnes a day, about two years after it had applied for it. Even so, the industrial licence, the MRTP clearance, and the import licences, are "ridden with some onerous conditions" which the company had to accept "if its growth and the country's and consumers' interests were to be safeguarded". In view of the acute shortage of soda ash resulting in a "flourishing black market" and need for import, the company is taking steps to implement the expansion programme as rapidly as possible. Meanwhile, in response to the government's notification, inviting applications for the creation of additional capacity, the company applied for permission to further expand capacity from 360,000 tonnes to 500,000 tonnes per annum. If the application is cleared quickly, the company will be able get the further expansion integrated into the current programme. The company has also applied for expansion of its chlor-caustic facility at Mithapur to 50 tonnes per day of caustic soda (equivalent), and has proposed to utilise the co-produced chlorine in a manner that will lead to the manufacture of phosphoric acid and phosphates of sodium.

The revised fertiliser project, for which a 'letter of intent' had been issued in July 1970, continues to be bogged down. The chairman, J R D Tata, complains of "frustrating delays" at the government end. Even four years after it was submitted — in response to government's invitation to the private sector to help raise fertiliser production—the fertiliser project remains undecided. After two-and-a-half years of procrastination, the company was compelled to reduce the project to about a third of its original size. Thereafter, a fresh objection was raised to the import, in the initial years, of phosphoric acid. According to the company, the import of phosphoric acid in the initial period was a fundamental element in the project, which was aimed, insofar as the manufacture of phosphatic fertilisers was concerned, at the total elimination of sulphur through a process—still under development abroad and at Mithapur—that would use hydrochloric acid instead of sulpuric acid. Tata asserts that the proposed change in the 'letter of intent' effects a "fundamental and unacceptable change" in the project and that, if it is insisted upon, "we would prefer to abandon altogether the phosphatic part of our project until it can be undertaken without importing sulphur".

The proposed scheme of merger of the Bank of Baroda Ltd into Tata Chemicals could not be finalised because of objections raised by institutional shareholders of the bank. The management has recently sought to revive the scheme with some alterations that are expected to overcome the objections raised by the institutions. The Argentine soda ash project, for which the Tata bid was rated as the best, could also not be finalised, because the validity period of the bids having expired the Argentinian government decided to annul the tender and to enter into direct negotiations with the bidders for determining the terms and conditions of the contract for Solvay soda complex in that country. Owing to changes in the government, and for other reasons, the matter has made little progress since then.

Last year, Tata Chemicals installed plant and machinery worth Rs 307 lakhs—by far the largest additions to the assets in any one year. The delivery of the topping turbo-generator set, on order with Bharat Heavy Electricals, has suffered "numerous" delays, aggregating about 12 months. Expansion of the benzene hexachloride plant, to 7,200 tonnes per annum, was completed last year. The company also installed further facilities for the formulation of benzene hexachloride (technical) and copper oxychloride (technical) and has since been granted COB licence in respect of these two products.

GLAXO LABORATORIES (INDIA) spent, last year, Rs 1.5 crores on planned projects, including establishment of a new research and development centre at Thana comprising 4 separate units devoted to research in chemicals, pharmacy and food, and to analytical control. A new indigenous process for producing betamethasone has been developed to effect significant saving in foreign exchange. The programme of expansion and diversification was also continued by the company. Industrial licences have been received to effect substantial expansion in the production of vitamin 'A' and to "carry on business" in the diversification of the range of laboratory chemicals. Permission has also been received for increasing output of calcium sennosides and beta-ionone. Glaxo increased its exports by 22 per cent, but "at a considerable loss to itself". The main item of export, beta-ionone, accounted for nearly a quarter of the country's exports of pharmaceutical intermediates and raw materials. Reviewing the company's working during last year, James S Raj, chairman, says that for most of the year the company was obliged to accept a number of downward price revisions and that it was not until January 1971 that it was able to implement a small number of "very necessary price increases". He attributes erosion of profits mainly to the sharp increase in material costs. The canalisation of imports of bulk drugs through STC and the system of "pooled prices" for many essential materials, he observes, have taken heavy toll of the company's resources. He points to the sharp increase in costs of raw materials bought from STC, IDPL, and The National Dairy Corporation. Higher duties on packing materials, notably tin-plate, also account for a sizeable increase in costs. He believes, however, that demand for the company's products will continue to increase and looks forward with a measure of confidence to the future.

BOMBAY BURMAH TRADING is investigating a few large-scale projects for diversification. A small electronics research section has been set up and six applications for 'letters of intent' have been submitted for manufacture of various items of electronic equipment. Some of the applications have been approved. An application has also been made for a 'letter of intent' to set up a soda ash plant, and negotiations are going on for collaboration with a state government for establishing a plant to produce cresol. Meanwhile, the directors are examining ways by which further finance could be found from self-generated sources within the group. Dental Products, a subsidiary, has received permission to import additional plant which will enable the factory to utilise cheaper raw materials and reduce foreign exchange requirements. Formica India, the associated company, is also engaged in re-

search and development on new and allied projects. The subsidiaries' shipping interests have brought into service their second log-carrying vessel and contracts were signed for the construction during 1972 of the third and fourth vessels, each of 13,500 tonnes. Negotiations with various government departments are still going on in Malaysia, Thailand and Indonesia; it is hoped that timber concessions may be secured which would supplement North Borneo Timber Berhad's existing operations. The managing consultants are also assisting in the development of investment in Australia and New Zealand, which offer good long-term prospects of growth. Commenting on the current year's prospects, Pratapsinh M Vissanji, chairman, says that Sabah subsidiary companies are under a recession following slackening demand for plywood and allied timber products. Prices have fallen appreciably, and demand for the lower grades of logs has weakened. But he is confident that the companies will have another profitable year—unless the situation deteriorates further. The South Indian estates, he feels, are unlikely to repeat their 1970-71 profitability. Since the Bangalore branch was closed last year, the South Indian properties should, in the overall results, do "reasonably well", provided prices can be maintained. Summing up, the chairman views the current year's prospects as "fair" and the long-term outlook "promising".

BLUNDELL EOMITE PAINTS' good results for the year to June last, in spite of "continuously rising prices" of all raw materials and containers and higher labour costs, are attributed to the efforts to be more selective in the range of products. Export performance was also further improved upon, with exports of about Rs 19 lakhs. Though exports were effected at a loss, benefits in the form of import licences are being received. The total dividend of 14 per cent, including the interim of 4 per cent already disbursed, is expected to be exempt from tax. The dividends paid for the last 5 years will also be wholly or partly exempt from tax in accordance with a supplementary certificate furnished to shareholders. Last year, the company raised Rs 30 lakhs by issue of 15-year debentures carrying interest at 8.5 per cent per annum, which were privately placed with LIC and UTI. The proceeds were used to repay the term loans obtained for acquisition of capital assets of the Thana factories.

DEEPAK NITRITE made a public issue of equity shares of Rs 22.50 lakhs and preference shares of Rs 15 lakhs in July last. The former was oversubscribed over 19 times, but the latter was "substantially" subscribed for by the underwriters. The construction of the factory buildings is in progress and is expected to be ready by January next. The company has started receiving consignments of equipment and machinery. The technical knowhow pertaining to the manufacture of sodium nitrite and sodium nitrate has been obtained from Fertiliser Corporation of India.

SWADESHI POYYTEX, which is setting up a polyester fibre plant at Ghaziabad in UP, expects to put its product on the market by early 1973—or even earlier than that. One batch of engineers has already been trained by the collaborator, Vickers Zimmer, in Germany and the second batch is due to leave shortly. A senior engineer of the collaborating firm is posted full-time at Ghaziabad. Of the total estimated project cost of Rs 12.72 crores, including the foreign exchange component of Rs 2.29 crores, the company is getting rupee loans of Rs 4.20 crores from official financial institutions —IDBI (Rs 2.20 crores), IFC (Rs 50 lakhs), LIC (Rs 1.00 crores) and UTI (Rs 50 lakhs in 8.5 per cent privately placed debentures). It has been agreed that IDBI will have a right to convert into equity at par upto Rs 31.43 lakhs out of its loan, LIC upto Rs 14.29 lakhs of its loan, IFCI upto Rs 7.14 lakhs of its loan, and UTI upto Rs 7.14 lakhs out of its debentures. This right of conversion is to be exercised during the calendar years 1976 and 1977. The foreign currency loans have been secured from ICICI and LIC. SPL's total paid-up capital is Rs 2.40 crores. The first call to the shareholders is expected to be made in the near future. The company will use the 'continuous process' for its manufacture of polyester fibre.

METTUR CHEMICAL has applied for increase in caustic soda capacity at its plant number one by 10 tonnes a day and also for expansion of capacity of rayon caustic soda plant by 50 tonnes a day. There is a rising demand. Reviewing his company's results for the year ended March 1971, chairman P S Lokanathan observes that the company had to bear increased costs of raw materials, both indigenous and imported, and encounter shortages in some of the essential raw materials. The increase in freight rate on salt — the main raw material — added to the unit cost. He also points out that items imported by STC and MMTC are not only more expensive but their delivery schedules are irregular — though the channelling through the state trading agencies is ostensibly to exploit the advantages that accrue from large purchases and savings in transport costs. Commenting on the excise duty at 10 per cent *ad valorem* on chlorine, the chairman feels that the resultant rise in the price would affect demand for the product and its gainful utilisation which had recently gone up from 65 per cent in 1968 to around 86 per cent. The company has applied for actual user licence for import of chlorine containers, as shortage of containers has hampered exploitation of a growing export market.

FROM OUR CORRESPONDENTS

NEW DELHI

New Deal for Coking Coal

IT had been appreciated, when the decision to take-over the management of the coking coal mines was taken preparatory to their eventual nationalisation, that this would have to be done in an entirely different manner from the take-over of the larger banks or insurance companies. Barring a few organised companies, coal mining in the private sector has existed in a state of jungle law. This was true not only in respect of mining practices, but also in respect of management procedures and labour relations.

A whole host of statutory obligations exist for the mining industry, but in practice they have achieved nothing worthwhile. Collieries employed qualified managers only to satisfy the legal requirements; in most cases these managers have not been allowed to run the mines according to the norms and standards of modern mining or of the law. A wage board award for workers has been in operation for the last several years, conferring substantial benefits upon the miners. However, only a fraction of the mine workers have in fact enjoyed these benefits, though on paper the industry's labour costs have been shown to have gone up—a large part of the additional 'costs' being syphoned off by mine owners, contractors and even so-called labour leaders. The decision, after the take-over of coking coal mines, to make wage payments directly to the individual worker on the wage board scale, therefore, created a great impression on the workers and generated much enthusiasm among them for the take-over. A large number of managers have also taken a positive view of the government's decision, though many of them have to accept the fact that their own salary scales will probably be revised downwards.

It was thus that a new organisation for the take-over had to be created almost overnight—taking into account the realities of the situation in coal mining. The existing mine managers could not be relied upon to take up the functions of the custodians as was done when the banks were taken over. The Chief Technical Adviser in the Mines Department of the Ministry of Steel and Mines was, therefore, made the Custodian-General of the 214 coking coal mines taken over under the Coking Coal Mines (Emergency Provisions) Ordinance promulgated in the middle of October and was invested with all the powers of the government to carry out his functions. He brought under his wings 25 custodians, drawn from the National Coal Development Corporation. The office of the Custodian General at Dhanbad, in the heart of the Jharia-Raniganj coalfields, where the coking coal reserves of the country are mainly located, has been implementing the take-over of the mines in a manner somewhat similar to the conduct of war operations. After a couple of weeks of confusion and hectic activity, the situation began to settle down. The fact that production of coking coal has not suffered and was in fact marginally higher in the first month after the take-over should be a matter for some satisfaction. The first reports about sabotage, removal of machinery and equipment by the old owners and non-cooperation by managers were obviously exaggerated.

The installation of the custodians even as the existing managers remained in position and continued to be responsible for production and running of the mines certainly threw up many problems. The custodians and the Custodian-General himself are in most cases, professionally and otherwise, less experienced than and junior to the managers of the mines taken over by the government. This was probably the biggest cause of confusion in the first few weeks. The situation was aggravated in several cases by the tendency of the custodians to throw their weight about more than was necessary. On the whole, however, the custodians have done their work with enthusiasm and competence. Now that the position has stabilised, the custodians will go back to their old places

of work on the completion of their mission and the existing professional staff and managers will be given their proper places in the management set-up of the mines.

The work of the custodians is confined to bringing the records and properties of the mines under the custody of the public authority and to bring the records uptodate. This will enable proper valuation of assets and liabilities to determine the compensation to be paid to the owners, which is bound to be a tricky affair considering the many layers of claimants. Besides the fact that mining rights in many cases do not necessarily include surface rights in long-term leases, there is the widespread practice of managing contractors actually running the mines on short-term sub-leases taken from the main lease-holders. Once the problem of compensation is settled and full nationalisation is carried through, the real purpose of the take-over will begin to be attended to. It is proposed to set up an altogether new public sector corporation for coking coal mining and the professionally trained personnel in the coking coal mines will get their due place in this organisation. To begin with, till nationalisation is effected, there will be a board of management to be later replaced by a regularly constituted board of directors. The present Custodian General is tipped as the chief executive and Chairman in the first year of the new organisation. It is something to be grateful for that a civil service bureaucrat has not been chosen for the post.

The question of nationalisation of coal mining, in particular coking coal mining, has been pending since the mid-fifties. It was being actively canvassed in the Mines Ministry for the last three years at least. What was lacking was the political courage to take the decision. After the failure of the scheme for voluntary amalgamation of collieries, the government for some time toyed with the idea of compulsory amalgamation. Together with this, laborious exercises were carried out on the pros and cons of setting up joint sector enterprises in coking coal mining, since the joint sector concept had become a fashion of sorts in government thinking for some time. All this has now been cut short by the decisive action at the political plane, though there was no immediate compulsion for taking such action. As things stand, thanks to the large lags in the steel development programme, coking coal production exceeds the requirements of the steel plants and other users. The established capacity for coking coal production is around 18 million tonnes per year while production in the last few years has ranged between 15 and 16 million tonnes. The offtake of the steel plants, on the other hand, has been of the order of only 11 million tonnes; the rest of the coking coal has been consumed by railways, or used in brick burning and other similar activities involving waste of a national resource reserves of which are certainly not plentiful. Considering the present state of the coke ovens of the steel plants and the possibility of import of coke, the demand for coking coal may actually face a further decline in the immediate future. This will give some breathing space to the proposed public sector coking coal organisation to organise the industry on a sound basis instead of trying to maximise production in the short run. The new organisation will have to gear itself more for the tasks of the eighties rather than those of the present decade. This will be the case particularly if the steel development programme at last gets into its stride and the idea of a 2 million tonne steel plant being commissioned every year takes practical shape. From available indications, the thinking on the problem in the Mines Ministry is along these lines.

The most significant economic benefit of the take-over of coking coal mines is stated to be that it will make it possible to completely revise the earlier plan drawn up in the late fifties for the development of deep mines to meet the coking coal requirements of the economy. This will cut by nearly half the cost of development of coking coal reserves. According to the earlier plan, nine deep mines (on the pattern of the Sudamidih and Mundih mines being developed by the National Coal Development Corporation with Polish collaboration) were proposed to be established over a period of time. They were to be set up in the more difficult mining areas on the periphery of the main Jharia-Raniganj coking coal field. This programme would have required heavy capital expenditure, besides being time-consuming. The 400 metres deep Sudamidih mine project, for instance, began in 1962 and is expected to be completed only in 1975. The initial estimate of cost of Rs 19 crores is going to be exceeded by several crores of rupees. The deep mines plan, it is estimated, would have required more than Rs 120 of investment per tonne of coal-raising capacity. The economy would have been saddled with such high costs of exploiting its natural resources not because of any natural factors but entirely because of the fact that the main Jharia-Raniganj coking coal fields were parcelled out and held in private ownership which would not permit their scientific and economic exploitation.

After the nationalisation of these fields, it will no longer be necessary to go into difficult virgin areas; instead the development effort can concentrate in the coking coal fields proper. The idea is that the maximum should be got out of the proven reserves of coking coal which are capable of yielding upto 40 million tonnes of coking coal per year over a period of 40 to 75 years. This is proposed to be done by redrawing the boundaries of the Jharia-Raniganj fields on the basis of natural faults and barriers and by the development or mining on that basis. As a result, it is estimated that the investment costs will come down to Rs 60 per tonne as against Rs 120 per tonne in the case of the earlier deep mining plan. This will go together with modernisation of coal extraction in the existing mines. It is estimated that hardly Rs 20 crores will be required to pay compensation for the take-over of mines and another Rs 200 crores may be required by way of investment in coking coal mining over a period of 15 years to meet the requirements of the economy.

A team of Polish experts has been invited to prepare a detailed project report for the development of coking coal mining in the Jharia-Raniganj fields. The Poles are stated to have done good work in the post-War reconstruction of coal mining in their country and their assistance will be valuable for what is in a sense a similar venture. The implementation of the project report prepared by the Polish team will not require any particular foreign assistance since India has sufficient expertise in the field. The project report for the reconstruction of the coking coal mines will not be confined to coal mining only. It will also include development of pitted coal washeries for each of the mining zones together with facilities for selective crushing, preparation and blending of coking coal suitable for use by the steel plants. All this is to be viewed as an integrated operation to be carried out by the proposed coking coal organisation. It is in accordance with this line of thinking that it has been suggested that Hindustan Steel or Bokaro Steel need no longer bother about having captive mines and that they should give up the coal washeries now under their charge. Instead they should depend for their requirements of coking coal on the proposed coking coal organisation under long-term contracts.

Economic Policy-Making by the Judiciary

(From a Special Correspondent)

THE Supreme Court's judgment on automobile prices has implications for economic management which go far beyond the immediate case before the Court. Both — the Court's decision on automobile prices and the broader implications — need to be considered from the point of view of economic policy-making by the government.

As regards the immediate case before it, the Supreme Court has in effect ruled that the prices fixed by the Tariff Commission, and modified by the government, were not fair. It, therefore, referred the issue to another commission, with some of whose findings again the Supreme Court judges have disagreed. However, in broad terms the finding of the commission have been approved of and the government has been asked to fix prices according to these principles.

One may ask whether the Supreme Court should have concerned itself with laying down the principles for fixing prices or with fixing the prices themselves. The case before the Court was one of fixing prices; to the extent the Court has not gone into the subject, it has in effect side-tracked the task set for it. The decision on prices will in any case be made by the government and while the principles may be laid down, the exact arithmetical values are likely to be always a matter of doubt and dispute. To that extent, the prices fixed by the government cannot be deemed to be same as those that would have been fixed by the Court.

The Supreme Court's decision on the specific case before it rests on two major issues. First, the determination of cost and, second, the fixing of the rate of return to be allowed to the manufacturers (cum-assemblers). As regards cost, the Court's decision amounts in effect to a charter for the inefficient manufacturer. Cost is one aspect which is within the ability of a management to manage within limits. It is the responsibility of the manufacturer to prove that the costs incurred are in fact the minimum possible costs. A manager may employ his nephews at high salaries, and this could become an item of cost. A manager may incur expenditure on research and development, whose benefits might be passed on to an associate concern; this again could become an item of cost. A promoter may pay high prices to favoured suppliers; this again may become an item of cost. In a cost inquiry these matters need to be looked into. If a consumer is required to pay a price for a product which is government-determined (and whose production is made possible by the government's policies of protection and licensing), then it is the obligation of the price-fixing authority to ensure that the costs incurred are the minimum needed for efficient production.

Efficient production should cover quality. In a product sold by specifications, the specifications determine quality. In an engineering product which is, moreover, an assembly of a large number of components (self-produced and bought), like a car, it is difficult to buy purely on the basis of specifications; therefore, a system for maintaining quality has to be evolved.

This was a major deficiency in the government's pricing policy so far. While the government could ensure that the producers charged a notionally fixed price, there was no control on the quality of the product set for that price. Manufacturers have been able to delete items (such as clocks) from cars and have been able to reduce quality to a substantial extent by use of inferior goods, inadequate inspection and provision of inferior servicing. While the Supreme Court's decision takes care to make available a fixed price to manufacturers, there is no provision in it which will ensure that the product supplied at the price would be of the requisite quality. It is is not clear who is to be the arbiter in this matter.

Second, the rate of return. The rate of return is compensation for use of capital, and this is related to the interest rate structure and the government's policy on returns to be allowed, in general as well as from different types of activities. So far the government's policy has been to allow a rate of return of 12 per cent on capital employed. One does not know by what logic the Supreme Court has accepted a rate of return of 16 per cent for automobile manufacturers.

Significantly, this return is allowed on total capital employed, even though a substantial part of this capital is obtained, in the form of borrowings, at rates varying between 6 and 10 per cent. The amount of borrowed funds and the rate of interest on them determine the actual return available on owned funds. To allow an equal return on all funds, whether owned or borrowed, has little economic logic. It allows for varying rates of return on owned funds, depending upon the volume of borrowed funds and the rates at which they are obtained.

The more complicated issue is that related to the implications of the Supreme Court's judgment for the government's economic policies. Price control is an aspect of the government's social and economic policies. The main rationale of such price control is the need to slow down the pace of price rise in specific commodities as a means of reducing inflationary pressures in the economy. The government might also decide to allow a relatively lower rate of return in a particular industry (in a luxury goods industry, for instance) in order to prevent undue expansion of that industry. The Supreme Court's decide to allow a relatively lower rate power to the government.

Price freeze and price controls are operated by governments in most countries as part of their administrative efforts to regulate the economy. Even in the most free of the 'free enterprise'

7 years old and already expanding

Soon we will expand our range to include upto 150 mm diameter tubes. Increase our capacity substantially. And diversify into the manufacture of other products. All this in just seven years!

Gujarat Steel Tubes are in demand in 35 international markets. Earn over a crore of rupees in foreign exchange. Account for 10 per cent of the country's total export of steel tubes and pipes. We have increased our exports by 220 per cent since 1966—twice winning Engineering Export Promotion Council awards.

We started with advantages: the enthusiasm and enterprise of youth. Sound technical know-how. An uncompromising dedication to quality. All of which enabled us to declare a dividend in our first year of production.

Since 1966 we have doubled our sales. And added the most modern welding technique—TUFFWELD —high frequency induction welding. Today we are one of 73 export houses recognised by the Government of India.

We look forward to the future with confidence. A confidence born of achievement. The trust of our dealers. The satisfaction of customers. Above all, the unsurpassable quality of our products.

economies, namely the USA, the government recently chose to impose a total price freeze (covering, incidentally, also new models of cars incorporating technical and other improvements which would, on the basis of the Indian Supreme Court's judgment be entitled to a price rise on that ground). Such decisions of the government have not been challenged in any other country; in this country in future they would apparently be open to challenge before the judiciary.

This situation is particularly anomalous in this country because here the government provides various kinds of advantages to industry. For example, industry is given protection not only from external competition (through import control) but also from internal competition (through industrial licensing). In such a situation the government needs to have countervailing powers in order that it can prevent the exploitation of a scarcity situation by a manufacturer. In the process of protecting the manufacturer (but not the user) of a product the Supreme Court appears to deny these powers to the government.

The Court's decision in effect puts the government in a straight-jacket in regard to use of its discretion in economic management. On this basis, manufacturers could challenge many other aspects of the government's economic policies. On considerations of legality rather than justice, the government is virtually denied the right of economic management. Clearly, the implications of the Supreme Court's latest judgment for the exercise of the government's administrative powers needs the most serious consideration.

SOUTH

Loosening in Andhra

Mohit Sen

THE new Chief Minister is an amiable gentleman, a scholar and with long years of administrative experience — if being a Minister does provide such experience. But one quality he conspicuously lacks — a political base of his own. He comes from Telengana and is well known enough. But it would be stretching things to state that this fame has taken or can take the material shape of an organised political following. This fact has been amply demonstrated by the record number of flights that he had to make between Hyderabad and New Delhi in order to form his cabinet. He is dependent on the Prime Minister for everything and makes no secret about it.

From an understanding of this basic weakness of P V Narasimha Rao, it is quite wrong to draw the conclusion that his Ministry is worse than its immediate predecessor. Brahmananda Reddi and the present Chief Minister were cabinet colleagues for a pretty long time. They followed the same policies and, indeed, evolved them together, though the former Chief Minister's share in this was undoubtedly larger. At the time of the Telengana separatist crisis they stood together. Therefore, there is little to choose between the two. If one wishes to go by class analysis, even then one would find it impossible to make a distinction between the two. Essentially, they are both leaders of a Congress which, in the main, represents the interests of the block between the capitalist landlords (or farmers) and the rich peasants.

Brahmananda Reddi happens to come from the more affluent and far more developed delta areas of Andhra, while P V Narasimha Rao comes from the relatively deprived districts of Telengana where, if anything, the landlord interests are stronger than in the delta areas. The former is a Reddy and the latter a Brahmin. These are the differences which, though important at the operational level of routine politics, do not signify when one is considering longer term trends.

Therefore, there is absolutely no reason to bemoan the fact that Brahmananda Reddi stepped down at last. If anything, the people of the state would have been spared some bitterness and anguish had he done so earlier. The appointment of a Chief Minister from Telengana, however politically weak and unrepresentative he may be, was a long overdue political step. Tweedledum has been replaced by Tweedledum! A Tweedledee, evidently, could not be found!

But there is an important consequence of this action which one must properly understand. The stepping down of Brahmananda Reddi will, surely, lead to a loosening of the Congress grip over itself. The former Chief Minister has been deprived of political power but not of factional strength. He has kept financial reserves ready for the coming battle of the ballot boxes. In the first instance his effort would be to secure tickets for as many of his nominees as possible and only after that would he decide to put up rival candidates in many key seats. In this way he hopes to emerge as the leader of a majority of Congress MLAs and then press his claim for reinstatement.

It is not, however, going to be all that easy. Brahmananda Reddi's faction has no stability. It was based essentially on the fact that he was the Chief Minister and so in a position to distribute patronage. Neither a common ideological-political platform nor even caste links wrought it into a cohesive whole. Skill at manipulation the former Chief Minister possessed in abundance and this he used to keep his group together. Sanjeeva Reddy's folly in rushing into a factional compact with Sanjeevaiah was also grist to his mill. The so-called power of state satraps has been grossly overestimated. So one cannot say how much damage the former Chief Minister is capable of at the present moment and much less some three months hence.

All one can say is that factional conflicts in the Congress would be sharper and more pervasive in 1972 than they were in 1967. This is a fact which the Left forces in the state would have to take into account even as they would have to steer clear of any analysis that seeks to project any ideological overtones into this conflict.

What this means is that there are now somewhat better chances of weakening the Congress grip over administrative power in Andhra. It may be possible to reduce the strength of the Congress in the legislature which is an altogether desirable objective. This is the central aim which would, and should, inspire the electoral line of the Left in Andhra. The difference from 1967, of course, would be that any temptation to ally with the Right outside the Congress (the Swatantra and the Syndicate) would have to be shunned. Whether all segments of the Left would be able to resist this temptation remains to be seen.

In this connection mention has to be made of the convention that the Congress Socialist Forum organised in Vijayawada. There is no doubt that it was an impressive gathering which heard Left speeches and passed Left

resolutions. It was a clear demonstration of the fact that radicalised sections of the youth are also being attracted to the radicalised image of the Congress. It is this fact that has alarmed the Rightists in that party. What is more, they seek to make out that the Brahmananda Reddi faction has only rechristened itself as the Congress Socialist Forum. This is a complete travesty of the truth. To this convention a few undesirable elements came but they were from both factions or, rather, all factions. But the overwhelming majority of the delegates were representatives of the new radical currents which have made a swerve in the direction of the Congress.

The CPI and the CPI (M) would have to take note of this new phenomenon. For the former this would present no difficulties, but would the latter be able to make a distinction between this new force and the rest of the Congress? In terms of its programmatic understanding, it would find this impossible but in terms of operational effectiveness it would have to do something. It is necessary to remember that the CPI (M) has in recent months lost yet another of its few remaining strongholds in the state — in Khammam district. Its sectarian rigidity is proving costly and one can sense the growth of a critical outlook among the cadres and members.

In any event, the political quiet of Andhra is over. The loosening one witnesses may well be the prelude to a desirable breakthrough.

MAHARASHTRA

Election Salvoes

THE tension on the Indo-Pak border has diverted attention from two important developments within the Maharashtra Congress. Earlier this month Y B Chavan inaugurated the first conference of the revived Maharashtra unit of the Congress Forum for Socialist Action in Poona. The leadership of the Forum has been thoroughly revamped. The present president is the state Party General Secretary, Sharad Pawar, a known acolyte of the Union Finance Minister. Earlier the Forum had been dominated by men like Tulshidas Jadhav and had threatened to become a platform for those who sought a measure of independence of the Union Finance Minister and the established leadership of the state Congress. Y B Chavan's attitude to the Forum then had been one of indifference. He used to say that there was no need for a separate platform such as that provided by the Forum for prodding the state party and government into accepting socialist programmes because both were already 'socialist-minded'. At the time of the last presidential election, prominent members of the Forum defied his directive to Maharashtra Congress MLAs and MPs to vote for Sanjiva Reddy. After this Chavan could not tolerate the Forum under its then leadership and set about completely revamping it. This process has been completed, it was evident at the Poona conference.

The revived Forum has a further political purpose. Chavan is conscious of the domination of the state Congress by affluent farmers and by those who control the sugar co-operatives. He also knows that there is a big gulf between the state and district level leadership of the party and the rank and file who come from among the small farmers and the poor rural masses. The enthusiam of the latter for the revived Socialist Forum was obvious at the Poona meeting. Chavan's strategy seems to be to give positions in the Forum to people from among the rank and file of the party who are disgruntled at being denied all power in the party itself. This way he hopes to contain the growing frustration in the party at the district and lower levels. If in the process the Forum grows into a force countervailing the established leadership of the state Congress, Chavan would not be unhappy at all. In fact in the state assembly elections he would want to use the Forum, first, as proof of his party's and his own socialist credentials and, second, to dislodge well-entrenched elements in the party leadership whom he has found in the last two or three years challenging his position in the party.

The revival of the Forum is, therefore, viewed by Chief Minister Naik and his Vidarbha colleagues with some apprehension. Naik fears that the Forum would be used to undermine his position. Immediately his apprehensions are that some sections of the Forum would question the sincerity of his declared intention to lower the ceiling on agricultural holdings and to change the basis of fixing of ceilings from the individual to the family.

The danger is not fanciful since even as V P Naik has adopted a radical posture on the question of land ceilings, his followers in western Maharashtra, led by Shankarrao Mohite-Patil, MLA and chairman of a sugar co-operative and a district co-operative bank as also of a host of sale-purchase unions in Sholapur district, have publicly declared their opposition to the lowering of the ceiling and changing of the basis of fixing the ceiling. At a rally of farmers organised and presided over by him at Sadashivnagar in Malshiras taluka of Sholapur district last week Shankarrao Mohite-Patil warned the state government and the party bosses that if the proposed ordinance was proceeded with, they would work against party candidates in the elections and would refuse to give elections funds to the party.

Sadashivnagar Conference

In organising the revolt of the affluent and influential farm lobby against the proposed land ceiling ordinance, Chief Minister Naik has also taken a swipe at his rival for the chief ministership after 1972, Shankarrao Chavan. The Sadashivnagar conference was largely attended by rich farmers from western Maharashtra which is the political base of Shankarrao Chavan.

The Sadashivnagar conference also strongly condemned the revival of the Socialist Forum in the state and attacked Mohan Dharia for what they called his 'left adventurism'. Shankarrao Mohite-Patil and others have also threatened that they would organise even small holders against the new ceiling policy under the slogan that the proposed ordinance would ruin the state's farming community and social fabric once and for all. The threat has been well timed on the eve of the assembly elections when Y B Chavan and the state party bosses cannot afford to antagonise the rich farmers who are the party's pillars in the countryside. Naik also knows that his political adversaries in the party, like PCC President Vasantrao Dada Patil and Y J Mohite, are equally opposed to the lowering of the land ceiling. The meeting of the Pradesh Congress Committee on December 4 and 5, specially convened to discuss the land ceiling question, will be a test of the socialist postures of the Union Finance Minister as well as state leaders like Mohite who have sought to differentiate themselves ideologically from the Chief Minister.

Confusion and Contradictions

(From a Correspondent)

THE ordinance amending the Industries (Development and Regulation) Act is yet another example of our continuing faith in resolutions and amendments as substitutes for policy and purposive executive action. The new measure has been justified on the ground that it would provide an effective answer to the continuing distress in a large number of industries, particularly in West Bengal, and to the large-scale unemployment. That it is unlikely to do anything of the sort comes as no surprise.

Completely Ignored

The dominant theme of the Industries (Development and Regulation) Act is the regulation of production of goods in the scheduled industries. Perhaps this is the reason why the ordinance does not provide the framework for a new policy for development. The provision for taking over the management of units badly managed (through reckless investments, diversion of funds, etc), closed ones and those under liquidation refers to "the production of articles manufactured being affected", to closure "prejudicial to the concerned scheduled industry" and to maintenance of "production, supply and distribution of articles" relatable to the industry as conditions precedent to the take-over of management by government. Fall in demand for traditional items, uneconomic prices, outmoded methods of production, overaged equipment, scarcity of raw materials and inadequate long-term finance for modernisation are some of the causes of 'sickness' of industrial units, particularly in the engineering industry. These considerations appear to have been completely ignored.

There may be several cases in which the shortfall in production of goods of some of the closed/sick units has already been made up by new small-scale units or in which the demand for these goods simply does not exist any more. Will these units which may otherwise have useful equipment, land, other commercial facilities and trained, skilled labour be ignored in the scheme for take-over by government?

Mere take-over of management will not solve the problem of these units. It may add up to no more than unemployment relief for some time with no substantial benefit to the economy. The alternatives of new investment and utilisation of existing production facilities will have to be carefully evaluated with reference to their costs and benefits. Unfortunately, the ordinance has raised hopes of only safeguarding employment and not economic revival. It is to be hoped that government will be able to evaluate the economic justification for taking over industrial units before yielding to the political pressures of organised labour. If some of the closed units have to be reopened for utilising their resources (plant, skills, etc), it should be by means of a completely planned reconstruction and reorganisation programme.

The ordinance does provide for the preparation of schemes of reconstruction. But why the schemes should be prepared only after a period of take-over is not clear. Clearly, the provisions of the ordinance on this subject are loosely and hastily drafted and government would be well advised to alter them drastically. In all cases the schemes of reconstruction should be prepared before the take-over of management. The framing of the schemes should be left to a body like the Industrial Reconstruction Corporation and the government should be bound to accept such schemes or it should permit the Corporation directly to apply to the Court. Again, the possibility of merger of some of the weaker units with more profitable units has not been envisaged at all—another sad omission.

Admission of Defeat

That a government which has shown so much indulgence to organised labour —who are by no means the poor of the country—should seek powers to exempt units managed by it from the operations of the Industrial Disputes Act and the Minimum Wages Act is a clear admission of defeat in the field of industrial relations. The inclusion of the Minimum Wages Act in the list of laws from which the units would be exempt is definitely objectionable. There would be no justification for running any industry which cannot pay a minimum wage—even as unemployment relief.

The timing of this measure, immediately after promises of higher bonus even in unproductive units, shows confusion in objectives and contradictions in policy. Perhaps a pre-election year is not the best period for the evolution of a clear policy.

Exemption from the application of the Industrial Disputes Act, etc, will also apply to units that have already been taken over. If it is admitted that these legislative restrictions hamper the survival of units facing difficulties, there is no reason why such exemption should not be given to these units before they become sick and are taken over by the government. One wonders whether in the context of the large number of closed units in West Bengal this is meant to give some political advantage to one section of organised labour. That the ordinance is not incapable of being so used is a matter of concern.

Unsolved Problems

There are a number of legal and other problems that remain unsolved. If units which cannot be reconstructed have to be sold as running concerns what is the guarantee that they would continue to be run by those who purchase them? Is it necessary that in such cases they should be run for some time with government subsidy or with government financing the losses? Instead, is it not possible that these could be sold free of encumbrances even before the government takes over the management for some time? The position of the creditors to whom the fixed assets are mortgaged is not clear either. There are a number of such problems for which answers have to be found. Perhaps it would be futile to expect a hurriedly put together piece of legislation to have provided all the answers.

One may, however, conclude on a note of optimism. There has been no dearth of enabling legislation that has not been effectively used. (Chapter IV-A of the Companies Act providing for removal of managerial personnel, is only one instance.) No great harm has perhaps been done by adding to this list. Nothing has been said about the necessity for an ordinance that has not been made use of in the two weeks following its promulgation. Perhaps this is a matter for parliamentary privilege and not public concern.

BONN

Indira's Ostpolitik — and Brandt's

Aswini K Ray

THE Government of India's role in South Asia is indeed becoming 'curiouser and curiouser' for those innocents who have stubbornly resisted all logic. Indira Gandhi's position as the kingpin of the South Asian *status quo* has been obvious to all except a section of our establishment intellectuals. Her desire for 'normalisation' of relations with China, a long-term treaty of friendship with the Soviet Union, and a 'goodwill' tour of the West in the midst of a crisis, leaves no doubt as to the role the Indian Prime Minister is to play. She only had to prove her bonafides before being allowed — and helped — to play that role.

In this sense, the Indian Prime Minister's Western odyssey was a great success. At home, she has managed to retain the right radical image. In the West, her oft-recurring, often out of context, allusion to Vietnam in relation to the Bangla Desh issue left one with the uneasy suspicion that she might be thinking of the Ganges Delta as the future key domino, now that the Mekong Delta is as good as lost to the 'free' world.

By the time the Indian Prime Minister reached the last leg of her tour in Bonn, it was obvious that, despite all the sound and fury at home, neither the loss of credibility of the Awami League nor the disintegration of Pakistan (as distinct from its weakening) — in that order of priority — was in the Government of India's interests. The much talked of 'political settlement' of the Pakistan problem had to reckon with these two variables. An Indo-Pak war, which could lead to the disintegration of Pakistan, would not be in India's interests; war can only be thrust upon India by the shortsightedness of the Pakistan military *junta* whose policies have posed new problems for the 'free' world's freedom. Short of war (if possible), and even after a war (only if unavoidable), the generals must negotiate wth the Awami League. Indira Gandhi even agreed to talk with Yahya Khan — which would have been difficult to announce in India particularly after what the General promised, through *Le Figaro*, to tell her — but, "only on condition that Bangla Desh was not discussed". The success of the Prime Minister's tour "to convey to the West the Indian people's greetings and goodwill", lay in her ability to elicit general Western support for the immediate goals of Indian diplomacy in South Asia — which had been earlier underwritten by the Soviet Union, and to which China lately seems to be reluctantly reconciled, at least for the time being.

Many Promises

Many other smaller promises were made and given: there would be no lack of Western sympathy, and even bounty, for the non-rehabilitation of the Bangla Desh refugees; in return India would not recognise either the dream of a *swadhin* Bangla Desh or the reality of a German Democratic Republic "till the proper time". At her television interview in Bonn, the Indian Prime Minister was asked a few uncomfortable questions: right of self-determination in Kashmir and a possible growth of secessionist sentiments in the CPM-dominated West Bengal. As always, her answers were legally incontrovertible. She even went out of the way to warn the East Bengalis against any latent desire for a united Bengal: "the industrially advanced West Bengal would dominate the East".

Enough of our synthetic *Ostpolitik*. Now to Willy Brandt's patented variety, which recently won the Nobel Peace Prize — an acknowledgment of the 'free' world's gratitude to the West German Chancellor. The Swedish Parliament's announcement could not have been better timed for Brandt, who was in a bit of a spot ever since his return from Crimea. A desperate opposition, a week away from its party elections in which parliamentary leader Rainer Barzel's entire political career lay at stake, awaited his return from Crimea. A section of the press, angry at the lack of Russian response to some of their top correspondents who wanted to 'cover' Crimea, set the tone for the opposition clamour. The government straightaway walked into the trap. In the special Bundestag debate on the issue, the opposition announced 'total confrontation' against the government's foreign policy and accused the government of subverting the Western allies by not taking proven friends into confidence prior to the talks and by shrouding the Crimean talks in mystery. Brandt was also accused of talking with the Soviet Communist Party Secretary rather than the governmental functionary. Formally speaking, the criticism of the opposition was tenable, and, in any case, not even all the rabble-rousing by its parliamentary leader Herbert Wehner — SPD's man for all seasons — could help the ruling coalition.

In fact, for a time, everything seemed to be going wrong with the ruling coalition. Shortly after the much-publicised Four Power Berlin Agreement, the intra-German dialogue appeared to be heading towards a dead-end as the East Germans could not find any official German version of the text to form the basis for negotiations. Almost simultaneously, US Ambassador Rush announced at the West Berlin Chamber of Commerce that his country would not ratify any Berlin agreement before a "satisfactory regulation of the Berlin traffic" between the two Germanies.

Britain's Negative Tactics

Relations with France remained cool, begiming with the currency crisis. Nor were they helped by the French fear that their traditional rivals were trying to rob them of their 'legal' inheritance of the Eastern trade from the de Gaulle era. Warning signals also came from across the channel: conservative Britain was hell-bent upon proving, if necessary by negative tactics, that Britain still remained great, and that a European security conference was inconceivable without Whitehall's active endorsement. Two years after the original 'discovery' of a Soviet spy ring in Britain, Douglas-Home suddenly announced that KGB espionage had reached too dangerous a stage for the island's security. This made headline news in this country, as elsewhere, and the Springer press 'found' Bolshevik agents in all corners of West Germany and railed about the sort of people the Brandt government was trying to make peace with. The government was clearly on the defensive.

The ruling coalition's defence was to play down foreign policy issues and to focus public attention on controversial domestic reforms. The day after returning from Crimea, the Chancellor spoke to the trade union conference about the government's determination to push through legislation enabling workers' participation in management; the budget debate and the tax reforms were put on the anvil; the controversial Rent Control Act was put up for a second vote in the *Bundesrat* (upper house of the federal parliament which still has a majority opposition coalition), and, as anticipated, for the second time, the opposition stood exposed as a collection of rentiers, speculators, and finance capitalists; the debate on reform of the laws concerning abortion by choice was revived; and inevitably the search operations for the so-called 'Baader-Meinoff Group', the anarchist red rebels of West Germany, was dramatised to new heights.

Unexpected Help

Help for the government soon came from an unexpected quarter. French President Pompidou's telegram to Brandt, endorsing his *Ostpolitik* and his Crimean talks, and proposing a Franco-German summit on the currency issue, arrived on the very day the West German Chancellor was answering charges of subverting the Western alliance in the *Bundestag*. Later events, however, proved that the French President was only keeping his own record straight before his historic welcome for Brezhnev in Paris. The Russians also came to the rescue of the West German Government. Once again: they replied to British intransigence with strong warnings, but mild reprisals. And the East Germans, fairly soon, found a new basis for the continuation of the Bahr-Kohl intra-German talks. The announcement of the Nobel Prize came just at this moment which made it most timely. Even in ordinary times such an honour for a ruling politician would be big news but the party machinery made the news appear as if it was the event of the year. Meanwhile, on the opposition side, Rainer Barzel had been elected as the party leader of the CDU by an overwhelming majority, and, the defeat of Helmut Kohl meant the end of Gerhard Schroeder's candidature for shadow Chancellorship. Strauss, the leader of the sister CSU, who was till recently playing all the tricks of the trade, biding his time for standing for the same post, has now found the going too rough and announced his preference for "growing pineapples in Alaska rather than be the [shadow] Chancellor". Barzel, more responsible, now that he is on the way to becoming the uncrowned king of the opposition, wrote to the Chancellor, the very day he was awarded the Nobel Prize, climbing down from a position of 'total confrontation' and offering 'qualified co-operation'.

In Paris, Brezhnev managed to cash in on the Franco-German competition for Soviet affections. He let it be known that Citroen was preferred to Daimler-Benz for the manufacture of trucks in the Soviet Union. But presumably the West Germans will now be given the opportunity to help build the gas pipeline from Siberia. Moreover, on his way back from Paris Brezhnev stopped over in East Berlin. Soon after Brezhnev's departure for Moscow, East German Party Secretary Honecker announced that a satisfactory solution of the Berlin traffic problem would be found before Christmas. The Bahr-Kohl talks swiftly reached the stage where experts from both sides were called in to work out the details. The Aeroflot delegation followed suit and worked out a new deal with Lufthansa, indicating one more step forward in the new Bonn-Moscow relationship.

SAIGON

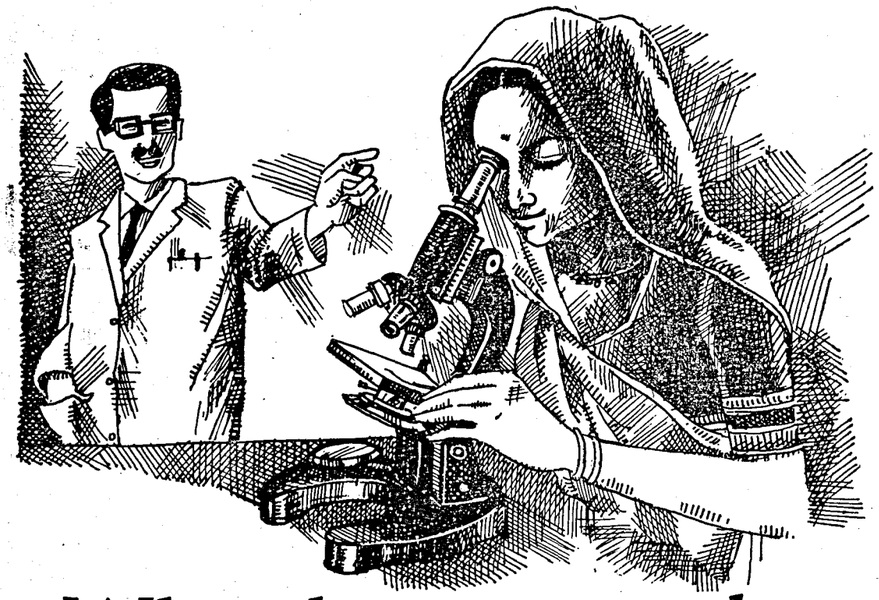
Distribution Centre for US Arms

Harish Chandola

THE United States is sending vast quantities of war material out of Vietnam. In the two fiscal years ending June 1971, the US distributed to its military allies in Asia and shipped home military equipment valued at three billion US dollars from its Vietnam stocks. During the fiscal year 1972 (from July 1971 to June 1972), a total of 440,000 short tons of war material will be shipped out of Vietnam from the four military ports established and controlled by the US in this country (New Port, Camranh Bay, Qui Nhon and Danang). According to the US military authorities, nothing, not even scrap, will be left in Vietnam. All material will be sold, shipped or used.

How is it that the US has such huge surpluses of military equipment in Vietnam? The apparent reason is that the surpluses have been generated by the withdrawal of US combat troops. But what is not so apparent is that while withdrawing its combat forces, the US is also equipping a large number of South Vietnamese troops besides equipping Laotian and Cambodian forces from its stocks in Vietnam. To be exact, while the US has so far withdrawn 350,000 of its troops, it has equipped nearly five times that number of South Vietnamese: 1,100,000 men of the Army of the Republic of South Vietnam, plus 500,000 South Vietnamese provincial and village defence forces.

How could there then be such vast surpluses when the overall requirement of military hardware in Vietnam and the other two Indochina countries has considerably gone up? Observers have come to the conclusion that Vietnam had been developed by the US as a centre for distribution of military equipment to its allies in Asia. This conclusion is strengthened by the fact that most of the equipment leaving Vietnam is not going back to the United States but to Asian and Pacific countries. Of the equipment so far sent out of Vietnam, only 28 per cent went back to the US. Forty per cent of it went to Okinawa, five per cent to Japan and 27 per cent to the Philippines, Korea, Taiwan and Thailand. In terms of tonnages, in the fiscal year ending June 1971, 181,827 short tons of military hardware went from Vietnam to Okinawa, 22,480 to Japan, 126,604 to the US and 119,324 to US allies in Asia. Of course, a lot of this equipment was not in serviceable condition. The US has large repair depots in Okinawa, Formosa, the Philippines and Japan, and it has now begun utilising the repair facilities for ships and river craft in Singapore.



All military equipment sent out of Vietnam is classified into four grades. Items that need minor attention, like painting and patching up, are placed in the first category. Those needing more complicated repair are placed in the second. Those that have to be sent to depots outside for rebuilding are placed in the third and the fourth category consists of items which are economically unrepairable. Components in good condition are salvaged from the unrepairable item — like a carburettor or a starter from a military vehicle — and the remaining hulk is then sent to the Property Disposal Yard where it is auctioned in lots.

Incoming Equipment

South Vietnam has been and shall continue to be the US supply depot for the armed forces of not only South Vietnam but also of Cambodia and Laos. And so, while one sees a lot of military equipment leaving Vietnam, one can also witness at the four US military ports, new equipment, including trucks and all kinds of vehicles, arriving in the country. The incoming equipment is largely for the armed forces of the three Indochina countries.

The consignments of arms leaving Vietnam for the Pacific area bring to light a chain of US arms distribution centres in that region. These centres are not merely convenient points for despatching arms to Asian countries, but are also large depots where mili-

Milk co-operatives as an instrument for adult education

What happens when a village woman in Kaira peers at buffalo semen through a microscope?

In Kaira, batches of women – most of them illiterate – visit the artificial insemination centre every day. They learn the mysteries of conception and birth in scientific terms, from the technicians employed by their milk co-operative. Can they help relating these facts to themselves? When their technicians speak of the nutrition needs of buffaloes and calves, their thoughts turn to themselves and their children.

A new view of their own life begins to form, and the frontiers of knowledge widen. When true education begins, superstition breaks down.

Amul has shown the way.

ASP/ABF/SP-12

tary trucks, tanks, armoured personnel carriers, artillery, communication equipment, sea and river craft, and even aeroplanes are repaired, assembled, and rebuilt. That is why 40 per cent of US arms and equipment from Vietnam goes to Okinawa, which itself has no demand for these things. At Okinawa the US Department of Defence has established an organisation called Pacific Utilisation and Redistribution Activity (PURA), which sends out arms and equipment to Asian countries. Representatives of Asian countries covered by the US Military Assistance Programme visit Okinawa to identity the equipment they need.

Besides those in Okinawa, the US has other large repair and rebuilding depots. In South Korea there are depots for rebuilding military vehicles and sending out material under the Military Assistance Programme, in the Philippines for marine maintenance and property disposal (bulk disposal of economically unserviceable items) and in Taiwan largely for maintenance and rebuilding of vehicles like earth-movers and road-building equipment, and for electrical equipment like generators.

PHILIPPINES

Democracy Asserts Itself

T J S George

THE off-year elections in the Philippines attracted worldwide publicity mostly because of the violence which attended them. Nearly 200 politically motivated murders took place — and the world press lapped them up in gleeful confirmation of its notions about the Philippines as a blood and guts society.

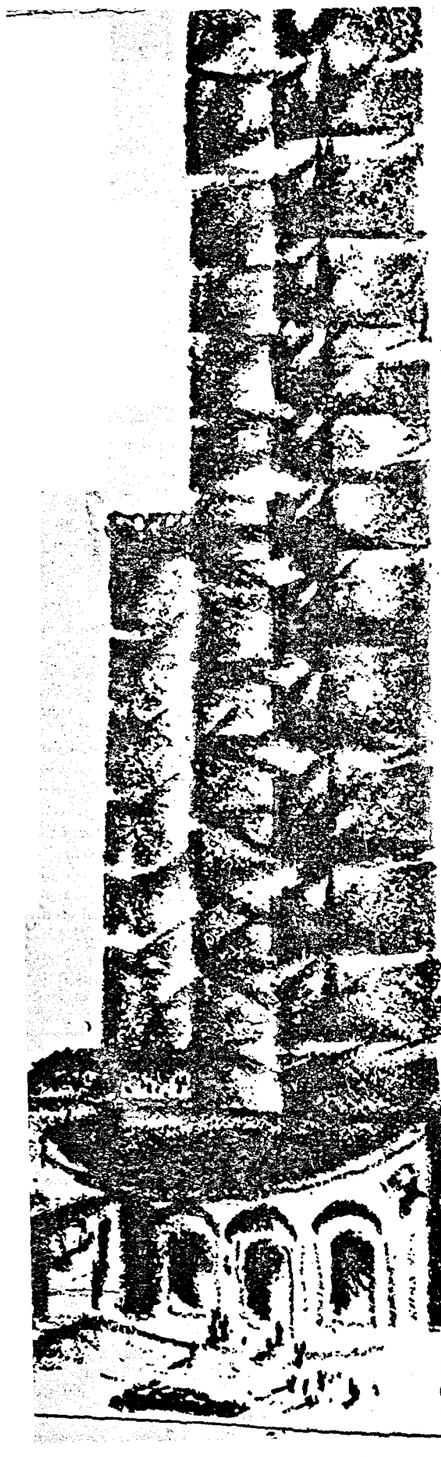
A more serious analysis of the events will, however, highlight two significant facts. First, the murders were related almost entirely to local and municipal elections as distinct from elections to the eight senate seats. Second, despite the violence, there was a notable absence of electoral fraud which has prompted Filipinos to say proudly that the system of democracy is alive and well.

In terms of party power and national politics, what mattered was the senate race, not contests for the more than 15,000 provincial and city offices at stake. In this race, the ruling Nacionalista Party was badly beaten. All eight candidates of the Nacionalista Party were shining stars of the political firmament, four of them members of the present government. But all except two of them were soundly trounced. The opposition Liberal Party's six winners were carried to victory by almost a landslide vote.

The rejection of the Nacionalista candidates was in fact a rejection of President Ferdinand Marcos. For, in this election Marcos was the central issue. The two years following his historic re-election in 1969 have seen Marcos becoming one of the most controversial presidents in Philippine history. A nationwide political debate has been raging and the November elections provided the first opportunity for the people to show what they thought of their President. They expressed their feelings unequivocally. Marcos comes from the northern province of Ilocos and this area has been considered an impregnable bastion of his Nacionalista Party. But this time the bastion was breached by the Liberal Party which did much better than the ruling party in Ilocos.

The reasons for Marcos' popularity plummetting are clear enough. In these two years prices have rocketed. Unemployment has increased. There has been no letup in corruption. Law and order has gone completely haywire. General economic deterioration seems to have been aggravated by the prolonged floating of the peso. Above all, the President has given the impression that he is manipulating affairs with a view to securing yet another term for himself. There is widespread suspicion among Filipinos that if the constitutional bar on a president seeking a third term continues, Marcos might put up his energetic, ambitious and popular wife, Imelda, as presidential candidate in 1973.

The most spectacular and immediate cause for the Nacionalista debacle was evidently what is known as the Plaza Miranda incident. The Liberals had convened a massive public rally in this Manila square on August 21, where some unknown people hurled fragmentation bombs at the platform. Some ten people were killed and almost every top leader of the party was maimed. It is fair to say that the Nacionalistas lost the election that night.



It has not been proved that the Nacionalista Party had any hand in that bomb attack. But Manilans know that an over-enthusiastic party man had in fact done so; the *cognoscenti* even know the name of the person. It is also known that this man staged the mass assassination attempt without the President's knowledge. But the President's image has suffered all the same because the government has so far failed to book even one suspect in connection with the bomb attack.

Pressing home their advantage, the Liberal leaders began campaigning from wheel chairs and crutches. Heavily bandaged Liberals attracted huge audiences wherever they went. A measure of the sympathy votes they won is that the man who was most seriously wounded by the attack, Jovito Salonga, emerged the biggest vote-getter in the election. Ramon Bhagatsingh (a Filipino of Indian origin), who is not a Liberal but was supported by the Liberals — and lost a leg at Plaza Miranda — succeeded in getting elected as mayor of Manila, defeating the powerful Antonio Villegas who had been mayor for 12 years.

The defeat of the ruling party with its superior resources and advantages of power was, as Filipinos claimed, a tribute to the fundamental health of their democracy. As if to confirm this, Marcos immediately made the right kind of noises. He publicly recognised the popular desire for a less partisan approach to urgent national issues and invited the Liberal Party to actively participate in the government's policy-making councils. The Liberals for their part set up a shadow cabinet to prepare for their expected victory in 1973.

But it would be a bit too premature to expect the Philippines to settle down to a period of constructive bipartisan politics. It is somehow difficult to imagine Marcos accepting the idea that he should behave like a lameduck president. He has a serious credibility problem and not many Filipinos believe him when he says he will retire from politics in 1973. Liberal leaders for their part say that Marcos is essentially a warrior and will now regroup his forces with a view to staging a comeback at an appropriate time.

Given his political shrewdness, Marcos can use his power to play one group against another or otherwise consolidate his hold on the political machine. If it comes to the worst, he can easily contrive a constitutional crisis and declare martial law under which he would be able to rule with absolute power. But it is doubtful whether he would go in for such extreme measures. He may rather take advantage of the rivalries that are bound to develop among the Liberal Party's presidential hopefuls and strike bargains with one group or another. In the sense, the really intensive phase of the political struggle in the Philippines is only beginning.

FEEL THE PULSE OF PROGRESS

All the time we are planning more and more years ahead. Planning, striving, attaining, both the possible and the impossible. Setting our sights to new horizons everyday. For all the time we are catching up sooner than we planned, on tiers built of achievements.

10,000 industrial units to date is not a mere term in Urban Dynamics. The sky scraper is only a visual symbol of how we are catching up, higher and higher, what we are planning year after year, farther into the future. Pulsating with dynamism — an outcome of successful industrial endeavours.

The basic essentials for progress are here. An abundance of natural resources, Developed land. Surplus power. Communication & transportation network. Trained manpower. All coupled with the state's encouragement and incentive schemes bring maximisation of opportunities within the reach of every enterprising individual or group of entrepreneurs.

You are invited to share this opportunity and the prosperity.

MSIIDC helps decision makers to invest in an industrial future.

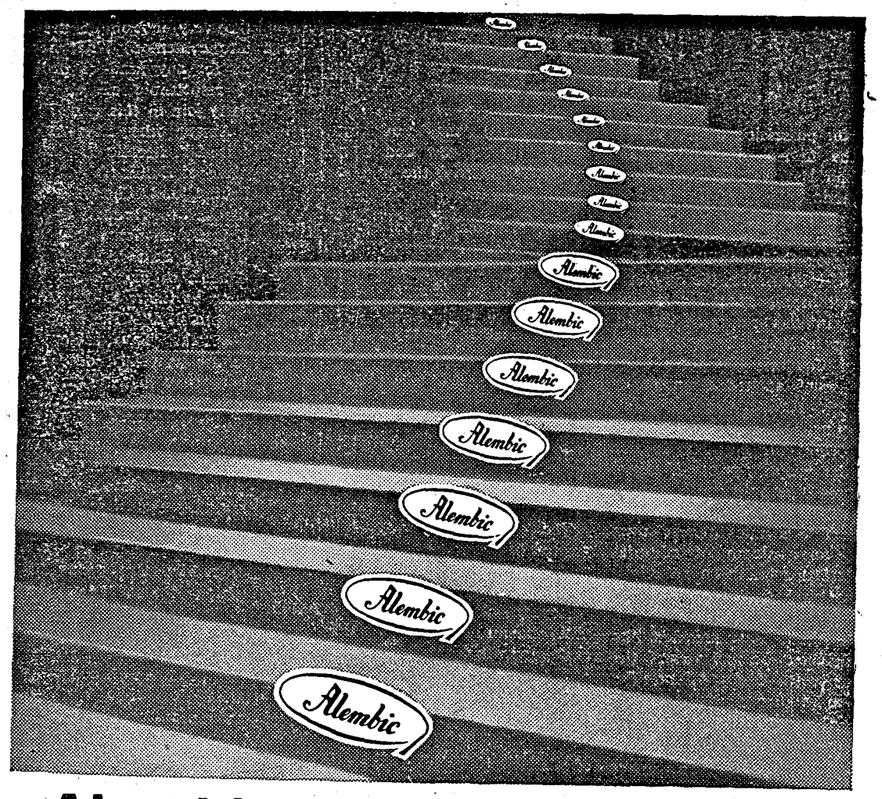
To Flog a Dead Horse

Nireekshak

THE fight for possession of the yoked bullocks—the former election symbol of the Indian National Congress—had "for all practical purposes [become] a dead issue after the Congress (R) had clearly established its massive majority in the last Lok Sabha poll", as *Tribune* put it. Nevertheless the Supreme Court verdict in the symbol case and its 'sequel' in the seizure of the old AICC offices in New Delhi by some members of Congress (R), have been subjects of much excited comment in the press.

"The symbol issue seemed to be important before the elections to the House of the People", wrote *National Herald*: "now it is only one of academic interest." Yet, the paper proceeded to spread its 'academic interest' over more than one column of editorial comment. "There has been no doubt what the Indian National Congress is", it declared. "It is only the Syndicate, over which Nijalingappa presided like a pinchbeck Napoleon and over the remnants of which Sadiq Ali presides with absence of dignity, that pretended to be the Congress." And now that "the figleaf of the symbol claim has been removed, the Syndicate stands as exposed as a nude by Epstein in one of London's parks". (If anyone wants to know whether an Epstein made in a London park has any particular relevance to the Syndicate, or why any other nude in any other park anywhere else by any other sculptor cannot do justice to the Syndicate, he should of course write a letter to the editor!)

According to the *Indian Nation*, again, the verdict of the Supreme Court has only symbolic value. "The real victory is of the Election Commission whose impartiality had been seriously questioned by a political party. It is a matter of deep satisfaction for the country that the Commission has emerged clean out of this ordeal." As for Congress (O), *Nation* said, "whatever the legal implications, there is no justification now for Nijalingappa's faction to call itself Congress party. It will have to choose a new name" — which indeed it has since been compelled to do, having been asked to do so by the Election Commission. Some newspapers like *Amrita Bazar Patrika* correctly anticipated that the Congress (R) "may not discard the symbol [of] a cow and a calf with which it contested the mid-term elections".



"The historical symbol of a political party such as the Indian National Congress", asserted *Deccan Herald*, "is avocative of its glorious record of service and also signifies all that it stands for. It more or less represents its very soul, and with the Supreme Court also confirming where that soul resides, together with the assertion that for all election purposes the ruling party in the Indian National Congress, any resistance by the Syndicate to do its obvious duty can only invite ridicule to itself."

The takeover by Congress (R) was greeted by newspapers with such words as "outrage at Jantar Mantar" (*Mail*); "unfortunate" (*Nagpur Times*); and "arrogance of power" (*Times of India*). "The manner of this unlawful seizure", exclaimed *Mail*, "smacks of Fascism.... If the Prime Minister did not instigate her followers to commit this outrage, she has certainly connived at it since the building has not been vacated so far. What has happened...is an illustration of might being right...of gangsterism." "Thoughtful people view with concern", *Mail* added, "the widespread symptoms of incipient Fascism in India where mob rule is gradually replacing the rule of law. It is in the interest of the New Congress itself that this tendency should be suppressed and obedience to the law strictly enforced."

Nagpur Times showed it was equally upset. "In view of the definite observations by the Court defining the scope of the Election Commission's decision as 'limited' and also stating that the proper forum for adjudication of disputes about property is civil courts, the action of the members of the ruling party...in taking the law into their own hands and forcing entry into the building...is, to say the least, unfair... [and] cannot be described as anything but trespass....This is a sad and perhaps dangerous precedent." *Times of India* also spoke with unconcealed heat when it said: "The Congress (R) members have disgraced themselves. As it is there are any number of small groups in the country busy bringing the very motion of the rule of law into contempt. What hope can there be for any kind of ordered progress if responsible officials of the ruling party join in this game?"

Among other issues which attracted editorial attention, mention may be made of Zulfikar Ali Bhutto's visit to Peking and Chou En-lai's letter of thanks to Indira Gandhi. Though Bhutto's mission had a "cordial reception" in Peking, wrote *Hindu*, "it is difficult to discern any fresh commitment by China to the Pakistan military dictatorship." The announcement that the talks "have achieved satisfactory results...certainly does not give the impression that the Chinese have given the Pakistanis a blank cheque for immediate assistance." As China has advised Pakistan to work for a 'reasonable settlement' of the Bangla Desh crisis, *Hitavada* observed, the "obvious hint" is that "such efforts have not been made so far by the military dictator of Pakistan". The Chinese Foreign Minister's speech "may be interpreted as a polite hint to Yahya Khan to gain the confidence of his own people, instead of throwing himself headlong into a military adventure... The Chinese may or may not help Pakistan. But they would certainly not encourage Pakistan to fight a self-invited war, and drag China into it."

Chou En-lai's letter to Indira Gandhi, thanking her for India's vote in favour of China's admission to the United Nations, represents "nothing more than a routine diplomatic courtesy", said *Free Press Journal*. "The extraordinary importance which is being attached to the India-China exchanges is only a measure of the near-total absence of such diplomatic civilities between the two governments in recent years. Certainly, the revival of courtesies is to be welcomed. But... Mr Chou's exhortation that the friendship between the peoples of China and India may grow and develop daily...will have to be read without emotion, indeed cautiously", it said. *Deccan Chronicle* took much the same view, though on a somewhat more hopeful note. Mr Chou's message "may be construed only as a routine courtesy", it said, "but the Chinese leaders are not known to waste their words. If nothing more than "diplomatic etiquette" was involved, Chou's message "would have stopped at thanking the Prime Minister without frills."

Alembic—where the pursuit of progress is endless!

Sixty-one years devoted to easing human pain, allaying suffering, bringing health to the people, fertility to the soil ...this has been Alembic's mission.

Alembic has placed in the hands of doctors the means to fight almost every disease. Alembic's antibiotic plant is the first in the private sector and the most modern in India. Alembic's home remedies, tonics and nutritional and cough preparations have become household words. Alembic also produces fertilizers, pesticides, cattle and poultry feed supplements to invigorate the land and livestock.

Alembic does not rest on its laurels—its endeavours are continuous. In its up-to-date, well-equipped, well-manned research division it carries out fundamental and applied research in Organic Chemistry, Biochemistry, Pharmacology, Chemotherapy, Microbiology, Immunology...to discover more potent weapons against disease, to find new ways to promote health and growth, and to set ever higher standards for further achievements.

Health assures happiness. Alembic *assures health*

Foreign Policy Planning

B L Maheshwari

Foreign Policy and Its Planning by K P Misra; Asia Publishing House, Bombay, 1970; pp 88; Rs 15.

THE study of foreign policy is an underdeveloped area in India. Few scholars devote full time to this field and one often finds it difficult to recommend even a couple of good books on Indian foreign policy. Moreover, in spite of our conscious acceptance of the need for planning at the national level, foreign policy planning has been a neglected subject. It is in this context that the attempt of a scholar of K P Misra's standing in analysing the issues, the institutional aspects and the prospects of foreign policy planning becomes a very commendable thing.

Mishra begins and ends by stating that foreign policy is much too serious a matter to be left to civil servants and politicians and indicates in the book that the politicians and the civil servants also seem to agree with this view. There seems to be a general agreement on (i) the interrelationship between the domestic political process and foreign policy; (ii) increased scope, complexity and impact of foreign policies in modern times; and hence (iii) the need for planning in foreign policy. The author rightly points out that whereas democratic politics are open politics, the decision making process in foreign policy is often secret. The Pentagon Papers also established this. Misra, however, does not agree with the oft-cited view that the democratic system is not conducive to effective formulation and implementation of foreign policy. He suggests that foreign policy should be studied as an integral part of the overall policy process and methods and approaches developed in the policy science could be applied to it.

The author does not deny that some sort of planning is inherent in foreign policy but he stresses the need for conscious, structured and deliberate planning. Obviously, as the foreign policy situations become more complex, the need for policy planning is felt more urgently. The establishment of the Policy Planning Council in the US State Department in 1947 marked the beginning of such conscious planning. In India, no formal foreign policy planning machinery was created until 1962, largely due to Nehru's dominating role in the Indian political system.

By providing chronological review of the planning efforts in Indian foreign policy, Misra amply demonstrates that the process of institutionalisation was accelerated during the last decade. The Policy Planning and Review Committee in the Ministry of External Affairs was set up in 1966.

All through this book, the author compares the institutions and practices in India with those in the Western countries. He also emphasises the importance of close linkages between foreign policy and domestic politics. Since the author relies entirely on public materials, his analysis and, more than that, his prescription for future suffer from a sort of fascination with the institutional structure without adequate understanding of the processes of decision-making. This is not unusual because Indian scholars have had little access to the policy makers and the policy-making processes. It would have, therefore, been useful if the author could present authentic case studies of foreign policy planning in India. This would have sharpened his specific recommendations. This would have also helped him to reduce his reliance on American and British examples to substantiate his assertions in the numerous footnotes.

Looking to the future of foreign policy planning, Misra recommends three institutional remedies, i e, (i) establishment of a National Council of Foreign Policy, consisting of representatives of various political parties; (ii) appointment of an Expert Advisory Committee consisting of 20 to 30 eminent experts; and, (iii) strengthening of planning capability in the Ministry of External Affairs, particularly the Policy Planning and Review Division. He seems to think that the proposed National Council and the Advisory Committee will promote the process of consensus building and provide the policy planners with political support and research-based knowledge.

These suggestions are not new and, therefore, it is important to investigate the reasons for non-implementation. In fact, already there is considerable degree of agreement on the direction and substance of Indian foreign policy. The scholars engaged in the study of foreign policy in India have failed to present even new angles of analysis, not to speak of new strategies and action plans. With about two decades of experience of the study of international relations, Misra is aware of the limitations of Indian scholarly effort in this area. He himself points out to the existence of outdated syllabi and research programmes of the universities and other institutions and questions the relevance of what is being done there. Then, is it not unrealistic to hope for establishing closer links between the foreign policy planners and the growing body of scholars in this field?

Strengthening of the Planning and Review Division again is a desirable thing but the author has not discussed the implications of this for the organisation of the Ministry of External Affairs. For one who is "an outsider to the foreign policy planning process", his insights are penetrating and Misra deserves congratulations for this competent analysis. The problem of foreign policy planning, however, is not one of lack of ideals but essentially one of lack of acceptance and implementation. The two obstacles here are the arrogance of the civil servants and politicians and the inadequacy of the scholars.

A Straight Survey

Vinod Mehta

The Trade Unions in Maharashtra (A Basic Survey 1967-69), Labour Studies Number 1, Labour Research Cell at Bombay Labour Institute, Bombay, 1971; pp xi +225.

THIS volume is a basic survey of the organisational and financial aspects of trade unions in Maharashtra. It gives detailed statistical information together with a resume of the salient points. The object of the survey is to furnish basic data for further research.

The survey covers 1,057, or 46 per cent, of the 2,307 unions which were on the register of the Labour Department during 1967. Only those which were fairly regular in sending their returns during 1968 or 1969 are included in the survey.

The data have been classified according to the affiliation of the unions to one of the central labour organisations, *viz*, AITUC, BMS, HMP, HMS, INTUC and UTUC. There is also another category of unions which have been lumped together under the head 'Not Affiliated'. The breakdown of data according to the state, divisional and district levels is also given. The organisational aspect provides information on the size of the unions, the industrywise classification, and the classification according to the sector of operation. The financial aspect covers the income and expenditure patterns of the trade unions.

A cursory glance at the data would reveal that the numerically strong unions are not necessarily financially strong also—as can be seen from the following Table where the six central labour organisations have been ranked according to their membership and financial position.

	Rank in Terms of Membership	Rank in Terms of Income
HMS	I	II
INTUC	II	I
HMP	III	III
BMS	IV	V
AITUC	V	IV
UTUC	VI	VI

The category of non-affiliated unions requires special attention as it claims 32.39 per cent of the total membership and accounts for 38.6 per cent of the total income of all unions in the survey. These unions rely to a considerable extent upon donations for their funds. About one-fourth of their income is made up of donations. Thus these two characteristics — (i) keeping aloof from central labour organisations and (ii) dependence upon donations — raises a number of fundamental and interesting questions. If they are not affiliated to any of the central labour organisations, are they associated with any other local political party? Or are these unions sponsored by employers as rival unions? What is their role in the trade union movement? The present volume does not provide any information on these questions.

One should be cautious while interpreting even the available data. One would be susceptible to bias which may be immanent in the data. As indicated earlier, the survey covers only those unions which were fairly regular in sending their returns during 1968-69. It may be that a number of unions affiliated to a particular central labour organisation are not regular in sending their returns; the data, therefore, may not reflect true organisational characteristics.

As it is the first of the Labour Studies Series, it is to be hoped that the Labour Research Cell will put out a much-needed survey on the unregistered trade unions. With the funds and other resources at their disposal this should not be a difficult task.

SPECIAL ARTICLES

What Did Fail?

Loop (IUCD) as a Contraceptive? Administrators of Loop Programme? Or, Our Ill-Conceived Expectations?

Kumudini Dandekar
Surekha Nikam

The loop programme has made no headway in India. This is contrary to the reported experience in a number of other Asian countries. The present article is an attempt to diagnose the Indian case.

NO contraceptive device was ever tested, retested and evaluated to the extent and scale of IUCD, before its introduction for use among the masses. As for other contraceptives, they stood the test of popularity by use and tradition. Their testing was being done not in the laboratory atmosphere of the hospitals, but in the bed-rooms. Their results were not estimated and published after applying complicated techniques such as life-table techniques. Their popularity was passed on to people not by figures but by word of mouth. Quick popularity and fast acceptance by the vast illiterate majority was never expected of them as of IUCD. The IUCD programme in India was very cautiously launched after watching the results in the rest of the world and especially in Asian countries such as Korea, Taiwan, Thailand and Pakistan. Moreover, to judge the reactions of local women, a number of careful studies were conducted in India itself in urban—mostly city—clinics. The results of such IUCD programmes were presumably useful for launching the programme in the rural populations, only if all those connected with its administration were well aware of the results to ensure confidence regarding the contraceptive device. Did the results in urban clinics resemble those in other Asian countries? Did the administrators of the rural programmes know about them? Did they handle the rural programme the same way as they did the urban one? If not, did they put a good contraceptive instrument into disrepute and lose the chance of effective population control?

The following is a carefully recorded experience with IUCD in the non-city areas of Maharashtra.

In Maharashtra state the loop programme was zealously launched in 1965 with a total of more than 2,71,000 insertions during the two years 1965-67. This indicated a very promising response and was almost equal to the intended target for IUCD insertions set for later years. However, the numbers of insertions declined fast in the following years. In 1967-68 there were only 28,000 insertions and in the two following years there were respectively only 11 and 10 thousand. The year 1970-71 saw only about six thousand insertions. Thus the loop-insertions for Maharashtra did not attain any sizeable proportion of the stipulated targets for the state.

TABLE : TERMINATION RATES OF INTRA-UTERINE CONTRACEPTIVE DEVICE

Interval after IUCD Insertion (months)	Cumulative Rate of Termination per 100 Insertions					
	Our Sample[1]	Poona City[1]	Urban Clinics[2] in India (D V R Murty's report)	Taichung[3] in Taiwan	Korea[2]	United States

* Calculations for this interval are not reliable being based on small number of observations.

1 For IUCD size 30 mm.
2 For IUCD size 27.5 and 30 mm.
3 For IUCD size 27.5, 30 and 31 mm.
4 For IUCD size 31 mm.

We attended 65 loop camps held during 1965-67 in non-city areas of Maharashtra. Our interest was in watching the administration of such a mass programme. Moreover, we wanted to conduct a follow-up of the loop cases later to assess the effectiveness of the programme. Selecting a sample of 3,365 loop acceptors in the camps, we tried to contact them during 1967 to 1970. Of these, we dropped 767 because they belonged to villages with less than 15 cases. This was necessary to avoid the prohibitive costs of investigation. Thus we were left with 2,598 loop cases from the camps.

At the very outset it is worth noting that only 132 cases out of 2,598 were considered unifit for loop-insertion by medical doctors at the camps. Excluding the pregnant few, they did not constitute even five per cent of the total while in mass programmes in other countries of the world, 20 per cent or more were considered ineligible for loop-insertion due to some health or physical derangement. This can be explained only on two grounds. One is that our women were more fit for loop-insertion compared to other women exposed to the loop programme. Or our screening processes of the ineligible were defective. The first seems highly unlikely, as the conditions of ineligibility for loop included a variety of gynaec and other disturbances which are not likely to be less common in India than in other countries. Then our problem is that if our screening processes were defective why were they so? Was screening not practised in the urban clinics wherein the loop or IUCD device was tried earlier? It seems from D V R Murty's report[1] on these trials that no data were recorded on screened out cases in the pilot inquiries. The neglect of such record no doubt proved hazardous for administering the mass programmes in rural areas.

Thus 2598 — 132 = 2466 women had the loop. We tried to contact these for a follow-up and were successful in interviewing 2,100. The non-response constituted 8 per cent and the rest were not found at the addresses noted by us at the camps. Compared to the time lag between the holding of camps and our investigations the success in interviews was laudable.

The follow-up of the 2,100 loop cases was started in 1968 which made an allowance of more than two to four years for observation of the loop experience. A questionnaire was devised for the follow-up which elicited information on the following items regarding loop experience.

(1) Socio-economic status of the women and their family as defined by caste, income, education and occupation.
(2) Demographic status of the women as defined by their ages and the number of male and female living and dead children with their ages.
(3) Source of information regarding loop and other contraceptives, if any.
(4) Reason for accepting the loop as a contraceptive.
(5) Husband's co-operation in the matter of loop-insertion.
(6) Conveyance and other facilities for attending the loop camp.
(7) Date of loop-insertion.
(8) Time of loop insertion in the menstrual cycle.
(9) Date of removal/expulsion in case of removal/expulsion.
(10) Total duration of loop *in situ*.
(11) Troubles regarding health, bleeding, extent of bleeding, menstruation, its regularity, etc, etc, immediately after loop-insertion, later and at the time of inquiry.
(12) Medical treatment and relevant expenditure for the troubles accompanying loop-insertion.
(13) Final favourable or unfavourable reaction to loop.
(14) Contraceptive practice before loop-insertion and reason for the shift to loop.
(15) Intentions of contraceptive practice after getting rid of the loop.
(16) Reproductive performance to the date of inquiry from the date of loop insertion.
(17) Remuneration for loop-insertion.

The data on all the above and the related items were obtained by interviews at the time of camp and the follow-up survey. They are described in the subsequent paragraphs only briefly to avoid the load of tabular material. However, details regarding certain aspects of the loop programme are referred to as they help to evaluate the programme besides diagnosing the reasons of its failure.

Out of 2,100 cases about 90 per cent opted for loop after getting convinced of its utility besides 7 per cent who were forced by their husbands. Only 11.5 per cent had actually practised some method — mostly traditional and chemical contraceptives—before adopting loop. Thus most of the loop-adopters were fresh cases of family planners.

The 2,100 interviews have a great significance as they bring to light a number of aspects about the mass programme of IUCD. Initially we want to show how far women were motivated to adopt IUCD. This motivation which is of basic importance for the success of the programe was assessed from:

(a) The number of living children or living sons the women had and the

ages of the women.

(b) The eagerness with which they adopted the contraceptive device with or without the permission of the husband.

(c) The eagerness to adopt the device even in the period of lactation amenorrhoea.

(d) The capacity of the women to tolerate the device in spite of bleeding and similar accompanying discomfort.

(a) The median age of the women at loop-adoption was 32.5 years. For Poona city this was 26.4 years. This definitely was not early in the reproductive span and the women seemed to adopt the loop rather for family-limitation than for spacing of children. They had 4.5 children on an average though 14 and 32 per cent of the women had adopted the loop with two or less and three or less children, respectively. Broadly one could conclude that loop-adoption as found in the 1965-67 programme could bring down about 25 per cent of the total contribution to fertility of the loop-adopters had the popularity of the loop been maintained later.

(b) The eagerness of the masses to adopt the IUCD is seen in the adoption of the device in spite of clashes of couples in its adoption. When there was no agreement between the couples, sometimes the motivated husband brought pressure on his wife (7 per cent such cases) and sometimes the wife adopted IUCD without the husband's permission (24 per cent cases).

(c) The eagerness of wives to take to contraception with IUCD was also clear from their adoption (44 per cent) of it even in the period of amenorrhoea when women have a much smaller possibility of conception.

(d) Loop-adopters reported some physical discomfort due to the device in sixty per cent cases. Out of 2,100 cases, 27 per cent had no bleeding at all, while fifty per cent had bleeding for less than a week. About 16 per cent had excessive bleeding for a duration of more than a week. In spite of this, the women bore the device patiently. At the time of interviews only 20 per cent had IUCD and they had it for more than 36 months on an average. About 62 per cent got it removed. Even these bore the device for more than 16 months on an average. About 16 per cent had the device expelled. These had the device for 8 months on an average. Thus the total wearing of the device was about 19 months on an average for 2,100 women. This, no doubt, can be regarded as enthusiastic acceptance of IUCD. Further among 2,100 women, 55 per cent required no treatment of any kind for pulling on with the device. The remaining 45 per cent needed some treatment. These included 31 per cent who took the treatment with success, 8 per cent who got treatment without success and 5 per cent who neglected the treatment. In short only 8 per cent cases had definite reasons for complaint, and their reactions to loop could be very unfavourable. Such unfavourable reaction could easily drive the other 37 per cent panicky as they needed some treatment for wearing the device.

The strength of motivation of the loop-adopters was also apparent from their running to other contraceptive devices once they failed with IUCD. All those with loop removed or expelled were interviewed with regard to their intention of family planning practice after the loop-experience. About 4 per cent got the loop re-inserted. Five per cent shifted to condoms, 43 per cent to sterilisation. Those shifting to sterilisation included 12 per cent who opted for male sterilisation, 31 per cent opting for female sterilisation. The remaining 10 per cent had an intention to get sterilised. But 35 per cent of those without loop had no intention of family planning practice. Was not this group a great loss to the family planning practice of the state?

The panic over the loop could be easily stopped if the administrators were well-informed about the possible side-effects and discomfort due to IUCD. Earlier records of the urban clinics were not useful in guiding the administrators. It seems from Murty's report that the records were not well maintained. As noted earlier, the number of women regarded as unfit for the loop, the period in the menstrual cycle when the device was fitted, the percentage of women which could not be followed in the urban clinics, period for which women suffered from bleeding were not always reliably available from the records. Since these were pilot projects specially designed to help the mass programme, they needed careful recording. But this was apparently neglected. Moreover the rates of termination of the device as given in Murty's report are low compared even to those in the United States for the first 18 months. The relevant rates of termination of IUCD for our sample, for Murty's pilot urban clinics, our Poona City (Maharashtra) follow-up, Taiwan, Korea and the United States are presented in the Table for comparison. The termination rates for the first 12 months in our sample do not appear very different from those for other mass programmes in Taiwan or Korea. They differ most widely from those of the urban clinics of D V R Murty. This raises a number of questions.

(a) Was it that IUCD programme for Maharashtra was much like that in Taiwan and Korea in the earlier 12 months?

(b) Did bleeding after IUCD insertion drive people panicky? If yes, one can easily understand the fast decline in numbers of women coming up for IUCD-adoption.

(c) Was it that the termination rates of IUCD were affected by the *panic raised due to bleeding?*

(d) Did the panic affect heavily the rates for longer durations? The panic no doubt affected the smaller durations, but to a smaller degree because, given the panic, women did not come up for loop adoption at all.

(e) Could better recording in earlier urban projects have helped in administering the mass programme in Maharashtra?

(f) Were the administrators of the programme well-informed about the side-effects of IUCD?[2] If they were, why could not they stop the panic?

In short, the IUCD programme in Maharashtra was not very badly handled in the initial days. But the administrators, probably uninformed about the statistics of side-effects, could not stop the people from getting panicky. The same ignorance probably drove them to go ahead fast with the programme even without a temporary follow-up. This no doubt proved a terrible setback from which there is no easy recovery.

It is worth bearing in mind that even such an IUCD programme for the state of Maharashtra during 1965-67 may have prevented many more than 50,000 births in the state. This despite the way it was handled.

Notes

1 It is a publication of 12 pages on about 20 thousand loop cases from the whole of India summarised by D V R Murty for the Central Family Planning Institute, Delhi, in 1967. Another overview of loop studies in India by Ashok Kumar of the International Institute for Population Studies is equally incapable of providing such data.

2 It is important to note that though IUCD should be inserted within less than one week of menstruation, our sample showed that only 21 per cent insertions were done during the first five days. Respectively about 23, 23 and 32 per cent were done during 6 to 10 days, 11 to 18 days and 19 and more days. About 44 per cent were done in lactation amenorrhoea.

For Whom the Engineer Toils

Richard F Devon

The manpower model in its policy form applied to higher technical education implicitly sees the individual engineer as an industrial number compensated with certain privileges. No consideration is given to the personal development of the engineer, and no education is provided to enable him to improve his performance as a social actor.

Attempts to allot a small percentage of the curricular time to courses in the humanities and social sciences are laudable, but these have to be seen as a mitigating influence rather than a remedial one. What is called for is the development of a philosophy of technical education rather than a utilitarian policy.

A philosophy of technical education can be developed from the consideration that an engineer should act ethically in his work. There are two educational principles which follow from this consideration. First, an engineer requires the knowledge that will enable him to understand the physical and social consequences of his actions. Secondly, an engineer should receive an education that would make him more likely to act ethically. The political implications of higher technical education also cannot be overlooked. Engineers have a higher propensity for mobility to the highest ranks of industry. If they are at no time in the educational process exposed to enlightened thought, then what sort of an industrial elite is in the making?

In the educational context, we are as responsible for the ideas and values that we fail to try to change as we are for those that we try to inculcate. Education changes people, and designing programmes of education that will change their ideas and values is a very delicate task, but not one that can be avoided. And, surely, we can all agree on a number of specific issues ranging from designing street lights so that they do not shine into bedroom windows to designing modes of transport that do not kill people and to cities that have parks in them.

In any nation that is progressing industrially there are two essential questions to be answered, industry for what and a better life for whom? Engineers should be educated so as to be capable of considering these questions.

WHAT are the intents and realities behind a programme for imparting technical education? Current policy on technical education in India, as in the West, is dominated by the "manpower model". This model can be expressed by the following statements. A class of people with a specific expertise can facilitate the acquisition of material goals. This expertise can be imparted in educational institutions. The nummer of people recruited into an educational ipstitution which imparts certain expertises will depend upon the industrial needs associated with these expertises. The capitalist version of this model tends to rely more upon vocational interests and vocational guarantees (high salary and job security), or lack thereof, to keep the flow of experts at the required level than it does upon policy directives from central authorities, such as might issue from a government through its Ministry of Education. Avowedly socialist countries make a deliberate effort to plan and control at the government level both industrial and educational development and to make these plans complementary to each other.[1]

The manpower model is accepted in both capitalist and socialist countries, and one of the main differences is over which policies (planning, free market, or mixed economy) are considered to make the model work more effectively. At present the unemployed engineers to be found both in the United States and in India suggest that neither planning nor allowing the "free market" to adjust can always be relied upon to fulfil the promises implicit in the model. Yet, even when analysing the failures of earlier planning, the model still remains the basis of the analysis. The case of unemployed engineers in India has been explicitly stated to be due to an unforeseen recession in the economy and an enrolment in engineering colleges above the planned targets.[2] Also, it has been argued that the number of educated unemployed in India generally can be greatly reduced by better matching the occupational structure of the economy and the educational goals, specifically more primary education and less higher education.[3] In the United Kingdom the situation has a rather more subtle dimension. There, one concern is that the technical education imparted is not sufficiently flexible to respond to the changing needs of industry in what is a fairly capitalistic industrial economy.[4]

To continue to use the manpower model and to try to improve it is a reasonable thing to do. But what concerns me is the apparent absence of a parent philosophy for the manpower type of analysis, i e, a set of principles for discussing people at work and the work they do in terms of human values. With this in mind I shall look at the case of engineers and higher technical education.

What I wish to suggest in this article is that the impact upon society of engineers cannot be assessed by only considering their numbers and skills as defined by industrial needs (the manpower model). By manipulating the environment the engineer is instrumental in making changes of far-reaching physical *and social* consequences. As a member of at least a quasi-elite class he will also have a social and political role to play. The manpower model, and the derived technical educational policies, never properly account for the engineer in these two roles. To see this we need to begin with an examination of the model itself.

A *fairly concise statement* of what manpower planning involves would be as follows. Assessments are made of current and projected labour resources and of the current and anticipated industrial and national labour needs. Strategies are then planned to match *these over a given period of time*[5] by, one, improving the skills and distribution of the present labour force and,

two, developing manpower resources that are new by quantity and, or, by skill type.

The manpower type of analysis can, at its own level, be articulated intelligently as shown in a useful study of the Indian case by George Tobias and Robert S Queener.[6] They identify many concepts central to the manpower model, such as recruitment, deployment, utilisation, worker efficiency, incentives (rewards and stimuli), training, stabilisation (minimising turnover) and adequate research programmes to acquire empirical data.[7] I would like to note three more concepts, *viz*, the attitudes related to the identified skills, unplanned (and often unrecorded) inter-job mobility, especially at a high level and international mobility. There is evidence of the importance of all of these in the case of engineers in India. Human skills do, after all, reside in a human being who can, if so disposed, work badly when he, or she, is capable of working properly. A person is also able not to do at all the work for which he, or she, has been trained. Moreover, even if that person does utilise his skill properly, he might still work in some place other than that anticipated by the manpower planner. These dimensions of choice involve human rights and are not readily mutable by manpower planners. One manpower analyst writing on the American case and wishing to associate himself with "freedom" (apparently referring to the American concept of individualism) wrote that "In a free and democratic society... Workers and management freely make their own decisions about employment..."[8] As an excursion into social philosophy this is rather baneful and it leaves unexplained (amongst other things) the existence of trade unions and, by and large, of manpower planners! The manipulation of human rights makes a manpower planner a social engineer at the policy-making level, but he does not have to make policy himself and it is probably better if he does not. What he can do is to document the way in which choices about work are being made.

It would, therefore, seem of importance for the manpower analyst to have some idea of job satisfaction levels. Assessing job satisfaction is certainly more difficult than asking the person involved if he is satisfied with his job, which is about as far as most surveys in India seem to have gone.[9] It is important to know what things cause dissatisfaction, and satisfaction, and why. Also, job satisfaction is relative to the desirability of other jobs. Your present work may be fairly satisfactory to you, but if you have a strong ambition to do something else and some opportunity to do it, then you may leave the job which you considered to be fairly satisfactory. So the two concepts of job-related atitudes and inter-job mobility are intimately related.

An indication of a potentially large amount of unplanned inter-job mobility was found in a recent study of IIT students. A D King brought out several important characteristics in a survey of the 1970 graduating class of the IIT Delhi. It was found that 27 per cent of civil engineering students were dissatisfied with their field of engineering, whereas the figure for mechanical engineering was only 2 per cent.[10] As King suggests, this sort of difference in commitment could have important effects in industry. Commitment to engineering in general also appears to have been weak with 34 per cent of the students saying that they would "like to take up a job which has little or nothing to do with engineering."[11] Further, 52 per cent of the students when given a list of career alternatives such as design, construction, production, etc, stated a preference for administration and management.[12]

The majority of students at the Indian Institute of Management at Ahmedabad have a first degree in engineering. These students can be identified by the manpower analyst, but the IIT graduates who go into management directly represent a mobility that will remain largely hidden unless there is a substantial reorganisation of the present manpower research programmes. (Surely, the class and educational background of, and other mobility factors of, managers and executives in business and industry is one of the most neglected areas of manpower research in India.)

The question of engineers going into management and administration is an extremely important one. King reports a study done in the UK which found that one-third of all engineers are in senior or top management functions at the age of 33, and that 22 per cent are in top executive positions at the age of 47.[13] In the USA it has been reported that in 1960 over one-quarter of the top executives in the 600 largest corporations in the USA had degrees in engineering.[14] Now these are striking figures. They are striking because there is little or nothing in technical education in the USA, the UK or India which prepares engineers for what many of them will end up doing full-time and what most of them will have to devote at least some of their time to, that is, executive and management duties.

Now the distinction between management and administration and engineering cannot be sharply drawn. Perhaps it can best be approached by asking the following two questions. What percentage of his working time does the engineer spend making analyses and decisions which can substantively be termed engineering? Further, in the context of education, what percentage of his working time is spent utilising knowledge and skills that were originally learnt in college, and what percentage of his entire college education in terms of content is not utilised at all in his work? These are difficult questions to answer but a methodology that produces results which allow working approximations should be possible.

Another question is at what point in their careers do engineers take on managerial and administrative duties? If they work for 15 years in design first, then by the time that they move into an administrative position they will have forgotten anything that they learnt about management in college. The more important engineers in administration, i e, those that rise highest in an organisation, may be those that make the move earliest. It would be interesting to know how many move into management within five years of graduating and to what levels they typically rise. This group could most benefit from educational changes which involved less engineering specialisation and more general knowledge of industry and management practices. There is some evidence that IIT graduates a few years ago were not moving into administration very quickly at all.[15]

All this poses substantial problems for the manpower analyst in India and it certainly depicts an area which needs researching.

Another problem for the manpower analyst is international mobility, or the brain drain. Most sources suggest that about 20 per cent of those who graduate from the IITs each year go abroad and few seem to return.[16] (There are indications that the current figure is lower than this, probably due to the tight job market for engineers in the USA.) The IIT graduate costs the government at least two to five times as much as engineering graduates from most other colleges.[17] Since those that go abroad often rely on private funds, an argument could be made to increase the representation of the lower classes amongst IIT students.[18] However, the brain drain problem has received a lot of attention already, so it is unnecessary to expand upon it here.

What Society Gives the Engineer

Another important area for the manpower analyst to consider is that of motivations. Why do people become engineers? Several contributing factors can be noted.

Engineering is associated with many positive political values such as progress, material benefits and scientific achievement. Technology, like science, has achieved some remarkable things; it invokes awe. Recently, and particularly in the USA, the concept of ecology has cast a shadow over science and technology, but, in principle, ecology means a study of the consequences from any particular process carried to completeness rather than a consideration of limited industrial goals. Ecology, then, probably means an expanded methodology for science and technology rather than a radically changed one, and the new benefits will be appreciated as were the old ones. However, should the shadow remain, the aura around science and technology would be threatened by the argument that it endangered rather than enhanced human welfare.

Students who go into engineering are drawn from those who do well in the intellectual evaluations carried out in primary and secondary schools. These evaluations are such that those that do well are well considered by others. All these things contribute to the social status of the engineer. It has also been suggested that certain types of action such as boldness, swiftness, and dynamism may be associated with the engineer and this, too, would increase his status.[19]

One study has suggested that the status of an engineer is inversely proportional to the degree of industrialisation of the society in which he works.[20] This is certainly plausible since not only the needs of a society but also the occupations become highly diversified in an industrialised society. The urgent needs for which an engineer is so crucial in a society wishing to industrialise are no longer so urgent once a substantial amount of industrialisation has taken place. Further, the engineer is a member of a class which becomes much bigger with industrialisation not only in absolute numbers (there are over one million engineers in the USA now), but bigger relative to other professional groups also.[21] Although the status of the engineer in India seems to have declined somewhat in recent years (probably partly due to the greatly increased numbers of engineers and partly due to the stigma of large numbers of unemployed engineers), their status is still high[22] and their industrial role still very significant.

A very powerful influence upon those contemplating a career in engineering is the high salaries available in the profession. In more industrialised countries than India the income of engineers is fairly good relative to those for other careers, but in India the salary is very attractive indeed and for those from less well-endowed families engineering represents a good avenue to a modicum of prosperity.

There is also the job itself. Generally, an engineer is engaged in a positive, creative type of work which can provide a definite source of satisfaction. Further, the individual may have a genuine vocational interest in the work that he does.

The engineer may be typically someone who perceives that engineering offers a career that satisfies certain of his personality needs. At least there is evidence in the USA that engineers have typical personality characteristics. Some of those found in student engineers have been low interest in other people, a low indulgence in non-technical literature, and positive interests in material rewards and sport.[23] Reporting from the results of interviews with about 25 per cent of the scientists and engineers in the UK during the Second World War, C P Snow also reports a near complete ignorance of non-technical literature amongst the interviewees.[24] Some engineering educators, in one study, have been seen to be fairly high on ratings of authoritarianism and social prejudice when compared to educators in other fields. Interestingly, these ratings were higher for those who had not engaged in research activities.[25] Several commentators have suggested that engineers are introverted.[26] And Robert K Merton has complained that engineers have an ethic of only doing their job and of not feeling responsible for any social consequences of their work.[27] The vast majority of American engineers work in large organisations (about 75 per cent work in organisations which employ over 1,000 people),[28] where they may see their work as a creative outlet in a safe, firmly hierarchical, and quite confined social structure in which they only have to relate to like-minded people. Conflict in their lives, then, would be very much confined to their dealings with the natural environment rather than with other people. There is no data for the Indian case, but because of the different level of industrialisation and different cultural background the types of personalities that are currently being attracted to careers in engineering may be different than the American case in some respects.

The actual decision to become an engineer may be made somewhat haphazardly under the influence of kin or peer pressures and with an ignorance of other possibilities.[29] Yet those that elect to go into engineering surely perceive that there is something in it for them. There is a very substantial financial investment made in their education by society and many rewards come their way. Surely it is reasonable if engineers, in return, do not work entirely to limited interests, but remember the needs of the larger society. And, if so, is it not necessary to develop within the technical education that engineers receive an awareness of their social roles and duties? If the manpower model is not derived from an educational policy which holds not only industrial skills as important but also the broader goals of building a better social system for the furture, then talk of social planning is idle.

The various rewards listed above constitute, in a way, compensatory privileges for those who I am suggesting are, in terms of the manpower model, industrial numbers. I do not mean to imply that engineers in India are not highly favoured and highly envied by virtue of the reasons given above. But the underlying philosophy behind the policies that produce engineers in India, as in most other countries, denies certain human dimensions to the "engineer". The engineer is produced for his usefulness; his right to function autonomously as an elite or quasi-elite member of society is sabotaged at the beginning in the very policies that give him his social position. His education lacks the breadth required for his social role.

Learning Engineering

Let us first discuss the education required for the engineer *qua* engineer and then for the engineer as a social actor. These two points are by no means exclusive for the engineer as part of his work may be directing a working

force, or the pollution from an industrial plant that he designs may have widespread social consequences. The social and technological aspects of the engineers' work are interrelated and both must be evaluated if we are really to discuss the "usefulness" of an engineer.

There are two issues which figure in any discussion of the educational philosophy pursued by an institute which imparts technical education. The first is the perennial debate of "education" versus "practical training". This debate, I think, loses much of its vigour if the word "experience" is used to replace the word "training". Practical training, conceived to mean the training of experts according to specifications laid down by industrial concerns, cannot be imparted at a public institute for what, ironically, are quite practical reasons. One institute cannot train the multiplicity of specialists required for the region it serves in an industrialised or industrialising society. Not only does industry require specialists, but so also do government departments, professional firms and research centres, and this makes even a general form of practical training for industry hard to implement. Furthermore, it cannot be conducive to scientific and technical progress to produce experts on the basis of a "spare parts" philosophy, since technical experts upon recruitment should be a source of fresh ideas and talent. Technical education must concentrate on the things that are of widest application, such as mathematical and experimental methods of analysis, well-used theories such as elasticity, and heat flow, and basic knowledge on, say, the properties of materials. Finally, it may be noted that an institution financed wholly or partly by public funds should not cater to such limited special interests.

The concept "practical experience" is not subject to the criticisms just made of practical training. Yet, it inherits many of the arguments often made in support of practical training. It clearly incorporates desirable principles such as a physical understanding of the materials and processes common to contemporary technology, an appreciation of industrial goals (e g, output, profit, efficiency), and the limitations of theoretical goals (e g, scientific understanding, exactness, qualitative perfection). Practical experience, also, can encourage a heightened understanding of the ethos of the labour force. Practical experience may be obtained in laboratory exercises, research projects, or through a working situation of, say, two to three months during the annual academic vacations. These things can be, and already are in the IITs, encouraged by educators and industrialists alike.

The debate between the industrialists and the educators continues rather fruitlessly.[30] The industrialists and many working engineers themselves consider that the higher technical education imparted in India is too theoretical, although I suspect that a large part of the problem is an inadequate emphasis on design procedures and not practical experience per se. Most of the teaching staff in engineering colleges in India, incidentally, have not had any practical experience. The educators' usual reply, also justified, is that the industrialists never make any concrete proposals. To the extent that there is an impasse here, I would like to digress from my main theme to make a concrete proposal.

A working engineer should be able to take a month or two, or more, off work on either full-time or part-time leave to study a specialised area related to his work and in which he feels deficient. This study would be done on campus and under the guidance of a professor. (Professors would, of course, only be allowed to take on a few such students at any one time.) The result should be to de-emphasise the importance of degrees (a welcome prospect), to increase the importance of ability and mitigate the effects of the obsolescence of knowledge. So a civil engineer who finds himself working as a road engineer might like to improve his knowledge of soil mechanics. A sales engineer, unable to take a full course in business management, might be able to acquire some introductory knowledge in accounting or marketing, although such a radical change of subject would have to be dealt with carefully. This proposal could mean the development of a more meaningful relationship between education and industry. If the scheme were placed under the control of the educational institutions there would be no question that industry might exploit the situation. It would be particularly useful if the IITs expanded their facilities somewhat to perform this service for the graduates of less well-endowed colleges.

Where a problem of communication between industrialists and technical educators exists on the question of identifying what skills are really required by industry, the manpower analyst is in a difficult position. He will have to continue to rely on the rather superficial categories of numbers, degree level and degree field for assessing the available and materialising engineers.

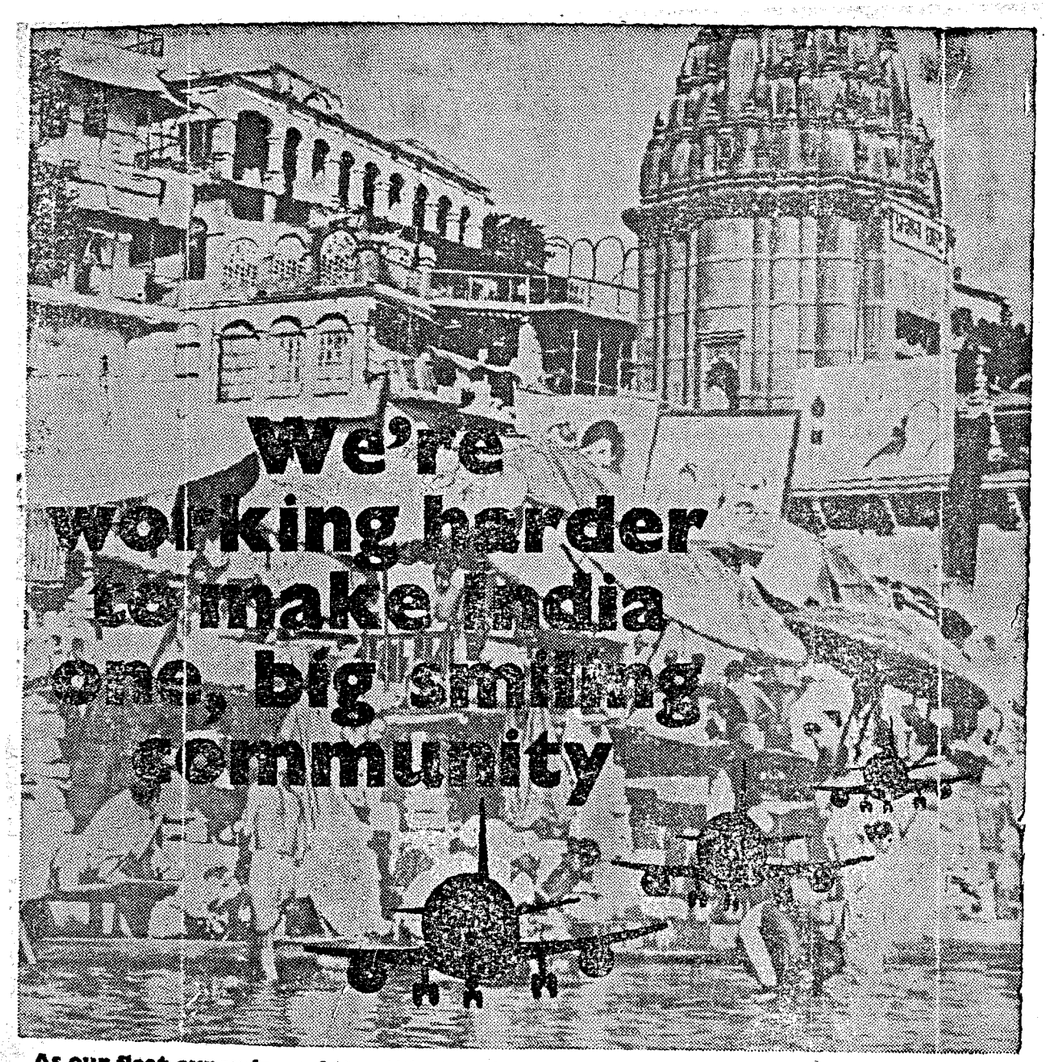
Educating the Engineer

This second issue is a question of the breadth of the education to be given to technologists. Should institutes of technical education be providing experts that are something more than specialists?

A broad approach to the questions of education as a process has been taken by F Harbison and C A Myers who concentrate on what they term the development of human resources.[31] They consider that an educational programme can be designed that will satisfy both the economist who is concerned about developing skills pertinent to production and also the humanist who wishes to foster an appreciation of human values. Depending on who the "economist" is and who the "humanist" is, Harbison and Myers are undoubtedly right. It is certainly possible for an educational system to produce artists, writers and philosophers as well as scientists, managers and technologists; almost all educational systems already do. There are, of course, a multitude of different opinions on the proportions involved and also upon the nature of the subjects involved (e g, should politics be studied as legal history, philosophy or social science?).

What Harbison and Myers seem to fail to perceive is the need to satisfy the humanist and the economist in terms of the education of a single person, an engineer, for instance. Rather than allow society to fragment into a multiplicity of cultures which cannot communicate with each other, should not an effort be made to promote integrative subjects such as industrial sociology or political economics? Harbison and Myers fail to explain how society will function as a result of their educational system. Who will have political power, will there be proportional representation amongst the philosophers and engineers and so on? In an industrialised society those closest to industry usually have more power. What will be the importance of liberal ideas, then, if they only exist in books and magazines that the industrial elite never read? It is hard to evolve political institutions which can survive in a democracy where the elites do not generally appreciate them. Surely then, it is a better policy in the long run to promote an understanding of society (integrative knowledge) in each person and an appreciation of the cultural values of that society (liberal, socialist or whatever). And this is best done through formal education. Where it can only be done for some, it should, at least, be done for the elite classes. Engineers with a relatively high mobility up through the ranks in industry must be considered as an elite group.

With regard to the question of no communication between different cultures, C P Snow has argued against the type of specialisation in education which creates this,[32] something that has been especially true of higher education in the UK. To be clear in making his argument, Snow considered only two cultures: the literary and the scientific. But he failed to make clear why a lack of communication is important and between which groups of people communication is, or is not, important. It would certainly be helpful if the insights of art were developed through an understanding of modern science and industry rather than a rejection of it. Yet this is not so crucially important as the need for communication between what I would call the political culture and the scientific culture. (I cannot accept Snow's tendency to equate the political and literary cultures[33] for anything outside of the House of Lords) or between the scientific culture and what I would call the humanistic culture. (As Snow himself would agree, the literary culture is certainly not necessarily a humanistic culture.) Why this communication is important is simply a question of ethics set in the context of a highly organised society.



A recent international survey[34] revealed a wide variety of approaches to the goal of introducing non-technical subjects into the curricula of higher technical institutions of education. I prefer to define the issue more broadly than the dichotomy technical/non-technical suggests. Not only is there a problem providing a specialist with knowledge about his society, but, in view of the great degrees of specialisation in science and technology in recent decades, there is also the question of integrating the specialist into his parent disciplines (e g, educating the technologist in general science). Then, and perhaps most importantly, there are the interdisciplinary fields such as the philosophy of science, the history of science and technology and the sociology of technology.[35] These interdisciplinary fields are required in order to weave the fragments of science and technology into a meaningful whole and also to integrate that whole into the larger context of human affairs from whence it comes and in which it operates. This, in turn, requires an understanding of human affairs which in curricula terms means the disciplines of the humanities and the social sciences. In using the word "whole" I am not merely suggesting a body of knowledge that is bound together by some degree of logical and semantic coherence, but also I am suggesting a body of knowledge which attempts to provide a certain completeness of scope as gauged by its ability to handle the human experience, in this case from the perspective of the technologist. I am, in short, concerned about the epistemic resources the technologist has for defining his relationships with the whole society to which he belongs. In contemporary industrial societies in particular the individual often acts upon other segments of society at a great human distance from them. These actions may be of great import for other people who are not only strangers to the actor in the personal sense, but also strangers in the sense that the actor has little or no knowledge of them even in the more objective sense of knowing such things as the demographic statistics, the behavioural traits, and the human values of these other people. Worse still, this lack of knowledge may include an ignorance by the actor of the fact that those other people are affected at all by his or her action. Indeed, one might argue that there is an educational imperative of a pre-categorical nature, viz, one should endeavour to understand the world in which one lives so that one can act ethically.

Obviously much of what has been said above does not apply exclusively to engineers, but there are some critical reasons which make the case of engineers important in this regard. In the UNESCO study mentioned above, Gould and Smith writing on the UK case bring out two of these reasons. The first is the obvious one that engineers are the class of people who design and implement the technological changes which are the material core of the social changes taking place in all industrial and industrialising countries. It would be desirable, it is argued, if engineers had an appropriate understanding of the natural and social consequences of their actions.

The second point made by Gould and Smith is that the work of an engineer makes demands upon him or her as a human being and he should be sensitive to what is known about, for example, industrial management, bureaucratic structures, labour relations and so forth.[36] The implicit recommendation appears to be the inclusion of courses in industrial management, etc, in an engineering curriculum. As currently taught and practiced such disciplines are really skills and not different from engineering skills. Yet Gould and Smith obviously consider that such courses would "humanise" an engineer in some way. Surely, human sensitivity involves the ability to understand others and to be able to reflect tolerantly over value issues. Whereas such courses as Gould and Smith seem to recommend could undoubtedly be of value to an engineer, they will not alone be enough to help the engineer handle demands that are made upon him as a technologist whose actions may be of great social import.

There are two further points which may be made. The engineer has a social status, the relative importance of this status varies from one society to another. In all societies they constitute at least a quasi-elite class as professionals and experts. A certain amount of authority and leadership is thus acquired by them. Hence, situations arise where, say, an engineer's report stressing the feasibility of building a dam carries with it a veiled recommendation to actually build the dam. In a similar case which occurred in India recently, a group of natural scientists made a political gesture by petitioning the Indian Government to sanction the development of the atomic bomb in India. This was an unprofessional action, it might be argued, but the deed was done and the petition of the scientists obviously carried much more weight than if a group of librarians had done so, even though they would be equally well qualified to consider the principal issues involved which are moral and political and not scientific at all. In the UK another example was suggested in the editorial of the *New Statesman*, September 10, 1971, which argued that "...politicians have found themselves embarrassed with the technically superb but socially destructive and economically disastrous Concorde because, at the outset, they failed to cross-question the 'experts' who claimed that a British SST was a noble target for the nation." To prevent problems like those just referred to that arise when there is a cultural discontinuity amongst the elite, the engineer as a member of an elite or quasi-elite class must also promote the new culture in a changing society.

The final point is a simple one and

**As our fleet expands, and its utilisation increases...
places and people will continue to come closer.**

Every new plane that has joined our fleet has helped the people of India come a little closer.
It happened with the Friendships. With the Caravelles. With the HS 748s.
And lately, with the Boeing 737s.
Already our Boeing 737s have helped shrink distances in India by hours.
They've helped even small towns enter the jet-age.
With a bigger passenger capacity they've helped people and places come closer than ever before.
To date, our utilisation of the Boeing 737s has gone up several hundred hours.
And will continue to increase.
But this isn't the end.
Distances will continue to shrink as we get bigger, better planes.
And the day isn't far when you'll be just a smile away from your destination.
We're working in that direction.

Indian Airlines

not exclusive to the case of the engineer. Do the educational policy-makers when providing sixteen years or so of education have the right to deny any individual the type of education that will make his or her life richer or more meaningful? How far can the process of sacrificing the individual to industry go without doing harm to both? To deny a liberal education to someone, may be, as noted above, to deny the individual the chance to act ethically. While it is not generally possible to give all members of a society a liberal education surely it is in everyone's interest that an engineer should understand his own actions.

Such ideals, of course, do not usually suffer much criticism, but few philosophies of technical education at the active stages of policy making and implementation reflect a very serious commitment to them. An exception is the USSR as the following excerpt indicates: "In the Soviet Union an engineer is not only a technical specialist, but also a public figure, a carrier and disseminator of culture. To perform these functions, he requires extensive knowledge in various walks of public life and human activity."[37] In the same source it is reported that an engineer's curriculum includes a considerable exposure to subjects ranging from natural science to philosophy and including, of course, the history of the Communist Party in Russia. Whether or not these policies are successfully implemented, they do reflect, albeit with a bias, a sophisticated attempt to develop a philosophy of technical education which comprehensively approaches the problems involved.

The IITs have made some effort to give their graduates a general education by allotting around ten per cent of the curriculum to courses given by departments of Humanities and Social Sciences. (The figure of ten per cent has also been adopted in Britain recently in contrast to the previous situation there where there was no general education in an engineering degree programme.) The departments of Humanities and Social Sciences in the IITs are teaching and research units, and yet they do not have any undergraduates majoring in these fields. This poses several problems. First, liberal education is given the status of an addition to the curriculum, i e, something which is not fundamental to the degree programme. This is further reinforced by the absence for the engineering students of peers studying humanities and social sciences in their own right. Also, the teaching staff themselves are in danger of becoming specialists, e g, specialist in teaching liberal education to engineers. It would be more appropriate if these departments became of the same status as the various engineering departments with a body of undergraduate students. This would mean a considerable expansion of staff and facilities and the creation, perhaps, of more departments. It would, incidentally, have the advantage of allowing the development of high quality departments in non-technical subjects which is something that is much needed in Indian higher education. It is, in any event, the point of view of the author that not less than a third of the curriculum should probably be devoted to non-engineering subjects. It is pointless to progress technologically if such progress is not guided by a rational and humanistic base, and besides institutional restraints on the uses of technology nothing may be surer in the long run than providing the engineers themselves with a well-designed liberal education. Certainly I am sceptical of the idea that all will be well if the politicians take the responsibility for guiding the development of science and technology. Nor is it likely that professional societies in India will prove to be any more prominent in guiding the development of technology than they have been elsewhere. And at the moment such societies are very undeveloped in India.

We can now return to the discussion of the manpower model with a question. If in our educational philosophy the qualities of human beings are to be considered paramount then is all that is required in the manpower model an adjustment such as a few general education courses in an engineering curriculum? Clearly not, since either educational policy is governed by considerations of the *type* of people desired, or it is governed by industrial needs. Both goals cannot be paramount, and, if the first is, then it may well be that, on occasion, industrial needs will not quite be met and material production will slow down. (John Kenneth Galbraith makes a strong argument that production should slow down in the USA.) And this is only reasonable since material progress is of no great value after all if it is not so guided as to be of benefit to mankind. What is the purpose of progress if the ability to end poverty and hunger is not exercised while the ability to wage war and wreak havoc and destruction upon millions is constantly used? Of course, engineers alone do not guide material progress and the general arguments that I have made above obviously have a wide reference, but the engineers as a class are a crucial factor in defining the nature of material progress.

Suffice it to conclude then that the manpower model is a technique and not a philosophy and industrial needs are only one factor to consider in a philosophy of higher technical education, and not the most important one either. What is required most of all are men and women who will promote peace and justice and the alleviation of want because they are wise enough to appreciate the sufferings of others, to tolerate the values of others and have the necessary social and technological knowledge to be able to achieve these goals.

It might be thought that discussing valid reasons for slowing down India's industrial production at a time when the problem appears to be its inadequate growth rate is rather perverse. However, later in this article I shall propose an educational system which would produce people with an understanding not only of industry, but also of society. Such people would be of great value in guiding the development of industry, and in the area of technological transfer may well make a very dynamic contribution to industrial development. In the countries that have fostered technological progress there exist both the latest technology and the costly legacies of the parent technologies. By judiciously importing new technology India could achieve a very rapid development in many areas. However, good judgment in technological transfer may in general be beyond the limited perspectives of a traditionally trained engineer. For example, consider the question of developing a traditional (petrol engine) car industry in India. The air pollution caused by petrol and diesel engines in many Western countries is so extensive that alternative types of propulsion have already been developed and are being implemented. The extremely costly networks of roads in these countries often consist of empty rural highways and traffic-choked urban networks. More and more metropolitan areas in the West are developing and expanding rapid transit systems which are efficient, do not pollute the air, and have very few accidents. There are other social factors than air pollution to be considered also. More Americans, for example, have died on the roads in the USA than in all the wars they have fought put together (and the USA has very high standards in cars,

India needs power

HE

helps provide it

Even a decade ago, India was dependent on foreign countries not only for plant and equipment for generation of Power but also for men to install and commission them.

India has since turned the corner; indigenous know-how and technology have been developed at the Heavy Electricals factory at Bhopal.

For the first time in the country, three Hydro Power stations—Obra in Uttar Pradesh, Bassi in Himachal Pradesh and one Power Station of U.B.D.C. in Punjab—have been completely equipped and commissioned with machines supplied by Bhopal factory. The erection and commissioning work has been done by Indian workers and engineers.

Eleven more Hydro Projects—Chibro, Ram ganga, and Khodri in U.P., Koyna in Maharashtra, Ukai in Gujarat, Gumti in Tripura, Sharavati and Kali nadi in Mysore, Sumbal-Sind in Jammu & Kashmir, Dehar and Pong in Punjab, are in different stages of manufacture, erection and commissioning.

On the thermal side, Basin Bridge Thermal Power Station Extension Project of Madras has been commissioned with machines supplied from Bhopal factory. Machines have also been supplied for Parli in Maharashtra, Santaldih in West Bengal and Chandrapura in Bihar. Other thermal projects on hand are Ukai and New Power Stations in Gujarat, Koradi in Maharashtra, Korba in Madhya Pradesh and Namrup in Assam.

The Bhopal factory is also playing its part in eliminating dependence on imports for Naval Steam Main Turbines required for driving modern warships. India's first such turbine built at Bhopal factory has already been supplied and more will follow for propelling India-built Leander Class frigates.

The Bhopal factory has entered the nuclear power field. Kalpakkam Nuclear Power Station in Madras will be the first Nuclear Power Station in India to be equipped with indigenous turbines being built at the Bhopal factory.

All these developments at Bhopal factory are a symbol of India's achievement in the field of power development through indigenous efforts to meet the evergrowing need of Electric Power.

roads and driving care). Also, in India it may be noted that only the very wealthy will be able to afford cars for the foreseeable future. To develop a car industry in India, then, may be bad technological sense, a poor deployment of resources, inhumane and non-egalitarian. This argument presents one side of the case only, but surely it is enough to justify some thought by very well-informed people who are given power to make policy. Yet, Indian higher education is not structured to produce such people, and it must be if the maximum benefits are to accrue from the interaction between imported technology and the indigenous socio-economic goals.

A New Model for Technical Education

The reasoning so far has stressed the inadequacy of most current conceptions of technical education. It is appropriate, then, to suggest an alternative model for higher technical education.

Instead of a five-year engineering degree course, the education could be given in two degrees. The first course could be of about four years duration and lead to a first degree in arts, science and technology. About half the curriculum could be devoted to maths, science and engineering courses, and the rest of the curriculum would be in the humanities and social sciences with an emphasis on such courses as introductory economics, management, industrial relations, the sociology of technology and perhaps a general series of seminars and films on a group of topics such as contemporary industry in India, ecology, India's natural resources and the idea of the engineer as a professional.

Graduates with this first degree would be valuable in a wide range of industrial careers, e g, administration, sales, publications. They would also be much better material for the management institutes than an engineering graduate from the present system. And, in view of the dire shortage in India of people with a broad understanding of industrial society such graduates would be very suitable for extending their studies for higher degrees in the social sciences (which IITs already offer).

To graduate as an engineer in this system would then require two more years mainly devoted to specialising in a particular field of engineering. This would lead to a masters level degree without involving a substantial research effort, but that does not seem to be an important point.

Such a degree programme would take six years to produce an engineer instead of the present five years (in most places). Given the current surplus of engineers, to start moving in this direction now would not involve a harmful effect on the output of engineers. At present, however, only the IITs have the structure and facilities to even contemplate this change. It is probable that the individuals who chose to complete the second course will be those who seriously find the job of engineer *qua* engineer to their interest. Thus, the resources expended in specialised technical education will not be so likely to be used mainly as a stepping stone to management but fully utilised.

An interesting example, incidentally, of what can happen when an education as well as a skill is provided to a professional class is that of lawyers in the USA who take a three-year law programme only after a four-year undergraduate course, usually in the liberal arts. The USA actually produces far more lawyers than it really needs. But a law graduate is always capable of doing other work by virtue of his general education and one does not hear of unemployed lawyers even though nothing is done to control the vast number of lawyers produced. The manpower model applied to engineering would have a fail-safe mechanism built in for high level manpower planning if engineers were employable because they had other abilities.

Many of the arguments of this paper have been predicated on the assumption that engineers *can* be given an education that will make them more liberal, tolerant and socially aware. Research into the effects of education is a neglected area, but there is now enough data available on higher education in the USA to draw some conclusions. In a recent review, T M Newcombe and K A Feldman's "Impact of Colleges on Students", it is stated that freshman-senior changes such as declining authoritarianism, dogmatism and prejudice have been quite prevalent in American universities in recent decades. They also find that the attitudes held by college students tend to persist thereafter, and that the impact of the college experience is conditioned by the background and personality of the student. It is hoped that future research will identify the significant variables even more precisely. In the meantime, the development of similar knowledge for the Indian case should be given a very high priority.

Concluding Remarks

The success of manpower analysis in India is dependent upon the ability of economists to predict industrial growth. This is very hazardous when it involves being able to predict monsoon failures, wars and many other unforeseeable phenomena such as the political failure to adhere to the targets of enrolment in engineering colleges of the Third Five-Year Plan.[38]

When manpower planners in India have researched their topic they have tended to ignore the significance of three factors. These are job-related attitudes, qualitative assessments of manpower needs and resources, as opposed to *pro forma* considerations such as degrees, and unplanned inter-job mobility. It might also be added that an undue reliance on questionnaire surveys through the mail has created a lot of data of very doubtful reference since most response rates are between 25 per cent and 45 per cent.

It has been argued that manpower considerations have an excessive influence on the development of technical education. The manpower model in its policy form applied to higher technical education implicitly sees the individual engineer as an industrial number compensated with certain privileges. It takes advantage of material constraints, such as material desires, and psychological constraints, such as vocational interest, operating upon the individual during what are very formative years. The last phase of a person's education is of great significance in a society that is occupationally defined when that education makes the recipient very eligible for certain occupations and very ineligible for almost all others. When higher technical education is derived from manpower considerations there will be no consideration given to the personal development of the engineer, and no education will be provided to enable him to improve his performance as a social actor.

Attempts to allot a small percentage of the curricular time to courses in the humanities and social sciences are laudable, but can be seen as a mitigating influence rather than a remedial one. The education of elite classes cannot be considered without a thorough analysis of all the problems involved. This will inevitably lead to the development of a philosophy of technical education rather than a utilitarian policy.

A philosophy of technical education can be developed from the consideration that an engineer should act ethically in his work. There are two edu-

cational principles which follow from this consideration. An engineer requires the knowledge that will enable him to understand the physical and social consequences of his actions. Secondly, it follows that an engineer should receive an education that would make him more likely to act ethically.

The political implications of higher technical education, also, cannot be overlooked. Engineers have a high propensity for mobility to the highest ranks of industry. If they are at no time in the educational process exposed to enlightened thought, then what sort of an industrial elite is in the making?

It is not suggested that an engineer should be indoctrinated in some ideology. An exposure to rational and humanistic thought, to different schools of philosophies, to the ways of different cultures, to ideas like tolerance and free speech, can scarcely be termed indoctrination. Moreover, in the educational context, we are as responsible for the ideas and values that we fail to try to change as we are for those that we try to inculcate. Education changes people, and designing programmes of education that will change their ideas and values is a very delicate task, but not one that can be avoided. And, surely we can all agree on a plethora of specific issues ranging from designing street lights so that they do not shine into bedroom windows, to designing modes of transport that do not kill people and to cities that have parks in them. In any nation that is progressing industrially there are two essential questions to be answered, industry for what and a better life for whom? Engineers should be educated so as to be capable of considering these questions.

Notes

1 I do not maintain in general any distinction in this article between engineers who go to work in industry and those who go into service for the state or central governments. The distinction is not easy to make in a mixed economy, and most of what is said in the article is applicable to both groups of engineers.

Differential Interest Rates

Another View

A Bagchi

BIMAL JALAN and Boswel, authors of the two articles "Differential Interest Rates: I and II" (September 4), Jalan in particular, deserve to be congratulated for bringing out certain fundamental issues, crucially relevant to the subject, which do not figure explicitly in the Report of the Hazari Committee or the Note of Dissent. There are, however, some gaps and inconsistencies as well as errors of assumption in the arguments of the two authors which this note seeks to discuss.

Boswel is opposed to the idea of differential rates of interest being used as a redistributive instrument on the ground that it is not for the banks to undo 'the historical wrongs', their function being only to provide credit to everyone who is 'potentially capable of economically and profitably using that credit'. The contention that the suggestion for banks to give loans to the weak at lower rates of interest is perverse just because 'it is not the function of banks' seems to be rooted in some conventional ideas about the 'true' functions of commercial banks and cannot stand in the radically altered context of Indian banking today, unless compelling reasons are advanced in support — and Boswel gives none. Nor can the reasoning that the 'interest rate mechanism by itself provides rather limited scope for redistributive policies' be an alibi for refusing to explore the use of that mechanism to the maximum possible extent. With a multiplicity of aims to pursue, a Government should have at least as many levers of control as there are objectives and, as Jalan acknowledges, there should be no inhibition against using all instruments of policy, monetary as well as fiscal, to promote social objectives.

Jalan's objections to the differential scheme suggested in the Report, especially the Note of Dissent, are more basic. A subsidised interest rate as proposed, he argues, is strictly a transfer payment to help the indigent to improve their standard of living rather than an incentive to invest or a device to equalise the social and private rates of return. According to him, the distribution of such 'an unrequited social transfer', as he calls it, 'should be a matter of deliberate social policy rather than be incidental to the allocation of credit'.

The argument that if the proceeds of levies on the rich — be they taxes or high rates of interest — are to go to help the poor, there is no reason why struggling engineers and artisans should get precedence over those in more desperate straits is indeed unexceptionable. But the presumption that the differential scheme was conceived as a mere 'transfer' device to enable the poor to improve their living standards does not seem to be valid. Despite recurring reference to social justice, the poor and the rich, neither the majority of the Hazari Committee nor the dissenting member can be said to have viewed it that way. Nowhere in the Report of the Note of Dissent is there any suggestion that the banks should give loans to support pure consumption. The borrowers intending to avail of the loans must invariably have a project in view whose viability will be open to scrutiny by the credit-sanctioning authority. Contrary to Jalan's supposition, house-building does not come within the purposes envisaged in the credit schemes contemplated in the Report. The possibility that a part of the loans intended to provide working capital for the project may be used for the sustenance of the borrower — maybe, in many cases, a self-employed individual and his family and at a level a little better than what he could afford when he was left virtually without any income — does not lend support to Jalan's presumption. Now the question is whether there is a case for subsidising such loans on purely economic grounds and, if so, how best the cost of such subsidy is met.

If social desirability of an investment project and inadequacy of its commercial return to reflect the social gain correctly can justify a subsidy for it, the rationale for subsidised credit for the weaker sections of traders and producers can be found even within the framework posed by Jalan. One does not have to think of urban development or road-building to spot areas of divergence between social and private return. Instances of 'inefficiency' in the allocation of resources through the market mechanism for the satisfaction of entirely private wants are not wanting and the factors making for such inefficiencies are too well known to need enumeration here. There is hardly a town or village in this country which does not have its monopolists, the Arhtiya and the Mahajan, each with his well fortified domain. Conditions of the money market alone which breed such monstrosities as 3,600 per cent rate of interest (per annum) on loans taken by small hawkers[2] can give an idea of how wide is the gap between social and private returns and where. Cheap loans to a number of traders and producers over a wide area can be an effective way of bridging the gap. It may be argued that for removing imperfections of the market what really matters is the availability of credit rather than its cost. True enough. But, to enable the small producer or businessman to survive competition with his more resourceful rivals in trade every kind of help, from subsidised raw material and price protection to soft loans, would be justifiable. Interest may not be so inconsequential in the calculations after all — how else does one apprehend a stampede for loans if they are given at nominal interest?

Eyebrows may still be raised apprehending that low rates of interest would lead to the flow of investible funds into channels of relatively low return and thus aggravate the inefficiencies instead of removing them. But, though important, the allocative efficiency arguments cannot be carried very far in a country with so much of unemployment and inequality abounding, not to speak of the market imperfections. Besides, the test of viability, however liberally applied, should provide as good a safeguard against gross inefficiencies as one can reasonably expect in the situation obtaining at present in our country.

A case for subsidising interest on small loans can thus be made out on purely economic grounds. There are, to be sure, practical difficulties in the implementation of a subsidy scheme of this kind — primarily, (a) formulation of a truly objective criterion for classifying the borrowers; and (b) prevention of relending. But, however serious, they can at worst act as constraints limiting the area as well as the form of its application but cannot take away

from its basic rationale.

It does not, however, follow that the subsidy so intended should be financed by charging interest at higher rates from the affluent borrowers. The broad choices in meeting the cost are (a) raising the required funds within the banking system or (b) providing for it through the Budget. Assuming that the cost must be met by the banks themselves, there is again more than one alternative, e g, (i) charging according to 'what the traffic can bear'; that is to say, borrowers of different categories within a sector may be made to pay interest on their borrowings at rates linked with their means as reflected by their 'surpluses', (ii) charging interest on loans given to different sectors at varying rates, again, commensurate with 'what the traffic can bear', and (iii) raising the general lending rate of the banks irrespective of sectors. It is interesting to note that while refusing to countenance any significant differential in the rates — anything beyond 'a fiddle here and a scratch there' — on grounds discussed earlier, Jalan nevertheless seems inclined to agree with Ashok Mitra (and Boswel is at one in this) that there is good scope for charging a high enough rate of interest to tax the 'unearned surplus' enjoyed by the rich because of high profitability in certain sectors. It is not clear whether the suggestion is to tax the 'rent' or 'surplus' of only selected sectors in this way and leave others out or to mop up the surplus of intra-marginal units in each sector individually. In either case, attempts to tax the 'surplus' would lead to interest differential of a much wider range than even that proposed in the Note of Dissent. Since, however, the framework within which the scope of interest differential was considered by the Hazari Committee referred specifically to 'each sector' (item 1 of the terms of reference), we may confine the discussion here mainly to the question of intra-sectoral differential.

The suggestion that the banks should fix their lending rates for different categories of borrowers to mop up the surpluses by charging as much as the traffic can bear is, presumably, derived from the idea that interest being a 'price' can be modulated to discriminate between takers according to their urgency of demand or that 'unearned rents' can be tapped as effectively and harmlessly through interest as by a lump-sum tax on profits. Either way, the argument is open to question on several counts.

If the idea is to exploit opportunities of price discrimination available to banks, it must be remembered that the prerequisite for the successful operation of a policy of price-discrimination is a monopoly of the market by the supplier. Does this condition hold in the present case? Even granting that the State now commands a near-monopoly of the organised sector of the money-market, with a large fraction of monetary resources outside the banking fold and unaccounted money providing such a rich source of funds, there is no reason to suppose that the unorganised sector or the non-banking sector of the money-market is non-existent or so small as not to matter. Even otherwise, the problem of seepage can be formidable. Besides, unlike the situation where a discriminating monopolist seeks to extract for himself the 'surplus' that would otherwise be enjoyed by the intra-marginal consumers of his product, the customers of the banks, i e, borrowers, being producers, will surely try to pass on the impost of high interest charges to the final consumers and their ability to do so cannot be wholly discounted.

Looking at it as a tax on 'surplus' profits also, fears of shifting cannot be regarded as altogether unfounded. Even corporation tax, supposed to fall entirely on profits, is widely believed to be passed on, at least, partly.

Moreover, a lump-sum tax on profits in the shape of high rates of interest, being related directly to the size of capital borrowed, mainly working capital, and thus the scale of output or business rather than the volume of profits and that too on so narrow a base as rent or surplus element of profits, partakes essentially of the character of an excise tax rather than an income-tax.[3] Hence the possibility of its shifting will remain as long as there are shades of monopoly on the scene reflecting varying degrees of inelasticities. Besides, all the arguments about the excess burden of an excise tax as against a tax on income will also apply.

Formulating an acceptable definition of 'unearned surplus' too will not be easy. For, needless to mention, surpluses can arise not only through monopolistic practices but also on account of lack of foresight on the part of producers or as a result of imperfect mobility of factors of production, that is to say, 'friction'. It is quite conceivable that the earnings of a small borrower, such as a share-cropping farmer, contain a good element of unearned surplus occurring through a sudden rise in prices or simply because the farmer happens to be an intra-marginal 'firm' in the agricultural sector. While attempts to tax away the surpluses generated by market imperfections are socially desirable, efficiency in sources allocations may be seriously impaired if all profits are sought to be taken away. For, not all profits are surpluses in the economic sense, the line of distinction between 'earned' and 'unearned' elements of profits also is not always as obvious as to be taken for granted. Even assuming that the activities where profits are inordinately high are fairly well known, it is not possible for the banking system or, for that matter, any authority to locate the surpluses accurately in the different sectors and, what is more, among different sections within given sectors, and identify that portion thereof which constitutes 'unearned rent'.

Further, if, as has been postulated, the overall return of the banks is not to be affected by the scheme adversely, the differentials as between various groups will need to be worked out with a precision which would demand sophistication of an extraordinarily high order in the accounting procedure and machinery of the banks. Fixing the rates for the different 'quintiles' as proposed in the Note of Dissent — and the bands can be more in number — to arrive at an assumed average rate will surely be more complex than appears from the Tables in the Note, when 'weights' are taken into account and these weights keep moving in unanticipated directions. It will not be rational to brush this aside as a mere problem in arithmetic. If regard for efficiency in the use of resources is not to be given up, the 'weights', i e, the quantum of credit to be rationed for each quintile, decile, etc, have to follow the market trend and cannot just be fixed arbitrarily. To estimate this unerringly would require expertise akin to perfect foresight.

Attempts to recoup the cost of the proposed subsidy through inter-sectoral differentials will not be free from these difficulties, though this device is often used for directional control of investments. Suitability of such differential even for influencing the level of activity in different sectors is not beyond doubt. For funds will always tend to move in directions where their return is the highest and measures which fail to alter the relative profitability of the alternative investment channels significantly can do little to swing their course. Raising the rates of lending can help provided the costs are not passed on. That apart, a steep rise in the interest rates for a given sector like trade or industry may do more harm than good by accentuating the pressures for relending from the favoured sectors and by choking off quite a few lines of 'productive' activity. If the rates for organised trade or industry are jacked up to say 30 per cent because some sectors therein earn as high as 100 per cent return, the activities will still remain profitable and thus continue while others, though 'productive', may have to shut down. It is doubtful if selective increase for a particular branch of a given sector, e g, textiles within 'Industry', can get over this problem. It is just possible that if interest cost goes up beyond a point, textile mills will step up the production of superfine cloth in preference to the coarse variety because the rate of return on the latter is no longer remunerative. To expect that the rate structure can be adjusted so neatly as to leave certain lines of production within each sub-sector unaffected, while effectively netting the surpluses from others is to place too heavy a reliance on the manoeuvrability and efficacy of monetary instruments. These objections would apply *a fortiori* to a hike in lending rates of the magnitude suggested by Boswel.[4] There may be room for pushing up the interest structure generally but a decision in that regard should be based on considerations of the major aims of monetary policy, and market trends as well as profit maximisation of the banks and not the narrow requirements of a specific subsidy.

This is not to argue that the profits of business and industry should be left untouched but only to show that differential interest on bank credit is but a clumsy and poor instrument for such purposes. A better course is to widen the income tax base and if the profits of trade are to be curbed and not merely mopped up, to intervene in the markets on a bigger scale. What the banks can do best to help in this situation is to impart a greater degree of competitiveness by multiplying the credit supplying points (i e, by opening more branches), enabling potential traders and producers to enter the market in larger numbers and by withdrawing the privileges enjoyed by the wealthy borrowers because of their special links with the banking institutions.

In any event, it does not seem possible or desirable to recoup the cost of the proposed interest subsidy through a graduated rate structure. Even with the best of efforts, results of such graduation will be uncertain if not harmful. There can be no getting away from the fact that the scheme may entail losses for the banks. But that is no reason why the subsidy should not be given. The real question is whether the losses so arising should be borne by the banks or by the Exchequer directly. That involves issues beyond the scope of this note.

Notes

1 Leif Johansen, "Public Economics", 1965. It is not absolutely necessary that the number of instruments must be more than the number of goals. The requirement applies when each of the instruments affects progress towards each of the goals and the relations are linear and independent (*vide* Carl Shoup, "Public Finance", 1969, p 472).

2 "Organisational Framework for the Implementation of Social Objectives" — Report of a Study Group of the National Credit Council, 1969, p 82.

3 Milton Friedman, 'The Welfare Effects of Taxes', in "Essays in Positive Economics", reprinted in "Price Theory", 1962.

4 Boswel's argument that this will help the banks to meet their costs is not very convincing since, in his scheme, deposit rates too would move up in step, raising the cost of funds. The contention that a rise in interest rates will step up savings and bring more deposits for banks assumes a high degree of interest-elasticity of savings and deposits of which there is as yet no clear evidence

Defence: A Socio-Economic Problem

B V Rangarao

India is likely to face conventional wars on its borders as well as internal civil disturbances. No army anywhere is faced with such diverse requirements as ours. In the circumstances, a nominal nuclear weapons programme is more likely to be a liability than an asset. A premature start may only lead to a ruinous situation in which a military industrial complex may get into power.

The defence of the nation is emphatically not an isolated problem, and it cannot be the sole responsibility of any one section of our people. Besides, those who accept public responsibility should make an effort to understand the meaning of modern science and technology, the impact they make on social systems, and the implications of it all for our survival and prosperity. Adherence to traditional military concepts in the modern technological age cannot lead to sound defence policies.

IT is generally agreed that the military weapons found in the arsenal of a country are an index to the social and political outlook and the global ambitions of that country. Security and weapon systems are not synonymous.

Armed conflicts possible in the present context may be divided broadly into three types: (1) total war involving the Super Powers; (2) local wars involving two or more neighbouring nations, each enjoying the moral or/and material support of one or more outside Powers and the Super Powers, without direct involvement, and (3) national liberation wars or civil wars, the conflict in each case being confined to two or more hostile factions within a country. The flow of arms in a war of national liberation may be from several sources, but the war is generally within the boundaries of the country concerned.

Since 1945, more wars have been fought by the newly independent nations either to settle territorial disputes with neighbouring countries or for ideological reasons. Civil wars are more common in these countries than in others, the arms being supplied invariably by the erstwhile rulers of these countries or by other advanced countries. Almost every country in Asia, Africa, and South America, is under this threat. Western Europe, which was the scene of most of the conflicts during the last century and in the early years of this century, has on the other hand become relatively quiet. The political division of the region is now almost complete. National boundaries are well defined, and social orders are fairly stable. There is less tension in the region than before, partly because the governments of the

various countries, are indirectly involved in the wars being fought in other regions. If, however, a war should break out in the region between the two major groups of nations there — although, of course, the possibility of such a war in the region is very remote — it would be a nuclear war which would lead to the devastation of the entire world.

In the second type of wars, *viz*, local wars, the nations involved are generally those which belong to the developing world and which constitute what is sometimes called the Third World. These countries have to cope with certain legacies that they have inherited from their erstwhile imperialist rulers, and they are jealously nationalist. The aspirations which they have cherished since the days of their struggles for independence are based on outdated histories; hence their efforts to realise them inevitably pits them in conflict with their neighbours. Quite a few national boundaries and social orders in these regions are under challenge. The confrontations between Malaysia and Indonesia, India and Pakistan, besides those within Pakistan and Ceylon are examples. Whereas the governments of advanced countries are often willing to shed a little of their sovereignty for the sake of the benefits accruing from membership of a regional organisation or an international arrangement, the governments of the Third World countries are found to be overly attached to their sovereignty — viewing with suspicion and hostility any move that might encroach on their sovereignty. Nevertheless, they depend on foreign countries — often their erstwhile rulers — for arms, economic aid, and technical help.

Vague Political Ideas

Often the governments in these countries are weak. This is because, for one thing, unifying forces within the country are not sufficiently strong: in each country there are far too many local and temporary political parties, dominated by vague and confusing political ideas. The immense diversity in education, social outlook, economic standards, and political aspirations of the people, makes them so heterogeneous that it is difficult to set common goals for the nation as a whole. National liberation wars or civil wars are thus likely to increase in these countries in the next few decades. In these wars sophisticated conventional weapons supplied by the Super Powers are going to be widely used. Use of nuclear weapons, however, it out of the question. No Power would be so irresponsible as to supply nuclear weapons for use in civil wars.

For centuries, since the early primitive days, wars were fought with hired soldiers. Training imparted to these soldiers was meant only to increase their physical strength, endurance, and skill in the use of crude weapons. The soldiers carried with them their provisions, arms and ammunition, fought for a few hours or days — and returned victors or fell victims. Now, wars mean the involvement of whole populations and specialised training to various groups has become necessary. In the rocket units of the major military Powers, 66 per cent of the personnel hold degrees in engineering or science, in addition to having received military training. Preparation for war is a major activity for some governments. A modern army requires to be backed by a massive national effort to produce and supply the requirements for armed conflict — with an efficiency proportionate to the advance in technology. The distinction between the fighting forces and the civilian population, in times of peace or war, is only superficial. The concept of the battlefield is obsolete. Not only is the civil population involved in producing and supplying materials but it is the first to suffer in a bombardment or ground attack. There are more casualties among civilians than among the regular armed forces.

Physically, conflict entails use of force. Three basic forms of force, originating in three different conceptual fields of physics, may be distinguished: (i) mechanical force, (ii) electrical force in chemical form introduced by explosives, and (iii) the more recent nuclear force. The third is about a million times as powerful as the second while the second is similarly about a million times as powerful as the first.

An inventory of war items, even in a modest arsenal, would be formidable in size. The explosive capacity of known nuclear weapons ranges from a few tonnes of TNT to millions of tonnes of TNT. The largest to be tested had an explosive capacity equivalent to that of 50 million tonnes of TNT. Khrushchev once claimed that the Soviet Union had a weapon with an explosive capacity equivalent to that of a 100 million tonnes of TNT. In fact, the limitations are in the carrier systems in spite of the massive rockets that have been developed. If one could only carry these weapons by sea or leave them under water, the weapons could be as destructive as one likes. The technology of nuclear exposive devices is well known. The secrets relate only to the question of bringing down the cost of production.

There are weapons using uranium 235, plutonium 239, and uranium 233. Uranium 235 is the only fissile isotope which occurs naturally; it is, however, found in nature invariably in combination with uranium 238, and the separation of the one from the other is an expensive and laborious process. The other two fissile materials — plutonium 239 and uranium 233 — are artificially produced. In the first-generation US thermonuclear devices, the fusion fuel used was the very expensive tritium, which is an isotope of hydrogen heavier than deuterium. The Russians, even in their first attempt, used an isotope of lithium which is far cheaper than tritium.

Delivery Systems

The delivery systems too have a wide range — from artillery to Multiple Independently Targetable Re-entry Vehicles (MIRV's), which can carry as many as 20 thermonuclear bombs, with independent self-guidance towards different, predetermined targets. The identification of targets itself is a major task in any nuclear war that may be fought. A quarter of a century has passed since nuclear weapons were first used, and the strategies of war have undergone more change during this time than in all the past centuries. Till the First World War, objects directly visible used to be the targets. Today, however, more than the thickly populated cities it is the secret deep silos that contain solid-fuelled rockets with thermonuclear warheads — all ready to be launched within minutes — which are the first targets. Though continuous flights of strategic bombers with thermonuclear warheads have become outdated, nuclear-powered submarines, each carrying 16 missiles with thermonuclear warheads in the fathomless depths of the sea, are threatening globe-trotters.

There are surveillance satellites spying on all activities. Every underwater vessel is probably followed by another underwater vehicle. The deep ocean and the limitless expanse of space with all its celestial bodies are now the green-rooms where preparations are afoot for the unprecedented tragedy of a nuclear war. It is now possible to plant explosive devices either deep

down in the sea-bed or afloat beneath the surface of water a few miles off the coastline and to explode them by remote-control methods to cause tidal waves several hundred feet high which would completely submerge thousands of square miles of land and wreak destruction on all life and material wealth.

Moreover, in every arsenal built for a major war, there are biological and chemical weapons of a bewilderingly wide range and destructive capacity.

The Indian Problem

The variety of weapons in the arsenal of any country depends upon the political, economic, and social goals of that country. The technological capability of the country also depends upon these factors. As we know from experience, the countries most advanced in science need not have the same status in technology and economic growth. Technology is a more complex social activity than science, and the organisational patterns required to put scientific knowledge to use in economic and social spheres are so complex that they are not easily worked out even in many advanced countries.

In some respects, then, it is not only countries like India that can be said to be tradition-bound and conservative. Even certain Powers of Western Europe, which used to be regarded as first-rate Powers only a couple of decades ago, are now reduced to a second-rate position. The economic advance made by the United Kingdom and some other West European countries during the last three or four centuries is excelled by the prosperity attained by North America within the last one century and by the Soviet Union within the last 50 years. It need cause no surprise if similar progress is achieved by some other countries within 25 years or less.

The capability to wage war or to influence international events cannot be separated from social and economic programmes. Each country, including India, has to determine the role it can play on the basis of its social goals and capabilities. The wars in which a country is likely to be involved are also governed by the same factors. It is, of course, possible for a country to shift from one group to the other, depending upon its domestic prosperity, political cohesion, and social advancement.

In India, as in other countries, it is not wishes but the objective situation that decides the options. If any country aspires to achieve or to retain a position of prestige, without undertaking the social and economic support needed for the purpose, it runs the risk of sliding to a position lower than the one it already has reached. For instance, after spending £300 million on the acquisition of all-weather TSR-2 bomber, the United Kingdom was obliged to give up the whole idea for want of resources and to content itself with buying from the United States some F-111s which were later grounded after trials in Vietnam. The United States itself is intending to abandon its supersonic transport project after incurring an expenditure of $730 million. It spent vast sums to develop and produce chemical and biological weapons, and now it has authorised an expenditure of hundreds of millions of dollars to destroy them — and pollute the oceans and the atmosphere in the process. There are several other instances of technological programmes being given up half-way on account of the increasing complexity of related socio-technological problems. There are many examples of countries trying to imitate others more advanced in technology and ruining themselves in the process. Attempts to copy weapons systems are likely to lead to similar results. Informed and hard-headed discussions are, therefore, necessary within the framework of agreed social objectives, facts and analyses.

Democratic socialism is the social goal accepted by the vast majority of the people in India. In spite of three Five-Year Plans, our country is still among the few countries with a miserably low per capita income. Ours is a typical example of an heterogeneous community, and this is a hindrance for evolving and implementing agreed policies. The social values existing in our society today may have been conducive to social progress once upon a time, but today they constitute a serious handicap in evolving and implementing technological and social programmes that can take our country forward.

India's Immediate Requirements

In view of all these factors, we are likely to face conventional wars on our borders as well as civil disturbances — which, if not tackled in a systematic manner, may lead to guerilla warfare. These two threats are already there and no Government faced with internal strife can ward it off by diverting the attention of the people to its global ambitions. The immense diversity we notice in the social and political outlook of our people arises from the wide disparities obtaining among them — in income, in education, etc. This makes it difficult for the government to take any step that might bring about drastic changes. In the absence of a well-knit and stabilised social order, a young democracy like ours is likely to pass into the hands of a military-industrial complex when an unbearable burden is taken up. Already some political parties are openly professing different social goals — often, in the name of national defence. By constant propaganda some vested interests are depicting patriotism as something which is synonymous with support for an ever-increasing military budget. As in many countries which have passed under the sway of military-industrial complexes, so also in India, it is the defence budget that gets accepted with the least discussion. Immediate dangers to the accepted social order are, therefore, internal, although border security, too, needs attention. These limitations themselves should help determine military options. Besides, a coastline 5,900 km long, mountain crests extending to a total of 2,400 km, and a land border 15,200 km long, our armed forces have to keep up their fighting abilities in arid deserts, humid forests, high altitudes, and so on. There are also several islands far removed from the mainland.

As regards the conventional weapons needed for the defence of our borders we are yet to equip our armed forces with the equipment that would help pinpoint targets. Nor have we organised a centralised control system so necessary in the use of long-range guns. High fragmentation shells, detonated at the proper height by proximity fuses, are no less sophisticated than crude nuclear weapons. In our conflict with Pakistan in 1965 tanks constituted an important component of our armoury. However, teleguided anti-tank weapons with shaped charges giving high penetration which can render heavy armour plating and turrets useless, are yet to be suitably developed and adapted to our needs. Air-lifting of tanks and development of air-to-air, ground-to-air and air-to-ground missiles are some of the serious challenges before Indian technology.

Our communication systems too are still in a primitive form. It is only recently that it became possible for us to introduce micro-wave-linking. There is urgent need for telecommunications

in wet forests and hills and we must develop them at once. Our long border demands for its security the use of complicated radar and air-defence systems which are already installed in many other countries. The 'spin-off' in our communication technology is a reality, but it is doubtful in nuclear weapon technology, let alone space technology.

No army anywhere — whether of an advanced country or of an underdeveloped country — is faced with such diverse requirements as ours. We have not succeeded even in sealing our borders so far.

Going Nuclear

The threat to use nuclear weapons is a sign of desperation. Once they are used in a war, the war is bound to escalate into a global war in which there will be neither victors nor vanquished. If a country decides to be counted among those which have the capacity and determination to escalate a local war into a global war, it should go in for a whole range of fissile and fusion bombs, as well as missiles of varying ranges that can be concealed underground, under the water (even in the sea-bed), and in outer space.

What do these programmes mean in terms of investment? The sums spent by the US give us a clue. The US spent about $50,000 million on nuclear weapons; about $59,000 million (about $28,000 million on account of acquisition costs and about $ 31,000 million on maintenance during 1950-70) on strategic aircraft; and about $51,000 million (about $ 37,000 million on acquisition and about $14,000 million on maintenance during 1960-70) on missiles. It is now building what is called thin defence — i e, the Anti-Ballistic Missile System (ABM) — which again is likely to become thicker and thicker with accelerated expenditure. (MIRVs can easily pierce this thick defence, and it is, therefore, natural that the US should be anxious to increase the thickness.)

It is sometimes argued that a nominal nuclear-weapon arsenal acts as a deterrent. This is contrary to the very meaning of deterrence, which is now understood as the ability to make the enemy desist from mounting an attack for fear of a retaliation that might cause him unacceptable damage. The introduction of the ABM, which is said to be a purely defensive device, disturbs the balance of terror and is, therefore, considered a threat. The effect of a moderate nuclear force (such as that of France which has spent more than $5,000 million on the programme over a decade) is neither credible nor respectable.

A nominal nuclear-weapon programme is more likely to be a liability rather than an asset for us. In the first instance, it provides justification for Pakistan to acquire a similar capability somehow. The countries anxious to maintain a balance of power in the region may rush to its aid and act in a hostile manner towards India in matters of trade and other economic matters. If Pakistan forgoes its nuclear option on account of the civil war it is engaged in, the world powers might create another state to take its place in the regional politics of balances.

Apart from ideological and political considerations, a self-reliant and self-generating economy, a forward-looking technology, and a stable political and social order, are prerequisites for initiating a programme for producing nuclear weapons. A premature start may only lead to a ruinous situation in which a military-industrial complex may get into power. The failure of the programme may also demoralise democratic and socialist aspirations. The manner in which certain revivalistic elements and vested interests argue the case for a nuclear weapons programme makes it clear that they regard it only as a tool to change the social order into an autocratic one. When the resources are limited and the programme is ambitious, they get a lever to destroy the democratic order step by step in the name of nationalism and patriotism.

It is argued that a nuclear-weapon programme accelerates economic growth, and that the 'spin-off' leads to advance in various fields of technology. Victor K McElheny, in a report to *Science* (January 1, 1965), points out that the only technical fall-out of the nuclear-bomb programme in France has been the high-speed camera. In spite of passionate chest-beating, the two wars of 1962 and 1965 have not put the country on a path of rapid growth. To hope that a nuclear-weapon programme will act as a stimulant for economic advance is a vain hope: there is no substitute for hard work, informed analysis, and determined social reform.

It is often wrongly presented in our country that the peaceful uses of nuclear energy and stock-piling of nuclear-weapon fuels could go together. There is, no doubt, a lot in common in technology, but the two projects are different. No country has gone in for nuclear weapons so far *via* peaceful application. In fact, nuclear-weapon technology is less sophisticated than nuclear-power technology; the former capability can be expected of any country with an independent automobile, ship-building or steel industry. The materials required for the modern electronic industry and nuclear-power technology are more complex than those needed in nuclear-weapon technology.

It is thus often by considering the issue in isolation that the need of nuclear weapons for our country is stressed. There is also the mistaken notion that the bang power of weapons is the decisive factor in the outcome of a war. There is, further, an anxiety to be on par with the advanced nations, whose problems and possibilities are not the same as ours.

The Chinese leaders, for instance, insist that the People's Liberation Army is a great school in which armymen should learn politics, military affairs, and culture. The soldiers are also asked to engage in agricultural production and pursue some side occupations. Besides, they are made to run some medium-sized or small factories and take part in socialist education. In contrast, in India, when there was a move to engage army personnel, by way of an experiment, to construct residential quarters for their own use, it was strongly criticised by military officers and politicians alike. An army with a suitable social education along with military training as in Vietnam can evolve techniques of warfare in which the material advantage of sophisticated weapons is reduced to almost nothing. It was realised in the early fifties then that an economically backward and ill-equipped army also could wage a successful war against one that was far more advanced economically and equipped with a wide range of far superior weapons, including nuclear weapons, by forcing the enemy to fight on a level where its superior weapons would be futile. The escalation of a local war into a global one is but hypothetical — the logical consequence of using a tactical nuclear weapon being nothing short of a holocaust. It is also apparent that sound social organisations and political systems can withstand any threat and stand up to any kind of aggression. For an underdeveloped country to make progress and to secure its social order, it is the evolution of appropriate social and economic plans and their implementation that are important and nuclear weapons are no substitute for that.

Democracy can be defended only by providing the minimum living conditions to our 550 million people, by providing social justice within the framework of the contemporary world order, and by setting the nation on the path of rapid advance. In international relations, we should therefore revive and pursue with determination such policies as may lead to nuclear disarmament, general disarmament, the banning of chemical and biological weapons, a substantial reduction in the annual global armament cost of $ 200,000 million, and a reconciliation among the nations of the world enabling them to live and let live. The defence of the nation is emphatically not an isolated problem, and it cannot be the sole responsibility of any one section of our people. Besides, those who accept public responsibility should make an effort to understand the meaning of modern science and technology, the impact they make on social systems and the implications of it all for our survival and prosperity. Adherence to traditional military concepts in the modern technological age cannot lead to sound defence policies.

FROM THE CHAIR

The Bombay Gas Company Limited

Speech of the Chairman, Shri K L Jalan

THE following is the Speech of the Chairman, Shri K L Jalan, delivered at the Annual General Meeting of the Shareholders of the Bombay Gas Company Limited, held on Tuesday, November 16, 1971:

Gentlemen,

It affords me great pleasure to welcome you to our Annual General Meeting pertaining to the 109th operational year of the Company and to present to you the Balance Sheet and the Annual Accounts, together with the Directors' Report, for the year ended 31st December, 1970. These have been in your hands for some time now, and, with your permission, I shall take them as read.

I should at the outset wish to express the overwhelming sense of grief with which the Directors have to report the painful premature demise of Mr B L Jalan, the Chairman of your Company. Mr B L Jalan's tenacity, perseverance and wisdom have left an indelible mark on practically all the activities of the Company.

Before proceeding to discuss the Company's affairs, I would like to offer a few brief observations on the socio-economic situation prevailing in the country. The most overwhelming dominating factor on the National scene is the sudden entry of several millions of citizens of East Pakistan, plunging the country into enormous expenditures, so long met out of normal budgetary resources, and currently necessitating the imposition of several emergency levies under special Ordinances.

Inflation, Growing Unemployment and Rising Cost of Living, Industrial Unrest

The familiar phenomena of inflation, unemployment and rising prices and cost of living are spreading discontent among the workers. Law and order situation still continues to be unsatisfactory, though there are a few signs of improvement in some areas. Industrial unrest continues unabated. It is certain that the clarion call of our distinguished Prime Minister to all the sections of the people to rally to the Honour, Safety and Territorial Integrity of the Nation, will evoke spontaneous and universal response.

Moderation and Flexibility in Restrictive Policies

In this great national crisis, we would respectfully suggest to the Government to moderate and relax the restrictive policies against the larger Industrial Houses, so as to enable them to make their full contribution to the economy and defensive strength of the country.

Turning now to the affairs of the Company, the Company is witnessing the third consecutive year of profit, although to a moderate extent, after a spell of heavy losses spreading over a period of seven years. The Company's net profit for the year amounts to Rs 4.65 lakhs. This net profit of Rs 4.65 lakhs, conjointly with the excess provision of previous year's writen back, and a provision for Reserve for bad and doubtful debts and obsolete stores, reduces the accumulated losses to Rs 42.46 lakhs, to be carried over to 1971.

It may be noted that the revenue for the year was higher by Rs 16.82 lakhs as compared to 1969, mainly due to increase in the sale of gas and of residuals. Gas sales increased by 129 MCft during the year, the figures for 1969 and 1970 being 1615 and 1744 MCft respectively. Simultaneously, the cost of production also increased by Rs 16.50 lakhs, mainly due to rise in the cost of material, and increase in wages and salaries and other related payments.

Company's Inability to Avail of Timely Benefit Under the Price Fixation Rules

A recurring feature of the Company's inability to avail of a full and timely benefit of the Escalation Clause incorporated by the Government in the Bombay Gas (Fixation of Price Limit) Rules, and increase gas price as and when there is an increase in the cost of production, may now be set out. The basic objective of an automatic escalation clause is to provide, in cases of increase in the cost of production, prompt and necessary relief to producers. Relief delayed on this account is, as in the case of Justice, relief totally denied. The matter is under correspondence, and it is hoped that the Company would be able to satisfy Government that in accordance with the recommendations of the Gas Advisory Committee, and the letter and spirit of Price Fixation Rules promulgated by Government, it would be competent for the Company to increase gas price as and when there is an increase in the cost of production, and not belatedly resulting in the deprivation of legitimate revenues of the Company.

Import Licences

Reference may be made to another factor which hinders the progress of the Company and greatly hampers its operational schedules. On an application submitted in October 1968 for grant of a licence to import domestic gas meters, the licence came to hand, after protracted correspondence, May 1971, that is to say, after a delay of over 2½ years.

Similarly, on another application covering essential items, the licence was issued nearly 2 years later. Then again an application dated 1st June 1970 covering gas meters, has been in the hands of the authorities pending compliance with the prerequisite formality of a purchase order which is required to be placed on an indigenous manufacturer for a part of our requirements. The highest standards of public utility which the Company is at pains to maintain are severely crippled by reason of such delays in obtaining import licences and non-availability in a large measure of satisfactory indigenous equipment.

Inadequate Coal Supplies

Another matter which is a source of constant anxiety to the Company relates to the supplies of coal, quite apart from the aspect of steep increases which prices have been registered, landed cost of coal in August 1967 being Rs 81.45 per tonne and currently Rs 105.54. The Company, which utilises more than one lakh tonnes of coal per year, obtains its supplies from West Bengal and Bihar collieries. The Company has been using only Selected 'A' Grade high volatile non-coking coal in its carbonising plant for the past several decades. Consideration had earlier been given to the possibility of switching over to the use of inferior coal other than Selected 'A' Grade, but it was not found possible for various operational and technical reasons. By a recent Notification, the Government of India amended the Colliery Control Order, bringing blendable coals (in which category Selected 'A' Grade Dishergarh Seam coal falls) under the purview of distribution control, and there are disturbing signs to indicate that a new policy is being evolved to reserve these supplies for the use of Steel Plants, to the detriment of the Bombay Gas Company. Representations have been forwarded to the concerned authorities that the Company is supplying Gas to several major industries, some of them export-oriented, in addition to hospitals and nursing homes, as well as educational institutions and several thousands of domestic consumers, and thus serving a national cause, and requesting that the reservation of requirements for production of Fuel Gas may be maintained.

Fuel Policy

It would be pertinent, in this context, to make a reference to the general question of Government fuel policy. The Government of India set up in October 1970 a High Level Committee to formulate a long-term fuel policy. It is hoped that the Fuel Policy Committee, and the appropriate Government Authorities framing the national fuel policy, will appreciate the need to continue an unrestricted allotment of the special grade of coal capable of use in the Gas Industry. The problem requires to be studied in depth, and the measures suggested should in fact lead to the establishment of Gas Industry on a national scale.

Notwithstanding the handicaps enumerated above, the Company provided above 700 new gas connections during the year, bringing the aggregate of new gas connections since 1965 to over ten thousand. Having at long last obtained the licence to import gas meters, as also certain other equipment required urgently, the Company has currently drawn plans to quicken the pace of expansion, and effect further improvement in consumed service in the shortest possible time. The Company has also placed Indents on foreign suppliers for a few latest model gas cookers for the use of consumers. The special measures already taken towards service efficiency are enumerated below.

Production of gas has increased, although full use could not be made of the elevated purifiers due to non-availability of licence for the import of gas purification material, which has since come to hand. A water chilling plant was, however, installed in September 1970 to improve the purity of gas. Besides, a small Unit for toning the calorific value of gas was installed late in 1970, and improved results have become noticeable in 1971.

One more booster was commissioned at Gas Works to stabilise station pressures; the re-booster station at Jacob's Circle was commissioned by the middle of 1971 to provide additional relief to the consumers in Central and South Bombay.

The routine progamme of relaying, enlarging and cleaning of mains was maintained; the programme of augmentation of mains capacity in certain areas of Marine Drive and Malabar Hill was completed.

In view of the moderate profit for the year under review and carry-forward of past years' heavy losses, your Directors regret that no dividend could be recommended for this year as well.

We would like to express our appreciation to the General Manager and the Chief Engineer for their valuable services, as also to all other officers, and to staff members and workers, for the co-operation which they extended.

Japanese Monetary Views

THE Japanese Finance Minister, Mizuta, has stated that revaluation of the yen was conditional on the quality of multilateral co-operation including that of US co-operation. Depending on the result of these international efforts to readjust the exchange rates of major currencies, Japan is prepared to revalue the yen "by a reasonable margin", he added. Asked what the "reasonable margin" would be, the Finance Minister said Japan would need more than a $ 2,000 million balance of payments surplus annually after the current economic slowdown is over. Unless this surplus is assured, he continued, Japan will find itelf "in a difficult position".

"We would co-operate only to a reasonable extent, that is, to the extent that our national interests are not impaired by too large a revaluation", he said. Nothing that there were mounting pressures at home for an early return to a fixed yen exchange rate, Mizuta said his statement was designed to "explain the difficult problems" involved in the international readjustment of currency parities and dispel public anxiety over upward revaluation of the yen.

Mizuta also made these points during his press conference: (1) The Government will study measures, including easing the foreign exchange controls, to minimise the impact of the floating system on industry, particularly small businesses. (2) Japan is not in a position to take the initiative for a multilateral currency realignment. There are no assurances that Japanese action would be followed up by other nations. (3) Japan's payments surplus will drastically decrease after the current business slump has run its course. If the yen is revalued by a very wide margin the payments balance might run a deficit.

Mizuta also said the "fundamental reason" for the current monetary unrest was that the US balance of payments had seriously deteriorated. He added: "We are fully aware that the Japanese economy is dependent upon the stabilised growth of the world economy, including the US economy."

The Final Option

EVER since the night of March 25-26, when the Pakistan army launched its repression campaign in East Bengal, the military rulers of that country seem to have followed a course which has progressively narrowed their options and pushed them towards an all-out confrontation with India. Given a choice of political compromise or military action, Yahya Khan has at every turn chosen to rely on the fire power of his army. Although it is still not clear what happened during the series of talks between Yahya Khan, his military subordinates, Bhutto and Mujibur Rahman, it can be said with some degree of certainty that Mujib till he was arrested, had wanted East Bengalis to rule themselves within the framework of Pakistan. From what can be surmised, the negotiations during the third week of March between Yahya Khan and Mujib might even have led to a reconciliation between the two wings of Pakistan, had Yahya and Bhutto (who had thrown in his lot with the army then, but now appears to be less than enthusiastic about his position vis-a-vis the army) placated Mujib and the Awami League by agreeing in principle to the League's six points, which could later have been watered down in practice, through political bargaining. This would have meant that the central government of Pakistan would still have been the sovereign ruler of Pakistan. But such an opportunity was thrown to the winds in favour of military action.

At that point, and even later, the Government of India would have been quite satisfied to see a political solution worked out within the framework of Pakistan, as its interests have been — and still are — to maintain stability in the eastern region of the subcontinent. But Yahya's army resorted to pushing out millions of refugees into India — a tactic which it no doubt thought clever at the time. As the number of refugees multiplied so did the Government of India's commitment to seeing a popular government established in East Bengal. Of course, it would be disingenuous to say that our motives in helping the East Bengalis did not include the prospect of weakening Pakistan. Yet, even then, Yahya and his military coterie had the option of making a dramatic gesture of recompense — such as releasing Mujib and negotiating with him. But in a remarkable display of a military mind drilled to be narrowly consistent, Yahya Khan chose to apply a milder version of the same medicine in West Pakistan by banning the National Awami Party — a party which has a considerable following in the North-West Frontier Province and in Baluchistan.

And now he has finally closed all his options by launching air strikes on the western front. All the evidence suggests that India was not the first to strike in the west. We were not interested in opening a front in the west as our main concern lies in the east. In his broadcast to the nation declaring war on India — a tautologous declaration, as the act of war on the western front preceded the words by a day — Yahya has said that this would be the final war with India. In one sense this is very likely to prove true. East Bengal will in all probability be liberated by the Indian army; this will not be as desirable an outcome as the liberation of East Bengal by the efforts of its own people, but the break-up of Pakistan now appears inevitable.

In spite of the useful help of the guerillas of the Mukti Bahini in attacking the rear of the Pakistan army in East Bengal, the Indian army's liberation of the East will not be an overnight Goa-type of 'police action'. Due to a terrain intersected by numerous water channels whose crossing-points the Pakistani troops could obstruct, our eastern campaign is likely to take some time, by when the Pakistani forces are likely to run out of supplies and ammunition if the Indian navy does its job of blockading the coast of East Bengal. In the meanwhile, our forces are unlikely to waste men and material in making unnecessary offensive thrusts on the western front against a well-entrenched enemy.

The great imponderable in all these calculations is to what extent the government will resist big power pressures to stop the fighting before the Indian army has completed its task in the east. The Soviet Union is likely to emphasise the need for a political solution of the Bangla Desh problem. The other big powers, including the United States and China, may well insist on an immediate cease-fire, leaving the political issue of Bangla Desh to be tackled subsequently. If these pressures prove irresistible, this war will have been waged to no purpose from India's point of view. In the next few weeks, therefore, the Government of India will need to lean heavily on the support of the

Cash Crops

Missing Momentum

WHILE foodgrains production has made significant strides since 1967-68, cash crops have had little share so far in the 'green revolution'. In 1967-68, there was a general improvement but in the very next year oilseeds, jute and cotton production declined sharply, though sugarcane production was slightly better. In 1969-70, production of oilseeds, jute and sugarcane rose sizeably and the Economic Survey for 1970-71 had forecast that 1970-71 would finally present a mixed picture with oilseeds registering a rise, sugarcane being at about the same level, and jute and cotton being somewhat lower. Latest reports have it that jute, cotton and sugarcane, all showed a downtrend last year. A comparison with the Fourth Plan's output targets for 1973-74 show the vast ground yet to be covered. Against the target of 80 lakh bales, the production of cotton in 1970-71 was 46 lakh bales; and against the target of 74 lakh bales, production of jute was 49 lakh bales. Sugarcane was better off: against a target of 15 million tonnes, production was 13.19 million tonnes. This year, however, the jute and cotton crops are better, but the oilseeds crop has suffered owing to drought in various producing areas and sugarcane has shown no marked rise after 1969-70.

Why has production of the major cash crops failed to gather momentum? To some extent year-to-year fluctuations are to be expected, but overall productivity has failed to rise. This is borne out by comparison with the productivity of cotton in UAR or raw jute in East Bengal. There has been no varietal breakthrough in the cash crops as there has been in foodgrains, particularly wheat. Yet there is much scope for improved cultivation of the existing strains and varieties. Improved seeds, systematic use of inputs, etc, are possibilities that have been neglected. Replanting in tea has also made slow progress. Jute goods, tea and cotton textiles are major export items accounting for nearly 30 per cent of our foreign exchange earnings and unless their raw material base is economically reinforced they could well lose out against international market forces. In oilseeds we have, over the years, become consistent importers after having been exporters.

If the textile industry, for instance, has not, in the circumstances, taken major initiatives to stabilise cotton prices and give a leg-up to productivity, it must be because it has had access to imports. Moreover, both cotton textiles and jute industries have units ranging widely in efficiency so that any joint industry effort in crop improvement — like the consortium idea in exports — has never been feasible.

Agricultural research institutes have developed strains of jute, cotton and oilseeds with higher yields and possibilities of multiple cropping. Nearly Rs 15 crores have been allocated to intensive jute cultivation in six producing districts over the last three years of the Fourth Plan. The initiative in this, as in the initial high-yielding varieties programme in foodgrains, will probably have to rest with government which has by now developed a machinery for distribution of inputs and seeds. It must realise that better raw material production is as important as the much vaunted idea of modernising the mills. Individual states, too, have gradually begun to take more responsibility. It would definitely help if the import tap is at least partially turned off.

World Currencies

Freezing the Float

THE poker game in currency values, started by the USA on August 15, appears to be gradually moving towards a resolution. The three months since President Nixon's announcement have been used for a little sparring (over who was guilty of what sins against the rules of the international trading game) and considerable probing (about what was acceptable to whom). The various national positions have as a result become a little less hazy, if not more clearly defined.

The most inscrutable seemed to be the US, particularly since it had taken the initiative in breaking the (no longer maintainable) status quo. The objectives of the US measures—local tax reliefs, delinking of dollar from gold and the 10 per cent import surcharge—were simultaneously to stimulate the economy and to improve the country's international balance. The US, however, refused to define the situation in which it would revert to international orthodoxy—fixed parities, removal of the import surcharge and non-discriminatory taxation. Apparently, the US considered it to be up to the other countries to change their positions (particularly currency parities) to a sufficient extent to enable the US to withdraw its extraordinary measures. The other countries, particularly Japan, were most reluctant to declare their hand, fearing that the US would use the situation to wring further concessions from them. As a result, major international currencies have been floating—fortunately without damage to the volume of international trade or giving rise to a rash of retaliatory measures like import surcharges by other countries. Denmark is the only country which has imposed a 10 per cent surcharge on imports, but this is recognised to be justified by special factors within Denmark. In any case, Denmark is not an important element in international trade.

But the period has been used for considerable discussions, particularly bilateral, and national bargaining positions have become more clearly defined. The US was the first to indicate that it was seeking a turn-round of $ 15 billion in its international trade account. More recently the US has indicated that it was seeking an average increase of 11 per cent in the parities of foreign currencies *vis-a-vis* the US dollar.

Once the US position got known, it became easier to make counter-moves to unfreeze the uncertain situation. The OECD almost immediately countered by its own estimate that the turn-round required in the US trade position was much smaller—$ 7 to $ 9 billion. The major issue that remains to be determined is the average change in parities needed *vis-a-vis* the dollar and, secondly, how this change is to be shared by the various countries (including the US itself).

Of the major trading partners of the US, Canada is the least concerned about parity changes (though it is about the trade surcharge), since the Canadian dollar has been floating since last year. The UK, West Germany and France have taken very different positions on the crisis brought about by the US action. The UK has floated the pound which has appreciated 3 to 4 per cent in relation to the dollar. The UK's official position, as expounded at the annual meeting of the IMF, is that it would seek a return to the fixed parity system with slightly wider bands for fluctuations. However, the UK's internal economic situation hardly justifies this position. Barber's reflationary June budget has still not led to the expected boom and if a recovery takes place, the recent appreciation of the pound represents an overvaluation of its currency which the UK can ill afford. France has tried to have the best of both the worlds—a fixed rate (at old parities) for the trade account and a floating rate for capital and financial transactions. Given some haziness in transactions, this has enabled France to keep the appreciation in the value of the franc to less than 2 per cent. West Germany which floated the D-Mark in May 1971 is finding the situation becoming more difficult. While the D-Mark has appreciated by 9-10 per cent since the May float, the country has been faced by growing unemployment and fears of a major recession. It is evident that West Germany would want to stabilise the D-Mark soon—and at a much lower parity than what has now been reached.

The Japanese position has undergone a sea change during the last three months. Japan started with an attempt to maintain the then existing parity of the yen (360 yen to the dollar). When this position could no longer be sustained, it let the yen float and the yen has appreciated by 9 per cent so far. Everybody knows that even this is not the true value of the yen and that the value of the yen is being maintained by considerable intervention on the part of the Japanese government which has been responsible, in the process, for the appearance of the expression 'dirty float'. The Japanese economy has eased, which only means that it has a growth rate of 5-6 per cent against the customary 10 per cent. Some industries like steel are in a recessionary phase, leading to the formation of an officially recognised cartel to regenerate production.

The Japanese claim that their export margins are hardly ½ per cent on sale prices. In any case, the Japanese have let it be known that they would not be averse to a 12½ per cent appreciation of the yen, provided the US gave up the surcharge and agreed to a 5 per cent devaluation of the dollar (in term of gold). The Japanese are also known to be planning a 'heavy' yen (1 new yen equal to 100 old yen) and calculating machine manufacturers are already taking steps to adjust to the change.

The main rub in the US position is its insistence on forcing all others to change their parities, without itself taking any steps to change the dollar parity. This has run into predictable resistance. A substantial appreciation of a currency impairs the domestic industry's profit position, and affects adversely the exporting enterprises. A small devaluation, on the other hand, brings about a mildly stimulating profit position. The US attempt to force a unilateral one-way change has not succeeded, particularly as the US was unable to isolate Japan from its other OECD partners. Consequently the US is becoming less flexible regarding a lowering of the dollar parity in terms of gold.

Given the present situation the best way out would be for Japan to revalue 14-15 per cent, West Germany 6-8 per cent and France and the UK 2-4 per cent. If the bands are then widened to 3 per cent either way, the dollar price of gold would become $ 34 to $ 36 — which would give the appreciating countries the psychological satisfaction of having forced the US to devalue. The OECD, now meeting after a postponement forced by the US, would appear to be moving to such a position. If so, by the year-end, the world, or at least its bankers, would have returned to the serenity of fixed rates and no import surcharges — and in a mood to celebrate Christmas.

Small Industries

Phantom Growth

A Correspondent writes:

A PHANTOM figure used by official spokesmen to confound critics of the country's industrial performance in recent years is that of the rate of growth of output of small-scale industries. The apparition was first conjured up by the Reserve Bank which had claimed in its annual report for 1969-70 that output in the small-scale sector had registered an impressive increase in that year as compared to the previous year and had given the respective rates of growth with commendable precision at 11.2 per cent and 8.2 per cent. These figures were later repeated in the Finance Ministry's Economic Survey for 1970-71 which added that there were 'a number of indicators' which suggested that the rate of growth in the small-scale sector had been even faster

Sachin Prize

The last date for submission of papers for the Sachin Prize, 1971, is extended to January 31, 1972.

Three annual prizes of Rs 1,000 each have been instituted by the Sameeksha Trust to perpetuate the memory of the late Sachin Chaudhuri. Prizes are to be awarded for the best paper each in Economics, Sociology and Politics. The papers must be concerned with application of theoretical concepts to interpretation and analysis of Indian situations. Authors must be persons of Indian nationality, not more than 30 years of age as on December 31, 1971.

Papers should be between 5,000 and 8,000 words, typewritten, and should be sent with two extra copies to the Editor, *Economic and Political Weekly*, Skylark, 284 Frere Road, Bombay-1.

in 1970-71 than in the previous year. The Minister for Industrial Development, not being bound by the same standards of accuracy, has been glibly repeating the figure of 11.2 per cent as though it pertained to 1970-71 and not the previous year.

This is not, however, the most interesting aspect of the matter. The Reserve Bank's estimates of growth in the small-scale sector in 1968-69 and the following year were based on figures supplied by the Development Commissioner for Small-Scale Industries, Government of India. The figures were for the value of output of the units registered with the Development Commissioner. How they were arrived at is not clear. At best they must have been based only partially on actual returns, considering the slackness in the submission of returns by registered units; for the rest they could not have been anything better than guesstimates, pure and simple. Further, the figures were of gross ex-factory output and not of value added by small-scale industrial units. And since they related to the value of output, they were inflated to the extent of the price increases in the respective years. Finally, since the figures related to units registered with the Development Commissioner, a part of the increase must have been definitely on account of expansion of coverage.

For all these different reasons, the figures of 11.2 per cent and 8.2 per cent are completely meaningless as measures of the actual growth of output in the small-industries sector. It remains a minor mystery how the Reserve Bank's star-studded economic department came to overlook all these considerations.

BUSINESS

Iron Ore Export Prospects Bleak

Magnus writes:

FEARS about a drop in iron ore exports have been expressed recently by the major Goan mine-owners and by officials of different organisations, particularly the National Mineral Development Corporation. These fears are unfortunately well-founded and some counter-measures are obviously called for.

There are two aspects of the problem, one relating to demand and the other to supply. Taking the latter first, mines in Goa are certainly in a happier position than the mines of NMDC and others in interior regions. NMDC has some very good mines, and even better schemes in hand, but it is handicapped to some extent by divided corporate commitments. Its famous Bailadilla mine had a flourishing period, but has not been able to deliver sustained high outputs over long periods. Now it seems that the second mine at Bailadilla is at least one year behind schedule, and will deliver only in 1974. Kiriburu is doing well, and the project at Donimalai should do even better. Private mines in the Hospet sector and elsewhere are still struggling in their usual fashion, but manage to deliver quite substantial tonnages. Unfortunately, producing ore is only the beginning.

Transport as a bottleneck is by now so hackneyed an excuse that people very often do not realise how serious it is. Bailadilla alone is running short by nearly two rakes per day, and there are any number of producers whose main concern is wagons, not production. Railways and loading ports are really the key to ore exports, and it is often said that a backward country exports the transport services involved as much as the ore. Even an advanced country like the US has to face transport bottlenecks and high costs. An interesting study has been recently conducted by the US Bureau of Mines for transportation of iron ore by pipeline from the Mesabi Range in Minnesota to the steel and pelletising plants near-about Chicago. The pipeline could relieve the snarled-up rail-cum-ship system now in use. Two possibilities have been studied, one of 95 miles and the other of 515 miles. The former, it is estimated, will cost $ 112 mn and will carry 10 mn tons per year, at a lower cost per ton than the present system. Similar studies used to be carried out in India for some of the new prospects, where rail lines are missing or too costly to build. Failure of the Indian Railways can jeopardise major export contracts.

Demand for iron ore is the other aspect of the problem. When there is a slump in Japanese steel-making, our exports suffer because a large proportion of them is tied to Japanese steel mills. Our exporters have apparently not noticed the phenomenal strides made by the iron and steel industry in the Soviet bloc countries during the past fifteen years.

While India's share of steel output has never exceeded 4.5 mn tonnes, its iron ore output of 28 mn tonnes in 1970 may increase at most to about 40 mn tonnes by 1980. This would be a mere 0.4 per cent of world output. This insignificant contribution will make India a nonentity in the market, and the resultant neglect will lose us further business.

Competition from Australia and Brazil has been always keen. It is being rapidly supplemented by Peru, Chile and South Africa. Moreover, we have made almost no move towards pelletisation, while all others have long established pelletising plants. We must do the same, as much to make use of the fines as to get a foothold in the pellets market. It would be most useful if the teething problems at Tisco's plant at Noamundi and Chowgule's plant at Pale are more freely discussed with others intending to set up such plants, so that costly mistakes are not repeated.

Customers are also becoming more grade-conscious. One of the largest suppliers, Hamersley of Australia, were recently accused by the Japanese of having supplied sub-grade material, whereas the truth probably is that supplies were close to the specified grade instead of containing a few 'bonus points'. Hamersley has by now accumulated millions of tons of marginal ore (58 per cent against the export grade of 62 per cent) and is planning for its utilisation. In India such material is just thrown into the nearest valley and lost for ever. We are also quite prodigal about the grade of export ore, 64 per cent being regarded as the minimum in many cases.

It must be admitted that only part of our troubles are due to poor management. There is a genuine lack of finance on the scale required for developing large complexes which comprise mines, pelletising plants, railways and ports—not counting shipping for the present. For this some of the blame must lie with national policy which frowns on foreign capital participation. Virtually every project in Australia or

Brazil was financed from other countries. In both, let it be noted, safeguards for national interests were incorporated in the agreements, and the host countries as well as the companies have benefited from export of iron ore on an unprecedented scale.

The iron ore business is a two-sided coin. Unless one has large orders in hand, the development of big mines and transport facilities cannot be taken in hand; and unless one has these facilities, large export orders cannot be obtained. The strategy for India must obviously be to make the best use of existing mines and facilities, thus proving our ability to compete and then to obtain bigger orders spread over the next ten years or more. It is a well known fact that if orders and ore reserves are available, international finance is not difficult to arrange in this industry. Whether India wants this finance is another question. Although the answer to the question is known to be in the negative, the reasons for it are by no means clear.

Air-India

White Elephants?

THE uses of adversity for Air-India may not be exactly sweet, but they may yet be educative. About the fact of adversity itself there is no doubt left any longer. In an official press release last week the airline forecast a loss of Rs 4 to Rs 5 crores in 1971-72, for the first time since nationalisation in 1953. The loss may in fact turn out to be rather larger since in the period April-September, normally the more profitable part of the year, there had already occurred a loss of Rs 3.67 crores. The more pessimistic among Air-India officials fear a loss of Rs 8 to Rs 9 crores this year and as much as Rs 15 crores next year.

About the causes of adversity, Air-India is being unnecessarily coy. Thus the press note goes out of its way to emphasise that the airline had begun to operate at a loss in March 1971, "before the commissioning of the Jumbos". But the whole world knows that it is the arrival of the Boeing 747s on the scene which has upset the cosy, cartellised world of the international airlines. Air-India is committed to buying four 747s of which two are already in operation and the other two will be delivered next year. Clearly, Air-India's calculations of the impact of the 747s on its economics have gone completely haywire.

The increase in costs has been startling. The additional expenditure on account of interest, depreciation and insurance charges on the two 747s commissioned in May adds up to Rs 6.81 crores per annum, which is only a little less than one-tenth of Air-India's total operating revenue in 1970-71. On the other hand, the expectations of growth of traffic — largely based, some suggest uncharitably, on the rosy projections understandably supplied by the Boeing company — have been belied. The 747s were ordered for use on the India-UK-USA route and a fleet of four was considered to be the minimum required to operate a daily service on this route. As things have turned out, however, traffic on the Atlantic route has shown practically no increase this year. Of course, Air-India is not the only airline to be left high and dry, but it still needs to be explained why it did not exercise its option, which was open till about a month ago (by when the trends in traffic had become clear enough), to stagger the acquisition of the fourth 747.

An altogether desirable consequence of the enormous expansion of capacity in international air transport resulting from the introduction of the 747s has been the beginning of the break-up of the cartel of airlines functioning under the IATA umbrella which rigged up fares even as airlines flew with half the seats on their planes empty. There have been rumblings against IATA-fixed fares in the past. It was usually the giant American airlines, Pan Am and TWA, which pressed for lower rates to attract more traffic, while the European ones on the whole preferred high fares and low traffic to the risks of a sharp cut in fares. Air-India was invariably on the European side in this argument. Now the situation has changed and it is the European airlines which want to try to fill up their empty 747s by reducing fares whereas the US airlines, in a bad shape recently as a result of managerial and other problems, are not prepared to risk lower fares. Air-India has followed airlines like BOAC and Lufthansa in sharply cutting its trans-Atlantic fares. (The so-called excursion Bombay-New York return fare is Rs 4,125 which is lower than the regular one-way fare of Rs 4,605.) Air-India has also registered a wholly-owned chartering company, under the chairmanship of its commercial director, which is nothing but another ruse to offer cut fares. What airlines like Air-India, BOAC and Lufthansa are trying to do is to set up a dual fare structure which will enable them (or so they hope) to charge IATA fares to those who will pay these fares and fares lower by half or even more to those who will otherwise either not fly or will take airlines offering under-the-counter cuts on IATA fares.

Air-India needs to be pushed in two other directions. First, it must pay more attention to ethnic traffic to and from India which at present accounts for less than one-third of its traffic and a good part of which is mopped up by other airlines. Why should not Air-India extend its cut fares to routes other than the India/UK/USA one? Along with lower fares, Air-India also needs to impress on its staff the importance of treating their own countrymen with the same courtesy that they extend to Westerners. Second, Air-India and Indian Airlines need to be prodded to achieve a measure of co-ordination in their operations. Such co-ordination must aim primarily at the maximum utilisation of their combined capacities — there is no reason, for instance, why Air-India's 747s should not operate on the internal trunk routes — but it should extend to other areas, ranging all the way from a computerised booking service to a joint training programme for pilots. Indeed, this appears to be right time for the Ministry of Civil Aviation to initiate a serious study of the pros and cons of eventually merging the two air corporations.

Dempo Steamship

Wherewithal for Expansion

DEMPO Steamship's chairman, Vasantrao S Dempo, has underscored the need for reviewing the decision to withdraw the development rebate from 1974 and to change the method of calculating profits eligible for tax holiday. (The conventional method of calculating profits on the basis of the written-down value of the ships has been changed in favour of adjustment of Government loans against the capital base before arriving at the tax-free quantum of bonus.) These steps, in his opinion, will affect the growth of shipping by impinging on internal resource generation in the industry. The rapid tonnage expansion in the past has been largely financed by self-generated funds. Now shipping companies are hesitant to place fresh orders or to go in for secondhand ships despite the fact that market conditions are favourable. There has been a lull in international shipping activity following a slight recession in Japanese industrial growth, reinforced by the international currency crisis and US protectionist measures. Charter market rates have fallen to the lowest level in twenty

years and international shipping companies are reviewing their development plans. Prices of ships, both old and new, have come down in the international market, but Indian shipowners are following a cautious policy in the matter of tonnage acquisition. Their attitude may well change should the government give any indications of reconsidering its policy with regard to development rebate, at least in respect of ships which were ordered much before the announcement of the new policy but are to be delivered after March 1974.

Dempo's performance in 1970-71 was impressive enough and reflected the boom in the international charter freight rates. Total freight and charter hire increased from Rs 306 lakhs in 1969-70 to Rs 558 lakhs in 1970-71 and, operating profits, after allowing for higher depreciation at Rs 83 lakhs (Rs 68 lakhs), rose from Rs 33 lakhs to Rs 144 lakhs. This is significant considering that the company had to pay charter hire to the extent of Rs 67 lakhs and there was a 70 per cent rise (from Rs 18 lakhs to Rs 31 lakhs) in repairing and dry-docking expenditure. The profitability of the company as a ratio to total capital employed more than doubled from about 7 per cent to about 15 per cent. Despite higher profitability, the company has declared a dividend of 10 per cent in view of the uncertain conditions prevailing in the freight market.

Commenting on the company's future prospects, V S Dempo hopes that there will be an early recovery from the current freight rate slump. During the year, the company placed orders for two bulk carriers — one of 66,000 dwt from Belgium and another of 21,450 dwt from the Hindustan Shipyard — which, on delivery in 1975, will raise the company's tonnage to 212,000 dwt from the current year's 126,700 dwt. SDFC finance to the tune of Rs 13 crores has been secured for acquiring the new tonnage.

KSIDC

Overstretched?

DURING its tenth year of operation (1970-71), the Kerala State Industrial Development Corporation (KSIDC) made a net profit of Rs 2.26 lakhs (Rs 2.60 lakhs in 1969-70). Gross income by way of interest on loans, dividends, etc, was maintained around Rs 23 lakhs. The Corporation's share capital remained unchanged at Rs 4.15 crores; its borrowings, however, increased from Rs 1.73 crores to Rs 2.50 crores, mainly through an issue of bonds of Rs 53.50 lakhs. Total assistance sanctioned by KSIDC declined marginally from Rs 169 lakhs in 1969-70 to Rs 165 lakhs. Net aggregate sanctions as at March 31, 1971 were Rs 9.48 crores and the total amount disbursed was Rs 8.44 crores.

But the financial statistics apart, it is KSIDC's promotional and entrepreneurial role that requires attention. KSIDC has been instrumental so far in the promotion of 8 companies, including one for setting up a mini steel plant. Of these three are already in production and progress on two others has been satisfactory. One company has been wound up and in the case of another company, KSIDC's efforts to secure technical and financial collaboration have still not been successful and work on this project has been at a standstill. Dastur and Co have been appointed as consultants for the mini steel plant, but it seems doubtful that this plant will get the required scrap. KSIDC has also obtained letters of intent for three other projects, for manufacture of, among other things, electronic items and cigarettes. It is reported to be active in promoting a newsprint project and is also engaged in mineral explorations relating to deposits of iron ore, cement-grade limestone and mineral sands.

Kerala is not one of the officially recognised backward states, though industrial activity in the state is relatively low compared to its neighbours, Tamil Nadu and Mysore. KSIDC would thus seem justified in undertaking diversified entrepreneurial activities. But in its anxiety to make an impact on the industrial scene, KSIDC, like its counterparts in some other states, runs the risk of overstretching its resources, financial and managerial. Like many other State Industrial Development Corporations, KSIDC is also managed by civil servants, in service or retired, and lacks the financial and managerial resources to effectively play its promotional and entrepreneurial role. There is also the danger of over-involvement in the projects promoted and, in any case, promotion cannot be carried out on any extensive scale with the meagre funds at its command.

Bombay Gas

Long Haul

AFTER a long spell of seven years of heavy losses, Bombay Gas Company earned a moderate profit for the third consecutive year in 1970-71. Sale of gas and residuals were higher in 1970-71; the increase in revenue was, however, neatly neutralised by higher costs of production. The company's net profits during the past three years have averaged around Rs 4.5 lakhs. At its present level of operations and profitability, it would seem that the company would be able to wipe off its accumulated losses of Rs 42.46 lakhs sometime around 1980-81.

For a company favoured with excellent conditions for growth, Bombay Gas's performance has been disappointing. Gas output has been on the increase; one more booster has been commissioned to stabilise station pressures; and the programme of augmentation of mains capacity in certain areas of Marine Drive and Malabar Hill has been completed. Though poised for quick expansion, the number of new gas connections have remained at a low level, being only 700 in 1970-71 which brought the aggregate of new connections since 1965 to about ten thousand. This by any reckoning is pitiably low.

This is not to deny the problems faced by Bombay Gas in raising the number of new connections. Coal supplies have been inadequate; prices of coal have continued to register increases; and obtaining import licences for gas meters has always been a problem. Even more important, increase in gas prices has time and again been the main theme of the statement of the company's chairman to shareholders. Though the escalation clause incorporated by the state government in the Bombay Gas (Fixation and Price Limit) Rules provides for automatic revision in prices in case of an increase in costs, the company has been complaining of delays in effecting these revisions. The objective of providing domestic fuel to a larger section of the people can be achieved only if Bombay Gas is able to generate adequate resources. Also, if electricity undertakings are permitted to charge what the traffic can bear, why not Bombay Gas? Isn't it possible for Bombay Gas to charge differential prices like the railways (an inverse of the telescopic rates system would seem to be applicable in this case? As a public utility concern, Bombay Gas must continue to grow and the company has to seek out avenues of growth. The manufacture of gas meters is not all that complicated and the company could well have taken up the production of this item instead of lamenting delays of two-and-a-half years in obtaining import licences.

China in the UN

I THINK you exaggerate when you describe ("China in the UN", October 30) the failure of Americans to carry through their resolution making China's admission an 'important question' as a 'defeat' of American foreign policy. The American resolution was defeated by a small margin of votes (54 against 59) and that too despite the fact that the US did not use all the forces at its command to pressurise member states to support its resolution. Leaving aside the small Afro-Asian states, even Britain could not have afforded to vote against the US resolution if the US had fully exercised all its political-economic influence over it. If the US made any efforts, it was not so much to save Taiwan as to get a respectable number of votes (though not a majority) in favour of its resolution to convince the American public that it did try to save its faithful ally from being expelled. Perhaps Kissinger had even mentioned to Chou that for the sake of domestic public opinion, the US had to put up a show of trying to save Taiwan's seat in the UN.

In short, knowing that the expulsion of Taiwan from the UN does not mean handing over the island to the Chinese, the Nixon administration decided to concentrate on the more important objective of the success of Nixon's visit to China. That China's admission into the UN became possible only when the US changed its attitude towards China shows that the US still holds sway over the world body and that a large number of European and Afro-Asian countries can vote against its wishes only so long as the US does not seriously mind their doing so. 'Defeat' or 'beginning of the liquidation of American empire' are thus terms too strong to describe the sudden but smooth readjustment that Nixon has brought about in US foreign policy objectives.

Also, only those who want to wish away the American empire would suggest that Nixon's desire to talk with Mao means that the 'imperialists' have 'bended' because the Chinese stuck to their guns. Just as the US can 'no longer pretend to be unaware of the phenomenon of China', China, too, functions under severe limitations so long as its existence is anathema to the two Super Powers. And to overcome these limitations the Chinese would be no less keen on a detente with the US. To regard Kissinger's visits to China followed by China's admission to the world body as a 'defeat' for the Americans and a 'victory' for the Chinese is, therefore, rather naive. These events only indicate that both countries are making mutual adjustments.

This is not to deny that the defeat of American objectives in Vietnam has forced it to accept the limitations of its military might or that this in turn has indirectly impelled Nixon to establish friendly contacts with China. But the American defeat in Vietnam cannot be credited to the Chinese. The Nixon administration has accepted a detente with China because it knows that given the logic of triangular power competition, the Chinese too would be equally keen to improve their relations with the US and even help the US to withdraw from Vietnam without altogether losing face. Thus the gains made by China by way of securing a seat in the UN and acceptance by the US of the fact of 'one China' have been made at the expense of revolutionary forces in the third world in general, and at the expense of the Vietnamese in particular.

Your editorial has nothing to say about the implications of China's admission to the UN for China itself or for India. As for India, all that the Indian Press has to say is to give credit to India for having tried to bring China into the world body some twenty years ago, forgetting what a lot of water has flown under the bridge over these twenty years. In the early fifties we assumed a patronising attitude to China. But today India and China are enemies and in terms of power-status we are nowhere near China nor are we on very good terms with the US. Thus, if we have supported the Albanian move for China's admission, it is more for the sake of appearing 'consistent' and 'objective'. In fact we are rather apprehensive of the results of China sitting in the UN. For instance, we could so far afford to play a big brotherly role in the Afro-Asian organisations of the UN such as ECAFE. This we can no longer do once China enters these organisations. Similarly, when Indo-Pak questions come up in the Security Council we will now have to completely change our strategy, for with China there we will not be able to dub every UN move on the Indo-Pak question as stemming for Western partisanship towards Pakistan.

Even for China a seat in the UN, particularly in the Security Council, is not going to be without problems. So far its policy-intentions could remain inscrutable to the world and it could get away by keeping silent on major international issues till it had sorted out its options. But now it will have to 'reveal' its preferences. This will put it in a situation in which its policy-intentions will become exposed, thus limiting its options to some extent. Also, its own actions will become subject to some kind of sanctions. For instance, one wonders whether China would have been able to take a quick punitive military action against India of the type that it did in 1962 had it been a member of the UN at that time.

A N OZA

Bombay

Domestic Resource Cost

IT is good that your contributors Samuel Paul, and S A Dave and S K Subramaniam agree among themselves that the "shadow" exchange rate provides the acceptable upper limit for domestic resource costs ("Competitiveness of Indian Steel Exports", May 22; "A Comment", September 11; and "Reply", November 13;). Grateful as all of us are for this rare example of solidarity among economists, I would like to ask them two further questions: (a) how do they propose to estimate the "shadow exchange rate"? In this respect, I hope they would want to do a little better than simply add 30 per cent to the prevailing exchange rate, as suggested by S A Dave and V V Bhatt in another article on domestic resource cost criterion ("Criteria for Evaluation for Capital Projects", August 28); and (b) if they can estimate a "shadow exchange rate", why are they still interested in calculating domestic resource costs in order to evaluate projects? Why not use the derived shadow prices for evaluating projects in the normal way through calculation of rates of return?

It is also a little surprising that none of the above authors have thought it fit to mention, let alone acknowledge, the earlier economic work on this subject by other writers, particularly Michael Bruno. In view of the literature that already exists on the domestic resource cost criterion, it is perhaps a little presumptuous to speak of it as "my", "our", or "Paul's" criterion.

Calcutta

Bangla Desh in the Making

Romesh Thapar

HE Capital has assumed a posture of ıiet confidence with regard to the ɔnfrontation with Pakistan. Apart om some ranting on AIR, or unneces-ıry excitement over "war news" in arliament, a remarkable maturity is ɔticeable. Visiting Delhi, you would ɔt imagine that we were in the midst an extremely tense situation, with any possibilities.

Reporting on the developments ong the Bangla Desh border is rappy, incomplete and, I suppose, de-berately toned down to avoid the ıphoria of earlier days. From what e can surmise, the Pakistani army in ıe East, acting in the belief that it ould not be challenged, concentrated major part of its force around bor-er strongholds. These are now under ssault.

The future of the Mukti Bahini is ependent largely on its success in ıese crucial battles. A glance at the ıap, and it will be clear that five ırusts are developing in the direction f Dacca. A breakthrough at any two oints would compel a major Pakistani etreat—and this would mean, in the rimitive mobility of East Bengal, the bandoning of a major part of its for-es. The ferocity of the battles under-ines this realisation.

According to current reports, a regu-ar Pakistani military establishment of some 80,000 men is able to draw on para-military reserves and police of almost equal strength. It is unlikely that any further reinforcements would reach the Pakistani Army in the East. Even the harbours of East Bengal are becoming unsafe. A kind of blockade is developing.

If the military junta in Islamabad is still capable of sophisticated thinking —and it doesn't look like it judging from the way the National Awami Party, dominant in Baluchistan and the NWFP, has been banned in West Pakistan—it should be deeply disturbed by the way the situation is developing in the East. A retreat would spark uprisings all over East Bengal. Last-ditch fights in the strongholds would dig the grave of the Army. Some dilemma.

Hence, the speculation about a diversion in the West. Two broad views have formed. One claims that the military junta in Islamabad must escalate the conflict in Kashmir, or along the very open Rajasthan border, to compel the intervention of "peace-making" powers—and that this would not be all that adventurous if China moves to create the impression of a general offensive. The other view plays with the possibility that pressures will build up in West Pakistan to avoid an escalation, to write off East Bengal—a view which expects China to make off-stage noises, but little else.

Pakistan is learning to its cost that it has not paid sufficient attention to the warnings from India. It may now mount a massive campaign throughout the world to prove that India is an "aggressor", but the fact remains that hundreds of millions are convinced that the aggression began with the genocide in East Bengal and the pushing across the Indian border of some 10 million refugees. India is unlikely to be halted in its resolve to settle this problem in the shortest possible time, for delay would destroy India's stability.

Never before, not even in previous military crises, have the people of this country stood so united. And this, despite the difficulties of the times. The economy is in bad shape. Inflation is gatting worse. Goods are scarce in many areas. But there is an overruling determination to puncture the pretensions of the Pakistani military *junta*. The cost doesn't matter to a people who have been blackmailed too often.

At another level, the understanding is growing that we are about to witness profound changes in the balance of power in South Asia. Zulfikar Bhutto is so correct when he says that the old Pakistan is finished. In its place, two states are taking shape in the fury of the battles joined in the East and which may be joined in the West.

"This is primarily because of the civilised world—we've to speak a language they understand"

Plea for Tax Concession

Hansavivek

SCINDIA STEAM has placed orders for two bulk carriers, one of 53,000 dwt and the other of 75,000 dwt, with West German and the UK shipyards respectively. The former is to be delivered in May 1974 and the latter in 1976. The two ships of 16,200 dwt, already ordered from West Germany, are scheduled to be delivered in May and September next. Of the eight ships of 13,600 dwt, for which order had been placed in 1968 with a shipyard in GDR, six have already been delivered and the remaining two are expected to be completed by the third quarter of 1972. The company had applied for government approval for purchase of shares belonging to Dharma Teja in Jayanti Shipping, but that company has since been nationalised. Scindia has at present 42 steamers of 3.79 lakh GRT, as compared to 255 steamers of 24.92 lakh GRT owned by all the Indian shipping companies. Krishnaraj M D Thackersey, chairman, feels that the Indian shipping companies need to place orders for at least 5 lakh gross tons more than the orders so far placed by them if they have to fulfil the target of carrying 40 per cent of the country's overseas trade as envisaged in the Fourth Plan. He points out the reluctance of the world's shipyards to accept Indian orders owing to overbooking and inability to extend credit. But he adds that, even if the shipping companies succeed in placing orders now, none of the ships can be delivered before May 1974. The Finance Minister's hope, that the advance notice of the abolition of development rebate from May 1974 would accelerate the pace of investment, cannot be realised in the shipping industry. Thackersey observes that practically all the maritime nations give tax concessions in one, or more, forms to develop their shipping. The government, he feels, should do something to enable Indian shipping to face international competition.

During the 52nd year ended June 1971, Scindia's increased freight earnings were offset by higher operating costs such as fuel, wages, insurance, etc. The profit position, however, showed a fair improvement, owing to increased receipts from interest on investments and a net profit of Rs 67 lakhs on sale of six old vessels. About 63 per cent of the recommended dividend is expected to be exempt from tax. Commenting on the current year's prospects, the chairman points out that, from February 1971, the rate of interest on loans given to the shipping companies by the Shipping Development Fund Committee has been raised from 3 to 4.5 per cent and the period of initial moratorium as well as the period of amortisation have been reduc-

ed. With an amendment to the Income-tax rules for the relief available under *Section 80J*, the basis for calculation of capital employed has also been revised so as to reduce the benefit.

PREMIER AUTOMOBILES has shown only a marginal improvement in its working results for the 27th year ended June last, following the increase in production and sale of cars from 12,083 and 12,034 units to 12,381 and 12,530 units, respectively, and of trucks from 3,957 and 3,936 numbers to 5,001 and 5,030 numbers, respectively. Sales realisation increased by Rs 535 lakhs to Rs 3,762 lakhs, but gross profit was up by only Rs 18 lakhs at Rs 36 lakhs. Nearly the whole of this surplus has gone to provide for 'unserviceable items' in the inventory, aggregating Rs 12.92 crores as at the end of the year. Allocation to development rebate could be made by utilising almost the entire surplus of Rs 30 lakhs brought forward from the preceding year. Statutory development rebate reserve, not provided, still stands at Rs 99 lakhs. Depreciation amounting to Rs 144 lakhs could not be provided for yet another year. Total arrears on this account have mounted up to Rs 7.25 crores. The overall performance is indeed disappointing, considering that total funds employed in business are about Rs 26 crores. The company has been experiencing financial stringency. Five instalments due to USAID, in repayment of its loan, have been deferred. Some of the fixed deposits have been overdue for repayment since January 1968. Imports against the credit in respect of deferred credit arrangement of Rs 18 lakhs with Fiat of Italy have been effected. Further credit for about Rs 12 lakhs under similar arrangements has been issued. The supply position of raw materials and components was "slightly better" during 1970-71, but that of diesel engines was not satisfactory. The directors complain that prices of raw materials and components registered a "steep increase" and that labour costs went on rising continuously in spite of reduction in manpower. The interim increase, granted at the instance of the Supreme Court from April last, could find reflection in accounts for only the last quarter of the year. The company is seeking government permission to increase production to 18,000 numbers of cars per annum, in the first instance. Cost of this expansion is estimated at Rs 4 crores, and IDBI and other financial institutions have been approached for the required capital expenditure. The company expects to complete the project in about two years from the date of clearance by government. Meanwhile, the management envisages better results for the current year because production of vehicles is likely to be higher than in the past year and a higher price for the cars has been allowed by the Supreme Court. But the company's future hangs in balance, since government has recently made it known that the question of take-over of the company is being considered.

COOPER ENGINEERING has had to experience the impact of the recession in the diesel engine industry for a full year, as against for a part of the preceding year. Total sales declined by 16 per cent in the 31st year ended June last as sales of diesel engines and spares dropped from Rs 3.90 crores to Rs 2.53 crores—even though sales of machine-tools and spares increased from Rs 1.38 crores to Rs 1.49 crores, looms and spares from Rs 18 lakhs to Rs 47 lakhs and receipts from miscellaneous and jobbing work from Rs 25 lakhs to Rs 30 lakhs. The outcome was a much bigger trading deficit of Rs 1.20 crores, without providing for depreciation amounting to Rs 31 lakhs against Rs 30 lakhs after providing Rs 40 lakhs for depreciation. The accumulated deficit increased to Rs 1.39 crores. In order to reduce dependence on the diesel engine market, the company has been attempting to concentrate more on specialised jobbing work. Orders worth Rs one crore have already been secured, and additional orders worth about Rs 1.5 crores are expected in the near future.

MORARJEE GOCULDAS SPG AND WVG has completed 100 years of existence. The company has been continually modernising its plant and machinery. During 1970-71 alone such additions were worth Rs 91 lakhs. After the year-end, further orders were placed for plant and machinery worth approximately Rs 5 lakhs. The company has been paying increasing attention to exports. Its foreign exchange earnings from cotton cloth and yarn aggregated Rs 80 lakhs in 1970. Fabrics are exported to the US, UK, USSR, East and West Africa, Ceylon, Burma, West Indies, the Middle East, Malaysia, Australia and New Zealand. During 1970-71, M G Mills' profit margins showed notable improvement, despite considerable decline in turnover. The management, nevertheless continues to complain that it had to struggle with "ever rising costs". Equity dividend, lowered from 15 per cent to 10 per cent, is payable on the capital as enlarged by a one-for-one bonus issue. The enhanced quantam of distribution is very well covered by earnings; the last year's payment was short-earned. The company has floated a separate company, Gopikisan Piramal, with a view to developing exports and dealing in powerloom cloth. This will also help the parent company to utilise the surplus capacity of its dye-house.

NEW DELHI

Half-Finished Changes at Hindustan Steel

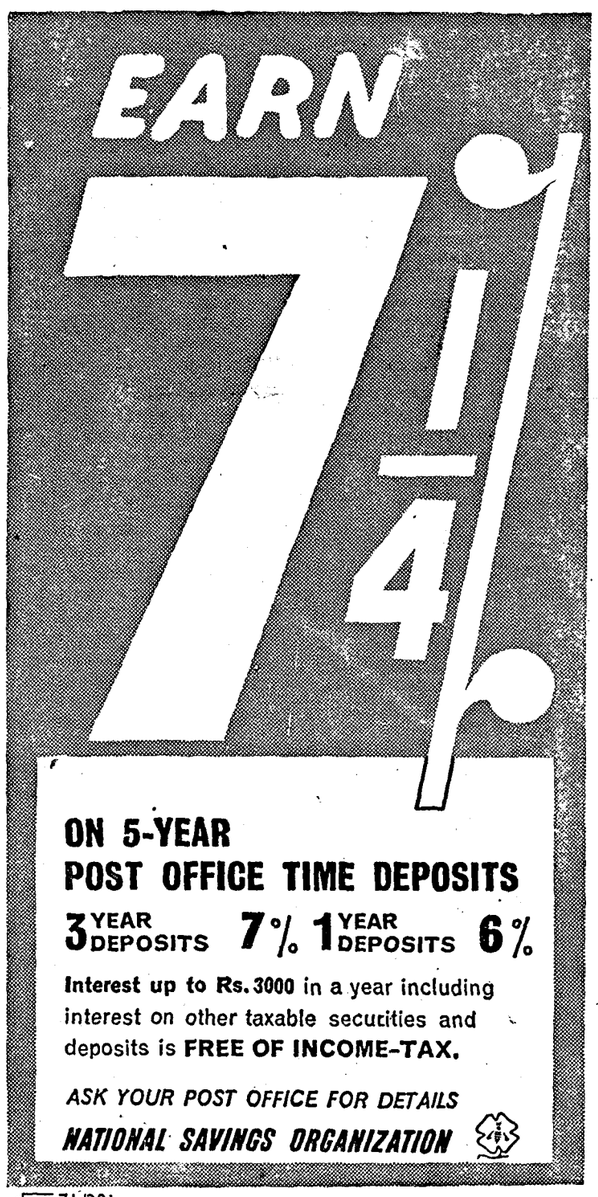
THE recent changes in the top management personnel of Hindustan Steel, the largest public sector industrial enterprise and one which has been in a bad shape for quite some time, are supposed to have given a 'new look' to the company's management. A new chairman, H Bhaya, took over charge on November 13. The new chairman and three of the four new general Managers of HSL's plants have been promoted from within the organisation. This is claimed to be the most significant feature of the new appointments.

The promotions from within to top positions, which had hitherto been normally filled by 'outsiders', and the resultant series of other promotions have certainly been well received in HSL. But looking at the total picture of HSL's performance, these appointments and promotions touch hardly the fringe of the problem. The poor performance of HSL year after year and the extremely low morale in the organisation have deeper and more complex causes and will require more radical remedies than have been attempted. That HSL would show a loss bigger this year than it has suffered in any year so far is now considered inevitable. The figure is expected to be well over Rs 50 crores.

The new appointments do not change the present top heavy and bureaucratic structure of HSL. They leave untouched the Board of Directors, in particular the so-called functional directors. Even if the quality of the persons at present holding positions as functional directors is ignored, the very institution of functional directors has been so conceived and built up over the last three years that it has become synonymous with centralisation of powers and bureaucratisation of functioning at the headquarters to the detriment of plant level leadership and initiative. HSL's four production units are vastly different from each other and cannot possibly lend themselves to centralised management, direction and control such as HSL's headquarters at Ranchi has attempted to impose in the last few years since the establishment of the system of functional directors in 1968 in place of the earlier system of maximum plant autonomy with the HSL headquarters providing only coordination and general policy direction.

The system of functional directors in HSL has resulted, in the course of the last three years, in the creation of elaborate directorates around each functional director. These directorates, besides inflating the cost of the headquarters establishment (which has increased fourfold in three years), work as interfering busy bodies in the management and operation of the plants —as inspectors trying to find fault with the plant managements. Their intrusion, together with the general tendency towards arbitrariness and whimsicality in the top management of HSL in the last three years, became a major factor responsible for tension and irritation between the plant managements and the HSL headquarters at Ranchi. In particular, the much-publicised production directorate and the personnel directorate became the sources of much bad blood and conflict in the HSL organisation. This system remains intact even after the new appointments and there is no indication that the new chairman, who with his personal experience of managing a plant in this set-up has a realistic appreciation of the problems posed by it, has been given a free hand to overhaul it and clip its negative features.

Over-Centralisation



The excessive centralisation of the functioning of HSL is one aspect of its bureaucratic structure. Another, which is probably a common feature of all public sector enterprises, is the system of service conditions and rules which are closer to the requirements of general administration than to those of an industrial enterprise. In this system, for instance, there is no way of rewarding good performance, except by removing the person concerned from the work where he might have done well! A person doing good work on the shop floor in a particular capacity or on the cake ovens, if he is to be rewarded gets promoted to a higher place in the establishment hierarchy and is no longer available for the work in which he had acquired competence. He cannot be given higher remuneration or status while continuing to do the work at which he is good. In the period of centralisation in HSL, this system worked particularly badly from the point of view of the development and utilisation of skills in the plants. Under the so-called system of centralised promotions and transfers, people were shuffled about, promoted and transferred from their places of work in one plant to another plant in a different position, without regard to the requirements of the individual plants. In addition, men needed in the plants were drafted to do desk work at the headquarters. This further aggravated the problem. It is possible that with a greater regard for plant-level autonomy and initiative, the excessive zeal hitherto exhibited in such matters may get mitigated. But the problem will remain unless the entire system is changed from the existing civil service-oriented pattern to one suited to the needs of a large industrial enterprise.

While the existing pattern of service conditions in general is unsuitable for public sector industrial enterprises, the situation in HSL, aggravated by overcentralisation, has become critical as a result of the application of disciplinary rules which have no relevance to an enterprise as HSL. The latest exercise in taking disciplinary action and meting out punishment in connection with the roof collapse at Rourkela has had a particularly bad effect on morale. The roof collapse was certainly a major disaster. In monetary terms, the loss on this account is estimated at Rs 30 crores. But the actual loss may be said to have been far greater because the disaster resulted in suspension of production of high value steel items of which the country is experiencing a severe shortage. But the manner of going about fixing responsibility for the roof collapse has created a widespread impression in HSL that, unlike officers of the civil services who cannot be touched, steelmen can be thrown to the wolves to suit the convenience of the administrative and political bosses. The concept of "constructive responsibility", which has been invoked to remove a whole group of officers at Rourkela, including the general manager of the plant — with some inexplicable exceptions in the case of some, which smacks of arbitrariness —, does not impress the HSL men. In any case, the question is widely asked why application of the concept of constructive responsibility should stop with the general manager of the plant and not go beyond to those at the very top. The report of the Loomba committee on the roof collapse has still not been made public and the government has not taken any

decision on its quality, which many experts in the field of steel structures do not consider particularly high. The men at Rourkela, who have been obliged to leave on this account, had no opportunity to defend themselves and their exit was clearly managed in a manner which is not altogether above board.

The new chairman of HSL and the new general managers of its four steel plants do not have to reckon only with problems of morale or industrial relations. They have also to come to grips with a whole host of complex technical problems of plant operation so that the plants can perform at levels closer to their rated capacities instead of the present 50 per cent level. The HSL plants have run into serious maintenance and operational problems which will not be easy to overcome. For one thing, it is now generally agreed that HSL's rush into the second stage expansion of its plants before the first stage capacities had been fully developed, stablished and consolidated was not such a good idea. The available skills and expertise were unable to cope with the problems of operating established capacities together with the burdens imposed by the second stage expansion of the plants. The situation became all the more difficult because, after the establishment of first stage capacities, there was a brief period of reckless running of plants to achieve production records. This happened particularly in the period 1962-64 and resulted in neglect of maintenance and was to the detriment of a steady build up of production. Some respite came in the period of the recession and fall in demand for steel and this could have been used to consolidate, renovate and overhaul. But, except for stopping further expansion of capacities, these tasks were neglected. In the case of the second stage expansion too, the setting up of all the balancing facilities to achieve results in production from the main units covered by the expansion scheme has taken far too long and the expanded capacities are in fact only now becoming realisable in terms of production of saleable steel. Maintenance problems have, meanwhile, become more serious. These are to be seen not so much in the blast furnaces and in the steel melting shops as in the coke ovens and in the finishing lines.

The coke oven position is particularly serious. There is today a general crisis in coke oven operations in all the steel plants in the country, including TISCO, so much so that the country may be compelled even to import coke from abroad to keep the steel-making facilities running. It is no longer a problem of a single coke oven in one plant but an overall problem of the coke ovens in the steel plants as a whole. The situation has been allowed to reach this critical stage because the problems of the sensitive and complicated operation of coke ovens were never closely studied. As a result, no phased programme of repairs and maintenance was prepared nor were standby capacities created. It was generally assumed that a coke oven had a life of 25 years. Whether this was in fact so in Indian conditions does not seem to have been examined by any one. Almost all the coke ovens in the country have run into difficulties within 15 years and this is posing a bigger threat to steel production than did the roof collapse at Rourkela. This is one of the high priority problems before the new HSL management.

WEST BENGAL

Liquidation of the Left

WHILE the attention of the world is focused on the more momentous events across West Bengal's eastern frontier, cold-blooded and calculated liquidation of organised Left is proceeding apace in this state. Massive attacks on CPI(M) bases jointly by armed police and armed Congress bands, pointblank shootings of boys and girls, inhuman atrocities on detained men and women and cases of people burnt alive, have been followed by another, the sixth, massacre of undertrial prisoners and detenus in jail, in which, according to the official handout, six prisoners have already been killed and over 200 injured, many of them so seriously as to be hovering between life and death.

Not a Word of Condemnation

While the latest event is so outrageous that the Calcutta dailies could not but splash them on the first page, the other atrocities committed daily—such as stationing armed policemen on tall rooftops to shoot indiscriminately into the adjoining bustees—do not find even a brief mention in their columns. And while most of the Left parties and mass organisations have been very prompt in condemning this latest instalment of massacre in jails, there has been so far not a word of condemnation from the advocates of liberal democracy, so senile and effete has liberal democracy turned today. What a pitiful contrast with the day in 1938 when Rabindranath Tagore, then 78, had left his sick bed to preside over a mass meeting at the Calcutta maidan to condemn the shooting down of two detenus in the Hijli detention camp!

The only consolation one can draw from these mounting atrocities is that the ruling party and the henchmen recruited by it are riding roughshod over all human values—for an early fall.

There is no doubt that various signs of degeneration of Congress(R) are coming to the fore. The battle cry raised by the party in its campaign against the Naxalites was defence of culture and heritage from the vandalism. These 'cultured' crusaders themselves committed the worst vandalism in the Calcutta University's administrative building in the course of which Tagore's portrait done by the famous painter Atul Bose was badly damaged. All this had to take place simply because some of the top leaders of the Congress(R) youth and student wings had not exactly covered themselves with glory in the University Law examination.

The indiscriminate recruitment of hoodlum elements into Congress(R) and the open patronage extended to them by the tallest among the party leaders have already led to headlong collisions among rival gangs. One such incident some days ago, which hit the headlines in the newspapers, was the clash in the state headquarters of Congress(R) between the supporters of one of the PCC secretaries and a member of the powerful Ghosh clan, proprietors of *The Amrita Bazar Patrika*. The Secretary who was personally assaulted sent a wire to New Delhi demanding his opponent's expulsion from Congress (R) within 72 hours. The other side retaliated by demanding a public apology from the Secretary. The state Congress leadership authorised Siddhartha Shankar Ray to conduct an inquiry and submit his report within 48 hours. But the situation within Congress(R) is so explosive that in the three weeks since then neither has Ray submitted any report, nor have the parties involved in the clash insisted on any formal step in regard to the incident. Instead, both the factions are manoeuvring for vantage points with a view to settling scores at an opportune moment. Indeed, according to knowledgeable sources, the rival gangs are but pawns in the hands of powerful operators. The principals are fighting by proxy for the control of the state Congress, as a stepping stone to the Chief Minister's suite in the Writer's Building.

Powerful Incentive to Chaos

The apparently brighter election prospects for Congress (R), created by the good work of the Congress strong arm brigades in the form of violence and terror against CPI(M) bases, seem to have produced its dialectical opposite—a powerful incentive to bitter infights for power and privilege, which can only jeopardise the prospects themselves.

The image of Congress(R) as also of the state administration under its thumb has been so much sullied in the recent weeks that even its most ardent populiser, CPI has been constrained to lodge some public protests. The state executive committee of the party in its last meeting (November 16-18) passsd a long resolution on the subject. It says: "In the countryside, jotedars have started harvesting the crops sown by sharecroppers and the police has been illegally intervening in favour of the jotedars... In order to harass the poor peasants and render them destitute, many false police cases are being instituted; on the other hand, police remains unconcerned when jotedars resort to murders, arson and loot...

"Police has assumed the right to commit murder on the pretext of 'died in a clash with police'. Police has resorted to this method on a large scale against the Naxalites. Besides even others who are *persona non grata* with the police are also being killed as Naxalites. It is reported that such inhuman and terrible tortures are inflicted on the arrested persons in the police stations that they either get incapacitated for life or die... Mass murders at Barasat, Baranagar and Cossipore have strengthened the belief among the people that the police force is implicated in these massacres."

Demands for Inquiries Not Accepted

Referring to the massacres in jails, the resolution notes that the demands for inquiries by commissions have not been accepted. Hence, "the popular belief that the state administration under the Governor is conniving in the assumption of the power [to kill, etc] by the police is not baseless."

Although characteristically enough CPI holds the poor civil servant of a Governor responsible for the policies and actions guided by the highest political leadership, the resolution does not stop there. "Presently a section of Naxalites and anti-socials," the resolution continues, "has penetrated in the ranks of the New Congress workers. These infiltrators are pursuing the same path of violence and individual terrorism as done by the Naxalites and CPI(M). Many of these anti-socials are police agents. They work in collusion with the police." (Translated from the Bengali version, published in CPI *Kalantar* of November 22, 1971.)

Four days later, the CPI daily said

NOW a 60-second contest for industrialists:

Given below are 10 of the problems industrialists often face, and the solutions to these are available from SICOM. Indicate the correct letters of alphabet of the SICOM solution against a particular problem. Remember, you've just 60 seconds.

Problems

1 You have the ☐ resources and you want to know what projects are profitable in Maharashtra.

2 You want a ☐ feasibility study made on your project and are willing to pay only 25% of the cost.

3 You need ☐ evaluation of an alternative site for your project.

4 You want to start ☐ a small or medium-scale industry and you need 75% capital assistance.

5 You know what ☐ industry to start but you don't know where in Maharashtra.

6 You want share ☐ capital participation and under-writing support.

7 You want short-☐ term, medium-term or long-term loans on easy conditions.

8 You want to locate ☐ suppliers of raw materials.

9 You need interest-☐ free loans (from the sales tax you pay) to set up another project.

10 You need ☐ expeditious clearances for various basic industrial needs like water, land, power, telephone, etc.

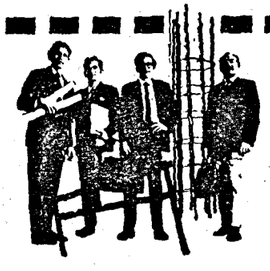
Solutions

(a) SICOM's Project Investigation Service.

(b) SICOM's Capital Participation Scheme.

(c) SICOM's Plant Location Service.

(d) SICOM's Industrial Services Division.



(e) Government of Maharashtra's Package Scheme of Incentives. (SICOM administered).

(f) SICOM's flexible schemes for financial assistance.

For correct solution to any or all of these problems write to the Senior Development Officer.

SICOM– *the moving force for developing industries*

CMSC-39-254

in a leaderette "there is no doubt that the organisation [Congress-R] in the rural areas is influenced and led by jotedars and rich peasants. In order to protect jotedar interests, members and leaders of New Congress are assualting and beating the peasants and their leaders." The editorial complained of collusion among police, goondas, jotedars and Congress (R).

All this has not, of course, led to any change of practice on the part of CPI. But the growing exposure of the real character of Congress(R) and its covert rule in West Bengal has already led RSP and Forward Bloc into a common front with CPI(M) in the Burdwan municipal election scheduled to be held on November 28. Whatever the results of the Burdwan polls, this line-up is a pointer to the future political alignment in the state.

KERALA

Cracks in the Coalition

M S

THE partners of the ruling alliance in Kerala have reason to congratulate themselves on their good performance in successfully surviving the CPM-led opposition's first serious challenge after the induction of the Congress(R) into the Achutha Menon Ministry. The successive waves of agitation launched by the teachers of private colleges and the various student organisations in the state coupled with the threatened strike by the state governmnt employees could well have had an impact on the stability of the Ministry, had not the ruling parties defused the situation before the CPM's major offensive of a 'Kerala Bandh' on November 10 could come off.

Mutually Irreconcilable Claims

Once the Congress party's entry into the Achutha Menon Ministry became an accomplished fact, the CPM which had hoped that the exploratory talks among the ruling parties would founder on the rock of mutually irreconcilable claims over the spoils of power, realised that it would, for quite some time to come, be reduced to promoting agitational campaigns as the only avenue of protest. Hence it extended vigorous support to the agitation of about 6,000 teachers of private colleges in the state who were demanding, among other things, direct payment of their salaries by the state government. As direct payment was one of the election pledges of the Congress party, the CPM was in a position to demand that the Congress should fulfil its promise as it had now become the major ruling party. In view of the financial commitment that this would involve and also in view of the constitutional difficulties which would come in the way of certain controls over the managements of private colleges which the state government would want to impose as a precondition to the direct payment of salaries to the teachers, the CPM well knew that it had the ruling parties, particularly the CPI and the Congress(R), in a tight corner and that it stood to gain propaganda advantage if the teachers' demand was not met. The agitation of the teachers which was launched on September 15, assumed serious proportions during the last week of October when the powerful student community in the state, led mainly by the Congress and the CPM, joined it and supported the demand for the imposition of some controls over the managements of private colleges in regard to the appointment of teachers and admission of studetns.

Compromise Proposal

The stepping up of the students' strike in the first week of November and the announcement by the non-gazetted employees of the state government that they would go on an indefinite strike from November 10 in protest against the alleged attack on their basic trade union rights by the state government, provided the CPM the opportunity it was waiting for to mount a massive agitational campaign against the Achutha Menon Ministry calculated to threaten its stability. CPM and its close allies, the KTP and KSP, gave a call for organising a 'Kerala Bandh' on November 10 and to give added force to the 'Bandh' announced their decision to simultaneously stage a state-wide picketing of Government buses in protest against the increase in bus fares earlier ordered by the state government. The ruling parties had little time and only limited chances of success in dealing with the new and rather alarming situation. However, since the situation was likely to affect the very survival of the ministry the ruling parties which had earlier turned down the demand of the teachers on grounds of financial stringency, decided to climb down and signify their acceptance of a compromise proposal put forward by the Congress-led students to settle the teachers' strike. This proposal provided for direct payment of salaries in all private colleges which agreed to government supervision of appointment of teachers and students; the setting up of a suitable machinery to look into complaints regarding non-payment or irregular payment of salaries; and, finally, the setting up of a commission to rationalise and simplify the entire procedure regarding grants-in-aid to private colleges. By accepting the compromise proposal, the ruling parties were successful in persuading the pro-Congress students to withdraw their support to the teachers' strike. Similarly, the pro-Congress section of the teachers were also asked to drop their agitational campaign. Once the solidarity of the strikers was broken and the powerful Congress-led students as well as sizeable sections of the teachers had withdrawn their strike, the pro-CPM teachers and students faced isolation. After complaining for some time against the 'betrayal' of the cause, they were also forced to withdraw their agitation.

Compelled to Withdraw the Agitation

After depriving the CPM of its initiative on the teachers' and students' fronts, the ruling parties were in a stronger position to handle the threatened strike by the non-gazetted employees of the state government on November 10. Here again, they adopted identical tactics and brought about the withdrawal of the strike by a section of the government employees led by the ruling parties after granting a few minor concessions. As a result of these divisive tactics, the pro-Marxist employees' union again faced isolation and was compelled to withdraw the agitation.

Thus, with the momentum for the 'Kerala Bandh' on November 10 completely gone, the CPM was left with only its programme of picketing of state transport buses to go through with. The desperation of the party at the failure of its plans to generate a massive wave of agitations against the Achutha Menon Ministry was evident in the number of violent incidents

provoked during the picketing campaign as well as in the damage caused to public property.

Though the ruling parties in the state have thus demonstrated their ability to rally round and defeat attempts which threatened their continuance in office, the entire course and complexion of the teachers' and students' strike have served to highlight and expose their basic vulnerability. In this connection, the role played by the Congress-led students in the teachers' strike is significant. While the agitational activities of the CPM-led students were a natural corollary to the party's backing of the teachers' demand, the active role played by the pro-Congress students came as a surprise and embarrassed the Congress ministers in the Cabinet. Though the student leaders of the Congress emphasised that the edge of their agitation was directed at the managements of private colleges, this argument was not calculated to convince the partners of the CPL-led Front who were aware of the earlier opposition of the Congress youth wing to the entire idea of the party's participation in the CPI-led Ministry. Besides, it is a known fact that the youth Congress leaders in the state desire an early election in the belief, however misplaced, that their party would sweep the polls and return to power on its own. It was, therefore, no surprise that some partners of CPI-led Front complained that the Congress was adopting the same tactics of 'agitation cum-administration' preached and practised by the CPM while in office.

Power Conflict

The recent agitation has thus affected the image of the Congress party *vis-a-vis* the partners of the CPI-led Front, and the latter's fear that what the Congress was really after was power to itself is likely to increase rather than lessen in the coming days. Though it is now quite some time since the Congress joined the Achutha Menon Ministry, it is yet to be seen how the party and the members of th CPI-led Front propose to function together to implement commonly-accepted progressive measures. Recently, while the Congress (R) has expressed itself in favour of a time-bound one-year programme for the implementation of progressive measures, the CPI has stated that it would rather go in for a four-year programme for this purpose. This is perhaps an indication that the Congress party would like an early poll if the other partners in the ruling alliance are reluctant to fall in line with its one-year programme; the CPI, on the other hand, is anxious that the present Ministry, which came to office in September 1970, continues as it is for the full term.

The difficulties of the ruling parties do not end here. The Muslim League, throughout the teachers' strike, more or less sided with the private managements, thus indicating its opposition to any move to introduce government restriction on the running of private educational institutions some of which belong to the party. Though it finally agreed to the compromise proposal put forward by the students, the Muslim League's endorsement of it was not wholly enthusiastic. This may, at a later stage, lead to some friction between the Muslim League and the other ruling parties which support the measure.

Further Rift

The state RSP has not yet obtained the central leadership's clearance for its close association with the Congress party in Kerala which is clearly against the party's all-India policy of opposition to the Congress. In case the all-India leadership directs the state party to implement the national line, fresh divisions may arise within the state RSP between those who support the line of participation in the Achutha Menon Ministry and those who oppose it, thus contributing to a further rift in the ruling alliance.

The PSP rump in Kerala, which continued in the Achutha Menon Ministry in defiance of its all-India leadership's decision to merge with the SSP, has itself been further split on account of the demand of a section of the party for the stepping down of the party's present nominee in the Cabinet in favour of another. The refusal of the PSP Minister to do this and the consequent antics of the rival factions within the party are matters of concern, primarily because the ruling alliance which has 72 members in an Assembly of 133, will lose one PSP MLA belonging to the anti-ministerial faction. The hostility of this faction which has a base in the Trivandrum district has already cost the ruling parties the mayorship and deputy mayorship of the Trivandrum Corporation which went to CPM candidates in a recent poll. This has not endangered the Ministry's majority in the Assembly but the ominous fact remains that not infrequently in the past the dissident activities of socialist groups in the state have led to the collapse of various ministries. It must be remembered that the former ISP was in some measure responsible for the downfall of the Namboodiripad Ministry in October 1969 and also contributed substantially to the troubles of the first Achutha Menon Ministry which led ultimately to the dissolution of the state Assembly in June 1970.

The role of the Kerala Congress deserves some mention here. Like the Muslim League in Malabar, the Kerala Congress in the Travancore-Cochin region is a stable political force and would be a useful ally in any electoral contest. It is on account of the ruling parties' awareness of this that they had made a special effort to keep the party on their side during the last Lok Sabha poll in the state and this was the main cause of the CPM's rout then. In the subsequent period, when the party's efforts to join the Ministry ended in a fiasco because of reservations among the ruling parties about its 'reactionary' character, it moved rapidly away from the ruling parties and even joined the recent students' agitation with the sole object of adding to the government's difficulties. The enmity of the Kerala Congress would cost the ruling parties 13 votes during divisions in the current sessions of the state Assembly, and this may prove decisive during critical votes. The CPM certainly would do nothing to mitigate the Kerala Congress's hostility to the ruling parties and indeed would seek to profit by it.

Broad Political Consensus

Following the CPM's ouster from office in October 1969, the anti-CPM forces in the state led by the CPI attempted to construct a broad political consensus against it. This process was partially completed during the mid-term poll of September 1970 with the reaching of an electoral understanding between the CPI-led Front and the Congress party. The exclusion from the electoral accord of the Kerala Congress with its sizeable Christian following had worked to the advantage of the CPM which managed to secure as many as 32 Assembly seats. However, in the Lok Sabha poll in March 1971, the Kerala Congress was also included in the electoral understanding among the ruling parties which completed the shift in the

balance of political and communal forces against the CPM. This resulted in the CPM's near rout at the poll.

The alienation of the Kerala Congress which followed in the subsequent period on account of the ruling parties' reluctance to asmit it into the Achutha Menon Ministry has restored the balance partially in favour of the CPM and has increased its scope for manoeuvrability. Of late, the party, which at the time of the mid-term poll of September 1970 and the Lok Sabha poll of March 1971, had rationalised its isolation as resulting from the correctness of its political line has sought to mend its relations with the other parties of the former United Front led by it and has made a beginning with the KSP and KTP. It has also showed an inclination to cultivate better relations with the state unit of the newly formed Socialist Party.

UNDP Country Programme

Dipak B R Chaudhuri

THE United Nations Development Programme (UNDP) has introduced a new procedure for programming assistance in various countries from January 1, 1972. The main feature of the new programme is that, unlike the present system of filing *ad hoc* requests, the recipient countries will now be required to draw up a Country Programme within an Indicative Planning Figure (IPF), representing the amount of resources expected to be available from the UNDP during the period covered by the Country Programme.

The Country Programme

The Country Programme approach was developed and recommended by Robert Jackson in his now famous report on the "Capacity of the UN Development System"; the approach as a procedure for programming was adopted by consensus by the UNDP Governing Council. The stated purpose of this procedure is to overcome existing factors encouraging inertia and to escape from the traditional distribution of operational activities among the various economic and social sectors. Each partner — each developing country — will have to rethink its programme and its requirements and to identify sectors in which it feels multilateral aid will be preferable to other forms.

The Indicative Planning Figure for the five-year period 1972-76 is $ 50 million. In order to make the Country Programme cocyclical with India's plan period, the Government of India have decided to present a Country Programme for the seven-year period from January 1972 to March 1979, i e, for the remaining two years of the Fourth Plan and for the five years of the Fifth Plan. The precise IPF for the five-year period from 1977 is not yet known but on the assumption that UNDP assistance of the order of $ 25 million would become available during the period January 1977 to March 1979, Government of India have decided to present a Country Programme for 1972-79 of $ 75 million.

The Planning Commission and the Department of Economic Affairs are jointly working on the preparation of the Country Programme Document. With reference to the amount of $ 75 million mentioned above, a sum of $ 10 million was reserved for Technical Assistance (TA) type schemes which may emerge during 1972-79 and out of the balance available, *viz*, $ 65 million, they made sectoral allocations with a tentative ministry/departmentwise breakdown of the proposed allocations. Against the tentative allocations thus made, the ministries and departments concerned were requested to formulate schemes which in their view should be considered for assistance from UNDP by inclusion in the Country Programme Document.

The allocation for the industry, minerals and small industries sector was $ 11.70 million including requirements for the export promotion programme and out of this $ 2.28 million was tentatively allocated to the Ministry of Industrial Development. Since this allocation included $ 692 thousand on account of 'on-going' and a further $ 990 thousand on account of 'pipeline' projects, the effective balance amount left for fresh proposals was only $ 600 thousand.

A major complaint of developing countries including India has been that UNDP does not have at its disposal adequate resources for undertaking programmes relating to industrial development and that the share of UNDP assistance for industries is only about five per cent, while it could be substantially increased, say to 20 per cent. The standard answer to this complaint from the UNDP, as well as the developed countries, has been that it is for the developing countries themselves to propose more schemes relating to industrial development for UNDP assistance. In this context and considering the general needs of industrial development and especially those relating to the small-scale sector, the allocation of $ 600 thousand for fresh schemes to be sponsored by the Ministry of Industrial Development was not considered adequate and a request was made both to the Planning Commission and the Department of Economic Affairs to increase the allocation to a suitable level. Discussions were also held with the officers of the Department of Economic Affairs and it is expected that an allocation of $ 4.5 million will be made to the Ministry of Industrial Development for fresh schemes in addition to the provision of $ 692 thousand for the continuation of 'on-going' schemes related to this ministry.

Industrial Sector

The Ministry of Industrial Development is also requesting the Department of Economic Affairs for an allocation of $ 200 thousand in the TA sector for a scheme relating to Appropriate Technology. It is expected that when these allocations are made, the overall allocations for industries for the Ministry of Industrial Development as well as the Ministry of Petroleum and Chemicals, Ministry of Steel and Mines and Ministry of Foreign Trade will add up to $ 17.11 million against $ 70 million of total UNDP assistance now proposed to be distributed to various ministries, after reserving $ 5 million for unforeseen needs emerging over the next seven years. In other words, when the final Country Programme Document is drawn up, it is expected that the industrial sector, including small-scale industry, would have received an allocation representing roughly 25 per cent of the total UNDP assistance available under the Country Programme, as compared with 7.5 per cent during the last 12 years. Originally, the Department of Economic Affairs had proposed only 18 per cent of the Country Programme funds for the industrial sector.

Among the new projects the Ministry of Industrial Development has proposed are a welding research institute ($ 1,000,000), an automobile ancillaries testing centre ($ 500,000), a numerical control centre for engineering manufacture. Among other proposed schemes are projects for the quality control of small-scale industries and a project for the exploration and identification of alternative raw materials for the manufacture of newsprint and paper.

LONDON

All in Their Name

Farrukh Dhondy

BRITAIN'S entry into the European Common Market is a dead certainty, in spite of the parliamentary games played to give its people the conviction that everything is done in their name and with their fingers dipped in the bowl of decision. At the Labour Party conference, the Trades Union representatives called upon to hold the disintegrating party together said some strong words about Roy Jenkins and the other pro-marketeers in their party. Some went so far as to suggest their expulsion. 'Smoothy Chops' Roy — as some Labour members call him in gentlemanly jest —, in spite of his leadership of the Labour defiance, in spite of splitting the Labour Party's vote against entry substantially, was re-elected this week as deputy leader of the party. The Left wing of the party put up a brave show; their man, Michael Foot, got 125 votes on the second count, as opposed to Jenkins's 140.

Nominal Opposition

The canvassing, horse-trading, speculation on marginal shifts of significance, and deals for power involved in this parliamentary 'Monopoly', were reminiscent of the sort of thing that goes on at the state Assembly level in India. Though it was made much of by the newspapers, it belongs to the politics of Peyton Place, and as far as the Labour Party is concerned, can bring no change of attitude or shake-up of policy. Besides, there are very few differentes between Wilson, Jenkins, Foot, Wedgwood Benn *et al.* They are pragmatists who offer leadership in the framework of British capitalism. Whatever opposition they show to the market is nominal. In their regime, they perpetrated an identical plan for entry and supported it with almost exactly the same draft plan for legislation to control the working class and take away the right to strike, the same policy on black labour, the same policy on exports, imports, and the balance of payments.

Yet there are some in Britain who say there is hope for Labour; the party is dead, long live the party. Among them, the Communist Party of Great Britain. At their annual conference this week, apart from passing resolutions imploring members to be vigilant about the quality of hedges the local parishes were cultivating, they were called upon to become more active so as to "push the Labour Party further to the Left". One member even recommended that the party should be dissolved and all its members join the Labour Party as individuals.

Failed to Evolve an Alternative

Whether they know it or not, the CPGB and the Labour Party, the militants, the lefties, and all, have by their sheer lack of policy (one must pay them the courtesy of not being willing compradores) failed to evolve a line or an economic policy for Britain in the seventies. Labour's political support for broad Tory policy is no secret. On the political front, Wilson has just visited Northern Ireland accompanied by an official from the Home Office, and is to give reports of his 'findings' to Ted Heath and to Home Secretary Reginald Maudling. For all their show of wanting to integrate shop-floor decisions into the programme of the party, their economic strategy is the same as that of the Tories. In the words of Ted Heath, "lame ducks must be left to die", "every man must stand on his own two feet", and so on. The cornerstone of this policy is the overhauling of the old imperial machine. British industry must be forced to modernise, to mechanise, and to come into line with the standard of production that Europe has set. The balance of payments must be fixed by stepping up exports and cutting down on imports which have no direct bearing on the 'modernisation' of industry.

In the process of implementing this broad economic policy, Britain has involved itself in the classic fight of crisis-ridden capitalism. To survive in their way, industries all over Britain are creating unemployment, mechanising, and trying to force productivity deals on smaller labour forces. British industry, to survive, is being forced by the withdrawal of state subsidies to compete with the multi-national monopolies. Investors who came into the lame-duck category are selling out and taking their capital elsewhere, forming larger combines, and in the process creating unemployment figures which are among the worst in the century. Unemployment is far above the million mark, the highest figure since 1939. Last month alone, 50,000 workers lost their jobs (official parliamentary figure).

The workers are replying with strikes against redundancy, occupation of the factories, and demands for retaining and redeployment. The Upper Clyde Shipbuilders, a group of four companies in Scotland, were threatened with closure in July. Since then, the workers have kicked the management out, occupied the yards and attempted to keep full employment through work sharing. Paradoxically, the militant move in fact supports Tory policy. The workers of UCS are doing their best to fulfil the foreign orders which UCS has for ships. Jimmy Reid, member of the Communist Party and chief shop steward of the yards, has negotiated with the receiver, to finish the work that the UCS has without any guarantees from the government of continued employment after the current list of orders runs out. The government knows that 'free enterprise' must have its limits: when it means that workers negotiate their own orders with foreign customers, they must be stopped.

Written Guarantee

Just next door to UCS at Alexandria near Glasgow, the workers of the engineering works which were bought over from the Ministry of Defence by a firm called Plessey, have gone a step further. They occupied their plant on September 3, and have been in it since then. They refuse to work the plant, however, till a settlement is reached with Plessey who planned to make the entire work force redundant by moving the modernised machinery to Ilford in Essex. The workers demand a written guarantee from any buyer who takes over from Plessey that there will be no redundancies. Ted Heath denationalised the plant which cost the taxpayer £ 1.5 mn and sold it to Plessey at the bargain price of £ 650,000. Plessey bought the plant, with no intention of working it but just to get the machinery cheap. In other circumstances, the police would have been called in to get the workers out. With the workers in the plant, they dare not do this, as their valuable machinery would be reduced to scrap metal if the workers were attacked. Besides, Scotland has enough troubles already, and the Tories don't want another military occupation on their hands.

A catalogue of strikes and analysis in this situation, would stretch till the crack of doom. I can't think of any important unions which haven't given notice of strike in the last year. Unfortunately, too much has been said

Economics

about the 'complacence' of the British worker and the world has been given the feeling that the average unionist in Britain has very little consciousness of what he is involved in here, that the worker of Britain thinks of nothing more than beer, bingo, and the football pools. Today, he is seriously having to think of the dole queue, of the depression of being unemployed; he is having to face the prospect of real hardship and the prospect of having to translate that sense of being pushed around into a will to fight.

The Silent Sell-Out in Rhodesia

V Subramaniam

TO an observer from India, the strangest feature of the whole drama of Douglas Home's elaborate negotiations with Rhodesia's Smith, ultimately "legalising" his regime is the low key of the comments thereon in Zambia. Ever since the UDI of Rhodesia, Zambia's political leaders have rightly concerned themselves with discovering some means of reversing it. On moral and legal grounds President Kaunda has on every possible occasion condemned the "illegal minority regime" as an outrage against human dignity. The leaders of black Africa, with few exceptions, joined with Kaunda in condemnation. Over the last six years, Zambia's trade has been slowly turned away from the South progressively to the North—mainly because Rhodesia was holding Zambia to ransom in regard to imports in retaliation against Zambia's condemnation. The pipeline from Dar-es-Salaam to bring in petrol, the improvement of the Zam Tan Road and the accelerated construction of the Zam Tan Railway by China, all these were clear indications of Zambia's earnestness in reducing ties with the South. A more positive indication of a commitment to liberate the five million Africans in Rhodesia from a minority regime was Zambia's support of the liberation movements, ZAPU and ZANU.

Bitter Comments

On all earlier occasions when efforts were made to reopen negotiations between Britain and Rhodesia, the Zambian Press and politicians were quick to see through the game and expose it. The insistence on NIBMAR or 'No Independence Before Majority African Rule' was never relaxed. And yet at the moment of betrayal there are very few emotional outbursts, no processions, no demonstrations but only cynical and bitter comments and even of them not too many.

Thus there has been no comment from top leaders and the President has promised a detailed comment on Saturday, November 27. It is true that the local press, has put the news on the front page and has given it strong headlines. But as for comment, the *Daily Mail* came out with a Niagara of indignation on Friday but the *Times of Zambia* added hope to its sense of betrayal by suggesting that just as the Zambians in 1962-64 worked a complicated 15:15:15 constitution towards freedom, through political education and organisation, the Rhodesian Africans could do the same. The rest of the comments were just a summary of world reactions. Even in regard to news coverage, there were grave shortcomings. The full sordidness of the deal was not revealed. Thus the ten million put aside for African education may be spent on *mutually agreed projects* other than education. Again the constitution can be changed with a white and African majority. The latter is rather easy to secure with nominated chiefs.

Bored Cynicism

What are the reasons for this bored cynicism and sullen silence. The more important ones can be identified through a little investigation. There is first a sense of exhaustion and disillusionment. There is, secondly, the present political and economic weakness. There is again the clever timing of the sell-out by Heath. And, lastly, there is the obvious incapacity of African countries to act in unison apart from a chorus of condemnation. The proven capacity of the Smith regime to survive, even if in a state of economic stagnation, against economic sanctions seems to have brought several sympathisers of Zambia to the view that it was no use ignoring the reality of the Smith regime. Arguments about Zambia itself depending on Rhodesian maize in this year's emergency were used to dull demanding consciences. Within Zambia itself voices have been raised about the illogicality of half-hearted commercial ties with the South. Both in and out of Zambia, by sheer emotional exhaustion, Rhodesia's Smith was slowly being accepted as an existing and even necessary evil.

This has been buttressed by the pathetic ineffectiveness, and the ridiculous internecine feuding of the two liberation movements of Southern Rhodesia operating in Zambia, namely the Zimbabwe African People's Union (ZAPU) and the Zimbabwe African Nationalist Union (ZANU). For quite a long while these two were hurling verbal thunderbolts at each other most of the time rather than doing much against the Smith regime. Continuous warnings from President Kaunda to make up their differences only produced a third liberation movement, FROLIZI, this year. Several Zambians had begun to say that it was little use trying to help those who could not help themselves.

Confusing Problems

The present political climate is not again very conducive to a tough foreign policy. As long as the UNIP led by Kaunda was clearly the dominant party, with the ANC being a purely regionally strong group, the President could pose a strong challenge to British efforts at selling out to Smith's Rhodesia. With the formation of the United Progressive Party by Kaunda's former companion and colleague, Simon Kapwepwe, with a more verbally revolutionary platform, the political triangle poses some confusing problems. No one knows what following the new party has and its alliance with the professedly conservative ANC is indeed a strange thing which UNIP speakers have not failed to ridicule. But the real confusion flows from the ultra-nationalist stance which the UPP takes in public on issues of importance which leaves the government less responsible choice than would be the case if they were faced with the regional ANC alone. While all the three parties would at heart agree about the terrible consequences of the sell-out to Smith, the very existence of a political triangle restricts the toughness of foreign policy.

In regard to its economy, Zambia seems to be in a psychologically weak position. Prophets of doom have predicted an economic fiasco but this is unlikely to materialise. In spite of falling copper prices and six years of economic struggle against UDI, Zambia still has reasonable foreign reserves and reasonable agricultural production at home. Indeed she has more foreign reserves than several other African countries. But psychologically Zambia seems to a foreign observer not well

armed for a period of trial. Two months ago a panicky decision was taken to buy maize from Rhodesia under harsh conditions to build up reserves — a decision which could have possibly been avoided or postponed. Again seven years of post-independence boom seem to have produced a certain flabbiness of nerve in important sections of the population. One suspects that foreign financial authorities such as the World Bank and the British Overseas Development Ministry are doing a considerable amount of arm-twisting in the present rather weak psychological climate. Indian readers need no elaboration of the arm-twisting process similar to that which India was subjected to in 1966 leading to the devaluation of the rupee and the long 'plan holiday'. One does not know what the financial agencies are upto in the case of a smaller and more isolated country like Zambia. One can only pray for realistic toughness on the part of the Zambian elite.

Moment of Betrayal

Heath has again chosen his moment of betrayal carefully. Quite apart from the lack of bargaining power on the part of Zambia and its friends, the British public and the world community seem to be in a mood to accept anything. With the preoccupations in Ulster and the aftermath of the Common Market Entry decision, the British Press and Public are not concerned about Rhodesian Africans except marginally. The world community is too preoccupied either with currency crises and fear of recession of the Indo-Pakistan cauldron. The USA had anyway decided to buy Smith's chrome well before these negotiations.

A substantial part of the onus should be placed on free African countries as a whole which have so far left Zambia to bear the burden alone with only token help. Free Africa, to use a worn-out cliche, has indeed failed Zambia and Zimbabwe.

Too much hope is now pinned on the ability of African leaders in Rhodesia to educate their own people politically fast enough to extract independence from the present sell-out constitution. Such things have happened elsewhere and Rhodesian African leaders are probably more worldly wise now. But Africa and the liberal world have yielded to disciplined and toughened racism at a crucial moment when they could have fought back.

DAR-ES-SALAAM

Guinean Revelations

A K Essack

THE principal feature of the African situation in the seventies is the intensification of the class struggle. Blurred to a certain extent during the nationalist phase of the struggle, when all the classes united to drive out the colonial oppressors, there is now an increasing class consciousness. Classes are now seeking out allies and have cut across national boundaries. The reality of the situation is that a small section of the African people—the African bourgeoisie—whose economic interests are such as to perpetuate capitalism is seen to be openly linking itself with international finance capital and the former colonial masters against its own peasants and workers.

It has been widely believed and accepted that with independence imperialism granted political power, but retained economic control. But this is a misconception, as the political structure must reflect the interests of the dominant economic class. Events in the last decade have proved that the idea of political independence existing alongside economic subservience is a dangerous illusion. What the imperialists granted was not political power but merely the state machinery to be run on their behalf.

There is no contradiction in the behaviour of the leadership of a nationalist movement which decides on pursuing a capitalist course under spurious slogans like African socialism or partnership, for that is why independence was granted. The contradiction arises precisely when the leadership decides on taking the socialist road which involves the liquidation of the economic interests of imperialism. It is then that not only does the leadership come into conflict with the representatives of international finance capital overseas, but also with the machinery of the state internally.

Not an Impartial Arbiter

The only institution that imperialism developed fully in the colonies was the state machinery. And this appeared to be the only "worthwhile" legacy it left behind when it departed. Just what is this institution? What is its historical function? Does it stand above classes to reconcile antagonisms or is it an instrument of coercion and suppression? There is enough literature to show that the state is not an impartial arbiter in society but is used by the dominant class to supress the other classes—till now the minority suppressing the majority of workers and peasants. Hence a leadership embarking on socialism has to ask itself the pertinent question whether it is possible to bring about a basic change in the social and economic relations of a society and transfer property from the few to the majority by using the existing state machinery?

Corruption of the top layers of the state machinery—in the civil service, the ministries, the armed forces or in the police — is one of the accepted practices of capitalism. And this has been one of the salient features of a section of the nationalist leadership in the post-independence period. The next question that one may ask is why was it possible for such corruption to take place? Firstly, the forces of monopoly capitalism which control the Western countries have unlimited funds. Pool the resources of all the multinational corporations together and one can see the threat posed to Africa. Consider the situation when they pump these resources into various aid agencies, churches, foundations and development corporations, and we see the enormous temptations put before the political leadership and the bureaucracy esconced in the state machinery of most African countries.

Bureaucratic Bourgeoisie

The African bourgeoisie in the immediate post-independence period was essentially bureaucratic with a small trading class. But essentially it was a bourgeoisie without much property, let alone substantial capital. Having arrived late on the historical scene—at a time when the world was moving towards socialism—one can understand its desperate haste in accumulating property. It previously had little property but its tastes were distinctly bourgeois as were its aspirations. But unlike the classical bourgeoisie, this bourgeoisie was not involved in production, as, in any case, the profitable section of the economy had already been cornered by the monopoly corporations. All they then had were positions in the state machinery. This is all they had to give to imperialism when they sold themselves for money and goods. The state machinery became one large cesspool of corruption. Those who wanted to get rich quick, openly advertised that they were up for sale. This is what the confessions of the fifth column in Guinea have revealed.

The principal feature of these confessions is that those who sold themselves were connected with the state and also occupied posts in the party. These agents of imperialism were in the pay of West Germany, France and the US. Britain was also involved. Their confessions make sordid reading. These personages linked themselves with the West German Secret Service when publicly they identified themselves with the socialist policies of Guinea. They sat and deliberated on behalf of their people in the highest organs of the state and the party, only to reveal what was decided upon to the enemies of the people. What is of importance to Africa in these confessions is the groundwork that imperialism lays before attempting a coup or in this case, an invasion. What the world sees or hears of is the coup, but the groundwork for it has been laid over a period of many years. In Guinea's case, the bribes given were large by any standards. The ministers got outright grants of 200,000 dollars plus 5,000 dollars a month. Cars, fridges, etc, were also thrown in. Below are a few details of some of the confessions.

Confessions

Keita Noumandian, ex-General of the armed forces: First he was in the French Secret Service. The contact man was Captain Bourreau, French Press Attache. Noumandian's tasks were: (1) Use racialism and pit tribe against tribe in the army, particularly on questions of salaries and promotions; (2) organise theft of ammunition; (3) incite soldiers to mutiny on salary and leave matters; (4) increase antagonism between army and militia.

Diallo Amadou, ex-Minister of Information: "I was contacted for the German Secret Service by Dr Richards, a Cultural Attache." Amadou's functions were: (1) Give West Germany favoured treatment in economic planning; (2) send students to West Germany; (3) oppose the influence and presence of the Russians and Chinese.

Diope Allsane: "Siebold, the head of the German Secret Service contacted me. He said that I should safeguard the interests of his country. I asked him what he meant and to be precise. He said, 'I and other influential men should prevent the nationalisation of their investments'."

Zoumagi Kekouri, commander of the gendarmerie: "I was recruited by Madame Rossein, First Secretary of the Embassy of France. I had to create shortages of consumer goods. I had to arrange for the smuggling of arms. I knew the date of invasion. I had to render the gendarmerie inactive. I also had to organise the elements in the interior and assist the aggressors to occupy the important places.

Barry Baba: He was expected to make people dissatisfied by making day-to-day commodities more expensive. "I was to poison the beer when it was put into the market. We wanted the consumers to die and thus to turn the people against the government."

Balde Oumar: "My job was to act as a liaison between Conakry and Dakar [Guinea and Senegal]. My job was to: (1) Isolate Guinea from other states; (2) I had to be the liaison between the External and Internal Fronts; (3) We recruited mercenaries from Senegal and Gambia and sent them to Guinea Bissau to be grouped with white mercenaries... The countries which helped us on November 22 were NATO countries, Ivory Coast and Senegal. After the abortive invasion Senghor [President of Senegal] told me not to go back to Guinea for he said 'I have information that you would be arrested'."

The strategy of imperialism thus was first to win over layers of the state machinery on to their side and then undermine the government by way of creating economic shortages and showing that capitalism was a superior system to socialism. This was in order to win the battle for minds. Then was to come the final blow — the attempt to overthrow the government of Guinea by force.

Foiled Plots

As the overthrow attempt failed, the imperialists are now casting doubts on the validity of the confessions. They have even suggested that the confessions are either false or made under duress. The fact is great pains are taken to be just. The method used is one of denunciation and confrontation. Before anyone is arrested he has to be denounced by at least three people. He is arrested only if, in addition, incriminating evidence is found, like letters, unlicensed guns, etc. If he denies the charges, he is allowed to confront and question his accusers. In this way the innocent have been able to acquit themselves speedily.

How were the Guinean people able to foil the plots of the combined forces of the German and French Secret Services, as well as the CIA, after these agencies had bribed so many important layers of the party and government. The answer lies in the high degree of political and military mobilisation of the people and the acute political consciousness of the cadres of the Democratic Party of Guinea. Without fear, the people denounced those of their own leaders whom they believed were in league with the imperialists. Simultaneously they acted on their own to defend Guinea in defiance of those leaders who were assisting the aggressors by showing lack of enthusiasm in fighting. President Sekou Toure of Guinea later admitted that party militants had, in fact, warned him against some of the ministers, but he could not believe that these ministers would betray the party and the revolution.

Now that the forces of socialism have triumphed over capitalism, it has become necessary to fashion the state machinery to serve the needs of the workers and peasants who protected their revolution with their blood. In the course of the struggle, the entire bourgeois judicial system has been dispensed with. To create an organic link between the civil service and the people, civil servants are made to work part-time in factories and rural co-operatives. The educational system is being transformed so that it ceases to produce an elite which turns against the people and towards the bourgeoisie. Students are being linked up with the process of production.

Guinea has an excellent and highly politicised party in power and its 8,000 cells meet every week to discuss everything from international to local issues. The party has established control of every section of Guinean life. Yet this party had housed the traitors who evaded suspicion. For this reason careerists in the party are being weeded out. Workers and peasants now control the party. Dedication and commitment to the revolution are given precedence over technical knowledge and specialised skills.

The period of transition from capitalism to socialism is the most difficult one in a people's history. It is then all the more necessary to establish all-round vigilance and all-round mobilisation with the gun alongside the plough and the hammer.

More Vinegar than Sugar

Nireekshak

DURING a parliamentary session, newspapers generally do not have to search hard for interesting topics of comment. Debates, bills, reports and even questions provide much food for thought, and not unoften there are controversies to enliven the news pages as well as to irritate or gladden leader writers. However, with the Government and MPs thoroughly preoccupied with the Bangla Desh crisis, the current parliamentary session is yielding far less than the usual crop of talking points for newspapers; Bangla Desh, moreover, being very nearly an all-party or non-party issue, is non-controversial. The result is that there is very little journalistic attention being paid to anything other than the fighting in Bangla Desh, he confrontation with Pakistan and the diplomatic fall-out in the world capitals of this confrontation.

Even when Parliament is seized of some other issue like, for example, the problem of holding the price line, it inevitably gets intertwined with Bangla Desh. And if the Deputy Home Minister tries, as he did in the Rajya Sabha, to make out a feeble case for Devanagiri as a common script for all Indian languages or asserts that anyhow English "is slowly going out of India", he is sternly reminded by *Statesman* that this is hardly the time for such talk! Perhaps the coup in Thailand—"not a coup in the normal sense", according to *Free Press Journal* —and China's first statement of policy in the United Nations were the only two subjects of recent editorial comment which did not seem to suffer from the baleful effects of Bangla Desh. But even here not quite, for some leader writers, have not failed to take note of the fact that Chiao Kuan-hua made no mention whatever of Bangla Desh in his speech! Only Thenom Kittichachorn, it seems, has somehow managed to avoid the influences radiating from Bangla Desh, However...

Yeshwantrao Chavan has had worse luck. "So many pronouncements have been made by Finance Minister Chavan on stringent action against the speculative activities of the mercantile community and on holding the price line with such little effect", wrote *Deccan Herald* "that his latest statement in Parliament is not likely to be taken seriously. The way the Government has acted in imposing fiscal and administrative restraints on hoarders and profiteers has served little purpose either as deterrents or for infusing in them a sense of discipline or service." There was no doubt, the paper said, that the prices of most commodities were steadily rising; yet the Government, which awoke to this situation rather late, did not seem to be tackling the problem on the right lines. "To ask the people of a country where 90 per cent of them live at below-subsistence level to practice austerity is only to indicate how unrealistic the Minister is and also how helpless the Government is in tackling the powerful forces which menace society."

When the Finance Minister presented his taxation measures in May last, *Hitavada* recalled, he had given the assurance that the prices of untaxed commodities would not be allowed to be affected by the new taxes. However, it added, these assurances have proved unavailing in the context of the steady spiralling of prices of all commodities during the last few months. "Unless all the present laws—which are good—are faithfully implemented, the tax evaders are brought to book, the traders are effectively dealt with whenever they are found erring, the hoarders are ruthlessly punished and last but not the least, the taxation burden is studied to know its part in the rising prices", *Hitavada* asserted, "the essential commodities would not be sold in the the market at fair prices. These measures should be strictly adopted without party or political considerations". "Otherwise", the paper warned, "our whole economic structure will crumble one day, and history will hold the politicians responsible for this chaos."

Commenting on the annual report of the Reserve Bank, *Deccan Chronicle* said: "Despite a record crop, foodgrain prices have registered a 16-point rise in August in just under five months; production of cotton, jute and sugarcane has not kept up with the expected levels; industrial production has not developed to the required extent. The Plan therefore faces drastic revision." In such a context, the paper said, "salvation seems to lie in a radical shift in the trade pattern with the Soviet Union." Now that an Indo-Soviet treaty was a reality "New Delhi and Moscow will have to think of integrating planning policies. This is an inescapable choice."

About the coup in Thailand, no one here seems to believe that the reasons advanced by Thanom Kittichachorn for his puts are the real reasons for it. The situation in Thailand did not seem to have posed any threat to the country's institutions, observed *Hindustan Times*. "What has been offset [by the coup] on the other hand can perhaps have been a threat to certain individuals, including Field Marshal Kittichachorn, from a section of the ruling clite itself... It is [also] implausible that the coup is precipitated by a threat from Thailand's northern neighbour." *Statesman*, too, remained unconvinced about the reasons advanced for the coup. "Military dictatorships have not been notably more successful than democratic regimes in dealing with internal disorder or external threats", it said. "By discarding the democratic experiment, Thailand's rulers have followed Cambodia's in a disturbing trend in South-East Asia, which seems to stem from the belief that a dictatorship is the only answer to the threat of communist subversion." *Mail* thought, on the other hand, that there might have been some truth in the fear of internal subversion. If the threat of "a swing to communism by Thailand's Chinese population inspired by Peking's entry into the United Nations" was a reason for the coup, *Mail* remarked, then "there is something here to ponder for those in the UN who greeted China's admission with 'screaming, singing and dancing in the aisles'. It has certainly not been long before those who rang the bells have begun to wring their hands", it said. "But the reason adduced by Thailand's dictator for the military takeover is unconvincing."

Chiao Kuan-hua's speech in the UN seems to have elicited a mixed reception in the press. *National Herald* has had no difficulty in concluding that by his speech "China has put herself in the forefront of the struggle for collective security. It is a powerful and unmistakable voice and that voice will have to be heard", it said. However, *Hindu* was not quite sure. The question uppermost in the minds of UN members when China was admitted to the world body, it noted, was: "Will [China] spread sweetness and sugar or vinegar and obstruction?" And if Chiao's speech is any indication, "there is henceforth likely to be more of vinegar than sugar".

A Civilisation over Time

Viswa Nath

India: The Social Anthropology of a Civilisation by Bernard S Cohn; Prentice-Hall, Englewood Cliffs, New Jersey, 1971; pp xv+164; $ 1.50.

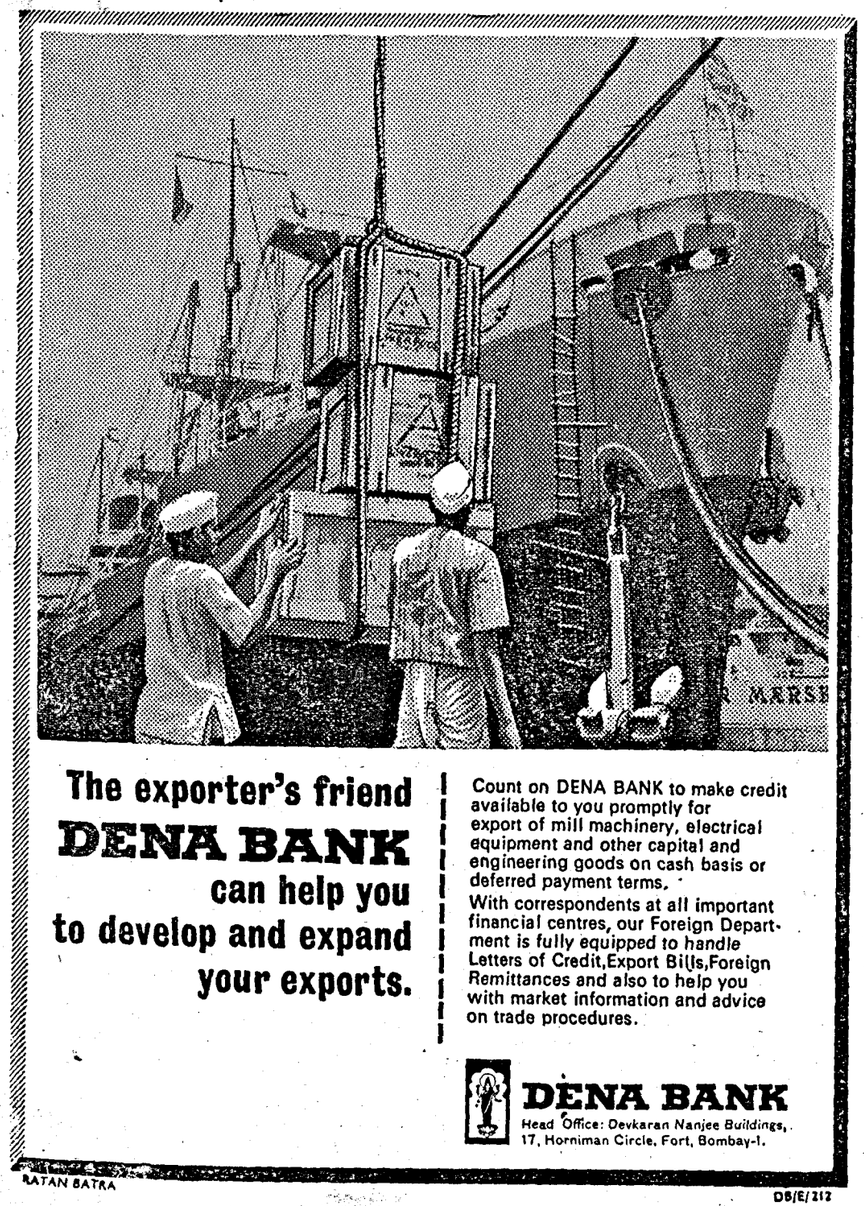
IN 'great civilisational' areas such as India with a long and recorded historical past, society can be studied not merely at a particular point of time but also over a period of time. With the help of archives available in the Government record offices and a whole lot of other literature particularly in the regional languages, social conditions in India during different periods in the past can be studied and analysed sociologically. Moreover, the 'ethnographic present' can be studied in relation to the past. This is very useful, if not essential, in the analysis of social change.

The book under review is part of a series on the Anthropology of Modern Societies. This is significant. For one thing, it shows that the study of 'modern' societies in increasingly engaging the attention of anthropologists who were until recently preoccupied mainly with primitive societies. For another, practically all 'modern' societies have a recorded past, and the anthropologist studying such a society is forced to grapple with historical material about the society as contrasted with his almost sole reliance on the participant-observation method in the study of preliterate societies. The study of 'modern' societies requires an integration of the two modes of inquiry.

Cohn fulfils this requirement eminently. He is a trained anthropologist as well as a historian. He has done an intensive field study of a village in eastern Uttar Pradesh and also worked on published and unpublished historical records relating to the eighteenth and nineteenth centuries for the same region. In the book under review, he brings together in a useful way historical and anthropological knowledge about India.

The study of Indian society in a historical perspective presents certain problems in sociological research. The sociologist as well as the historian usually distinguish between different historical periods in Indian history. However, the sociologist is not interested in any one period of Indian history, say the mediaeval or the modern. He is interested in the study of the society in the past in general and in any period for which reliable historical data are available. If the sociologist is studying the 'ethnographic present' alone, he can study almost any aspect of society he wants. But he cannot do this for the past. He has to select an aspect of society for study in which, of course, he is interested but for which archival material is also available. It is also necessary in the study of a society's past that historical documents should lend themselves to sociological analysis. That is, they should throw light on different aspects of society and deal not merely with political history.

In the first chapter of the book under review, Cohn has discussed the approach of different scholars to the study of Indian civilisation and the theoretical frameworks they have suggested for understanding the nature of Indian society and culture. One way of looking at Indian society is to study it in terms of specific traits which can be listed and described; another way is to find out what cultural traits have endured in Indian society through the millenia. This chapter is followed by three chapters dealing with (1) the geographical features of the Indian subcontinent, (2) the cultural and historical geography of different regions in India, and (3) the demographic, economic, and linguistic structures. These are followed by three more chapters which are purely historical. They deal mainly with the political history of India upto the British conquest. The above-mentioned chapters cover nearly 70 out of 164 pages of the book and serve as a background to the discussion that follows on various aspects of Indian society. I wonder if such a lengthy background is necessary in a book dealing with the social anthropology of Indian civilisation. It strengthens the impression that the book is primarily meant for the student at the undergraduate level.



After the background chapters, there are two chapters dealing with various aspects of Indian society during the nineteenth century. They include, among other things, a discussion of the pattern of landownership, the nature of the Indian village community, and the urban structure during the early nineteenth century. The older type of urban centres of that period such as Banaras, Bareilly, Anupshahr and Dacca have been compared with the modern port cities of Bombay, Madras, and Calcutta which developed after conquest by the British as centres of trade, commerce, and industry. This discussion of the nineteenth century Indian society will, no doubt, be of very great interest to sociologists and anthropologists as also to the sociologically minded historians.

The discussion of aspects of Indian society during the nineteenth century is followed by three chapters on Indian social structure, which deal among other things with the Indian family and the pattern of interpersonal relations in it, the caste system, concepts of purity and pollution, caste dominance in rural India, and caste mobility. In dealing with these topics also, Cohn has dealt wherever possible with the past. However, the treatment of certain topics — for instance, the Indian family and the concept of purity and pollution — is too brief.

The major emphasis in Cohn's book is on aspects of Indian social structure during the British period. He has dealt with society in pre-British India very briefly. Cohn has rightly pointed out that, during the nineteenth century, there was not only a great concern about the legal rights of those who owned land, but it was also assumed that the landowners were ancient aristocrats who had traditionally owned land for a long time. A good deal of legislation was passed during the British period to 'protect' the rights of those who owned land. There can be no doubt that, in this, the British in India were influenced by the pattern of landownership prevalent at the time in England where the traditional landowners were the 'gentry'. Cohn has suggested — and I think quite correctly — that for a proper sociological analysis of landownership in India during the nineteenth century, the assumed origins of those who owned land is less important than an understanding of the actual ownership of land and the dominance derived therefrom. It is clear that, in the late nineteenth century, the person who exercised control over others in the rural social structure in India was not the big landlord but the substantial peasant belonging to the numerically large castes. This continues to be the pattern even now.

In the discussion on the nature of the Indian village community in the early nineteenth century, Cohn has pointed out that there are only a few

published accounts of the Indian village at this time. This is no doubt true. A number of studies of India's villages were undertaken by anthropologists in the early 1950s, which have since been published. If we could have some studies of early nineteenth century village India, it would provide a useful and interesting comparison. There is, of course, Thomas Coats's excellent study of village Lony in Maharashtra to which Cohn has referred. The same village was studied again by G S Ghurye and his students in the 1950s to see what changes had taken place. But Coats's study is perhaps the only extant published account of an Indian village in the early nineteenth century. More such studies are necessary. The village revenue and other records are a useful source of information for reconstructing a picture of the Indian village community during the early nineteenth century. Vernacular newspapers and journals are also an untapped source of information for this purpose. It is clear from such information as there is, that at the advent of British rule there was in the Indian village a high degree of monetisation, considerable rural indebtedness, and involvement of the village in the surrounding region.

The section dealing with the nature of the Indian family and the impact of urbanisation and industrialisation on the ideology of the joint family is interesting. There is a significant observation: "Recent research seems to indicate that the nuclear family certainly as far back as the Middle Ages in England was the predominant type" (p 122). Thus the evidence suggests that, in the West, the assumption that the large extended family broke under the impact of industrialisation is not correct. Recent research by anthropologists on the Indian family also suggests that the assumption that there were large joint households in the past in rural India and that they are breaking down under the impact of urbanisation and industrialisation is open to doubt.

There are certain statements in the book with which it is difficult to agree. Thus, on the caste system, Cohn observes: "The caste system like any stratification system, requires groups with power to maintain the system. This power has been provided not by Brahmans, not by sacred authority, but by political power" (p 129). The caste system, as is well known, has existed through the ages and has passed through many vicissitudes. Even groups which did not have this form of social stratification, or were directly opposed to it, have in course of time acquired all the characteristics of the caste system. It has often been doubted whether the caste system could survive in a modern political democracy where there are political parties and organised pressure groups. Yet the caste system has not only survived but has acquired new forms. One wonders how, in view of this, the caste system requires political authority or patronage for its maintenance.

In the concluding chapter of the book, Cohn has indulged in a good deal of speculation. He has, for example, speculated on the effect the ever-increasing population of India might have on the Indian family and the interpersonal relations in the Indian village. He has also speculated on the effect that mechanisation of agriculture and increasing agricultural productivity may have on the social structure of the Indian village. Likewise he has speculated on whether the movement to stronger regional identity would lead to better governance. Such speculation is thought-provoking; but it is also highly controversial and could well have been avoided.

The book seems to have been printed in haste. Though the list of contents states that there is an index, there is in fact no index at the end of the book. All in all, it is a good introductory study of Indian society and culture, viewed in a historical and sociological perspective. It will be useful at the under-graduate level to students of social anthropology as well as of history.

SPECIAL ARTICLES

A Linear Programming Model for Storage of Buffer Stocks of Foodgrains

K V Natarajan
A S Rao

Several objectives have to be borne in mind in the location of storage points and in the determination of storage capacity, both for buffer stocks and for distribution and procurement. These are: first, that grain should be readily available at short notice; secondly, that the total cost of procurement, handling, and transport should be the minimum; and thirdly that such storage capacity as is created should be optimally utilised.

In this paper an attempt is made to construct a linear programming model to help in decisions about location and capacity. The time horizon in view is the Fourth Plan period. The focus is on finding out what will be the storage requirements by the end of 1973-74.

[The authors are grateful to A M Khusro for comments, and to S Vohra for giving a practical insight into the problem and for encouraging the completion of this work. However, the views expressed in this paper are those of the authors.]

THE objective of the present paper is twofold: first, to determine the location of grain storage both for buffer stocks and for public distribution and procurement in Rajasthan; secondly, to determine the capacity required in each location. The time horizon within which planning is attempted for the creation of storage is the Fourth Plan period. In other words, the attempt is to estimate storage requirements by the end of 1973-74.

Several objectives have to be kept in view in the location and capacity creation for storage. One such objective is that, wherever these locations and whatever their capacities, grain should be readily available for consuming centres within short notice. This objective is of particular interest for us since this exercise, apart from being concerned with ordinary pipeline stocks, is concerned with buffer stocks, i e, anti-speculative governmental stocks. The objective just outlined therefore suggests locations in favour of deficit districts. Another important objective, for the agency operating these stocks, is that the total cost involved in the entire process of procurement, handling, and transport of grain, should be the minimum. On this consideration, storage capacity should be located near surplus districts. A third objective must be the optimum usage of the existing storage capacity. According to this criterion, it is not advisable to create additional storage at places where the turnover of grain is

TABLE 1 : DISTRICTWISE PROCUREMENT AND ESTIMATED PUBLIC DISTRIBUTION OF FOODGRAINS BY END OF 1973-74 IN RAJASTHAN

Total	1,61,000	50,000

more but the quantum of procurement and distribution is low. This criterion is particularly useful in suggesting the requirements for pipeline storage.

One could thus arrive at a set of advisable locations and capacities of storage, based on some probabilistic considerations and recent experience. Alternatively, linear programming techniques can be used towards the same end. A more realistic approach would be to make use of both. In the present paper, attention is concentrated on the second approach, though an attempt is also made to formulate a third approach in finally estimating storage capacity for each location.

Before going into the actual formulation of the model, it is necessary to see that the model represents the real situation to the extent possible. It is appropriate, therefore, to identify the factors affecting buffer and pipeline storage. Clearly, pipeline stocks have to be located both in deficit and surplus districts — since they are required in daily transactions. Buffer storage, on the other hand, has to be determined, apart from climatic conditions and needs of public distribution on (a) the procurement potential, (b) the availability of transport and (c) the command area of the location. If one of the considerations governing buffer storage is to minimise cost of procurement, locations have to be near procurement centres. In addition, if it is intended to minimise transport cost also, locations have to be among the surplus districts in the following way: After meeting the public distribution requirements of the deficit districts in the state as a whole, some of the surplus districts can still maintain some stocks. These stocks should give us an idea both as to the location and capacity of buffer storage.

THE MODEL

After omitting Banswara which, according to our estimation, will remain just self-sufficient, there are 25 districts with imbalances between public distribution and procurement. Of these 25 districts, 15 will have surpluses of procured grain over their public distribution requirements and the rest will fall short for their public distribution needs. Hence we have 15 supply points and 10 demand points, with their surpluses and deficits respectively. Let a_i be the disposable procurement in the ith surplus district and b_j the amount required by the jth deficit district, *i e*:

a_i = procurement in the ith surplus district minus public distribution there.

b_j = public distribution in the jth deficit district minus procurement there.

Since the procurement in the state is in the aggregate in excess of public distribution, to convert the present problem into a standard transportation problem, these two have to be equalised and so an 11th fictitious demand point imagined. If a surplus district happens to send grain to this demand point, it means that the district is left with some stock after the requirements in the state as a whole have been met at least cost.

If x_{ij}, which is to be determined, is the optimum amount to be catered from the ith surplus district to the jth deficit district, and c_{ij}, is the cost of transporting one unit of grain from i^{th} surplus centre to the jth deficit centre, then the cost involved in meeting the public distribution requirements of the deficit districts in the state as a whole is given by the sum of all possible products of x_{ij} and c_{ij}, *i e*:

$$\sum_{i=1}^{15} \sum_{j=1}^{11} c_{ij}\, x_{ij}.$$

The problem is to minimise this expression. Two important sets of constraints have to be imposed on the policy variables x_{ij}. The first of them is that the total quantity that is catered from a surplus district to all the deficit districts should be at most equal to the disposable procurement in that surplus district. Secondly, the total quantity received by a deficit district from all the surplus districts should add up to the amount required in that district. When these constraints are expressed in a mathematical formulation, the problem becomes:

Determine a non-negative set of numbers x_{ij} which minimises

$$\sum_{i=1}^{15} \sum_{j=1}^{11} c_{ij}\, x_{ij} \quad \text{subject to}$$

$$\sum_{i=1}^{15} x_{ij} = b_j \quad j = 1, 2\ldots,11$$

$$\sum_{j=1}^{11} x_{ij} = a_i \quad i = 1, 2\ldots,15$$

DATA AND ASSUMPTIONS

Public distribution requirements and procurement by 1973-74 were estimated in consultation with the state government, for each of the districts in Rajasthan and are presented in Table 1. Cost of transporting a unit of grain is obtained by applying the grain freight schedule, which is telescopic in nature, on the nearest rail route. A nine per cent surcharge, levied by the Railways, is then added to the rates thus obtained. The costs associated with the 11th fictitious demand point is taken to be zero, since no transport is involved in that case. The cost matrix is presented in Table 2.

It is assumed that the public distribution requirements in the state are entirely met from the procurement within the state and no grain is received from outside the state. Grainwise break-up of data, on public distribution and procurement, is not readily available; so the figures relate to the aggregate of foodgrains. This assumption does not alter the cost matrix since the cost of transporting a tonne of either rice or wheat is the same. Finally, the rail grain freight schedule is applied on the nearest road distance in the case of a single district lacking rail connections.

SOLUTION OF THE MODEL

To illustrate the model according to the least cost solution, represented in Table 3, Alwar need not send any grain to any district and can keep all the procurement of 18,000 tonnes of grain as stock. Whereas Ganganagar, out of the procurement of 35,000 tonnes, has to send 4,000 tonnes for Bikaner, 2,000 tonnes for Churu, and 5,000 tonnes for Jaisalmer, and has to keep 24,000 tonnes as stocks and so on. Column 11 of Table 3 indicates that in particular Alwar, Ganganagar, Kota, Bharatpur, and Sawaimadhopur have substantial stocks. Among them, Bharatpur and Sawaimadhopur are well connected, both by broad- and metre-gauge railways, besides having a high procurement potential. Ganganagar, Kota and Alwar, are connected but only by either metre- or broad-gauge, and are favourable for locating buffer stocks because of their high procurement potential. Kota is on the broad-gauge line and also has good transport facilities, and is therefore desirable as a location point. Ganganagar has a preference over Alwar — even though both have only metre-gauge connections — owing to Ganganagar's high procurement potential so that large stocks can be kept at least cost.

So, buffer storage at Bharatpur, Sawaimadhopur, Kota and Ganganagar — in the order of preference stated — would appear the most suitable alternative locations, in the sense that the cost of procurement and transportation is minimum. Besides, they have good transport facilities as well as the necessary climatic conditions for preservation of grain.

So far, we have dealt with only buffer storage. Regarding the state's pipeline storage, as mentioned earlier, it has to be located both at surplus as well as deficit districts. The present model suggests locations and storage requirements only at surplus districts. Storage requirements of deficit districts have to be worked out independently of the mo-

del, particularly based on past experience and using data on public distribution and procurement by 1973-74. They have to be worked out taking into account the projected procurement within the district, projected movement of foodgrains, from one district to others obtained from the least cost solution referred to above, and the number of turnovers which the public distribution system would call for in each district. Specifically, if C be the public distribution requirement for the year within the district, B the required capacity to be determined for pipeline storage, and T the number of times grain rotated in a year, the following identity holds good:

$C = BT$

For example, if grain is moved in four instalments to meet the public distribution requirements in a year in a particular district, and if the requirements are 5,000 tonnes, then, the ideal capacity for public distribution in that district should be one-fourth of the requirements, i e, 1,250 tonnes. The same formula could also be made use of in estimating the storage requirements for procurement. But in this case, the turnover may not be the same as in the case of public distribution. However, exclusive reliance on this formula may not give a realistic solution and some corrections have therefore to be applied. Table 4 gives the storage requirements for buffer and pipeline storage, that were finally arrived at.

Pragmatic Politics in a Rajasthan Town

Case Study of a Municipal Election

Hugh S Plunkett

In considering the development of politics in India, Western-trained observers have tended to assume that the adoption of a device — elections — has, or should have, as a necessary concomitant, the spread and acceptance of the democratic ideology.

This view ignores both the fact that multiple forms of political competition co-exist in communities and other types of social systems in addition to those organised through elections, and the common finding that local and pragmatic interests tend to govern the course of electoral opposition in local communities round the world.

The author suggests that in the town in Rajasthan studied by him here, as elsewhere, the institution of elections may play only a secondary part in shaping political values and norms — though elections do provide a convenient 'window' for observation of on-going political processes.

ON May 29, 1966, the voters of the Rajasthan district town of Chhaoni went to the polls to elect a new Municipal Board. The results of that election surprised and disconcerted the townspeople: despite anti-Muslim sentiment in the region, aggravated by the recent Indo-Pakistani war; despite the fact that Muslims in the town numbered only a fifth of the population and were dominant in none of the electoral wards; despite the fact that, on the three previous municipal boards elected in Chhaoni since merger, only two Muslims had ever held seats; despite the modest expectations of Chhaoni's Muslim candidates, who were perhaps more surprised than anyone at the outcome — five of the ten General seats were won by Muslims. The problem which I shall take up in this paper is the interpretation of this election, as a political event, in relation to social and cultural change in post-Independence India. Can we view the outcome of this election as the consensus of informed voter preferences in predominantly Hindu, parochially-oriented Chhaoni? Or is it better understood as the unanticipated consequence of a complex sequence of political activities in which the people of this Indian district town are involved? And in what ways does analysis of this event add to our understanding of the impact of democratic institutions at this socio-cultural level in India?

The Setting

The former capital of the small princely state of Zalimgarh, now a district headquarters, Chhaoni is still an administrative rather than a trading or industrial centre, providing goods and services to district officials and organisations now located there. The town's political elite is drawn primarily from its advocates and merchants, with continuing participation by persons formerly part of the Maharaja's court. In 1966 the townspeople numbered approximately 16,000, of whom 7,741 were registered voters.

The town's 25 neighbourhoods (*mohalle*) are incorporated into 10 electoral wards. Although *mohallas* often have a core population of a single caste group, wards are multi-caste; in no ward does a single caste dominate numerically. In the 1931 Census, the largest caste groups in the town were listed as:

	(Per Cent)	
Brahman	10	
Kumar	6	
Mahajan	6	(Agarwal and Oswal)
Chamar	5	
Mali	5	
Rajput	4	
Teli	2	
Muslim	21	(all Muslim castes)

These figures remain roughly correct. According to the 1961 Census, 41 per cent of the townspeople are literate, compared to the average for the district as a whole of 13 per cent.

The municipal board of Chhaoni, composed of ten General members, two Scheduled Caste members, and two Nominated members (whose seats are usually held by women), is charged with revenue collection through *octroi* and local taxes, and with provision of municipal services such as street cleaning, sanitary facilities and water supply. Day-to-day administration is conducted by a Rajasthan state civil servant and his staff, reporting to the District Collector. Despite its limited scope

and resources and its relatively recent establishment following the merger of the former princely state, the municipal board is the major focus of town-centred political activity. Control of the board is indicative of the relative power positions of individuals and groups, and the board's machinery may be used to provide patronage or for the harassment of rivals.[1] Until 1965 the municipal boards of Chhaoni had been dominated by Brahmin and Mahajan advocates, with support from dependent allies of other castes, and token representation by a Congress-affiliated Muslim lawyer or his nominee. Leading members of these boards were linked to state-level factions within the dominant Congress party, tieing the town arena to district and state politics.

Candidates and Campaign

Upon the announcement by the Rajasthan state government that state-wide municipality elections would be held in May of 1966, the state's political parties decided not to contest the elections on a formal party basis. At that time the state Congress party was embroiled in factional controversy, in which Chhaoni's former Maharaja, a minister in the state Congress government, was deeply involved, and therefore the Maharaja was unable to direct his influence toward the Chhaoni arena. As a result state-level political prestige involved in the outcome of the Chhaoni election, and the availability of party funds for the contest, were both much lower than they might otherwise have been. Because the competition was to be defined in local terms, without preliminary jockeying for party tickets, and with less need for expensive propaganda and organisation, many candidates were tempted to enter. The following table indicates the number of candidates in the wards:

No of Candidates	No of Wards
General Seats	
2	1
3	1
4	5
5	2
6	1
41	10
Reserved Seats	
1	1
2	1
3	2

Viewed in terms of the structure of electoral competition in the town as a whole, several "teams"[2] may be noted. Most prominent were the factions within the town's Congress party. One, smaller and weaker, was based upon Brahmans and Mahajans associated with the early years of Congress activity in the district following merger, and led by an old Mahajan (not himself a candidate), who was linked strongly with the Chief Minister's faction of the state party, hereafter referred to as the Sukhadia faction. The second was led by a young advocate, Mangi Lal, formerly the chairman of the municipal board, who controlled a coalition of local influentials, including some Muslims, and was loosely affiliated with the district "machine" led by the former Maharaja. Three other party-affiliated teams provided candidates: two of these, the Socialists and the Swatantra, were little more than cliques of ideologically-oriented, educated young men, with few rank-and-file supporters. The Jan Sangh party had an active core of workers in the town, drawn primarily from young Brahmans and Mahajans, and was able to draw on a reservoir of "Hindu" sentiment in the town. A wave of solidarity among Muslims had been further stimulated by the success of two important Muslim festivals managed by Muslim advocates, and ten Muslims stood in eight wards, under a variety of party labels or as independents. Finally, a part was played by an aide to the former ruler, who put up candidates in the Maharaja's name in several wards, to oppose those of the Sukhadia faction as well as those of other parties.

Campaigning was based on personal contacts by the candidates and their supporters with voters in the wards, augmented for some candidates by occasional *gasht* (or "lightning tours") by influential persons from elsewhere in the town. The town's only election meeting was held by Muslims in the *jama masjid*, and its organiser considered the turnout very poor. Despite general and frequent complaints about the previous board's "corruption" and "inefficiency", town-wide concern over poorly-managed and over-priced water supply by municipal carts during the severe drought then going on, and background issues of food shortage, rationing, and inflation widely attributed to the "Congress raj", no clearly defined community-wide issues were articulated by political teams during the campaign. Voter choices and candidates appeals were thus directed toward goals and values important to the social structure of the town but not directly associated with electoral office.

Victories by Muslims in 5 wards showed a clear and unprecedented gain for Muslims in town politics. Muslim communal sentiment was reflected in higher turnout and bloc voting, and in the election of young Muslims who were not linked to political groups and had never been active in politics before, in the face of rising anti-Muslim sentiment in the town and region.

A second clear result was the defeat of persons and groups identified with the state Chief Minister's faction of the Congress party, interpreted by those active in politics as indicative of growing anti-Congress sentiment. The son-in-law of the leader of the Sukhadia faction and two former members of the municipal board who were old-line party workers were soundly defeated.

A third outcome was the humiliation of the Maharaja's aide who had attempted to set up 4 candidates, all of whom lost decisively. This failure resulted in a shift in the internal organisation of the district machine, and the ultimate defeat of the aide in the subsequent General Election. The influence position of the Maharaja, however, remained relatively undamaged.

Election and Social Process

As described so far, the Municipal Board election in Chhaoni appears to be a straightforward example of the operation of democratic processes in the Indian hinterland. As such, it may be analysed following familiar lines of academic tradition dealing with political institutions, and its outcome assessed in terms of the relative strengths, skills, and degrees of success of parties and factional groupings in the town. According to this view, the important roles are those of party and faction membership; the ultimate prize which is sought is succession to electoral office within the framework of democratic norms; and the rules for competition are entirely derived from the ideology of egalitarian democracy. This is conceptually neat and tidy — and in fact most studies of local elections, in India and elsewhere, have been structured along these lines.

However, this view, and the stress on election analyses in the literature, involves several assumptions which appear to me to obscure rather than illuminate the interpretation of the facts on the ground. The assumptions I object to are three:

(1) That *all* politics is electoral politics — elections are relatively easy to study, since they are being temporally

bounded and highly visible. And they *are* important political events. But they are not the *only* relevant political structures in rural India.[3]

(2) That in a local community such as Chhaoni a unitary town-wide political structure stands in contraposition with structures of the superordinate society. As I hope to show, the political system in Chhaoni is composed of multiple, intersecting structures of political competition, only some of which are bounded by the town itself.

(3) That the appropriate unit for analysis in such studies is the coherent, cohesive political group, whether clique, faction, or party. If these units do not emerge clearly in political competition, there is a strong tendency to fall back upon residual terms, such as "amorphous", to describe the situation, and to abandon the attempt to explain it further.[4]

I am more concerned with the processes of politics than with taxonomic identification of groups or of structures: following Barth,[5] I think it more important that we look for the activities and the choices made by Chhaoni citizens according to determinable rules, and from these derive social *forms* — cliques and factions — and understandable outcomes of political competition as well. This kind of fine-grained analysis is precisely where the anthropologist may make his most effective contribution, complementing the approach taken by most political scientists.[6] In order to accomplish this end, we must shift our perspective concerning the Municipal Election in Chhaoni, viewing it not so much as a culmination and resolution of political forces defined in group terms, but rather as an event providing a *"window" into the* opacity of on-going social processes.[7] How best can this be accomplished?

Intersection of Political Structures

In a stimulating, much anthologised but little utilised article, Norton Long[8] has written of the local community as an "ecology of games" — that is, in the local community a number of political structures exist simultaneously and intersect each other. Through competition for prestige, power and resources within the framework of rules defining these structures, of "games", individuals obtain a sense of purpose and a role. Long also implies that the many types of interactions and many types of games, played by a variety of institutionalised players, may have as partly unanticipated results the development of higher-order structures.

Applying this scheme to the Chhaoni *municipal election, it is possible* to identify at least six separate but intersecting political "games" which emerge in the context of electoral opposition in various wards. They are:

	Game	*Opposed Players (Roles)*	*Prizes (Goals)*
(1)	intra-caste	exogamous kingroups	relative prestige/ material resources
(2)	inter-caste	endogamous kingroups	deference/access/ goods
(3)	"communal"	Hindus/Muslims	solidarity/ deference/security
(4)	factional	leader/leader	influence/access to higher levels
(5)	party-based	party organisations	influence/access to policy-formation/ideological goals
(6)	personal enhancement	individual/relevant group	deference/preference/prestige/ influence

Each of these structures provides its players with a set of goals, a definite role, and a *significant* public capable of assigning scores. The strategies appropriate to the various games are diverse and make use of differing sets of meaningful symbols; all strategies, however, permit the symbolic display of opposition in the context of the election as a public event. In consequence, the election in Chhaoni may be seen less as a confrontation among a set of corporate opposing groups than as the arena within which a multiplicity of political "games" intersect *ecologically*,[9] conditioning but not determining their respective outcomes.

Examples of Intersecting Games in Chhaoni

In the space available, full presentation of the material for the entire town is impossible; I will try to illustrate my argument through examination of the structures of opposition in selected wards.

Ward A. Five candidates stood for the seat in a heterogeneous ward of craftsmen, clerks, and agriculturists. Important social segments were reported as follows:

	Households
Mali	50
Brahman	5
Scheduled Caste (Koli)	70
Rajput	3
Julaha Muslims	24
Other Muslims (approx)	50

A total of 554 voters were registered, 219 of whom were Muslim. Of the total registered, 352 (64 per cent) voted in the election.

The opposing candidates were:

(1 and 2) A Muslim Sheykh, son of a stone contractor, stood in opposition to a Muslim Julaha, also a stone contractor, though less successful, bringing to the electoral arena a long-standing feud between the families with overtones of both economic competition and claims to symbolic rank (inter-caste game). The Julaha attempted to mobilise support from both segments of the local Congress party, but was unsuccessful (faction game).

(3) A Brahman shopkeeper, formerly a municipal board member from a neighbouring ward, and recognised as a low-ranking member of the local Sukhadia faction, was shunted into candidacy in Ward A rather than his home ward as a result of machinations by Mangi Lal, the former municipal board chairman, assisted by the Maharaja's aide (faction game). The aide wanted a candidate to represent the Maharaja; Mangi Lal, the factional opponent of the leader of the Sukhadia faction, wished to defeat the rival faction. The shopkeeper recognised his awkward position and bitterly resented it, sitting in his shop instead of actively campaigning.

(4) A young Brahman advocate, son of a former official in the princely state, of the same sub-caste but of very different social position from the shopkeeper, stood representing the newly-fledged Swatantra party organisation in the town (party game), opposing the Congress as represented by the Brahman shopkeeper.

(5) A young Mali fruit contractor/ vegetable seller, from the largest single caste in the ward, one both prosperous and upwardly mobile, stood primarily as representative of his caste to the town, and secondarily to advance his claim to influence within his own caste (intra-caste game or perhaps, since no overt lineage opposition emerged, personal enhancement game).

Results in Ward A. The Muslim Sheykh was able to enlist canvassing support from other Muslims to capture the votes of non-Julaha Muslims, and was also supported by Scheduled Caste voters economically dependent upon him. He obtained 118 votes (34 per cent) to win the seat. His Julaha opponent secured his caste-fellows' votes, but few others, receiving a total of 42 votes (12 per cent) and losing his security deposit.

The Hindu candidates split the Hindu vote in about the manner they had separately predicted to me before the election: the Mali candidate received 74 votes (21 per cent), virtually all from his caste-fellows; the young Swatantra Brahman lawyer received 91 votes (26 per cent) to run second, primarily, it would seem, from those disgruntled with Congress inefficiency in managing the water supply in the ward; and the "carpet-bagger" Brahman shopkeeper forfeited his security deposit with only 27 votes (8 per cent).

In this ward the small vote-margin required for victory and the cross-cutting oppositions of the Hindu candidates were decisive in the election of a Muslim, whose own major goal seems to have been the defeat of a rival Muslim rather than his own victory. Factional and party intervention in the campaign in this ward was small and intersecting concerns within the ward determined the outcomes. The young Swatantra lawyer and the Mali candidate felt that by standing for election they had accomplished a positive goal — they seemed almost as happy with their showing as they would have been had they won the seat.

A second example shows the penetration of the ward contest by more extensive structures of opposition.

Ward B. Ward B includes part of the main market area, as well as pockets of Muslim and Gujar residents. Registered voters numbered 518, with Muslims accounting for 27 per cent; 314 persons actually voted (61 per cent). The five candidates were:

(1 and 2) Two Baniya brothers were quarrelling bitterly over the division of their inheritance from their prosperous father, and the elder had set up a rival shop. This elder brother had been an active politician for some years, serving for some time on the District Congress Committee and pursuing a variety of covert interests as well. The younger brother was determined to stand for board membership, hoping to "gain friends" to assist in his fight with his brother. The elder publicly and repeatedly vowed to spend Rs 50,000 if necessary to have his brother defeated (intra-caste game), and, more practically, approached Mangi Lal, the former municipal board chairman, his classificatory sister's son (*bhanej*), whom I noted above as the factional opponent of the Sukhadia faction, and who was tied loosely to the Maharaja's district organisation (faction game outside the ward). The two managed to set up a rival candidate, a young Baniya related affinally to the former chairman (and with precisely the same name as the younger brother), in order to split the Baniya vote.

(3) Abdul Ali, a personable Muslim Pathan with a prosperous machine-tool shop in the ward and a frank interest in political fame (personal enhancement game), was approached by the clique of young Swatantra-linked Hindu advocates, and agreed, after he had already decided to stand, to call himself a Swatantra candidate. He received no further aid from them, and never joined the clique. He did accept support from a Muslim jagirdar with town influence, and, in the later phase of the campaign, from Mangi Lal as well. This latter alliance resulted from the situation of candidate No 4.

(4) A retired Muslim Pathan official, in poor health, was coerced by the Maharaja's aide into standing for election to represent the interests of the Maharaja against the Baniya candidates, regarded as anti-Maharaja Congress representatives (faction game), and at the same time to split the Muslim vote otherwise destined for Abdul Ali (intra-caste game). Although he acquiesced, he was unable to campaign, effectively retiring in favour of Abdul Ali. At this, Mangi Lal, sensing that Abdul Ali would be the winner, and wishing to bolster his own position, approached him and a linkage was made (faction game).

(5) A young Jan Sangh-affiliated Joshi candidate stood to increase his party's "visibility", without, he claimed, any expectation of actually winning the seat (party game).

Results in Ward B. Abdul Ali, the ambitious Muslim Pathan won decisively with 97 votes (31 per cent), mostly from Muslims. The candidate put up to split the Baniya vote came second with 77 votes (25 per cent), while the younger Baniya brother ran third with 60 votes (19 per cent), dividing the ward's Baniya vote along kin lines. The young Joshi collected the rest of the Hindu votes, receiving 48 (15 per cent); and the retired official, with only 32 votes (10 per cent), mostly from his large family, lost his security deposit.

The quarrel between the Baniya brothers thus remained in asymmetrical balance; the position of Mangi Lal, the former chairman, was enhanced through both his successful engineering of the Baniya vote split and his budding alliance with the Muslim winner. The town's Congress party, and especially the Sukhadia faction, were further weakened. The Maharaja's aide was discredited because of his inept and unsuccessful attempt to set up a candidate in this ward (he was equally unsuccessful in trying the same tactic in three other wards as well), and his position in the inner circle of the district machine was badly eroded. Paradoxically, the position of the Maharaja himself seems to have been damaged neither by the victory of an ostensible Swatantra candidate (to whom he immediately made successful overtures through Mangi Lal and others), nor by the poor showing of the candidate put up in his name. People in the ward, and leaders in the town generally, felt that the retired official had acted honourably in standing out of loyalty to the Maharaja despite his disabilities, and the Maharaja's ability to command such "loyalty" was remarked on. Finally, the young Joshi's reputation as a worker within the small nucleus of the town's Jan Sangh party was enhanced, and he began to set his sights on working in the coming General Election.

The intersecting oppositions described above are intended to exemplify the complexity of political processes operating in the town, and they are paralleled by similar complex situations in the other wards. In some instances, to be sure, the election game coincides with other games. In Ward C, for example, a Muslim unsuccessfully opposed a Hindu in a straight fight, but even here lineage opposition among the Hindu's caste-fellows eroded his support. And in the Scheduled Caste seat in Ward D, two Yadav stone-contractors stood opposed, with cleavage among their major supporting groups structured on lineage lines. Where more than two candidates stood, however, identification of inter-locking games in the electoral situation becomes increasingly crucial in understanding the processes of opposition and their outcomes.

Conclusion

Students of Indian politics will recognise the intricate—almost Byzantine —admixture of caste, communal, party, factional, and personal conflict described in Wards A and B—this is, after all, the stuff and substance of local politics in India, as reported in a large literature from all parts of the subcontinent. Efforts to impose

conceptual frameworks on this chaos in terms of ideology, and in terms of party and faction, have not been completely satisfactory. The Muslims in Chhaoni came to office not because they represented the majority of the citizens as a whole, nor because their organisation as a community was cohesive or solidary. Rather, they were the beneficiaries of the outcomes of multiple sets of interesting political games in their various wards. Although this fact is obscured by focusing attention on the groups involved in town politics, it is clearly revealed by an analysis of the structures of opposition which underlie the formation of such potential social forms. Though the matter cannot be explored here, further elaboration of the crucial nature of roles linking diverse structures, such as displayed by the activities of the former board chairman, and the Maharaja's aide, would shed still more light on political processes in the town.[10]

In conclusion, let me return to the problem I posed at the beginning of this paper, that is, how does the complex of intersecting political "games" that I see in Chhaoni relate to "democracy" as manifested in the Indian context? It seems to me that, despite the framework provided by the election as an event, and despite the facade afforded by the institution the municipal board in Chhaoni, little of the politically significant behaviour in the town is informed solely by the norms of democracy or is structured by oppositions usually considered basic within its framework of rules. This is hardly surprising: although the form imposed from above is formally democratic, the substance of the competition derives from more fundamental social cleavages and goals embedded in the hierarchically-oriented local social structure.

In considering the development of politics in post-Independence India, Western-trained observers have tended to assume that the adoption of a device — elections—has, or should have, as a necessary concomitant, the spread and acceptance of democratic ideology. This view ignores both the fact that multiple forms of political competition co-exist in communities and other types of social systems in addition to those organised through elections, and the common finding that local and pragmatic interests tend to govern the course of electoral opposition in local communities around the world. I would like to suggest that in Chhaoni, as elsewhere, the institution of elections may play only a secondary part in shaping political values and norms —though elections do provide a convenient "window" for the observation of on-going political processes. Democracy, like any ideology, interacts with and is conditioned by its enactment in specific social contexts, and local-level democratic processes in India will surely continue to display distinctive qualities, related to local and regional social structures and cultural traditions.

Notes

[Research for this paper was done as part of a field study of district-level politics and social change, November 1965-March 1967, supported by a Junior Fellowship granted by the American Institute of Indian Studies. Responsibility for the contents of this paper rests solely with myself. Data were obtained through observation and interviews before, during, and after the election in Chhaoni, and were supplemented by documents kindly provided me by the Municipal Secretary, the District Collectorate, and private individuals of the town. All proper names, including those of the town and district are pseudonyms. Social characteristics and events have in some cases been altered to protect persons in the town.]

1 Fox, Richard, "From Zamindar to Ballot Box", Cornell University Press, Ithaca, NY, 1969, pp 191-194 cites a similar example from Uttar Pradesh.

2 Bailey, F G, "Stratagems and Spoils", Schocken Books, New York, 1969.

3 I have drawn inspiration here from Somjee, A H: Review of Bailey, F G, "Politics and Social Change: Orissa in 1959", in *Journal of Commonwealth Political Studies* 3 (1965), No 3.

6 The point of view I stress here differs from that which has so far appeared in the writings of most political scientists concerned with South Asia. Most such work (*cf* Brass, Paul "Factional Politics in an Indian State", University of California Press, Berkeley, 1965, for a brilliant example, focused upon the politics of Uttar Pradesh) takes as unit of analysis the social groups involved in politics—factions, parties, and the like—and considers the origins of these social forms as being based simply on "lasting personal enmities" between faction leaders. I feel this approach obscures the dynamics of social change in political development. Its inadequacy as an explanatory device is revealed in telling fashion when one considers that in 1967, after 15 years of opposition (as described well by Brass), Mohan Lal Gautam formed an alliance with his arch-rival C B Gupta, undermining the validity of Brass's contention that the only fixed aspect of UP politics was the immutable personal enmity between such major factional opponents.

9 "There is a...kind of group conflict in which the groups interpenetrate each other, either in physical or social space, so that there is no line boundary between them and each individual of one group tends to be in some sort of contact with individuals of the other group. This is the sort of group conflict that characterises an ecological system of competing species, where the individuals of the various species interpenetrate the space and there is no central organisation of the group. This is pure group conflict or the conflict of species; we may call it ecological conflict... we should perhaps call this competition rather than conflict, as it is not organised or conscious." Boulding, Kenneth, "Conflict and Defence", Harper and Row, New York, p 113.

10 I hope to present such material in future publications.

Trek to the Cities

ACCORDING to the UN Demographic Yearbook 1970, 34 per cent of the world's population now lives in urban areas and there are 1,784 cities with more than 100,000 inhabitants, an increase of 20 per cent in a decade. Among other facts in the Yearbook: world population increased by one billion in the last 20 years, but will grow by 1.75 billion in the coming two decades; seven nations now have a population of more than 100 million — China, USSR, USA, India, Pakistan, Indonesia and Japan; Tokyo is the largest city with 9 million inhabitants, New York and London following with 7.8 and 7.7 million respectively; 133 cities have a million or more inhabitants, 29 cities more than 10 years ago; Australia has the highest degree of urbanisation, 83.3 per cent, Burundi the least at 2.2 per cent; and Swedish men and women have the highest life expectancy, 71.9 and 76.5 years, respectively.

Scientists and Their Commitment to Organisational Goals

S P Gupta

K D Sharma

A Rahman

It is not enough for a country to pump in more monetary investment into scientific research; it must create a climate that is conducive to the flowering of creative talents. For this, scientists must be made to feel committed to organisational goals. This cannot be done just by changing the organisational system or providing more facilities.

It is necessary to study the factors that influence scientists' commitment to organisational goals. In this paper are presented the results of such a study for India.

THE goals of an organisation and the objectives it sets for its scientists and technologists are not the same as those of the profession. An industrial firm, for example, demands from its research scientists results that develop and improve its line of products. Science as a profession on the other hand demands of its practitioners that they maintain the standards of scientific ethics even in the face of contradictory demands by employers. Scientists as industrial employees are thus caught between these two cross-pressures.[1] It is, therefore, necessary that the factors that influence their commitment to organisational goals should be studied. In this paper, results of such a study for India are presented. The main characteristics of the sample analysed are given in Table 1.

The main operative variables that influence one's commitment to organisational goals studied in this paper are:

(a) recognition;
(b) professional freedom; and
(c) researcher-supervisor relationship.

Age, experience, status and place of work (i e, type of organisation) have been treated as constraints of the situation.

Recognition[2] has been by and large measured by self-evaluation by the respondents themselves. If the respondent felt that he was highly appreciated by his supervisor and given preference in authorship, it was taken to mean high recognition and otherwise he was categorised as having low recognition.

The extent of freedom in research is inferred from the extent of autonomy in selection of the project on which he was working. Like the index for recognition, index to measure the degree of freedom has also been reduced to two classes only, i e, high and low degree of freedom.

The researcher-supervisor relationship is classified as harmonious and disharmonious depending upon whether the researcher finds the supervisor (i) appreciative of the basic value of the projects and helpful in his work (harmonious); or (ii) appreciative but not helpful in his work or helpful but not appreciative or neither appreciate nor helpful (disharmonious).

Analysis and Results

Table 2 shows the inter-correlation among the various indices as defined above. It is found that three of the six possible correlations were statistically significant at or beyond the 0.001 level. All correlations were positive except for the inter-correlation between indices for freedom and researcher-supervisor relation which is negative. This indicates that to have harmonious relations with supervisor the freedom index should be low.

Secondly, commitment to the organisational goals is highly related to researcher-supervisor relation. Further, recognition has strong influence on supervisor-researcher relationship which suggests that recognition may be a factor in generating conflict in the researcher-supervisor relationship. Lastly, recognition and commitment are also significantly inter-correlated.

Organisations as an environmental constraint play an important role in determining one's commitment to organisational goals. The various types of scientific organisations in India employing scientists are: national laboratories; government-research institutes (other than national laboratories); private/industrial research institutions and universities/teaching institutions. Table 3 gives the commitment indices for each of these organisations. Each of the organisations presents a social situation and affects recognition, freedom and supervisor relationship according to its characteristics of control and administrative structure and scientific tradition.

It is apparent that for scientists working in national laboratories, government research institutions and universities/teaching institutions recognition is a strong motivating force to commit them to organisational goals. However, in private/industrial institutions scientists have high commitment to organisational goals even without recognition.

Professional freedom has no bearing on commitment to organisational goals under all forms of organisation. The researcher-supervisor relation and organisational commitment are significantly related at better than 0.0002 level for all organisations other than private/industrial research institutes. In the latter case, it is significant at 0.02 level. The results reflect that researcher-supervisor relationship is highly effective in the development of commitment to organisational goals. The more harmonious the researcher-supervisor relations, the greater is the commitment.

It has been found that under Indian conditions whatever be the organisational variation, salary is a direct indicator of the status of the scientist in the organisational hierarchy. For the purpose of analysis, status has been classified in three categories, i e, high, middle and low (Table 4).

It can be seen from Table 4 that status is positively and monotonically related to commitment. This relationship is statistically significant at 0.01 level which is consistent with Goffman's result that "low placed members tend to have less commitment and emotional attachment to the organisation than higher placed members".

Age and commitment are also positively related. The commitment in this case becomes operative through mobility. Survey indicates that mobility decreases with age. Scientists over 45 years of age are more committed to

organisational goals than the scientists in the lower age-groups (Table 4). Older scientists are likely to be in part constrained by their age, lesser mobility and imminent retirement. Secondly, it may be because they have remained so long in the group that they feel committed to it.[3] They are also probably committed to the organisations on individual grounds of their involvement in its informal group structure which gives them eminent positions in the organisational hierarchy.

How does experience influence one's commitment to organisational goals? Glasser[4] finds that scientists with high professional experience are more committed to organisational goals. The threefold classification of experience, i e, high, middle and low [see note (b) to Table 4] for the Indian situation does not seem to agree with those of Glasser. It is found (Table 4) that experience and commitment to the organisational goals are not significantly related.

In the subsequent discussion this anomalous situation is further examined with respect to other variables such as (i) organisations and (ii) recognition.

The relationship of experience and commitment to organisational goals with type of organisation is examined in Table 5. For national laboratories and universities/teaching institutions, experience is curvilinearly related to the commitment, with the lowest percentage of highly committed scientists occurring in moderate experience group (4-12 years experience).[5]

These relationships are statistically significant at .05 for national laboratories and at .10 for universities/teaching institutions. For government research institutions and private/industrial research institutions, on the other hand, experience is not significantly related with organisational commitment.

When commitment is treated as constant and experience and recognition are related, we find that the scientists with high experience and high recognition are highly committed to the organisational goals than those with low recognition and high experience. Among scientists with low experience, those with high recognition are highly committed. (Table 6). A comparison of these differences shows that the commitment of scientists with high experience to organisational goals is slightly less dependent on recognition than in case of scientists with low experience.

The survey further indicates that people with both high experience and low experience need recognition to maintain their commitment to organisational goals, but for different and diverse reasons. Those with high experience need recognition because of lack of mobility and because they have become part of the system. In the case of scientists with low experience, recognition is the means to establish them. However, the middle group, i e, with experience of 4-12 years, seems to be indifferent to recognition.

TABLE 1 : CHARACTERISTICS OF THE SAMPLE

Characteristics	Percentage	Characteristics	Percentage
I Sectors of Research		**IV Age**	
National labs	23.0	Under 25 yrs	21.7
Government research institutions	30.8	26 - 30	30.5
Private / industrial institutions	6.8	31 - 40	32.5
Universities/teaching institutions	39.0	41 - 50	11.4
Not reported cases	0.4	Over 50 yrs	3.3
		Not reported cases	0.6
Total	100.0	Total	100.0
II Fields of Research		Median age	32.1
		V Salary	
Agriculture	7.3	Below 500	56.7
Engineering	12.4	501 - 800	24.4
Medicine	7.2	801 - 1100	10.1

DISCUSSION AND CONCLUSIONS

On the one hand, the employment opportunities for scientists are limited and on the other the country expects demonstrable and tangible results from them. Moreover, science organisations in India, as well as in other developing countries, are directed to achieving the objectives of economic and social development. Therefore, the commitment of scientists in these countries to the objectives and goals of the organisation is directly related to the national objectives of economic and social development.

The importance of the present study lies in bringing to the fore certain environmental variables which can be operated to increase the scientists' commitment. Manipulation of these variables does not involve any monetary resources, but certain administrative and managerial readjustments.

Thus the study indicates that recognition is a variant of prime importance that influences one's commitment to organisational goals. In the Indian situation, even for a person with long experience and higher status, recognition is of great significance. But still there is an organisational system —

TABLE 3 : ORGANISATIONAL VARIABLES IN RELATION TO SCIENTISTS' COMMITMENT

Institution	Organisational Commitment	Recognition		Freedom		Researcher-Supervisor Relation	
		High	Low	High	Low	High	Low
National laboratories	High	93.9	87.0	89.3	91.8	94.6	81.7

the private/industrial research institution — where this recognition does not seem to be operative. This may be due to two reasons. Firstly, the major organisational goals are the direct application of research results in the actual production process of the company. Secondly, the management does not encourage its scientists to publish their research results. The secrecy of research results is an organisational constraint. Recognition under these conditions is perceived through rise in hierarchical structure and monetary gains that a committed scientist gets.

Scientists the world over emphasise the importance of freedom to work. They feel that creative faculties cannot flourish without freedom. But the study finds that "freedom" of a scientist in selection of his research work does not seem to influence his commitment to organisational goals. It is rather surprising to find that scientists should be able to maintain commitment even without freedom. It is not possible to hazard any guess about this paradoxical finding. This may probably be due to divergence in the definition of the term freedom. In the survey the main emphasis is on the freedom to select research projects whereas probably the scientist at the bench is more concerned with the freedom to attack the problem. If a scientist is free to decide the tactics, he is less bothered who takes the strategic decision of problem identification.

Experience also binds a scientist to his organisational commitment. Here again the main operative variable is recognition in the organisation. Moderately experienced scientists (i e, those in the experience range of 4-12 years) do not identify themselves with the organisation and its goals and do not see their career in terms of commitment to the organisational goals and are prepared to leave the organisation, and hence do not care for organisa-

	High %	N	Low %	N	
High	98	201	86	201	12
Moderates	93	244	87	301	6
Low	98	108	83	130	15

tional recognition. Scientists in this category gather experience as they move from organisation to organisation. As they grow old they tend to identify themselves with one organisation. At this stage they require recognition as a motivating force to commit them to organisational goals. In the case of new entrants, recognition is very important as it helps them to establish themselves.

Researcher-supervisor relationship increases commitment to organisational goals as it gives to a scientist a sense of participation in the system.

To sum up, it may be said that it is not sufficient for a country to pump in more monetary investment into scientific research. It must create a climate that is conducive for the flowering of creative talents. For this the young scientists must be made to feel committed to organisational goals. This cannot be obtained by changing the organisational system or by providing more facilities alone. It can be done by properly manipulating environmental factors such as those studied in this paper.

Criteria for Evaluation of Capital Projects

A Comment

L C Gupta

IN their article ('Criteria for Evaluation of Industrial Projects', August 28, 1971, pp M-105-114) Dave and Bhatt have raised some interesting issues which need to be given a closer look.

Minimum Rate of Return

First, as regards their method of deriving the minimum rate of return on capital. They rightly observe that, since the market rate of interest, which is regulated by the Government, may not reflect the true social cost of capital, the cut-off rate of return for evaluating industrial projects need to be fixed at a higher level. They proceed to derive the minimum rate of return from the targeted rate of growth in industrial production and the corporate propensity to save, as follows:

> From the Company Finance data published by the Reserve Bank, it is observed that roughly one-half of net cash flow, generated by the existing capital, returns in the form of gross fixed assets formation. Thus if net cash flow were 50 per cent of capital, the gross fixed asset formation would take place at the rate of 25 per cent per annum. For net capital stock to grow at the rate of 8 to 10 per cent per annum, therefore, net cash flow must be at least 15 to 20 per cent of capital. The minimum rate of return on capital, in other words, should be above 15 per cent in the Indian context.

This procedure of deriving the minimum rate of return on investment is open to several objections. First, the net cash flow has been equated here with the minimum rate of return. As ordinarily used, the term 'net cash flow' represents the cash flow generated by the operations of an enterprise, net of current expenses. (How far the netting out process is carried depends upon the objective of analysis. Interest payments and corporate taxes may or may not be netted out depending upon the objective). It is easy to convert the net profit figure to net cash flow by adding back to the former the amount provided for depreciation which is a non-cash item. Thus, cash flow is always inclusive of depreciation allowance. On the other hand, the minimum rate of return on capital has to be exclusive of depreciation. It is, therefore not correct to equate the minimum rate of return to net cash flow.

Further, the authors seem to assume that capital formation in the corporate sector would have to be wholly financed from internally generated funds. That is why, taking the corporate saving propensity to be 50 per cent they require a net cash flow of at least 15 to 20 per cent of capital in order to achieve an annual growth rate of 8 to 10 per cent in net capital stock. However, corporate growth need not be financed entirely by internal funds. In fact, over the last decade in India, the corporate sector's gross saving has financed roughly only one-half of its capital formation.

A more fundamental objection to the procedure suggested above arises from the fact that, neither the corporate saving propensity nor the targeted rate of corporate growth are directly relevant to the calculation of the minimum rate of return on *future* investment projects. The procedure in question would imply that the minimum rate of return for corporate investment projects can be derived from a few selected facts about the corporate sector, irrespective of what may be happening in the other sectors of the economy. This, however, is not so. In economics, the required rate of return is an *opportunity cost* and is wholly a question of the available investment opportunities *vis-a-vis* the available resources for the economy taken as a whole.

NPV *versus* IRR

Comparing the Net Present Value method with the Internal Rate of Return method, the authors observe:

> The basic difference between NPV and the IRR lies in the assumption regarding interest rate and the treatment of depreciation.

As regards the treatment of depreciation, they explain that, while in the case of the NPV method an allowance for depreciation calculated by the sinking fund method is "deducted before arriving at the value of the net cash flow", in the case of the IRR method, the net cash flow is defined inclusive of the allowance for depreciation.

It is submitted that there is a conceptual confusion here. The mistake lies in deducting depreciation before arriving at the value of the net cash flow for calculating NPV. It may be asserted that there is absolutely no difference between the NPV and the IRR methods in the treatment of depreciation. Under both methods, the net cash flow has to be taken inclusive of depreciation. Both methods look at *cash* flow and, it must be remembered that, depreciation is a *non-cash* item. Under both methods, depreciation is automatically taken care of because, both forms of return (i e, NPV and IRR) represent only the excess of cash inflows value over the initial capital expenditure. A deduction for depreciation from net cash flow would, therefore, amount to counting it twice. Hence, there is no question of any express provision for depreciation in NPV as well as in IRR. The figures of net cash flow for net present value, as given by the authors in columns 14-16 of Table 2 are, therefore, not correct.

The authors take an oversimplified view of the problem of evaluation in a situation of capital rationing. The solution they suggest is to rank the project according to their rates of return, and then to go on selecting the projects in the order of their ranking until all capital is exhausted. This is an oversimplified view, because it ignores altogether both the basic problem of choosing the appropriate discount rate in a situation of capital rationing and the fact that the ranking of projects is *not* independent of the discount rate selected. The authors' preference for IRR against NPV seems to arise from their oversimplified view of the problem and is contrary to the recognised theoretical superiority of NPV over IRR.

S A Dave

V V Bhatt

L C GUPTA in his Comment has raised issues which, we submit, were not adequately explained in our article. We take this opportunity to clarify and further elaborate the points that have given rise to these questions.

Minimum Rate of Return

First, the question of derivation of the minimum rate of return on capital. The rate of return (RR) as the method of computation in our article implies, is defined as the ratio of undiscounted value of net cash flow to the capital expenditure. If C=capital expenditure, and B=undiscounted value of annual net cash flow, the RR is simply $\frac{B}{C}$. The internal rate of return (IRR), on the other hand, is that rate which would give the discounted value of the stream of net cash flow to be equal to C. *In other words, the internal rate of return, r, is such that*

$$C - B\sum \frac{1}{(1+r)^n} = 0$$

where n= life of the project. If r is positive (we are interested only in positive values of r) and n sufficiently large (strictly speaking $n \to \infty$), r can be approximated by $\frac{B}{C}$. For smaller values of n, naturally, there will be some divergence between the values of IRR and RR. To illustrate, assume that capital expenditure on a project is incurred in the first year, and the capacity output is achieved from the second year. For simplicity, assume that the salvage value of capital is zero. The influence of n (years of working life of the project) on IRR and RR can be seen from the following table:

n	IRR	RR
15	15	17.28
20	15	15.98
25	15	15.47

Thus for n equal to 15 (16 years including the year of construction), difference between the IRR and RR is 2.28 for an IRR of 15.

Normally, however, the construction lag is longer and the capacity output is not reached in the very year a project is commissioned. In such cases, divergence between the IRR and RR would be still larger. Take the case of a project where capital expenditure of Rs 100 is spread over a period of three years, and the capacity output is reached in the next three years as shown in the following table:

Year	1	2	3	4	5	6-20
Capital expenditure	20	30	50	—	—	—
Net cash flow	—	—	—	0	13	23

This project is 'assumed' to have a life of 20 years with the salvage value of capital equal to zero. The IRR of the project is 15, whereas the equivalent RR is 23. In all realistic problems, an IRR equal to 15 per cent would very likely be equivalent to RR of 20 to 24 per cent.

If the rate of return is between 20 and 24 per cent, the annual rate of growth of gross capital formation, as the Company Finance data suggest, would be between 10 and 12 per cent. The rate of growth of gross fixed assets would also be the same, as long as the proportion of inventories in gross capital remains constant. If we further assume that average life of capital is 15 years with zero salvage value, the annual depreciation requirement by the sinking fund method at an IRR of 15 is two per cent of capital. Consequently, the rate of growth of net fixed assets formation would be between 8 and 10 per cent. An IRR equal to 15 per cent, therefore, is likely to yield 8 to 10 per cent rate of growth in net fixed assets formation.

The crucial assumption here is that n is sufficiently large; and this assumption, as is shown later, is the basis of our article We have explicitly suggested in our article that at least 15 years of the working life should be taken into account for project evaluation. We would like to emphasise the word *at least* and qualify that the years of working life should be years of capacity output. This certainly is a somewhat crude way of transforming more easily understandable RR into IRR; but there is only a small loss of accuracy so far as the derivation of the cut-off IRR is concerned.

We have *not* assumed that capital formation in the corporate sector would have to be entirely self-financed. In fact, only half of the net cash flow generated by the corporate sector returns in the form of gross capital formation. The other half of the net cash flow remains with the rest of the economy and depending on the saving propensities of all other recipients, (i e, government, banks, financial institutions, directors, shareholders), a part of the capital formation in other sectors might be financed out of the net cash flow generated by the corporate sector. It is true that the corporate sector does borrow from banks, financial institutions, and the household sector for the purpose of capital formation. But it also pays them, and the payments to all the recipients taken together exceed what it borrows from them.

We are interested in this article in evaluation of projects in the industrial sector. It is certainly true that, for any investment, we should examine its opportunity cost in the entire economy. We do not question this. But once certain funds are earmarked for the industrial sector there is a problem of selecting projects for the efficient utilisation of resources allocated to this sector. Our article deals only with this problem.

NPV *versus* IRR

Gupta is correct in pointing out that the cash flow for NPV and IRR should not be different and that figures in columns 14-16 in Table 2 are incorrect. Figures given in columns 11-13 would hold both for NPV and IRR.

We do not deny that, if an appropriate social rate of discount is known, we should use that rate for discounting and projects which have positive net present value should be selected. This would be the correct procedure if there were no capital rationing and each project is selected on its own merits. The 15 per cent cut-off rate suggested in our article is nothing but a rate of discount based on declared social preference for 8-10 per cent annual growth in industrial production. This is an objective of the Fourth Plan. The statement that the NPV of a project is positive at 15 per cent discount rate, or that its IRR is above 15 means exactly the same and the project would be selected on either criterion.

But the situation is different when there is capital rationing. The ranking could differ depending on whether we use NPV or IRR as the criterion. In theory, it is not difficult to devise problems where ranking according to IRR and NPV are different or even diametrically opposite. This would depend on the timing of the future stream of net cash flow and the 'assumed' life of the project. An example was given by us on page M-110. But, in reality, project life does not get over so soon. If we assume that (i) the projects under consideration will continue perpetually and that (ii) a project with an 'assumed' project life would at least earn a return equal to the IRR of the next lower ranked project till the end of the 'assumed' life of the longest lasting project, there should not be any conflict in ranking according to either criterion. The second assumption is more important when the 'assumed' lives of different projects are unequal. In the case of the first assumption we only need n to be sufficiently large.

In practice, however, a project analyst does not estimate net cash flow for a very long period because of the obvious problems of estimation. What he normally does is to truncate the net cash flow of a project at the end of the 'assumed' life and take credit for the salvage value of capital. But the salvage value of capital, and, therefore, the net cash flow during the terminal year (years, in case there was capital replacement) does not sufficiently reflect the productivity of the terminal stock of capital. If the 'assumed' life of the projects is sufficiently long, both criteria would very likely yield an identical set of ranked projects. If the 'assumed' life is short enough to give different ranking according to these two criteria, sideline considerations regarding the productivity of terminal capital stock should be taken into account. From a practical point of view, we believe that, so long as n is reasonably large (at least 15 years of working life), ranking according to IRR should be preferred. This would obviate problems associated with the estimation of the productivity of the terminal stock of capital.

PAY INCOME-TAX PROMPTLY

on NOTICE OF DEMAND

On failure to pay income-tax within the period specified in the Notice of Demand issued by the Income-tax Department, the tax can be recovered through various processes under the law.

If, on account of some genuine difficulties, it is not possible to pay the income-tax in time, then, an application may be made, within the period specified in the Notice, to the Income-tax Officer for extension of time or for instalments which he will consider on merits. Any application made after the expiry of period specified in the Notice of Demand is invalid in law and, therefore, cannot be entertained.

The First Week

THE first week of the war has unfolded largely according to expectations. Indian forces in the east have advanced as planned — the only surprise was the hasty withdrawal of the Pakistan army from Jessore — but are now bound to meet tougher opposition as they come up against the concentration of enemy forces ringed around Dacca, unless of course there is a wholesale surrender by the beleaguered West Pakistanis even if this unlikely surrender takes place, the Indian army has a delicate job ahead of it in maintaining a modicum of law and order in Bangla Desh, especially in preventing an outbreak of killings of non-Bengali civilians by aggrieved Bengalis. Plans for establishing civil rule in the liberated areas are well in hand; IAS and IPS officers are about to be seconded to Bangla Desh to smoothen the administration of a war-ravaged land.

In the west, the war has closely followed the classical pattern of 1965. The main confrontation has been in the Southern Kashmir-Punjab sector where both sides are firmly established in extremely well-entrenched defensive positions. Even the smallest offensive in positional warfare conditions involves heavy casualties. The Pakistanis have at heavy cost tried to break through our defensive network at Chhamb in order to approach the vital Jammu-Srinagar road, but have been pushed back every time. In spite of local advances into Sind from Kutch and the Jaisalmer and Barmer regions of Rajasthan, our basic interest in the west, for military as well as political reasons, is to maintain a defensive posture till Bangla Desh is totally liberated. It is only then that we will be able to agree to a cease-fire. As Pakistan has conspicuously failed to occupy any significant territory in the west, it will not readily agree to stop fighting as soon as it has lost in the east. This suggests the present war will probably go on longer than the last one, unless there are dramatic developments in the international field which lead to unexpected diplomatic and economic pressures on the two combatants.

The United States seems to have lost all semblance of serenity now that the balance of power in the subcontinent — which has so frequently been used by the big powers as an excuse for interference — is being radically altered. Economic aid, that age-old instrument for arm-twisting, has been cut off, at least for the time being. The Government of India does not seem unduly alarmed by this predictable manoeuvre, especially as it now seems to have the full backing of the Soviet Union both in and outside the UN. In the Security Council the Russians vetoed two resolutions which were not suitable to India as their accent was on a cease-fire and mutual withdrawal of troops to pre-war frontiers rather than concern for the political problem of Bangla Desh. Due to the deadlock at the Security Council, the whole question was transferred to the General Assembly where the predominant concern was to bring about peace without worrying too much about what kind of peace it would be.

As far as declarations in the UN go, the Chinese have been as concerned about the integrity of Pakistan as the United States, although the Chinese speeches have been more virulently anti-Russian than anti-Indian, in contrast to US statements which have focused on Indian 'aggression' but have been relatively silent about Soviet backing for India. While the Chinese, for the moment, may appear to be against the breakup of Pakistan it is most unlikely that they will back their words with any deeds on the Himalayan frontier. That they are taking a very long-term view of political developments within the subcontinent is substantiated in an interview with Chou En-lai before the war broke out, published in the *Sunday Times* (London) last week, where the Chinese Prime Minister's tone clearly suggests that he is thinking of a revolutionary situation developing in and around Bangla Desh in the long term: "If India should brazenly provoke a war, can it benefit from it and can the problem be solved? Once a war breaks out both sides, not just one, will incur losses. You know what our attitude will be if a war breaks out between India and Pakistan. We firmly support Pakistan against India's subversive and aggressive activities. India would *in the end* taste the bitter fruit of its own making. And from then on there would be no tranquillity on the subcontinent." (Emphasis added). It seems likely then, that once Bangla Desh becomes a reality, China will turn towards aiding potential revolutionary forces in Bangla Desh against the established Awami League government. At the same time it would try to maintain good relations with the government of the Pakistan that remains in the west. In the interim period, it might even soften its posture towards the Government of India.

US and the War

Lost Balance of Power

THE policies of the Nixon administration towards the developments in what was East Pakistan and the war between India and Pakistan have to be viewed within the framework of the concepts of balance of power which have, ever since the Second World War, exercised a dominant influence on the foreign policy of succeeding American governments. It may seem, from the considerable criticism to which it has been subjected by American political and public opinion, that the US position is the outcome of the peculiar prejudices of the present administration or even of the present President. This is not the case, however.

American policies towards South Asia have been based on the premise of the existence — and the need for maintenance — of a balance of power between India and Pakistan. Linked with this has been another sort of balance which the Americans have been trying to sustain — that between the relative influences wielded by the great powers over the South Asian region. In a report to the US Congress made in February this year on 'US Foreign Policy in the Seventies' President Nixon had defined a major objective of US policy in South Asia as being "to bring our activity [in the region] into a stable balance with that of the other major powers with interests in the area". Expanding on this, President Nixon said in the same report: "We will try to keep our activities in the area in balance with those of the other major powers concerned. The policy of the Soviet Union appears to be aimed at creating a compatible area of stability on its southern borders, and of countering Chinese communist influence. The People's Republic of China, for its part, has made a major effort to build a strong relationship with Pakistan. We will do nothing to harm legitimate Soviet and Chinese interests in the area. We are equally clear, however, that no outside power has a claim to a predominant influence, and that each can serve its own interests and the interests of South Asia best by conducting its activities in the region accordingly."

It is now possible to see why the US has reacted with such alarm to the war between India and Pakistan. The liberation of Bangla Desh by the Indian army completely upsets the so-called balance of power between India and Pakistan, such as it ever was; by emaciating Pakistan and extending India's influence to what was till now, population-wise, the bigger part of Pakistan. Further, the Soviet role in this development, according to the Americans, went way beyond "creating a compatible area of stability on (the Soviet Union's) southern borders and of countering Chinese communist influence". Also, the Soviet Union had acquired in the process "a predominant influence" in the area — something forbidden to an outside power. Soviet diplomacy in the 1965 Indo-Pak war, culminating in the Tashkent conference, did boost Soviet influence in South Asia, but this had been done within the rules of the balance of power game as envisaged by the United States. The Soviet Union had then played the role of the honest peacemaker without seriously disturbing the political status quo in the subcontinent.

The US government has alleged that the Indian intervention in Bangla Desh came at a time when secret negotiations were under way to find a political solution to the problem posed by East Bengal's demand for autonomy. It is impossible to say whether any such negotiations were in fact in progress; the Government of India as well as the leaders of the Awami League have denied knowledge of them. However, more generally speaking, the Americans were no doubt concerned about finding a solution to the problem of East Bengal's relations with Pakistan. Of course, in these efforts the dictates of preserving the balance of power between India and Pakistan by safeguarding the integrity of Pakistan predominated over the need to fulfil the just political aspirations of the people of East Bengal, but in this the Nixon administration was only following the logic of successive US administrations in underwriting manifestly repressive regimes and political arrangements to safeguard what were seen as legitimate US interests in different parts of the world.

The criticism of its policies which will hurt the Nixon administration most is not Senator Edward Kennedy's moralistic broadsides but the charge of Senator Fred Harris that "we have not saved Pakistan ... [while] we have driven [India] firmly into Soviet arms". Since there appears to be little that can be done to "save" Pakistan, the Nixon administration (or the one that replaces it next year) will now proceed to try to reduce Soviet influence over India. Therefore, those in this country who foresee hard times ahead without US succour in its various forms will not have to wait long to see their worst fears proved wrong.

Bangla Desh

Long Way to Economic Independence

IT was evident from the very start that East Bengali nationalism had a real economic content. The middle class—whose aspirations the Awami League represented and incorporated in the six points put forward as the terms for East-West Pakistan co-existence—was discontented with the growing disparity between the two wings and was aware that autonomy could yield greater economic gains to the East. It was not merely that disparities had been growing in terms of gross provincial product (GPP) but that the economic relationship between the two wings had progressively become colonial in character. Industrial development and diversification had taken place primarily in the West which, by its control of the central government managed to corner industrial growth and economic power. The East became a source of foreign exchange, through the export of jute goods, and a market for West Pakistani manufactures and investments. The autonomy sought by East Bengal was to break through this stranglehold and check the net flow of resources out of East Bengal.

Now, with liberation by the Mukti Bahini 'in concert with' the Indian armed forces apparently close at hand, Bangla Desh will soon have to face up to the tasks of realising its economic dream. That dream, as conceived by the Awami League, in any case never had much radical content. But even the more limited aims of self-determination and a maximum GNP growth may not be easily achieved. The new, emerging 'links' were outlined by Hossain Ali, the Bangla Desh envoy, early this week when he said that as the liberation of his country was completed economic collaboration with India would begin. The first task would be that of massive reconstruction of communications and industry. For that, help will primarily come from India, and from such other countries as will recognise Bangla Desh and its needs—among them Hossain Ali cited Britain whose investments in plantations are sizeable. India's investment in Bangla Desh will have been sizeable, too, by the time the war ends and India should be keen to encourage economic co-operation with Bangla Desh. Hossain Ali stated that Bangla Desh would be benefited by any kind of economic co-operation with India; it needs developmental materials like coal, cement and so many other things and Bangla Desh can give in return many items like raw jute, fish, etc.

Not long after the civil war began, there were already high-level deliberations in New Delhi in May to map out how the most could be gained from East Bengal's major curtailment of jute goods exports. By Hossain Ali's own revelations, though the Bangla Desh board of trade had asked India to purchase, through the STC, some 80,000 bales in storage in the liberated areas for re-export so that the foreign exchange could be held in credit for Bangla Desh for future use, we had legalistically refrained from doing this. After all, we had not recognised Bangla Desh. At the same time, our mills did purchase vast quantities (reportedly Rs 80 crores worth) of raw jute—at cut-rates.

Assistance for reconstruction of the Bangla Desh economy should also follow and will, no doubt, establish markets for our industries. Much of the Rs 100 crores worth of goods hitherto annually imported by Bangla Desh from West Pakistan would now be supplied from India. After Pakistan imposed quantitative import control in the early fifties and West Pakistan industry began to develop, a wide range of manufactures—cotton textiles, cement, sugar, chemicals, drugs and pharmaceuticals, salt, paper, footwear, and provisions—comprised much of East Bengal's imports from West Pakistan. These are all items that our diversified industrial base can export with ease to a ready market, and our established private industry straining to expand, can have a field day in another ready, protected market. Among the industries declared strategic since the outbreak of war is the textiles industry, to which credit has been further liberalised to step up production. There will be relief for our cement-surplus south and a strengthened case for further units in the 'deficit' north and east. In return, raw material for our jute goods and paper industries might become more readily available from Bangla Desh, and fish supplies will increase to West Bengal.

That is not all. West Pakistani investments in Bangla Desh used to yield Rs 30-40 crores annually. Indian capital, already in the collaborations business abroad, can now find a grateful recipient in Bangla Desh. Said Hossain Ali, he wished "friends would visit Bangla Desh and spend money there".

The initial flow of goods to Bangla Desh will be under Government of India 'credits'. Companies are already getting organised to take advantage of these credits and to help Bangla Desh recuperate. The process should be helped along by the Indian Administrative Service on which apparently will fall the major burden of re-installing civil administration in Bangla Desh.

United Nations

Diplomatic Failure

TWO things about the UN General Assembly resolution, calling upon India and Pakistan to cease fire and withdraw to their own territories, appear to have taken the Government of India by surprise. First, the speed with which the resolution was passed and, second, the overwhelming support which it secured. The Government had evidently expected that the General Assembly would take a few days to debate the "complex situation" by which time, it was confident, the Indian army would have more or less completed the liberation of Bangla Desh. As it happened, it took the General Assembly only a few hours to complete the debate on the motion moved by Somalia and a number of other countries and to adopt it. Similarly, while it probably did not expect to muster enough support to defeat the motion, it has come as a surprise to the Government that except the Soviet bloc countries, it got the backing of only Bhutan and Cuba. The line-up during the earlier abortive debates in the Security Council should have prepared us for some such outcome. Even so, it has not been easy for the Government to accept the fact that even countries like Yugoslavia, Ceylon, and the UAR, supported the resolution when they might have at least abstained.

The reaction in the country to the vote in the General Assembly has been, predictably, to argue on the one hand that the resolution is irrelevant and we should not allow it to interfere with whatever we are doing in Bangla Desh and on the other to question the motives of the United Nations and the countries with whose behaviour we are displeased. That the General Assembly resolution need not bother us too much may be warranted. Given the continued support of the Soviet Union, there is little danger of the UN being able to take any action to implement the resolution. At the same time, there is no gainsaying that the voting in the General Assembly was a diplomatic debacle. At the very least, it bore out the criticism that the sending out of a continuous stream of politicians on inter-continental jaunts all through the summer to explain the Indian position on the developments in Bangla Desh had been a complete waste of time, money and effort.

More serious than this, however, is the criticism of the United Nations. The petulance and self-righteousness which mark much of this criticism only serve to emphasise our diplomatic failure. It has been alleged that the overwhelming vote for the resolution was the result of pressure by the US. After being stymied by the Soviet veto in the Security Council, the US was obviously keen to push through the re-

Sachin Prize

The last date for submission of papers for the Sachin Prize, 1971, is extended to January 31, 1972.

Three annual prizes of Rs 1,000 each have been instituted by the Sameeksha Trust to perpetuate the memory of the late Sachin Chaudhuri. Prizes are to be awarded for the best paper each in Economics, Sociology and Politics. The papers must be concerned with application of theoretical concepts to interpretation and analysis of Indian situations. Authors must be persons of Indian nationality, not more than 30 years of age as on December 31, 1971.

Papers should be between 5,000 and 8,000 words, typewritten, and should be sent with two extra copies to the Editor, *Economic and Political Weekly*, Skylark, 284 Frere Road, Bombay-1.

solution in the General Assembly, but it can scarcely be argued that countries like Yugoslavia, Ceylon, the UAR as well as a number of other African and Asian nations supported the resolution only to please the United States or China. Similarly, it has been maintained that countries voted for the resolution without regard to the long chain of events, since last December's elections in Bangla Desh, which finally led to the outbreak of war between India and Pakistan. In this context it might be instructive to look back at our own record in the matter of seeing grave international issues in their proper context. How often have we, for instance, equated the presence of American troops in Vietnam with that of the forces of the National Liberation Front and demanded — in a posture of apparent impartiality — the withdrawal of *all* troops from Vietnam?

The fact is that, like us, other countries generally look at international issues in terms of their self-interest and, in these terms, it made no sense to a very large number of Asian, African, and Latin American countries to support India against Pakistan in Tuesday's vote in the General Assembly. As most countries see it, there is a war on between India and Pakistan and they voted for putting an immediate end to the fighting. The issue of the return of the refugees, vital to India, was not altogether ignored; one of the paragraphs of the resolution urges that efforts be intensified to bring about "conditions necessary for the voluntary return of the East Bengal refugees to their homes".

The United Nations has been charged also with having done nothing at all to tackle the situation created by the inflow of refugees into India and having woken up only after the outbreak of fighting between India and Pakistan. There is much substance in this criticism, but it might well be asked why India itself did not raise the issue in the UN — something which it could have done at any time during the eight months since March but which, perhaps rightly, it deliberately did not do so as to keep its option open.

On the whole, the shrillness of the criticism of the United Nations in this country on this occasion reminds one of Adlai Stevenson's statement, on behalf of the United States, after the Indian takeover of Goa and after the Soviet veto of the Western resolution on the subject that the UN was witnessing "the first act in a drama which could end with its [UN's] death".

BUSINESS

Oligopoly by Licensing

THE Government is reported to be considering permitting Tata Chemicals to further expand its soda ash capacity from 1,000 tonnes to 1,400 tonnes per day. Other reports suggest that the proposal sponsored by Saurashtra Cement and Chemical Industries of the Nanji Kalidas group has, after four years of waiting, at last come up for Cabinet approval — thanks largely, it appears, to the persistent interest shown in the proposal by the Gujarat government.

The history of licensing in the soda ash industry clearly illustrates how licensing has often encouraged the perpetuation of monopolistic situations in industries. Soda ash production increased more than five times between 1955 and 1969 and the number of units rose from two to four — Tata Chemicals, Saurashtra Chemicals (Birla), Dhrangadhra Chemicals (Sahu Jain), and another unit belonging to the EID-Parry group. The Tata and Birla units between them, however, account for 85 per cent of production.

Licensing of capacity in this industry in the Second and Third Plans bore little relationship to the Plan targets of production or capacity. At the beginning of each Plan, a great deal of capacity was licensed, in excess of the Plan targets. According to the report of the Licensing Policy Inquiry Committee, the Second Plan target of capacity was 2,53,000 tonnes, whereas the capacity actually licensed was 4,76,000 tonnes; for the Third Plan the corresponding figures were 5,30,000 tonnes and 7,05,000 tonnes. Fortunately, in the Second Plan, non-implementation of licences was just enough to make the capacity installed equal to the targeted capacity. But in the Third Plan, non-implementation was much larger, with the result that the capacity actually created was only 60 per cent of the Plan target.

Over-licensing has been a major factor responsible for non-implementation of licences in the soda ash industry, and it has acted as a barrier to the entry of new units. The risk of idle capacity is more forbidding to the new entrant than to the existing producer with an established, often diversified, production base. The new entrants with licences, therefore, hesitate to go ahead with their projects, leaving the field open for the established concerns to implement their substantial expansion licences. If there were a better balance between licensing of capacity and the Plan target and likely demand, then the new entrant to the industry would have confidence to go ahead with his project.

There are other aspects of licensing policy which have also served to perpetuate the oligopolistic structure of the soda ash industry. The Licensing Policy Committee found that, between 1956 and 1966, a number of applications for soda ash units had been rejected, mostly on the ground that there was no scope for creating further capacity in the industry. And yet the existing units belonging to the large houses of Tata, Birla, and Sahu Jain, were allowed substantial expansion of capacity from time to time. The existing producers were also permitted to expand and perpetuate their domination over the industry on the ground of their experience in the industry. This is clearly suggested by the revocation of the licence granted to a small group, Bhiwandiwala, simply on the ground that licences for additional capacity should be given to experienced producers.

The Licensing Policy Committee did not find, from the evidence available to it, that there were any strong techno-economic reasons which justified the policy of creating new capacity in soda ash only through expansion of the established units. And when techno-economic factors were advanced in support of licensing decisions, the reasoning was often completely irrelevant. To quote the Licensing Policy Committee's report: "Another case where a small party — Saurashtra Cement and Chemical Industries — was attempted to be treated unfavourably as compared to large houses — Saurashtra Chemicals (Birla) and Tata Chemicals — is in respect of soda ash. The difficulty put forward was that there was not enough limestone. All the three units were proposed to be located in Saurashtra (Gujarat), and the inadequacy of limestone deposits could have been expected to affect all the units equally."

Finally, as licensing of capacity in soda ash, like in most industries, is not done on the basis of long-term planning, the standard practice has been to license fresh capacity only after shortages appear. This has naturally weighted the scales in favour of the established units who can claim to be able to expand capacity in a shorter period of time than a new entrant to the industry.

It is against this background that Saurashtra Cement and Chemical's application for a licence for a soda ash unit becomes important. This case will be a test of whether the licensing authorities persist in the approach of preferring established units belonging to the large houses to new entrants without any technical or economic justification for doing so. Also, if along with granting a licence to Saurashtra Cement and Chemical Industries, the licensing authorities proceed to license capacity far in excess of demand (by simultaneously permitting substantial expansion of one or more of the established units) then once again, as so often in the past, the dice will be loaded against the new entrant into the industry. In the past, this policy has resulted in non-implementation of licences. This may be expected to happen again, leaving the present oligopolistic structure of the soda ash industry intact. Clearly, this would be contrary to the Government's proclaimed policies of encouraging new entrepreneurial groups and fostering competition.

Joint Ventures Abroad

Selective Study

WHEN in response to charges of malpractices levelled by the Minister for Industrial Development against Indian industrialists participating in joint ventures abroad, the Federation of Indian Chambers of Commerce and Industry announced sometime in August that it had decided to conduct a study of such ventures, it was of course not expected that FICCI would go out of its way to throw light on the nature of the malpractices or the identity of the culprits. The main allegation of the Minister was that Indian parties who had been allowed to invest in the joint ventures were not remitting to India dividends, royalties, and technical fees, earned by them.

The results of the FICCI study have now been published; as expected, the study provides little fresh information. Even if FICCI could not be expected to look too closely into the alleged leakages of foreign exchange, it should have been possible for it to give detailed information about the joint ventures which is now lacking. Only section II of the study gives some limited factual account of the joint ventures already set up. Even this is likely to be of some interest until more details are unearthed by some other official or non-official study.

The FICCI study reports that total sanctioned Indian investment in all joint ventures so far amounts to about Rs 17.8 crores of which that in projects under production and implementation comes to Rs 4.5 crores and Rs 9.8 crores, respectively. The Indian role in these ventures is confined mostly to supply of machinery and equipment and technical knowhow, all of Indian origin. The study reports that with a few exceptions, all the 28 completed projects have been in production for only about two years or less. Foreign exchange amounting to about Rs 1 crore, earned by way of dividends, fees for technical knowhow and management and royalty, has already been remitted to India. The ventures have also earned foreign exchange worth about Rs 4 crores through export of machinery, equipment and raw materials. The FICCI study is at pains to emphasise that in view of teething troubles and likely losses in the first few years of operation of industrial projects, it would be too much to expect in the short run a large inflow of foreign exchange earnings through Indian joint ventures abroad.

The study has given limited information about nearly half a dozen cases of joint ventures which have earned and remitted their earnings to India as 'illustrative examples'. It is not explained why similar details were not given for the other joint ventures which have been completed. It is possible that the new office bearers of FICCI, who are so keen to improve the 'image' of the business community, were not able to persuade the Indian partners in all these joint ventures to co-operate in the task of refuting the charges levelled against them. Not surprisingly, therefore, the FICCI president's foreword to the study report makes no mention of the Union Minister's charges which had prompted the FICCI to undertake the study.

West Bengal

Forgetting the Closed Units?

A Correspondent writes:

THE new package of incentives announced by the Government of West Bengal to attract entrepreneurs to make fresh investments in the state appears to be a not-so-clever move to cover up the Government's failure to implement the 16-point programme which the Union Minister in charge of West Bengal, S S Ray, had earlier announced with much fanfare. Ray had then promised to take over all the 356 closed industrial units in the state "free of encumbrances".

About three months have elapsed since the Minister's proclamation but so far not even one of the 16 points has been taken up for implementation. Apparently, both New Delhi with whose blessings the programme was announced, and Writers' Building in Calcutta are now visibly less enthusiastic about reopening the closed units and providing employment to the over 1.25 lakh people who have been thrown out of jobs—notwithstanding the Industrial Reconstruction Corporation of India and the amendment of the Industries (Development and Regulation) Act specifically to facilitate take over of closed and badly run units. Has Governor Dias's administration at last discovered that talking about reopening closed units is not quite the same thing as actually reopening them? Hence perhaps the attempt to divert public attention from the failure to do first things first.

The excuse till now put forward by many industrialists in West Bengal for keeping their units shut was the law and order situation. But both Minister Ray and Governor Dias have been claiming spectacular improvement in the law and order situation. And yet most of the industrial units which had been closed still remain closed. What new excuses are the Government and the industrialists going to put forward now? There are faint murmurs that many closed units are "not economically viable" and that their take-over would necessitate pumping in of very large sums of money by the Government. But was this not evident to the Government when it had announced its 16-point programme? In any case, what response can the state Government expect to its new package of incentives when hundreds of units remain closed for months and over 70 per cent of the units work below 50 per cent of their rated capacity?

Clearly, the task of industrial reconstruction in West Bengal calls for a far less simple-minded approach than that reflected in the earlier 16-point programme or in the new package programme of incentives.

"Bleak House"

I AM pleasantly surprised to discover that two of your regular correspondents are unconscious humorists in the Dickens vein. On page 158 of the MacDonald edition of the master's Bleak House" appears the following :

"Then there is my Lord Boodle, of considerable reputation with his party who has known what office is, and who tells, after dinner, that he does not see to what the present age is tending. A debate is not what a debate used to be; even a Cabinet is not what it formerly was. He perceives with astonishment, that supposing the present government to be overthrown, the limited choice in the formation of a new ministry, would lie between Lord Coodle and Sir Thomas Doodle—supposing it impossible for the Duke of Foodle to act with Goodle, which may be assumed to be the case in consequence of the breach arising out of that affair with Hoodle. Then, giving the Home Department and the Leadership of the House to Joodle, the Exchequer to Koodle, the Colonies to Loodle and the Foreign Office to Moodle, what are you going to do with Noodle? You can't offer him the Presidency of the Council; that is reserved for Poodle. You can't put him in the Woods and Forests; that is hardly good enough for Quoodle. What follows ? That the country is shipwrecked, lost, and gone to pieces, because you can't provide for Noodle."

While Romesh Thapar operates at this elevated level, Mohit Sen works lower down among the people and the parties, as Dickens suggests in the next paragraph:

"On the other hand, the Right Honourable William Buffy, MP, contends across the table with someone else, that the shipwreck of the country—about which there is no doubt; it is only the manner of it that is in question—is attributable to Cuffy. If you had done with Cuffy what you ought to have done when he first came into Parliament, and had prevented him from going over to Duffy, you would have got him into alliance with Fuffy, you would have with you the weight attaching as a smart debater to Guffy, you would have brought to bear upon the elections the wealth of Huffy, you would have got in for three counties Juffy, Kuffy, and Luffy, and you would have strengthened your administration by the official knowledge and business habits of Muffy. All this, instead of being as you now are, dependent on the mere caprice of Puffy!"

I cannot pretend to the learning of Romesh Thapar or of Mohit Sen, but I hope that they will eventually discover that behind the alienated shadows that they see, behind the reified fantasy that they watch, behind the fetishistic mumbo-jumbo that they purvey, stand the Indian masses at labour. No amount of smart surveys by Thapar and Sen will be able to convey the agonised cry of the landless labourer, or the painful poverty of the city slumdweller. Now, as 136 years ago, "the bones of the cotton-weavers lie bleaching the plains of India".

VINAYAK PUROHIT

Forward Trading

IN his comment on forward trading ("More Senseless Curbs", November 13, p 2296) your correspondent seems to give the impression that non-transferable specific delivery (NTSD) contracts have some relationship with futures markets. While in India Government has assumed powers under the Forward Contracts (Regulation) Act, 1952, to regulate NTSD contracts along with futures contracts, nowhere else in the world are NTSD contracts subject to such regulations. By definition, an NTSD contract is any genuine contract for purchase of an article where delivery or payment is made after 11 days. It is, therefore, a contract under which genuine delivery transactions take place day to day at all levels of trading in all commodities.

No industry can plan smooth flow of its raw material requirements except through orders on suppliers sufficiently in advance to take care of the time needed for getting such raw materials ready and transporting them to the factory. Payment usually takes its own time in negotiating documents through banks. Even the small retailer providing credit to its regular customer and quoting payment at intervals is using NTSD contracts. Hospitals, hotels, canteens, etc, purchase cereals, pulses, groundnut oil, etc, on annual contract basis which are all NTSD contracts. It is impossible to ensure that in all these cases both delivery and payment can be completed within 11 days as the ban on NTSD provides.

In this sense the ban on NTSD in cereals, pulses, dals and now groundnut and groundnut oil becomes as unrealistic as would be a ban on knives just because of their use in many cases of homicide.

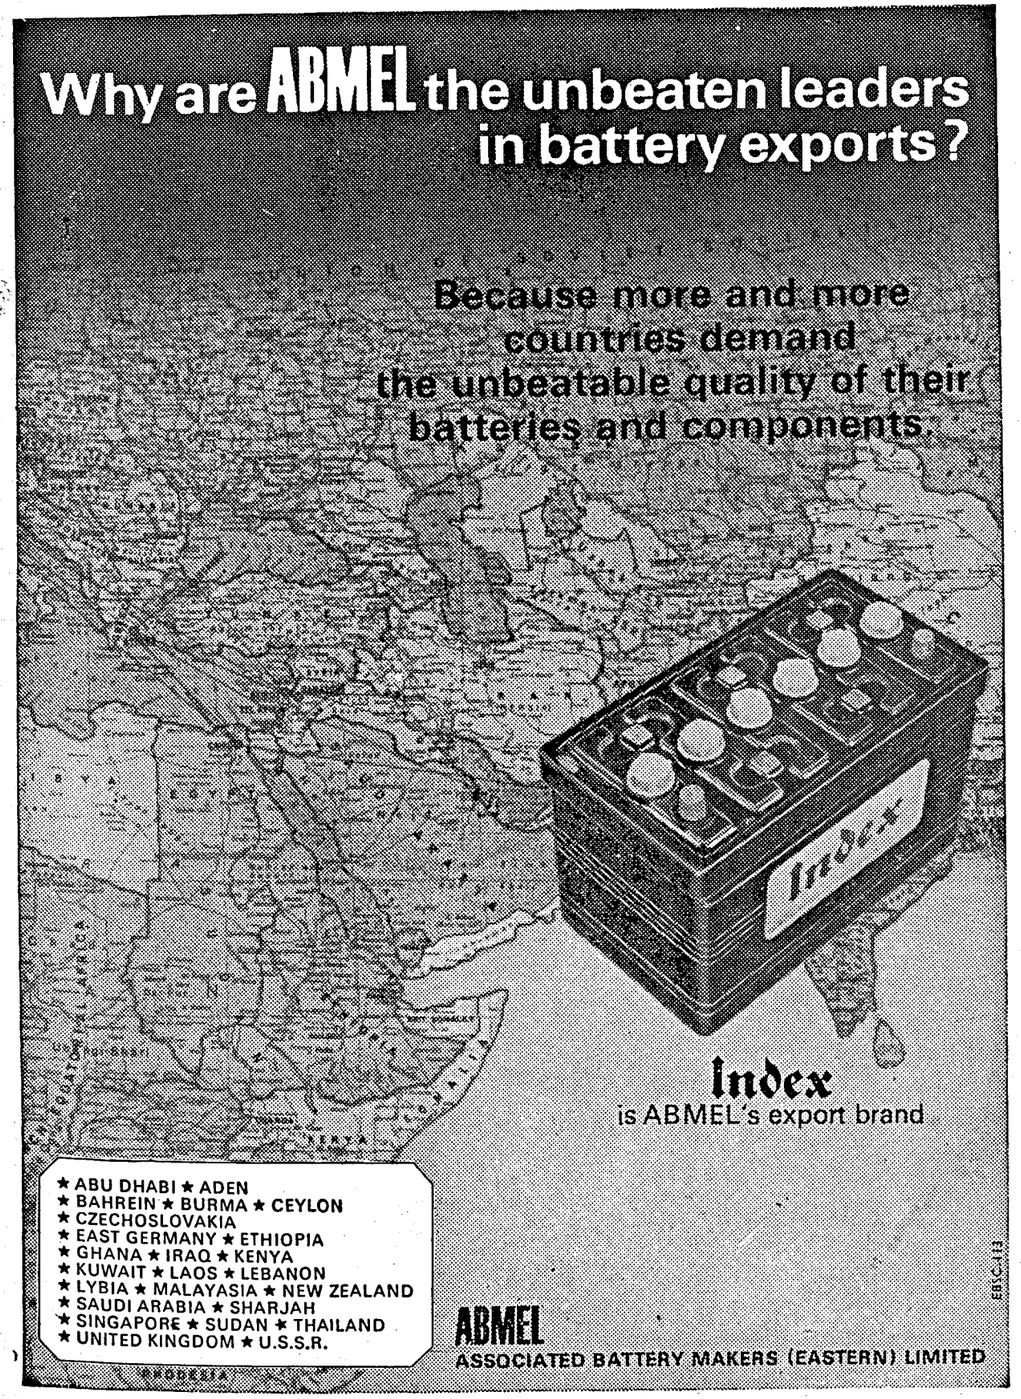
SARDAR PATEL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

has vacancies in the following grades : (a) ECONOMIST Rs. 700-50-1100-75-1400 : A good Master's degree in Economics with five years' experience and published work or Ph.D. in Economics with three years' experience essential. Specialisation in one of the following areas desirable : Agricultural Economics, Econometrics, Industrial Economics, Labour Economics, Monetary Economics and Regional Economics. (b) RESEARCH ASSISTANTS : Rs. 300-25-600 : A good Master's degree in Economics and/or Statistics. The posts carry D.A., H.R.A. and C.C.A., and P.F. benefits as per rules of the Institute. Apply with full particulars to the Director, Sardar Patel Institute of Economic and Social Research, Sheth Mangaldas Marg, Ahmedabad-6, by December 25, 1971.

Rising 'Costs', Yet Expanding

Hansavivek

ANDHRA PRADESH PAPER has received 'letter of intent' for expansion by 15,000 tonnes per annum under the 'crash programme'. Applications to the financial institutions for foreign exchange and rupee loans are being submitted. With a substantial increase in production, from 36,907 tonnes to 51,179 tonnes, following installation of balancing equipment, net sales advanced 48 per cent to Rs 9.60 crores and gross profit turned out to be two-and-a-half fold at Rs 2.01 crores. Of this, Rs 1.53 crores were provided for arrears of depreciation for the two years ended June 1970. Depreciation amounting to Rs 1 crore for the latest completed year has not been provided for. There are also arrears of dividend on cumulative preference shares of about Rs 42 lakhs. The profit figures have been arrived at after providing for sole selling agents' and selling agents' commission of Rs 13 lakhs (Rs 9 lakhs). G D Somani, a director, is interested in one of the sole selling agents, Sanjay and Company, as his relatives are partners in that firm. Placid of Calcutta and Thakkar and Company of Bombay are also sole selling agents. Somani and Company Private is the proprietor of the latter firm. It is stated that none of the directors has any interest in the resolution, proposing certain variations in their agents' territories. The company is seeking additional forest ranges from the state government to augment the supply of raw materials as owing to flowering in some of the forest ranges the supply of bamboo has depleted. A nursery for fast growing species of wood has been set up by the company. The company complains that there has been continuous increase in the cost of raw materials, chemicals, coal, and stores. Also, power tariff rose from Rs 400 to Rs 525 KVA.



SPENCER AND COMPANY is paying increasing attention to the hotel business and expects to derive benefit from suspension of prohibition in Tamil Nadu which should give fillip to sales at the Connemara Hotel in Madras and the Savoy Hotel in Ootacamund. A renovation and improvement programme at Connemara is being implemented in phases. At West End Hotel, Bangalore, some new construction was completed last year. General improvements are planned to provide for suitable additional amenities. The pharmaceutical division has provided additional facilities for distribution of pharmaceutical products through various depots located in different parts of the country. The company has also acquired, in certain areas, distribution rights for other well

known products. With the manufacture of expensive and quality cigars becoming uneconomic, the company has concentrated on improving sales of cheaper varieties. Rob Roy Tea estate produced 'reasonable' results despite a decline in crop from 2,45,478 kg to 2,24,720 kg. This was because the average auction price increased over the year from Rs 5.31 to Rs 5.59 per kg. Spencer's 1970-71 results showed sizeable decline in margins, with a slight shading of gross profit despite increase in net sales..

WEST COAST PAPER has received balancing equipment, but is awaiting some indigenous equipment to carry out the erection work. The delay in supply of indigenous equipment has upset the company's schedule. Meanwhile, the company's application to increase capacity by 15,000 tonnes per annum under a 'crash programme' has been approved in principle by the licensing committee. Industrial and import licences are awaited. The company's application for additional areas of bamboo on a permanent lease basis has been approved by the Mysore government. The plantation programme of fast-growing species of wood and bamboo is also being continued. During 1970-71, production increased from 41,100 tonnes to 42,651 tonnes and despatches from 41,004 tonnes to 42,176 tonnes. While net turnover was up by Rs 60 lakhs at Rs 813 lakhs, gross profit was only a shade better at Rs 202 lakhs (Rs 201 lakhs). The shrinkage of margins was attributed to increase in prices of raw materials, chemicals, stores, etc.

SPECIAL STEELS has diversified its production into more sophisticated wires, such as fine wires, alloy steel wires for ball bearing and for other specialised industries, stainless steel wire, and tyre bead wires. The company has also entered into a technical collaboration agreement with Suzuki Metal Industry of Japan with a view to improving the quality of specialised products to bring them on par with international standards. During its thirteenth year, ended June last, the company faced "serious difficulties" in obtaining the raw materials, particularly mild steel wire rods for which it depends almost entirely on the Bhilai steel plant of Hindustan Steel. Imports of all categories of wire rods is canalised through HSL, and the company has to obtain its requirements of high carbon and alloy steel wire rods through it. The company should be able to maintain the tempo of production if canalisation does not result in due delays and administrative difficulties. In spite of difficulties in obtaining the raw material supplies, SSL produced good results last year with substantial increases in sales and gross profit. The profit figure has been arrived at after debiting to the profit-and-loss account the entire amount of about Rs 16 lakhs which is actually payable by instalments to Suzuki by way of technical service fees and has been guaranteed by a bank. Since the tax liability has taken Rs 39 lakhs more than in the preceding year, net profit is lower. Even so, the dividend, stepped up 3 points to 15 per cent, is still very adequately covered by earnings. Actual production during the year was 40,416 tonnes (excluding processing of 2,756 tonnes of outside parties), against the installed capacity of 50,000 tonnes. With improvement in raw-material supplies, the company should be able to produce still better results.

FROM OUR CORRESPONDENTS

Soviet Union and the War

(From a Special Correspondent)

THE difference in the Soviet Union's attitude to the present war between India and Pakistan from that to the war in 1965 is truly remarkable.

In a letter to the late Lal Bahadur Shastri, then Prime Minister, dated September 4, 1965, four days after the fighting had started, Soviet Prime Minister Kosygin had taken the position that hostilities between the two countries "only play into the hands of those external forces which try to split and set at loggerheads States which have freed themselves from the colonial yoke, forces which are interested in weakening the unity of Afro-Asian countries" and had demanded that "the main efforts should be concentrated on the immediate termination of military operations". The Soviet Union later enthusiastically supported the Security Council resolution calling upon India and Pakistan to cease fire and withdraw troops, passed on September 20.

This time the Soviet attitude has been completely different. In the Security Council it has used its veto powers to defeat successive resolutions calling upon India and Pakistan to cease fire and withdraw troops. It also led the opposition to the similar, but successful, General Assembly resolution. In the debates in the Security Council and the General Assembly the Soviet position has been that a cease-fire and withdrawal of troops would be untenable without prior effort to tackle the root causes of the present war. Consistent with this, the Soviet Union has opposed "intervention by external forces" to arrange a cease-fire.

The reasons for the sea change in the Soviet Union's position have to be sought partly in the difference in the political and military situation in the subcontinent today from what it was six years ago and partly in the Soviet Union's own vastly changed relations with India. To take the first set of reasons. Among the big powers, the Soviet Union appears to have been among the first to conclude, after the brutality of the Pakistani army crack-down in East Bengal had come to light fully, that Pakistan as it had existed till then was finished; that *de facto*, if not *de jure*, West Pakistan and East Bengal no longer constituted parts of the same country; that while the West Pakistani army might be able to hold on to East Bengal for a while, the political bonds between the two parts of Pakistan had been irreparably snapped. The Soviet Union seems to have come to the conclusion, at a fairly early stage, that those who were working for the preservation of the old Pakistan were working against the basic political forces operating in East Bengal. So it decided that it did not want to be on the wrong side of the dividing line, especially as this did not suit its own other strategic considerations.

Fuller Appreciation

At the same time, having recently become the major supplier of arms to India, the Soviet Union evidently had a much better and surer idea of the relative superiority of all branches of the Indian armed forces over those of Pakistan, an appreciation which was not fully brought out by the conventional inventories of armed personnel and military materiel. For instance, the conventional comparisons in terms of the number of tanks and planes possessed by either country certainly did not prepare any one for the kind of action carried out by the Indian Navy which resulted

in the destruction of two Pakistan destroyers at the mouth of Karachi harbour.

On the basis of the above two considerations the Soviet Union appears to have concluded first, that any action that India might take in East Bengal would only hasten what was in any case inevitable—the detachment of the eastern wing of Pakistan from the western wing—and, second, that India had the military capability to contain any retaliatory action that Pakistan might take along the western border between the two countries.

Even more important than the Soviet Union's assessment of the political and military realities of the situation has been the sea change that has taken place in the Soviet Union's relations with, and stake in, India since the last Indo-Pakistan war. Soviet military assistance to India began in the wake of the India-China hostilities in 1962. But while the Soviet support at that time was enthusiastically welcomed by the Government and people of India, Soviet influence in this country was still an uncertain quantity when war broke out between India and Pakistan in 1965. Not only was there a measure of unavoidable political uncertainty in India after Nehru's death, but there were also apprehensions of a 'rightward' turn in the country's domestic and international policies under the late Lal Bahadur Shastri. It was, therefore, necessary for the Soviet Union in 1965 to proceed with the utmost caution while playing the role of the impartial peacekeeper.

Tashkent Approach Abandoned

The Soviet Union's success in arranging the peace settlement of Tashkent was a major breakthrough in its relations with the subcontinent. Initially, it gave the impression of trying to improve relations equally with both India and Pakistan. But subsequent events in India and Pakistan made it possible for the Soviet Union to abandon this approach and to increase its influence over India to a far greater extent than the Soviet Union must have considered possible at the time of the Tashkent conference. Important among these events were the political upheaval in the country leading to, and following, the split in the ruling Congress party and the marked 'leftward' shift in the tone of the government's policies under the present Prime Minister. The overwhelming majority won by the Prime Minister in the March elections to the Lok Sabha gave the Soviet Union much-needed confidence about the stability of its position in India. In sum, in India the Soviet Union was on the side of a leader whose popularity among the people of the country had been established beyond question and who heads a government which is politically stable and is committed to policies considered generally progressive.

By contrast, in Pakistan the political situation had undergone a debacle. There was the overthrow of Ayub Khan, the manifest political disaffection not only in East Bengal but also in some of the provinces of the West and, more recently, Yahya Khan's bungling efforts to return the country to civilian rule. Even in the eyes of the Western aid-givers Pakistan ceased, in the late sixties, to be one of the model developing countries. There was, therefore, no longer any question of the Soviet Union wanting, or needing, to be equally friendly with India and Pakistan. The Treaty of Friendship with India signed in August formalised the Soviet Union's special relationship with this country.

Ensuring Political Stability

The Soviet Union's attitude to the current India-Pakistan conflict has to be viewed in this context. This does not mean that the Soviet Union is averse to a cease-fire or that it underwrites every action of the Indian Government. What it does mean is that it will not accept any solution to the conflict which is likely in any way to threaten political stability in India. The Soviet Union has wholly accepted the Government of India's position that the presence of the nearly 10 million refugees from East Bengal in India constitutes a disruptive burden on the country's economy apart from also being a more direct threat to the political stability of the country's sensitive eastern states. The Soviet Union must therefore insist that any solution must ensure the return of the refugees. Also, the Soviet Union cannot lend its support to any solution which might appear to the Indian people as a political or a military setback for their government. Since the Government of India has taken the initiative to recognise Bangla Desh as an independent nation, this position will be sustained by the Soviet Union, irrespective of whether or not it itself recognises the Bangla Desh government immediately.

As the Soviet Union sees it, its present happy relations with India will be imperilled not so much by any sudden change for the better in India's relations with the United States or China but by anything which makes for the disturbance of the political stability of this country. The Soviet Union must be aware of the economic difficulties facing India, which are certain to be aggravated by the present war. Any assistance that the Government of India is able to secure from any source for shoring up the economy will be, therefore, basically in the Soviet Union's long-term interest. From that point of view, the Soviet Union can have no serious objections to efforts by the Government of India, once the dust of war settles down, to mend its fences with the United States and to secure the restoration of US economic assistance, for the moment partially suspended.

ECONOMICS

SIMON KUZNETS

Economic Growth of Nations

Total Output and Production Structure

In his new book Professor Simon Kuznets, who has been awarded the 1971 Nobel Prize for Economics, summarizes some of the results of his studies of the economic growth of nations in modern times. He reviews long-term trends in growth of total output and in changes in production structure. He covers a variety of countries, suggesting general characteristics and noting the limits within which they hold. He also provides comparisons between the economically developed and the less developed countries.

Chile and the Lessons of Legal Socialism

Pradip Krishen

IF Indira Gandhi's margin of electoral success appears astounding in retrospect, it is largely because the massive measure of faith extended to a repentant bourgeois-nationalist regime, reaffirming 'socialism', appears irrational. Whether the electorate is seen as peculiarly gullible or merely as naive in its weakness for symbolic programmatic commitment, there is still room for explaining the credibility of a promise of change within the lumbered structure of Indian government. In this context, it is pertinent to ask how far is it likely that the ostensibly left-wing tone of Congress(R) politics will ring untrue? How far, indeed will the phenomenon of 'legal socialism' emerge as a tenable idea?

One does not have to course very far to see that the notion of a peaceful transition to socialism is emerging as a recurrent paradigm in the third world — I have chosen to discuss the situations in Chile, Ceylon and India in their broadest implications. The last two mentioned, despite the tempting analogy with the transfer of power to social democracy, are yet seen as unique in the particularity of their underdevelopment, and consequently, in the absence of powerful trade-unionism as a base for government. To 'genuine' socialists, the asimilarity may even be welcome, if the disappointing record of British Labour governments and the economistic drift of German social democracy in their most promising periods are recalled.

The Chilean Unidad Popular (Popular Unity), on the other hand, is not readily appreciable as new because of its superficial resemblance to the Popular Fronts of the 1930s in Europe. The real difference between the two, however, recognises that the Chilean electoral alliance is rooted in less transient immediate objectives than the turning back of fascism, and in contrast to the academic perspective of middle-class radicalism in the 30s, is dominated by two working-class parties of revolutionary Marxists. Salvador Allende's situation is thus unprecedented: it is not a government of anti-fascist union, in composition it is considerably more than social democratic, yet stops short of being a people's democracy or of being a euphemism for Soviet orthodoxy. If this is not seen as being far ahead of parliamentary socialism, it is because firstly, as in India and Ceylon, there is an insurrectionary pressure group (MIR — Movement of the Revolutionary Left) waiting in the wings and firmly to the left of the Unidad Popular (UP) and secondly, because of the constraints of constitutionality itself — the very plane that revolutionary Marxism would wish to transcend. There is thus a basic similarity between the three countries on the level of political latitude for manoeuvre — it is arguable that the experience of any one of them in translating policy into an achievement of meaningful change will have an important bearing on the nature of the experiment itself.

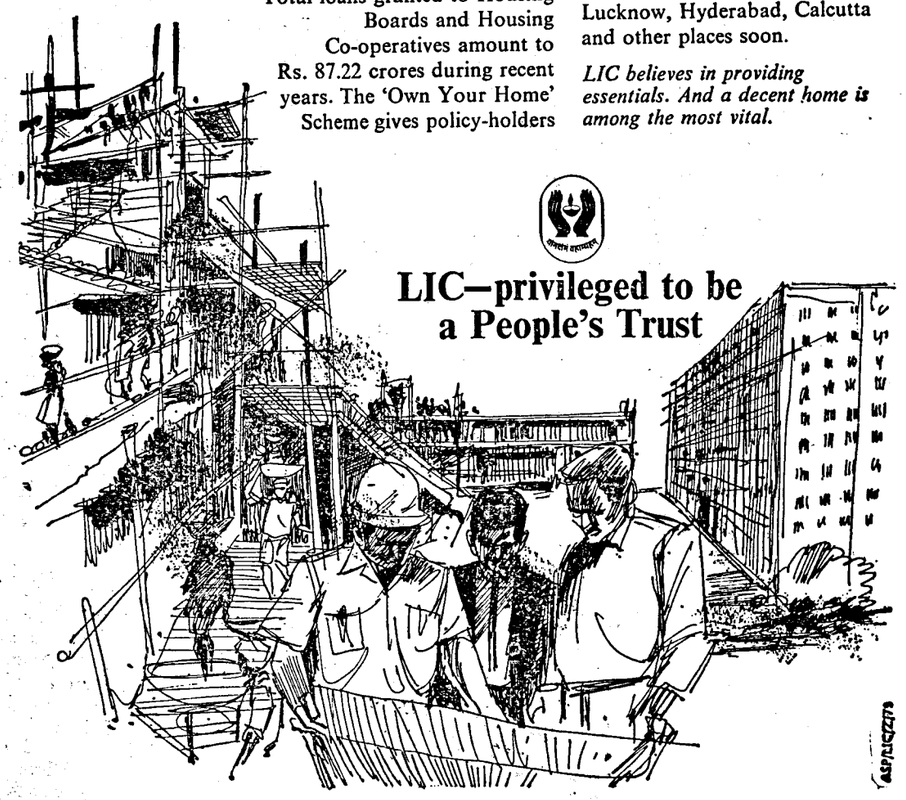
Inherited Constraints

Because legal socialism, as a political genre, evolves within or about an existing constitutional armature, it is bound sooner or later to experience a degree of constraint by its inheritance. The extent to which Indira Gandhi is constricted by a legal system based on property is evident enough. Sirimavo Bandaranaike's new constitution, too, has been framed acutely aware that the Westminster-style document it succeeds gave a certain entrenched status to the right-wing United National Party, and also aware that Ivor Jennings and D S Senanayake are uncongenial fathers of the nation's legal guidelines. Her own version thus incorporates socialistic symbols such as the principle of public sector predominance and the idea of a single Popular Assembly. Allende's 'shackling' has been more difficult to readjust, in that he has had to formally guarantee the survival of the democratic regime as the price of being allowed to take office. With the UP's slim plurality in the face of a Congress controlled by his opponents, his power to ask for a show of plebiscitory loyalty is an unpredictable device that only theoretically balances the fact of parliamentary opposition. Allende's response has been a virtuous avowal of legality. Institutionally, he will function through a unicameral legislature, but he has been careful to dissociate its judicial trappings from bourgeois democracy. In other words, there will be legality, but as the Presidential message to Congress in May 1971 iterated, "this is no mere formal compromise ... but the explicit recognition that the principle of legality and the institutional order are consubstantial with the Socialist regime". Again, "there will be legality, yes, but not one reflecting the requirements of a capitalistic system. The judicial norms will reflect the requirements of a people straining to build a new society."

In many ways, for those schooled on the rigidly dichotomous solutions employed in the third world, there is something disturbingly anomalous in such a pattern of government posing as socialist. Operating through undynamic processes, such regimes, it is felt, must eventually provoke the kind of grass-roots left-wing insurrection that surprised Ceylon earlier this year. Orthodox finger-wagging, where it does not question the *bona fides* of professedly leftist parties, points to the inherent inability of such regimes to create a climate for radical change. In Chile, for instance, the charge could be translated into specific terms of seeing the UP land reform programme as one that has merely accelerated the previous Christian Democratic trend, as it happens, not with much success. In addition to gradualism, there is the feeling that a parliamentary party, by its very nature, is unable to propagate a policy of frugality and asceticism that a state of underdevelopment, rapid progress and initial travail demnad. The explicit comparison is with Cuba and China. In practice, the charge is serious and means that having to present itself at free elections, the range and scope of governmental policy cannot but be severely circumscribed and geared to producing short-term and spectacular results. Thus, the Chilean Presidency takes the lamentable though necessary

There is a shortage of 82 million houses in India

LIC is building homes- doing what is most needed today



A growing population, a growing gap in housing. LIC has already invested over Rs. 300 crores in housing loans.

Loans to State Governments have financed housing schemes all over the country, in cities, towns, industrial townships.

Total loans granted to Housing Boards and Housing Co-operatives amount to Rs. 87.22 crores during recent years. The 'Own Your Home' Scheme gives policy-holders an opportunity to build their own homes.

A new venture by LIC is the Township started at Borivli, Bombay, which will provide for 4,000 flats. This is the first of the model townships that LIC plans to build and would be followed up at Bangalore, Lucknow, Hyderabad, Calcutta and other places soon.

LIC believes in providing essentials. And a decent home is among the most vital.

LIC—privileged to be a People's Trust

view that during its term of office, heavy industrialisation and the development of an economic base must be subordinated to the immediate and more visible goal of the production of consumer goods. Whether the indulgence of a consumer fetish will, in fact, provide adequate support to a government of legal revolutionaries, is too dependent on other issues to be clear at this moment. But the compromise is viewed as one that stems logically from the nature of the electoral process. As far as the pursuance of goals unadulterated by political expediency is viable, it is certain that parliamentary socialism cannot accommodate such a process.

Legal Legerdemain

Meanwhile, the "tactics of legality" have been put to individual use in Chile. Unlike India and Ceylon, where sheer parliamentary consensus enables the governments to forge legal implements to suit its own ends, Chilean socialism is not blessed with an amenable assembly. Allende has been forced to ferret out laws useful to his purpose from among the 17,000 or so valid laws with which his office is provided. Notably, he has made use of an unrepealed decree of the fortnight-long Socialist Republic of 1932, that empowers the government to appropriate any factory or industry that "fails to supply the people" with its goods and services. Ensuring that this precondition is met, has been achieved by the simple device of having the workers occupy the necessary factories to halt production. If one is initially impressed by this piece of legal legerdemain, however, it is balanced by the observation that the new or anticipated lineaments of the Chilean economy are not in bold contrast to conditions that antedated it. Before Allende, the economy was already theoretically dominated by a public sector which provided 70 per cent of all investment and was engaged upon "some drastic interference with domestic and foreign private property." A similarly unnoticeable chiaroscuro emerges if past and present Indian and Ceylonese economies are compared. Ceylon, with its colonial dependence on the afternoon whims of British tea-drinkers, and the 'twice-born-ness' of Indian Socialism, with its connotation of a second initiation and the higher castes, both seem little more than conscience-stricken programmes of gradual change, dependent on continued popular support.

This raises the other fact of crucial importance to parliamentary socialism — the 'quality' of its support. Subject by their own acquiesence, as they are, to indictment or removal at the polls, it matters not a little that such regimes should rationalise their electoral basis in a section of the people. Consonant with the ethical desire to root out economic exploitation for its own sake, is the need to identify with the interests of this exploited class whose interests they claim to represent. Failing this, as I have implied, the fact of intermittent socialist governments does not make for any more than didactic rule 'on authority', or perhaps, even an attempt to pre-empt genuine revolution. Insofar as this is an analysable quality, it seems that in all three countries there is a significant section of the poor that is either hostile to or uncultivated by the governments. Allende's support comes from a solid stratum of industrial and urban workers, especially the miners and labour unions; large enough, perhaps, as a base for government, but nevertheless a minority. The Chilean countryside (30 per cent of the population), the white-collar workers and public employees are either pitted against Allende or remain unconvinced that socialism will last or recur frequently enough. The most vulnerable spot in Allende's popular posture, however, is an unwieldy mass consisting of miscellaneous and unclassified "pobledores", often regarded as a marginal entity. It is perhaps correct to see them as a difficult group to assimilate, but they are marked out as a vital section by the fact of their being a favourite stomping-ground for demagogic right-wing politicians.

Judging by the municipal elections earlier this year, the Unidad Popular is still far from having made inroads into the traditional voting pattern of this group. And that Ceylon's indigenous "pobledores" can be belligerently inclined towards the government was witnessed during the large-scale violence in April. In India, even if the helicopters lent to Ceylon are not taken as an indication of Indira Gandhi's natural proclivities, there is little to hide the fact of agrarian discontent in some areas, which if easily explained by the absence of land reform, is nonetheless significant. Extrapolating from this pattern, only the broadest generalisation can be ventured: that a combination of parliamentary socialism and underdevelopment, in its affirmation of a progressive urban political culture, is likely to leave the peasantry prone to general discontent, perhaps to significant hostility.

There remains an assessment of the likelihood of the regimes in question realising their own ends, and here it will be necessary to dissolve the generalisation into its component specificities. Allende has often said that there is no socialist system appropriate for Chile to copy. What he probably means is that the Vietnamese or Chinese exemplar is not easily transplanted in a Chile where it is at least possible to discern the lineaments of political situations that could occur in industrialised societies, with a similar complement of strategies and problems. This is immediately clear when it is remembered that Allende's support is primarily proletarian. Chile's problems are thus more easily comprehended on its own terms. So far, the Unidad Popular's domestic economic policy has been innovatory and spectacularly successful. Yet, already there are ominous auguries for the government's popularity in 1972, when the international price of copper is expected to drop, with calamitous results for Chile's food procurement programme. These problems may be overcome by 1973, but the intervening year will be difficult and crucial. Surely it is a tragic commentary on the parliamentary system that the electoral popularity of domestic reaction should be bolstered by the USA's willingness or unwillingness to buy copper. On the credit side, it is significant that the UP is based firmly on the working-class, and is not primarily inspired by nationalism or 'modernisation' *per se*, but by the emancipation of the exploited and poor. However, it is difficult to escape the conclusion that so far, the party has not been taken beyond the boundaries of socialist reform.

Strategic Avenues

Ceylonese socialism, like the Chilean, is likewise dependent on economic performance criteria that are bedevilled by the vagaries of a single export commodity. If the world market in tea drops (as it has already shown signs of doing), it is simply possible that parliamentary socialism will disappear as a political alternative, to be replaced either by non-accountable socialism or a regime that comes to power on its electoral ashes. The strategic avenues open, seem limited to the simple economic determinism that envisages a perpetuation of socialism by eroding the economic bases of the bourgeoisie so that it cannot return. The forms that such thinking have taken are familiar enough.

Seen in the light of the Chinese Revolution, India and Ceylon would seem to be more eligible for a brand

of rural revolution than, say, Chile. But it is less in context to speculate on the variety or justice of possible models than to take cognisance of the strengths and weaknesses of the present regimes. It is true that the Indian and Ceylonese governments are far from being formed by working-class parties, yet it is somehow a measure of their contemporaneity—no more—that Russia and China have been led to recognise the specificity of post-colonial bourgeois governments. The Russian notion, formulated at the Twentieth Congress, attributing a genuine progressive nature to such regimes, is well known and, broadly, still adhered to. Implicit in their postulation is the idea that the contradictions between the national bourgeoisie of newly independent states and imperialism are infinitely more profound than that between the former and the peasantry or proletariat. Thus, Russian collaboration with the national bourgeoisie can be lasting and sincere throughout the period during which imperialism exists, to the extent that the problems are envisaged primarily in terms of national interest. The Chinese have never been this explicit, though their strategic intent is open to a more flexible interpretation than their official pronouncements. Without raising the whole issue, it is enough to suggest that Mao's relations with states such as Burma (till 1967), Cambodia (till Lon Nol), Afghanistan, Pakistan and Tanzania are not simply *realpolitik*, but reflect the contradiction between internal and external criteria of what is 'progressive'. In Mao's eyes, it stands that any government consciously or unconsciously opposing imperialism, is objectively playing a revolutionary role on the world scene.

On a less abstract plane, it is perhaps facile to sum up by saying that Allende's chances of survival are slim merely because he has the slenderer parliamentary majority. But on a more meaningful level, it emerges as crucial for this type of regime to initiate and maintain a conversation with the unorganised poor between elections, so that the latter are more involved, and the former more present as a government. What is at stake is not a method of government or a campaigning pitch, but a style of politics. Thereby, though far from revolutionary, such a government will stake a claim to a relatively more meaningful leftist status. Other questions pertaining to India and Ceylon, such as—Can socialism ever be achieved in an agricultural economy that is dependent on outside influences? Can the changes that development requires be produced fast enough in this manner?—remain sceptically posed.

Problem of Refugees from East Bengal

P N Luthra

MIGRATIONS of uprooted humanity have taken place in very early times in the history of man. Records show that the Roman Empire received many waves of refugees from North and East. Amongst the countless refugee tragedies, there were the Jews of the Dispersion, the Armenian refugees from the Ottoman Empire and the Russian Whites who migrated after the 1917 Revolution. More latterly, we have the case of Spanish Republicans who fled to France in 1939 and the Germans and Austrians — mainly Jews — who escaped from Nazi rule. In the Middle East there exist today Palestine Arabs and in the Far East refugees from the mainland of China and the two halves of Korea and Vietnam. The two world wars saw vast movements of population and, in fact, the twentieth century has come to be called the century of the uprooted. A former United Nations High Commissioner for Refugees, Hauven, has said:

"Persecution and fear chased thousands of people from their homes and sent them across the border of their Fatherlands walking into an unknown and uncertain future."

However poignant the records of refugee tragedies have been, none of them come to the level of what the world has witnessed in the way of the refugee influx which started on the fatal day of March 26, 1971 from East Bengal. Its number has surpassed any other displacement from a single country. The nature and magnitude of this influx is unique in history.

Refugee Influx

In the brief span of seven months upto the end of October 1971, the influx from East Bengal has been of the order of 9.5 million. Four states in the neighbourhood of East Bengal have received refugees as shown in the following statement:

West Bengal	:	7.1 million	76%
Tripura	:	1.4 million	15%
Meghalaya	:	0.7 million	6%
Assam	:	0.3 million	3%
Total Influx	:	9.5 million	100%

The daily rate of influx has varied during the preceding months. It was as high as 102,000 persons per day in the month of May; in June it was 68,000 and in April 57,000 per day. Calculations indicate that, on an average, some 1,600 refugees have been entering India every hour round the clock.

The influx continues unabated till today although it has now come down to some 7,000 per day. But let it be made clear that any diminution in the rate of influx does not reflect that there is any return to normalcy in East Bengal. The influx during the preceding months has followed an erratic pattern. The conclusions are that the influx has increased or decreased in relation to the intensity of Pakistani persecution of the East Bengal people; it has also varied in line with the changing pattern of the Pakistan Army's dispositions along the border. Whenever the Pakistan Army established itself along the border, it hindered egress and the people waited for an opportunity to steal across when the Pakistan Army relaxed its vigil.

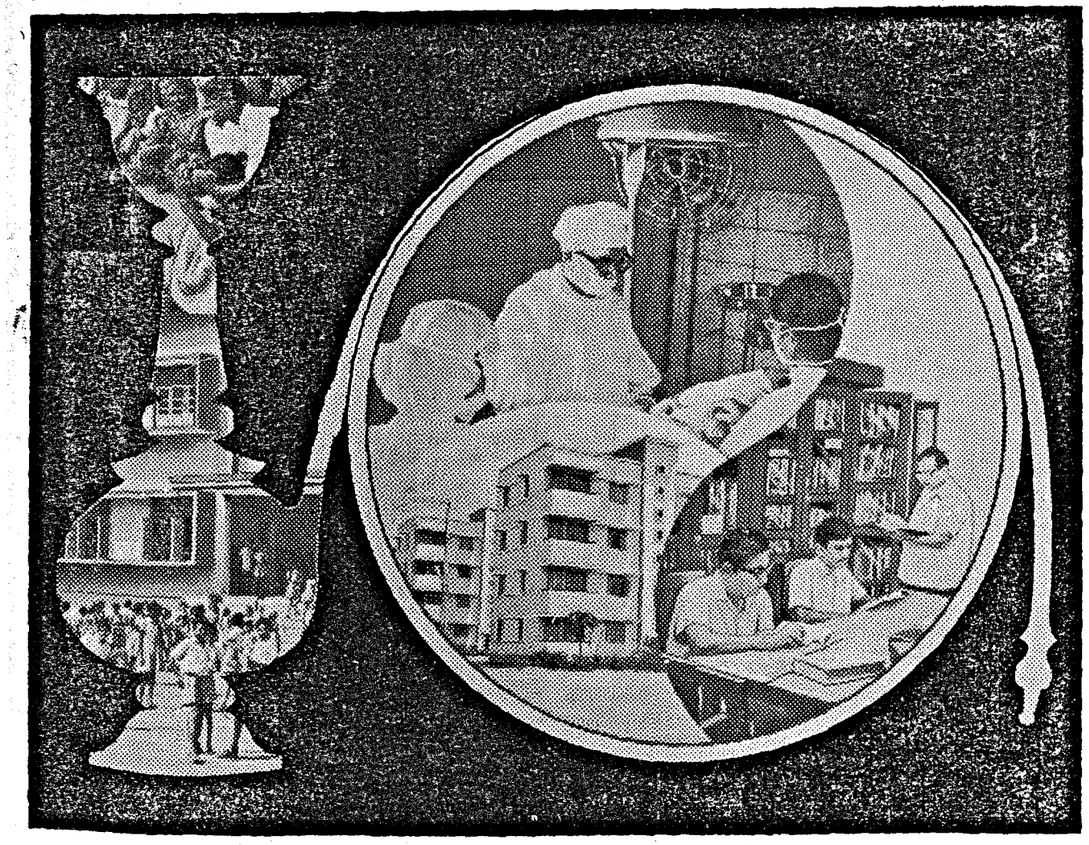
The refugees are entering India through numerous points stretching over several thousand miles of border between East Bengal and our country. They are utilising all modes of transport such as, bullock carts, motor cars, country boats, rickshaws and the like. The majority has, of course, trodden long distances on foot in grim agony and in a desperate effort to escape from the ruthless atrocities of the Pakistan Army. Even after seven months of the Army crackdown in East Bengal, the influx continues at an enormous rate.

Before dealing with the problem thrown up by the massive influx of 9.5 millions — many countries in the world have populations of this order— it would be worthwhile to consider the origin of this unparalleled upheaval. Its origin goes back many decades to the period prior to the Partition of India.

It would appear that Muslims of East Bengal had grievances against the Hindus and against the power exercised by Calcutta. These people had two things common with West Pakistan: firstly, a common religion and secondly, a common struggle towards the formation of Pakistan. East Bengal was strongly in favour of Pakistan even at the cost of partition of the former Bengal. But after partition these people found that all that had happened was that the former domination of Calcutta had been exchanged for that of Karachi. These people had not only a passion for autonomy but, what was more important, a fair recognition of their claim of the Eastern Wing being at par with the West. Soon after the creation of Pakistan, the people of East Bengal witnessed a period of neglect of their province and an ever-increasing domination by West Pakistan over their culture, language and finances. They soon realised that the National Government in West Pakistan was hostile to all things Bengali. Ataur Rahman Khan said as follows in the Constituent Assembly of Pakistan in 1955:

"Sir, I said that the attitude of the Muslim League coterie here was of contempt towards East Bengal, towards its culture, its language, its literature and everything concerning East Bengal. In fact, Sir, I tell you that far from considering East Bengal as an equal partner, the leaders of the Muslim League thought that we were a subject race and they belonged to the race of conquerors."

Sense of Neglect



In the early years of independence, the activities of the Central Pakistan Government were centred round areas within the easy reach of Karachi, namely, Sind and the Punjab while remote East Bengal suffered from lack of attention. The sense of neglect among the Bengalis arose almost immediately: "It seems, Sir," said one Bengali Muslim Leaguer in March 1948, "that in the present scheme of things East Bengal is really very much neglected."

The Chief Minister of East Bengal presented a list of demands of his province by saying:

"First and foremost among these is that as far as Eastern Pakistan is concerned, we must have a fair and proper share in the Armed Forces of Pakistan."

The Bengali complaint arose from maldistribution of financial resources as well. East Bengal is inflicted with much greater poverty than the areas in West Pakistan. The Bengalis wanted the chronic poverty of East Bengal to be a primary concern of Pakistan national policy. They wanted the federal resources to be allocated to bring the standards of East Pakistan into line with those of the West. Another major grievance of theirs was that very little of the expenditure of

THE PLEASURE OF OUR COMPANY

Enlightened industrialism has become an NRC tradition. And the spirit of employee welfare, a constantly motivating force. No less than 8,000 persons are housed in NRC's vast and impressively maintained factory colony at Mohone, while as many as 24,000 dependents are supported by NRC employees on remuneration and benefits received. From housing to medical care, from schooling to recreation, an NRC employee receives careful company attention. But even more than this quantum of actual benefits, is the *real* benefit an NRC employee receives — of good talent well rewarded.

THE NATIONAL RAYON CORPORATION LTD.
EWART HOUSE, BRUCE STREET, BOMBAY 1.

NRC'S COMPANY WELFARE ACTIVITIES HELP 8,000 DAILY

Creative Unit-477

the Central Government was taking place in East Pakistan. Thus Abu Mansur Ahmed said in the Constituent Assembly of Pakistan in 1956 as follows:

"I shall show, Sir, from statistics published by our Government that the share of East Pakistan to the Federal revenues from 1947-48 to 1954-55 has been Rs 168 crores and 14 lakhs. During this period West Pakistan contributed Rs 553 crores 53 lakhs to the Federal revenues. These figures may make our West Pakistani brothers, like Mr Gurmani, boast and say 'Look! East Pakistan is contributing only 18 per cent, West Pakistan contributes more than treble'. But, Sir, look at the expenditure side. This is the expenditure. The Central Government has spent during these 9 years, Rs 42 crores and 66 lakhs in East Pakistan as compared to Rs 790 crores and 67 lakhs spent in West Pakistan. Therefore, Sir, we have got back much less than what we have contributed."

Another crucial issue involving antagonism between East and West Pakistan concerned the status of the Bengali language. Among the languages spoken in Pakistan, the proportion of people speaking Bengali is 54.6 per cent as against 7.2 per cent of Urdu speaking people. The decision by the Government of Pakistan to make Urdu the only national language and to relegate Bengali to a lesser status imposed an additional burden on the already handicapped province. This issue aroused strong feelings at the very beginning of the State of Pakistan. In February 1948, a Hindu Bengali moved an amendment to the Assembly rules to permit Bengali to be used in the House along with Urdu and English. The Prime Minister replied:

"Pakistan is a Muslim State and it must have as its lingua franca the language of the Muslim nation... [The Mover] should realise that Pakistan has been created because of the demand of a hundred million Muslims in this subcontinent and the language of a hundred million Muslims is Urdu... It is necessary for a nation to have one language and that language can only be Urdu and no other language."

A month later, Jinnah's authority was used to put the same proposition before an audience in the capital of East Bengal:

"Let me tell you in the clearest language that there is no truth that your normal life is going to be touched or disturbed so far as your Bengali language is concerned. But ultimately it is for you, the people of this province, to decide what shall be the language of this province. But let me make it very clear to you that the State Language of Pakistan is going to be URDU and no other language. Anyone who tries to mislead you is really the enemy of Pakistan. Without one State language, no nation can remain tied up solidly together and function."

The language question has been merely the most flagrant example of the series of issues on which Bengalis feel that they have to fight desperately to secure satisfaction. There was then the factor of distance which by itself had proved a major obstacle to the attainment of effective unity of Pakistan. East Bengal had been increasingly dissatisfied with its status as a constituent part of the Federation. The province, containing 56 per cent of the population of Pakistan, has been clearly a less advanced area than West Pakistan in matters of industry, trade and urban development.

The cultural and social separateness between the people of the East and the West Wings of Pakistan became a question of sentiment amongst the Bengalis who form the majority:

"Pakistan is a unique country having two wings which are separated by a distance of more than 1000 miles. These two wings differ in all matters, *viz*, the language, the tradition, the culture, the costume, the custom, the dietary, the calendar, the standard time, practically everything, is different. There is, in fact, nothing common in the two wings particularly in respect of those which are the *sine qua non* to form a nation."

Added to the above mentioned variants, the threat of Punjabi domination was another major factor in the political struggle at the national and provincial levels. After the Partition of India, the Punjabis in West Pakistan represented the most advanced component of the new State. The Punjabi middle class tended to occupy the best positions not only in their own province but at the Centre and they began to spread into East Bengal as well. This led to considerable resentment by those who found that strangers were coming to dominate the entire machinery of Government and commerce. It will, therefore, be seen that the recent political upheaval in East Bengal was nothing else but the boiling point of a discontent which was simmering in the hearts of East Bengalis ever since the creation of Pakistan in 1947. The immediate cause was provided by the fact that the leader of the Awami League, Sheikh Mujibur Rahman, who had won the elections in December 1970 on the basis of his six-point programme was not permitted to form a Government which was the next logical democratic step after the elections. In fact, the six-point manifesto on which he fought the elections — elections which President Yahya Khan had styled as fair and just — was called into question. Sheikh Mujibur Rahman was sought to be coerced to give up his stand for internal autonomy. When coercion failed, President Yahya Khan clamped down the rule of martial law and there followed untold repression, killings and genocide let loose by the Army which was given unlicensed free play in wreaking destruction over a defenceless people.

We are pleased to announce—for the first time—the results of the STC Group in a consolidated manner. This follows upon the recent major reorganisation in two years in the holding company, effected to properly back the fast expanding activities of the group. Organisationally, STC is developing in three directions: its new subsidiary corporations, now four; a long chain of marketing and services divisions; and an expanding network of offices abroad, from Sydney to New York, now 18: achieved without adding to our numbers or cost significantly.

Mention may also be made of two other significant aspects of our new marketing policy:

—now ranging freely and competitively in the export field; and

—providing a package service to small industries in India through the State Corporations.

Our first half-year accounts, profit and loss and balance-sheet, have been completed, with all provisions made and contingencies allowed for. From now on we will complete our accounts each quarter—we already declare a dividend quarterly. In between, we will prepare Flash Monthly Accounts by the 10th, necessarily with a degree of approximation, but enough to enable our management to keep closely in touch with performance compared with budget. Each Monthly Account will, however, be properly adjusted and merged with the Flash Account of the following month and thus the quarterly accounts will represent the accurate position.

We have also done a mid-year review of our Performance Budget and prepared the Latest Estimate, which makes an encouraging reading. It looks as if we will meet all our targets, and even improve upon them in some cases. Most encouraging of all, though, is that last year's exceptional decline in profitability has been stemmed and it is once again beginning to look respectable. In the present situation the more profit we make, the more power to the national elbow!

The Latest Estimate shows that, compared with last year, exports this year might be 28% plus; imports 62% plus; total sales 52% up, while the profit before tax may double from Rs. 7.2 crores to Rs.15.1 crores. This is still only a 4% return on turnover – well below the industrial norm of around 10%, and below the 6% we achieved in 1969-70.

Our expenditure is well held at an estimated Rs. 6.7 crores against Rs. 6.4 crores last year despite a 52% increase in turnover. We expect the stocks/turnover ratio to improve from 15% to 9% and the Debtors/turnover ratio from 11% to 8%. Working capital, however, while continuing to decline as a percentage of sales, will in absolute terms, go up, largely on account of the buffer stock operations for vegetable oils. In consequence, we will be paying interest instead of earning it, as in the past.

Our exports would have been still better had it not been for the shortages that are developing in many areas—steel products and engineering, alcohol, cement, molasses and even coins, influenced further by the international monetary uncertainty.

As mentioned earlier, the influx of 9.5 million refugees placed no mean social, economic, and political burden on the host country. The entry of this vast refugee population has greatly changed the population statistics of the receiving states of West Bengal, Tripura, Meghalaya and Assam. About 76 per cent of the total influx, namely 7.1 million, are in the eight border districts of West Bengal. In West Bengal they account for 16 per cent of the normal population of the entire State and 32 per cent of the total normal population of the eight border districts of West Bengal. The highest concentration of refugees is in 24 Parganas namely, 26 per cent of the total influx in West Bengal. This is followed by West Dinajpur where it is 25 per cent and Nadia where it is 15 per cent. It is further interesting to see that in West Dinajpur the population of the refugees and of the local people is of the same order, namely, 1.8 million each. In Cooch Behar, where the influx consists of 0.8 million and the local population is 1.4 million, it is 57 per cent. The density of population has also indicated violent patterns of change. In West Dinajpur, for example, the density per square km has doubled from 344 to 684. Similarly, in Cooch Behar, the density has increased more than 58 per cent from 423 to 653 per sq km. The density of population of West Bengal as per 1971 Census is 507 persons per sq km as against the all-India average of 182 persons per sq km. Within a span of seven months, the influx of the refugees has sent up the density of population in this state to a new height, namely, 600 persons per sq km and thus has placed West Bengal as the most populous state in India.

Within West Bengal the concentration of refugees is more in North Bengal consisting of the five districts of Malda, West Dinajpur, Darjeeling, Jalpaiguri and Cooch Behar. These five districts have 37 lakh refugees which account for over 50 per cent of the total refugee influx into West Bengal.

Relatively speaking, the concentration of refugees is the highest in the union territory of Tripura. The influx is nearly as much as the local population. The density of population of this union territory has thus nearly doubled in that it has gone up from 149 persons per square km to 290 persons per sq km within a period of seven months. The concentration of refugees is much higher in the south and west districts.

From the geographical, social, economic and linguistic viewpoints, Meghalaya is an inhospitable area for the refugees. Hilly terrain, cold climate, differences of languages and dialects with the local population and difficulties as to the means of communication, are some of the factors which would obviously discourage the people from East Bengal to cross the border into Meghalaya. But in spite of these barriers, the atrocities of the Pakistan Army were so intense that the refugees fled to secure refuge in the foothills lying along the border between Meghalaya and East Bengal.

Some seven lakh refugees have sought sanctuary in the tiny state of Meghalaya which has a population of about one million. Refugees in the state thus constitute over 60 per cent of the local population. In Garo Hills District, the refugees number 3.2 lakhs as against the local population of 3.9 lakhs. In the United Khasi and Jaintia Hills District, there are over 3.1 lakh refugees as against the local population of 5.8 lakhs.

The refugee relief work centres around five major necessities. These are requirement of space, the construction of shelters on this space, provision of medical cover, supply of water and, fifthly, supply of food. These immediate needs have been expanded from time to time to cope with the ever-increasing number of refugees. With the passage of time and the change of seasons, we have had to carry the burden of additional provisions. For example, with the onset of winter, it was decided to issue blankets to the refugees. Similarly, it became necessary to give free clothing to them. Recently, it was decided to give utensils and mats also. The expenditure caused by the supply of these additional amenities is very high. For example, the requirement of blankets comes to the tune of 4 millions whereas an expenditure of Rs 8 crores will be incurred on the provision of clothing.

Relief camps were opened from the very beginning when the refugees started entering India. The number of refugee camps was about 300 in April 1971 but it reached a record figure of 1,200 in June 1971. In West Bengal, the number of camps during the period of four months from April to August 1971 rose from 170 to 615. During the peak period, camps were opened in schools, public buildings, dharmasalas, co-operative stores, polytechnic institutes, etc, etc. In May 1971, in some sub-divisions of the state, 75 per cent of the total camps were located in schools and public buildings. There are, however, no refugees in schools and other buildings at present except in West Bengal where about 1,000 buildings are still occupied by the refugees.

From the point of view of accommodation, the refugees may be divided under two heads. Firstly, the refugees who are living in camps and, secondly, those who are living with their families and relatives. The number living in camps is 5 million as against 2.2 million living with friends and relatives in the case of West Bengal. In the case of Tripura 8.5 lakh refugees live in camps and 5.6 lakh outside the camps. In Assam 2.2 lakhs live in camps and 89,000 outside the camps. In Meghalaya the statistics are that 5.8 lakhs are sheltered in camps while 77,000 live with their friends and relatives.

The principle underlying the provision of relief to the refugees is that they will return to East Bengal at the earliest opportunity. The camp facilities provided to them are, therefore, on a transient basis. The term used is 'transit camps' of which there are two types, namely, those looked after by the Centre and those by the states. In both cases, shelter is constructed out of local materials such as bamboo and thatch. Where thatch is not available, tarpaulins and polythene sheeting are provided. As regards the size of camps, the policy is that these should house substantial numbers. Small camps sheltering 2,000 to 5,000 people are not only uneconomical but also pose a problem from the point of view of communications. The figure of 25,000 would appear to be the optimum. There are, however, camps today which have as many as 3 lakhs of refugees while there are others which have only 3,000. In the former category we have the instances of the Salt Lake Camp near Calcutta or the Kalyani complex in Nadia District or the Balat-Mailam Camp in Meghalaya. Each of these three camps has a refugee population varying from 2 lakhs to 3 lakhs. This obviously is a remarkable figure considering that Shillong, the capital of Assam and Meghalaya, has only about 1 lakh people.

In the course of the last few months, refugee camps have been consolidated with a view to eliminating smaller units which had to be raised earlier under the force of circumstances along the main roads. Today, there are 827 camps in the seven states of India, namely, West Bengal, Tripura, Meghalaya, Assam, Madhya Pradesh, UP and

Bihar. Of these, 17 are run by the Centre and the remaining by the states. The Central camps came into being as a result of the realisation that the problem of refugees is a national one. The influx into West Bengal and Tripura has been very heavy and it became necessary to shift refugees from these states to others. Recently, the Government of India decided to take over the administration of some two million refugees in West Bengal. Also about 5 lakhs refugees will be moved out from the state. Thus in the case of West Bengal some 50 per cent of the total refugee population will be administered directly by the Centre.

Camps as a rule are entirely run by the Centre or state governments. The entire expenditure is being incurred by the Government of India. The Government of India has built up the necessary infrastructure not only in the form of a Secretariat in Calcutta of the Ministry of Labour and Rehabilitation but also Refugee Departments in all the states. Some 30 voluntary organisations are operating in the various states to assist the administration of camps. The contributions made by the voluntary organisations consist of providing medical cover by opening hospitals and dispensaries, maintenance of sanitation and hygiene in camps and the distribution of milk.

A significant contribution by the voluntary social welfare organisations has been the running of orphanages and training homes for girls. Pakistani atrocities had rendered many boys and girls of tender age from four years to 22 years orphans. There is a heart-rending case of a young girl who saw five members of her family shot dead in front of her eyes. These children require proper attention in the name of humanity. They should not be made to feel that the entire world is as monstrous as the cruel hand of the Pakistan Army. For this vulnerable section of the refugees, 18 orphanages have been set up where unattached boys and girls receive residential education and training in handicrafts with the idea that on return to East Bengal, they might be in a position to maintain their skills and seek employment in due course.

Malnutrition is endemic both in India and Pakistan and this disease indeed affects many other neighbouring countries. In India malnutrition amongst the children is as high as 30 per cent. Some 40 per cent of the deaths in India are due to malnutrition amongst children. Malnutrition lays its tight hold on children in the age group of 0 to 5 years. A sample survey carried out in refugee camps has shown that some 14 per cent of children suffer from malnutrition. To combat this inadequacy, it has been decided to establish 100 Nutrition Therapy Centres in the various states. This programme has come to be known as Operation "Life Line" which covers two phases of work styled as Alpha and Beta. The programme under Alpha includes provision of supplementary nutrition diet to children while the Beta programme is intended to cure malnutrition diseases amongst children. The cost of this scheme has been computed at about Rs 4 crores.

The population of refugees, namely, 9.5 million represents the population of many countries in the world today. This is three times the population of New Zealand and it equals the individual population of countries like Denmark, Sweden and Norway. The administration of 9.5 million refugees has all the complexities which a National Government would normally face. It involves heavy financial expenditure. Our estimates are that it requires Rs 2.77 per day to maintain one refugee. The total daily average of expenditure on the refugee population comes to Rs 2 crores approximately. The estimated expenditure for 7 months has been of the order of over Rs 400 crores. Against this, the foreign aid so far promised has been $157 million. The actual receipts against this figure have been about Rs 30 crores. Thus it will be seen that there is a big margin between the actual expenditure and the foreign aid promised. Therefore, the extra funds required to maintain the refugees have had to be produced by extra taxes in our country which were recently notified in the newspapers. Owing to the diversion of our financial resources to refugee work, much of the development programme of the affected states had to be slowed down either for lack of financial resources or because of the primary engagement of Government staff in refugee relief work. This has been and continues to be a major problem. There are then the social, economic and political problems which constantly tell upon the staff at all levels. Our figures show that some 35,000 Government functionaries are employed on the entire refugee relief programme.

The social problems are that the refugees cannot remain without work and enjoy a perpetual disposition of leisure. Indeed, lack of work among the refugees has become a problem. Many refugees have attempted to seek employment or set up small business in the way of running shops or taking to agricultural labour to keep themselves occupied and earn wages. This has been resented by the local population for which there are undeniably sound reasons. For example, when there is unemployment to the tune of 2.5 millions in West Bengal, how can they look kindly at the foreign refugees. Such happenings lead to social tensions and throw an extra burden on those who are engaged in relief work.

There is then the danger of communal passions being generated not only in the refugee camps but between the camp inmates and the people around. President Yahya Khan has made earnest efforts to give the entire political phenomena of East Bengal the garb of a communal incident. The minority communities who have been, time and again, hounded out of East Bengal cannot always easily contain their antagonism for Islamic fanaticism and intolerance. But in the secular State of India and more so in the interest of the political Bangla Desh movement which has transcended to a secular plane, communal passions have to be kept in check. To this our people have responded remarkably well. This area of refugee relief work has to be most vigilantly guarded.

In the political sphere it is vital that the refugees should, under no circumstances, be used as convenient targets for the extension of Indian politics. They, as foreigners, have to be kept outside the pale of our national political controversies. This means insulation of refugee camps from the surrounding political activities. This again poses serious problems for the refugee administration.

The foregoing, therefore, are the various political, administrative, social and economic problems which face our country. The refugee problem is a national one. It has two implications: firstly one of humanism towards those subjected to untold oppression; secondly, recognition of the political progress which East Bengal has made in the sense that its politics hitherto confined to religious urges has now risen to a higher plane of secularism. This is a major advance in the applied field of political science and is living evidence against the theory of two nations which 24 years ago split India into two. Bangla Desh is a phenomenon of the people of this subcontinent awakening to the deeper content of democracy. This phenomenon aims at human beings not identifying themselves in terms of hate and love generated by religion but by the desire of men to be equal and to be friendly and to be free.

The Lines Are Drawn

Nireekshak

HAVE newspapers lost interest in themselves? From the way some of them have hiked up their sale prices — in conjunction with the hike due to the two-paise excise levy imposed by government for refugee relief — it seems not. Far from it. The occasion for raising prices was most certainly provided by the enforcement of the excise levy rather than by any sudden increase in the costs of production. Costs may have risen somewhat in recent times, but so has revenue if the growth in total volume of advertising is any guide. In any case, it is doubtful if the increase in costs would have led to an upward revision of sale prices at this stage had Government not decided to impose the excise levy. If Government can raise additional revenue to meet the needs of increased expenditure, why can't newspapers do the same? This seems to have been the deceptively simple reasoning behind the price hike — which, however, has convinced few people, least of all the government.

Some Calcutta newspapers, for example, which raised their sale prices have had to retract, partly as a result of resistance from hawkers, and more decisively as a result of government intervention. On the other hand, at least two Bombay dailies continue to charge a higher price, though they are reported to have been advised by the government to revert to the old price. One interesting thing is that the wealthiest newspapers, which also had the highest sale prices, have not sought to raise their prices this time. With the highest price now standing at 27 paise (including two paise excise levy) for daily issues and 35 paise for the Sunday issues, it was probably thought prudent by these newspapers not to price themselves out of the market by raising prices any further!

In the absence of any statutory price regulation for newspapers, the government's right to intervene in a newspaper's sale price fixing may not be above question. And it would be odd, too, if government intervention resulted in one newspaper being allowed to charge a higher price while another is prevented from doing so on arbitrary considerations. Such a practice, if allowed, would give the government an additional handle to influence, if not control, the press; and it is, therefore, one which it would be dangerous for the press to encourage. Yet, as the different experiences of the Calcutta and the Bombay newspapers show, the government has been able to impose its will, irrespective of whether it has any legal rights to arbitrate on prices.

Illegitimate Discrimination

Hitherto, the sale prices used to be fixed by prior agreement among the 'competing' newspapers themselves. In the present case also, the higher prices were fixed by prior agreement among the various newspapers. But now that this cosy arrangement has been disrupted by government intervention — at least temporarily —, it remains to be seen how the trade union of newspaper owners, the Indian and Eastern Newspaper Society, will seek to set things right again! What the price wrangle proves most of all is that half-measures are often worse than no measures. While readers in the Calcutta region have been spared by government intervention from having to pay more than the excise levy for their daily newspapers, readers in the Bombay region have had no such luck. Should not readers of newspapers have the same protection against arbitrary price fixation by the 'manufacturers' which, say, consumers of vanaspati have? Viewed from any angle, there is no substitute for a price-page schedule and the sooner Government sheds its inhibitions and revives the scheme, if necessary by a constitutional amendment, the better. However, the day of resolution seems distant.

Even the much-trumpeted draft bill (or 'discussion paper' as it was later described to be) on diffusion of newspaper ownership seems to have been shelved, at least for the time being. There was much that was ruritanian and one or two things which were plainly repugnant to professional independence, in the draft proposals. But it was not all black on that account and had at least some features designed to give the journalist, if not the total professional independence that he seeks, at least a far greater say in the formulation of policy and running of his newspaper. No wonder the proposals were pounced upon by the monopoly press, by its professional front — the All India Newspaper Editors Conference —, and subsequently by such champions of freedom of the press as the Kirloskars and the Bajajs of the market place.

It had the desired effect: Nandini Satpathy, reputedly co-author of the proposals with Raghunatha Reddy, announced in the Lok Sabha last month that government had decided to set up a committee of Ministers to go into "all aspects of the proposals for diffusion of ownership of major newspapers and news agencies". Besides Satpathy and Reddy, the committee consists of Mohan Kumaramangalam, H R Gokhale, and Raj Bahadur; Uma Shankar Dixit, though not formally a member, will also be associated with the committee. In what form the proposals will re-emerge from the committee, and when, has now only to be speculated upon. Even if Raghunatha Reddy stands his ground firmly against attempts at defeating the main object of the proposals — as he is known to have indicated he would to some senior journalists — the final proposals will now most likely be subjected as well to a detailed scrutiny of the Cabinet as a whole. And second thoughts may prevail.

To return to the question with which this review began, let it be said that after the first volley was fired against the diffusion proposals, a great silence has descended on the press! Newspapers, with one or two honourable exceptions, seem not to be interested in themselves! This seeming disinterestedness began actually from the morrow of the mid-term parliamentary elections and now seems to have become a well-set trend. Of course, this conspiracy of silence is no more than a diversionary smokescreen, under cover of which the monopoly press hopes to wage its battles from other fronts. And, as the leaping of the Kirloskars and the Bajajs from their hitherto secure foxholes onto the van of battle for the freedom of their press shows, the hope has not been unjustified. Yet, simultaneously with this development, the monopoly press has also abandoned its pretence to being an 'independent' organ of our democratic system and with no other purpose for existence than disinterested public service. As for the journalist representatives of the monopoly press, one senior editor is known to have denounced the proposals for diffusion angrily, on the ground that it may require him to explain policy to a mere sub-editor! The lines of battle are indeed more clearly drawn now than ever before.

On Irrelevance in Economics of Employment

Bimal Jalan

Employment and Unemployment Problems of the Near East and South Asia, Vols I and II, edited by Ronald G Ridker and Harold Lubell; Vikas Publications; 1971.

I

THERE are three aspects of the unemployment problem that have received the professional attention of economists. The first is the problem of measurement, i e, how to count the unemployed. The second is an analysis of the past experience in absorbing labour in different countries and in different sectors. And the third is the problem of policy or how to employ the unemployed.

The problem of measurement arises because of the difficulty of satisfactorily defining either the labour force or the unemployed. In predominantly rural and non-monetary economies, it is difficult to be sure who is and who is not in the labour force because of differences in working age, differences in period of work, seasonal nature of demand for labour, and the large number of unpaid workers in households and family farms. Similarly, unemployed or partial unemployment may manifest itself in various forms. While the number of persons actively seeking full-time work may be low, there usually exists substantial underutilisation of labour in the sense that productivity and income of a large number of the apparently employed are far below some average or norm. As a result of these and other definitional difficulties (in addition to those pertaining to data availability), estimates of unemployment turn on the definition one adopts, and can vary widely for the same country. On this, economists and demographers seem to be fairly well agreed.

These difficulties are so formidable that unidimensional definitions of unemployment, and estimates based on them, are considered somewhat meaningless and a number of economists have concluded that defining unemployment in developing countries is not entirely a technical matter and that one's definition of unemployment should be related to policy objectives. This has led to the "productivity" definition of unemployment based on some physical norms, and the "poverty" definition of unemployment in terms of some minimum consumption norm.

The analysis of past experience with labour absorption has proceeded along two lines. One is the estimation of employment that has actually been created in the course of development and growth in different countries. Here, there has been a striking similarity in the growth experience of various countries — industrial and national income growth has been faster than the growth of employment, and countries with faster rates of growth have tended to register higher rates of growth of employment *vis-a-vis* the slower growing ones. In addition, considerable research effort has also been directed to estimating employment functions in individual countries, and for the less developed countries as a group. Here, the object is either to project employment levels associated with a given growth objective, or to estimate rates of growth and the sectoral composition of output that is necessary to meet a given employment objective.

Thus, for example, on the basis of assumptions regarding likely growth in labour force and a constant ratio between growth of output and growth of employment, ECAFE has made estimates of unemployment in India for the year 1980-81 associated with different rates of growth of domestic output. OECD has used a similar approach for estimating rates of growth required to eliminate by 1980 the estimated level of unemployment in 1965 in various regions of the world. (The required rates of growth during 1965-80 vary from 4.8 per cent in Sub-Saharan Africa and Middle Asia to 8.4 per cent in West Asia.)[1] In a more elaborate model, Yves Sabolo has estimated the relationship between the sectoral employment pattern and economic growth by fitting regression equations on past data from 40 developed and developing countries. This model relates employment in each of the major sectors (e g, agriculture, manufacturing, construction, commerce, transport, etc) to per capita national income; since countries included in the model are at different per capita income levels, the estimated co-efficients are expected to reflect the "normal" relationship between the pattern of sectoral employment and economic growth.[2] In this and similar studies it is believed that this "normal" pattern can be applied to project the employment consequences of growth in any typical developing country.[3]

On policy questions, the state of economic thinking is not as clear-cut. However, there seem to be two major, although not always clearly separate, schools of thought on the subject. One school seems to regard employment as a function of the rate of development alone; the solution to the unemployment problem boils down to increasing the rate of development sufficiently to absorb the growing labour force. The problem of employment is thus essentially the same as problem of development, and cannot be treated separately. The other school regards the rate of employment generation as capable of being influenced by the pattern of development as well as specific development policies, even though the overall rate of development may be fixed. The employment-objective would influence the pace of development, the sectoral allocation of investment during different time-periods, the choice of industries to be set up, the choice of techniques and the choice of policy instruments. Employment, therefore, is a distinct issue of development strategy. The emphasis in this approach is usually on labour-intensive industries, labour-intensive techniques, and policies that favour the employment of labour input over capital during the development process.

Outside of these two main schools, there are a few who equate unemployment with the extreme poverty of the majority of people in the developing countries, and despair of the "normal" pattern of development or policies as being capable of alleviating the extremes of poverty in the near future. Since much of this poverty is in rural areas (or was there before spreading to urban areas), they seek an interim solution of the problem in special rural schemes to engage the rural poor in productive endeavour. The rural poor are, as it were, waiting to be employed in industry and the organised sector. However, since the period of waiting before sufficient jobs are available, is likely to be very long, the poor should be provided with some socially productive employment in the meantime. In this way, their poverty can be eradicated by their own productive effort.

II

The twenty-nine conference papers on unemployment in the Near East and South Asia, brought together in the two volumes under review belong to the mainstream of economic thinking on the subject. There is unanimity among the authors about the formidable data and conceptual difficulties involved in estimating unemployment levels in developing countries. Nonetheless, since it is important to know the extent of unemployment in these countries, estimates — sometimes by more than one author — are presented for a number of Asian countries (*viz*, Afghanistan, Ceylon, India, Pakistan, Iran and Turkey) as well as for Africa, Latin America and Puerto Rico. There are methodological essays on projections as well as projections of unemployment for Ceylon (1968-72), Pakistan (1960-80) and Turkey (1972-1982). There are essays on employment-effects of new technology in agriculture as well as experience with labour absorption in industry, construction, services and roads. Finally, there are essays on an appropriate policy for employment in developing countries. While the quality of the papers is not uniform and a number of papers are repetitive with little new or interesting in them, the editors deserve to be congratulated for making available a wealth of information on such a wide range of issues.

In his introductory piece, R G Ridker has summarised the conclusions of the country studies: "If the data are taken at face value, we would conclude that open unemployment is a serious problem in only some Asian countries under review, that we must reserve judgment on underemployment, and that while the problem is likely to deteriorate over time in most of the countries, we do not know how it is likely to manifest itself" (p 23). A perplexing feature of the estimates presented in these volumes is the wide variation in the extent of open unemployment in Asian countries: they vary from 29 per cent in East Bengal and 19 per cent in Ceylon to 4 per cent in Iran and 2 per cent or less in India. No plausible hypothesis for these differences has been presented, and it is believed that a principal reason for these differences in observed experience may lie in differences in definition and data gathering methods. The authors also agree that not much reliance can be placed on these or even more tentative estimates of underutilisation of labour for individual countries. Since these data cannot be taken at face value, on the basis of considerations outside of the estimates and studies presented, Ridker concludes that "even in countries such as India where open unemployment rates are very low, the overall problem is quite serious, but it is more one of inadequate rather than non-existent jobs. Put this way the unemployment problem is seen to be the problem of poverty, a manifestation of the general development problem."

The estimates of the effects of industrialisation on labour absorption are somewhat more firm. All the studies agree that growth in labour force has been faster than the increase in industrial jobs and that the process of industrialisation has so far failed to take care of the rural and the urban unemployed. Even where countries have been growing at 5 or 6 per cent in real terms, the annual rate of labour absorption in the non-agricultural sectors has been at levels of no more than 2 or 3 per cent. Sethuraman's study of employment generation in the large-scale manufacturing sector in India during 1950-64, for example, shows that while capital stock and value added in this sector increased at the rate of 17 per cent and 10 per cent respectively, employment increased by some 6 per cent. Employment generation in small-scale industry was even lower. What is more, it has been found that the elasticity of employment relative to output in the industrial sector in developing countries is not only low but has also been falling over time. Gustav Ranis estimates the elasticity of employment to have fallen from 0.5 in the fifties to 0.3 in the sixties.

Failure of industrialisation to generate sufficient jobs to absorb the growing labour force has naturally raised doubts about the industrialisation policies of the developing countries, and almost to a man the authors agree that these policies must be changed and made more employment-oriented. Ridker, Ranis and Frank, in particular, have elaborated the point. Industrialisation policies and incentives in developing countries have favoured capital-intensive sectors and techniques over labour-intensive ones — with little or no regard to the relative "factor endowments" of these countries. Bias in favour of capital-intensity has been the direct result of the strategy of import-substitution and distrust of the market mechanism as a means of accomplishing the import substitution goals. In order to encourage import substitution, factor and product prices in developing countries have been held away from their "equilibrium levels". Wage rates are too high and interest and foreign exchange rates too low relative to the actual availability of these factors, with the consequence that excessively capital-intensive techniques and sectors have been favoured over others that would have employed more labour. These policies lie at the root of the problem of underutilisation of labour, industrial inefficiency, structural imbalances and lower than desirable growth rates.

Happily for developing countries, the new policies that are required for generating greater employment opportunities in industry are also the ones that would give more and better growth. Although the contents and comprehensiveness of the "policy package" prescribed by different authors differ somewhat, there are two points on which there is substantial agreement. First and foremost, factor price distortions should be corrected — by lowering wages in relation to the price of capital. This would favour adoption of labour-intensive techniques and greater utilisation of labour in relation to capital in industry. Secondly, investments should be reallocated in favour of agriculture and more labour-intensive industrial products. Emphasis on agriculture will provide greater opportunities for employment in that sector, and would also slow down migration to the cities. Concurrently, emphasis on labour-intensive industries would generate more jobs per unit of capital employed.

These policies, it is believed, may lead not only to greater labour absorption but also to more output, *at any given level of resource mobilisation.* In addition, there is also plenty that the developing countries can do to (a) mobilise more resources, and (b) use these resources better to generate faster rates of growth of income and employment. Thus, among other things, Ridker has suggested that "the overall size of the public budget must be reviewed to ensure that maximum expansionary pressures subject to inflationary and other constraints is placed on the economy" (p 49). Ranis, on the other hand, has asked for a whole new set of policies and development strategies which are necessary not only in the interest of employment but of development itself. Action on a number of

fronts is necessary; thus, "a devaluation, for example, to bring the exchange rate into line with the real cost of foreign exchange, may have to be accompanied by a change in the rationing system, in this case the import control regimes, if, in fact, a more price-determined allocation is to become possible. Even a re-examination of the tariff structures underneath the quantitative restrictions, often quite haphazard in character, may be necessary... liberalisation in a number of markets may be needed, i e, with an adjustment of the signals and a willing-

ss to permit greater play for the rket and a lesser role for discreonary actions by officials" (p 67).

The essays on agriculture focus on e likely effects of the new technology labour absorption. Although the perience with new technology in deloping countries is still very short, ese studies highlight two important ints about its likely effects: (a) the tal effect of new inputs (including m mechanisations) on labour requirements is likely to be very different in fferent regions of a country and in fferent months of the year depending land relations, size of farm, cropng intensity, and growing conditions; nd (b) there is no inherent conflict beween higher agricultural yields from ew technology and greater labour abrption in agriculture *provided* mecha*isation is introduced selectively* and ction is taken to reform land relations. s an example, Billings and Singh menion the case of Japan which uses 3.5 ectares of crop land or about double he US figure, and at the same time ses 2.04 workers per hectare of land *vhich is more than twice that of India.*

III

What to make of all this? While hese essays have certainly contributed o highlighting the universal nature and similarity of the unemployment problem in Asian countries, they are perhaps unlikely to be remembered for their analysis of the problem in individual countries or the estimate and projections of unemployment that they present. With the possible exception of two essays — one by Murad Asiel on Afghanistan and the other by Syed Hussain on Pakistan — these are largely of ephemeral interest; their main usefulness lies in making available statistics on unemployment (along with a careful analysis of their limitations) that may not be easily accessible to the non-residents of these countries.

Nor perhaps are these essays likely to be remembered for the policies they propose for increasing labour-absorption in developing countries. In the view of this writer, these suggestions are either too obvious and tautological or irrelevant to the employment problem as it arises in labour-surplus economies during the process of industrialisation. I propose to examine these in some detail not only because they are of utmost concern to policy-makers in developing countries, but also because they have become a part of the conventional economic wisdom that is being offered to developing countries with increasing frequency.

As pointed out above, suggestions for employment policy are mainly of three kinds: (i) the developing countries should adopt a strategy of industrialisation based on their relative factor endowments. They would get both more employment and more growth if they were to specialise in labour-intensive industries and freely exchange it with the rest of the world at realistic exchange rates: (ii) they should save more, invest more, and grow more; and (iii) they should adopt labour-saving techniques in industry,. and the best way of doing this is by removing factor-price distortions and lowering wages. Let us take the "development strategy" argument first.

The argument omits enough of the current reality of international trade to make it likely that it would overlook some important questions about economic development, and the objectives that the developing countries are trying to seek. Korea, Taiwan and Hong Kong notwithstanding, the option to develop on the basis of exports of labour-intensive commodities is simply not open to all the developing countries for all times. And even if it were, it does not necessarily follow that this is the only sensible strategy that the developing countries must seize upon.

While the ultimate objectives of development may be the same for all countries, — i e, eradication of poverty — the strategy for getting there is likely to differ from one country to another. I will depend firstly on the perception and evaluation of opportunities that are available (e g, trade prospects, availability of aid, and stock of skills), but it depends also on a number of other political and value judgments which are outside the purview of technical economics. These include issues such as the desired degree of openness, the acceptable degree of dependence on external aid, the choice between current and future consumption levels, and the distribution of benefits among various sections of the community. These decisions ultimately rest on social and political value judgments, and it is futile to prescribe a unique development strategy for all countries — unless we are also prepared to prescribe a unique value or preference system.

It is thus possible that a predominantly agrarian and labour-surplus economy may deliberately choose to change its factor endowments by establishing the kind of industrial structure which does not *immediately* generate sufficient jobs for the growing labour force. This strategy may be based on the belief that, in view of the country's objectives and external opportunities, it provides the shortest route between two points — the present day low-productivity traditional economy and a modern economy capable of harnessing science and technology and thus raising the average productivity and income of the future labour force. This long-term strategy, however, may fail to do sufficient justice to the current factor endowments and, during the transitional period, there may exist the problem of unemployment which has to be tackled for social as well as political reasons. The only interesting question then is the extent to which the long-term strategy or the pace of progress towards that objective has to be modified (rather than abandoned) in order to take care of the immediate problem. One may still argue endlessly about the right development strategy or what is best for a given country, but it does not help the discussion of the employment problem in countries that have already made that choice. What they have chosen may be wrong, but that is a different debate.

The proposal to invest more and save more as an answer to the unemployment problem is as unexceptionable as it is uninteresting. It is unexceptionable because it is clear that within any given development strategy, the higher the rate of investment and the pace of development, the greater will be the number of jobs created; and there can be no doubt that the developing countries must do all they can to raise their level of investment and saving. In the context of employment policy, the proposal is uninteresting because the developing countries need and should anyway be trying for as high a rate of investment and growth as they can get, quite apart from the effect on employment. The problem that they face is that their capacity to invest in the short- and medium-term is not growing at a rate fast enough to absorb the unemployed, and they urgently need a policy specifically directed to tackling that problem. Moreover, it is not clear whether growth in investment and income at *any* feasible rate can solve the unemployment problem in countries where the labour force is also growing at a fast rate. The study of Puerto Rican experience by Lloyd Reynolds, included in these volumes, is a case in point. Reynolds argues that economic development is employment destroying as well as employment creating, and despite the remarkable economic ex-

pansion of last twenty years (which has led to a more than threefold increase in per capita income), the number of unemployed workers in Puerto Rico is about the same today as in 1950.

While in principle it is difficult to object to the use of labour-intensive techniques whenever feasible, it is not clear what exactly the advocates of this proposal have in mind. Obviously, it cannot mean that labour-intensive techniques should be preferred only when they are economically as efficient or as profitable as the capital-intensive ones. Nor can it mean that any available technique which is labour-intensive should be used, irrespective of the efficiency considerations. So what is probably being proposed is that an inferior but labour-intensive technique should be given a certain "margin" of preference" over capital-intensive ones in the interest of creating more employment. If so, this naturally raises the question of trade-off between more employment *now* and more development — and consequently — more employment later. Therefore unless the margin of preference to be given to labour-intensive techniques is specified, it is difficult to give the proposal any operational meaning or judge its likely impact on employment.

The operational significance of this proposal also depends on an assessment of the technological choice that is available to the developing countries in the form of alternative production techniques, once the direction of industrialisation has been chosen. The very condition of underdevelopment and technological inferiority constrains this choice since most of the machinery and capital goods are produced in industrialised and labour-scarce countries, which may have little interest in producing labour-intensive equipment for use in developing countries. At this point, it may be argued that the developing countries should develop their own technology to suit their needs, and thus increase their technological options. This is true; but it cannot be accomplished right away and in the meantime they may have very little choice in the matter. The need to decrease their total dependence on foreign technology may be another good reason why some countries may choose to break away from their current factor endowments and develop domestic capital goods industries. Technological development cannot take place in a society wedded to traditional modes of doing things, and there is a limit to the type and amount of technology that can be incorporated in a man working with a shovel or a plough. Without a domestic capital goods industry, the developing countries are forever likely to remain dependent on imports of labour-saving machinery.

In this connection, another point made by Demir Demirgil, in his essay on choice of technology, may also be mentioned. He has argued that economic development implies the integration of the developing countries into the world economy at a different level of productivity that they possess at present, and this requires adoption of capital-intensive production methods and the most modern techniques available. The low-productivity of currently available capital-saving techniques, in his view, "will tend to perpetuate the existing conditions rather than to change them". Demirgil accepts the point that in the short and medium terms, it may be necessary to tolerate the existence of relatively unproductive techniques because they absorb a certain amount of manpower. He argues, however, that "this should be explicitly recognised as a cost imposed by social considerations, and its limits should be very clearly determined" (p 698).

Finally, there is the oft-repeated suggestion of removing factor-price "distortions" in developing countries by lowering wages in relation to interest and profits on capital. There are two separate points here: one is that lowering of industrial wages would reduce the rate of rural-urban migration and thus relieve urban unemployment, and the other is that lowering of industrial wages would lead to selection of more labour-intensive techniques and industries. On the first point, suffice it to say that if it were considered desirable to decrease the rate of migration, an equally effective policy should be to *raise* rural wages and bring them in line with industrial wages rather than the other way round. There is no *a priori* reason why industrial wages have to be lowered.

On the second point, apart from what has been said above about choice of techniques, it is a little strange to speak of wages and profits as payments to disembodied factors of production. Changes in wage and profit rates have distributional implications which need to be clearly understood and recognised. If the rate of accumulation remains the same, and the rate of profit is raised in relation to wages, it is clear that distribution of income would shift in favour of profits. In countries where much of the capital is privately owned, it means a redistribution of income and consumption in favour of those who own capital *vis-a-vis* those who do not. It is meaningless to discuss the question of relative returns to factors of production independently of the distribution of ownership of capital and incomes among different classes in the society.

In sum, in my view, taken either individually or as a whole, the above policy recommendations do not provide a sufficient or acceptable basis for consideration of employment policy in developing countries with an unemployment problem. This is not a criticism of the individual papers or economic expertise that has gone into them; it is a statement that can apply equally well to much of the contemporary economic discussion of this issue.

As a more positive contribution to the employment debate, I would offer the following simple propositions: (i) development implies a change in the composition of output; however, industrial expansion, when beginning from a low base, can only have a marginal employment-creating effect in the short and medium term (in relation to growth in labour force). Ultimately, the objective of development is to create the kind of economic structure which will provide employment to all those who seek work at a high level of productivity and income, but this will take a long time; (ii) in the meantime, countries with existing under-utilisation of labour and a fast growing labour force are inevitably going to face an unemployment problem; (iii) in the transitional period, special measures are necessary to tackle this problem. Rural public works programme which provide socially useful and productive employment to surplus labour (while they wait for industrial jobs) is one such measure. However, the ability to do this on an adequate scale is dependent on organisational capacity; and (iv) in a country without sufficient organisational capacity, the problem of unemployment becomes essentially one of relieving poverty associated with such unemployment. A society may thus wish to direct some of its current resources to welfare and increasing the consumption of the unemployed. This may somewhat slow down the rate of progress towards the long-run development strategy, but must not vitiate it.

Changing Consumption Pattern in Punjab

Projections of Consumer Demand for 1973-74

Amarjit Singh
Haramol Singh

This paper projects the demand for different commodity groups for Punjab on the basis of certain assumptions regarding the size and distribution of the population between rural and urban areas, the rate of growth of per capita income, the stability of consumption habits, the parity in the structure of relative prices and the rise in the level of the wholesale prices, etc.

These projections furnish a profile of consumer demand in the Punjab economy in 1973-74 and could usefully be utilised for adapting resources to the structure of wants and the structure of wants to resources.

[This paper is based on a study conducted by Punjab Economy Research Unit at the Punjabi University, Patiala, under the direction of H K Manmohan Singh.]

ECONOMIC growth with stability requires that the supply of consumer goods, specially those of an essential nature, is kept in balance with rising demand. This objective could be partly realised by restricting demand through rationing and controlled distribution of goods at pre-determined prices. Our experience in this regard has been, however, extremely unhappy. Effective administration of controls presupposes not only an honest and competent bureaucracy but also a sense of national duty and capacity to put up with austerity among the people. Since both the assumptions are violated in the Indian context, controls are almost invariably associated with blackmarkets and breed further controls so that virtually the entire economy is ultimately engulfed by controls which make excessive demand on the most scarce resource, *viz*, administrative skills. Successful planning in India, therefore, requires that, as far as possible, the availability of each item of essential goods (domestic production plus imports) is continually equated to its demand as arising under the free play of the market for consumer goods. In short, it must satisfy the test of consistency. In this context, the need for fairly accurate, if not absolutely precise, projections of demand for consumer goods can be hardly overemphasised.

Fortunately, we have a long series of data on consumer expenditure collected through the National Sample Survey which could provide the basis for dependable projections of demand. In the absence of comparable data on income, the data on total consumer expenditure obtained from the same source could be utilised as a proxy for income. The kind of data available would permit a search for some relationships of a general nature between expenditure on particular commodity groups and the total consumer expenditure, in addition to permitting some broad comments on the change in the consumption pattern which is taking place under the impact of development.

Specifically, the objectives of the present study are:

(i) to examine the pattern of consumer behaviour;

(ii) to estimate expenditure elasticities for different commodity groups; and

(iii) to project demand for consumer goods for the year 1973-74, at constant and current prices, for Punjab.

Pattern of Consumer Expenditure

It is about two decades now that Punjab, along with the rest of the country, initiated the process of planned economic development, with a view to providing its people the material requisites of a full life. It would, therefore, be useful to examine how the pattern of consumption has undergone a change over this period. The NSS Organisation collected in 1967-68 data on consumer expenditure for 20 commodity groups. It is proposed to analyse the average per capita consumer expenditure on each of these groups over time. Table 1 is designed to compare the average per capita consumer expenditure on different commodity groups for 1961-62, 1964-65, and 1967-68, i e, 17th, 18th and 22nd rounds of the NSS

Broadly speaking, the per capita total consumer expenditure on all the commodity groups is marginally higher in the urban than in the rural areas. The monthly per capita total expenditure was Rs 27.69 in urban and Rs 22.92 in rural areas in 1961-62 and was Rs 47.04 in urban and Rs 44.39 in rural areas in 1967-68. The traditional inequality between urban and rural expenditure seems to have been considerably abridged due to the significant progress in the agricultural sector of the state in recent years. The percentage expenditure on food items continues to increase in both the rural and the urban areas. It increased from 72 per cent in 1961-62 to 75 per cent in 1967-68 in rural areas and from 64 per cent to 69 per cent in urban areas over the same period. On the contrary, the expenditure on non-food items during this period declined from 28 per cent to 25 per cent in rural areas and from 36 per cent to 31 per cent in urban areas. Further, as Table 1 reveals, the per capita expenditure on food is lower in urban areas as compared to that in rural areas, indicating that the expenditure on food declines as developmental process leads to urbanisation.

Within the food group, it seems that both in the urban and rural areas there is a decline in the percentage expenditure on 'cereals'; whereas there is an increase in the percentage expenditure on 'meat, eggs and fish', 'vegetables, fruits and nuts' and 'sugar'. There is a marginal decline in the percentage expenditure on 'edible oils' and 'beverages and refreshments' in both the urban and the rural areas.

So far as the non-food groups are concerned, both in the urban and the

Note : Figures for 17th round of NSS relate to composite Punjab and those for 19th and 22nd rounds to reorganised Punjab.
Source : NSS Punjab.

rural areas, the percentage expenditure on 'fuel and lighting', 'clothing' and 'durable goods' has declined during the period 1961-62 to 1967-68. So far as the percentage expenditure on 'pan, tobacco and intoxicants' is concerned, it shows an increase from 1.35 per cent in 1964-65 to 2.18 per cent in 1967-68 in the case of rural areas and a decline from 2.09 per cent in 1964-65 to 1.19 per cent in 1967-68 in the case of urban areas.

CONCENTRATION IN CONSUMER EXPENDITURE

Concentration curves of expenditure can be used to study the degree of concentration in consumer expenditure. The concentration curve gives the percentage 100q of the total consumption expenditure by the poorest 100p per cent of the population. So the curve is absolutely independent of units of money and can readily be used to compare the concentration in consumer expenditure of the rural with the urban areas and also between different groups of commodities. Table 2 shows that more than half (51.37 per cent) of the population in the lower expenditure groups in the rural areas accounts for about one-third (34.94 per cent) of the total consumer expenditure. The upper 15 per cent of the population incurs nearly 30 per cent of the total consumer expenditure. In the urban areas

also more than half of the poorest population (52.29 per cent) accounts for about one-third (32.07 per cent) of the total consumer expenditure. But the richest 14 per cent of the population incurs about 30 per cent of the total consumer expenditure in urban areas. Figure 1 shows the expenditure concentration curves for rural and urban areas. It would be seen that there is a slightly greater concentration in total consumer expenditure in urban areas as compared to the rural areas. Further, Figure 2 shows the expenditure concentration curves for 'food' and 'non-food' items. It will be observed that there is a much greater concentration in 'non-food' consumption expenditure as compared to 'food' expenditure, in both the rural and the urban areas.

ENGEL'S FUNCTION

The Engel function for an item refers to the relationship between the quantity or value of the item consumed and income. When data on income are not readily available, we can compute expenditure elasticities as a rough approximation to income elasticities. These expenditure elasticities could then be deflated by multiplying the expenditure elasticities by the elasticity of total consumer expenditure with respect to income because[1]

$$I = \frac{dq}{dy} \cdot \frac{\bar{y}}{\bar{q}}$$

$$= \frac{dq}{dx} \cdot \frac{\bar{x}}{\bar{q}} \times \frac{dx}{dy} \cdot \frac{\bar{y}}{\bar{x}}$$

$$= E.C$$

where I = Income elasticity of demand

$E = \frac{dq}{dx} \cdot \frac{\bar{x}}{\bar{q}}$ indicates expenditure elasticity

$C = \frac{dx}{dy} \cdot \frac{\bar{y}}{\bar{x}}$ indicates elasticity of total consumer expenditure with respect to income.

However, as the relevant data, i e, total consumer expenditure for the purpose of calculating the elasticity of total consumer expenditure with respect to total income are not available for Punjab, such a correction could not be carried out.

The expenditure elasticities for different items of consumption are very significant in economic analysis. These elasticities may be used:

(i) for classifying consumer goods as 'inferior', 'necessary' and 'luxury' goods, which classification provides a useful basis for determining commodity taxes, assessing the tax yield and construction of cost of living indices, etc;

(ii) for projecting future demand of different commodities to ensure proper balancing of demand and supply; and

(iii) for studying the impact of changes in the level of living on the structure of the economy.

It is, therefore, essential to obtain precise estimates of expenditure elasticities. Insofar as their magnitudes depend on the form of the Engel function, it is desirable to estimate them from the relationships which explain the maximum variation in the expenditure on different items in question.

A few important forms of the Engel function used by different researchers in the past are the linear, the semi-logarithmic and the double logarithmic. Not all of them satisfy the basic criteria of feasibility of demand functions. Nevertheless, they have been used because they have their own respective merits. The linear form ($Y = \alpha_i + \beta_i x$) has the advantage of being the simplest of all as regards the estimation and interpretation of the parameters is concerned, satisfying the adding up, the homogeneity and symme-

try conditions.[2] An item is defined as 'necessary' if η_i is positive and lies between zero and unity, as 'inferior' if η_i is negative, and as 'luxury' if η_i is greater than unity. It may also be seen that the magnitudes of η_i and α_i would be inversely related, i e, the larger α_i the smaller would be the magnitude of η_i. Further, the linear form assumes constancy of marginal propensity to consume for all individual consumers belonging to different income or expenditure groups. Besides, it implies that the income or expenditure elasticity of consumption η_i tends to unity as income (or expenditure) tends to infinity.

The most extensively used form is double-log (log $\hat{Y} = \alpha_i + \beta_i \log X$) or constant elasticity Engel curve. In this case, parameter β_i is the income (or expenditure) elasticity of consumption. Insofar as it is free of unit of measurement, it can be applied even to those Engel functions which involve dependent and independent variables differing in terms of units of measurement. It provides convex and concave curvature to the income (or expenditure) axis according as $\beta_i \lesseqgtr 1$ and straight line for $\beta_i = 1$. Besides, it also provides automatic correction for heteroscadasticity of disturbances. With slight modification in the specification it can satisfy all the Slutsky conditions.[3] Its inapplicability to the extreme values of C and $\bar{X}$ (i e, zero and infinity) is perhaps the least serious trouble inasmuch as zero values can be replaced by some very small fraction of the unit of measurement. However, because of the constancy of income (or expenditure) elasticity of consumption, it gives good approximation of the Engel curve only within a small range of incomes (or expenditures) and is not as elegant for the items having $\beta_i < 1$ as for $\beta_i \geqslant 1$.

The semi-log function ($Y = \alpha_i + \beta \log X$) gives good approximation of double-log form in the neighbourhood of average income. It implies a decline in the income (or expenditure) elasticity with rising income (or expenditure) particularly for the items having inelastic demand. It provides positive initial critical level of income although it does not have any asymptote. Despite its nearly acceptable behaviour, computational simplicity and some favourable empirical evidence, it does not command universal applicability.

Since very few forms of the Engel function satisfy the Slutsky conditions, it would be rather difficult to reject/ choose any one of them on *a priori* basis. However, we can test the reasonableness of an hypothesis by fitting the alternative forms of the Engel curve. Thus, for the present study, the future demand is viewed as a function of the average current consumption of each commodity plus (or minus) any change which will result from the expected growth of expenditure and three different forms of Engel functions, *viz*, linear, semi-log and double-log, have been tried to represent the demand relationship.

Expenditure or Quantity Elasticities

The demand analysis could be conducted either on the basis of quantities consumed or in terms of expenditure incurred on different items. Since the NSS Organisation collects information on both these variables, the choice depends largely on the objective of the study. The two approaches are complementary rather than competitive. We can compute quality elasticity of an item by subtracting quantity elasticity of that item from its expenditure elasticity. The quantity elasticities are quite useful in predicting physical consumption of various items. In contrast, expenditure elasticities are helpful in predicting the expenditure on various items. Both are useful in making policy decisions. However, if the items under consideration involve high quality differentials such that with the increase in income the consumer may shift to better quality items rather than consuming more of them, the predictions based on quantity elasticities may be very much of dubious value. Similarly, the change in the price of any item may also bring about some changes in the consumer behaviour through income and substitution effects. Thus, the expenditure elasticities may serve better for forecasting purposes than the quantity elasticities. Besides these analytical problems, the quantity approach involves some difficulties with regard to data. In the present study we have calculated the expenditure elasticities by fitting the following functions:

$$Y = \alpha_i + \beta_i X \text{ (Linear form)}$$

$$Y = \alpha_i + \beta_i \log X \text{ (Semi-log)}$$

$$\log Y = \alpha_i + \beta_i \log X \text{ (Double-log)}$$

In these equations Y denotes the monthly per capita expenditure on a particular commodity and X denotes the monthly per capita total consumer expenditure. The elasticities are worked out at the mean values of the variables.

Expenditure elasticities of demand for various commodity groups can be calculated from cross-section data either in grouped form or on the basis of individual observations. We have calculated the expenditure elasticities on the basis of grouped data. We have used NSS Punjab State Sample 19th Round 1964-65 data (unpublished) as the data for the Central sample on a full matching basis were not available. The expenditure elasticity co-efficient for each commodity is chosen from that form of the three relationships (Linear, Semi-log and Double-log) which has shown the highest co-efficient of determination between the two variables in the equation (or which generally explains the maximum variability in the behaviouristic equation) for the two types of areas studied, namely, the rural and the urban areas. It may however, be added that the use of grouped data for purposes of evaluating demand relationships overstates the correlation between the variables under study though the estimated co-efficients in the demand relationships are little affected whether we use grouped or ungrouped data.

Expenditure Elasticities of Demand

We may now examine the salient features of the expenditure elasticities obtained in this study for the selected commodities. The straight line or linear form of demand relationship has been selected for explaining the family consumption of 'pulses', 'milk and milk products', 'meat, eggs and fish', 'vegetables, fruits and nuts', 'salt and spices', 'beverages and refreshments', 'pan, tobacco and intoxicants', 'clothing' and 'durable goods'. The semi-log form has been found to be a relatively better fit for explaining the consumption behaviour with regard to 'edible oils', 'sugar', 'fuel and lighting'. The double-log form has been chosen for calculating expenditure elasticities of 'cereals', 'food items' and 'non-food items'.

The expenditure elasticity of demand for food items was found to be low both for rural and urban areas. But the expenditure elasticity for 'non-food items' was found to be quite high in both the rural and the urban areas. Within the food group, the expenditure elasticities for 'cereals', 'pulses', 'milk and milk products' and 'salt and spices' were found to be low, but the magnitudes of these elasticities were found to be slightly higher in the rural areas than in the urban areas. The expenditure elasticities for 'meat, eggs and fish' and 'sugar' were found to be

high in both the rural and the urban areas. But the degree of elasticity was found to be higher in the rural than in the urban areas for both these commodity groups. The demand for 'edible oils' was found to be inelastic in the rural but highly elastic in the urban areas. This is presumably because of the fact that the rural people in Punjab have a high propensity to consume 'milk and milk products' and take 'edible oils' only when it becomes essential. Similarly, the demand for 'beverages and refreshments' was also found to be expenditure inelastic in rural areas as compared to highly expenditure elastic demand for urban areas. This may be due to the fact that this item constitutes only a small proportion of the total consumer expenditure in the rural areas. And whatever quantities of it people consume in the rural areas, they will continue to consume almost the same quantities even when the total consumer expenditure increases. On the contrary, in the urban areas the expenditure elasticity seems to be quite high, possibly because of the easy availability of 'beverages and refreshments' to the town people as also because of the widespread demonstration effect in the consumption of such items in the urban areas.

The expenditure elasticities for 'pan, tobacco and intoxicants', 'fuel and lighting', 'clothing' and 'durable goods' have been found to be quite high both in the urban and the rural areas. The expenditure elasticities for 'pan, tobacco and intoxicants' and 'clothing' are marginally higher in the rural as compared to the urban areas. But the expenditure elasticity for 'durable goods' is much higher for the rural areas as compared to the urban areas. This indicates that the rural people have also now taken to the consumption of 'durable goods' and their expenditure on these items is increasing quite fast in the wake of their increasing total consumer expenditure made possible by rising rural incomes.

Projections of Demand for Different Commodity Groups

Economic development implies an increase in the level of expenditure as a result of an increase in per capita income. As expenditure on different commodity groups increases disparately, it is necessary to calculate the expenditure elasticities for different commodity groups for the purpose of projecting consumer demand. Different sets of projections would result from different sets of assumptions used. This study relates to projecting demand for consumer goods for 1973-74 and is based on the following assumptions:

(i) The population of Punjab would be 14,174,343 in 1973-74.[4]

(ii) The growth in per capita income would be 3.5 per cent.[5]

(iii) Within both the rural and the urban areas, the consumption habits will not undergo any significant change between 1964-65 (the base year) and 1973-74 (the year for which the projections are made).

(iv) The relative prices of different commodities will remain more or less unchanged.

(v) The proportion of the population as between the urban and the rural areas will change from 23:77 in 1964-65 to 24:76 in 1973-74.[6]

(vi) The price level will increase by 103.86 per cent assuming a linear growth rate.[7]

To estimate the aggregate demand for different commodity groups (in value terms) based on expenditure elasticities for rural and urban areas, the per capita demand for different commodities for human consumption in 1973-74 has been worked out by using the formula:[8]

$$Q_{rt} = Q_{r0}\left(1 + \frac{R}{100}\right)^{n_r}$$

Where Q_{r0} = per capita availability of a commodity in the year 1964-65 in the rth region (r=1 or 2 according as the region is rural or urban). The subscript '0' refers to the base period 1964-65 and 't' refers to 1973-74. 'R' refers to the expected percentage change in the per capita income between 1964-65 and 1973-74. This is assumed to be the same for both the rural and the urban areas. n_r = expenditure elasticity of demand in 1964-65 based on the per capita expenditure on the commodity in the rth region (r=1 or 2 according as the region is rural or urban).

Table 4 presents the projections of consumer demand for the year 1973-74. Columns 2 and 3 of the Table indicate the annual per capita expenditure on different commodity groups in 1964-65 for the rural and the urban areas respectively. Columns 4 and 5 provide the estimates of annual per capita expenditure, at constant prices, on these items for the year 1973-74. Columns 6 and 7 show the total consumer expenditure in 1964-65 for the rural and the urban areas on the above assumptions regarding the size and the distribution of population in the base year. Columns 8 and 9 provide the estimates of total consumer expenditure in 1973-74 on similar assumptions regarding the size and the distribution of the population in that year. Columns 10 and 11 indicate the percentage increase expected in total consumer demand in 1973-74 over 1964-65 at constant prices for different commodity groups for the two sets of areas. These columns are significant as they indicate the areas or the commodity groups for which the demand is likely to experience a sharp spurt. For example, the demand for 'durable goods' is expected to rise the sharpest in both the rural and the urban areas, i e, by 39.70 per cent in the rural and 40.70 per cent in the urban areas. The other commodity groups for which the demand is likely to rise sharply in the rural areas are 'pan, tobacco and intoxicants', 'meat, eggs and fish' and 'clothing'. In the urban areas the demand is expected to rise considerably in the case of 'edible oils', 'beverages and refreshments', 'pan, tobacco and intoxicants', 'fuel and lighting', 'meat, eggs and fish', in addition to the 'durable goods' in which the increase would be the sharpest. Further, as our experience shows that the inflationary pressure cannot be altogether avoided in a developing economy, there is need to keep a clear distinction between the estimates of demand at constant prices and those at current prices. Columns 12 and 13 provide the rough estimates of the demand for different items in 1973-74 at current prices. These estimates have been obtained on the assumption that the prices of all commodity groups will increase uniformly. [This has been done owing to the non-availability of data on prices by commodity groups for Punjab.] Columns 14 and 15 indicate the percentage increase in expenditure on different commodity groups in 1973-74 over 1964-65 at current prices and give an idea about the percentage increases in monetary expenditure on different items.

In the above analysis we have tried to project the demand for different commodity groups for Punjab on the basis of certain assumptions regarding the size and the distribution of the population between the rural and the urban areas, the rate of growth of per capita income, the stability of consumption habits, the parity in the structure of relative prices and the rise in the level of the wholesale prices, etc. These projections furnish a profile of the consumer demand in the Punjab Economy in 1973-74 and could usefully be utilised for the bilateral task of adapting resources to the structure of wants and the structure of wants to resources.

Twenty-five Years of UNICEF

UNICEF, the United Nations Children's Fund—originally the United Nations International Children's Emergency Fund—was created on December 11, 1946, to provide relief for the suffering children in war-devastated Europe. Today, though UNICEF continued to respond swiftly to emergencies affecting children, most of its programmes are long-term operations, closely related to the national development plans of individual countries. The main categories of UNICEF aid are health, education, training, nutrition and family and child welfare. The shift to developing countries came in the early 1950s.

The first UNICEF shipment reached India in May 1949—150 tons of skim milk powder. This was the beginning of a stream of vital supplies that were to include drugs, vaccines, seeds, garden tools, pump sets, vehicles, dairy plant equipment, science education kits, and many other items. On a rough estimate, there are 25,000 locations in India where UNICEF aid is being used for the benefit of children.

AGRICULTURAL REFINANCE CORPORATION

[Incorporated under the Agricultural Refinance Corporation Act, 1963 (10 of 1963)]

ISSUE OF SHARES — SECOND SERIES

Authorised Capital	:	Rs 25,00,00,000
Divided into	:	25,000 fully paid up shares of Rs 10,000 each
Issued, subscribed and paid-up	:	5,000 shares of Rs 10,000 each
Present Issue	:	5,000 fully paid-up shares of Rs 10,000 each

Under Section 6 of the Agricultural Refinance Corporation Act, the shares of the Corporation have been guaranteed by the Central Government as to the repayment of the principal and the payment of a minimum dividend of 4½ per cent per annum.

The issue of shares is being made under the provisions of the aforementioned Act. In terms of Section 5 of that Act, the Reserve Bank of India will subscribe for 2,500 shares and the remaining 2,500 shares may be subscribed for by central land development banks, state co-operative banks, scheduled banks, the Life Insurance Corporation, insurance and investment companies in the proportions specified below, subject to the condition that no institution will be allotted more than 10% of the shares reserved for the class of institutions to which it belongs:

Central Land Development Bank and State Co-operative Banks	1,500
Scheduled banks, the Life Insurance Corporation, insurance and investment companies and all societies which are registered or deemed to be registered under the Co-operative Societies Act, 1912 (2 of 1912) or under any other law for the time being in force in any State relating to Co-operative Societies and carrying on insurance business	1,000

Applications will be received from 8 December 1971 to 7 January 1972 both days inclusive at

(a) the Head Office of the Agricultural Refinance Corporation, Shrineketan, (Shivsagar Estate) 'F' Block, Dr Annie Besant Road, Worli, Bombay 18 WB.

(b) the branches of the Reserve Bank of India, Bombay, Calcutta, Madras, Bangalore, Kanpur, Patna, Hyderabad and New Delhi.

No subscriber can make more than one application.

Copies of the prospectus giving full particulars of the shares offered and the form of application can be had free of cost at any of the abovementioned offices. Tender of the full purchase price of the shares applied for must accompany applications.

Payments must be made by cheques or draft on a bank situated at the place at which the application is being made. Cheques and drafts should be drawn in favour of the office at which the application is presented.

The Market for Graduates—A Field Report

Enno W Hommes

Nivedita Trivedi

While it is generally known that there is widespread unemployment among graduates, not much is known about the graduates themselves, about their backgrounds, or about the way in which the market for them operates.

The following paper is based on the findings of a sample study of graduates from local colleges of Bulsar in south Gujarat. It attempts to trace the character of unemployment among graduates, the procedures and influence patterns prevalent in recruitment, and the social setting which makes unemployment impinge with quite differing magnitudes on the different caste and class strata.

[This article is a field report on one of the case studies of a larger Indo-Dutch research project on modernisation processes in Bulsar. The research project has been financed by the Netherlands Foundation for the Advancement of Tropical Research and the Universities of Amsterdam, Rotterdam and Leyden.]

EVERY few months, thousands of fresh graduates enter the labour market. Many of them have studied with great sacrifices being undertaken by their families, and many with grants from the government. They all know that the employment prospects are very poor for graduates, yet they have taken the trouble to go through four years of college after their matriculation, expecting graduation to give them better access to jobs.

Although it is generally known that there is serious unemployment among graduates, not much is known about the unemployed graduates themselves: Are they unemployed because they are of a lower calibre? Do they belong to the lower castes? Are they completely unemployed, or do they have some sort of low-paid jobs? What really is the situation of the graduates, and how does the labour market for them function?

We analysed a sample of graduates of the local colleges in Bulsar in south Gujarat.* From among 735 BAs, BComs, and BScs, who had graduated in the previous three years, we selected every third student for our sample. So the sample consisted of 245 graduates. The position of these graduates on November 1, 1970, is given in Table 1. We interviewed all the students who did not go for higher studies; we interviewed them in their homes, mainly in the villages around Bulsar. We found that there is a marked difference in the position of the girls and the boys. We shall present our analysis of the male graduates first.

'Higher Studies'

Although our study is focused on the graduates who tried to enter the labour market immediately after graduation, we also collected some information on those who went on for further studies. In Table 2, the different types of higher studies which these students selected are shown. To some extent, 'higher studies' can be considered as 'disguised unemployment'. A person may go in for higher study because he cannot get a job. This is true especially of those who went in for LLB. Many interviewees told us that they went to law college, "just to pass the time". The Bulsar labour market has hardly any scope for law graduates. Yet even BScs took up study of law, although it is improbable that the double graduation would improve their chances in the labour market. Those who went for BEd, generally spent some time at temporary jobs working as high-school teachers; in selections for admission to the BEd course, preference is given to persons with some experience, and the BEd which is a one-year course is required of those who want a permanent job in a high school. The BEd cannot, therefore, be considered as disguised unemployment.

From a sociological point of view, it is interesting to know whether those who went in for higher study were mainly those with better qualifications and those belonging to the higher castes. The position is given in Table 3. About half the students from the higher as well as from the lower castes go in for higher studies. Later, we will show that the position of the lower castes in the labour market is very bad because of their lack of influence; by going in for higher studies they can avoid immediate unemployment, and the grant system makes it possible for them to take up further courses. Their families are not deprived of extra income as a result of their choice, because most of them would have been unemployed anyhow.

The figures relating to differences in quality are very striking. That many first-class students should opt for higher studies seems but natural; but many third-class students also go in for higher studies. We found that the labour market is very difficult for third-class students so that it was likely that the threat of being unemployed motivated them to go in for higher studies. The figures also indicate that caste is not relevant to the quality of the student. In fact, the results of the low-caste students were slightly better than those of the high-caste ones.

The Unemployed

On November 1, 1970, the percentage of unemployed in the three years of graduates trying to enter the labour market were:

1968: 22 per cent
1969: 42 per cent
1970: 61 per cent

One cannot conclude from these figures that there has been an increase in unemployment. They may simply indicate the slowness with which graduates get jobs. This slowness is even more clearly evident in Table 4. From this Table, it becomes clear that on an average the 1968 graduate was unemployed for 10 to 12 months. In many cases, there were intervals when the graduates had low-paid or temporary jobs. When we restrict our discussion to the 1968 generation, we cannot say that the remaining 78 per cent of the graduates have found a permanent place in the labour market. A number of them have low-paid jobs or temporary jobs. Some of them have been working as machine-operators for years and the chance that they will ever get a job to suit their education is small. From our findings it was clear that caste plays an important role in securing a job (Tables 5 to 8). Graduates from the lower castes are not only more often unemployed, but they are also on an average unemployed for longer periods.

* The law college and the polytechnic were not taken into account because they were only recently established.

Moreover, they have more often to accept low-paid jobs. Finally, their average income is lower than the average income of the high-caste graduates. The main reason for this situation is their lack of influence. In the section on influence patterns we will analyse this more extensively. The quality of the graduate is, nevertheless, also an important factor in getting a job. In Table 9, the effect of the difference in quality becomes especially clear in the income levels.

Low-Paid Jobs

The families of many graduates are badly in need of money, and the graduates then are ready to accept low-paid jobs. Thus a number of them are working as machine-operators for Rs 175 a month. Others are working as so-called 'apprentices' to accountants, for Rs 50-100 a month, though their work has little 'apprenticeship' quality about it and they are simply cheap labourers. The graduates, in fact, are doing all kinds of jobs; one sells vegetables in the market, another does transport work with a bullock cart, and one is selling cutlery with a hand-cart. Of all the employed graduates whom we interviewed, 35 per cent have low-paid jobs, which we defined as jobs below Rs 200 a month. The income of the others ranged between Rs 200 and 300. A normal salary for a fresh graduate is about Rs 275.

The teachers in high schools in rural areas constitute a special category of low-paid graduates. We came across a number of them getting only half-pay. Their financial position is more often than not vague and uncertain. Sometimes they get no income for months. Yet they are prepared to accept such jobs because they can get the experience which they need for admission to the BEd course. Moreover, as one informant put it: "Rs 150 is much better than nothing".

K is the son of a land-labourer. His father earns Rs 2-3 a day. To finance his study, K took a loan of Rs 1,000 from his father's employer. During his study at Bulsar, he did a number of odd jobs to earn some money on the side. After finishing his graduation he was unemployed for some months. Then he suddenly got a job in a high school in the interior. His earning would be a welcome addition to the low family income. Although he was told by others that the school paid poorly and unreliably, K accepted the job. For some months, he did not get any pay at all. After that, he got Rs 150 a month. It was a temporary job, and in seven months he earned a total of about Rs 600. When we interviewed K, he was again unemployed for some months. He had no hope of getting a job within a few months.

Some graduates, however, told us that they were not ready to accept low-paid jobs, because they are afraid that it would reduce their chances of getting a better job. When you are applying for a job as a chemist, it is no recommendation that you have been selling cutlery with a hand-cart.

Functioning of the Market

The labour market for graduates is limited in and around Bulsar. BScs can get jobs as chemists in one of the industrial concerns in the Atul complex. But, apart from that, the demand for them is very limited. Small-scale industries generally do not take graduates. Some BScs are working in banks, and high schools absorb a number of them. BComs have to rely main-

ly on banks, so they complain about the fact that banks also take BScs and BAs. For the BAs, *jobs in the high schools are important.*

Most of the jobs are advertised, or they are known to the graduates via the employment exchange. There is a lot of competition and it is not unusual to find 200 applications for one job. The usual procedure is that some of the applicants are invited for an interview; after that the selection is made.

Almost all the unemployed graduates whom we interviewed gave 'lack of influence' as the main reason for their unemployment. The idea that it is hardly possible to get a job without *using influence is* also generally supported by our research *findings.* About 80 per cent of the graduates who were employed admitted that they got their employment through influence. The remaining 20 per cent were either employed in their family-business or they got a job for which recruitment is organised on a regional or national basis. It seems to be difficult for most graduates to use influence at that level. For instance, in the nationalised banks, recruitment is organised on the regional level. Very few graduates have influence-channels through which they can reach the level of regional managers. We came across only one or two such cases. In the local private banks, however, recruitment takes place on the basis of local influence. Very few of the graduates got jobs in Surat, Baroda, Ahmedabad or Bombay, although quite a number of them had tried. An additional difficulty in a city like Bombay is that employers expect knowledge of English, and most of the graduates can speak hardly a sentence in English. Also, graduates do not want to go out of their villages. Recently, an all-India organisation recruited a large number of graduates from this district, but when they were appointed a number of them did not take on the job.

Influence Patterns

We asked all the employed graduates how they got their jobs. Some were reluctant to give this information, as they were doubtful about its effect on their position. We assured them that we did not want any names and that we were only interested in general patterns—whether they had got their jobs through family, caste-members, friends, people from their village, or through influential people like political leaders and social workers. When the question was framed in this way, we had no difficulty getting the information. In Table 10 we show the frequency with which the different relationships are used, either as the first link or as the second. In this Table we have simplified by giving only the most important links. In some cases, the chain was quite long. The Table represents the influence channels for different jobs. It thus becomes clear that family members are by far the most important links between the graduates and their jobs. This is especially true of the first link. In the second link, friends are more important. The very modest role of caste is interesting. This seems to contradict our conclusion that the higher castes have a much better access to the labour market. But, of course, family members are caste-members, and if one belongs to one of the higher castes then it is possible to have access to the other high castes with influential positions. An interesting phenomenon is that the graduates almost never approach influential people directly. We find the influentials in the second links, which means that they are approached through family or friends.

We would like to compare the position and influence channels of two different castes to illustrate our view of the significance of different influence channels. We selected the Desais, a dominant caste of big landowners, and the Kolis, a community of small landowners and land-labourers.

	Employed	Unemployed
Desai	12	3
Koli	6	7

Out of the six employed Kolis, four had low-paid jobs. Out of the 12 Desais, only three had low-paid jobs. So the difference in their condition is very striking. All the Desais, except one, got their jobs through family or caste-members. The Kolis had to rely mainly on friends, as they do not have family or caste-members in influential positions. We realise that these figures are small, but the differences are so great that we feel justified in using them.

What is 'influence'? This is difficult to answer. Our research material shows different ways of getting a job.

A graduate has the strongest position in the labour market if he belongs to an influential family. Employers who have a clientele relationship with the family are simply asked to employ the fresh graduate. In sociology, this relationship is called 'patronage'; the patron (the influential) can influence his clients to do what he likes. He may not only secure jobs for his own family members, but he may also see that employers take any man he introduces. Another type of strong influence is exercised by the business relationship. A big account-holder in a bank might ask the manager to employ one of his proteges. But, in the majority of cases which we analysed, this influence channel is not strong at all. Relatives and friends have to ask employers for a favour. Whether the favour is given or not depends on the strength of the position and of the relationship of these friends or relatives with the employer. The weakest influence channel is the one that goes through friends.

The Role of Helper

What makes a man help a client, a family member, a caste-member, or a friend, to get a job? A patron favours his clients in order to increase his own power-structure. At any time in the future he can be repaid by votes, labour, or any other services. The position of the client is controlled by him:

S got a job in a high school through a village leader (caste-member), who, in his turn, approached a local politician, the chairman of many educational societies. This politician is a typical patron. He has control over many organisations. Almost daily, people go to him for his help to get a job. After some months of service, S wanted to leave because he did not like the job. But this was very inconvenient to the principal. The principal went to the local politician who in his turn called the village leader. Finally the village leader forced S to keep his job, threatening that no help would be given to him in the future if he left the job. So S decided to stay.

The 'duty' to help members of the family to get a job is one that is not only generally accepted among family members but is recognised by employers too.

More complicated is the situation with friends and with people from the neighbourhood. In explaining their motivation, we touch on the complicated system of mutual obligations that characterise the Indian social setting. The fact that one lives in the same village, goes to the same school, or works in the same factory, puts the whole system of mutual obligations into function. These obligations are basically not different from the obligations typical among family members. To help a friend to get a job is not so much a favour as a moral obligation. Most interesting is what could be called 'third party involvement'—i e, obligation extended to friends of friends or relatives of friends, or friends of family members. This 'third party involvement' is not taken for granted in Western countries. However, while friends are generally ready to keep their obligations, just sometimes they are reluctant to do so. As one informant told us: "By helping somebody to get a job, I have to ask the management for a favour, which weakens my position". Especially those who themselves have an uncertain position are reluctant to keep their obligations. Many of the low-caste graduates told us that it is for this reason that their caste-members are not ready to help them. Unemployed graduates complained about this behaviour, maintaining that it should be important to keep one's obligations.

Role of Employer

Why do the employers accept the influence patterns? The clients of influential people have to accept the graduates sent to them whether they like them or not. They have to accept them because some time they will need their patron for one thing or another. Employers may accept the influence because of business relationships; we have already given the instance of the bank manager who took a graduate sent to him by a client who had a big account. But in the majority of cases employers are under no duress; nevertheless they accept the influence pattern and take on certain candidates. The main reason why employers seem to accept the candidates who come through influence is that they hope to increase their control on their labour force. By employing a man through somebody else he already has a relationship with—preferably somebody in his own factory—the employer can increase his control over the new employee. When the newcomer does not behave according to his wishes, it is possible for the employer to control him through the man who sponsored him for the job. For this reason, a number of industrialists keep a list of their labourers side by side with the names of the people who brought them.

T, for instance, got his job in the factory through his uncle who supplies raw material to the factory. After some time, T became active in the labour union, and on behalf of this union he had to fight a case with the management. Then the manager called his uncle and told him about the 'misbehaviour of his nephew'. Immediately, the uncle put successful pressure on T to stop his labour union activities. This type of social control is, therefore, of invaluable importance to the management.

Corruption and Malpractices

Influence patterns can nullify differences in quality. When a first-class graduate and a second-class graduate are trying to get the same job but if the influence channel of the second-class graduate is stronger, it is the latter who will definitely get the job. We came across some of these cases. In one case (in an educational institution) the first-class graduate objected to this, and brought the case for consideration to a higher administrative level. The employer was then forced to dismiss the second-class graduate and to take the first-class graduate.

Though the graduates have a strong dislike of this aspect of influence, most of them accept influence as such. It is interesting that the graduates talk of 'corruption' only if money is involved. Before we started our research, we expected that lack of influence could be compensated by money. But our research findings did not support this hypothesis. Our impression is that the role of money is negligible in the labour market for graduates. Many graduates stated that money does play a role, but when asked if they could cite some concrete examples even without mentioning any names, their answer was in the negative. We came across one case where a man was asked to pay some money but was not prepared to give it. And one influential politician told us that his friends in a factory did not like it when he sent them graduates with a note from him, because then they could not ask for money. It is not impossible that the actual role played by money is greater than we were able to discover because people are understandably reluctant to talk

about it. But there are also some sound reasons why money might in fact play a minor role—the most important of them being that many jobs are temporary, or at any rate involve a trial period. Nobody would want to invest his money in a temporary job when he might be unemployed again after some months. But the story is different with permanent jobs. For instance, graduates who have temporary jobs in banks might pay money to the local manager in order to get themselves confirmed in the job. However, we do not know how often these things happen. But it is clear that money has to be employed together with influence: only when you have a good influence channel can you corrupt somebody. The reason for this is quite simple. Corruption is always risky for the recipient, and only when he can rely on an influence channel is he prepared to accept the risk. The amount of money involved is, of course, very difficult to trace. The estimates given by our informants range between Rs 500 and Rs 1,000.

A special problem is that of the graduates who work in high schools for half pay or for no pay at all but who have to sign for receipt of the full salary. Sometimes, the first three months' salary is considered a 'donation' to the high school. We did not try to find out what happened to this money, but it is relevant that the graduates themselves think it goes into the pockets of the management. This problem is, of course, well known in India and many government committees are trying to cope with it. Even when high school teachers try to get admission to BEd they come up against corruption. Many graduates told us that to get admission a 'donation' of upto Rs 1,000 may be required.

Although influence is a generally accepted pattern, many factories and other organisations still pretend to have objective selection methods. They put up an appearance of organising 'interviews'. But, in fact, the 'interview' lasts only two minutes. Understandably, the graduates hate this situation. They have to travel long distances, they have to wait, and all the time they hope that the interview is serious. One informant, who had gone through this procedure several times, said: "Sometimes I feel like taking a gun with me and forcing the manager to accept me". Nevertheless, many graduates are happy when they are called for an interview. Often, you need a good influence channel to be interviewed at all.

In this respect, graduates belonging to scheduled castes and tribes are particularly badly off. Although officially there are reserved seats for them, there are several known ways in which employers can avoid the implementation of these rules: Some of the lower-caste graduates claimed that their applications were simply removed from the files; or, of course, they 'fail' the interview. Especially high schools are disposed against low-caste graduates because—as the principals put it—"their language is very bad". We are inclined to believe that their caste is more important than their language.

Reactions of Graduates

How do the graduates react to all the difficulties that confront them? Some of the graduates had applied more than 100 times for a job, in vain. Others had applied only four or five times because they knew it would be useless to apply without influence.

Before we started our research we had believed that the graduates would have radicalised their attitudes. The student unrest in the big cities is, after all, an indication of the relation between frustration and radicalisation. We tried to measure the radicalisation in the different fields of caste, religion, and politics. Perhaps the most striking result of our research is that radicalisation is negligible among the graduates. Moreover, there is hardly any difference in this respect between the employed and the unemployed. Although more detailed analyses of our findings are yet to be done, the overall impression is clear. The difficult and partly corrupt functioning of the labour market has failed to bring about significant radicalisation. We will try to explain this situation.

In the first place, we found that the graduates are still strongly embedded in the traditional social setting, defined by joint family, caste, and village. In this situation, the graduates in many families do not bear much responsibility. The responsibility for the family, including for themselves, rests on older brothers or father or uncle. We have seen that family plays an important role in getting a job: in fact, the major responsibility for finding a job rests with the family. Consequently, the graduates are not considered blameworthy when they do not get a job, by either their family or their community. Secondly, there is the fact that, in the social environment of the graduates, there are many unemployed people anyway. It was not unusual for us to interview the 'unemployed graduate' in the presence of many other caste-members and villagers who were also unemployed. Thirdly, we found an almost complete lack of political and social consciousness among the graduates. More often than not, the graduates had almost no knowledge about the socio-economic problems of this country. When we gave them a list of the political parties and asked for their comments on them, there were some who asked us what the letters 'CPI' stood for. The lack of fresh ideas was striking. It was difficult to imagine that we were interviewing a generation that had passed through four years of college-education. Strangely, we found the older generation, too, frequently complaining about the dullness of the fresh graduates. No doubt, the educational methods in the colleges are partly responsible for the failure to stimulate critical thought.

A consequence of the inertia of the graduates is that they do not try to improve their position in the labour market in any rational way. Few take up extra courses like typing and stenography. We did not come across a single graduate who was trying to improve his English.

The present lack of radicalisation, however, cannot be projected indefinitely into the future if graduates continue to be produced without a corresponding supply of jobs. The experience in some big Indian cities proves that radicalisation can start with a comparatively minor incident. In fact, it seems likely that the problem of unemployment among graduates in and around Bulsar will become critical as the market is saturated. Industrial development has been taking place in small-scale industry, and here there is little scope for the graduates.

The Women

In our study of the graduates, we decided to treat the girls as a separate category, because we felt that their position would be qualitatively different from that of the boys — not only as regards the labour market but more so as regards their approach to employment and education itself.

Early on in the interviews, it became clear that their 'motive' for joining college was not employment. Only 10 of the 59 girls were working; most of the others never made any serious attempt to get a job. Obviously, studying with employment in mind, played little or no role in the education of most of the girls. Only a small number of the girls belonged to low-income groups. Moreover, the few who want, or need, jobs can't get them. Such difficulties are not new, but more and more girls still join college each year. The 'motive', then, may be found in the sphere of marriage.

Evidently, to the girls themselves, their education does not mean much. Excluding the small percentage who are working, the others seem to make no use of their education, nor are they very enthusiastic about it. As one girl put it succinctly, "One must have some degree". In a society where marriage for girls is a must and is often the only 'career', and where for the family 'marrying off' the daughters is important for prestige and status, it is logical to put daughters through college. Educated and well-settled men of caste want at least graduate brides. The girls are also conditioned to this way of thinking: education is part of the whole 'package' necessary for marriage, comprising good looks, good family, various accomplishments. This point is reinforced by the fact that about 75 per cent of the girls are of high caste, and an even higher number are from the higher income groups who can afford college-education. Among girls of the lower castes, this argument was much less important. Their main objective in graduation was to secure a job. Their plight was therefore worst of all: on the one hand job opportunities for girls are almost non-existent, and on the other the marriage prospects of these graduate girls become limited since few boys from their caste are graduates. This discourages other parents from sending their daughters to college.

The girls who intended to take a job chose their subject in the hope of getting a school teaching job. But most schools prefer men teachers or do not have vacancies. Banks, too, do not employ women here nor do any of the big firms — it is an unspoken, unwritten policy of most firms. One girl who had appeared for an interview at a bank complained bitterly that "some firms and banks would interview a few girls along with the boys only because they cannot declare that they do not employ women".

If women in this area had access to the labour market, which section of women would go in for jobs? It seems likely that more and more lower-caste girls would go in for college studies then and later try for jobs as well. But by and large we found the girls at present remarkably lethargic, uninterested, and unaware about many things. Few had any opinions on any of the questions on caste and politics, and most of them were startlingly pessimistic. Many made it clear that they had no interest in their subject (at graduation) and few have kept in touch with it.

Emancipation

As important as emancipation of the girls is emancipation of the lower castes. To what extent could the lower castes improve their position by entering the colleges? One of the main findings of our research is that their position is very difficult, because of their lack of influence. Lack of influence is mainly due to the fact that the lower castes are newcomers in the labour market. After 10 or 15 years, they may have a majority position and then real emancipation could start. But there are two qualifying factors here. In the first place, it is possible that the increasing shortage of jobs will lead to the higher castes monopolising the market even more. Secondly, the resultant social tensions may snowball into a radical movement. This may not be of a Leftist character. As far as we could find, such radicalisation as there has been is more of the fascist kind. Bulsar is, of course, not an island, and much will depend on the developments in India at large.

Civil Strife and Doctrine of Responsibility

A Comment on the Events in Ceylon

R S Perinbanayagam

IN the extensive coverage given to the abortive revolution or insurgency in Ceylon, the notion that the punishment that has been/is being meted out to the insurgents is unjust and immoral has been canvassed. Such a view, it seems, is based on the following assumptions: (a) the insurgents were youthful idealists; (b) the left oriented government in Ceylon had somehow deserved the insurgency; (c) uprisings and insurgencies in any country must somehow be an expression of just grievances; and (d) the insurgents were mere victims of unwarranted terror and repression. While many observers on the left have made one or more of the above assumptions in their attack on the government of Ceylon, it is Vinayak Purohit who gave it sturdy expression in a long analysis, where he concluded:

> In conclusion I must confess to my sentimental weakness for the brave and heroic deeds performed by the young in Ceylon. They fought against heavy odds and against a fantastic combination of international powers. Their timing and tactics may be faulted, but their desperate valour will probably find a permanent place in the history of their socialist movement of Ceylon. For the time being Sirimavo Bandaranaike has prevailed. She and her successors will however not be able to forget that the youth of the nation did try to make Ceylon, if not the emerald, at least the ruby of the Indian Ocean. (*Economic and Political Weekly*, Special Number 1971.)

In a more vitriolic piece, a "Special Correspondent" writing in July has also romanticised the uprising in Ceylon and painted gruesome pictures of the reprisals by the army and the police on the insurgents or those suspected to have been involved.

> In most cases the armed forces have razed villages during curfew hours, captured youths and shot them in the cemeteries. Eye witness accounts speak of hurried burials with cartridges strewn in the cemeteries ... Reports of police atrocities, army killings of civilians, public executions and savage conduct of the repressive forces of the state are pouring in. (*Economic and Political Weekly*, July 17, 1971).

These observations and the data they are based on may very well be untrue. It is not my purpose here to challenge the facts of these stories nor even to deromanticise Vinayak Purohit's heart. I do however want to challenge the thesis that youthful revolutionaries are exempt from responsibility for the privations visited upon the entire people of Ceylon (which includes the deprivation of civil liberties of the masses, virtual police and military government and, not least, the threat of a right-wing *coup d'etat*). The thesis implicit in the *Economic and Political Weekly's* treatment of the troubles in Ceylon seems to be that the government — a duly and popularly elected one — acted without morality in defending itself from an armed insurrection of a minority of the population, and turned to the only instrument at their disposal to meet such an insurrection — the army and the police. Once the insurgents begin the activity with arms and armed attack on policemen and their offices, the response of the government is also *ipso facto* predetermined by the insurgents. If, for example, the leaders of the insurgents had challenged the government to a cricket match, the

government would have arranged for such an encounter; if the challenge was for an armed contest, it is quite foolish to expect the government to field a cricket team. In other words, the moment the insurgents launched their attack and by the manner of their launching it (by attacking the police posts in outlying districts) they determined not only the nature of the conflict, but virtually cancelled the government's powers and invited the violent and brutal men of the military to become almost the rulers of the country. When a civil government of a country is driven to the expedient of calling upon the military to maintain internal peace, the government is quite literally in the power of the military whereas before such an event, the opposite was the case. To put it briefly, the government in effect abdicates all or some of its powers to the military. For all actions of the military henceforth, the government can bear only technical or legal responsibility in the hallowed tradition of the British parliamentary system. The causal responsibility however lies elsewhere: with those who created the situation in which the government had to abdicate power to the brutal men of the military on the one hand and the military itself on the other.

They Speak the Language of Violence

Once such a situation is created — one assumes that even youthful revolutionaries have the intelligence to anticipate that once the firing starts, it will be returned — and the military takes over, it can act only in the style and manner it is trained to do. The military by training is a machine that does not pause to ask Socratic questions and engage in subtle disputations. Force of action and the force of their weaponry are the only instruments at their disposal — indeed the only language they speak is violence and the only categories they recognise are friend or foe. Hence once they are let loose among civilian populations where such a language is not readily understood or these categories are not valid, one can expect only violations of the rule of parliamentary law. It is the same whether the army is one from Germany on the Russian front or Americans in My Lai or the Sinha Regiment in Kegalle or some other place in Ceylon.

Hence, the romantic yearnings of parlour revolutionaries apart, the basis of political action should be the likely consequences of contemplated activities and an examination of the cost in suffering and persecution. If such an examination yields the answer that the suffering and persecution are a necessary price to pay for future liberation or that present suffering warrants such activities irrespective of future suffering, then armed insurgents we must become. However part of the calculus must also involve the chance that the insurgency or revolution may make matters worse for the foreseeable future. Once the decision is taken, the responsibility for the actions and the consequences cease to be exclusively the opponent's. Dialectically speaking, both the enemy and the initiators would have created — with varying degrees of responsibility — the ensuing conditions.

In the end, what do we know of the insurgents? That they are young and enthusiastically committed to a revolutionary change in the society in a more egalitarian direction, to reach which goal they were willing to take to arms, is undisputed. Did they however possess and announce any systematic programme of action to achieve these goals? The answer to this question is an unqualified negative. Besides vague and mindless references to the expropriation of tea and rubber plantations and their conversion to usage by peasants, there was no theoretically informed and practically workable programme forthcoming from the insurgents at any stage of their four or five years of existence. On other matters of urgent importance facing the people of Ceylon, the JVP is no less secretive except on the question of minorities in Ceylon — Indian Tamils, Ceylon Tamils, Burghers, Christians, etc—on which question the JVP has, no doubt in pursuance of its rationalistic, internationalistic and socialistic convictions, announced a virulent Sinhala-Buddhist chauvinism reflecting the fact that almost its entire recruit-strength and social base was also Sinhala-Buddhist.

Indispensable Ingredients

A sentimental attachment to violence against the establishment *per se* has never led to a successful revolutionary transformation of a society. While passion, ardour and guts are imperative, intelligence and knowledge are indispensable in any programme of change.

LOK UDYOG

(PUBLIC ENTERPRISE)

(A monthly in English)

For authentic information on the public sector enterprises.

Includes articles by Chief Executives, eminent management experts, economists on problems of Public Enterprises management, economic and industrial development.

Some of the contributors include Shri J R D Tata, Chairman, Air India, Shri S Bhoothalingam, Director-General, National Council of Applied Economic Research, Shri P L Tandon, Chairman, State Trading Corporation of India, Shri K T Chandy, Chairman, Hindustan Steel, Dr Vikram A Sarabhai, Chairman, Atomic Energy Commission, Prof Jan Tinbergen, Nobel Laureate.

Special features in recent issues :

Management Information Systems, Industrial Relations, Techniques of Financial Management, Appraisal System.

Regular features:

Project Review * Enterprises round-up * Public Sector in Parliament * Public Sector Abroad * Book Reviews * Research & Development Statistics.

Editor :

Ajit Singh,
Director,
Bureau of Public Enterprises.

Single Copy Rs 3
Annual Rs 30

Payment : Crossed Cheque/Demand Draft/Postal Orders in favour of "Deputy Secretary (Coord), Bureau of Public Enterprises, Ministry of Finance".

Send your remittance to : Assistant Director, Bureau of Public Enterprises, (Information and Research Division), Ministry of Finance, 'F' Wing, Nirman Bhavan, New Delhi-11.

Post-War Leadership

IN terms of history this has been a most unusual war. Wars very rarely work out according to the plans of any of the protagonists. But this one, at least in its short-term consequences, has totally fulfilled the immediate aims of the Government of India. Bangla Desh is now a fact. Yahya Khan's regime in West Pakistan is in great disarray and its army is discredited in the eyes of the populace. Some of the refugees in India have already started trekking back to Bangla Desh. The Americans, in spite of the theatrical gesture of sending the Seventh Fleet into the Bay of Bengal, shied away from getting dangerously involved in the conflict. The Chinese, for all their anti-Indian and anti-Soviet rhetoric, did not provoke even a minor skirmish on their Himalayan frontier—and probably never intended doing any such thing. In all these senses, the Government of India's shrewd calculation and control of the sequence and outcome of developments during the last two weeks can only be regarded with awe. The Government and the armed forces, it can be seen with hindsight, must have carefully worked out contingency plans for most eventualities, once they began to back the Mukti Bahini seriously in September-October. And these plans seem to have been executed with a good deal of despatch and precision once the all-out fighting started with the Pakistani air attack on the western front on December 3. Of course, the collapse of Pakistan was made surer by the incredible bungling of the Pakistani regime in every sphere—internal political, diplomatic and also military.

The top layers of the army and civil service are likely to be so discredited and demoralised by their straight record of progression from one fiasco to another, that they will pass on the task of facing up to the consequences of defeat to Bhutto as soon as they can. But at a time when a leadership with the political finesse to consolidate and soothe the disenchanted people of West Pakistan is most needed, Bhutto's style of leadership, going by past experience, is likely to be a self-defeating formula of socialist slogans and more anti-Indian rhetoric.

It is not, however, in Pakistan alone, that the quality of the political leadership is likely to be the crucial element. Without detracting from the need for efficient administrators, economic planners and engineers, the prime need in Bangla Desh also is for a political leadership which will command the necessary prestige and respect to mobilise the people of the country for the tasks of national reconstruction instead of mounting reprisal campaigns against those groups which have admittedly caused much suffering in the last eight months. The Government of India cannot order the Indian army to carry out indefinitely the delicate task of restraining the Mukti Bahini and other irregular armed men from mass reprisals against Biharis and suspected collaborators. This is a task which can be fulfilled only by the political leadership of Bangla Desh. If Mujibur Rahman is still alive, it should be the Government's primary objective to get him released in negotiations with West Pakistan. We have a number of bargaining counters, including West Pakistani territory and soldiery, to demand his release. Although he proved to be extremely politically naive in his assessment of the nature of military regimes, Mujib is still probably the leader most capable of creating political calm in Bangla Desh in the initial period of its genesis. In his absence, the Awami League leaders of the erstwhile provisional government have been noticeably reticent in facing up to the tasks of providing leadership to the new nation.

On the international stage it might look as if the Russians have gained great influence in South Asia by backing the winner and the Americans have suffered a grave setback. But after the drama dies down, the Americans will in all probability work towards regaining influence in India and establishing themselves in Bangla Desh by renewing their aid programmes and soft-pedalling their hitherto pro-Pakistani postures. And the Russians are not likely to take serious exception to this as their global view precludes them from antagonising the Americans too much, especially at a time when they are seeking mutual arms cuts with the Americans and require American co-operation for a much-desired European Security Treaty. Moreover, they would want to reopen contact with Pakistan, just as the Americans would with India and Bangla Desh. The Chinese are also a super power, notwithstanding their denials, and would be looking for better relations with Bangla Desh and India. To be sure, this general lowering of tension by all concerned is hardly likely to make this an area of big power co-operation; joint interference would be a fair description of what appears to be in store.

Exchange Rates

The Dollar Link

THE critics of the United States in this country, whose numbers have multiplied so dramatically in the last two weeks, have seen the capitulation of the Nixon Administration on the issue of devaluing the dollar almost as retribution for its policies towards Bangla Desh and the India-Pakistan war. Such is the mystique about the exchange rate of a currency! Fortunately there is more to exchange rates than national prestige which makes it possible, though still not easy, for countries to bargain about them. Proof of this is the slow but steady movement, now on the verge of completion, that we have seen in the last few months from one set of exchange rates for the world's leading currencies to another set after an interlude of floating rates.

The experience has been instructive, among other things for having subjected the claims of floating exchange rates to the test of actual operation. It has been established that floating rates are no magic formula for reconciling the conflicting economic ambitions of partners in international trade. Under the regime of fixed exchange rates, the US was able, through wide-ranging governmental management, to carry through massive programmes of capital investment abroad, particularly in Europe, even as other countries' holdings of the dollar mounted to levels at which there could not be the slightest hope of their conversion at the official rate of $35 per ounce of gold. A regime of floating rates is subject to the same sort of management ('dirty floating') to insulate supposedly free exchange rates.

The US decision to devalue the dollar, announced after Nixon's meeting with President Pompidou of France last Wednesday, reflects the United States' assessment of the balance of political and economic advantage to it from return to a state of fixed exchange rates. The Nixon Administration evidently decided that it could not carry on its war of attrition against the West European countries and Japan, with the 10 per cent surcharge on imports and the buy-American tax incentive on new investments, without affecting its political relations with these countries. Nixon is scheduled to visit China and the Soviet Union early next year and he appears to have calculated that it would scarcely help him in his talks with the leaders of the two major communist powers if the US and the Western countries remained at loggerheads in their economic relations. Also material has been the fear that international currency uncertainty might affect the prospect of internal economic recovery.

The US agreement to devalue certainly removes the major road-block in the way of a return to a regime of fixed parities for the world's leading currencies. The major issue that remains to be determined is the average change in parities needed *vis-a-vis* the dollar and how this change is to be shared among the various countries, including the US. Two other related issues which the US had been insisting on settling are those of new agreements with Europe on trade and on sharing of the military burden. The US has now apparently dropped its insistence on settling these issues along with the parity realignments as a package deal. It should not be surprising, therefore, if the new currency parities are agreed upon at the meeting of the Group of Ten in Washington this weekend.

The devaluation of the dollar, when it comes, will confront the Government of India with the decision whether to maintain the rupee's link with the dollar which would require an equivalent devaluation of the rupee. As a result of its link with the dollar, the rupee already stands devalued in relation to the yen and those European currencies which have appreciated in relation to the dollar during the period of floating rates. The decision to link the rupee to the dollar was based on the consideration that the country's competitive position would be best served by preventing the rupee from appreciating in relation to the dollar and securing for it the advantage of the full extent of the appreciation of the other major currencies. Nothing has happened since then to alter the economic logic which would now require the rupee to be devalued to the full extent of the devaluation of the dollar. But politically much has changed; after the position taken by the Nixon Administration in the India-Pakistan war, the temptation would be strong for the Government of India to appear to sever with a flourish the rupee's link with the dollar. But is this a matter in which considerations of political prestige ought to take precedence over economic calculation?

Pakistan

Return to Civilian Government?

A Correspondent writes:

YAHYA KHAN'S attempt to carry on ruling Pakistan as if the surrender of his troops in Bangla Desh had made no difference at all is farcical. The people of Pakistan have yet to be told of the full extent of the military disaster that has befallen their army in the East, but the truth cannot be kept from them much longer. And once they realise what has happened, Yahya Khan will surely be saved the trouble of going through the motions of promulgating a new constitution and transferring power to a civilian government.

With the loss of East Bengal, Yahya Khan's Bengali Prime Minister-designate, Nurul Amin, has ceased to have any *locus standi* in the politics of Pakistan. With this has also collapsed Yahya's attempt to create a combination of right-wing parties to balance the People's Party of Bhutto. This, it may appear, clears the way for Bhutto and the People's Party and for the transfer of power to a civilian government without any serious hitch.

The actual course of events may not turn out to be so smooth, however. In the first place, it is ironical that in trying to find a replacement for the disgraced Yahya regime, Pakistan should pick on the one politician whose culpability for the course of events leading to the loss of East Pakistan is second perhaps only to that of Yahya Khan. Bhutto's boycott of the National Assembly on February 15, following a meeting with Yahya Khan three days earlier, made a major contribution to destroying such confidence as the Awami League had in the sincerity of the Yahya regime's moves to restore representative government in the country. Bhutto's boycott was the first step on the road which ended in the holocaust of March 25; it was followed by Yahya Khan's decision on March 1 to postpone the National Assembly session *sine die*. Nor did Bhutto subsequently oppose the government's policy of suppression of Bangla Desh. And even as the war clouds were gathering Bhutto was actively in the service of the military regime, drumming up Chinese support in Peking. It would be interesting indeed to know if he made a positive contribution to the Yahya regime's decision to launch the war by giving it exaggerated ideas of likely Chinese support.

It is not lost credibility alone which augurs badly for an effective civilian government under Bhutto's leadership. So-called civilian governments in Pakistan in the past have been fronts for the joint exercise of effective power by the higher civil service and the military top brass, both of whom serve the same economic and allied interests. Similarly, the Ayub and Yahya regimes were not pure military governments but once again instruments of joint rule by the army and the bureaucracy. And now Bhutto, with his own hands none too clean and without any particularly well established political base, will need to lean heavily on the support of the bureaucracy and those elements in the armed forces who have not been directly discredited in the war.

Given this background, it is not unlikely that the supposedly civilian government of Bhutto may go the way of earlier civilian governments in Pakistan such as those headed by Nazimuddin and Mohammed Ali of Bogra in the fifties which the then Governor-General Ghulam Mohammed, an ex-civil servant, had no difficulty in dismissing when the occasions arose. Of course, there are major differences between the situation in Pakistan at that time and now, above all in the level of political consciousness of the Pakistani people. It is nevertheless difficult to be convinced about either the viability of Bhutto's civilian government or the prospect of a lessening of the power which the civil service-military complex has wielded uninterruptedly in Pakistan almost ever since the country's independence.

The power of the entrenched bureaucratic-military complex is likely to be threatened in the present context not so much by any civilian government that might be formed but, paradoxically enough, by a military coup—not by *pucca* Sandhurst-type generals in their fifties of the Ayub and Yahya variety, but by some group of young colonels: intensely nationalistic, puritanical and, very likely, fervently Islamic. Of course, this will be the opposite of the outside world's ideas of what is good for Pakistan just now—democracy, secularism, liberalism, etc—but it stands the best chance of lifting Pakistani politics from the two decades-old morass. Is there perhaps a Nasser in the making among the survivors of East Pakistan who were pushed into fighting an unwinnable war first against fellow citizens and then against an immeasurably superior external opponent and who have suffered the humiliation of defeat and surrender?

Planning Commission

Abdicating a Distinct Role?

THE Planning Commission has apparently completed its mid-term appraisal of the Fourth Plan. From reports which have appeared in the press, it does not appear that the Planning Commission's diagnosis of the factors responsible for the low growth of industrial output goes very much beyond what the Minister for Industrial Development has been saying recently. What is particularly interesting is that the Planning Commission appears to concur with the popular view of industrial licensing as the principal villain holding back investment in industry and hence the rate of industrial growth. According to the Commission, in some important industries inadequate or delayed licensing has led to capacity bottlenecks. Two other features of licensing policy also come in for comment. First, the policy of giving licences to new entrepreneurs has apparently led to a large number of licences remaining unimplemented. Second, there have emerged imbalances in the issue of licences between substantial expansions and new units and between investment in developed and in backward areas. Isn't there some contradiction here, one wonders. If the risk of non-implementation of licences issued to new entrepreneurs is to be avoided, then the licensing authorities are likely to favour applications for substantial expansion against those for new units. The odds are weighted against new entrepreneurs also by the rigid and play-safe policies of the term-financing institutions in respect of equity-debt ratio, promoters' contribution to capital, etc.

More important is the impression which comes through the newspaper reports of the mid-term appraisal, that Planning Commission appears to regard the working of the licensing policy as a variable outside its purview. After all, licensing control is no more than one of the instruments for implementing that part of the industrial plan which is to be fulfilled by private investment. Delays in issue of licences is a procedural problem and one can appreciate that the remedy does not lie with the Planning Commission. But the major shortcoming of licensing is quite different and lies in an area which is, or should be, very much within the purview of the Planning Commission. What, more than anything else, has nullified licensing as an economic policy instrument is the wide gulf between licensing and plan strategy, priorities, and targets. The Licensing Policy Inquiry Committee commented lengthily on the complete absence of any interdependence between planning and industrial licensing. It also pointed out how this resulted from the failure of the Planning Commission to provide specific guidance on *inter se* priorities within each industry group, long-term capacity requirements, priorities within the import-substitution criterion, and the locational plans for different industries so as to meet the requirements of balanced regional development. As a result, the Planning Commission and the licensing authority have by and large worked independently of each other.

With this background of experience, one wishes the Planning Commission had made suggestions to guide the licensing authorities for closing the gap between private industrial investment and whatever remains of Fourth Plan targets. Surely, the Planning Commission cannot consider its task done by tabulating revised targets of growth of capacity and production. The Commission has to go beyond this simple exercise and formulate in detail the pattern of private investment necessary to fulfil the various and often conflicting objectives of planning — like fulfilment of plan targets of capacity and output, development of backward areas, import substitution, export promotion, promotion of new entrepreneurs, deconcentration, competition, and employment.

That the Commission should do so is particularly important now for two reasons: (i) Reacting to public criticism of the licensing and anti-monopoly controls, the Ministry of Industrial Development seems to be in a rush to clear up licence applications. Once speed becomes the only objective of licensing, in the absence of clear-cut guideliness from the Planning Commission, any coincidence between the pattern of private investment that materialises and the objectives of industrial planning will become purely accidental. (ii) The recent war and our responsibility towards the rehabilitation of Bangla Desh will surely drain away whatever resources were left with the Government for stepping up public sector investment in industry. As a result, reliance on private investment will necessarily become heavier. This will make it all the more important to ensure that the private investment that takes place is consistent with plan objectives.

Bangla Desh

A New Market?

ONE of the more curious, and least understandable, reactions to the emergence of Bangla Desh is the hope raised in a number of industries that they are in for a major shot in the arm since a large new market has opened up for their products. Among such in-

dustries are textiles, pharmaceuticals, cement, fertiliser, commercial vehicles and railway equipment, to mention just a few. To be sure, war-devastated Bangla Desh, cut off from its traditional sources of supply in West Pakistan, desperately needs the products of these and a number of other industries. Also, there can be no question that we have a major responsibility in making these products available to that country. But this is an altogether different proposition from the one which suggests that Bangla Desh provides a new market for these industries for which to expand their production, hitherto presumably held in check by the limitations of the Indian market.

Take the pharmaceutical industry, for instance. To the best of one's knowledge, it has never been claimed on behalf of this industry that its growth has been constrained by the smallness of the Indian market. How could it be, considering what large parts of the country and what large sections of the population still remain outside the pale of modern medicine? Then how does Bangla Desh become vital as a *new market* for pharmaceutical products, as spokesmen of the industry have begun to claim privately? Two possible explanations suggest themselves. First, it is likely that the industry sees the Bangla Desh market as more easily accessible than the non-urban Indian market. Second, it is possible that the industry expects Bangla Desh to be a more remunerative market since, presumably, it will not be subject to the control on drug prices. Both considerations are very material from the private profit point of view, but neither matters from the social interest standpoint.

Let us now take a different industry, railway equipment manufacture—which, it may appear, does suffer from lack of a large enough market internally. Here again the scope for expanding and improving railway transport capacity is obvious enough. However, over the last few years the Indian railways' purchases of various types of equipment (e g, wagons) has been restricted by the railways' own unhappy financial state and by the Government's inability to spare funds out of the general budget for such investment. Here what difference will Bangla Desh make? True enough, in the absence of manufacturing facilities, Bangla Desh will need to buy large number of wagons, locomotives, etc, and this will go to increase the production of Indian manufacturers. Equally true, however, these purchases will have to be financed by credits advanced by the Government of India out of its budgetary revenues. The same result could have been achieved from the point of view of the railway equipment manufacturers by the Government making comparable funds available for investment by the Indian railways. Or, to look at it in another way, the use of budgetary revenues for extension of credit for sale of railway equipment to Bangla Desh will correspondingly reduce Government expenditure on—and therefore demand for—other goods and services.

None of this is to question the case for making available to Bangla Desh much-needed consumption goods and capital equipment or for extending Government credit for this purpose, but only to question the view of Bangla Desh as a large new market to likely to trigger industrial expansion in this country. A country of 550 million people, abysmally deficient in a wide range of goods and services, ought not, unless its economic affairs have been managed very badly indeed, to suffer from lack of demand for the output of its limited productive apparatus.

BUSINESS

Steel Shortage Not to Blame

THE export target of Rs 165 crores fixed by the Engineering Exports Promotion Council (EEPC) at the beginning of this fiscal year was raised by it to Rs 175 crores about two months ago. At the time of stepping up the target, engineering exports had amounted to Rs 64 crores in the first half of the fiscal year as against Rs 59 crores during the corresponding period of 1970-71. It is difficult to understand how the EEPC expects exports in the second half of the financial year to be nearly twice their level in the first half.

Some of the reasons cited by the EEPC for raising the export target deserve mention. EEPC claims to have orders worth Rs 151 crores for railway wagons and coaches, railway track materials, wires and cables, industrial plant and machinery, structural fabrication, air conditioners, bicycles, iron and steel castings, wire ropes, electric motors, and transformers. According to delivery schedules, orders worth Rs 76 crores are to be fulfilled in the current financial year. Apart from these bulk orders, there are a large number of engineering goods that are exported on the basis of repeat orders not normally reported to the EEPC. According to the EEPC, it had plans to mobilise all efforts to ensure that shipments worth Rs 60-70 crores took place against these repeat orders.

However, the export performance of engineering goods in October does not appear to be promising enough to justify the stepped up target of Rs 175 crores. Engineering exports in the first seven months of the year, April-October, aggregated Rs 73.3 crores, reflecting an increase of about 34 per cent over exports in the corresponding period of last year. This is an impressive rate of growth, but it is unlikely that exports would average Rs 20 crores a month during the remaining five months of the year. Exports may suffer during the current month because of the Indo-Pakistani war resulting in less frequent calls by foreign ships at Indian ports. It is, of course, likely that exports would pick up now that hostilities have ceased. Also, average monthly exports of engineering goods are normally higher during the latter part of the financial year. For example, during November 1970-March 1971, average monthly exports of engineering goods were Rs 12 crores whereas they were Rs 7.8 crores during April-October 1970. In spite of this favourable trend in exports during the latter part of the year, the monthly average of engineering exports is unlikely to be more than Rs 13 crores during November 1971-March 1972. Thus, even on optimistic expectations, engineering exports are unlikely to exceed Rs 140 crores.

The EEPC has been complaining time and again of steel shortages which are said to be coming in the way of the growth in exports in engineering goods. According to the EEPC, steel requirements of engineering exporters stood at 5.4 lakh tonnes against an assured supply of 2.1 lakh tonnes (inclusive of imports of 87,500 tonnes). Thus the EEPC's estimate of the shortfall in steel supplies is 3.3 lakh tonnes. However, looking at recent trends in steel prices, one does get the impression that the EEPC is placing exaggerated emphasis on the steel shortage as a factor responsible for holding back exports. The downward movement in steel prices in the last two months is likely to continue in view of the scheduled large-

scale imports of steel and the improvement in domestic production. It is reported that orders for imports of steel through HSL/MMTC alone would amount to 7 lakh tonnes for the current year. Imported plates, which used to be sold at Rs 3,600/4,000 a tonne a year ago, are now priced at about Rs 1,500/2,200 a tonne. There has been an equally sharp fall in the prices of indigenous steel products like angles, channels, and rods and bars. Steel supplies during January-March 1972 are expected to increase by nearly 25 per cent over those of the current quarter. In view of these factors, one would expect the EEPC to come forward, later, with a more reasonable explanation for the difference between actual exports and its target.

Sugar

Identity of Interests?

THE 1971-72 sugar season started about 10 weeks ago. During this period industry pushed up ex-mill prices from about Rs 180 to over Rs 225 per quintal. The retail price increased from about Rs 2 to Rs 2.50 per kg. On December 3, the day hostilities with Pakistan broke out, the market price had dropped to Rs 221. But immediately on the declaration of the Emergency, the price rose sharply to Rs 228. This increase evoked criticism in public, press and Parliament. What has to be grasped, however, is that the government itself is responsible for the upward trend in prices since the start of the season.

At the beginning of the 1970-71 season, the sugar industry had launched a campaign making out that it was overburdened with stocks. To alleviate the 'burden', it succeeded in securing easy credit, longer despatch periods, and smaller monthly releases. In fact, the monthly quota for October 1970 was reduced from 600,000 tonnes to 400,000 tonnes; it was further reduced to 350,000 tonnes for the next five months — November 1970 to March 1971. By May 1971 sugar prices had increased from Rs 170 to Rs 206.

Later, the industry's tune was somewhat changed. It was rumoured that the area under sugarcane had declined by 10 to 15 per cent, so that production in 1971-72 might decline to 3.2 mn tonnes and, unless prompt measures were taken, there would be a sugar famine in 1972-73. Taking their cue, growers, who have not failed to notice that the industry had made profits while paying the growers only the statutory minimum price for their cane, joined hands with industry to demand a higher price for cane — with the co-operation, of course, of the major cane-growing states.

The Cabinet would not agree to increasing the price of cane directly, but employed instead the backdoor method of reducing the monthly quota from 50,0000 tonnes in October 1971 to 350,000 tonnes for November and further to 325,000 tonnes for December. Offtake during the last season ranged from 275,000 tonnes to 454,000 tonnes and averaged about 375,000 tonnes per month. A monthly release in the current season of anything less than 400,000 tonnes is, therefore, a straight technique to raise prices.

Evidently, an attempt was being made to guarantee the industry's margins. By the Food and Agriculture Ministry's own calculations, the fall in area under sugarcane is about 4 per cent and production would be about 3.6 mn tonnes. With an opening stock of more than 1.4 mn tonnes, total availability would thus be 5.0 mn tonnes. A minimum of 4.5 mn to 4.8 mn tonnes would be required for internal consumption. It was, therefore, decided to drop the 1972 export quota of 350,000 tonnes to the world's free markets, and instead to export only about 96,000 tonnes to the preferred markets of UK and US which also pay somewhat higher prices. Export of sugar, in any case, involves the country in heavy rupee losses; export of even the reduced quantity would involve a substantial loss to the exchequer.

The government has already permitted a handsome rebate, of 40 per cent, on excise duty for the whole season; most mills in UP have, therefore, stepped up crushing and are receiving adequate supplies of cane at Rs 8.50 per quintal. Since the fall in area has been only nominal, it now seems quite possible that the output of cane might in fact be almost as good as in the previous season. Secondly, Minister of State for Agriculture, Sher Singh, pointed out in the Lok Sabha on November 25, that in all areas factories were paying higher prices for cane — between Rs 8 to Rs 11.50 per quintal — in view of the high market price of sugar. Finally, as the sugar industry consumes only 25 per cent of the cane crop, changes in cane production need not get precisely reflected in sugar production. This has been conceded by the Agriculture Ministry. In the circumstances — and since in any case industry has offered to return to partial decontrol and hand over 60 per cent of production at a fixed price of Rs 150 per bag ex-duty, or Rs 190.50 per bag inclusive of excise duty so that consumers would get retail sugar at about Rs 2 per kilo — government should give up the practice of fixing monthly releases and allow mills to sell the rest of their production in the free market at the rates it can fetch.

Tea

No Will to Improve?

REPORTS have appeared suggesting that India may not be able to fulfil its share of the export quota for tea. Under the combined Indo-Ceylon export quota, fixed by the FAO Consultative Committee, 506 mn kg of tea were to be exported during the 15 months ending March 1972.

There was some scepticism about India's ability to export its share when the quota was fixed in September last year, but later circumstances seemed to indicate otherwise. There was a fall in Ceylon's tea production and also in that of some of the African countries — notably Kenya's where production fell by 6.5 mn kg in 1970 — and there has been dislocation of the tea gardens in Bangla Desh. On the other hand India's production of tea was nearly 10 mn kg higher in 1971 than in 1970, although a record crop of 422 mn kg had been produced in 1970. It seemed that India at least would fulfil its share of exports. In fact, however, India's export of tea to the UK in the first nine months of this year was only 33.83 mn kg against 52 mn kg during the same period last year. Total exports from India to all countries also declined by 3 mn kg.

Tea exports from India have been static or fluctuating around 200 mn kg a year and have failed to rise commensurately with the increase in production. Exports increased to 214 mn kg in 1967 from 199 mn kg in 1965, but in 1968 they declined again to 208 mn kg and in 1969 declined further to 169 mn kg. In 1970 export performance was better at 208 mn kg. Meanwhile, production has been fluctuating, though no exact correspondence can be seen between production and export performance. Production increased to 402 mn kg in 1968 from 375 mn kg in 1967, but declined to 396 mn kg in 1969.

In 1965 India lost its position as the largest supplier of tea to the world to Ceylon, although in 1968 and 1970

both countries exported equal quantities, *viz*, 208 mn kg. In 1968, India's share of the world market was 35 per cent against 45 per cent in 1951; in 1970 the world market shares of India and Ceylon were almost equal. Now, with Ceylon launching its five-year plan for stepping up production (about 95 per cent of Ceylon's tea is exported) and with the entry of several East African countries as suppliers in the international tea market, the threat to Indian tea exports is actually increasing.

The fall in exports is usually associated with larger domestic consumption. In the absence of any substantial increase in production, the surplus available for exports is low and exports suffer especially in the context of lower rates for tea in international markets. Domestic consumption of tea increased by an average of 7.3 mn kg per annum between 1963-64 and 1968-69. On this basis, internal consumption is expected to rise to about 230 mn kg by 1973-74.

Unless internal consumption can be checked or export prices made more attractive, exports will continue to suffer. The obvious remedy seems to be to increase the production of tea. The annual rate of growth of output is currently barely 2 per cent. The Committee of the Indian Tea Association, set up to examine ways and means of accelerating the rate of growth of production, has estimated that the industry will need to expand by 3 per cent to meet the expected increase in domestic consumption.

Poor average yield per hectare (the yield rate even in the best Indian gardens compares poorly with that in the gardens of other major tea-producing countries) is at present a major hindrance to higher growth. The need to increase productivity through the use of high-yielding seeds, fertiliser, pesticides, better drainage systems and mechanisation is vital. Moreover, sales can increase only if the quality of tea is improved simultaneously. The recent preference for East African tea is due to tea bushes in that region being younger and of better quality. India has, therefore, to concentrate on the replacement of existing bushes by newly developed varieties even as it seeks to improve the techniques of production.

Finance is a problem in launching major plans for modernisation of the tea industry. It is estimated that to achieve a 3 per cent annual growth rate the industry will need to make an outlay of Rs 250 crores. With the widely publicised dwindling profitability, internal generation of funds for modernisation appears difficult. During 1969-70 the profits of 80 tea companies, representing about 75 per cent of the paid-up capital of the industry, declined to Rs 2.3 crores from Rs 3.4 crores in the previous year. Reduced profitability and the consequent meagre ploughback of profits must force the industry to rely on external sources of funds. The industry has therefore been pleading for relaxation of fiscal levies, doubling of the replanting subsidy, introduction of development loans, upward revision of the Tea Board loan scheme, etc.

Yet paucity of funds is by no means the primary factor holding back modernisation. Foreign tea companies, which have come to believe nationalisation of the plantation industry to be inevitable, do not want to make any fresh investments but are after extracting the maximum profits from investments already made. Thus, though the tea industry is faced with problems such as severe competition in the international market, fall in export price, poor productivity and dwindling profitability, its worst problem is the lack of will among plantation owners to modernise the plantations which alone will rejuvenate the industry and promote exports.

Cotton

Varietal Breakthrough ?

GUJARAT's participation in the green revolution so far has been restricted largely to the spread of hybrid bajra. But the success of Cotton Hybrid-4, popularly known as "Shankar-4" may add a new dimension to the green revolution in the state and the rest of the country.

Released only three years back Shankar-4 is spreading fast. On farmers' fields the Shankar-4 has given an average yield of 700-1,000 kg per acre, which is much higher than the average yields of other popular cotton varieties in the state — Digvijay (150-200 kg), CO2 (250-300 kg), Gujarat-67 (300-350 kg). Further, because of its long staples, Shankar-4 is able to get a price nearly 50 per cent higher than the Digvijay and CO2 varieties of cotton.

The high returns because of both yield and price differentials have naturally tempted the business minded Gujarat farmers in the irrigated cotton growing areas to take to this innovation. In the cotton belt of Baroda, Broach and Surat the area under Shankar-4 has increased from almost nothing in 1968-69 to nearly 2,800 acres in 1969-70 and 25,300 acres during 1970-71. This year the area under the crop is expected to have further increased sharply. The most impressive aspect of the spread of the new crop as observed in the districts of Baroda and Kaira is that it is substituting not only the other cotton varieties but other remunerative cash crops like tobacco as well as vegetable and even orchard crops.

Shankar-4 has been till now mainly a big farmer's crop. Availability of water apart, the high input cost — ranging from about Rs 1,000 to Rs 1,500 per acre, due mainly to heavy and frequent use of pesticides —, high degree of risk involved and need for better management skill and overall resourcefulness (required at times also for getting the certificate of purity of the product) discourage many a small farmer from going in for Shankar-4 cotton. Field observations in central and south Gujarat confirm this fact.

In spite of high returns, the crop's vulnerability to pests may discourage many farmers. It is in this context that the Gujarat State Fertiliser Corporation is reportedly initiating a novel scheme of crop insurance on an experimental basis, to popularise Shankar-4 cotton. The LIC is reported to have agreed to participate in the project. The modest Rs 3.94 lakh pilot scheme will initially cover about 500 acres of black soil growing Shankar-4 in Baroda and Sabarkantha districts and may be extended to wider areas later. On the basis of experience gathered on its demonstration farms the GSFC has developed the idea of a 'package of practices with plant protection' to be sold as the '4-P Plan' to ensure high returns. Under this scheme the GSFC will supervise the adoption of the '4-P Plan' by the participating farmers and will guarantee to them a minimum yield of 700 kgs per acre. The LIC is likely to insure against losses due to crop failure to the extent of cultivation costs which on an average amount, according to the GSFC, to Rs 1,750 per acre. The GSFC expects an average yield of 1,500 kgs (worth Rs 3,750) of cotton and hopes that its '4-P Plan' will help in popularising the crop.

In this connection, it may be added that to make the '4-P Plan' a success and to popularise Shankar-4, it is essential that purity of seed is ensured first. It is now a well known fact that even this year a large number of farmers in central and south Gujarat suffered because of seed impurity, with all its adverse consequences for the spread of the new crop.

Price Spread and Farmer's Share

IN 'Price Spread and Farmer's Share — Oil and Groundnut in Gujarat' by B P Patel (July 17, p 1435), some important considerations have been ignored in arriving at the conclusion that the millers' share in the margin has increased throughout the period, gaining at the cost of the farmer, the wholesaler of groundnut, and retailer of groundnut oil.

(i) It cannot be assumed that the farmer's realisation depends on farm harvest prices of groundnut during the harvesting period. All surveys show that farmers in Gujarat generally market 30 per cent of the crop soon after harvesting, 35 per cent in the second quarter, and the balance 35 per cent in the off-season. The 'Jhangad' system, enabling the farmer to leave his produce with the miller with no storage charge and to sell it as and when he likes, has enabled farmers to take advantage of price increases as the season progresses.

(ii) Of the oilcake produced, 55 per cent thus has a material bearing on the relationship between oil price and seed price. Since oilcake prices do not vary to the same extent as do oil prices, seed prices obviously cannot rise to the same extent as oil prices.

(iii) Since 1964-65, a major distortion has been introduced in the relationship between oil prices and seed prices in Gujarat by the levy system, under which 15-22 per cent of the oil produced by a miller is procured by the state at artificially low prices. It is but natural, therefore, that the miller's share should widen to provide for the oil handed over to government.

It is also incorrect to take all recovery in expeller mills to be more than 42 per cent. The entire calculations of the oil trade in Saurashtra are based on 42 per cent recovery in oil and 53 per cent recovery of oilcake. Some add shells in the crushing and hence estimate a higher recovery of oilcake; but cake with high fibre content fetches lower value for extraction.

If all these factors are taken into account, the conclusion would be that the miller has not improved his margins significantly. In fact, in oil-milling, profitability depends on clever buying of seed and selling of products, rather than on any straight crushing parity.

Character of State Power and Strategy for Revolution

I WOULD like to point out that in Radhika Ramasubban's report on the recently concluded second all-India conference of the Indian School of Social Sciences (October 16, pp 2188-9), there are some inexactitudes in regard to my position on the character of the state power in India. The report ascribes to me the view that "it was specifically the monopoly and agricultural bourgeoisie which controlled state power, *neither leading the other.*" (Emphasis added). The position as stated in my paper really was: "If the top monopolies have a firm grip over the Central Government and its policies, the agricultural bourgeoisie dominates the state governments and through the latter exerts a powerful influence on the centre too... To conclude, the state in India is essentially the organ of the dictatorship of the Indian monopoly bourgeoisie and the agricultural bourgeoisie, led by the former."

Radhika Ramasubban also says that "his characterisation of landlords as agricultural bourgeoisie seemed to overlook the complex nature of the agrarian structure..." That I did not characterise the landlords as agricultural bourgeoisie was clear from the following paragraph of my paper: "The agricultural bourgeoisie has gained its strength and consolidated its position in recent years, thanks to the agrarian reforms introduced by the state in the post-Independence period. Though in its economic mode of operation, it is largely a homogeneous class, it arises from different social streams like the former statutory landlords or holders of inferior titles like jotedars in West Bengal, rich peasants and some new entrants into agricultural enterprise from other classes."

AJIT ROY
Calcutta

No Partial Solution

IN 'No Partial Solution' (October 2, p 2080) your correspondent refers to the resignation of V V John from the vice-chancellorship of Jodhpur University. The resignation of V V John is really an occasion for some heart-searching by the intellectual and academic community in the country. The cream of our academic system in any case prefers to go into business and industry rather than into the educational field. In such a situation, the loss of academic persons like K N Raj and V V John is only an irreparable loss to the educational field.

V V John was one of our best vice-chancellors, who contributed in a large way to bridging the communication gap between the academic community and the world around. It is ironical that he became the victim of petty-politics and faction-mongering of the very sort that he despised so much. His resignation indeed highlights the erosive and destructive effect of the petty-politics nurtured by professional politicians. Unless steps are taken to prevent such activity in our academic bodies, we shall soon find that men with intellectual and academic merit shy away from them. And that will be a tragedy inflicted on our future generations.

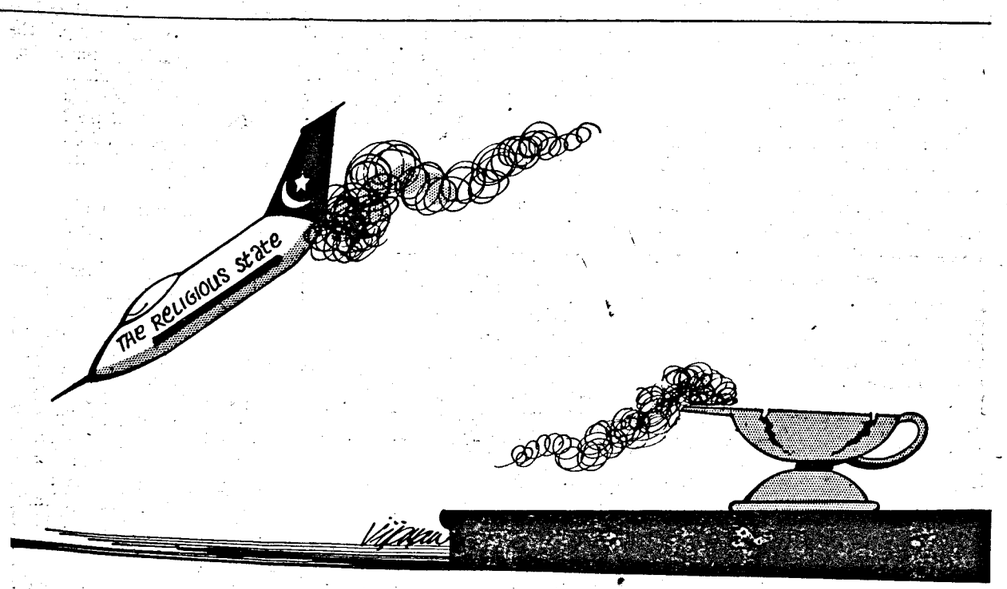
Gunboats and Gas

Romesh Thapar

THOSE who have all along believed in the extraordinary scenario techniques of Super Power USA must really revise their ideas in a rather fundamental way. The antics of President Nixon and his battery of bright men suggest that the crudest and most underdeveloped thinking goes with the business of decision-making. How else can we explain the US posture in the United Nations and its ridiculous attempt to use the much advertised Seventh Fleet as a pressure weapon?

This combination of gunboats and gas is designed to achieve an objective far removed from the thinking of the US government, if we can so describe the circus in Washington. Nixon and Kissinger will long be remembered as the men who effectively destroyed the US position in South Asia. It will take a long time to restore it, aiding operations notwithstanding.



A totally false impression has been created in various international quarters that India, following the surrender of the Pakistan army in Bangla Desh, is moving to the destruction of West Pakistan—and that it is the duty of the USA to halt this mad move. Masterly, isn't it? The Indian army's strict orders not to spread the fighting on the western front are proof of Delhi's intention—a cease-fire when the job is done in the east. Nixon and Kissinger urge upon us what we have already declared. Then why the alarums and pressures? Obviously, they wish to claim that it is their reprimand which paralyses India, compels peace on the subcontinent. A sordid episode in international diplomacy.

The scenario-designers in Washington will have worked out a series of positive developments stemming from the stratagem of gunboats and gas. We will be told that Islamabad is grateful for this act of solidarity which saved West Pakistan. There will be several theses on the beneficial effects of this action on Muslim opinion from Morocco to Indonesia. There will also be backslapping about China's responses. And we will be told how the Russians were not able to get the maximum advantage from their intervention on the side of India. As if anyone is going to forget the solid and wholehearted support of the USSR.

It will be interesting to see how a number of significant powers begin to dissociate themselves from the ridiculous US position, China notwithstanding. The United Kingdom and France have already made clear that they sympathise with India. West Germany and Japan are refusing to terminate aid arrangements. Already in the UN more serious steps are being taken to end hostilities and to recognise the reality of Bangla Desh. Very soon, the Muslim world, from Morocco to Indonesia, will have to take note of the rise of a state of 75 millions, an entity larger than West Pakistan. It is not possible to wish away any of these facts.

The international projection of Bangla Desh, and its recognition by more and more countries in the shortest possible time, must become a major plank in our diplomatic activities. Any soft-pedalling on this would be damaging not only to the early revival of Bangla Desh, but also to the security of this country.

Somewhat mystified, India is being thrust into a great power role. What all this means for the future, and for the flabby internal set-up, it is too early to say. But one thing is clear: momentous days are ahead which will demand the skilful mobilisation of the nation's total resources. This is the mood in Delhi. Beyond that, little else except confidence and optimism.

Nurtured Knowhow

Hansavivek

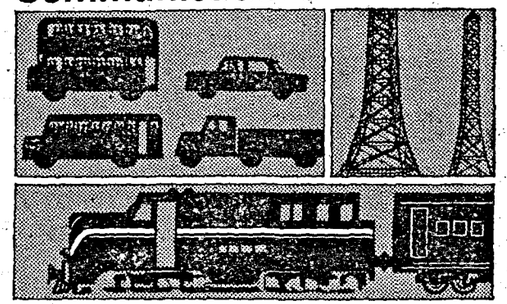
FERTILISERS AND CHEMICALS, TRAVANCORE reports that owing to delay of about two years, phase-one of the Cochin fertiliser project — designed to produce annually 330,000 tonnes of urea — would cost Rs 54 crores. The delay was attributed to the delayed delivery of converter and catchpot from AVB, Durgapur. The union government has already accepted, in principle, the expansion of the project, for which the World Bank has agreed to extend a loan of about Rs 15 crores to meet the expenditure in foreign exchange for import of equipment, foreign collaboration fees, etc. The project is designed to make 485,000 tonnes of high grade NPK complex fertilisers, at a cost of about Rs 35.8 crores by mid-1974. In order to raise funds to meet the requirements of the two phases of the Cochin fertiliser project, it is proposed to issue additional equity capital of Rs 19.04 crores in shares of Rs 10 each. These shares are to be offered to the union government for subscription at par. The existing shares are on offer in the market at around half their par value.

During its 27th year, ended March last, FACT expanded its turnover from Rs 26.06 crores to Rs 31.70 crores; but the outcome was a bigger loss. Depreciation, aggregating Rs 66 lakhs, has yet to be provided for. These disappointing results are ascribed to substantial shortfall in targeted production — the company produced 50,323 tonnes of ammonia against 49,475 tonnes produced in the preceding year and against a target of 71,000 tonnes. Major difficulties were faced in the phosphoric acid plant, and interruptions in electricity supply impeded output. A granulated mixing plant, set up at Cuddalore, is on trial runs. The fourth stage expansion of Udyogmandal division, designed to raise the ammonia capacity to 340 tonnes per day and ammonium phosphate 20:20 to 181,000 tonnes per annum, was further delayed.

FACT Engineering and Design Organisation (FEDO) has been retained by Kerala government to do a techno-economic survey of three backward districts in Kerala and also a further study of a project for developing the tapioca and tapioca-based industries in one of these districts. It secured a contract for the Khetri acid-cum-fertiliser project, valued at Rs 12 crores. FACT Engineering Works (FEW) has secured very large orders for storage tanks with various units of Fertiliser Corporation of India and is also acting as consultant to a public-sector company of the Kerala government. The steel shortage in the country, however, is likely to restrict the prospects of rapid expansion of FEW.

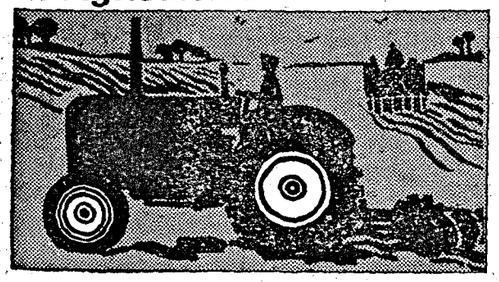
INDIAN EXPLOSIVES is awaiting industrial and capital goods licences for its nitrocellulose project, the preliminary design work for which has been completed. It has received government clearance for carrying on business at the Gomia works for manufacture of detonating fuses. The equipment required for this facility was designed and fabricated locally. During the 18th year, ended September 1971, sale of urea manufactured at the fertiliser plant at Kanpur was Rs 1,896 lakhs compared to Rs 1,122 lakhs last year, but there was no sale of imported urea compared to Rs 179 lakhs in the previous year. Output of the fertiliser division was affected by labour disputes which resulted in a loss of about two months' production. Despite rise in turnover, profit-margins were affected owing to increase in price of naphtha, fuel oil, and freight, coupled with reduction in the controlled price of urea. The explosives division achieved a high level of productivity in all departments. Sales of commercial explosives were some 2,800 tonnes more than last year. Sales of safety fuse were marginally better, but it is felt that demand in the ensuing year will decline as coal mines have been asked to change over from safety fuse firing to electric firing in the interest of safety. The company continues to be the major supplier of safety fuse and gunpowder for defence requirements. A range of delay detonators, designed for use in coal mines, were introduced and these have been well received by customers.

ALKALI AND CHEMICAL CORPORATION OF INDIA is seeking manufacturing licences for expansion projects in respect of pharmaceuticals, 'Gramoxone', and rubber chemicals The company has been commissioned by Imperial Chemical Industries, UK, and by its Indonesian subsidiary, to build a paints factory at Djakarta. Work on this unit is in progress, and the factory is expected to be commissioned in July next. ACCI's participation in the project will bring in foreign exchange through the engineering and design charges and the export of paint-making machinery from India. The company stepped up exports of its products by 20 per cent to Rs 42 lakhs during the 35th year ended September 1971. Exports would have been higher still, but for the Indo-UAR trade impasse: Egypt has been the company's biggest market. Now that a new trade protocol has been signed by the two countries, export business should prosper. Efforts are also being made in Thailand, gulf ports, and the USSR to establish new markets. ACCI's sales reached a new peak last year, and profits were also higher than those of the preceding year; there was optimum utilisation of capacity in all plants. Movement of alcohol from UP and Bihar was affected by the floods and railway strikes, but the company was able to achieve an all-time record in production of polythene with the help of buffer stock of alcohol. Demand for paints from the trade sector continued to be good. The Hyderabad unit, commissioned in December 1970, made a useful contribution to the revenues. Production of rubber chemicals exceeded licensed capacity and sales were the highest achieved so far. Output of caustic soda and chlorine was lower than in the previous year, mainly due to power-cuts, restricted movement of coal by Railways, and poor quality of coal. Sales of pharmaceuticals improved despite the uncertain trading conditions brought about by the Drugs (Price Control) Order 1970. Industrial relations during the year were cordial. A wage agreement, up to the end of 1974 covering the company's employees at Calcutta, has been signed. The company declared bonus at 20 per cent of gross salary for all its employees throughout India. The Board has decided not to proceed with the proposal to merge the company with CAFI.

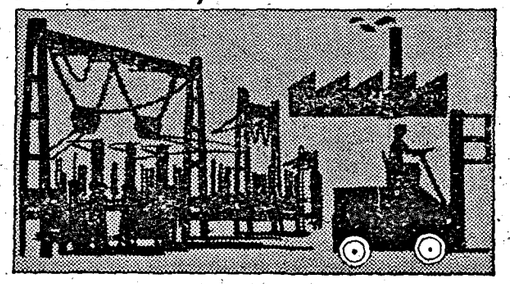


BHARAT BIJLEE, which has completed 25 years of existence, has progressed from a modest beginning to a point where it has a certain status in the electrical equipment manufacturing industry. During the year to June 1971,

ABMEL's role in the nation's economy



In Defence



In Transport and Communications

In Agriculture

In Industry

And above all, in EXPORTS

ABMEL are the undisputed leaders in battery exports. The proof is in the consistent repeat orders from more and more countries all over the world. Twenty-four countries now insist on the unbeatable quality of batteries and components from ABMEL—and the list is multiplying.

ABMEL makers of Exide

ASSOCIATED BATTERY MAKERS (EASTERN) LIMITED

EBSC-1192

the company expanded its turnover by 54 per cent. While both production and sales increased sizeably, largely on account of contribution from the motor department, the previous year had represented only about 9 months' working. Gross profit more than doubled, but the results might have been better but for the large number of orders for transformers accepted sometime ago at 'very unremunerative' prices, which were executed during the year. These orders have been completed, and those pending are at more reasonable prices. Demand for motors from the rural sector declined, but it is hoped that demand will revive. BBL continues to make motors for special applications. Transformers for special applications are also being developed. Selling prices of products have been increased to offset the rise in costs brought about by imposts levied on materials and components in the last Budget.

ALUMINIUM CORPORATION OF INDIA is going ahead with its Orissa project. In the first phase, substantial expansion is being launched by establishing an integrated aluminium plant of 15,000 tonnes, to increase capacity to two-and-a-half times the existing one. The second phase for further expansion by an additional 15,000 tonnes will be taken up after the completion of the first phase. On completion of both phases, total production capacity of the company would reach around 40,000 tonnes per annum. The financial institutions have agreed to finance the first phase of the project, estimated to cost Rs 16.5 crores. Meanwhile, designing and engineering of the plant in consultation with the technical consultants, Swiss Aluminium, are in progress. Reviewing the company's affairs for the year ended March last, Lakshmipat Singhania, chairman, says that the results showed a slight improvement over the preceding year because of an improvement in the labour situation. The company experienced during 1969-70 "intolerable labour indiscipline and violence" leading to stoppage of production for over 103 days. During 1970-71, the plant was stopped on 11 different days due to strikes and bundhs. Singhania complains that under the Aluminium Control Order selling prices of finished goods have been reduced even from the levels prevailing in 1967, although cost of production has increased. The company's actual cost of production was examined by the Bureau of Industrial Costs and Prices, but the prices fixed by government are on an "arbitrary" basis. Prices of important raw materials like cryolite, aluminium fluoride, caustic soda, calcined petroleum coke, and fuel oil have increased considerably. Since July 1970, increased power rates have been charged which, too, have a substantial impact on cost of production.

NEW DELHI

Problems of Aid Suspension

WITH foreign exchange reserves standing at well over $ 1050 mn, including $ 130 mn of SDRS, and the foodgrains stock position quite comfortable, the suspension of a part of American economic aid has been taken without much perturbation—all the more so because stock position quite comfortable, the other major aid givers, except Japan, will follow the American lead. According to indications, even the Japanese are not very happy at what they have done and might like to end the freeze on their credits to India as early as possible.

The suspension of American aid itself is partial and is of no particular significance in the short run. All it implies is a general trend of declining flow of American aid to this country and this was something which had been already taken into account by the Finance Ministry and the Planning Commission. After all, the American aid promise for the current year in the Aid India Consortium was only half of what the country had offered last year. Further, the American decision will have no immediate impact since letters of credit had been opened with banks before aid suspension in respect of the larger part of the expected aid flow this year, that is about $ 120 mn out of the total promised aid of about $ 200 mn. The impact, therefore, will be felt only over the long run in that aid in the pipeline will thin out and there may also be some problems in repayment of past credits.

The American decision will have some impact on the arrangements for import of cotton this year. It had been arranged to import 50,000 bales of cotton under PL 480 and an agreement to this effect was about to be signed when the aid cut intervened. Also affected will be the two fertiliser projects at Kandla and Ramagundam for which Americans had been depended upon to commit about $ 15 mn. These will not be available now and alternative arrangements will have to be made for the two projects.

Looking at the overall picture of India's economic relations with the US since the mid-sixties, when dependence on American aid loomed so large in this country's affairs, the present suspension of aid for purely political reasons only emphasises a trend which had emerged over the last five years of a decline in the importance of US aid. Total imports from the US to India in 1966-67 were of the order of $ 1043.9 mn. They had come down to only $ 594.9 mn in 1970-71 and will be still lower this year. Exports to the US have remained at about the same level through these years—$ 293.3 mn in 1966-67, $ 276.6 mn in 1967-68, $ 312.4 mn in 1968-69, $ 317.2 mn in 1969-70, and $ 276.4 mn in 1970-71. The significant decrease in the adverse trade balance with the US from $ 750.6 mn in 1966-67 to less than half that figure or $ 318.5 mn in 1970-71 was entirely on account of decline in imports.

The gap between imports and exports has been filled by American aid. Grants from the US have been very small during this period and were altogether missing in the last two years. Also with the narrowing gap in economic exchanges with the US, American aid too has declined over the years, from the level of $ 803.1 mn in 1966-67 to $ 406.1 mn last year, mainly because assistance under PL 480 declined sharply as India began to attain self-sufficiency in foodgrains. From the high figure of $ 479.5 mn in 1966-67, PL 480 aid had come down to only $ 50.3 mn in 1970-71. PL 480 assistance might have lingered on at this level for some time more to enable India to import such items as cotton, edible oils, etc, but may have to be dispensed with after the aid stoppage.

While aid under PL 480 has sharply decreased in the last five years, credits under general economic assistance, including PL 480 convertible currency loans, have remained almost at the same level in gross terms. But net aid, after allowing for repayment of past loans (which rose from $ 58.6 mn in 1966-67 to $ 98.9 mn in 1970-71) has declined significantly. Net aid, excluding PL 480 aid and $ 68.4 mn of PL 480 convertible currency loans, stood at less than $ 300 mn in 1970-71. To the extent that the flow of aid from the US now shrinks further, India will have to deal with the trade gap with the US in a different way. Since there is not much chance of stepping up exports to fill the gap, imports from the US will need to be cut in a fairly drastic manner. The same will apply to Japan or any other country which resorts to aid cuts. To the extent this happens, as an official in the Finance Ministry put it, the Western 'culture' of Indian industry in the form of excessive reliance on equipment, parts and spares and raw materials from Western sources will have to undergo a big change.

This prospect had been anticipated even before the suspension of US aid. This could be seen in the remarks of the Foreign Trade Minister at the recent meeting of the Foreign Trade Advisory Council. The Minister made a pointed reference to the need for India to move closer to the centrally planned economies of Eastern Europe in the sphere of foreign trade, in addition to expanding trade with other developing countries. He set very little store by such limited measures as the generalised system of preferences for exports from developing countries which some of the developed countries of the West have adopted to achieve any significant improvement in trade between India and the developed countries of the West. Against the background of the protectionist tendencies developing among these countries, particularly the US, very little could be expected by way of expansion of exports to them.

The Foreign Trade Minister was, therefore, inclined not to rely on the developed countries of the West, specially the US, for the expansion of India's foreign trade and was quite explicit in saying that his plan was to reduce India's dependence on these countries and to concentrate efforts on increasing trade exchanges with the Soviet Union and the East European countries in addition to the other developing countries. He referred specifically to the possibilities of securing some of the pressing import requirements of the Indian economy from the developing countries by expanding trade relations with them. He said: "While today this may cover increased procurement of copper from Zambia, more diamonds from Ghana or increased non-ferrous metals from Peru, over the coming years this will no doubt cover a wide spectrum of products." He went so far as to say that he was outlining a shift in the country's trade strategy in the coming years. In contrast to the outlook of the Minister, the representatives of industry and private trade were entirely taken up with the possibilities of expanding trade with the developed countries of the West and the US and enlarging the area of economic collaboration with them generally. But now it appears that the aid cut by the US and the hurried manner in which the Japanese have fallen in line will induce Indian industry also to greatly reorient its outlook and thinking on these matters.

Another aspect of the developing situation is its likely impact on import substitution and development on the basis of self-reliance. Aid suspension at the time of the 1965 conflict with Pakistan had a significant effect on promoting import substitution on a broad front. Some of the urgency and drive in this field sagged after the so-called policy of import liberalisation backed by massive foreign aid, which had been offered as the reward for devaluation but which in fact never materialised to the extent expected. A climate was created in which the urge towards self-reliance and import substitution did weaken to some extent. Also, the extent and depth of import substitution already achieved were not fully appreciated in estimating import needs and aid requirements. After the latest experience with foreign aid, some of the enthusiasm for self-reliance and import substitution generated by the 1965 conflict and subsequent suspension of Western aid might return. That will be a good thing for the health of Indian industry, particularly when it is backed by a far stronger agricultural base of the economy.

The Indian economy is certainly far better equipped and developed at present to face the problems of aid suspension, provided established capacities can be efficiently operated and exploited. A close look at the kind of imports that are aid financed will show that except in some cases, such as crude oil and non-ferrous metals where lethargic policies have resulted in holding back progress, much of these imports can be substituted by efficient operation of established capacities. Steel and fertilisers, for instance, form a large part of imports in bulk at present and the need for importing them arises almost entirely because steel and fertiliser plants, specially those in the public sector, are operating at half their capacities. If only these plants function better and produce anywhere near their established capacities, a large volume of these imports can be substituted within a very short time.

There is thus hardly anything to worry about in the aid suspension by the US. The difficulties of a country at war and the strain that this puts on available resources are bound to be felt regardless of the aid from the US. Imports will become more costly on account of likely increases in freight and insurance costs. But these strains will have to be absorbed anyhow.

★

With a full scale war on everything else must naturally get pushed into the background. The entire frame of reference for consideration of other matters, including problems of economic policy and management, must change in these conditions. The vital amendments made in the Constitution and the ending of the purses and privileges of the former rulers in the week preceding the outbreak of the war naturally failed to cause as much excitement as they might have done in other times. Such pedestrian matters as the much awaited reappraisal of the Fourth Plan, which the Planning Minister has promised to present to Parliament shortly, and his note for discussion on economic policy matters which he presented to the Congress Working Committee on the last day of November no longer arouse much interest and will have to wait till after the present crisis is resolved before they receive any attention.

The conduct of the war itself presents many problems in respect of the management of the economy, but they relate to the smooth working of the economy, movement of supplies and stability of prices of essential commodities of mass consumption rather than to long-term economic development and reorganisation of the economy. And yet the immediate problems that have to be tackled cannot be altogether isolated from the situation as it was developing before the full scale war started. The abrupt manner in which some of the commodities in demand have disappeared from shop counters and the pressure of rising prices are cases in point. The local administration in different places is trying to handle the situation with the rough and ready administrative methods suited to the conditions of a national emergency. But shortages in the economy and rising prices were already very much a feature of the economic scene before the war started. These problems have only been aggravated and they will be found to have assumed more acute dimensions after the fighting is over.

It is in this light that the work of the mid-term reappraisal of the Fourth Plan and the note submitted by the Planning Minister to the Congress Working Committee retain their relevance and importance. What they indicate is fairly grim and the Planning Minister at least has attempted for the first time to pose some issues sharply. It is now admitted that the operation of the Fourth Plan in its first three years shows a shortfall of over 10 per cent in respect of financial targets and probably very much more in the case of physical targets. Except for agriculture, the position in all other sectors is extremely unsatisfactory. The Planning Minister has taken courage to point out that the successes in foodgrains production have hardly been exploited for overall development of the economy. On the contrary, the additional foodgrains production, which has resulted in a buffer stock of foodgrains of 8 million tonnes with the government, is today being seen more as a financial burden on public resources rather than as a surplus "for promoting better nutrition, more employment and more development". The Planning Minister has posed before the leadership of the ruling party the need for finding an "answer to this contradiction".

That the Planning Commission and the Planning Minister have finally come round to a realistic appreciation of the problems arising out of the success in foodgrains production (in contrast to the thoughtless manner in which the reports of the Agricultural Prices Commission have been treated year after year) is a good thing. The Planning Minister has rightly stressed two important aspects of this problem — something which the late D R Gadgil had so forcefully done when he was Deputy Chairman of the Planning Commission, but without getting any response from the political leadership. First, the procurement price for foodgrains has been made synonymous with the support price and it gets fixed, in the name of providing incentives for the producer, without regard to increases in production and productivity at levels higher than even scarcity prices. Second, while the bulk of additional incomes and wealth in the last few years has been generated in agriculture, no part of it has been mopped up for public investment. In this light the Planning Minister has made two suggestions. First, the policy of treating procurement and support price as the same thing and procurement as just a price support operation must now be abandoned. There must be a support price fixed at a level lower than the procurement price and only a targeted amount of food must be procured by the government or its agencies

at a price above the support price; after that prices should be allowed to find their proper level. This is a midway position between lifting all controls on foodgrains and the suggestion repeatedly made by the Agricultural Prices Commission that procurement prices should be lowered to conform to changing production and productivity conditions. Second, it has been suggested that a pattern of agricultural taxation should be evolved which is progressive and ensures that tax receipts from this source are income-elastic.

The Planning Minister has been cautious in arguing his case. He is evidently aware of the resistance that the farm lobby can put up to his suggestions. He has combined his proposals with a suggestion for lowering the ceiling on land and redistributing surplus land among marginal farmers to make their holdings economic and viable. He has also urged a firmer policy of recovering loans advanced to landowners and has warned that "our credit system, whether of co-operatives or of the public sector banks, will collapse unless the loans are promptly recovered". These warnings and complaints to which the Planning Minister and the Planning Commission have now subscribed, have been often made in the past by others. The question is how far they will be heeded in policy making and implementation and to what extent the influence of the rich farmer on these matters will be overcome. That is yet to be seen.

Meanwhile, the reappraisal of the Fourth Plan cannot but result in a fairly extensive pruning of Plan programmes and downward revision of targets — on account of stringency of resources and failure to implement programmes and projects in physical terms. The price escalation will require an additional Rs 2,000 crores to implement the physical content of the Fourth Plan while resources in sight, even if the resource raising effort so far matches the figure given in the Plan, contain a larger component of deficit financing than was envisaged. This has been a contributory factor in causing the price inflation. The Planning Commission is now engaged in a study of the progress of Plan schemes and projects and is likely to rearrange the priorities so as to fit the tasks in the last two years of the Fourth Plan to resource availability and organisational ability. All this does not take into account the burden of Bangla Desh refugees nor the additional cost on account of defence and security which the present fighting must involve.

LUCKNOW

Economic Development of UP

DUE to the national emergency, the recent seminar on UP's economic backwardness organised in Delhi by Arjun Arora, MP, lost some of its impact. All the same, Arora did get together a number of political leaders, ministers from the state and the Centre, and economists, for this useful seminar. It was a broader based forum than the 'court' organised earlier by C B Gupta. But it could have been academically better organised to give it greater unity and coherence.

Most of the seminar papers dealt with specific problems like financing of agro-industrial development (Narain Dutt Tewari, state Finance Minister); agricultural productivity and its constraints—small size of farms, low landman ratio, low doses of capital and other inputs, and weak infrastructure (A K Singh); shortage of power and inadequate Central assistance (Triveni Prasad, Secretary, Planning); inadequate fiscal resources (R N Bhargava); the problem of human resource development (M D Joshi and J C Dixit); ground water potential and utilisation of water resources (S P Singh, UP Government); impact of industrial relations on economic development (P D Shrimali). Saraswati Chaturvedi of Banaras Hindu University tabulated the caste background, educational qualifications and regional distribution of the state political leadership. It would have been more relevant to add some more variables; chiefly, the political elite's links with vested interests. Chalapathi Rau quantified the backwardness of the press in UP in terms of the circulation of newspapers—English, Hindi and Urdu—and their readership.

From the point of view of the overall economic backwardness and economic underdevelopment of UP, three papers need special mention. Kamta Prasad has done some good homework in preparing his "Industrial Development of UP: Past Trends and Future Possibilities". But, it is regrettable that the politicians did not discuss this paper. B D Sanwal, an ICS officer, brought together his experience by explaining in detail the feasibility of location of various industries in different backward regions—mini-steel, tractor and tyre works in eastern UP, a scooter factory in central UP, paper and woodwork in Nainital and Dehradun, fertilisers and petrochemicals near the Rihand Dam.

It is now for the politicians and entrepreneurs of these regions to organise themselves and start these industries by employing their resources—political pressure included. And not very surprisingly, it was an industrialist, K N Mody, who presented a short, but pointed, paper on the problems of industrialisation of the state. At the beginning his paper has two tables to show the backwardness of UP in terms of per capita income (with Rs 419, at 1967-68 prices, UP would be at the bottom of the list but for Jammu and Kashmir) and the share of industrial income in total income (with 10.5 per cent, at 1967-68 prices, the state is above Rajasthan only). Then the paper gives the plus points favouring the state—self-sufficiency in food and raw materials, large power potential and abundant labour. But it underscores the point that UP does not have an adequate number of entrepreneurs and those that there are lack the enterprise to develop its resources.

Other measures suggested in the paper are: (1) Rehabilitation of existing industries like cotton, sugar, oilseeds and vanaspati. (2) Removal of power shortage—for which no one but the state government is responsible. (3) Preparation of feasible schemes to encourage new entrepreneurs. (4) Development of industrial centres. (In the discussions it was sharply pointed out that the state government had built sheds for industrial estates, but in the absence of demand from entrepreneurs they were being used for other purposes.) (5) Elimination of red tapism and delays. (6) Appointment of a high powered cell to help break the bottleneck in starting new factories. (7) More credit. (8) Labour intensive industries to be started to produce consumer goods. (9) The state government should move to ensure industrial peace. (Of course, here Mody forgot to mention that in UP there are more lock-outs than strikes.)

It is possible that the seminar could be interpreted as a lobby for industrialisation, but with one difference. So far it has been the monopoly of the state government to criticise the Central government for neglecting UP. This time, the representatives of the Central government also had their list of accusations. The Union Housing Minister, I K Gujral, pointed out that Rs 12 crores of Central allocations were still unutilised by the state government, but even then the Union government was prepared to give more for housing and urban improvement schemes. Similarly, the representatives of the Central Water and Power Commission pointed out that they had sunk tube-wells in the most needy region of Bundelkhand but the state government had not even begun to utilise them.

BHUTAN

A Friend in Need . . .

MANY people raised their eyebrows when New Delhi piloted the Bhutanese case for membership of the United Nations; for, what with Indo-Nepal relations having turned cold, the policy of supporting the cause of small neighbours had become suspect. But evidently, in Bhutan's case that policy has paid off. Bhutan was the first to follow India in recognising Bangla Desh. Thimpu is not another Kathmandu. Bhutan was admitted to the world body only this September, which has proved very timely for India. The philosopher king of Bhutan, Jigme Dorji Wangchuk, has shown that his country's interests lie indisputably with India. There is little room for sentimentalism in the domain of diplomacy, and the diplomatic moves of any country are dictated by past events and by national self-interest alone. And, in extending its recognition to the Gana Prajatantrik Bangla Desh, Bhutan has taken this alone into consideration.

Bhutan's cordial relations with India are based on its national interests and on the realities of its geographical situation. Situated in the Himalayan ranges, Bhutan's welfare and economic development are inevitably linked with those of its big neighbour to the south—particularly with the states of Assam and West Bengal. Carefully, therefore, the King has been nurturing a pattern of democratic rule with a view to achieving greater interweaving with India. India, on its part, has been assisting in Bhutan's economic development. True this was done for Nepal also. But Bhutan has felt more wary of Chinese intrusion from the north and has, therefore, more decisively opted for association with India whose traditions and social conditions correspond more closely to what Bhutan's King would have in mind for his country.

The background of Sino-Bhutanese relations has also been different from that of Sino-Nepalese relations. Between the withdrawal in 1904 of the notorious Younghusband expedition from Lhasa and 1910, the Manchu empire of China made a supreme effort to revive the old Chinese claim to suzerainty over the Himalayan kingdoms. Besides Tibet, the three Himalayan kingdoms—Nepal, Bhutan, and Sikkim—were described by the Chinese as "molar teeth lying side by side in man's mouth". British diplomacy foiled the design implicit in the Chinese saying.

Soon after the British withdrew from the subcontinent, however, and after the capture of Tien an Mien by Mao's Liberation Army, China started renewing its claim to the entire Himalayan region, including Bhutan. After forceful Chinese occupation of Tibet in 1951, Bhutan found itself becoming host country to a large number of Tibetans who started to flee from their homeland which had cultural ties and traditional barter trade relations with Bhutan. When the Chinese started introducing reforms in Tibet, Bhutan's regime became additionally anxious about China's claims to its own territory. In their public speeches the Chinese declared that the Himalayan kingdoms of Nepal, Sikkim and Bhutan were parts of China, lost to British imperialism, but which they would liberate at the appropriate time. In a book published in 1954 by the foreign language bureau in Peking, maps were shown which clearly laid claims to Nepal, Bhutan, and Sikkim. The Bhutanese with no defence structure worth the name, were nervous and sought association with India. When the Chinese started to build roads along the Bhutanese border, Nehru was persuaded to make a hurried visit to Bhutan. (Since there was no road, he had to go on mule-back passing through the Chinese-occupied Chumbi valley in Tibet.)

Subsequent to Nehru's visit to Bhutan, events seem to have driven the Bhutanese regime into India's arms. Relations between India and China deteriorated further. The Dalai Lama's forced flight in March 1959 brought in its train a large influx of Tibetans. Harrowing tales of Chinese atrocities in Tibet further scared the Bhutanese. At almost the same time, the Chinese forcibly occupied eight Bhutanese enclaves, viz, Khangri, Tarchen, Tsekhor, Diraphu, Dzong Tuphu, Jangche, Chakip, and Kocha. These villages had been under Bhutanese administrative control for some 300 years. After some time the Chinese showed parts of other Bhutanese territory as their own. Tsongdu, the Bhutanese National Assembly, in a communication to the Government of India in 1959 said: "The Government of China have shown in their latest maps some parts of our country in north and east as parts of Tibet. These maps were studied in our Assembly and the portions claimed by the Chinese as their own were found ours undisputedly." The Tsongdu then requested Government of India to lodge a strong protest on their behalf with the Chinese government.

It was almost at the same time that Bhutan asked the Government of India to construct a road linking its isolated capital with India. In 1962, when the Chinese mounted a surprise attack on India in NEFA and Ladakh, they cut across Bhutanese territory to attack the rear of the Indian army in the Kameng district of NEFA. Bhutan had no defence structure to stop the advancing Chinese. This Chinese trespass is still vivid in the Bhutanese mind. It therefore gave the final signal to military co-operation with India.

In early 1962, at the request of the Government of Bhutan, India sent a military mission to Bhutan to train a small traditional Bhutanese army in the use of modern arms. With Tung-themphu as its headquarters, the Bhutanese army—a type of militia of about 10,000—is equipped with light infantry weapons. There is hardly any heavy artillery, and no air force. The Royal Bhutanese Army is expected to offer resistance to the invading Chinese army till other friendly countries can intervene on its behalf. It is being trained more in guerilla warfare. Most of the passes along the Bhutan/Tibet border run over an altitude of 15,000 ft above sea level. There is an overall shortage of manpower for activities such as highway construction, and this shortage has also made recruitment for defence services difficult.

While the Bhutanese enclaves mentioned above continue to be under Chinese occupation, there have been numerous other Chinese intrusions. Just last year, the Chinese crossed over to the Bhutanese side several times. Thimphu, unlike Kathmandu, cannot play the South against the North. It knows where its national interests lie and who would be its 'natural' friends.

United States and the Indo-Pak War

(From a Special Correspondent)

THE discussion in the general assembly of the UN on the problem of Bangla Desh and the Indo-Pakistani crisis was notable for two reasons. It is rare indeed for the UN to bestir itself and take notice of a problem in the first place. The crisis in Northern Ireland or the British sell-out in Southern Rhodesia have found no echoes yet in the UN. Even in the case of Bangla Desh, the world body had no contribution to make for over eight months. As such, to not only consider a problem but to deliberate on it and pass a resolution all in 48 hours shows a devotion to duty very rarely matched in the past. (Similar alacrity was shown by the Security Council in the early sixties, when it passed a resolution on the Kashmir problem even before Krishna Menon had concluded his speech.)

Death of American Hegemony

The other notable aspect of the deliberations in the General Assembly was the massive vote (104) received by the US-supported resolution about ceasefire and the withdrawal of forces. When the question of China's representation was discussed in the UN only a few weeks back, the US government could muster only about 50 votes in the general assembly in support of its position and it was assumed by many, a trifle prematurely, that this signified an end of the American hegemony over the UN. Actually, as events show now, the earlier vote accurately indicated the limited extent of the US commitment to the Kuomintang cause in the world of the seventies. The present vote has clearly brought out the fact again that the US leverage over most of the "developing" countries of the third world is as undiminished as ever and that it can be employed when the occasion demands. What had happened at the time of the debate on China's representation was merely shadow-boxing, staged for the benefit of the US home audience.

However, this does not completely absolve the Indian delegation at the UN. By now the general ineptness of the Indian government in cultivating public relations and goodwill is well known, notwithstanding the perambulations of our ministers all over the world in the past few months. For far too long, we have laboured under the erroneous impression that the UN it some kind of a super legal forum and, more often than not, the contribution to the debates from the Indian side has taken the form of highly sophisticated legal quibbling and hair-splitting. In practice, even the World Court doesn't work this way. This state of affairs has undergone some change of late, but the lack of adequate image-building, at which Pakistan was particularly successful in the days of Zafrulla Khan, still persists. This explains, at least partly, the negative votes by the Scandinavian countries, except Denmark. Of our neighbours, none except Bhutan supported the Indian position and Ceylon actually voted with the Americans and their friends. So much for propping up Sirimavo Bandaranaike with our guns!

Motivated by Self-Interest

The Security Council discussed the problem both before and after the General Assembly and on both occasions no resolution could be passed because of the Soviet veto. However, in the present context of world politics, even an adverse vote in the Security Council would have left matters very much as they were; so this is only a negative achievement at the best. Thus, the claim made by some that this is a major benefit to have flowed from the Indo-Soviet treaty is hardly justified. In fact, assuming that the Soviet Union was already converted to the Indian viewpoint, the significant feature of the debates in the Council was the abstention of the UK and France from the voting. Evidently, the European countries are coming round to the conclusion that their long-term interests will best be served by working with India rather than against it, even if this means an India significantly stronger than its neighbours eventually.

This still doesn't explain the attitude of the US government towards India, which has, of late, become even more than normally hostile. The Nixon administration, even in domestic politics, quite often appears to revel in treading over other peoples' toes. Even its close allies such as Japan are not spared. But this general woodenheaded clumsiness would not completely explain the particularly virulent attitude the US seems to be adopting towards this country.

One possible explanation is that the US faces its own variation of the problem of credibility. After all, the Pak junta is only one client of the American government, ruling its country without any reference to democratic principles. Even if the Pakistani clique were expendable in the eyes of the Pentagon, the others such as the South Vietnamese generals, the Cambodian generals, the Greek colonels and so on are not so and certainly the American government would not like the vulnerability of military rule supported by American arms to be exposed so clearly to the world.

An Alliance for Mutual Benefit

It is also likely that both Pakistan and the US have already written off Bangla Desh as lost and are now concentrating their fire on saving Pakistani possessions in the west, particularly in Kashmir. A clue to this was given in the Security Council by George Bush, who insisted that India must at once declare its intentions *vis-a-vis* West Pakistan and Kashmir. Conceivably, a military junta in Pakistan can survive the loss of Bangla Desh, but it is hard to imagine any Pakistani ruler surviving the loss of even a part of Pak-held Kashmir, not to mention parts of West Punjab. Moreover, with all of Kashmir in Indian hands, it is possible to think of a land-route from India to the Soviet Union and Afghanistan, and also to break the land link between China and Pakistan. One may be certain that both China and the US will try their best, short of war, to avert this.

Finally, one must not minimise the role sheer stupidity plays in international affairs. The publication of the secret Pentagon papers recently has shown how even the smartest generals (Maxwell Taylor) or the cleverest professors (McGeorge Bundy) can go tragically wrong in assessing a revolutionary situation. There is no reason to assume that the Nixon administration is not blessed with its normal quota of stupidity. Quite the contrary.

SOVIET UNION

Modest Upgrading of Plan

K Krishna Moorthy

THE current Soviet five-year plan for 1971-75 has been modified to approach in several respects the levels envisaged for 1970 in the plans formulated by the late Nikita Khrushchev in 1961. The announcement of the upgrading of the current plan was made by Soviet Prime Minister, Alexei Kosygin, in the Supreme Soviet towards the end of last month.

Most of the changes made in the draft of the plan approved by the 24th Party Congress a few months ago are minor. The big change is in the target for fertilisers. The new target for grain production is modest. The Soviet Government has retained the assignment of a faster growth rate for consumer and light industries than for heavy industries, an innovation in Soviet planning.

Two Reasons

The changes, made within seven months of the party's approval of the draft plan, may be due to two reasons. First, the current performance of the Soviet economy is probably better than was expected earlier this year. Second, it is possible that the draft plan was deliberately set on a modest scale, unlike the various plans of Khrushchev which were clearly unattainable.

Under the revised current plan, national income is to go up by 39 per cent, gross industrial output by 47 per cent, gross agricultural output by 22 per cent, and industrial labour productivity by 39 per cent. Even the upgraded figures for growth in the current plan are less ambitious than the actual performance recorded during the last plan for 1966-70. In the last plan period, national income rose by 41 per cent and the gross industrial output by 50 per cent. It is mainly in the agricultural targets that the current plan is slightly more ambitious.

According to Kosygin, the grain crop this year will be around 180 mn tonnes, or six million tonnes below the record level of 1970. The grain output figures were 171 mn tonnes in 1966, 148 mn tonnes in 1967, 169.5 mn tonnes in 1968 and 161 mn tonnes in 1969. The April draft of the current plan had set a target of an annual average of 195 mn tonnes. Against this, the Soviet Premier has now announced a target of 200 mn tonnes in 1975, the final year of the plan — a feasible proposition. The major input increase will be in fertilisers — 90 mn tonnes, against the April draft target of 72 mn tonnes.

The increase in capital investment in industry will be less than 40 per cent, while investment in agriculture is to rise by 68 per cent, compared with an actual growth of 67 per cent in agricultural investment in the last plan. National income grew by more than eight per cent a year in four out of the five years of the last plan period; only in 1969 did it fall below five per cent. The planned national income growth rate is 6.1 per cent in 1971 and 6.2 per cent in 1972. The targets for increases in real per capita income are 4.7 per cent in 1971 and 5.2 per cent in 1972 — lower than the levels attained in the latter part of the sixties.

For the first time in the history of Soviet planning, new recruits to the working force are to be diverted more into "non-production" activities, like education, services and administration. Out of the expected 10 mn new recruits to the working force, 5.3 mn will be found jobs in "non-production".

Frank Admission of Inflationary Trends

According to the Soviet Finance Minister's statement to the Supreme Soviet, the monetary income of the people will be more than seven per cent above the planned figure in 1971. This is a frank admission of inflationary trends in the Soviet economy. One of the ways to mop up the extra money in the hands of some sections of the people is the planned sale of more than 2.5 mn passenger cars during the current plan period. The cars will have to be paid for in advance, with a waiting list lasting some years. The sales of 2.5 mn cars will double the number of private passenger cars in the Soviet Union.

The capital investment in agriculture is to be nearly 23,000 mn roubles in 1971, or about one-fourth of the total capital investment. The capital investment in agriculture was around 16 per cent of the total in 1961-65 and 18 per cent in 1966-69.

The Soviet Union also plans to increase trade with the other Comecon countries by 50 per cent to a total of 77,000 mn roubles in the current plan period. The total planned increase in foreign trade turnover is 35 per cent. In the past decade, Soviet foreign trade with non-socialist countries increased more rapidly than trade with the Comecon countries. The present plan seeks to reverse this trend.

Khrushchev had boasted in November 1958 that the Soviet Union would soon "catch up and overtake the most developed capitalist countries". The present ambition of the Soviet leaders, as expressed by Kosygin, is for the Soviet Union to reach the 1971 US level of production by the end of the current plan. The Khrushchev plan for 1961-70 called for an annual average increase of 10.2 per cent in gross industrial product and 9.6 per cent in gross agricultural product. The annual increase was an average of 2.3 per cent in 1961-65 and 3.9 per cent in 1966-70 in agriculture and 8.6 per cent in 1961-65 and 8.5 per cent in 1966-70 in industry. According to American calculations, the value of the Soviet gross product in 1969 was 47 per cent of the GNP of the United States, compared with 34 per cent in 1950. The present plan targets for 1975 are in many respects near the targets for 1970 set by Khrushchev in 1961.

The major producer goods targets for 1975 are as follows, with the actual production in 1970 within brackets: steel 150 mn tonnes (116): coal 690 mn tonnes (624): oil 500 mn tonnes (353): electricity 1,000,000 kilo-watt hours (740,000): cement 125 mn tonnes (95): fertilisers 90 mn tonnes (55).

Reduction in Overt Defence Expenditure

The official defence budget for 1972 is to be about 18,000 mn roubles while the estimate by the Institute of Strategic Studies, London, is of the order of 55,000 mn roubles. As a share of the total budget, the overt military expenditure in 1972 will be 10.3 per cent, against 11.1 per cent in 1971.

The reduction in the overt defence budget is in line with the Soviet leaders' peace offensive for the settlement of various issues with the West. The final shape of the current plan shows that the hardliners in the Politburo have not gained any ground. At the same time, the hardliners' influence has not been brushed aside, as can be seen from the slightly higher targets for heavy industries.

'Democratic, Secular' Hawks All

Nireekshak

"IT's war", screamed *Statesman* across eight colums of its front page, on December 4. In the general scramble among newspapers for the boldest headline types and space to squeeze them into, following Pakistan's air-strikes in the west and Indira Gandhi's midnight broadcast, *Statesman* was an easy winner; its simple headline stood out as the best of all. Since that fateful Saturday, sub-editors have been having the time of their lives and, beginning with the front page, the main news pages of all major newspapers have had an eye-catching appearance. *National Herald* has added — though obviously not as an aid to good looks — one distinctive stamp of its own to enhance its wartime personality: it has resumed daily reproduction, above its masthead, of one of Nehru's favourite quotations: "Freedom is in peril. Defend it with all your might".

The outbreak of war took hardly anyone by surprise. *Amritu Bazar Patrika* seemed to let out what sounded like an audible sigh of relief when it declared: "War at last"! For *Statesman*, war was the "moment of truth", while for *Nagpur Times* it was "the fire that purifies". *Hindustan Times* regarded it as a "call of history", while *Hindu* and *Mail* both stated in a matter-of-fact fashion: "Pakistan declares war". "So now it has come", wrote *Statesman*, "what all of us till the last moment hoped to avoid, but which all of us knew that in the last resort we might have to face.... The nation will face the fact...." India has faced many trials before, observed *Hindustan Times* and survived them all. "But this could be a greater test than any before, for not only India but the whole subcontinent is being born anew and the world will be different for this tremendous change."

Commenting on Yahya Khan's statement that this would be a final war, the Delhi daily recalled that "another dictator, Hitler" had similarly once sought "to make the world safe for himself". Hitler failed, it said, adding: "This is a war of the military junta's own making. And it will be its last". *Amrita Bazar Patrika* thought that Yahya's action "illustrates not only Pakistan's anxiety to commit suicide but also his Western friends's incapacity to make him see reason". Yahya's challenge, it said, "is directed against the basic values of the Indian way of life; what is at stake is the secular and socialistic democracy which the Indian people have built up during the last two decades. They cannot allow it to be subverted by foreign bayonets." And as the *National Herald* saw it, "Yahya Khan's war... is an act of impotent fury. It could only be a mad man's war, but the man is really, consistently, sincerely (!) mad.... Nobody can save a mad man from his madness." However, it noted, "there is an Indian nation again, at a moment of crisis... and no power on earth and no combination of powers can deflect India from her goals: the establishment of an independent secular Bangla Desh and the safe return and rehabilitation of the refugees. India wants nothing else and nothing less."

Both *Hindu* and *Mail* cautioned against any vacillation on the part of the government. "This time", said *Hindu*, "our military men should not be hampered by instructions to pull their punches. Yahya Khan has chosen the path of war and he must be given a crushing reply." And *Mail* declared: "It will be hoped that having been drawn into a war, India will fight it to the finish". The Indian people, it said, will "cheerfully make sacrifices but they have a right to expect that they will not be betrayed by a weak or vacillating leadership and that when they have done with this war, Pakistan, brought to birth by fanaticism and nurtured by hatred will be no more on the map in its former form". Finally, in a signed editorial in *Indian Express*, Frank Moraes had this to say: "Emboldened and at times incited by his American friends who have been supplying him with arms until the penultimate hour, Pakistan's dictator has alternatively been flexing his muscles and cooing like a dove.... Nixon's calculating strategy to serve his own ends in America has led President Yahya Khan in Pakistan into his present desperate adventures.... India can take care of itself."

The news of India's recognition of Bangla Desh hit the press almost as forcefully as the war itself. A joyous chorus greeted the new State. "A nation is born", exclaimed *Nagpur Times*. "There is no doubt that Bangla Desh has come into being out of great travail and suffering.... Bangla Desh, unlike Pakistan, has not come into existence by the gift of a foreigner or by the negative virtue of religious hatred .... A new leaf in the history of this subcontinent has been turned", it said. "A birth, a death", commented *Hindusthan Standard*. "A new State is born and old Pakistan is dead.... What the impact of the emergence of this new State will have on the subcontinent, it is difficult to say at the moment. Bangla Desh and India are already united in the afflictions of war; the bond will become closer when the new State is in a position to implement its policy and programme fully." And as *Deccan Herald* viewed it, "December 6, 1971, is as historic a day for Bangla Desh as it is for India.... If the tumult in Bangla Desh were the birthpangs of a new nation, it also tolled the death of Pakistan that was .... India has been but history's midwife assisting the birth of Bangla Desh. In the annals of free India it is our finest hour."

One other important event that excited editorial imagination in recent days was the passing of the 25th constitution amendment bill by the Lok Sabha. It is true that Parliament, "representing the will of the people has every right to change the basic law", wrote *Times of India*, but since the proposed changes will "give the government the power to curtail fundamental rights... it owes it to the people to state far more clearly than it has done how it intends to use it .... There is no warrant for the glib assumption that only by nationalising an ever-widening sector of industry can it carry out the directive principles .... The increase in the disparities in income and wealth is the result not so much of any constitutional impediment as of the government's failure to use its vast fiscal and other powers to better purpose."

It was scarcely surprising, noted *Free Press Journal*, that in its present mood the Lok Sabha passed the bill with a massive majority. But "the crucial question now is how the cherished socio-economic reforms will be fulfilled .... The present bill, as Smt Gandhi has said, is merely a little step forward which is intended to take the country in the right direction. The country has yet to travel from 'political democracy' to 'economic democracy' and 'a more social democracy'. This means that several other roadblocks in the legislative and executive spheres have to be removed...".

Far-Ranging but Superficial

N S Jodha

Principles and Philosophy of Co-operation by P R Dubhashi; Vaikunth Mehta National Institute of Co-operative Management, Poona, 1970; pp 256 + xvi; Rs 15.
Rural Development Administration in India by P R Dubhashi; Popular Prakashan, Bombay, 1970; pp 343 + xiii; Rs 35.

THE first of these two books by P R Dubhashi is an edited version of his classroom lectures at the Vaikunth Mehta National Institute of Co-operative Management between 1967-68 and 1968-69. The second book is a collection of the author's articles published during the decade ending 1966 mainly in the *Indian Journal of Public Administration* and *Kurukshetra—the Journal of Community Development and Panchayat Raj*.

The first book, comprising 23 chapters and four annexures, covers practically every theoretical aspect of co-operation. The discussion of the principles of co-operation as reformulated by the 1966 Commission of the International Co-operative Alliance—covering co-operative membership, democratic administration, interest on share capital, and distribution of surplus, co-operation among co-operatives, and co-operative education—is comprehensive and is characterised by simplicity. Besides examining the philosophical background, the author scrutinises the practical implications of each principle.

Dubhashi argues that though, in view of technological, organisational, and ideological changes, the 1966 Commission dropped some of the original principles—such as the principles of political and religious neutrality, and of business practices (e g, purity of product, cash payment, correct weighment and measurement, etc)—they are still relevant in developing countries. The author consequently devotes considerable space to co-operative ethics, state and co-operative development, co-operatives and management principles, etc.

One feature of the book, which needs special comment, is the author's stress throughout on principles of co-operation not merely as 'moral ideals' or 'sentimental shibboleths' or 'pious wishes', but as practical rules according to which an organisation identified as a co-operative organisation operates. Yet he also candidly records the extent to which and the manner in which co-operatives in India (and in other countries too) deviate from these principles.

The book is replete with citations indicating the violation of co-operative principles as reflected in non-member businesses (p 23); provisions of special membership (pp 25-27); abuse of the principle of democracy (p 51); the bureaucratic behaviour of co-operators (p 87); mushroom co-operatives springing up through the process of registration (p 109); gross violation of the principles of voluntary association and political neutrality (pp 174-177); co-operatives' struggle for profit in competition with private agencies (p 217), etc.

In view of the fact that lectures contained in the book are meant for top-ranking co-operators, trained at what the author rightly calls the 'intellectual nerve centre of the co-operative movement' (p 120), one would have expected him to go much beyond the conventional textbook approach of 'what holds good in theory should be made so in practice', merely counting patently obvious deviations and either rationalising them as temporary aberrations or simply being regretful about them. A more useful, though perhaps a less easy course would have been to probe deeply into the fundamental issues which the co-operative movement in a country like India is facing.

The relevant questions are:

(1) Having accepted the 'doctrine of state partnership in co-operative development' can we escape its wider implications, which are partly responsible for the present state of the co-operative movement in the country? The author very inadequately touches this problem in chapter 21.

(2) Similarly, what is the scope for, and feasibility of, injecting some sort of selectivity in the official approach to patronage or support to co-operatives? Specifically, in view of the development needs, which are the cases in which co-operative principles can be sacrificed (temporarily at least) and which are the cases where state patronage and support can be kept to the minimum, leading to slow but healthy growth of co-operatives?[1]

(3) Further, in a society where egalitarian philosophy is somewhat smothered by traditional practices and group relationships and 'big men's' domination of co-operatives is the rule,[2] how far and in what manner can the democratic principles of co-operation (borrowed from an entirely different social setting) be given operational content?

The second book, on Rural Development Administration, contains essays written during different years beginning from 1956. However, the author has added postscripts to some of them to make them up-to-date. The first essay sketches administrative changes in India since Independence. The administrative changes include as far-ranging provisions as the establishment of the Partition Apex Committee at the time of Partition to the setting up of the National Building Construction Corporation, or the provision of a Presiding Officer for each polling station during elections, or the setting up of the Agricultural Prices Commission. Viewed from a different angle, the chapter gives a fairly detailed account of horizontal and vertical growth of the bureaucracy in India. The study also gives the number (exceeding a dozen) of the Administrative Reforms Commissions and Committees set up by the state and central governments, with their almost identical terms of references and recommendations.

The rest of the 17 chapters cover different facets of rural development administration, including the problem of co-ordination, training of personnel, working of local administration, relationship between administrators and elected leadership, inter-state differences, financial problems, and evaluation of the whole programme. The essays, though written at different points of time and in different contexts, are able to maintain some order of sequence and to serve as a commentary on the rural development programme in general and its administrative aspect in particular—as the programme moves from its NES stage to the Panchayat Raj stage.

The treatment of the subject is largely descriptive, however, and the accent of the discussion is generally on the formal machinery and procedures of rural administration without almost any reference to the socio-political complexities in the context of which the administration has to operate.

One of the consequences of discussing the rural administration in isolation from the hard realities obtaining in the community is that Dubhashi exudes the same degree of enthusiasm and optimism about administrative innovations

as do most government reports. For instance, while talking about NES, he says: "At the district and at state and central levels, it created a degree of co-ordination unattained before" (p 15); "Through camps, seminars and literature, NES gave stimulus to thinking and action of administrators in the field of rural reconstruction" (p 18); "In Community Development Seminars, the Development Commissioner has to exchange ideas with the Village Level Workers, since they form part of the vertically co-operating team" (p 89); "With the establishment of local democracy, the programme has developed from being a government's programme with people's participation, into the people's programme with government participation" (p 74); etc. Yet, to realise how far most of these things have remained wishful thinking, one has quite simply to refer to the successive evaluation reports of the PEO.

Some of the factors reducing the efficacy of rural programmes and restricting the ability of administration to meet the new challenges, have been recorded by several studies. More crucial are the attributes of leadership—both in the administration and in the non-official spheres. The latter, coming as they do from the upper strata of the rural community, not only dominate the programme but actually prevent the percolation of gains to the bottom.[3] The former, generally belonging to an elite group, suffer from what Edward Shils describes in another context as 'Xenophilia'—implying lack of knowledge, understanding, and appreciation, of the problems of their fellow countrymen.[4] However, these factors do not find a place in the book's discussion, thus rendering it somewhat superficial.

White-Collar Unions in Bombay—A Survey

S D Punekar

In the years since Independence, a substantial change has occurred in the economic — and, therefore, social and psychological — conditions of white-collar workers. While industrial workers, through organised protest, managed to increase their real earnings on the eve of planning, the salaries of white-collar workers were generally eroded by the rise in prices. The white-collar workers, representing the social, cultural, and educational middle-class, were thus left with the legacy of having to maintain a certain way of life and prestige on an increasingly strained budget.

It was in this atmosphere that white-collar employees first turned to trade unionism which they had earlier shunned as not quite in keeping with their status.

This paper is based on a survey of white-collar unions in Greater Bombay. Its purpose is to trace the genesis, growth, finances, nature and functions of white-collar unions, and their affiliation patterns to the all-India level.

[The survey was carried out as part of the Labour Research Laboratory in the Tata Institute of Social Sciences. The junior students of the Personnel Management and Labour Welfare specialisation took this up as a group research project and collected data from 21 white-collar unions in Bombay during November 1970 to January 1971. The author is grateful to these students for provision of the data for this article.]

THE Second World War and subsequent post-War conditions have brought about a substantial change in the economic, social and psychological conditions of ployed persons below them. The War white-collar employees were 'middle' in the economic and social hierarchies with an 'upper' class of rich and successful professional people above them and a large 'lower' class consisting largely of industrial workers and self-employed persons below them. The War changed the economic positions. The industrial workers successfully protested against the War-time rise in prices by demanding higher allowances and bonuses; though their real earnings declined in the initial years (1941-1951), they recovered the loss on the eve of planning—by 1960, real earnings were some 14 per cent more than in 1951. On the other hand, the white-collar workers, with their fixed and small earnings, became vulnerable to the worsening economic conditions. Their real wages have throughout lagged behind the 1939 level. The managements conveniently overlooked this unhappy economic situation.

Unrelieved Economic Hardship

The plight of central government employees can be taken to illustrate this point. The First Pay Commission, set up immediately after Independence, agreed to link to a limited extent the dearness allowance to the rise in prices. However, when prices actually soared above the expected limit, the government closed the matter by paying a flat increase of Rs 10. The Second Pay Commission even refused to accept the scientific principle of linking dearness allowance to the Consumers' Price Index and recommended simply an inadequate flat increase. The Third Commission, still continuing, has given an interim relief of Rs 25, pending its final recommendations. Compared to this, white-collar employees in profit-making concerns (banks, oil companies, etc) have got their earnings improved.

On the whole, then, white-collar employees have been relegated to a lower economic category; yet, their struggle is to remain on the middle of the social ladder. Without the necessary economic means, they find it difficult to maintain their social status (or, in other words, to keep their collars white). They have the social attributes of a high rate of literacy and education, a certain established standard of living, inclination towards non-manual occupations or services, participation in cultural, social, and political affairs of the community, and a fair degree of urban bias. These social characteristics have become difficult to maintain without adequate economic resources. So, either they have to improve their economic earnings or they have to forget their social status.

White-Collar Unionism

It was in this atmosphere of darkness and despair that white-collar employees turned to trade unionism. Before Independence, they were not properly organised, except in banks and postal services; and even there, their organisation was weak. At that time, in fact, white-collar employees considered trade-unionism—with its agitational and often militant approach—to be an activity only for industrial workers strangely led by middle-class intellectuals. The white-collar gentry, with their superior social and economic status, looked down on such cheap and extrovert methods as demonstrations, slogan-shouting, and parading in the streets. The war changed this attitude. Caught in the grip of ever-growing economic difficulties and social discontent, white-collar employees were forced to exercise both their right to organise and their freedom of association. Trade unions of white-collar workers thus came into existence. They could easily overcome the initial difficulties—including the social and cultural barriers.

To understand the genesis, growth, nature and functions of white-collar unions, a survey was undertaken in Greater Bombay. For this purpose, 21 unions of white-collar employees were selected by purposive sampling. A wide cross-section of industries and services was covered, as can be seen from the following distribution:

(a) Four unions of bank employees (Reserve Bank, State Bank, and two private banks which were nationalised later on; from the State Bank, the Supervisory Staff Association, which is an officers' trade union, was selected).

(b) Five unions of employees of the central government corporations (State Trading, LIC, Employees' State Insurance, Airlines pilots, and Indian Oil; from the last,

LOTUS BRAND CEMENT Manufactured by **Shree Digvijay Cement Co. Ltd.,**
Shreeniwas House, Waudby Rd., Bombay 1.
Sole Selling Agents **Laxmi Cement Distributors Pvt. Ltd.,** Shreeniwas House, Waudby Rd., Bombay 1.
Hospital Road, Jamnagar. Digvijay Nagar, Ahmedabad. 58, Sundar Nagar, New Delhi 3.

the officers' union was selected).
(c) Four unions of employees in the central government offices (Income Tax, Civil Accounts, Railways, and Stores).
(d) Three unions of predominantly municipal employees (nurses, teachers, and clerks).
(e) Two unions of commercial employees (one in shipping and another in retail trades).
(f) Three other unions (one in a state government office, one from general insurance, and one from a private engineering concern).

There were thus different types of management in the sample: private and public, small and big, at the national and local levels. Naturally, the staff-management relations showed wide variations. At the same time, the nature and scope of these 21 white-collar unions revealed an interesting spectrum.

Origin and Growth

As discussed earlier, white-collar unionism is a recent development. The oldest union in the sample (of Income-Tax employees) was started, however, in 1928 by the 'father of Indian trade unionism'—N M Joshi. The remaining 20 unions came into existence after 1931. Most of them were started immediately before or after Independence, no doubt with the high expectation of utilising the new political opportunities. Four unions were started between 1942 and 1946; eight between 1947 and 1955; five between 1956 and 1960; only one between 1961 and 1965; and two during 1966-67. The enthusiasm, shown before and after Independence, waned after-1960.

In most cases, the immediate cause for starting a union appeared to be of little significance. For example, in a (then) private bank, a few clerks in the head office struck work because of the extra load of work; the employer filed a suit and the employees' solicitor advised them to form a union and get it registered under the Trade Unions Act. In a commercial shipping company, the employer formed a company union which, however, soon ceased to function. In a central government office, two clerks were arbitrarily transferred to Assam and the employees organised themselves to stop such practices. In a private insurance company, workers went on strike, when the *Sravan* Monday holiday was discontinued; employees formed a union for the struggle. Unionism among officers is an interesting phenomenon. In a government bank, the supervisors (sub-accountants, cashiers, and staff officers, getting more than Rs 1,000 a month) found that the clerks, through their organisation, not only got dearness allowance to compensate the rise in prices but that, in certain cases, they even got more than their supervisors. Hence the latter decided to organise—against the express wishes of the management. Similarly, officers in an oil company organised themselves in a union as a reaction to certain arbitrary decisions by the management threatening their job security. The commercial pilots, getting a few thousand rupees per month formed a union to enhance their salaries and to improve their conditions. Although the birth of a union might be due to such immediate causes, which may not always seem of much importance, the main purpose of a trade union naturally is to safeguard its members in particular and employees in general. White-collar unions, like their blue-collar counterparts, were established to secure better economic and industrial conditions.

Growth of Membership

Most of the white-collar unions grew in membership and strength; their growth is also due to the expansion in employment. Once the initial inhibition was got over, white-collar employees took enthusiastically to unionism. In most banks and government offices, membership comprises 80 to 100 per cent of the total strength. Among pilots, membership is compulsory, in spite of the high rate of subscription (Rs 15 per month). In certain other cases, regular *paid* membership is not taken into account, because of the slackness in collection of membership fee. In a number of concerns, women have taken to unionism and some of them have become active workers.

One of the important drawbacks of Indian trade unionism is the multiplicity of unions and the prevalence of inter-union rivalry. This is partly due to political unionism whereby every political party desires to have its influence in the labour field, and partly due to the majority union not being required as the sole bargaining agent. Happily, white-collar unionism is generally free from these defects. There are very few rival unions in the field. Attempts made by the managements (in banks, oil companies, shipping firms, etc,) to start company unions have failed. On the whole, white-collar employees have been loyal to their unions. Multiplicity of unions is an exception. Attempts to divide the employees on caste or communal or provincial lines have also failed.

Except for one union of central government employees, all unions appear to be financially well off. Their main sources of income are membership fees and donations. In a few cases, income is from interest on investments. A bank union collected Rs 2 lakhs through a souvenir, while a state insurance union uses this source (*Smaranika*) every year to collect between Rs 12,000 and Rs 14,000. Another central government employees' union collected Rs 2,500 in 1968 as 'emergency collection'. In a few concerns, it appears that membership dues are collected by a check-off system (which is illegal for factories). In some cases, collection of membership fees is not regularly effected. For example, in a central government employees' union, many had not paid membership fees for 4-5 years. In another office, all members, who had paid subscription at one time or another, were considered to be union members. In a railway union, Rs 5,244 had to be written off as arrears. In a municipal clerks' union, Rs 23,638 were in arrears; a full-time worker, specially appointed for the purpose, collected Rs 19,337 out of these.

The rate of subscription varies from 25 paise to Rs 15 per month. Often, it varies for the different categories of employees. In one union, for example, provision was for life membership (Rs 15), well-wishership (Rs 25), and patronship (Rs 50). In another union, an admission fee of Rs 10 was taken, though the membership fee was only Rs 5 per quarter. On the whole, the rate of subscription was not high and this was willingly paid to a union, which had considerably improved the earnings of their members. Since, in many cases non-members formed only a small proportion, the 'free-rider controversy' did not arise.

The items of expenditure were mainly establishment charges (rent, salaries, etc,) and litigation expenses. In most cases, income is more than expenditure and hence the unions have appreciable assets. Pilots have a balance of Rs 3 lakhs. Where the unions are local units of a Federation, they have to pay a proportion of their income accruing from membership fees as affiliation fee to the Federation; sometimes this fee accounts for one-third or one-fourth of total income. Very little is spent on welfare activities or on any constructive activities.

Important Activities

Most of the unions were started to obtain better earnings and better administrative facilities. Hence the usual issues on which white-collar unions have fought have included better pay scales, more fringe benefits, internal promotion, rational salary structure, and reduction

If yours is an industry dealing with petroleum, chemicals or explosive gases, there are two ways of dealing with the fire hazards. One is to get the most comprehensive fire insurance to compensate you after the event.

The other is to ensure, with Kirloskar Flame Proof Motors, that fires never occur.

What makes Kirloskar Single Phase Flame Proof Motors the best insurance against fire?

International Specifications

Manufactured to NEMA (US) Standards, and approved by CMRS (Dhanbad), CIE and Fire Insurance Pool Association, the motors are rigidly constructed with a steel shell, CI-covers and with the capacitor housed inside the cover to eliminate any possibility of sparks causing accidental explosions. Besides the perfect suitability of design and guaranteed performance, that only Kirloskar can ensure, with their two decades of experience of Indian Conditions.

So what's your problem? Inflammable gases? Combustible chemicals? Explosive petroleum? Nothing to get burned up about—if you use Kirloskar Flame Proof Motors, the only Single Phase Flame Proof Motors manufactured in India.

● Range: 0.18, 0.25, 0.33 kW continuous rated, 0.55 kW half-hour rated.
● Early Delivery.

All trade enquiries to be addressed to the Hubli Unit.

Manufacturers
KIRLOSKAR ELECTRIC COMPANY LTD.,
P.O.BOX NO. 317, BANGALORE 3 – P.O.BOX NO. 112, HUBLI-20, INDIA.

ASP-KEC-204A

of workload. For example, a bank union sought recognition from management, 10 per cent annual bonus from 1957 to 1963, promotion on priority basis, and an increment at the diamond jubilee. A commercial company union secured from the management a system of time-scale pay for various categories of staff, dearness allowance linked with the Consumer Price Index, and a gratuity and insurance benefit scheme; later, it got for its members profit-sharing bonus, reinstatement of retrenched staff, and a number of fringe benefits such as rent allowance, education allowance, leave travel concession, medical allowances, etc. By means of successive agreements with the management, the employees are now among the best paid in commercial circles, with even a peon getting monthly earnings of Rs 750 and a stenographer more than Rs 1,000. The commercial pilots have increased their earnings fourfold during the last few years; a turbo-prop pilot now gets between Rs 3,000 to Rs 5,000 per month, while a jet pilot gets nearly twice this. Most of the unions have succeeded in enhancing the earnings and benefits of their workers. In profit-making concerns, profit-sharing in the form of bonus has been secured.

In certain cases, however, employees had to struggle for even minor concessions. For example, an insurance union had to fight for its demand to reduce the weight of ledgers, which were bulky and unsuitable to handle. It also succeeded in getting the compulsory typing test removed and in having overtime allowance for work on Sundays. It also resisted the rationalisation proposed in the form of Teller and Ledger system that resulted in a reduction of employees. The fight of the LIC employees against office automation (installation of computers) is well known.

A few unions arranged for special instructions to candidates for departmental examinations and for revision of rules. Welfare activities are almost absent, except for some co-operative societies, canteens, libraries, and recreational facilities. In most cases, such work is entrusted to the employer or to the joint committee. Members have been dissatisfied with the neglect of welfare work by their unions. In one case, they complained that the joint committee has therefore relegated the union to the background.

Trade Union Methods

As noted earlier, white-collar trade unions have neglected the method of mutual insurance, even though they have the necessary funds. At least the insurance unions could have given a lead in this. With the assistance of management, white-collar unions could undertake beneficial activities in this.

The unions have also neglected the methods of 'common interest', by which the interests of the industry in which they work can at the same time be furthered—for example, through better union-management co-operation, better methods to achieve higher productivity, job evaluation, application of organisation and methods. Even the officers' unions do not adopt these desirable methods.

The method of collective bargaining is usually followed, but in a haphazard manner. The first normal step is preparation and submission to management of a charter of demands, usually with monetary demands. If this charter is neglected by the management, direct agitational methods are resorted to. In the initial stages, when organisation was weak, methods such as demonstrations during lunch-hour, mass casual leave, pen-down strikes for an hour or two, practice of work-to-rule, etc, are taken up. When the union gains in strength, strike notices are given. Most of the unions have gone on strike. The central government employees had two 'general strikes' in 1960 and 1968, though for short durations.

Employees of government had certain limitations about their unionism so far. Government Service Conduct Rules placed many restrictions on their organisational activities. They could not resort to agitational activities easily because of their responsibilities towards law and order. Lately, however, government employees' unions have increasingly taken to the agitational approach. This can be illustrated by the activities of the Confederation of Maharashtra State Government Employees, which first submitted its economic demands to the state government in a constitutional manner. Failing to get any response, it organised a one-day mass casual leave, which was followed after a few months with a similar three days' leave. Even then, the state government remained indifferent. The Confederation then launched an indefinite strike, which was backed by more than 90 per cent of the employees and marked by disciplined strength. The government employees kept themselves aloof not only from the workplace but also from violence, intimidation, and political parties, some of which tried to take advantage of the situation. A similar trend is noticeable among some of the 'service employees' like teachers and nurses. The nurses' union is officially for renunciation of the strike as a method, because it would not like to have interruption in the noble service its profession offers.

In many cases strikes, or threats of strikes, have led to negotiation, arbitration, and often to agreements. Litigation has become a common method of white-collar trade unionism, though a few unions have claimed success without litigation or strike.

In short, white-collar unions have two main methods—agitation and litigation. Members of a union also resorted to *dharna* and *gherao*. Officers of an oil company—350 of them—once took mass casual leave and used it to demonstrate before the board of directors.

Affiliation Patterns

Where the union is a local unit of an all-India organisation, the affiliation to the latter is clear. For example, a bank union in Bombay is affiliated to the All-India Banking Employees' Association. Similar affiliations are found in All-India Insurance Employees' Association, All-India Audit and Accounts Association, etc. In such cases, matters of common interest to all employees are decided at the national level, where a number of conferences are held for discussion and decisions. Local problems and grievances are dealt with at the Bombay level. In some cases, like the State Trading or State Insurance, the employing organisation has branches or regional offices at various places and hence an all-India union with regional branches can function efficiently. It follows a procedure similar to that mentioned above. In the case of one union of state government employees, the branches are at various centres in the state, with headquarters in Bombay.

Only two unions are affiliated to a central workers' organisation, namely the INTUC. One of these was started by an INTUC worker, while the other considered affiliation necessary for the reinstatement of 300 employees suspended for participation in a strike.

Though, on the whole, the white-collar unions are independent, some political influence is evident because of politicians placed in advisory roles. In many unions—insurance, commercial, engineering, nurses, etc,—outsiders are presidents or advisers. Nevertheless, it is claimed that, in spite of association with such outsiders, unions of white-collar employees are independent, at least in their internal affairs.

As white-collar unionism—particularly of its militant kind—is of recent origin, the management attitude has not been crystallised. The usual attitude

is one of opposition to this break from the traditional pattern of staff-management relations. The white-collar gentry was mild and law-abiding. When they took to the militant, agitational approach, managements took to victimisation and hostility. However, with the growing strength of unions, the futility of this attitude was evident. In most concerns now, trade unions have been accepted as representative organisations of employees; and in many government offices and also in private commercial concerns, the Whitley Councils type of machinery has been set up. Settlement by negotiations, grievance redressal machinery, development of personnel departments for staff welfare and for union-management relations, discouragement of litigation, conciliatory staff policy, and increasing monetary and other benefits to employees, are some of the happy features in recent years—though much more can be done in these fields. LIC has shown that with a competent and conciliatory Chairman, the relations between management and employees can be peaceful and conciliatory. Relationship is now based on reason and facts. Even strikes and work-stoppages become mere manifestations of labour protests.

Even supervisors, who are normally considered as part of management, found themselves in conflict with top management. In a state bank, when the supervisors adopted in 1969 'work-to-rule' practice, their four leaders were charge-sheeted for disobeying orders to pass certain cheques. Later, officers, including senior officers, took mass casual leave on June 10, 1969. Management retaliated by relieving four senior officers of their duties. The issue was, however, resolved after some bruises on both sides. The struggle led to a lot of awakening on the part of management and union, as both realised their particular weaknesses and strength. Similarly, when the officers in an oil company found that the management, took certain arbitrary decisions, threatening their job security, they drew inspiration from the successful functioning of the LIC Officers' Association, and formed their union with an eminent politician as President. The management took objection to an outsider as president and expressed its displeasure that officers should take up militant trade unionism. The union people met a central minister and the management came round.

Law so far does not provide for recognition even in the case of the majority union. However, most of the white-collar unions have unofficial recognition in that they have negotiations with management. In case of government employees' unions, recognition has been withdrawn after a strike by their members; however, recognition was granted again after some time. In case of teachers and commercial employees, there is no uniformity in recognition, as employers are numerous.

On the whole, managements now have good relations with trade unions and this is evident in the machinery utilised for prevention and settlement of grievances and disputes, provision of more benefits, grievance procedure, negotiation, conciliation, mediation, and arbitration.

The strong points of a white-collar union are: large proportion of workers as members, sound finances, internal leadership, confidence by members in their leaders, and cordial relationship with management. The educated and intelligent membership is itself an asset.

The weak points noticed include: some reliance on outsiders (politicians), lack of high quality leadership; absence of full-time, devoted office-bearers paid from union funds; indifference of 'non-involved' members; lack of social consciousness among members (such as nurses); old entrenched leadership; lack of competent leaders to argue with management; conflicts among different categories of employees (such as between turbo-prop pilots and jet pilots), preoccupation with agitation and litigation; and lack of welfare facilities by the unions. There is also little effective communication between leaders and members/workers.

Judging from recent trends, the future of white-collar unions appears to be bright. More and more employees will be white-collars, with the development of technological change. Till recently, these workers were poorly organised; however, now they can claim some strong, representative organisations. Their further progress will be faster if they could take up welfare and constructive activities—such as mutual insurance for workers and their families, productivity techniques, and scientific management.

GOVERNMENT OF INDIA

5 PER CENT NATIONAL DEFENCE LOAN 1981 TO BE ISSUED AT Rs. 100.00 PER CENT AND REPAYABLE AT PAR ON 20TH DECEMBER 1981.

5½ PER CENT NATIONAL DEFENCE LOAN 1986 TO BE ISSUED AT Rs. 100.00 PER CENT AND REPAYABLE AT PAR ON 20TH DECEMBER 1986.

5¾ PER CENT NATIONAL DEFENCE LOAN 2001 TO BE ISSUED AT Rs. 100.00 PER CENT AND REPAYABLE AT PAR ON 20TH DECEMBER 2001.

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs 100 crores (approximately). Subscriptions may be in the form of cash/cheque. Government reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

If the total subscriptions received for the new loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the subscriptions received and the balance refunded in cash as soon as possible.

Interest will be paid half yearly on the 20th June and 20th December. Interest on all the loans now issued together with interest on other previous Government securities and income from other approved investments will be exempt from income-tax subject to a limit of Rs 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of the investments in the loans now issued together with the value of other previous investments in Government securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax upto Rs 1,50,000/-.

Subscription lists will open on the 20th December 1971 and close on 22nd December 1971 or earlier without notice.

Applications for the new loans will be received at:—

(a) offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna;

(b) branches of the subsidiary banks of the State Bank of India conducting Government treasury work except at the branch of the State Bank of Hyderabad, Gunfoundry, Hyderabad; and

(c) branches of the State Bank of India at other places in India.

For full particulars please apply to any of these offices or branches.

Electricity Pricing in Uttar Pradesh

S Ramesh

J L Bajaj

The State Electricity Board of Uttar Pradesh, like the Boards in other states, has evolved a tariff structure which aims to cover costs and earn a net rate of return of three per cent on capital. In practice a number of other considerations, too, have determined rates. The result is a complicated tariff structure which is not too clearly governed by any pricing principles nor is based on any accurate calculation of costs. In fact, the Board does not have any data on the various categories of costs, and does not keep separate accounts on generation costs from the different stations. Moreover, its finances are in the red with deficits increasing every year.

This paper describes the present tariff structure of the UP State Electricity Board and outlines the principles on which it appears to be constructed. It then discusses the lines on which the structure needs to be changed, if electricity tariff is to have any rational relation to costs and the State Electricity Board is to run as a viable undertaking.

I

IT is the purpose of this paper to discuss the present tariff structure of the UP State Electricity Board and to consider the lines on which changes or modifications are necessary in this structure. We shall briefly describe the existing rate structure and then endeavour to outline the principles on which it appears to be based.

At present the Board has separate rate schedules for: (i) lights and fans; (ii) domestic power; (iii) domestic two-part tariff; (iv) street lighting; (v) small power for private tube-wells and pumping sets for irrigation purposes; (vi) small and medium power (other than for irrigation purposes); (vii) small and medium power (seasonal), i e, on regular basis upto 6 months; (viii) small and medium power for state tube-wells, pump canals, and lift irrigation; (ix) mixed loads between 5 to 100 kW; (x) mixed loads above 100 kW; (xi) large and heavy power given at high voltage; (xii) large and heavy power (seasonal); (xiii) high voltage supply to the railways for traction loads; (xiv) grid tariff for the Board's licencees.

Apart from these generally applicable rates, the Board has specially contracted rates for certain large consumers like Hindustan Aluminium, Kanoria Chemicals, etc. Though it is nowhere clearly laid down, the following principles appear to be at the basis of the tariff-schedules:

(1) The Board is required by law not to incur any losses in its operations. Section 59 of the Electricity Supply Act, 1948, states: "The Board shall not as far as practicable and after taking credit for any subvention from the state government ... carry on its operations under this account on loss and shall adjust its charges accordingly from time to time ...". Therefore, attempts have been made by the Board to evolve a tariff structure which would meet operating and maintenance charges, allow for depreciation and reserve, and ensure a 'reasonable' rate of return on capital investment. The Venkatraman Committee, which examined the working of the State Electricity Boards (SEBs), in the country, recommended that the net return to be earned by the SEBs—after meeting the operation and maintenance charges, contributions to depreciation and general reserves, and interest on loan capital—might be fixed at 3 per cent on the capital base. This would amount to a return of 11 per cent, taking into account the electricity tax/duty levied by the state government and after meeting operation and maintenance charges and depreciation (i e, interest charges at 6 per cent, net return 3 per cent, general reserve 0.5 per cent, electricity duty at 1.5 per cent).[1] The Board has also given an undertaking to the World Bank that it would adjust its charges to enable it to earn a rate of return of 3 per cent on the capital base.

(2) Keeping in view the broad objective of meeting the total costs and ensuring a 3 per cent return on the capital base, the rates evolved have been such as to charge the various categories of consumers 'what they can bear', though it cannot be certainly said that the actual differences in rates are based on any precise study of the various demand elasticities. In the case of a power-intensive industry like aluminium, where the cost of electricity is a significant proportion of the total operating cost, the rate per unit charged is substantially lower than in the other heavy industries. Differing rates are also charged for domestic, agricultural, and industrial purposes; domestic consumers pay much higher rates than do industrial and agricultural consumers.

(3) On the supply side, cost considerations play an important role in determining rates; for example, lower rates are charged for high voltage electricity supply, where costs of transformation and distribution are lower than for low voltage supply.

(4) The rates prevailing in the neighbouring states are also to some extent taken into consideration by the Board in deciding its rates.

However, it cannot be said that these 'principles' have been fully followed by the Board. Its annual financial statements bear testimony to the deficits in its operations which have been increasing over the years. The total deficit during 1965-66 was Rs 2.03 crores, which increased to Rs 8.92 crores during 1967-68, and to Rs 10 crores during 1969-70.

Although the tariff structure has been revised a number of times, there are serious deficiencies in the manner in which the revisions have been undertaken. Practically no attempt has been made to properly determine the different types of costs; in fact, the Board does not have any data on the various categories of costs. It also does not keep separate accounts on the cost of generation from the different generating stations, though some rough estimates are made by the Board's engineers.

Costs in the electricity industry may be divided into three categories—capacity costs, energy costs, and consumer costs. Energy costs consist primarily of fuel charges at the power stations, transmission losses, and wages paid to the labour for running the power stations. These costs vary directly with total generation of energy. Capacity costs include interest, depreciations, maintenance of fixed equipment, and wages and salaries of power station operators and managerial costs not dependent on actual output of electricity but varying with capacity. The two important features of electricity supply are that it is

not technically possible to store energy in commercially significant quantities, and that demand fluctuates during different hours of the day and at different periods during the year. Capacity cost, therefore, does not vary with the total quantity of electricity produced but with the maximum rate at which consumers use electricity, i e, the peak demand of the system. Consumer cost is that part of the cost of distribution which varies with the number of consumers; it also includes the direct cost incurred when an additional consumer desires service, i e, such costs as meter reading, etc.

The three major categories of power generation—hydro-electric (run of the stream), hydro-electric (storage), and thermal—have certain well-defined characteristics, with their attendant economic and technical implications.[2] The proper and optimum utilisation of available capacity in these categories, is the fundamental objective of the electricity system. The hydro-electric 'run of stream' projects constitute the base load of the system, because the running costs of these projects is virtually negligible. The thermal generating units come into play after all the available 'run of the stream' projects are working to their full capacity. The storage type of hydro-electric project, is, however, completely different. In this type, water stored in a reservoir during the wet season is utilised to generate power during the dry season. The problem here is one of ensuring an adequate water supply during the dry season, so that the water level in the reservoir does not fall below the critical level before the wet season replenishes it. Both thermal and hydel storage projects can be used to generate power to meet the extra requirements of peak hours (known as 'peaking'). But the storage project is technically and economically more suitable for this purpose. In UP, the present position is that peaking is largely done by the hydro storage projects of Rihand and Matatila.

II

Having outlined the present structure of the electricity system prevalent in the state, we shall now proceed to consider the lines on which we believe it needs revision. A brief excursion into theory will be helpful. There will no doubt be general agreement with the proposition that the rates of supply should be equal to the cost of supply, with some provision added for securing a reasonable minimum return on capital investment. The question, however, is: What cost concept should be used to determine electricity rates? For rate-making purposes, the costs that are relevant are not the average costs per unit of any past accounting period. Difficulties of allocation of fixed costs, common costs, etc, are invariably encountered if we make the average cost of a past accounting period the basis for rate-fixation. From the economist's point of view, the relevant cost concept will be the *expected* long-run marginal costs; these costs would include energy costs, capacity costs, and consumer costs. The argument briefly is that, if the expected marginal costs are not covered fully by the tariff in every case, the output by the resources employed for electricity generation would have a lower value than if they had been employed in any alternative occupation. Pricing at less-than-marginal cost would, therefore, result in non-optimality in allocation of resources.[3]

The electricity utility industry is in the position of a discriminating monopolist, who faces mutually separate markets with demand curves of differing elasticity. Theoretically, such a monopolist can maximise his net profits by charging appropriate different prices in the separate markets. But the electricity industry is also a public utility, which is not allowed to make maximum monopoly profits. Some writers in the past, therefore, sought to defend price discrimination in the electricity industry on the ground that the output under discrimination will be increased and will also be at the socially most desirable point. But, as Joan Robinson has pointed out "... total output in discrimination will be greater or less than in simple monopoly according as the more elastic of the demands in the separate markets is more or less concave than the lowest elastic demand curve, and that the total output will be the same if the demand curves are straight lines, or indeed in any other case in which the concavities are equal."[4] No presumption can, therefore, be made for a larger output in all cases of price discrimination, even if a larger output is held to be socially desirable.

Three main kinds of price discrimination are found in most electricity rate schedules.

(a) Peak-off-peak discrimination;
(b) Block-rate discrimination; and
(c) Class-rate discrimination.

Peak-off-peak discrimination results from use of inappropriate differential rates for peak and off-peak supply. Spreading the total cost of production over the total number of units generated on the basis of some supposedly equitable distribution of overhead costs among groups of customers, would obviously be discriminatory. As already explained in our discussion of the different types of cost, the costs of electricity supply are not independent of the point of time of consumption. Non-recognition of this fact leads to discrimination among groups of customers, although the rate-schedules may appear to be non-discriminatory. The correct allocation of capacity cost should be according to the consumer's contribution to the system peak, because it is this consumption during peak hours that determines the requirement of total capacity.

Block-rate discrimination occurs when, in the block-rate schedule (where rates successively decrease with increasing consumption), certain units are charged at below marginal cost and the earlier units are charged at above marginal cost to make up for the loss on the cheaper units. Obviously, there can be misallocation of resources under this type of discrimination also.

Class-rate discrimination occurs when specially low rates are granted to new classes of customers on the ground that the customers benefit from the reduction in average cost of service—either by increasing the utilisation of existing facilities or by taking advantage of the economies of scale. To be non-discriminatory, price differentiation among different categories of consumers must be based on cost differences. The ideal tariff structure should charge, for different customers, the long-run marginal (expected) cost of supplying electricity to them with appropriately different rates for peak and off-peak hours of supply.

There are, however, both theoretical and practical difficulties in the way of implementing the policy of marginal cost-pricing in any electricity undertaking. First, the rate of return that should be earned by an electricity undertaking is usually prescribed by law, by regulations, or by the policy objectives accepted by the state. Where the long-run marginal costs are rising,[5] an industry might start making profits which are higher than the return allowed. If, as is unlikely, the long-run marginal cost curve is falling, a strict application of marginal cost pricing may result in net losses or a return lower than the minimum prescribed for the undertaking. The financial constraints, under which the undertaking operates, will have to modify the marginal cost pricing rule. Second, where social costs are different from money costs—as is often the case in an underdeveloped economy—strict

application of the marginal cost rule may reinforce the very distortions it may be the object of state policy to remove. Pricing below marginal cost in the case of certain categories of consumers, may actually increase the total benefits accruing to society and thus more than outweigh any allocational disadvantages resulting from the deviation from marginal cost pricing. This argument is usually advanced in support of low rates for agricultural power, though this is not explicitly stated. It is clear that marginal cost pricing by the electricity undertaking would not be optimal, where there is non-optimality in other sectors of the economy—including in the pricing of substitutes and complements for electricity as well as in the prices of goods and services which use electricity in production. Turvey has argued that rather than adjust electricity pricing to allow for these non-optimalities it would be better to tackle them directly wherever possible.[6] However, there will be non-optimalities in the different sectors of the economy introduced by the actual rate structures, which were so far not based on the marginal cost pricing principle and which are sought to be revised on that basis. Where, for example, the rates charged have been below marginal cost for a number of years for any category of consumers, there has in effect been a hidden subsidy to this sector which may or may not be economically justified. If such a subsidy is held to be justified by considerations of social costs and benefits involved, it might be better to give it as an open subsidy. As a practical measure we would suggest that marginal cost pricing, especially where it involves a considerable change in the existing rates, be introduced gradually over a period of years.

Apart from the above considerations there are other practical difficulties in implementing a strict marginal cost pricing which we shall discuss towards, the end of this paper.

III

Viewed in this way, there can be no doubt that the present tariff structure needs considerable revision. We do not wish to discuss the different rate schedules in detail here, but a few examples will illustrate our views.

In the light and fan schedule, for instance, all consumers are divided into two categories, *viz*, (a) consumers in the cities of Lucknow, Allahabad, and Kanpur, and (b) consumers in the rest of the state. The rates of supply are as much as 11 paise per unit higher for the second category. Obviously, the cost of supplying electricity cannot be that much higher in the second category; in fact, the difference has historical reasons. The three cities were being supplied cheaper electricity before the Board took over their supply from the private undertakings concerned. In the domestic power tariff also, the difference is 9 paise per unit. Similarly, the street lighting rate schedule imposes a higher rate (higher by 15 paise per unit) for places other than these three cities. Since the cost involved in extension of street light mains (including cost of sub-stations) in areas where distribution mains have not been laid, will be borne by the consumer, this difference is obviously not based on cost basis. The different manner in which small power for private tube-wells, other small loads and state tube-wells etc, is treated cannot be justified either on economic grounds. The criticism that can be made against the large and heavy power schedules, where supply is given at higher voltage, is much more serious. These schedules are based on the two-part tariff system, under which there is a demand charge and an energy charge. The demand charge consists of 3 block rates with the rate decreasing with successive blocks; the energy charge is in addition to this and is also divided into 3 blocks, the charge decreasing with each successive block. Even a casual reading of these schedules is sufficient to make one conclude that they have been evolved largely on considerations other than the principles we have enunciated earlier. The demand charge is based on 'billable demand' during a month, which is defined as "the actual maximum demand registered or 60 per cent of the contracted demand, whichever is higher". We have already pointed out that the cost of electricity is not independent of the time of consumption and that non-recognition of this fact leads to peak and off-peak discrimination. If the basis of the demand charge in the industrial tariff is the capacity cost, then all consumers who consume electrical energy during the system peak are co-responsible for the peak according to their consumption at that time and capacity cost should be allocated accordingly. Under the high voltage industrial tariff, however, the consumer's demand charge varies according to his individual peak. This may mean that a consumer who regularly has his peak during the system's off-peak hours is paying more than he ought to, because the cost of serving him is lower. The cost of supplying electricity to the peak hour consumer includes capacity cost but the cost of serving the off-peak consumer excludes this. Secondly, the demand charge goes down with successive bigger blocks of billable demands. It is difficult to see any rational basis for this distinction and it is impossible to justify it on any cost consideration. The capacity cost to be attributed to a consumer should be a function of the consumer's maximum rate of consumption during the system's peak—not of his maximum rate of consumption during the year, nor of his total use of electrical energy per period.

The above analysis shows that the present tariff structure needs considerable revision for bringing the rates more in the line with the cost of supplying electricity. If the tariff structure is sought to be revised on the basis of cost, this would also be in the long-run interests of the Electricity Board where today cost consciousness seems totally absent.

Two points will serve to underscore the need for the Board to keep a more watchful eye on its costs. First, the Board has no replacement policy; some of the smaller plants have outlived their useful life. If a careful study is made, comparing the costs of producing electricity from these plants with the cost of production from a new plant, it may be possible, depending upon the relative costs, to come to the conclusion that some of the plants need to be replaced. Secondly, the Board does not use any of the inventory control techniques now available.[7] The Board's present stock of inventories comes to nearly Rs 28 crores, which appears to be excessive. The Board with its present resources can hardly afford the luxury of poor inventory management. As a large proportion of the economics of an electricity undertaking is already built into the system, one of the very few areas that lend themselves to any effective control is material, which is the most important component in the cost structure. It would be beyond the purview of this paper to go into the purchase policy of the Board or into the difficulties in the way of its efficient and economical functioning.

We suggest that the Board should make a detailed study of the costs of generation from each of its generating units, *viz*, hydroelectrical (run-of-the-stream), thermal, and diesel power stations, and hydroelectric projects (stor-

age). The Rihand and Obra hydro-storage projects are used for peaking, and the thermal projects and hydel (run-of-the-stream) projects together have in effect become the base load. What is necessary for the Board is to calculate the cost of generating at high voltage from each of these projects. It would be importont to allocate the capacity costs to the peak hours. Obviously, the peak demand would vary for the different seasons in the year. The principle is obvious, and any practical tariff application to large numbers of small consumers can only reflect costs approximately averaging among the different consumers and over the different periods of the year.

Even if the costs of supply of electricity are available throughout the year, it is difficult to evolve for the different categories of consumption, rate-schedules which adequately reflect these costs. The costs of supply will obviously vary with varying voltages, the transformation and distribution costs increasing with the supply of electricity at lower voltages as well as at different periods of the year. The ideal system, which would be justified from the strictly economic point of view, has been summarised by R K Davidson thus:

> "In principle the proposed non-discriminatory rate schedule consists of a fixed monthly customer charge + the kW hour charge that varies according to the time of day. The unit charge equals marginal energy cost + marginal capacity cost during peak hours, and only marginal energy costs during off-peak hours."[8]

The load curve that is relevant for rate-making is the expected load curve for the system. Since this cannot be known with any degree of certainty and since the tariff structure cannot be revised every year, the only alternative is to predict the expected load curves for the next 10 years or so (on the basis of past records and estimation of future needs by large and small customers) and to utilise this information for determining the tariff. The ideal theoretical rate structure, as already mentioned, will be where the rates change according to the time of the day. Further sophistication can be introduced if consumption varies with the season, so as to ensure maximum utilisation of capacity. The theoretical solution is not, practically speaking, the most feasible for all categories of consumers. Perhaps a beginning could be made for large industrial consumers, where a time-of-day rate schedule can be implemented, utilising a combination Watt hour meter and time switch. Obviously, in the revised tariff structure which we are proposing, marginal capacity cost for high voltage supply would include generation and high-tension transmission costs, whereas distribution capacity and transformation capacity costs would be included for customers who buy electricity at secondary voltages.

Marginal energy cost may also vary between peak and off-peak hours : it older and less efficient capacity is used to meet peak consumption. However, it does not appear that this is the case in UP where the Rihand and Obra hydro storage projects are used to meet peak demand. In such a case, then, the fixed and variable costs of meeting the peak demand should be borne by those who demand electricity at peak time and the appropriate charge should be determined by the cost of expanding thermal capacity. This is justified because thermal power constitutes the major source of supply in the state and, except for Tehri and Maneri Bhali hydro-electric projects which are likely to take more than a decade before any power is available from them, all other major generating stations in the near future are likely to be thermal. Moreover, the potential hydro electric sites in the state are limited and the expanding requirements of electricity are expected to be greater than the supply from these sources. Greater thermal capacity would thus be needed to meet the expanding demand.

Apart from the industrial tariff, it is possible to apply this principle in respect of private tube-wells and pumping sets also. There has been a phenomenal growth in electric connections for private tube-wells and pumping sets during the last five years —from 4,729 in 1964-65 to 91,977 in 1969-70. This is largely due to the assured irrigation necessary for the new high-yielding varieties. During this period, the connected load for agricultural power has increased from 1.35 lakh kW to 7.10 lakh kW and the consumption of electricity has increased from 31 crore units to 61 crore units approximately. It is also proposed to add nearly 50,000 additional connections every year. The proportion of agricultural load to the total connected load, which increased from 13.5 per cent in 1965-66 to 31 per cent in 1969-70, is expected to increase further in the next few years; and the problem of evolving a suitable tariff for agricultural power, therefore, assumes considerable importance. The State Electricity Board claims that it loses nearly Rs 500 per tube-well per year, but this claim is not based on precise calculations of capacity, energy, and consumer costs. We know the general pattern of consumption of electricity for irrigation purposes, *viz*, that farmers generally irrigate their land during day-light hours. Sometime back the Board offered a concession of 33.33 per cent for consumption during night hours, but this facility has not been availed of by even a single rural consumer in the state. There is some reason to believe, therefore, that the pattern of consumption of agricultural power will remain constant over a wide range of rates. The known pattern of consumption of agricultural power can be utilised to evolve a tariff that reflects the cost of supplying electricity to private tube-well and pumping sets.

Similarly, street lighting occurs during certain defined hours of the day and the tariff in respect of street lighting can take this fact into account. It may not, however, be practicable or economical to enforce a time-of-day rate-schedule for domestic consumers.

The above analysis will support our contention that it is quite possible, with some modifications, to apply the economic principles that we have outlined in the earlier part of the paper. While the theoretically ideal tariff-structure may be impossible to implement in practice, that is no reason for not making a sincere attempt to base the rate-structure on acceptable economic principles.

New States and International Order

The East African States

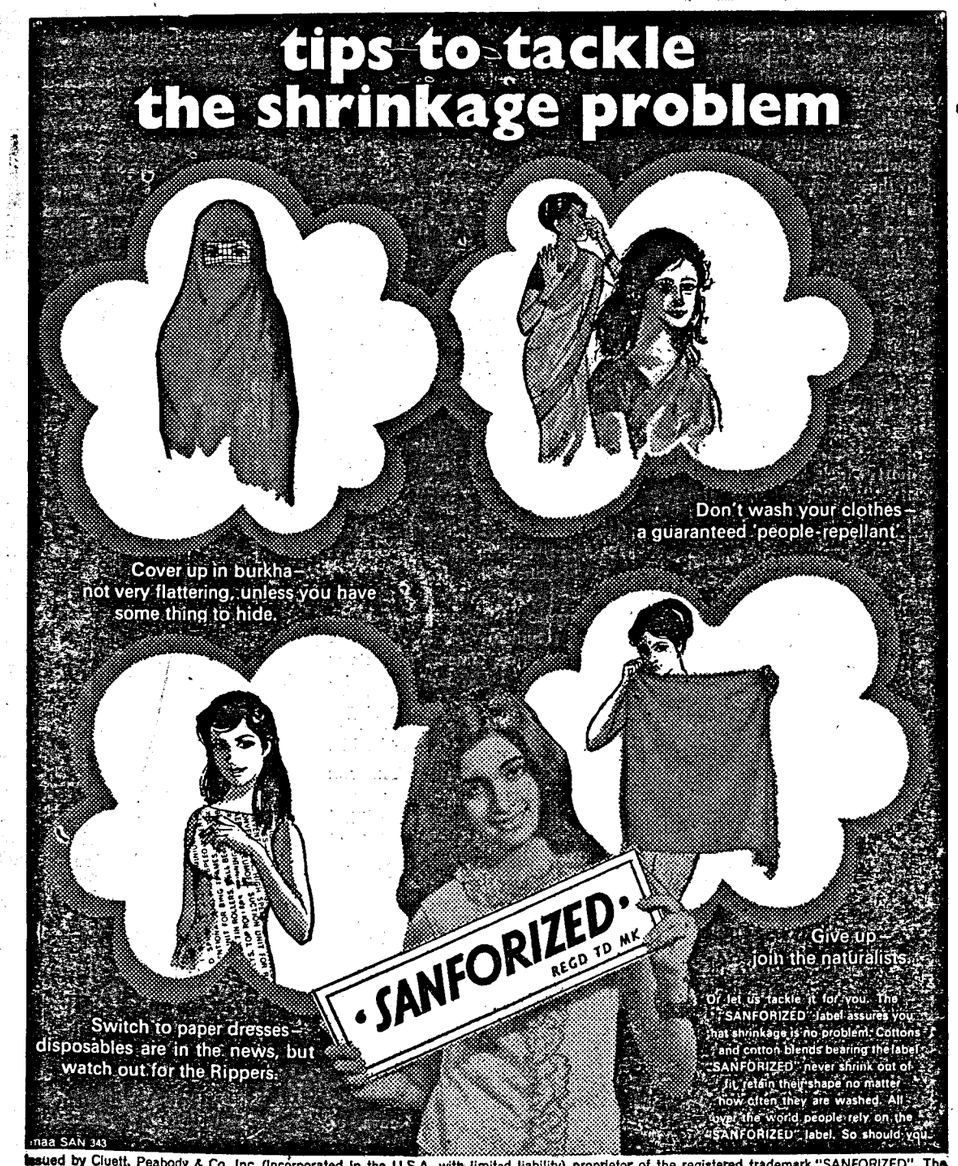
T V Sathyamurthy

NEW nations are brought into existence in an atmosphere of internal and international crises. They lack the advantage of older nations which experienced the process of development while maintaining their mastery of the international environment. In a very real sense, the growth of international relations paralled the growth of these states. With the development of communications and a deeper interdependence of the different parts of the world, new states commence their independent existence in an atmosphere of heightened international activity.

A new nation is compelled to cope with an international environment fashioned, at least in part, by the former metropolitan powers. On the one hand, it has to accommodate itself to this situation; on the other, it has to create conditions which not only permit its internal development but also help secure a favourable international position for itself. Thus, except in the revolutionary situations of Russia, China, and to a limited extent Cuba, which resulted in an initial period of self-imposed isolation, a new nation cannot avoid learning the body of rules and custom regulating the conduct of international relations, European in origin, and created without reference to the conditions obtaining in the Afro-Asian world. This note is concerned with the latter category of new nations.

Upon achieving independence, new nations generally regard some form of continued association with the former metropolitan power as useful and necessary. At the same time, they strongly believe that the continuation in a new form of their ties with their former colonial masters should be accompanied by a forging of new links with other states in order to tackle the major problems of economic development and technical assistance. The important fact to note here is that, as successor states to the colonial dependencies, these states automatically assume certain obligations which they have to discharge under normal circumstances. Two important questions frequently arise: To what extent should new states accommodate themselves to the international environment not of their making? In what directions and to what degree can they influence changes in the existing environment?

The adaptation of new organisms to the contemporary international environment poses special problems. Before the Russian Revolution, the international system was essentially homogeneous in character. During the last fifty years, however, new political models based on the experience of radical change in certain countries have become available. The new states are thus naturally attracted by the prospect of incorporating the diverse virtues of radically different models into their own developmental process. At the time of independence, leaders of new states, for reasons easily understood, adopted the institutions and ideas of the metropolitan country as their political model (e g, Indonesia and Ghana). A subsequent realisation on their part that transplanted political institutions were not effective, and that the experience of radical new nations would perhaps be more relevant to their conditions, resulted in an attempt (e g, African One Partyism) to combine different features of institutions created under widely varied conditions. The mere fact of the existence of ideologically opposed models stimulates unity, however loose and tentative, among new states acting as an ideological buffer. The increment in prestige, at home and abroad, resulting from such a collective sense of identity is not inconsiderable.



Expression of Aspirations Through Symbols

The impact of the available political models as symbols of different sets of norms, values and goals upon new nations is powerful, especially in our time. In the case of African nations we witness the phenomenon of African leaders expressing African aspirations through such symbols as "African personality", "African socialism", and "Negritude". The images bounced off by a nation (however ambivalent in character — the ambivalence itself stemming from a variety of reasons, e g, the contradictory tendencies within the top leadership as in Kenya, or the complexity of the interrelationship between different groups within the nation as in Uganda) on the international plane are vital to its international role definition.

The East African nation states achieved independence during the early sixties when the intense phase of the Cold War had subsided. By 1960, several intermediate political models had been generated (as well as, of course, the revolutionary situation in China which falls outside the continuum with which we are concerned here) in the ex-colonies of Asia and West Africa (e g, Indonesia and Ghana, both of which have undergone profound transformation within a few years of their independence). These models, however imperfect and vulnerable to internal and external forces, are attractive to new entrants to independent statehood (of societies which share many common characteristics with those which reached independence in the forties and the fifties) not only for emotional and psychological but also for practical and political reasons. Furthermore, for small nations the UN has acquired a sanctity out of proportion to its usefulness. Its chief significance for them lies in the fact that entry into it carries with it their indisputable legitimation as states. Not a few countries (e g, Zambia) make special efforts to secure as large a proportion of external technical and administrative assistance from UN sources as possible.

Should a viable definition of the international role of East African countries have to incorporate the concepts of legitimacy and identity/identification? The constraints imposed on the aim of their leaders to increase their autonomy and decrease or neutralise external pressures by the international system and its sub-systems (e g, the Commonwealth, OAU, Third World, EEC, etc) constitute an important dimension of the concept which we are exploring here. A vital difference between the central concepts of legitimacy, identity and participation and the one examined here lies in the fact that the contours of the latter are best delineated when it is not seen as a crisis. External affairs, unlike domestic politics, are pivoted to self-determination; though conditioned by such factors as the influence of colonial experiences and practices, commitments inherited from the colonial epoch, dependence on foreign powers for aid, relationship with immediate neighbours, position within the Third World, attitudes to such regional ideas as federation, common market and the relationship between domestic and foreign policies.

How do political, ideological, diplo-

matic and other determinants affect maximisation of autonomy? First, the idea of non-alignment, whatever its content in a given country, covers a wide range of specific aspirations while seeking to obscure potential areas of conflict between nations which share common characteristics. Second, Pan-Africanism, however diluted, still retains it emotional and symbolic significance as is reflected in the adherence of these states to the OAU and in the common struggle against racialism in Africa. The intensity of this problem is highlighted by geographical factors (e g, Tanzania which is surrounded by seven countries at various stages of political development). The usefulness of Pan-Africanism as a symbol of co-operation would seem to be a complex resultant of the scope allowed to the OAU and the foreign policies of the individual East African countries. The continued appeal of Pan-Africanism for countries with limited power and lacking in modern resources of communication and technology, dependent upon each other for a collective exercise of their influence on the international environment cannot be exaggerated. Third, account should be taken of the fact that East African countries have found that their views on colonialism, certain specific aspects of the application of the principle of self-determination, etc, have much in common with those of the slightly older Asian nations. Thus, even the tattered remnants of the Bandung spirit serve a useful purpose by providing a sense of common purpose if not solidarity in such bodies as the UN where they are compelled to seek successful solutions to problems affecting them in various spheres. The euphoria of the post-Bandung years (late fifties) was lost in the haze of problems created during the sixties (since Belgrade) by the emergence of more dynamic definitions of non-alignment in conflict with the original one fashioned by India. But the seventies (since the Lusaka Conference) would seem to hold the prospect of a more limited and more practical but also a clearer common denominator of foreign policy emerging among these nations. Here again, one is faced with substantially different variations of the theme when one studies the particular problems posed by the East African countries.

Almost all new nations are consciously committed to a policy of economic, social and political development. The resources and capital required for development have to be obtained from external sources (except in the case of China since the abrupt termination of Soviet assistance in 1960). This inevitably leads to a rivalry between Big Powers which have vested interests in the development of new nations. Despite the attempts made by the receiving states to cope with Big Power competition by pursuing a mixed strategy of economic planning (public and private sectors) and taking political precautions against "aid with strings", in reality they are subject to various influences by the mere fact that they are participating in an on-going relationship with the donor countries. Even the educational contact between foreign technicians and local technicians can be of significance. Another aspect of development concerns the balance between long term planning geared to sustained development and improving the standard of living of all and the utilisation of scarce resources — domestic and foreign aid — for expensive prestige projects of doubtful or marginal utility. To what extent a particular image projected by a new nation is conducive to its internal viability, political stability and a fruitful relationship with its neighbours is worth examining.

The foreign policies of new states are subject to an in-built pressure in the international environment in the form of the rivalry between the Big Powers. The non-aligned posture of the new states, while obviating the necessity of choice between ideological antagonists, permits them to accept aid from all sources. In all this, a new state sees as a fundamental necessity the safeguarding of its security and independence from all external interference. East African examples point to the practical difficulties involved in the simultaneous balancing of the above three factors in the shaping of a new nation's foreign policy. The 1964 US decision to assist the Congo (Kinshasa) government in their fight against the rebels along the Uganda-Congo border was viewed by Uganda as a threat to its security and has resulted in foreign policy shifts, the significance of which it would be profitable to assess. Similarly, the birth of the Republic of Tanzania was immediately followed by the problem of simultaneous representation of East and West Germany. The West German government which had only recently been involved in a serious misunderstanding of a similar nature with the UAR promptly issued a threat to cut off military aid to Tanganyika (Tanzania) if it decided to extend any kind of diplomatic recognition to East Germany. The Tanzanian government was faced with a choice between asserting its independence in foreign policy making and continuance of aid from a foreign country — a choice necessitated not so much by a psychological attitude to two different foreign states in Europe but by a concatenation of events of profound internal significance to the two parts of the new state. This case exemplifies the fact that the question of development aid is related to the overall foreign policy of a country in a series of concentric contexts (the national, the East African, African and so on). Political scientists should disentangle different aspects of policy which affect each other and ascertain limits imposed by specific internal and external constraints on autonomy in foreign policy making.

Foreign Policy and Style of Leadership

The developing style of leadership of a new nation exercises a profound influence on its perception of foreign policy problems, and is in turn affected by the external factors characterising the world situation at any given time. In general, personalities are important not only for what they do, but for what they represent to the outside world. Thus Kenyatta legitimates Kenya in the eyes of the world and Nyerere legitimates Tanzania. Here the personality of national leaders prior to independence is of crucial significance. In African countries, attention to foreign policy prior to independence was highlighted by the non-alignment of already independent Asian states. A general hypothesis suggests itself for examination: Where the struggle between the colonialist and the nationalist forces was intense and bitter, the post-independence leadership tends to be more radical and experimental in the choice of foreign policy; where it was peaceful the leadership tends to adopt a more moderate line, subject to there being little change in internal leadership patterns during the period subsequent to independence (a qualification suggested by, e g, Lesotho).

What happens *after* independence is even more important than what happened before independence (e g, the gradual radicalisation of Nkrumah and the CPP in Ghana). The case of Tanzania is particularly interesting. Tanganyika led by moderate Nyerere was forced to accommodate itself to the sudden revolution in Zanzibar. The revolution itself was quickly followed by an attempt by the military to disrupt civilian political power in Tanganyika,

Kenya and Uganda. The latter sought British assistance for their survival thus exposing their tenuousness. Nyerere attempted to retrieve his position by uniting Zanzibar with Tanganyika in an effort to contain the revolutionary character of the latter. But the union not only could not but profoundly affect the East African federation but also resulted in Nyerere changing his moderate foreign policy stance. A new legitimacy was sought to be created through the OAU which resulted in shifts in foreign policy — shifts which affected a whole series of policies of a regional character and have introduced new dimensions into the foreign commitments of Tanzania.

The Kenyan situation was characterised by a conflict between two essentially different sets of international image makers — the urban based trade union leader Mboya and Oginga Odinga, a tribal leader with a national stature. Immediately after independence, the two leaders were identified with the two sides of the ideological divide as a matter of convenience from the national point of view. Mboya's style was in keeping with the Western political idiom; Odinga, partly to avoid competition with Mboya in the West, looked to the Eastern bloc for assistance in building his international image and consolidating his international position, thus unwittingly casting himself in a radical mould. The fact that Mboya is now no more and Odinga is no longer in office does not alter the fundamental characteristic of the Kenyan political situation. Thus the foreign policy and international commitments of Kenya on the one hand, and the whole question of internal succession on the other need to be viewed against the dynamic of psychological factors generated by these two men. In the case of Uganda, however, there existed only one dominant line on foreign policy until the recent overthrow of President Obote. If the new regime is able to consolidate itself, a pattern of foreign policy not dissimilar to that which emerged during the post-Nkrumah period in Ghana may well come to surface — a possibility which perhaps lies at the root of the reluctance of other East African countries, especially the Sudan, Tanzania and Zambia to recognise the new regime.

Internal and External Policies

Though analytically separable, internal and external policies deeply influence each other. The different components of internal policy — e g, ideological self-perception, choice of development strategies, trade policies, attitude to refugees — determine to a certain degree the external policy of a state. In East Africa, all important changes of policy and internal leadership (e g, the Uganda coup of 1971) also affect federal institutions and their functions. The impact of internal policy shifts on the external commitments of a country should be investigated. Domestic factors affect not only the crisis orientations of the dimensions of penetration, participation, and distribution but also external variables. Thus, a deliberate choice of action in the domestic sphere may determine the choice of external policy preferences (e g, the Arusha Declaration 1967, though a document forging a new domestic policy, is, as has been demonstrated during the last four years, of international significance). Similarly, a choice in favour of one dominant mode of development may affect the distribution or participation crisis of the polity. It is a pity that social theorists (including such sociologists as T Parsons) have omitted the influence of external factors on internal arrangements by a wholesale transference of the thermodynamic model of adiabatic systems into the realm of social scientific speculation. This is a serious lacuna. A few political scientists have succeeded in bootlegging the internal decision-making environment as a salient factor in external policy-making; but the reverse is no less important and represents an unexplored area of research.

A few clues to an understanding of the relationship between internal and external policies are suggested here.

(a) Mass-elite continuum in new states: It is important to know whether the elite is fragmented or homogeneous, and the extent of discontinuity between the elite and the mass. Where the discontinuity is vast, a greater gulf exists between domestic and foreign policies. Where a conscious attempt is made to integrate the masses into the decision-making structure (e g, Tanzania, post-1970 Chile), a mutual sensitisation of internal and external policies leads to a bridging of the gulf. This picture can be transported to the international system where the elite-mass criteria could be applied with equal validity.

(b) The learning process to which new states are automatically subjected in the international environment is of crucial importance. Unlike the developed states which were able to build a corpus of political, administrative and diplomatic experience over a long period, the new nations lack the advantage of stored social knowledge. Domestic and international crises take place in swift succession needing immediate political attention from inexperienced politicians who find it difficult to separate the two in practice. Also, leaders of new nations are usually handicapped by their mastery of political tactics used in resisting colonial power because they lack expertise in the techniques of bargaining, negotiation and compromise which are essential to the normal running of government. In the case of East Africa, intra-African rivalries are bound to be affected by the degree to which compromise can be achieved. The style of internal politics affects the style of intra-African politics; so also tribal rivalries overlap with national integrative forces.

(c) The problems of international role definition are influenced by educational and cultural policies. In Africa, the student community is highly influential. Student organisations often tend to view problems of international importance in ways different from that adopted by the leadership. But students are leaders of the future and their attitude to politics, invariably influenced by foreign ideologies, is of great significance and may not coincide with the world-view which the leadership might like to foster in them. For instance, it is the practice of non-aligned countries to send students to both blocs for higher education and technical training. This leads to unintended and unanticipated consequences for the reason that students are affected by the whole culture to which they are exposed and often return home with radically altered norms and perspectives. In some cases, foreign help is sought for the establishment of national centres of political, administrative and technical training. The future of such institutions is often subjected to the vicissitudes of foreign policy (e g, the Lumumba Institute). Heterogeneity of indoctrination and diversity of ideological loyalties among the educated who represent an important section of the politically relevant community must be studied in an attempt to understand the way in which internal factors impinge upon external policy.

International Role Definition

The importance of the regional policy of each East African country stems from the significance — concrete and symbolic — attached to the idea of federation. Such supra-national organisations as the EARH, EACSO and EAPT were already functioning at the time of decolonisation. But as the national governments became preoccupied with domestic problems, the political aim of federation tended to be diluted despite the fact that the usefulness of existing federal arrangements have assured them an indefinite tenure. A study of the impact of internal developments on the federal intentions and capabilities of the individual countries would require an analysis of the great differences between them, ranging from their natural resources to their styles of political and economic development. The approach of each country to its internal crises of penetration, participation, legitimacy, integration and distribution will have important consequences for intra-regional relationships. Thus, important differences in approach to the crisis of penetration and distribution between Tanzania and Kenya on the one hand, and to the crises of legitimacy and identity between Kenya and Uganda on the other, may have far-reaching repercussions on the problem of federation.

A whole *genre* of problems unanticipated during the colonial period can be described under the rubric of irridentism. Uganda has to face border problems in its relations with Rwanda, the Congo, the Sudan, and Kenya with Somalia and Ethiopia. These are created by the system of defining colonial boundaries alien to the indigenous peoples, but in the context of political problems arising from boundary definitions they cannot be avoided. The political scientist should also be concerned with the phenomenon of new alignments of co-operation in specific matters, irrespective of their long term effect on regionalism. Thus the Tanzanian policy of offering hospitality to political leaders and resistance movements opposed to existing regimes in certain African countries (including Malawi) and her decision to build a railway line in co-operation with Zambia constitute two very different actions which may result in important consequences for East Africa as a whole. They also mean that Ugandan and Kenyan leaders are compelled to show interest in regional questions in which they would otherwise not have wished to embroil themselves.

An important barrier to empirical research in this general area lies in the very understandable tendency of the governments to withhold from scholars vital information affecting policy. In spite of this limitation sufficient scope exists for empirical inquiry in the general areas outlined here.

FROM THE CHAIR

The Scindia Steam Navigation Company Limited

Speech of the Chairman, Shri Krishnaraj M D Thackersey

THE following is the summary of the Speech of Shri Krishnaraj M D Thackersey, Chairman, Scindia Steam Navigation Company Limited, delivered at the Fifty-second Annual General Meeting of the Shareholders held on Wednesday, December 15, 1971, at Patkar Hall, Bombay 1.

Indian Shipping in general and your Company in particular is greatly honoured by the conferment of Padma Vibhushan by the President of India on Smt Sumati Morarjee who is the Director-in-Charge of the Company. Smt Sumatiben richly deserves the high National honour for her outstanding contributions to the cause and development of Indian Shipping.

On this occasion, I would recall the passing away of that Grand Old Man of Indian Shipping Shri M A Master on 7th January, 1970. As you know, Shri Master was one of the chief architects of your Company and was associated with it since its inception until 1948 when he retired as its General Manager. He grew with Indian Shipping and his contributions to the progress of your Company and of Indian Shipping were indeed very great.

Dividend

I am happy to inform you that your Directors have recommended payment of dividend at Rs 2.25 per share subject to appropriate taxation for the year 1970-71 as against Rs 1.75 per share paid last year. I trust this progressive trend will be welcomed by you all.

The percentage of dividend exempt under Section 80K has been provisionally determined by the Income-tax Officer at 62.88 per cent.

With an amendment to the Income-tax Rules, for the relief available under Section 80J, the basis for calculation of capital employed has been so revised as to reduce this benefit.

I had already mentioned last year the ever spiralling costs of ship operation. This tendency had continued unabated during the year. The fuel cost had gone up. Port charges/marine dues and stevedoring charges had gone up substantially in Indian as well as overseas ports. There had also been increase in the salary bills.

Your Company always aims at modernisation and diversification of its fleet which is absolutely necessary to provide efficient and fast shipping service in the face of ever-increasing competition.

New Tonnage Programme

The Company's new tonnage programme is: (a) Out of the eight East German ships already ordered out, six have been received and the remaining two are expected to be delivered in 1972; (b) two ships of 16,200 dwt each under construction with Rheinstahl Nordseewerke GmbH, West Germany, are also scheduled to be delivered in 1972; (c) the bulk carrier of 53,000 dwt ordered from Rheinstahl Nordseewerke GmbH, West Germany, is scheduled to be delivered in May 1974; (d) the bulk carrier of 75,000 dwt ordered out from Scott Lithgows Ltd, Glasgow, UK is scheduled to be delivered in 1976.

The Company sold six ships during the year.

Your Company has at present 42 steamers of 3.79 lacs GRT as compared to 255 steamers of 24.92 lacs GRT owned by all the Indian Shipping Companies.

As you are aware, the Company acquired its first bulk carrier mv Narottam Morarjee in 1968-69. I am happy to report that it has been possible to fix this ship on a three yearly charter at a good rate.

As authorised by the shareholders last year to bid for the shares belonging to Dr Dharma Teja in the Jayanti Shipping Co Ltd the Company made applications for the purchase of these shares but the Government have not given their approval. As you are aware, the Government have now nationalised the Jayanti Shipping Company Ltd.

Withdrawal of Development Rebate

The Finance Minister in his budget speech announced withdrawal of Development Rebate for assets acquired for industries generally after 31st May 1974. This decision will hit shipping industry seriously. Despite the reluctance of world's shipyards to accept Indian orders due to overbooking and difficulties to extend credit, even if the shipping companies succeed in placing orders now, none of the ships can be delivered before May 1974. The Finance

Minister's hope that the advance notice of abolition of Development Rebate would accelerate the pace of investment cannot be realised in the case of shipping industry.

With effect from February 1971, Shipping Development Fund Committee has increased rate of interest from 3 to 4.5 per cent. Further the period of initial moratorium as well as the period of amortisation have been reduced.

Practically all the maritime nations give tax concessions in one or more forms such as complete exemption from or lower rate of tax, accelerated depreciation, advance depreciation, investment allowances, tax-free reserves, etc, which cover on a conservative estimate over 70 per cent of world shipping registered under various flags.

Various Incentives Abroad

In the UK the Government have given incentives in various forms like initial deduction, investment allowance, investment grants and free depreciation. Free depreciation has been granted from April 1965 and is available only to shipping industry. Under this allowance a new vessel can be written off entirely in the first year if the profits permit. Similar incentives are given to shipping industry in Greece, Liberia, Panama, Scandinavian countries (Norway, Sweden and Denmark). It is therefore imperative that something will have to be done by our Government to enable Indian Shipping to face international competition.

The Government will have to consider alternative measures of fiscal relief, either free depreciation of ships or creation of tax-free replacement and expansion reserves which the companies can only utilise in purchase of new ships to reach the tonnage target of the Fourth Plan.

The Management of the Jalanath Insurance Limited, one of your Company's subsidiaries, has been taken over by the Government of India and a custodian has been appointed. The compensation that your Company is supposed to receive under the General Insurance (Emergency Provisions) Act, 1971 has not yet been determined.

The case filed by the BSN Co (1953) Ltd against the Maharashtra Government in respect of subsidy has still not come up for hearing.

Thanks

The present Minister for Shipping and Transport, Shri Raj Bahadur, is not new to shipping. He had rendered signal service to the development of Indian Shipping when he was Minister of Shipping before. With profound knowledge of the development problems of shipping, combined with his great zeal, dynamism and drive, Shri Raj Bahadurji will be able to guide the shipping industry to onward progress.

I take this opportunity to convey our special thanks to the Minister and Deputy Minister for Shipping and Transport, the Secretary and Joint Secretary and other officials in the Ministries of Finance and Transport, the Director General of Shipping and his officials as well as the officials of Transchart for their guidance, help and advice. Our thanks are also due to the officials of the Shipping Development Fund Committee for their co-operation and assistance.

I also thank our patrons, shippers and other well-wishers of the Company. I thank the Management, officers and staff both ashore and afloat and the agents at various ports for their devotion to duty.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

asci administrative staff college of india · hyderabad

announces

The Seventh Seminar on

MANAGEMENT BY OBJECTIVES

at Bella Vista, Hyderabad
from March 6 to 11, 1972.

OBJECTIVE: Management by Objectives is a top management planning and control approach to improve performance of both the individual executive and the enterprise. The primary objective of this brief and intensive seminar is to provide deep understanding of this approach and to help the top executives develop commitment for Management by Objectives based on proper understanding.

CONTENTS: The Seminar will cover all the elements of Management by Objectives, including determining and achieving corporate objectives, result-oriented action plans, agreement on manager-results, performance review and the role of management adviser in the process of implementation. The seminar programme will include two exercises on (i) Identifying key result areas and setting corporate objectives and (ii) Management Job Description. There will also be a presentation of the experience of a large Indian company currently implementing Management by Objectives.

ELIGIBILITY: This is a top management seminar designed for the executives of the private and public sector enterprises as well as the Government. Only chief executives and top executives directly reporting to the chief executives will participate in this seminar.

PROGRAMME DIRECTOR: Dr. B. L. Maheshwari

FEES: Rs. 2000/- per participant. This will cover tution, boarding and lodging, and educational material for the seminar.

LAST DATE: Completed nomination forms along with fees should reach the College by January 31, 1972.

For information and nomination forms write to :

The Programmes Officer
Administrative Staff College of India
Bella Vista, **HYDERABAD-4**
Grams : BELLAVISTA . Phone : 36952/56
Telex : 015-390

Review of Agriculture is published four times a year, on the last Saturday of March, June, September and December.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the

Unstudied Happening

SO much has been made of the 'green revolution' and its attendant problems, such as growing rural inequalities and storage problems, that the fact of the 'revolution' itself is seldom questioned. Yet a review of the agricultural sector during the first half of the Fourth Plan must make one do just that, notwithstanding that overall performance in this sector has been better than that in the industrial sector. The average growth rate has been nearabout the targeted 5 per cent, but it has been based mostly on the already established successes of high-yielding wheat varieties. Rice, which is the major crop, accounting for twice the tonnage of wheat, is yet to see the technological breakthrough turned into a commercial success. Current indications suggest that the early technical difficulties associated with its hybrid varieties may have been solved and that the dozen or so new seed varieties may show better performance, but only after much more has been done by way of soil-testing, production and distribution of seeds, and promotional measures for fertiliser and water applications. Rice thus remains a 'major imponderable' in the foodgrains programme. Similar initiatives are necessary also for jowar, maize, and particularly pulses whose production has actually declined and in which no new varieties have been introduced.

Among cash crops, oilseeds and sugarcane have recorded significant increases, but production of cotton and jute have lagged. While in cotton some progress has been made in the form of new varieties, extension efforts and 'package programmes' have not been effective. In jute the impediments are multiple: inadequate infrastructure of credit and input supply agencies, lack of improved seed varieties and, again, indifferent extension work. Neither of these two fibre crops is likely to achieve the Fourth Plan target.

All crops, moreover, continue to be susceptible to the monsoon. The 'revolution', it seems, has an altogether narrow foundation and an unassured future. It seems to have simply 'happened' where the seeds were available, water sources established, and capital in channel. Where, as in rice, dependence on the monsoon posed problems of irregular water supplies, further technical and extension work has yet to establish the potential. More inexplicable is the stagnation in jute, the country's major foreign exchange earner and with considerable industrial capital locked in its manufacture.

Why these imbalances have occurred among the various crops, and among the states, is a question answers to which would illuminate much of the structure of agriculture in the country and suggest what it is in the present private mode of farming that makes for or inhibits growth. Yet the Mid-Term Appraisal of the Fourth Plan has little to contribute to an understanding of the forces of growth or stagnation in the agricultural sector or of the sector's linkages with industry or government. The Appraisal's analysis is limited to enumerating the levels of actual production against the targets, shortfalls of input application against their targets, and the inadequacy of research, extension, and supply services. It should be tautologous that, if production has fallen short of target, the promotional services and the input applications have been sub-optimal. What factors have led to these shortfalls, is an analysis one has a right to expect of a body that is charged with evaluation of past performance with the purpose of planning future action.

Why, for instance, do cotton growers in Maharashtra not invest in controlled water, fertiliser, and pesticides use even when prices of cotton have been rising year after year? Why has raw jute productivity failed to benefit from the use of recommended input dosages and relatively simple improved practices — despite the acute competition to the industry in international markets and Bangla Desh's success in growing far cheaper and better jute in comparable conditions? Is it simply a matter of increased investment in extension and research services? If so, why have past investments in these activities failed to yield results? Why have storage facilities lagged so pathetically behind the spurt in wheat output when the need for augmenting such capacity should have been obvious at least a year ago given the commitment to build buffer stocks and stop imports?

An exercise of this nature would, no doubt, lead planners into less quantifiable area of socio-political linkages in the economy. It may be that the inhibition to carrying out such an exercise arises from the suspicion that the implications of it might be too hurtful to the present economic order. Yet the attempt is necessary if agricultural growth is to provide a stable base to investment in the other sectors. With 20 years of planning for a mixed economy behind us, it may be time to reorientate official economic analyses to include areas and relationships which a plan in a fully centralised economy may neg-

Problems of Fertiliser Distribution and Use

H B Shivamaggi

Seminar on Co-ordinated Marketing and Use of Fertilisers and Other Inputs, 1970 — Proceedings; The Fertiliser Association of India. May 1971.

A Study on Multi-Nutrient Fertiliser Market — A Pilot Study in Guntur District, AP; Indian Institute of Management, Ahmedabad, December 1970.

THE Fertiliser Association of India has been organising national seminars on fertilisers every year since 1965. These seminars bring together all the concerned agencies, including Government, and thus provide a well-represented forum for exchange of experience and for formulation of action programmes. The volume under review contains the proceedings of the seminar on "Co-ordinated Marketing and Use of Fertilisers and Other Inputs", organised by the Fertiliser Association of India at New Delhi in December 1970. In all, 253 delegates/participants and 116 organisations participated in the seminar. There were 29 papers for discussion, written by experts and persons working in input manufacturing concerns and credit agencies. The discussions at the seminar were spread over six working sessions: (1) water management in relation to efficient use of fertilisers, (2) financing for optimum use of fertilisers, (3) mechanisation and efficient use of fertilisers, (4) improved seeds and efficient use of fertilisers, (5) plant protection in relation to efficient use of fertilisers, and (6) integrated promotion and marketing of agricultural inputs.

Key Factor

Distribution has emerged as the key factor in fertilisers. For want of proper marketing arrangements, the rising tempo in fertiliser use and farm production may peter out into stagnation. Fertiliser consumption was short of the target by 17 per cent in 1970-71, by 23 per cent in 1969-70, and by 37 per cent in 1968-69. Evidently, our present efforts to promote fertiliser use are not adequate. Lack of adequate distribution machinery is one of the main reasons for the slow growth of fertiliser consumption.

There can be no dispute about the importance of the theme of the seminar, *viz*, co-ordinated marketing and use of fertilisers and other inputs, signifying an integrated supply-service to the farmer. As F W Parker puts it, "A farmer should have reliable information on his input requirements and not have conflicting advice from different sources; that he should be able to purchase all of them from one source or location, receive advice on their proper use, and get assistance in securing such credit as he may need to purchase them" (p 36). The real question is how to bring this about. Do the proceedings of the seminar indicate the path we have to follow?

Parker himself has suggested that, at the national level, an Indian Agricultural Industries Council may be set up, consisting of members of industry, trade associations, agricultural marketing and processing bodies, and major credit organisations. Government is to be closely associated with the work of the council. At the village level, there can be 'agro-service centres' which have been developed in the Philippines. Agricultural co-operatives can serve as agro-service centres. However, where they are not up to the mark, individual enterprises and other forms of organisation could serve as centres. There may also be taluka and district level agro-service centres. These service centres will require a new type of owner or manager and technical personnel in sales and service. Parker rightly emphasised that the seminar would render a great service if it initiates action leading to the co-ordinated marketing of all industrial farm inputs and the provision of credit required for their purchase and use.

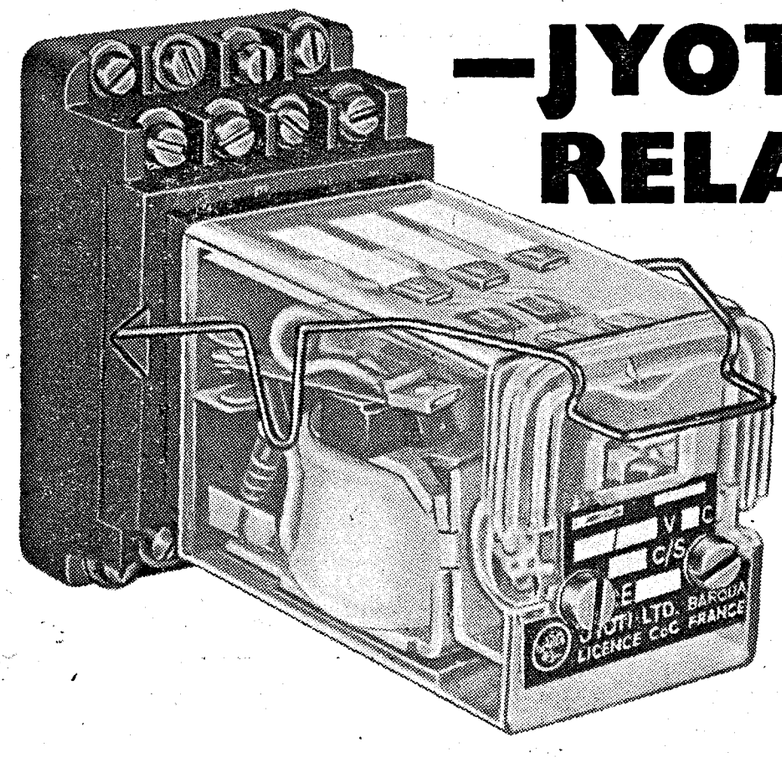
Two Basic Requirements

Assuming that extension work is properly attended to and that seasonal conditions are favourable, credit to farmers and adequate dealership promotion are the two basic requirements for promoting fertiliser use. Credit to cultivators is being made available on an increasing scale, but the real problem now is to ensure that the credit thus made available is really used to buy inputs. While the crop-loan system has a built-in arrangement to ensure purchase of fertilisers against credit available, farmers in some areas have been reluctant to make use of this facility because the concerned credit or marketing agency does not stock the particular brand of fertiliser liked by the farmers. It is here that the credit-card system, as suggested by R Rudramoorthy becomes useful. A card, indicating the credit sanctioned to the farmer, enables him to purchase fertilisers from any one of the approved dealers, ensures timely availability of inputs, avoids misuse of credit, avoids overfinancing, and trains the farmer in simple farm-accounting techniques.

Simultaneously with the introduction of the credit-card system, if the retail dealership is overhauled to pave the way for the emergence of technical sales-cum-service functionaries, fertiliser use would get a sizeable push. Such a new type of dealers would require bank support to establish themselves. It is learnt that dealers in sufficient numbers were not approaching the commercial banks for credit (p 187). However, the Agricultural Finance Corporation has already formulated schemes for this purpose.

Other Noteworthy Points

The other noteworthy points emerging from the seminar discussions are:



(i) A case study of a village in Tamil Nadu shows how the lead for agricultural development by a manufacturer (EID-Parry) of fertilisers, cattle-feed, etc, can help faster development. After establishing co-ordination with credit agencies, the manufacturer undertook preparation of land development plans for individual farmers.

(ii) Experience of another firm (Shaw Wallace) has shown that the ordinary dealer can handle fertilisers, pesticides, and seeds, but not the spraying and irrigation equipment. The ordinary dealer is not in a position to provide 'after-sales-services'. Discussions at the seminar implied that dealers with meagre educational background could not be expected to advise farmers about the correct use of fertilisers and other inputs. There should be trained personnel of the agencies concerned.

(iii) A study by FCI in Punjab and UP has revealed that there is a tendency for fertiliser trade to be concentrated in the hands of those dealing in other inputs, and sales are mostly in cash.

(iv) A study on distribution of fertilisers in Rajasthan (Shriram Chemical Industries) has revealed that retail trade in inputs is mostly in the hands of general merchants in the interior, grain dealers in mandis, and pesticide

Give your precious electrical equipments REFLEX-ACTION PROTECTION —JYOTI RELAYS

Jyoti relays sense faults in electrical network and initiate tripping of the circuit breaker.

Choose from the following ranges:

* Inverse definite minimum time over-current and earth fault relay.
* All or nothing auxiliary relay.
* Induction type time delay relay.
* Constant time delay and instantaneous three phase over-current relay.

and agricultural aid dealers in urban/semi-urban areas.

(v) Co-operatives should be given credit facilities by commercial banks to stock fertilisers and other inputs.

A review of the proceedings of a seminar cannot give an idea of all the papers presented and points discussed. Yet anyone vitally interested in the agricultural sector and particularly in the use of farm inputs, cannot afford to miss this volume. The Fertiliser Association of India (FAI) has been rendering signal service to the country by holding such seminars every year. If it could go further and formulate an action programme — holding seminars and working out plans to link credit with supply of farm inputs and extension service in selected districts (with potential for fertiliser consumption but at present lagging in fertiliser consumption) — the national seminar would, indeed, branch out to the important field level. In this task, the FAI could take the initiative jointly with the agricultural officials and the lead bank of the district. Such a tripartite arrangement, binding together the supply manufacturers, extension staff and credit agencies, would help in laying down steps to ensure improvement in the 'quality of lending', which has been emphasised by M Narasimham, in his paper on National Agricultural Credit Policy (p 47).

The second book under review deals with the problems following a change in the pattern of fertiliser consumption from straight fertilisers to multi-nutrient fertilisers (MNFs). With this qualitative change in fertiliser requirements, the problems relating to extension services and marketing have become more crucial. As it is, application of fertilisers in smaller doses than recommended is indicative of the weakness of the extension machinery as well as the marketing set-up.

Pilot Study

A pilot study on multi-nutrient fertiliser market, undertaken by the Indian Institute of Management, Ahmedabad, in Guntur District of Andhra Pradesh, has brought out path-breaking information on the characteristics of the multi-nutrient fertiliser users and on the problems of marketing of these fertilisers in the district. For the purpose of field investigation, the Institute selected 8 villages, 92 users, and 62 non-users, and the year of reference was the agricultural year 1967-68. Besides giving the economic background of the selected villages and cultivators, the study has thrown up useful information on the use of multi-nutrient fertilisers in the district. It is revealed from the study that, of the total fertiliser purchased by the users, 4 per cent was in form of MNFs while the remaining 60 per cent was in the form of straight fertilisers. The main crops for which the MNFs were used were paddy, tobacco, and chillies. Cropwise, 88 per cent of the paddy area, nearly 70 per cent of the tobacco area, 19 per cent of the chillies area, and 60 per cent of the jowar area that was treated with fertilisers was covered by MNFs.

MNFs are sold in two forms — complex and mixture. From the beginning, the distribution of complex fertilisers has not been subject to control, and has been in the hands of private trade operating through the network of wholesalers and retailers. The manufacturers of complex fertilisers were the national-level companies which operated through the wholesalers, giving them 40-45 days' credit. The wholesalers, in turn, extended credit to retailers not exceeding 30 days. The retailers did not extend any credit to the farmers. Most of the wholesalers were also dealing in other complementary inputs, such as pesticides. In addition to complex fertilisers, there were 21 producers of fertiliser mixtures in the district, who distributed their mixtures through their own set-up. In addition to the general fertiliser distributors, certain tobacco agencies also catered to the needs of tobacco growers. Thus Indian Leaf Tobacco Development, Golden Tobacco, and the Ongole Tobacco Processing and Marketing Co-operative, were some of the companies supplying fertiliser mixtures to the tobacco growers. They also provided credit, technical help, and processing services. The study reveals that most of the sample farmers purchased fertilisers from private retailers. Many members of the co-operative societies also purchased fertilisers from private retailers.

While some promotional work for fertilisers was undertaken by the national-level manufacturers of complex fertilisers, practically no promotional work was done by the wholesalers and retailers. The study has indicated that although the Government extension agency was not as effective as one would like it to be, it was doing much greater promotional work than the private agencies. However, there was no visible impact of the promotional work on the farmers. It seems that the farmers learnt the use of fertilisers more by trial and error than through any extension education process. For example, the tobacco growers applied a much higher dose of nitrogen and a much lower dose of P_2O_5 than the recommended doses. It is in this context that the significance of credit agencies and fertiliser manufacturing units joining hands, to make the fertiliser dealers extension-oriented, needs to be emphasised.

Delivery of Canal Water in North India and West Pakistan

W Eric Gustafson

Richard B Reidinger

The canal systems in North India and West Pakistan were set up by and large to prevent mine, at a time when it seemed more effective to spread the water thinly to provide each district a n... sure of famine insurance rather than to depend on transporting grain from surplus districts to deficit districts in this largely pre-railway age.

In the context of modern agriculture in which the time of delivery of water is as important as its amount, there are significant defects in the way in which the water is delivered under this system. The farmer cannot control water delivery to ensure its taking place when he needs it, nor can he predict water timing in a particular year so that he can choose his crops and the planting, fertilising and water schedules in such a way as to make the most of the water when he gets it.

One important way in which controllability of water might be achieved in some measure would be for farmers to sell water to one another or trade in it. Water trading and water sale are not now permissible. Yet these devices permit those closest to the growing of the crops to determine when water is of value to them and when it would be more advantageous to them to sell water or to advance or postpone its delivery as made possible by complementary needs on the part of others with whom water trading or sale is possible.

The idea of small-scale water sales and swaps within a given area may seem radical to those accustomed to a system which does not now include this feature, but a number of contrasting irrigation systems in various parts of the world include such practices.

One possible development to facilitate sale and trading of water might be some form of water-users' associations, comprising all farmers on a given outlet or watercourse, which could contract with the government for timed delivery of water and then manage internally the problem of allocation among ultimate recipients.

THE coming of the Green Revolution in India and West Pakistan has made clear that we must place more emphasis on the delivery of water to farmers, a subject on which our knowledge is scant. G A Narasimha Rao, the then chairman of the Indian Central Water and Power Commission, said in 1969, "I consider it the duty of the Irrigation Engineer to supply the required quantity of water at the right time on the farm". Although the words sound simple, they really are a large order for an irrigation system not designed with that goal in mind. In this paper we propose to discuss ways in which the objective might be met, and ways in which the present operation of the irrigation systems of North India and West Pakistan block its fulfilment. We limit our discussion to these areas, in which the system of canal irrigation on a large scale dates from the nineteenth century and in which it is regulated by the North India Canal and Drainage Act (Act VIII of 1873).

The pattern of development of the canal systems was set in the nineteenth century: even modern systems retain the characteristics imprinted by the British as they developed large-scale irrigation in Uttar Pradesh, Haryana, and Indian and Pakistani Punjab. The principal factor modifying the systems has been heavy private investment in tubewells within the last ten years on both sides of the India-Pakistan border. We will argue later in the paper that in part the introduction of tubewells on a large scale reflects the institutional inadequacies of the older system, especially in the context of new crop varieties offering high returns to sophisticated water management.[1]

An idealised picture of the distribution of water for irrigation in North India and West Pakistan would run something like this. Water is distributed to the lowest level of channels in the system, called watercourses, in such a way as to make water available to these watercourses in rough proportion to the culturable land commanded by each. Water is delivered to different parts of a canal system in a rotation sometimes called a Rotational Programme of Channels, because there is not enough water to run all parts of the system full at the same time except during the monsoon season and immediately afterwards. Each watercourse receives water from a canal of the system ranging in size from the small minors to large branches and may serve an area of up to about 1,200 acres, depending on the physical conditions. An area of this size usually includes the land of scores of farmers.

Deliveries of water to the farmers are arranged by the *warabandi*, agreed upon by the farmers concerned and fixed by the relevant canal official, which allocates a particular time of a particular day of the week to each plot of land. The farmer cultivating the land is then entitled to any water available in the watercourse during his weekly turn, say Sunday morning from midnight to three. If water is available in the watercourse at that time, he gets water. If there is no water, he gets none. The rotation of water among watercourses is supposed to be such that over the season, the amount of water made available in each will be roughly proportionate to the culturable land which it commands, and thus water deliveries to the farmer will be "fair", in the sense that each will get water in proportion to the irrigable land he holds.[2]

Although intended to be fair, the system's result is an unpredictable water supply. The unpredictability can be explained by remembering, first, that the system has little or no institutional

mechanism for local control of water deliveries. Second, that the rationing of water is not done through a market mechanism, but rather through a whole chain of institutional factors about which the farmers, and to some extent the operating engineers at the level which serves the farmers, have limited knowledge at best. The trade-off between electricity production and irrigation, reservoir factors, and capacity factors are all rationing devices at the level of releases into the system, which act to create an uncertain water supply. At the lower levels, the physical design of the system, the design of watercourse outlets, and especially the canal rotations and *warabandi* systems all interact to assure a relatively unpredictable water supply from the farmers' point of view. Indian agriculture has been described as a "gamble with the monsoon". In canal-irrigated areas it is a gamble with the canal as well.

In the context of modern agriculture in which the time of delivery of water may be as important as its amount, there are significant defects in the way in which water is delivered. Although it is extremely important with the new wheats to have water at the time of crown root initiation, to pick a particular instance for discussion, the farmer can neither control whether he will have water at that time, nor even predict whether he will. The element of uncontrollability is clear: the farmer has water available to him only when it happens to be flowing during his turn; it is quite easy for water not to be available for the restricted time during which crown root initiation takes place. He cannot *control* water delivery to insure its taking place when he needs it, even though he is supposed to get his share in the course of the season.

But even in the absence of *control*, if the farmer could *predict* water timing in a particular year, he could choose his crops and the planting, fertilising, and watering schedules they imply in such a way as to make the most of the water when he does get it. In the particular instance we have chosen, if the farmer could know that he was assured water at the time of crown root initiation for the new wheat, he could pick his crop and sowing date in a way which would take maximum advantage from the fact. In the absence of such assurance, he might well be better off planting a crop with lower potential yield under assured irrigation, but higher potential returns under water stress due to random irrigation.

In the restricted areas with which we are acquainted, even the element of predictability is lacking. Although it seems that the rotations among channels could be known in advance, in fact this knowledge does not appear to be made available to the farmers, even though the knowledge would enable them to predict whether or not there would be water in the watercourse at the time of their turns. It seems clear that the combined lack of control and lack of predictability must influence cultivators adversely, and indeed they make this situation clear in discussion.

We can see the response of farmers in two ways: the first is that they change the operating procedure to suit themselves, in conflict with the law and the regulations framed under it. The second involves the use of new technology, the tubewell.

The farmers change the operating procedure by trading water among themselves, both within seasons and between seasons. In this way, for example, a farmer who gets two successive irrigations may trade the water in his second irrigation turn to a farmer who has had several successive dry turns, and can thus benefit from the second irrigation to a greater extent than the first farmer can. The second promises repayment later in the season—or conceivably even in the next. Farmers in field interviews have described both intra-seasonal and inter-seasonal trading.

Water trading and sale are illegal, except with the permission of the Superintending Engineer.[3] He supervises an area of possibly a million acres or more, so his accessibility is obviously low. It can hardly be easy to obtain the relevant permission, and it was clearly not intended that it should be; the provision for permission is for exceptional cases, not for matters of routine. Apparently canal officials generally ignore or are unaware of practices of trading and sale; but since the practices are formally illegal, exchange of water can be practised only with a restricted set of people in whom one has confidence, since reciprocal obligations cannot be legally enforced and risk is thus high. Existence of the practices of trading and sale is thus strong evidence of the demand for timely water.

The second response of farmers to uncertain canal water supply has been to install tubewells. The option of course is restricted to areas in which the groundwater is sweet and relatively close to the surface, say 30 to 40 feet. Surveys of farmers who have installed tubewells invariably indicate that they see predictability and controllability of water supply as among the leading virtues of tubewells.[4] The tubewells offer of course greater supply, but the farmers are quite clear about the value of water delivery on schedules which match the demands of their crops—which cannot be exactly known in advance, because of variations in rainfall and temperature, for instance. Since the farmers own the tubewells, they can put water on the fields when they want.

The farmers' reaction to the canal water distribution system certainly indicates that something is wrong: their attempts to change the pattern of delivery to match the requirements of their new crops clearly indicate that the system does not "supply the required quantity of water at the right time on the farm".

In the context of the problems we have just discussed, the historical development of the system is not simply an antiquarian curiosity. The form which the system took was based on social and economic forces which in many instances still prevail. Any discussion of desirable changes in the way water is distributed and applied to the land must deal with the reasons why the system is the way it is and provide ways of dealing with the real problems *and* with the anxieties which both canal officials and farmers will feel if the Government undertakes substantial change.

The canal systems in North India were set up by and large to prevent famine, at a time when it seemed more effective to spread the water thinly to provide each district a measure of famine insurance rather than to depend on transporting grain from surplus districts to deficit districts in this largely pre-railway age. The ever-present threat of famine was the driving force behind Government irrigation; deaths numbered in the millions when the rains failed. For instance, in 1866, just at the beginning of a wave of spending on irrigation and the consolidation of Governmental irrigation policy, the Government of India estimated that over one million people died of famine in Orissa in a single season.[5] Under pressure from outraged public opinion, the vast amount of human misery, the costs of famine relief, and the loss of revenue from failed crops, the Government of India placed great emphasis on the delivery of some amount of irrigation water to every district in which supply was feasible. A fundamental memorandum by Colonel Richard Strachey, written in

1867 when he was Inspector-General of Irrigation, sets out a summary of the thinking behind the policy of the Government of India:

> It appears to me that the Government having now adopted the policy of extending irrigation generally, and so far as it is possible in a manner that shall to the utmost guard against the worst effects of severe drought... in every canal, at the earliest possible period, an allotment of the available supply should be made on fixed principles to the districts traversed by it.... The first limitation of the supply of water would be with reference to the proportion of the culturable area within the reach of each canal, for the irrigation of which a provision of water should be made. This proportion might either be fixed at one uniform rate for the whole canal, say one-third or one-fourth of the culturable area, or the share of water might be made to vary in some measure according as the several districts were more or less favorably situated as regards rainfall, or the natural facilities for well-irrigation.... A certain normal standard or proportion of irrigated area should be regarded as claimable by every district to which water can be given.[6]

Strachey makes quite clear—in this quotation and elsewhere in his memorandum—that what was primarily before the eyes of the Government of India was a question of *equity*, of giving a proportionate share of the available water to each acre of land which would be able to use it. He had quite clearly in mind that in a developed canal system the available water would never be enough to give full supply to any farmer's land. Apparently modern systems follow Strachey's recommendations. The planned irrigation intensity of India's Bhakra system is 62 per cent annually,[7] or about one-third of the canal service area for each season.

So the first major consideration in the system was set. The motivation was to distribute water in such a way as to maximise insurance against drought, rather than to maximise production. And this insurance against drought was bought by getting some water to all the land under the command of a canal, although Strachey anticipated that water would then be concentrated by individual farmers on one-fourth or one-third of their holdings.

The next issue is the controllability of the supply. There is strong reason for thinking that controllability of supply at the local level was knowingly avoided by those who designed the irrigation system. The water allocation spoken of above in itself implies low control in times of drought, that is, just at the time when the marginal value of the water would be highest. But there were factors beyond design which worked against controllability. One of the principal ones was the avoidance of corruption, to which the British became quite sensitive. Richard Baird Smith, one of the great canal engineers of the nineteenth century in India, speaks of the power of subordinate canal officials: "incessant supervision is required to prevent these men from turning their power into money". The less controllable the supply was locally, and the more it was regulated by fixed rule and fixed rotation, the less the opportunity for petty officials to practise extortion on the farmers.[8]

This system has certain clear virtues—especially when viewed against the backdrop of an agriculture demanding less skill in timely water management than do present high-yielding varieties. Opportunity to receive water is rationed in a way which can be seen to be fair: each parcel gets its proportionate amount. The possibility of human intervention in the system is small, so the possibilities for corruption and favoritism are also kept small. The rules for distribution are public knowledge, and each farmer is sure of his rights—even though these are rights to an uncertain water supply.

One important way in which controllability might be attained in some measure—as we have already pointed out—would be if farmers could sell water to one another, or trade it, a procedure which has much the same implications. Early rules permitted the practice. Richard Baird Smith wrote in one of the first revenue reports of the Ganges Canal that:

> Contractors having more water than they can themselves consume are at liberty under Rule VIII to sell it to other parties not belonging to their own villages.... It seems not improbable that in such sales as are contemplated in this Rule, valuable indications of the true value of water may be obtained. If others are willing to pay what a Contractor demands for his surplus water, the price so paid is always worth noting, and may be useful to us whether it be in excess or deficit of what we charge ourselves.[9]

The difficulty embedded here (not the only one) is that a contractor would *have* surplus water. The Government of India was most anxious to see that no rights to water became established: water was the property of the Government to be disposed of for the common good, as the Government saw fit. The stipulation of "no rights" was necessary precisely in order to achieve the objective of rationing the water among present and future claimants. The Government of India was quite explicit about this principle, several years in advance of legislation enunciating it clearly:

> The Governor General in Council thinks it very necessary to guard carefully against the possible growth of any legal rights on the part of cultivators or land-holders, adverse to the exercise on the part of the Government of a full discretionary power of distributing the available water as shall seem to it best for the general interests of the community as a whole.[10]

The conflict of the possibility of sale with the Government's discretionary power over water is clear: water deliveries were to be based on what people could use. By definition, if a contractor were receiving water which he could sell, he was receiving more than he could use. If he continued undisturbed in this right, he might somehow acquire a legal right to the excess water, enforceable through the Courts, or at least a troublesome claim on the water. The result was apparently the prohibition of water sale and trade now embodied in the law.

The existing system which spreads water thinly among farmers rather than providing a few with sufficient water to irrigate all their land is clearly here to stay. Certainly the present system enables a more nearly equal distribution of income—which is a stated national objective—than would a policy of water concentration. The primary difficulty, in our view, lies not so much with the relatively limited supply for each farmer, since that merely means that more farmers share in the water, and can concentrate it optimally on their own land. Rather, the principal problem is the lack of predictability, certainty, and controllability of the canal water supply by the farmer. These difficulties directly affect his yields and returns per acre.

In terms of the income equality objective, one might even suggest that water should be shared equally among people instead of among acres, as at present. What useful purpose is served by distributing water according to the amount of land held by individual farmers? If one traces the idea back to the Strachey memorandum of 1867, for instance, one finds him referring to "the *equal natural right of all irrigable lands to share alike* in an advantage brought to them without any effort or outlay on the part of their occupants...". To make land rather than individuals the possessor of natural rights seems a peculiar perversion of

eighteenth-century political philosophy. It seems even more so in the modern context, when a major worry in current agricultural policy is the impact of the Green Revolution on the small farmer and his possible displacement from the land.

It seems to us worth serious consideration whether it might not be better to allocate water to some extent to individuals rather than to land area, so that small farmers would be entitled to more water per acre than large farmers. This objective of doing something to strengthen the position of the small farmer would not necessarily be in conflict with efficiency objectives. Indian data from many areas indicate that small farmers apparently operate at no disadvantage in productivity per acre; some observers are even inclined to credit them with higher per-acre productivity.[12] If the small landowner is going to be squeezed by the new technology (we need not necessarily concede the point at this stage), one way of combatting the problem without loss of production would be to ensure him enough water to be able to compete effectively against larger farmers. The proposal is hardly without its political difficulties, but neither is the alternative, if that is forcing small farmers into the city or into the ranks of landless agricultural labour, as Indian and Pakistani political leaders are increasingly aware.

Apart from changes directly related to income distribution—which of course are controversial—what changes are possible and desirable within the system as it exists? Let us begin with the simplest. As the system runs at present, it seems to us that there would be gains in productivity simply if knowledge were increased. If farmers could know the timing of at least a portion of their water deliveries for sure at the outset of the season, they could make better plans for the type of crop to be planted, time of planting (which is often variable by weeks), fertilisation, and other critical decisions. It seems to us that this knowledge could be given at trifling cost. Indeed, it is apparently supposed to be, but our informants indicate that it is often not. If farmers knew the Rotational Programme of Channels, they could combine this knowledge with the *warabandi* to predict at least some of their deliveries.

To some extent of course, the insecurity about water delivery is the result of the engineers' not knowing what the flow at the canal head will be. We do not presume to know the answers in this area, but would it not be feasible to schedule some secure minimum supply for each farmer for periods of time known in advance? Perhaps engineering requirements and uncertainties would make such a practice difficult if tried simultaneously everywhere on a canal. The issue needs more exploration. But surely it would be an improvement if secure deliveries would be promised even on a rotational basis, by season or year, so that, say, one-third of the farmers in any given year would have promised secure deliveries of water large enough to be significant at critical times. The group of farmers to be allowed this security could change in every year, so that "secure water", if we may term it that, would be rationed out by turns. The system as it exists now parcels out to everyone a measure of insecurity along with an amount of access to water, so that although the canal system as a whole will be certain to have water at periods critical for crop growth, no individual farmer on the system can be sure of deliveries.

Second, there should be some way of scheduling known water deliveries so that they have some connection with likely crop requirements. It might well be a mistake to approach this problem on an administrative level, partly because of the complexity of the problem. But thought should be given to it. Canal engineers are often sensitive to the problem, but they are seldom in a position to do anything about it. Their actions are constrained by a system designed to make operation as automatic as possible. In the context of the new varieties, however, the losses from automatic operation seem larger than when we think in a nineteenth-century context. What we need is a redefinition of the objectives of the system.

We have already indicated a device which would move some distance towards making water available when wanted, even without change in higher levels of the irrigation system. Water trading and water sale are not now permissible. Yet these devices permit those closest to the growing of the crops to determine when water is of value to them, and when it would be more advantageous to them to sell water or to advance or postpone its delivery as made possible by complementary needs on the part of others with whom water trading or sale is possible. In early discussion, the Government especially did not wish to permit acquisition of rights over *surplus* water. When we talk of water trades, we are talking simply of the farmer's changing the distribution through time of the water he is entitled to in any case. The historical record does not indicate that the British engineers even considered the matter of trading. What reason is there for its continued illegality?

Attitudes towards sale of water might be more difficult to deal with. At least one official of West Pakistan's Water and Power Development Authority has been heard to be highly critical of farmers selling water from private tubewells, on grounds that they are "exploiting" their neighbours (by offering them water for which they are prepared to pay!). It is clear that such feelings run deep, at least among certain people. Yet in a situation in which canal water is clearly underpriced in many areas, prohibition of sale means that lower-productivity users are compelled to use water to which they are entitled, rather than receive a share of the benefits of more productive water use by other farmers. Everyone would be better off if exchange were permitted. It is virtually axiomatic in economics that any arbitrary allocation—like that of canal water—can be improved by permitting uncoerced trading or sale. The initial distribution or entitlement can be done in a way which satisfies equity criteria, and trading or sale then can be permitted to allow farmers to improve their position as they see it, and consequently to permit higher agricultural production from fixed resources.

To protect the politically and economically weak requires the proper institutional framework. No doubt an element of the rationale for sale prohibition might be that the possibilities for coerced sale are considerable. But surely the possibility exists now for coerced water trades (or for unrequited swaps). The opportunity for legal sale or trade might help to insure that the farmer giving up water would be able to profit by so doing. Nevertheless, it might be well to prohibit permanent sale of rights to water, so that farmers would not alienate a source of future income which present ignorance, present technology, or lack of skill might lead them to undervalue.[13] But a complete prohibition of sale, softened only by the inattention of canal officials, seems to us to offer no advantages.

The idea of small-scale water sales and swaps within a given area may seem radical to those accustomed to a system which does not now include this feature, but a number of contrasting irrigation systems in various parts of the world include such practices. In Alicante, Spain, for instance, there are semi-weekly sales of rights to the water of particular irrigation runs. Some of the water is sold privately by irrigators who own entitlements to water; some by non-irrigators who happen to own such entitlements. The *huerta*, the mutual water company, which owns some entitlements to the water of each irrigation run, sells these entitlements at public auction to pay for the operating costs of the system. A farmer selling water at one run of the canal from the reservoir is likely to buy rights for another run. Arthur Maass and Raymond Anderson have done simulation studies which indicate substantial advantages in the Alicante context of this sort of distribution system over other possible systems—including ones similar to those now extant in North India and West Pakistan.[14] In some parts of the United States as well water can be bought and sold, even in some cases between farmers whose land is served by different canal companies. Recent writing in the United States indicates that there is scope for increasing production and income through much more use of such water-transfer procedures.[15]

One possible development to facilitate sale and trading of water might be some form of water-users' association. The water-users' association—comprising all farmers on a given outlet or watercourse—could contract with the Government for timed delivery of water and then manage internally the problem of allocation among ultimate recipients, perhaps on the basis of purchase and sale or trade of water for particular irrigation runs. Irrigators—as now—could be initially entitled to water on the basis of land owned (with or without some preference for small holdings), but would be able to trade or sell water with other farmers on the watercourse when it appeared to their advantage to do so. Water available to the water-users' association above guaranteed deliveries might be auctioned or sold to farmers as is done in the Alicante system, the profits then to be shared among the members or perhaps devoted to watercourse maintenance.

The water-users' associations would have the advantage that they would be in a position to express a demand for water; a body large enough to be significant could represent the irrigators in their dealings with the canal authorities. As it is now, each farmer is obviously too small to make any difference, and of course has no feedback mechanism to register his demands with the authorities in any case. The water-users' association might be in a position to express a demand for more water by offering to trade, purchase, or sell water at various times with other water-users' associations, thus improving water allocation in a larger area than just that of the particular water-users' association.

The water-users' association would face the classic difficulty in rural India and Pakistan. What would prevent them from falling under the control of dominant landlords or caste groupings? Many observers attribute the scant progress of the co-operative system in India and Pakistan to just such difficulties. We need a great deal of exploration of such problems, in part through looking at analogous institutional structures in the Indian and Pakistani context, in part through examination of water-users' associations in other countries. (Taiwan presents an instructive example from the less developed world.) Experiment should certainly be on a small scale, and probably would be best undertaken in areas where landholdings are relatively uniform.

★

The suggestions we have made are not necessarily the best or the only ones that one could make. Our primary interest is in stimulating discussion of the whole range of possible measures which might be brought to bear to improve income through better use of irrigation water, while still preserving (and possibly strengthening) the equity considerations with which the systems were initially designed. The set of mechanisms we have discussed obviously reflects our bias as economists. Engineers and agriculturists have much to contribute to the discussion and might well focus on other issues. The important point is that much more needs to be done by all groups concerned to serve the needs of the farmer for timely water supply on which he can depend.

Notes

1 Contemporary data on system operation underlying our generalisations are from Richard B Reidinger, "Canal Irrigation in North India: Microstudy and Evaluation" (Ph D thesis, Duke University, 1971). The study area was a portion of Hissar District, Haryana, under the Bhakra canal system. He is preparing portions of the thesis for publication. Historical materials are from a still unfinished study by Gustafson of the development of irrigation legislation in India. The present paper was written for an Agricultural Development Council conference on the evaluation of water distribution systems at Colorado State University in August 1971.

2 Preliminary data indicate that the amount of water actually received per acre does not correspond well with the amount of access time.

3 J L Jain (ed), "Northern India Canal and Drainage Act", second ed, (Chandigarh: Jain Law Agency, 1968), p 30. Section 5(e) of the Act reads in part: "Unless with permission of the Superintending Canal Officer, no person entitled to water of any canal, shall sell or sublet or otherwise transfer his right to such use . . ."

Green Revolution and Farm Income Distribution

Uma K Srivastava

Robert W Crown

Earl O Heady

The hope had been cherished that the rapid increases in agricultural output especially foodgrains, as a result of the Green Revolution, would help trigger off general economic growth by raising the level of available savings. There was also good reason for such a hope. But crucial to its realisation is the capacity of government policy to use the Green Revolution's potential benefits to greatest advantage.

The problems that have attended the productive success of the Green Revolution have, however, yet to be surmounted. Among these, one of the most serious for economic and political stability is the unequal distribution of the gains from change and the perverse distribution of the burdens of change among those who gain least from it.

This paper examines the problem of inequitable distribution by a theoretical analysis. It centres on the distribution of income, as revealed in the changes in production-functions and derived supply-functions for farms and for the sector as a whole. The impact is discussed as it relates to (1) changes in factor shares and (2) changes in the relative income positions of farms in the different income classes. A quasi-empirical demonstration is included to assist in the exposition of the logic.

[This paper was written as Journal Paper Number J-7009 of the Iowa Agriculture and Home Economics Experiment Station, Ames, Iowa, Project Number 1558.]

THE Green Revolution has raised the hope in India and other Asian countries that, finally, rapid increases in agricultural output [22], especially foodgrains, will make it possible for more general economic development to proceed. There is hope that domestic production will eliminate the countries' dependence on United States for food aid, that surpluses might exist which could be sold abroad as a means of financing needed imports of strategic capital and maintenance goods, and that if the spectre of the Malthusian dilemma can be held in check long enough surpluses would exist to finance domestic non-agricultural growth simultaneously with a rise in rural per-capita living standards.

Early signs show that these hopes are not groundless [8, 9] if government policy is appropriate to reap the potential benefits. It is true that, both farm-sector employment and farm-sector income have risen [15, 16, 17]. But economists realise that boons generally are not given free, and this has become obvious in the second and third generation problems that the Green Revolution has created [11, 24, 25].

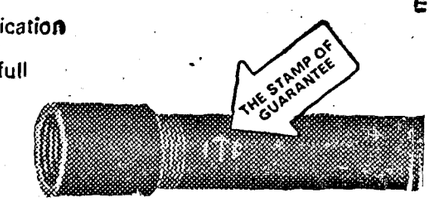
Of these, one of the most serious from the standpoint of stability—economic and political—is the high probability that, in spite of measurable benefits for the agricultural sector and the country's economies as a whole, the Green Revolution does not hold benefits for all the farm families which make up the sector. Thus, the Green Revolution poses the same problem for Asian countries, and India in particular today, as have all major technological changes in the history of agriculture. That is, it will create an unequal distribution of the gains from change, as well as an unequal and perverse distribution of the burdens of change among those who gain least from it.

This paper examines the problem of inequitable distributions by a theoretical analysis. The paper centres on the distribution of income, as revealed in the changes in production functions and derived supply functions for farms and for the sector as a whole. The effect of the Green Revolution is traced through these tools, and its impact is discussed as it relates to (1) changes in factor shares and (2) changes in the relative income positions of farms in the different income classes. A quasi-empirical demonstration is included to assist in the exposition of the logic.

Nature of the Green Revolution

Technological innovations in agriculture can be divided into two broad types: (1) biological and (2) mechanical. Biological innovations refer mainly to inputs that increase the productivity of a given land base. High-yielding plant varieties and fertiliser are examples. Biological innovations tend to raise total farm costs. Mechanical innovations mainly are those that cause a reduction in total cost. While biological innovations are labour-absorbing, mechanical innovations are mainly labour-saving [13].

The Green Revolution is frequently described as a seed-fertiliser technology [21]. In this sense, it falls in the class of biological innovations. But when classified so simply, its basic technological nature is obscured. Biological innovations of the seed-fertiliser type became more effective, and in some instances were possible, only with the support of mechanical innovation. Hence, the Green Revolution is better characterised as a biological-mechanical innovation. Whether the green revolution is labour-saving or capital-saving depends on the net effect of the forces simultaneously generated by the two different types of innovations. Similarly, whether total costs of production are increased or decreased depends on whether the cost increases due to biological innovation are greater or less than the cost decreases due to mechanical innovations. Based on data presented in Tables 1 and 2, Figure 1 can be used to illustrate this proposition. Figure 1 shows total cost, total revenue, and total output, with old and new techniques for agriculture taken as a single industry. The curve TR represents total revenue, C_1 represents the cost before the innovation and C_2 represents the cost after the innovation. Per-unit costs are lower with C_2 than with C_1, as shown by the lesser slope of OC with respect to OA. We assume that the normative profit maximisation motive prevails, hence the equilibrium for the industry, total cost, total revenue, and total output are U_1A, U_1B and OU_1, respectively, before the innovation. Total revenue increases as might total cost, at equilibrium under the new technique (C_2), but net profit (CD) is much larger than profit under



"I am looking for a length of pipe that won't crack, leak or wear out easily."

"Then remember to ask for tubes that carry the ITC stamp of guarantee for right wall thickness and correct weight. This ensures longer life."

And that's because Indian Tube exercises strict quality control right from the raw material stage to the finished tube. And the ITC stamp you see on the tube is the guarantee of correct weight ensured by right wall thickness. No wonder ITC tubes are being demanded by more and more wise house owners, farmers and other buyers.

Moreover, ITC tubes to IS : 1239 (Part I)—1968 enjoy certification by the Indian Standards Institution, a third party warranty of good quality. So when you use ITC tubes you'll always get full value for the money you invest.

the old technique (AB). Thus, the agricultural sector increases its output and improves its income because of the new technology. The distribution of this gain among the various factors and among farms of various sizes, is the subject of the next sections.

CHANGES IN RELATIVE FACTOR SHARES

With the greater use and cost of inputs, the absolute income of all production factors increases. The change in factor shares, however, depends on (1) whether the technical change is neutral or non-neutral, (2) whether the sum of production elasticities varies under technical changes, and (3) whether the labour/capital ratio varies. To analyse these possibilities, we distinguish between five classes of inputs: (a) land, (b) human labour, (c) bullock labour, (d) capital inputs including irrigation charges and all farm machinery (C_1) and (e) such non-mechanical inputs as new biological inputs (hybrid seeds) fertilisers, pesticides, new cultivation techniques (C_2). With the Green Revolution, C_2 has been the major expanding factor, complemented by a more modest increase in C_1. Comparing the gross production function for agriculture, before and after a growth in C_2 and C_1, we expect that, when $\triangle C_1 > 0$ and $\triangle C_2 > 0$, output increases, and the partial elasticities of production of all factors change. We illustrate this point in the framework of the following Cobb-Douglas production function (which satisfies neoclassical notions of a 'well-behaved function').[1]

$$X = A L^{\alpha} E^{\beta}_{1} B^{\gamma}_{2} C^{\delta}_{1} C^{\rho}_{2}$$

Where A, α, β, γ, δ and ρ are constants, X = output, L = land, B_1 = human labour B_2 = bullock labour, C_1 = mechanical capital inputs, and C_2 = non-mechanical inputs. The constants α, β, γ, δ, and ρ, numerically quantify the partial elasticities of production. The ratios of the partial elasticities indicate the relative factor shares between inputs, and, as Brown shows [6, 7] for the Cobb-Douglas production function, the elasticity of substitution between the factors is unity, regardless of scale-returns. This condition implies that, changes in factor ratios (substitution between factors) leaves relative factor shares unchanged. Factor shares change only when the addition of a new input (replacing or complementing existing input) embodies a technical change.

In essence, the embodiment quality implies that the technological change is non-neutral. Let the growth in C_2 and C_1 embody a technical change (the Green Revolution). A new production function then results (the technical change revealing itself in changed parameters) as follows:

$$X' = A'L^{\alpha'}_{B_1} B^{\beta'}_{B_2} C^{\gamma'}_{C_1} C^{\delta'}_{C_2} \rho'$$

Empirical studies suggest that, an expansion in C_2 is labour-using and that an expansion in C_1 is labour-saving [2, 3, 4, 5]; hence countervailing forces prevail. The net impact of the embodied technical change will depend,

FIGURE 1: CHANGE IN NET REVENUE, (TC — TR), WITH TECHNOLOGICAL CHANGE

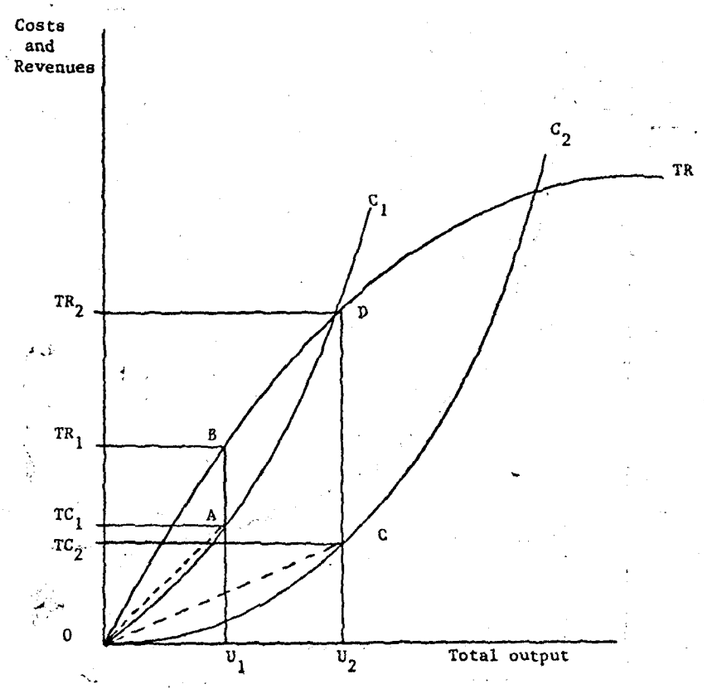

TABLE 2: CHANGES IN TOTAL COST AND TOTAL REVENUES IN WHEAT PRODUCTION OF MAJOR PRODUCING STATES IN INDIA

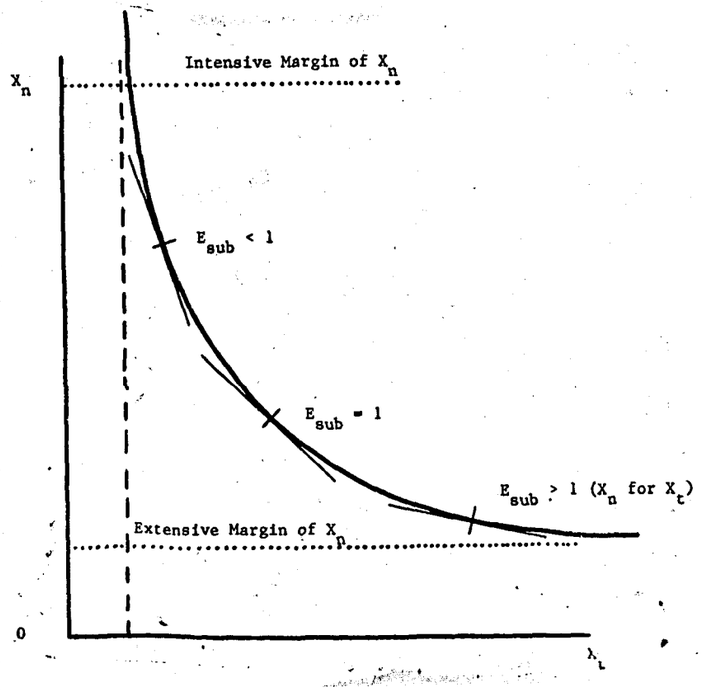
States	Total Cost I / Total Cost II	Total Revenue I / Total Revenue II
Uttar Pradesh	1.73	2.49
Punjab	2.93	5.79
Maharashtra	—0.66	4.54
Rajasthan	1.98	8.51

Notes: Cost I stands for the cost of production of hybrid wheat with new array of inputs made available by new technology.

Cost II stands for the cost of production of indigenous wheat with irrigation and old array of inputs.

Total Revenue I and II stands for the same as the costs respectively.



Source: [15, 16, 17, 18, 20].

therefore, on the outcome of a statistical experiment. However, a theoretical explanation of expected outcomes can be given. For example, if C_1 is a labour-saving input, [2, 3, 4, 5], we expect that $\frac{\beta'}{\delta'} < \frac{\beta}{\delta}$, and that labour's share with respect to C_1 declines. Further, if C_2 complements labour, we expect that $\frac{\beta}{\rho} \leqslant \frac{\beta'}{\rho'}$.

If the net effect of the Green Revolution is, in fact, to reduce labour's share in total, the net change has to be as follows:

$$\left[\frac{\beta}{\delta} + \frac{\beta}{\rho}\right] > \left[\frac{\beta'}{\delta'} + \frac{\beta'}{\rho'}\right]$$

FIGURE 2: ISOQUANT, SHOWING RELATIVE MAGNITUDES OF THE ELASTICITY OF SUBSTITUTION (E_{sub}) X_n FOR X_t.

INCOME DISTRIBUTION EFFECTS BY FARM SIZE

A non-neutral technical change may be sufficient to change the distribution of income over factors, but it is only a necessary condition for a change in the distribution of income by farm size. On the other hand, embodied technological change and differences in adoption rates among the different farm size groups, are sufficiency conditions for a change in the distribution of income by farm size.

For this analysis, we depart from the usual macro-economic definitions and distinguish between embodied and disembodied technological change for a specific farm firm. Technical change is disembodied when the farmer is constrained from using it only by his personal and non-economic characteristics, or through his ignorance. In contrast, an embodied technical change is one that cannot be adopted by a farmer because of economic constraints. The farmer's current income and asset position is the most likely economic constraint, since 'embodiment' implies purchase of inputs to employ the technology. The economic status of the farm is binding because the farmer cannot finance[2] new purchases and/or the basic production structure cannot profitably incorporate the new input.

Because of past decisions, a predetermined distribution of wealth, and so on, a wide disparity prevails in farm income levels. Thus farmers face a technological change, such as the Green Revolution, on unequal footing. Farmers in different income groups might be expected to exhibit diversity in behaviour, since: (a) the marginal propensity to consume could decline at higher incomes, (b) the marginal propensity to invest in new productive inputs might rise with higher incomes, and (c) the items for which the investments are made could differ among income classes, and so on.

Basic economic grounds to explain variance in adoption rates of Green Revolution technology are thus implied by the fact of embodiment, the initial diversity of incomes in the farm community, and variance of absolute and marginal spending behaviour at different income levels. Further, as we will now demonstrate, variance in adoption rates ensures that the initial income spread in the farm sector will widen.

First, we assume the absence of government programmes to make credit available at non-commercial rates for low-income farmers. The allocation of loans, then, will be based on risk-aversion and potential profit motives of lenders. If government credit programmes require collateral or a demonstration of near-term profitability before loans are made, the programme is commercially based. As will be discussed later, credit programmes of non-commercial nature are necessary to reduce the extent to which technical change is embodied for the firm. We now use a generalised algebraic example to prove that the income gap will widen under these postulates and assumptions. An illustrative numerical example will follow:

Increase in output vis-a-vis farm size groups:

Let P_y, P_x, Y, and X be the output price, the input price, the level of output, and the level of inputs used, respectively, expressed in index form. Let R be the ratio of output to input prices, P_y/P_x, so that R portrays the real profitability of production; it is a proxy for net revenue. R is also in index form.

The elasticity of supply with respect to the profitability of production can be written in the following identity:

$$\frac{dY}{dR} \cdot \frac{R}{Y} = \left[\frac{dY}{dX} \cdot \frac{X}{Y}\right] \times \left[\frac{dX}{dR} \cdot \frac{R}{X}\right]$$

In this expression, $\left[\frac{dY}{dX} \cdot \frac{X}{Y}\right]$ is the elasticity of production, and $\left[\frac{dX}{dR} \cdot \frac{R}{X}\right]$ is the elasticity of demand for inputs with respect to the profitability of using them. When a production function for a specific farm is derived, the elasticity of production will be uniquely determined as will the elasticity of demand for inputs. The elasticity of demand for inputs, as given here, incorporates both the income effect and the price effects with qualitative signs as recognised in consumer behaviour. A change in productivity of inputs can be reflected in the decline in real price per unit of input.

Now we subdivide total inputs (X) into two classes, traditional, X_t, and new, X_n. The profitability of employing these classes of inputs are R_t and R_n, respectively. Therefore, $X = X_t + X_n$, $R = P_y / \frac{1}{2}(P_{x_t} + P_{x_n})$, (where the denominator is the average cost of inputs) and $R_t = P_y/P_{x_t}$, $R_n = P_y/P_{x_n}$.

The elasticity of supply can be given as:

$$\frac{\partial Y}{\partial R} \cdot \frac{R}{Y} = \left\{\frac{\partial Y_t}{\partial X_t} \cdot \frac{X_t}{Y} + \frac{\partial Y}{\partial X_n} \cdot \frac{X_n}{Y}\right\} \cdot \left\{\frac{\partial X}{\partial R_t} \cdot \frac{R_t}{X} + \frac{\partial X}{\partial R_n} \cdot \frac{R_n}{X}\right\}$$

which is reduced to the following expression after dividing by R/Y.

$$\frac{\partial Y}{\partial R} = \left\{\frac{\partial Y}{\partial X_t} \cdot \frac{X_t}{X} + \frac{\partial Y}{\partial X_n} \cdot \frac{X_n}{X}\right\} \cdot \left\{\frac{\partial X}{\partial R_t} \cdot \frac{R_t}{R} + \frac{\partial X}{\partial R_n} \cdot \frac{R_n}{R}\right\}$$

To take an extreme case where the small farmer (a low-income farmer) does not purchase the new inputs,

$X_n = 0$; hence $\frac{\partial X_n}{\partial R_n} = 0$, $\frac{\partial X_t}{\partial R_n} = 0$, and $\frac{\partial X_n}{\partial R_t} = 0$. His change in supply is then given by:

$$\frac{\partial Y}{\partial R} = \left(\frac{\partial Y}{\partial X_t} \cdot \frac{X_t}{X}\right) \cdot \left(\frac{\partial X_t}{\partial R_t} \cdot \frac{R_t}{R}\right) = \frac{\partial Y}{\partial X_t} \cdot \frac{\partial X_t}{\partial R_t} \quad (X_t = X, R = R_t)$$

If, in addition, productivity of traditional input is not affected by the Green Revolution (another extreme assumption since it excludes in-farm economies of scale, but is totally consistent with the embodiment *postulate*),[3] and input and output prices do not vary significantly, the profitability of traditional inputs remains constant and thus $\frac{\partial X_t}{\partial R_t} = 0$. Hence the small farmer's level of production, before and after the technological change, should be the same.

By contrast, the larger farmer (a high-income farmer) is not financially constrained from buying the new inputs if their purchase is profitable. If he uses them, the following relations hold in general:

$$1 > \frac{X_t}{X} > 0 \qquad \frac{\partial X_n}{\partial R_n} > 0$$

$$1 > \frac{X_n}{X} > 0 \qquad \frac{\partial X_t}{\partial R_t} > 0$$

The new inputs can be either complements, or substitutes, for traditional inputs. In the situation where the farmer views the new inputs as strict supplements to traditional inputs (i e, cross-effects with respect to the profitability of other inputs is zero), the expression for his addition to gross output will be:

$$\frac{\partial Y}{\partial R} = \left\{\frac{X_t}{X} \cdot \frac{\partial Y}{\partial X_t} \cdot \frac{\partial X_t}{\partial R_t} \cdot \frac{R_t}{R}\right\} + \left\{\frac{X_n}{X} \cdot \frac{\partial Y}{\partial X_n} \cdot \frac{\partial X_n}{\partial R_n} \cdot \frac{R_n}{R}\right\} + \left\{\frac{X_t}{X} \cdot \frac{\partial Y}{\partial X_t} \cdot \frac{\partial X_n}{\partial R_n} \cdot \frac{R_n}{R}\right\} + \left\{\frac{X_n}{X} \cdot \frac{\partial Y}{\partial X_n} \cdot \frac{\partial X_t}{\partial R_t} \cdot \frac{R_t}{R}\right\}$$

This expression for the growth of output is clearly greater than that of the small farmers, because the individual terms on the right-hand side are all positive. Where there are no externalities, so that the traditional inputs do not gain greater productivity and when prices remain constant, $\frac{\partial X_t}{\partial R_t} = 0$. Thus, the output of the large farmer grows. This is in contrast to the small farmer's output which remains constant.

In the more likely event, however, the new inputs substitute in part the traditional inputs. The outcome, then, is less clearly defined. The existence of substitution is *prima facie* evidence that $R_n > R_t$, where P_y is constant. The signs of the cross-effects will be $\frac{\partial X_n}{\partial R_t} < 0$ and $\frac{\partial X_t}{\partial R_n} < 0$.

For output to increase, (that is for $\frac{\partial Y}{\partial R} > 0$), the following inequalities would have to be true.[4]

TABLE 3: QUALITATIVE SUMMARY OF LOGIC OF NET INCOME DISPARITY GROWTH

Demand Elasticity to Product Price		Change in Total Revenue	Change in Total Cost	Change in Net Revenue
$\infty > \left\lvert\frac{\partial Y}{\partial P_y} \cdot \frac{P_y}{Y}\right\rvert > 1.0$	Large	> 0	> 0	$\geqslant 0$
	Small	< 0	= 0	< 0
$0 < \left\lvert\frac{\partial Y}{\partial P_y} \cdot \frac{P_y}{Y}\right\rvert < 1.0$	Large	< 0	> 0	$\geqslant 0$
	Small	< 0	= 0	< 0

TABLE 4: MARKET SOLUTION FOR SMALL, MEDIUM AND LARGE FARMS, PRE-TECHNOLOGICAL CHANGE, ON PER FARM BASIS

	Small	Medium	Large
Price P_y	6.52	6.52	6.52
Quantity			
q_{si}	0.516	0.723	1.042
Q_{si}	1.291	5.426	13.022
Total revenue	8.416	35.378	84.901
Input use	.0026	0.012	0.034
Total cost	0.125	0.574	1.700
Net revenue	8.291	34.804	83.200

[2] Because of the lack of collateral, the small farmer is not a credit-worthy customer. Even if he is, the risk premium he has to pay is so high that the new purchases are not profitable.

[3] Even if the traditional inputs are subject to increasing returns to scale, the argument is not affected as long as the new inputs are not perfect substitutes for the traditional inputs.

[4] Since $\frac{\partial Y}{\partial R} = \frac{\partial Y}{\partial X_t} \cdot \frac{\partial X_t}{\partial R_t} + \frac{\partial Y}{\partial X_n} \cdot \frac{\partial X_n}{\partial R_n} + \frac{\partial Y}{\partial X_t} \cdot \frac{\partial X_n}{\partial R_n} + \frac{\partial Y}{\partial X_n} \cdot \frac{\partial X_t}{\partial R_t}$, the first two terms are positive, and the last two negative, the inequality $\frac{\partial Y}{\partial X_t} \cdot \frac{\partial X_n}{\partial R_n} > \frac{\partial Y}{\partial X_n} \cdot \frac{\partial X_t}{\partial R_t}$ would have to be true.

TABLE 5 : MARKET SOLUTION FOR SMALL, MEDIUM AND LARGE FARMS, POST-TECHNOLOGICAL CHANGE, FIRST APPROXIMATION ON PER-FARM BASIS

	Small	Medium	Large
Price P_y	6.59	6.59	6.59
Quantity			
q_{si}	0.516	0.740	1.069
Q_{si}	1.291	5.547	13.357
Total revenue	8.508	36.552	88·020
Input use	.0027	0.013	0.037
Total cost	0.136	0.652	1.835
Net revenue	8.373	35.900	86.185

$\left|\frac{\partial X_n}{\partial R_n}\right| > \left|\frac{\partial X_t}{\partial R_n}\right|$ and $\left|\frac{\partial X_t}{\partial R_t}\right| > \left|\frac{\partial X_n}{\partial R_t}\right|$

Given a constant P_y, the inequalities state that high-income (large) farmers would increase output if the growth in the demand for one type of input (say new inputs in this situation), resulting from a growth in its own profitability, exceeded the desire to reduce the use of a competing input when the profitability of the farmer input grows. These two forces tend to work against each other; the profitability of employing X_n leads to its greater use at the expense of X_t, but the marginal profitability of employing an additional unit of X_n will decrease (we suppose that the producer is in the economic range of declining elasticity for X_n). The decrease in productivity of X_n implies increasing relative profitability of marginal units of X_t. Hence a growing resistance to further substitution of X_n for X_t will prevail. The economic restraints in employing more X_n intensify because of its declining relative profitability *vis-a-vis* X_t.

The relative strengths of the conflicting forces can be observed in part by considering the elasticity of substitution of X_n for X_t. Being newly employed, it is likely that X_n is used more closely to its extensive margin than X_t is to its (Figure 2). That is, $\frac{X_t}{X} > \frac{X_n}{X}$, or traditional inputs still dominate the input mix even though both types are used. But this implies that the elasticity of substitution, X_n for X_t, exceeds unity. Under these conditions, it is expected that:[5]

$$\left|\frac{\partial X_n}{\partial R_n}\right| > \left|\frac{\partial X_t}{\partial R_t}\right|$$

Further, if we maintain the hypothesis that traditional inputs are virtually fixed in the farm sector; i e, labour will not be easily retired from agriculture, land will not be quickly withdrawn, and traditional capital will still be largely employed, then traditional input employment will at least be constant. Thus,

$$\left|\frac{\partial X_t}{\partial R_t}\right| \geqslant \left|\frac{\partial X_t}{\partial R_n}\right|.$$

Lastly, it seems intuitively true that, the potential of a rise in new input productivity to negatively influence the use of traditional inputs would quantitatively exceed (in absolute terms) the potential of changes in traditional input productivity to negatively influence the use of new inputs. Institutional pressure to expand new input use, say through government programmes, not easily solved or reversed once started, might in itself be enough to make this true. Thus,

$$\left|\frac{\partial X_t}{\partial R_n}\right| > \left|\frac{\partial X_n}{\partial R_t}\right|.$$

Under these conditions, therefore, output would expand even when X_t and X_n were partial substitutes. What is more, the expansion of output would be due to the activity of the adoption of technology who, in the situation now discussed, would be the large farmer.

Net income effect of increased output by farm-size groups:

We now consider the income distribution effects of the relative increases in output on low and high-income farms when consumer demand is elastic,

$$\left|\frac{\partial Y}{\partial P_y} \cdot \frac{P_y}{Y}\right| > 1.0, \text{ and price inelastic,}$$

$$(0 < \left|\frac{\partial Y}{\partial P_y} \cdot \frac{P_y}{Y}\right| < 1).$$

Under the price elastic conditions, an increase in output will increase the total revenue depending on the degree of demand elasticity. The increase, however, will reduce the price per unit of output. For the small farmer who does not increase output, total revenue will fall. Also, if the small farmer does not alter the input of traditional resources, $\frac{\partial X_t}{\partial R_t} = 0$, total cost (imputed as well as incurred) will not decline, and realised net income will decline. Initially the same income effect will prevail for the small farmer when consumer demand is inelastic with respect to price.

Yet, even the lower product price can lead to higher total revenues for the large farmers. Although his total cost will increase as more inputs are used, the rational producer will restrain input purchases so that the marginal revenue is not exceeded by marginal cost. His net income will rise (or at worst stay constant). Thus, income disparity between large and small farmers, will widen. These qualitative relationships are shown in Table 3.

When consumer demands are price inelastic, an increased offering lowers both price and total market revenue for the farm sector. If we maintain the claim that the small producer does not contribute to the expanded offering or reduce his input use, his total and net income position worsens. But the large producer does not necessarily lose total revenue in this case (although he might, if sectoral total revenue falls faster than the total revenue of small producers). Indeed, it is also possible for large farmers to experience rising total revenue in spite of a deterioration in sectoral revenue. In either case, the economically rational producer will only spend on new inputs and so add to total costs, to the point at which changes in net revenue are equal to or exceed zero. Again, the income gap will widen.[6]

ILLUSTRATIVE NUMERICAL MODEL

We now use a hueristic model to better illustrate the mechanics of the preceding economic reasoning. Although simplifying assumptions are used, the quantities employed are numerical approximations of current magnitudes in India. This illustrative model is applied to three stages: Stage I depicts the market solution before the technological breakthrough, State II portrays the changes resulting from the Green Revolution, and Stage III envisages the changes in income in successive production cycles. Our discussion of stages is merely for convenience and has no connection with Rostowian stages of economic growth.

TABLE 6 : MARKET SOLUTION FOR SMALL, MEDIUM AND LARGE FARMS, POST-TECHNOLOGICAL CHANGE, SECOND APPROXIMATION, ON PER-FARM BASIS

	Small	Medium	Large
Price P_y	6.39	6.39	6.39
Quantity			
q_{si}	0.521	0.784	1.190
Q_{si}	1.303	5.878	14.878
Total revenue	8.325	37.560	95.073
Input use	.0036	0.027	0.101
Total cost	0.180	1.338	5.066
Net revenue	8.145	36.223	89.997

Stage I

Suppose that equations (1), (2) and (3) represent per-acre production functions of small, medium, and large farms, respectively:

(1) $q_1 = .5 + 0.5X_t^{\cdot 5}$ (small)
(2) $q_2 = .7 + 0.6X_2^{\cdot 5}$ (medium)
(3) $q_3 = 1.0 + 0.8X_3^{\cdot 5}$ (large)

where, now q_1 (i=1, 2, 3) is physical output per acre on farm size coded i, and X_i is all inputs viewed as homogeneous mass.

Equation (3) supposes that the high-income farmer has the necessary capital, knowledge, and other fixed assets, to progress over the preceding production period; hence he will exhaust more of the potential scale economies than will the low income farmer.[7] We are, of course, aware of the long and somewhat inconclusive debate that surrounds the question of the relative efficiency of small farmers in India [1, 23]. For the time being, however, our model abstracts from the hypothesis based on previous empirical results and rests on standard theoretical logic.

A square-root form of the production function is selected for demonstration purposes, because its properties give 'easily added' supply functions (we suppose that the farmer is operating in a range of the production function, with production elasticities of less than unity) [12]. Equations (1a), (2a) and (3a) express the level of inputs used for the respective production functions:

(1a) $X_1 = (q_1 - 0.5)^2/(0.5)^2$
(2a) $X_2 = (q_2 - 0.7)^2/(0.6)^2$
(3a) $X_3 = (q_3 - 1.0)^2/(0.8)^2$

From (1a), (2a) and (3a), and the assumption of profit maximisation, the per-acre supply functions and the per-farm supply functions are derived. These are presented as equations (4), (5), (6), (4a), (5a) and (6a), respectively. In the formulation, P_X is the input price per unit of input, P_y is output price, q_{si} (i= 1, 2, 3) is per-acre supply and Q_{si} is per-farm supply. We assume that small farms (i=1) have an average acreage of 2.5 acres, medium farms have 7.5 acres, and large farms have 12.5 acres [14]. We assume, further, that intra-farm economies of scale do not exist, but that there are possible inter-farm scale economies.

(4) $q_{si} = 0.5 + 0.125\ P_y P_x^{-1}$
(per-acre supply of small farm)

(5) $q_{s_2} = 0.7 + 0.18\ P_y P_x^{-1}$
(per-acre supply of medium farm)

(6) $q_{s_3} = 1.0 + 0.32\ P_y P_x^{-1}$
(per-acre supply of large farm)

(4a) $Q_{s_1} = 1.25 + 0.3125\ P_y P_x^{-1}$
(per-farm supply of small farm)

(5a) $Q_{s_2} = 5.25 + 1.35\ P_y P_x^{-1}$
(per-farm supply of medium farm)

(6a) $Q_{s_3} = 12.5 + 4.00\ P_y P_x^{-1}$
(per-farm supply of large farm)

We suppose an agriculture composed of 60 per cent of small, 20 per cent of medium, and 20 per cent of large farms. Hence the aggregate supply function is

$Q_m = 2150 + 628.75\ P_y P_x^{-1}$ ..(7)

where Q_m is market supply (physical), P_y is output price, and P_x is input price.

Let the sector be essentially closed with respect to the trade in agricultural products, and let the regional demand function be

$Q_d = 8100 - 900\ P_y$ ..(8)

The demand function is inelastic with respect to product price[8] (but just so) over the range $9 > P_y > 0$.

The market is cleared when $Q_m = Q_d$, and the product price has the value:

$P_y = 5950\ P_x / (900\ P_x + 628.75)$ ..(9)

We assume $P_x = 50$ monetary units per purchased unit, given the current situation in India, especially in the use of high-yielding varieties. Where perfect competition exists in both input and output markets, P_y and P_x are the same for all farmers.

Prices, quantities sold per farm, total farm revenue, total farm cost, and per farm net revenue under market equilibrium are given in Table 4. Profit per large farm is 10.035 times that for small farms, and 2.391 times that of medium farms (Table 7). In turn, profit of medium farms is 4.198 times larger than that of small farms. These ratios indicate the extent of the initial income disparity.

Stage II

As a result of the Green Revolution, we suppose three exogenous shocks that can be reflected through the model. First, the price of output from farms adopting the technology, (P_{y_n}), will decline since they will produce a red-coloured grain (which consumers treat as inferior to the traditional white wheat). So we assume that $P_{y_n} = 0.8\ P_{y_t}$.[9] Secondly, the price per unit of the new input, (P_{y_n}), will exceed that of traditional inputs (P_{y_t}) (actual or imputed), thus $P_{x_n} = 1.2\ P_{x_t}$.[10] Third, the productivity of new inputs, X_n, greatly exceeds that of traditional inputs, X_t, so that one unit of new input conceptually produces the same volume of output as a multiple number of traditional input units. Therefore, $X_n = 2.5\ X_t$.[11] These equations, when substituted into the originally defined production functions, permit a comparison of pre- with post-technological change (since both situations are reduced to common terms).

The production, per-acre supply, and per-farm supply functions, for the small, medium, and large farmers, will be those given in (10), (11), (12), (13), (14), (15), (13a), (14a) and (15a).

(10) $q_1 = 0.5 + 0.5\ X^{\cdot 5}$
(per-acre production, small farm)

(11) $q_2 = 0.7 + 0.9492\ X^{\cdot 5}$
(per-acre production, medium farm)

(12) $q_3 = 1.0 + 1.2656\ X^{\cdot 5}$
(per-acre production, large farm)

(13) $q_{s_1} = 0.5 + 0.125\ P_y P_x^{-1}$
(per-acre supply function, small farm)

(14) $q_{s_2} = 0.7 + 0.300\ P_y P_x^{-1}$
(per-acre supply function, medium farm)

TABLE 7: RATIOS OF LARGE AND MEDIUM FARM NET REVENUES WITH RESPECT TO SMALL FARM NET REVENUE, ORIGINAL, AND FIRST AND SECOND APPROXIMATIONS

	Original (Table 4)	First Approximation (Table 5)	Second Approximation (Table 6)
NR_l/NR_s*	10.035	10.293	11.035
NR_l/NR_m	2.391	2.401	2.485
NR_m/NR_s	4.198	4.289	4.447

* NR_l : net revenue, large farm.
NR_s : net revenue, small farm.
NR_m : net revenue, medium farm.

(15) $q_{s_3}=1.0+0.520\ P_yP_x^{-1}$
(per-acre supply function, large farm)

(13a) $Q_{s_1}=1.25+0.3125\ P_yP_x^{-1}$
(per-farm supply function, small farm)

(14a) $Q_{s_2}=5.25+2.252\ P_yP_x^{-1}$
(per-farm supply function, medium farm)

(15a) $Q_{s_3}=12.5+6.504\ P_yP_x^{-1}$
(per-farm supply function, large farm)

(16) $Q'_m=2150+969.436\ P_y\ P_x^{-1}$
(aggregate supply function)

Here we assume that, on the planning horizon at least, no farmer will plan to leave agriculture. Thus, the post-technological market supply function, (16), is the weighted sum of the farm supply functions, with original weights. The new supply function is expressed in terms of the original prices. It incorporates the supply-increasing influences of rising input productivity, dampened by the supply-depressing influence of falling product prices and rising input prices.

If population grows by 2.5 per cent and disposable income per capita increases by a similar percentage, total demand shifts upwards to

$$Q_d = 8505 - 945\ P_y \quad \ldots(17)$$

In equilibrium, the product price is expressed in the form

$P_y+6355\ P_x/(945\ P_x+969.436)$

again in terms of the pre-technology prices.

The full market solution, given the input price $P_x=50$, is given in Table 5. The ratios of net revenue for large to small farms, medium to small farms, have increased (see Table 7), but the ratio of net revenue between large and medium farms has not changed. Thus, it is demonstrated that, the first-round impact of the technological change is to widen the income gap between adopters and non-adopters.

As a side note, we observe that the model shows that even the small farmer could realise or anticipate a slight rise in net income, possibly owing to an improvement in traditional white wheat prices resulting from the cessation of large and medium farm production of traditional grains (Table 8). But this good fortune would be short-lived even if it were actually realised. More generally, we would expect the smaller farmer to lose welfare, even relative to his former position.

Stage III

We suggested in the theoretical discussion that, farm spending behaviour was related to the farm's net income position. We now formalise those previously stated behavioural relationships and hypothesise that, the change in farm expenditure is linearly related to the change in net farm income over the proceeding period.[12] When subscripts $(t+1)$ and t indicate the present and past time periods.

$$P_x(t+1).X(t+1) - P_{x(t)}.X_t = \alpha_i\,(NR_t - NR_{t-1}) \quad \ldots(19)$$

We assume that the market price for input does not change over time; hence $P_x(t+1) = P_{xt}$. Dividing by P_x, and transposing,

$$X(t+1) = X_t + \alpha_i \frac{(NR_t - NR_{t-1})}{P_x}$$

(When $NR_t - NR_{t-1} > 0$) ..(20)

The factor α_i (i=1, for small, 2 for medium and 3 for large farms, respectively) is the product of the marginal propensity to invest out of net income and the marginal propensity to purchase non-land inputs (traditional for small farms, new for large and medium) out of investment funds. In the example, $\alpha_1=0.04$, $\alpha_2=0.07$, and $\alpha_3=0.11$. These magnitudes reflect the current behavioural situation in India, [15, 16, 17].

We emphasise that the numerical quantities used are for the post-technological change period. They reflect a set of economic relationships different from those that existed before the new technology made investment profitable for large farmers.

It is well documented that, before the Green Revolution, the average propensity to invest in non-land inputs decreased as farm size increased [20]. The reasons for this might be as follows. Under traditional technology, large farms could have come close to exhausting the potential for profitable new investment in traditional inputs well in advance of small, economically constrained farmers. Hence, large farmers' new net revenue might be spent, either on consumption goods or land, to increase absolute income in direct proportion to the number of new acres bought. Small farmers, on the other hand, could still find it profitable to invest (out of new income) in the non-land inputs which they had previously been constrained from purchasing. After the Green Revolution, it would again become profitable for large farmers to invest in new inputs, and, because of the lower marginal utility of consumption *vis-a-vis* small farmers, large farmers would demonstrate larger marginal and average propensities to invest in non-land inputs.

Because the net revenue of all producers increased in the first period, the use of non-land inputs will increase for all farmers. The solution to equation (20) shows that, small farmers should increase input use (traditional inputs) by 24.2 per cent, the medium farmers by 218.1 per cent, and the large farmers by 278.9 per cent (both on new inputs).

The resultant production functions, per-acre supply functions, and per-farm supply functions, are given in equations (21), (22), (23), (24), (25), (26), (24a), (25a), and (26a), respectively.

(21) $q_1=0.5+0.557\ X^{.5}$
(production function, small farm)

TABLE 8: RATIOS OF FARM NET REVENUES, POST-TECHNOLOGICAL CHANGE WITH RESPECT TO PRE-TECHNOLOGICAL CHANGE, BY FARM SIZE

	NR (First Approximation)* / Original	NR (Second Approximation) / Original
Small farm	1.01	0.982
Medium farm	1.032	1.041
Large farm	1.036	1.082

* NR = net revenue

(22) $q_2=0.7+1.402\ X^{.5}$
(production function, medium farm)

(23) $q_3=1.0+2.113\ X^{.5}$
(production function, large farm)

(24) $q_{s_1}=0.5+0.165\ P_yP_x^{-1}$
(per-acre supply, small farm)

(25) $q_{s_2}=0.7+0.655\ P_yP_x^{-1}$
(per-acre supply, medium farm)

(26) $q_{s_3}=1.0+1.489\ P_yP_x^{-1}$
(per-acre supply, large farm)

(24a) $Q_{s_1}=1.25+0.413\ P_yP_x^{-1}$
(per-farm supply, small farm)

(25a) $Q_{s_2}=5.25+4.914\ P_yP_x^{-1}$
(per-acre supply, medium farm)

(26a) $Q_{s_3}=12.5+1.861\ P_yP_x^{-1}$
(per-farm supply, large farm)

Again, assuming no net entry or exit from agriculture, the aggregate supply function becomes

$$Q_m=2150+2476.305\ P_yP_x^{-1} \ldots(27)$$

The demand function remains as given in (17). In equilibrium the market price of output would be given by

$$y=6355\ P_x/(945\ P_x+2476.305) \quad \ldots(28)$$

Again, with all quantities expressed in terms of the initial product and input prices and assuming that $P_x=50$, the full market solution is presented in Table 6.

The model now shows that the income disparity, even among adopters, will grow over time. The ratio of large-to-medium farms' net income has grown from 2.39 to 2.48, or by about 4 per cent (Table 7). An even more dramatic growth in disparity is seen between the large and small farms. The ratio of net incomes grew from 10.03 to 11.05, or by about 10 per cent. Further, the small farmer is worse off relative to his own former position (net income falls by about 2 per cent) (Table 8), so that one can conclude that the small farmer will be even less able (than he was formerly) to employ the new technology in an attempt to catch up. The income gap, therefore, will continue to widen in successive production cycles.

Thus, we have demonstrated, both theoretically and quasi-empirically that, embodied technical change, like that of the Green Revolution, will exaggerate existing inter-farm income disparities. The gap will grow because the initial pre-technological change income distribution means an unequal opportunity for farmers to attempt to adopt the technology. Further, the economic behaviour of farmers in different income classes differs, and differs in a way that reinforces the tendency for incomes to diverge.

SOME POLICY IMPLICATIONS

The analysis presented has some policy implications for India and other developing countries. These are not dwelt on here, but are suggested as a target towards which more inquiry should be directed.

Since mechanisation may dampen the increase in labour demand, resulting from the expanding factor of seed-fertilisers, the policies that encourage premature mechanisation in surplus-labour economies, such as India's, do not seem conducive to solving the problem of growing unemployment. The policies we question on these grounds are the indiscreet subsidisation of farm machinery and credit availability for the same. In addition, the import and foreign aid policies that encourage and facilitate the use of huge labour-displacing farm machinery also requires re-examination.

As we have demonstrated, the embodied technological innovation marked by the Green Revolution, left to itself, has an inherent tendency to widen the disparities between small, medium, and large farmers, not only in the initial stages but also in successive production cycles. This tendency can only be counteracted by Government's policy measures. Alternatives that might be studied could include:

(1) A policy measure aimed at raising the production levels of small farmers, e g, cheaper credit facilities for these farmers, subsidisation of seed/fertilisers and so on. Caution would be needed, however, for many ills have resulted in other countries which have embarked on this course (particularly the United States).

(2) A progressive system of taxation on rural incomes that are growing with the Green Revolution. There is hardly any effective measure of agricultural income tax now, although laws are on the books in several states.

(3) A comprehensive scheme of income transfers or welfare payments for the small farmers, possibly financed out of tax revenues from large farms.

(4) An effective implementation of laws pertaining to land ceilings to reduce the basic disparity in income. But again, caution is needed, for to close off the possibilities of added economies of scale by setting too low a ceiling would be counter-developmental.

These suggestions can only be placed in operational perspective, and discussed with wisdom, if the magnitudes assumed in this paper are empirically verified. Furthermore, many behavioural relationships assumed here require statistical grounding. The real evidence demanded cannot be adequately supplied by surveys, and studies based on the surveys, that were conducted a decade-and-a-half ago — however good these surveys and studies might have been. Hopefully, new statistical light will now be shed on these policy matters soon.

Notes

1 These are: (a) all marginal products exceed zero, (b) diminished marginal product exists, (c) homogeneity is guaranteed, but not specified *a priori* and (d) there is a finite limit to output as inputs increase to infinity. [6].

2 We do not wish to limit our use of the word 'finance' to the procurement of funds in the loan market or to the securing of credit from distributors of production inputs. There also could be a strong relation between the level of net income in real terms and the amount that a farmer would be willing to reinvest to finance his own enterprise. That is, the average propensity to consume may be smaller for a large farmer than a small farmer. Attitudes towards risk-taking might also be expected to vary directly with net income.

3 The present form of analysis could also be used to evaluate the situation in which disembodied technical change occurs, since in this case, the technological change could be interpreted as increasing the productivity of traditional inputs as well as adding new inputs.

Thus, $\dfrac{\partial X_t}{\partial R_t} > 0.$

In this case growth in output would be partially due to the output of small farmers as well as large. Even so, the large farmer would add proportionally more to output than would the smaller.

4 $\dfrac{\partial Y}{\partial R} > 0$, if $\left\{\dfrac{X_t}{X}\right\} \cdot \left\{\dfrac{\partial Y}{\partial X_t}\right\} \cdot \left\{\dfrac{\partial X_t}{\partial R_t} + \dfrac{\partial X_n}{\partial R_t}\right\} \cdot \left\{\dfrac{R_t}{R}\right\} + \left\{\dfrac{X_n}{X}\right\} \cdot \left\{\dfrac{\partial Y_n}{\partial X_n}\right\} \cdot \left\{\dfrac{\partial X_t}{\partial R_n} + \dfrac{\partial X_n}{\partial R_n}\right\} \cdot \left\{\dfrac{R_n}{R}\right\} + \left\{\dfrac{X_t}{X}\right\} \cdot \left\{\dfrac{\partial Y}{\partial X_t}\right\} \cdot \left\{\dfrac{\partial X_t}{\partial R_n} + \dfrac{\partial X_n}{\partial R_n}\right\} \cdot \left\{\dfrac{R_n}{R}\right\} + \left\{\dfrac{X_n}{X}\right\} \cdot \left\{\dfrac{\partial Y}{\partial X_n}\right\} \cdot \left\{\dfrac{\partial X_t}{\partial R_t} + \dfrac{\partial X_n}{\partial R_t}\right\} \cdot \left\{\dfrac{R_t}{R}\right\} > 0$

But this is true if,

$$\left\{\frac{\partial X_t}{\partial R_t} + \frac{\partial X_n}{\partial R_t}\right\} > 0 \text{ and}$$

$$\left\{\frac{\partial X_n}{\partial R_n} + \frac{\partial X_t}{\partial R_n}\right\} > 0 \text{ or if}$$

$$\left|\frac{\partial X_t}{\partial R_t}\right| > \left|\frac{\partial X_n}{\partial R_t}\right| \text{ and}$$

$$\left|\frac{\partial X_n}{\partial R_n}\right| > \left|\frac{\partial X_t}{\partial R_n}\right|$$

5 $$E_s = \frac{\Delta\left\{\frac{X_n}{X_t}\right\}}{\left\{\frac{X_n}{X_t}\right\}} \cdot \frac{\left\{\frac{P_{Xt}}{P_{Xn}}\right\}}{\Delta\left\{\frac{P_{Xt}}{P_{Xn}}\right\}} > 1.$$

$$\therefore \left|\frac{\Delta\left\{\frac{X_n}{X_t}\right\}}{\left\{\frac{X_n}{X_t}\right\}}\right| \cdot \left|\frac{\left\{\frac{P_{Xt}}{P_{Xn}}\right\}}{\Delta\left\{\frac{P_{Xt}}{P_{Xn}}\right\}}\right| > 1.$$

But $\frac{P_{Xt}}{P_{Xn}} = \frac{R_n}{R_t}$. Substituting gives

$$\left|\frac{\frac{\Delta X_n}{\Delta X_t}}{\frac{X_n}{X_t}}\right| \cdot \left|\frac{\frac{R_n}{R_t}}{\frac{\Delta R_n}{\Delta R_t}}\right| > 1$$

$$\therefore \left|\frac{\Delta X_n}{\Delta X_t}\right| \cdot \left|\frac{R_n}{R_t}\right| > \left|\frac{X_n}{X_t}\right| \cdot \left|\frac{\Delta R_n}{\Delta R_t}\right|$$

$$\therefore \left|\frac{\Delta X_n}{\Delta R_n}\right| \cdot \left|\frac{R_n}{X_n}\right| > \left|\frac{\Delta X_t}{\Delta R_t}\right| \cdot \left|\frac{R_t}{X_t}\right| \text{ (if } X_n, X_t, R_n, R_t \text{ } \textit{all} \text{ change)}$$

In the *limit* $\frac{\Delta X_n}{\Delta R_n} \to \frac{\partial X_n}{\partial R_n}$ and

$\frac{\Delta X_t}{\Delta R_t} \to \frac{\partial X_t}{\partial R_t}$. Further, since $R_n > R_t$

and $X_t > X_n$, $\left|\frac{R_n}{X_n}\right| > \left|\frac{R_t}{X_t}\right|$.

$$\therefore \left|\frac{\partial X_n}{\partial R_n}\right| > \left|\frac{\partial X_t}{\partial R_t}\right|$$

6 The implicit assumption made in this analysis is that the output of the non-adopter is indistinguishable from that of the adopter of the new inputs. In this case, consumers cannot discriminate and create a price differential for the outputs of different farms. If consumers make this distinction, as in India where the output of adopters is *red*, existence of a price differential becomes possible [10]. A higher price for the output of low-income farmers would dampen the widening of the income disparity. This aspect will not be treated theoretically, but will be built into the hueristic example that follows.

7 *In essence, we are suggesting that,* what we observe in data is the *ex-post* production function, while there is conceptually an *ex-ante* production function that incorporates *all the* 'latest' technology that could be attained. The degree to which any farmer can approach the *ex-ante* production function is determined by the *number and severity* of the constraints placed upon him by nature, *his past decisions and his* own personality.

8 The monetary units in this section are *not to* be strictly interpreted as referring to rupees or dollars.

9 *Estimated from [10].*

10 Estimated from [17].

11 *Ibid.*

12 It is quite likely that, in practice, these steps occur simultaneously with those given in *Stage II, with* decisions and responses based on anticipation, rather than on experienced fact. For the sake of exposition, however, we evaluate the *stages separately in the same manner*, as the analysis of consumer demand behaviour separates the price and income effects.

Inter-Class Incidence of Taxation in Farm and Non-Farm Sectors in India

S L Shetty

The existing differential in the tax burdens of farm and non-farm sectors may appear to follow from the difference between their inequality patterns. For, it may be argued that under progressive taxation the greater the inequality in income the larger the tax revenue earned by the State. But there is a false premise here. The prevailing systems of taxation in the farm and non-farm sectors are entirely different in nature and progressiveness. In fact, land revenue which is the principal direct tax on the farm sector is at best a proportional tax, whereas the income-tax on the non-farm sector is highly progressive.

Nevertheless, inter-class analysis of tax burdens is valid. Its purpose is to bring out the difference between the actual tax burden and the potential capacity at the different income levels. Moreover, the revenue potential of a sector depends not simply on the overall distribution pattern but on the distribution of income above a certain minimum. The revenue potential thus depends on the level and extent of 'big' incomes in the system.

This paper, therefore, measures the inter-class burden of taxation by juxtaposing two sets of data: the data on income distribution and the data on tax burdens at different income levels. Section I examines the two patterns of income distribution; Section II examines the distribution of tax burdens among the different income groups; Section III analyses inter-class 'equity' of tax burdens.

[*This study is an abridged version of Chapter 5 in the author's doctoral dissertation on "Tax Burden on Farm and Non-Farm Sectors in India — An Inter-Sectoral and Inter-Class Analysis", submitted to the University of Bombay in 1970. The author is grateful to the late H C Malkani, to C H Shah, E T Mathew and V M Jakhade, for their comments and encouragement at various stages of the study.*]

GIVEN a progressive system of taxation, the greater the inequality in distribution of income, the larger is the tax revenue earned by the State. It may be argued that the existing differential in the tax burdens of farm and non-farm sectors may be explained by the difference in their inequality pattern. But there is a basic flaw in this argument. The prevailing systems of taxation in the farm and the non-farm sectors—especially the system of direct taxation to which the pattern of income distribution is related—are entirely different in their nature and progressiveness. Land revenue, which is the principal direct tax on the farm sector, is said to be at best a proportional tax, whereas the income-tax levied on non-farm incomes is a highly progressive tax. Nevertheless, the inter-class analysis of tax burdens is still valid; for, its purpose is to bring out the difference between the actual tax burden and the potential capacity at the different income levels. This is not to suggest that the two sectors should have identical systems of taxation with identical rates schedules. But, any equitable system of taxation, devised for the farm and non-farm sectors under their existing patterns of income distribution, entails that the proportion of income paid as tax be equal in the comparable income groups of the two sectors.

There is yet another issue that needs to be clarified here, *viz,* the nature of the income distribution above a given minimum. Even in a progressive system of taxation, the revenue potential of a given sector does not depend merely on the overall distribution pattern; rather, it depends upon the distribution of income *above* a given minimum which may be treated as the 'exemption limit' for direct tax purposes. In other words, the revenue potential depends upon the level and extent of 'big' incomes in the system.

Against this background, we may examine initially the patterns of income distribution in the farm and non-farm sectors of the Indian economy. Basically, the measurement of the inter-class burden of taxation entails the juxtaposition of two sets of data: the data on income distribution and the data on tax burdens at different income levels. In Section I, we examine the patterns of income distribution in the two sectors; we devote Section II to examining the distribution of tax burdens among the different income groups in the two sectors; in Section III, the results of the first two Sections are juxtaposed for analysing the inter-class 'equity' of tax burdens.

I

Patterns of Income Distribution in Farm and Non-Farm Household Sectors

The most difficult part of the analysis[1] has been one of presenting reliable estimates of the patterns of income distribution in the farm and non-farm sectors. Even the Mahalanobis Committee on "Distribution of Income and Levels of Living" was sceptical about the data on income distribution in India; they said that "the required data are not available at present for a direct study of the question on income distribution referred to the Committee and no firm conclusions on the subject can be drawn".[2] However, they appended the following footnote to this observation: "It may be noted that adequate data for a thorough study of the changes in income distribution are not available even for advanced countries having better statistical systems than in India".[3] No doubt, quite a few studies have been undertaken in recent years which have a bearing on the distribution of income in India.

The only studies which bear a close resemblance to our requirements are those of Ojha and Bhatt in the *Reserve Bank of India Bulletin*[4] and the NCAER.[5] However, the NCAER studies are not available for any year before 1960 and hence the extent of changes in income distribution, in recent years over the earlier period of planning, is difficult to discern. Even among the studies it has done, only two are comprehensive, designed to obtain data on the pattern of income distribution: One is on urban income and savings undertaken for 1960 and the other on rural income and savings for 1962. Other studies are on consu-

mer expenditure of households, and the data they contain on income distribution are in the nature of a by-product. "It would be difficult to venture any comparison between the 1962 data presented earlier and these figures as both the definition and the purpose of two studies are different. In one case, data were canvassed on consumer expenditure and in the other, on savings and income."[6]

Even the comprehensive studies, referred to above, give the pattern of income distribution in respect of 'rural' and 'urban' households, and not of 'farm' and 'non-farm' households. On *a priori* grounds, it is difficult to accept that, in the Indian context, the patterns of income distribution in 'rural' and 'urban' sectors squarely correspond to the patterns obtaining in 'farm' and 'non-farm' sectors. Any attempt to redesign the NCAER data, to get the patterns of distribution in 'farm' and 'non-farm' sectors, should be only tentative. We have done it, but only to use it as corroborative evidence. However, we cannot apply the NCAER methods and derive the results for farm/non-farm classification of households for early years, for its studies are based on extensive sample household surveys. It is also not possible to read the trends in income distribution from the Ojha-Bhatt study and the NCAER Survey results taken together, as they do not appear consistent with each other. Though the essence of the method of estimation used in the Ojha-Bhatt study is the same as that of many other studies, *viz*, the integration of the income-tax data with the NSS consumer expenditure data, it is the most comprehensive of all, it is 'ingenuous' and 'worthy of emulation'[7] and amenable to revision and fresh derivation for subsequent years.[8] The results can also be obtained precisely in respect of the sectors with which we are directly interested, *viz*, 'farm' and 'non-farm' sectors. However, the method as it was originally employed was marred by certain drawbacks. The most serious one pointed out by Ranadive pertains to the inadmissability of deriving the size-distribution of personal household income from a given size-distribution of per capita consumer expenditure.[9] This needs to be amplified.

In the relevant NSS Round on consumer expenditure, employed by the Ojha-Bhatt study, the unit of sampling and accounting was the household. But, while presenting the final results, each household's total consumer expenditure was divided by its (household) size, and thus, every household was treated as belonging to a particular *per capita* expenditure group instead of as belonging to a particular *household* expenditure group. There were 13 such per capita monthly expenditure classes. Against each class, *inter alia* expenditure per capita for a period of 30 days, proportions of population, and size of households, were given. Based on these data, the Ojha-Bhatt study had converted the per capita expenditure classes into per household expenditure classes. It was done by multiplying the per capita expenditure with the size of household in each bracket. But, this multiplication process did not surely place the sample households into their original household size classes; in fact, the whole original NSS data got tampered with. In a situation where the high-income households are associated with large household size, particularly in the rural sector, the derivation of the size distribution of household income from the size distribution of expenditures by per capita expenditure classes does introduce a downward bias in respect of incomes appropriated

TABLE 3 : DISTRIBUTION OF ESTIMATED NUMBER OF HOUSEHOLDS AND PERSONS BY MONTHLY PER CAPITA EXPENDITURE CLASSES

* Lower expenditure classes are not reproduced here since they are not relevant to the subject under discussion.

by these high-income groups. This apparent inconsistency is evident from the results of different Rounds of NSS which present data on size of households by expenditure classes. It is widely accepted, both on *a priori* grounds and on empirical evidence—which we will presently cite—, that the size of household generally increases with income in the rural as well as urban sectors in India. On the other hand, all the Rounds of the NSS on consumer expenditure, which give their result in terms of per capita expenditure classes show that average size of households is the lowest in the last two highest expenditure classes, both in rural and urban areas. In fact, among the 13 expenditure classes, the size increases with expenditure classes initially, but thereafter it tapers off reaching the lowest size in the last two highest expenditure classes. Table 1 reproduces the results of a few Rounds to show how consistently these observations hold good in respect of both rural and urban sectors and in all the Rounds of the NSS. This shows that in the NSS classification, those households with large total expenditures but with equally large household size (much above the average) fall under lower[10] classes of per capita expenditure. Alternatively, those households which report small total household expenditures but which have equally small household size fall under higher expenditure groups.

In the Ojha-Bhatt method, the total expenditure of the high-income households is derived by multiplying the per capita expenditure of the high expenditure classes[11] by their respective household size. These are the households for which low household size is revealed in the NSS results. The total expenditure of these households with such low household size are taken as the expenditures of the high-income groups. It is precisely this that is objectionable. The total expenditures of these households may be high, but certainly not as high as the total expenditures of those households with large household size.

In this regard, in some of the NSS Rounds themselves, where the data are presented in *household* expenditure classes, there is evidence that large household expenditure groups have a bigger size of households. For instance, the data, reproduced in Table 2 from a few Rounds of the NSS, reveal how consistently size of households increases with the increase in the monthly household expenditure classes, both in rural and urban areas. It is also revealed that, against all expenditure classes, the

household size is higher in rural areas than in urban areas; and this difference is particularly significant in the highest expenditure class, *viz*, Rs 300 and above.

Since we have two sets of classifications (based on per capita and household expenditure classes) given by the NSS themselves, it is possible to examine the nature of bias the procedure adopted by Ojha-Bhatt study had possibly given rise to.

If the data by per capita expenditure classes are employed, the line of demarcation between low (below Rs 3,000 per annum) and high (above Rs 3,000 per annum) income groups should fall in the last expenditure class of Rs 55 and above, in both rural and urban sectors.[12] Incidentally, this assumes that there are no savings by the low-income households. When we employ the data given by household expenditure classes, the income limit of Rs 3,000 falls within the expenditure bracket of Rs 151-300, that is, at a monthly household expenditure level of Rs 250. Now, proportions of both estimated households and persons above this limit are observed to be higher in the data with household expenditure classes than in the data with per capita expenditure classes.

For instance, in the Fourth Round (where data are given in both the classifications), for the urban areas, the proportion of persons falling in the last two expenditure brackets of (Rs 43 and above) formed hardly 15.37 per cent of the total urban population (see Table 3). The same Round's data, when given according to per household expenditure classes, show that the proportion of households falling above the monthly household expenditure of Rs 250 formed about 24.41 per cent (see Table 4). This is, no doubt, based on the assumption that households within the class interval of Rs 151-300 are uniformly distributed. Even if it is not so, the difference should still be significant.

The differential distribution pattern in the two sets of classifications, described above, is found to be more in respect of the rural households. Thus, in the Fourth Round, while the per capita expenditure classification yielded only 6.77 per cent of the rural population as falling under the last two per capita expenditure brackets (Rs 43 and above), the household expenditure classification placed the proportion at 16.42 per cent, i e, only a little less than two and a half times the former. This differential is evident, almost to the same extent, even when the results of Thirteenth and Seventeenth Rounds, are placed against those of the comparable Rounds with per capita expenditure classes.

The second drawback of the Ojha-Bhatt study, which has been noticed in retrospect, is the application of data on consumer expenditure without making allowance for the widely known over-reporting in the consumption of foodgrains, particularly by the high-income rural households.[13]

The third modification pertains to only the Fourth Round (April-September 1952). The results of the first eight Rounds of the National Sample Survey on Consumer Expenditure are not comparable with the subsequent ones, mainly because till the Eighth Round the imputation of self-produced commodities was made at retail prices, and from the Ninth Round these were imputed at ex-farm prices.[14] Among the four Rounds of the NSS which Ojha-Bhatt had employed, the first two (seventh and eight) Rounds and the self-produced commodities imputed at retail prices. It was probably for this reason that they had made the following observations: "Moreover, the estimated all-India consumption expenditure on the basis of the NSS data exceeds the private income as estimated by the Central Statistical Organisation (CSO); thus the NSS data are not consistent with the National Income data".[15] It is observed that this is true for only the first of the three Rounds used here. Therefore, some adjustment has to be made for the overestimation of consumption expenditure due to imputation at retail prices. The adjustment is particularly necessary because the proportion of self-produced consumption is higher in the 'rural' sector than in the 'urban' sector. For instance, according to the Fourth Round (April-September 1952), the proportion of self-produced consumption worked out to about 44.4 per cent for 'rural' households and only 10.3 per cent for 'urban' households.

We have made an attempt to present independent estimates of income distribution in farm and non-farm sectors during certain intervals of years; for this, we have adopted broadly the Ojha-Bhatt model, but after eliminating the drawbacks cited above. Salient features of the final results are discussed here.

THE RESULTS

The patterns of income distribution in farm and non-farm sectors have been worked out for three periods: 1952-53/1953-54, 1957-58/1958-59, and 1961-62/1962-63. These years have been chosen on the basis of availability of the required NSS consumer expenditure data. In a comprehensive and formidable critique of the Ojha-Bhatt study, Ranadive had suggested that "the more reasonable course to follow would, therefore, be to use the original NSS data directly in terms of households".[16] This is precisely what we have done. It has been made possible because the National Sample Survey have themselves provided the consumer expenditure data in terms of households in three Rounds, namely, Fourth Round (April-September 1952), Thirteenth Round (September 1957-May 1958), and Seventeenth Round (September 1961-July 1962). The final results of our estimates of income distribution are presented in Table 5.

There are a few differences between the results of the Ojha-Bhatt study and those of the present study. The first major difference relates to the proportion of farm income appropriated by high-income households. According to the Ojha-Bhatt study, the high-income farm households (with income above Rs 3,000 per annum) appropriated about 12.5 per cent of the total farm income during the first period (1953-54/1954-55) and about 11.1 per cent during the second period (1955-56/1956-57). On the other hand, our results show that these households appropriated about 30.4 per cent during 1952-53/1953-54, about 25.7 per cent during 1957-58/1958-59, and about 26.6 per cent during 1961-62/1962-63. The most important explanation for the difference is to be found in the method employed by the Ojha-Bhatt study in deriving size-distribution of household income from the size-distribution of per capita consumer expenditure. As explained earlier, this has introduced a definite downward bias in the estimation of incomes of high-income groups both in farm and non-farm sectors, but the degree of underestimation is more in farm sector than in non-farm sector.

There is also corroborative evidence in support of our results in the survey results of the NCAER studies, which show that the proportion of income appropriated by the high-income groups in the 'rural' sector ranged between 24.0 and 25.8 per cent of the total 'rural' income during the years 1960 to 1962. True, the pattern of distribution in the 'rural' sector need not correspond to the pattern obtaining in the 'farm' sector. But, as shown in Table 6, the

TABLE 11 : DISTRIBUTION OF DIRECT TAX BURDEN BY GRADES OF INCOME IN RESPECT OF FARM HOUSEHOLDS

Grades of Income	1952-53/1953-54		1957-58/1958-59		1961-62/1962-63	
	Amount (Rs crores)	Percentage to Total	Amount (Rs crores)	Percentage to Total	Amount (Rs crores)	Percentage to Total
Low : below Rs 3,000	49.08	66.1	72.24	68.6	87.42	67.9
High : above Rs 3,000	25.16	33.9	33.34	31.4	41.26	32.1
(i) Middle : Rs 3,001-Rs 25,000	20.49	27.9	24.42	23.0	30.74	23.9
(ii) Top : above Rs 25,000	4.67	6.3	8.92	8.4	10.52	8.2
Total	74.24	100.0	106.08	100.0	128.68	100.0

difference is marginal, and, what is more, the share of income appropriated by high-income groups is estimated to be more in the 'farm' sector (27.8 per cent) than in the 'rural' sector (25.8 per cent). Significantly, our results for 1961-62/1962-63 place the estimated share for the high-income farm households at 26.6 per cent, which compares well with these estimates based on the NCAER study.

Secondly, the Ojha-Bhatt study has made the assumption that there are no households earning more than Rs 25,000 per annum in the farm sector. It is not that they have ruled out the possibility of any households in the farm sector earning more than that sum. What they opined was: "The exclusion of the small number of households in this bracket would not affect to any perceptible extent the distribution of income".[17] From the point of view of the present study, the sub-classification of the high-income farm group into middle and top-income groups is found necessary—however small the share of the top-income group may be. It is observed that the share of farm income appropriated by top-income bracket (earning more than Rs 25,000 per annum) works out to about 2 per cent, whereas the share of corresponding group in the non-farm sector generally stands at a little more than 10 per cent throughout the period under study. Incidentally, the NCAER had placed the share of 'rural' income appropriated by top-income 'rural' households at 1.92 per cent as against 10.8 per cent for the corresponding households in the 'urban' sector.[18]

The last important difference is on the share of high-income brackets in the non-farm sector. The Ojha-Bhatt study revealed that the high-income non-farm group (earning more than Rs 3,000 per annum) appropriated about 24.5 per cent of the total non-farm household income during the first period (1953-54/1954-55). The present estimates for 1952-53/1953-54 place the proportion at 40.5 per cent or, for 1961-62/1962-63 at 41.3 per cent. Here again our results seem to be on firmer ground. The Ojha-Bhatt study had understated the share of the high-income households due to the procedure adopted therein. The NCAER results also show that the share of high-income 'urban' (or 'non-farm') households should be much more than what was revealed by the Ojha-Bhatt study. Comparing the Ojha-Bhatt estimates with their own, the NCAER write thus: "As a result, the RBI data understate the concentration of income among upper income groups both at the rural and urban levels and give an appearance of relative equality of incomes in India compared with developed economies which is not warranted".[19]

Table 7 compares the share of high-income non-farm group as revealed in our study with the Ojha-Bhatt estimates, on the one hand and with those of the NCAER, on the other. Our results have a close resemblance to those of the NCAER based on field surveys. Here, it is to be conceded that, in the Ojha-Bhatt study, the extent of underestimation of the income share of high-income groups was much less for the 'urban' households than for 'rural' households because household size is larger in high expenditure 'rural' households than in high-expenditure 'urban' households. That their procedure had yielded inconsistent results may be observed from the fact that, while the share of high-income households within the 'urban' sector was as high as 41.9 per cent, the corresponding proportion for the non-farm sector was only 28.1 per cent. This is because the non-farm sector comprises 'urban' households as well as 'non-farm' rural households; and, since there was a gross underestimation of the share of the latter type of households, it brought about a downward bias in the estimates for the high-income non-farm households as a whole.

Here, it is necessary to make a little digression and to highlight the patterns of distribution of incomes above the limit of Rs 3,000 per household per annum obtaining in farm and non-farm sectors. This is in anticipation of the inter-class analysis of tax incidence to be carried out in the next Section.

It was said at the outset that the revenue potential of a group of income recipients is dependent upon the number of 'big' incomes among them. Assuming that Rs 3,000 is the possible exemption limit in a system of direct taxation for both farm and non-farm sectors,[20] it is necessary to know how the incomes above this limit get distributed. Table 8 is designed to portray this distribution in farm and non-farm sectors. The most striking feature observed from this Table is that, while the share of the top-income group in the incomes of the high-income farm households (i e, above the limit of Rs 3,000 per annum) formed about 7 to 8 per cent during the entire period under study, the corresponding share of the top-income group in the non-farm sector worked out to about 26 to 27 per cent. In terms of household distribution, while hardly less than one per cent of the households in the farm sector belonged to the top-income group, about 7 per cent of the non-farm households belonged to this group. This differential distribution pattern should have its significance for the revenue potentiality of the two sectors.

Before we conclude, it must be stated that we do not claim to have provided conclusive answers to all the problems connected with the estimates of income distribution for farm and non-farm sectors in India. We are primarily concerned with the problem of tax burden and the inter-class variations therein. However, we could not have proceeded further without succeeding in presenting fairly accurate estimates of income distribution for farm and non-farm sectors.

Certain phenomena, which are widely accepted in the existing studies to be true of the Indian economy, are also confirmed by our results. Thus, if concentration of income in the high-income groups is the yardstick,[21] distribution of income is more unequal for non-farm households than for farm households. It is also revealed that there was some reduction in inequality in the farm sector, particularly during the early fifties—possibly because of an important piece of legislation, *viz*, the abolition of intermediaries. Thereafter, there was no such policy impetus for redistribution, and the pattern of inequality seems to have remained static. In fact, there are signs of an increase in inequality in the farm sector in very recent years. For the non-farm sector, our results show that there has been no basic change in the inequality pattern, which is also revealed by the NCAER results, though their estimates belong to different time-periods. They write: "In the urban areas, on the other hand, there seems to be no definite indication of a change .... The broad conclusions from these data would be that, while there is some trend towards reduction in equality in the rural sector, this is not true in the case of the urban sector."[22] According to our results, the share of the high-income group in the total non-farm income was 40.5 per cent during the first period (1953-55) and remained at almost the same level (41.3 per cent) during the last period (1961-63). During the second period (1957-59), the share was less at 37 per cent as it was an exceptionally bad period for the non-farm households. All the relevant data—such as income originating in the sector, value-added in the manufacturing industries, savings of urban households, and share of top-income assessees in the total income assessed to income tax—suggest that the share of non-farm high-income households should be low during this period.

II

Distribution of Tax Burden by Grades of Income

NON-FARM SECTOR

Among the direct taxes applicable to non-farm households, income-tax is most important; other direct taxes are comparatively insignificant insofar as their overall burden is concerned. The Income-Tax Revenue Statistics, published by the Board of Revenue (Government of India), provide data on size-wise distribution of income-tax assessed from non-farm households. There are, no doubt, certain limitations in the Income-Tax Revenue Statistics but with respect to the distribution of the income-tax burden between different size-groups, there is no better way of obtaining it than through these Statistics.

Besides income-tax, other direct

TABLE 14 : RELATIVE INCIDENCE OF INDIRECT TAXATION BY GRADES OF INCOME—RATIO OF INCIDENCE OF NON-FARM SECTOR GROUPS TO INCIDENCE OF FARM SECTOR GROUPS

Grades of Income (Rs)	1952-53/ 1953-54	1957-58/ 1958-59	1961-62/ 1962-63

(ii) Top : above 25,000	5.25	4.73	3.94
All grades	1.26	1.27	1.24

taxes whose 'direct money burden' falls on the non-farm sector are: expenditure tax, wealth tax, gift tax, estate duty, urban immovable property tax, stamps and registration duties, and profession tax. Here, certain assumptions are made regarding the distribution of their incidence among different income groups. They are:

(1) The following taxes are borne by the top-income bracket only: expenditure tax, wealth tax, gift tax, estate duty and urban immovable property tax. Their rate schedules speak for the validity of this assumption.
(2) The profession tax and stamps and registration duties are distributed among middle and top-income classes in the proportions in which income-tax gets distributed.

The final results of this distribution are presented in Table 9. The specific results are : Generally about 77-78 per cent of the direct tax in the non-farm household sector is borne by the assessees whose annual incomes exceed Rs 25,000; in other words, the direct tax burden devolved upon the middle-income group (earning between Rs 3,000 and Rs 25,000 per annum) in the non-farm sector forms less than 25 per cent of the total direct tax burden. The significance of this phenomenon lies in the fact that, in contrast, the brunt of direct taxation in the farm sector is borne by low and middle-income households (earning less than Rs 25,000 per annum), as may be observed from the following paragraphs. Incidentally, as is widely known the low-income group in the non-farm sector does not bear any direct tax burden.

FARM SECTOR

Of the central and state direct taxes, the following are directly relevant to the farm sector:

(i) Land revenue,
(ii) Agricultural income-tax,
(iii) Stamps and registration duties, and
(iv) Estate duty.

Among these, agricultural income-tax is essentially borne by households earning more than Rs 3,000 per annum. A glance at the state laws relating to the tax would reveal that all the states without exception have, in effect, exempted household earnings of Rs 3,000 or less from the tax.[23] Further, for apportioning the agricultural income-tax burden between middle (Rs 3,001-25,000) and top (above Rs 25,000) income brackets, there is some evidence in the agricultural income-tax assessment data available in respect of three states where the major proportion of revenue from this tax is earned, *viz*, Assam, Madras, and Kerala. The relevant data are presented in Table 10. It may be observed from these data that about 16.5 per cent of the agricultural income-tax in 1960-61 was paid by the assessees in the income range of Rs 3,000-Rs 25,000 per annum, and the balance by the assessees with income above Rs 25,000 per annum. It is assumed that this proportion is valid for the all-India position and also for other reference periods.

Estate duty legislation, again, makes a substantial exemption of estates, so much so that assessees earning less than Rs 25,000 are unlikely to bear the tax. Originally the exemption limit was placed at Rs one lakh worth of property, but from 1960 it was reduced to Rs 50,000.

A tricky problem which we faced here was in the allocation of land revenue burden among low- and high-income groups. As in the matter of measuring the pattern of income distribution, we have apportioned the land revenue burden the way the Ojha-Bhatt study on income distribution has done, *viz*, in the proportions of their respective disposable incomes. We could as well have employed the data on the distribution of land-holdings by size-groups. But the Farm Management data, available in respect of a few selected states, show that the land revenue rates per acre decline as farm size expands.[24] This declining rate with increasing acreage is taken account of in the distribution of farm disposable income which we have employed here. Making a thorough scrutiny of the Farm Management data, Khusro has come to the conclusion that "if acreage is taken at its (uncorrected) face value, then as acreage increases, gross output per acre O/A decreases".[25] But, since the phenomenon of decreasing soil fertility with increase in farm size was observed (based on decreasing land revenue per acre), Khusro has worked out *corrected acreage* with land revenue per acre as an index of fertility. He thus found that both gross output and farm business income per corrected acre are constant with increase in farm size.[26] Therefore, the obvious inference is that land revenue is proportional to farm income.

While the above procedure is adopted for distributing the land revenue burden between the low and the high-income groups, it is found necessary to make a slight departure from this method in further apportioning the land revenue burden between middle- and top-income brackets since the distribution of their personal incomes itself depends on the distribution of land revenue burden. Therefore, the proportions of personal (pre-tax) income distribution between middle- and top-income brackets are employed for apportioning the land revenue burdens. However, the difference between the two is unlikely to be significant.

As for stamps and registration duties, by and large, legal transactions which bear these duties in the farm sector relate to land property. For this reason and, of course, in the absence of better evidence regarding the inter-class burden of these duties, the best alternative is to assign their incidence to various income brackets in the same proportions as the ones employed for land revenue distribution.

On these lines, quantitative estimates of direct tax burden on different income groups in the farm sector are made. A summary picture of these is presented in Table 11. As may be observed from this Table, during the entire period under study, about two-thirds of the direct tax burden on the farm sector is borne by the low-income households, and the balance of about one-third is shared between the middle- and top-income brackets.

When the above distribution of tax burden in the farm sector is compared with that in the non-farm sector, the following conclusions emerge:

(i) While the low-income group, earning less than Rs 3,000 per annum, pays no direct taxes in the non-farm sector, its counterpart in the farm sector bears about two-thirds of the direct tax burden in the farm sector; and
(ii) The top-income group, which bears more than 75 per cent of the direct tax burden in the non-farm sector, is not a significant tax paying group (or income earning group) in the farm sector.

However, while these results are useful as a part of preliminary reasoning, their interpretative significance is limited unless the absolute amounts of tax burdens are brought into relation with the quantitative estimates of household incomes in respect of different income groups in farm and non-farm sectors.

III

Incidence of Taxation by Grades of Income

DIRECT TAXATION

In respect of different income groups in farm and non-farm sectors, percentages of direct tax burdens to respective income levels are worked out and presented in Table 12. As may be observed therein, the middle-income group (Rs 3,001-Rs 25,000) in the non-farm sector paid about 1.9 to 2 per cent of its income as direct tax during all the three periods under study. The corresponding income group in the farm sector has paid only a little less proportion of its income as direct tax, except during the first period when the incidence was at 1.4 per cent in the farm sector as against 1.9 per cent in the non-farm sector. During the subsequent two periods, the incidence on the farm group remained static at 1.7 per cent, as against 1.9 per cent and 2 per cent on the non-farm group during the second and third periods, respectively.

On the other hand, the top-income bracket (i e, income above Rs 25,000 per annum) in the non-farm sector paid a considerably heavier burden of direct taxation than its counterpart group in the farm sector. The incidence on the non-farm top-income group was at 18.7 per cent and 18.2 per cent during the first and the last periods, as against 4.4 per cent and 7.3 per cent on the farm group during the respective periods. It is precisely because of this that the incidence of direct taxation on the high-income group (above Rs 3,000 per annum) as a whole in the non-farm sector worked out to levels higher than those on the farm sector high-income group, i e, 6.2 per cent, 7.1 per cent, and 6.3 per cent, on the non-farm sector group during the three periods, respectively, as against 1.6 per cent, 2.2 per cent, and 2.1 per cent, for the farm sector group.

Thus, the disparity in direct tax burdens on the households of the two sectors is observed in respect of two-income groups. First, the low-income group (earning less than Rs 3,000 per annum) pays no direct tax in the non-farm sector, while in the farm sector the corresponding group does bear some direct tax burden. Secondly, the top-income group (earning above Rs 25,000 per annum) in the non-farm sector pays a substantially larger proportion of its income as tax than does the corresponding group in the farm sector. The bulk of the direct tax burden in the farm sector is borne by low- and middle-income households the incidence on which is very well comparable with the incidence on the corresponding groups in the non-farm sector. On the other hand, the bulk of direct taxation in the non-farm sector impinge on the top-income brackets whose tax burden is much higher than the burden on the corresponding group in the farm sector, but the top-income bracket does not form an important income-earning group in the farm sector, though the unequal tax burdens borne by these comparable income groups in the two sectors do involve inequity. The non-farm household sector, taken as a whole, does bear a higher direct tax burden than the burden borne by the farm household sector only because of the existence of top-income brackets to a much larger extent.

INDIRECT TAXATION

In estimating the inter-class incidence of indirect taxation, we have relied on studies by the Taxation Enquiry Commission (1953-54) and the Tax Research Unit in the Finance Ministry of the Government of India (for two reference years, 1958-59 and 1963-64),[27] which give indirect tax burdens per capita and the distribution of population by various expenditure size groups. The broad conclusions which emerge from this exercise are presented in Table 13.

All the income brackets studied (low,

TABLE 16: RELATIVE INCIDENCE OF DIRECT AND INDIRECT TAXES TOGETHER, BY GRADES OF INCOME*

Grades of Income (Rs)	1952-53/ 1953-54	1957-58/ 1958-59	1961-62/ 1962-63
Low: below 3,000	0.76	0.92	0.87
High: above 3,000	2.11	1.69	1.53
(i) Middle: 3,001 - 25,000	1.36	1.10	1.26
(ii) Top: above 25,000	4.38	3.76	2.78
Low and middle (below 25,000)	1.02	1.03	1.08
All grades	1.44	1.31	1.29

* In this Table, incidence of taxes on various income groups in the non-farm sector is taken as a ratio of the incidence of taxes on the corresponding groups in the farm sector.

middle, and top) have paid as indirect tax higher proportion of their respective incomes in the non-farm sector than in the farm sector, but the extent of these differences in their incidence pattern does not appear to be significant except in respect of the top-income group. Here, to gauge the extent of these differences, the relative position of these incidence patterns is depicted in Table 14. In this Table, the incidence of indirect tax on each group of the non-farm sector is shown as a ratio of the incidence on the corresponding group in the farm sector. When the ratio is equal to unity, intersectoral equity is achieved in the concerned income group. If the ratio is more than unity, the farm sector is relatively undertaxed, and the farther away is the ratio from unity, the higher is the degree of under-taxation.

It may be observed from this Table that, for the top-income bracket (above Rs 25,000 per annum), the ratio of incidence in the non-farm sector to that in the farm sector stood at 5.25, 4.73, and 3.94, respectively during the three periods under study. For the middle-income group (Rs 3,001-Rs 25,000), the ratio was at 1.36 for the first period; it dwindled to 1.09 in the second period; but again picked up to 1.26 in the last period. For all classes together, the ratio of relative incidence works out to 1.26, 1.27, and 1.24, respectively during the three periods.

However, besides the intersectoral differences, there are some intra-sectoral differences to be noticed. The major difference within the farm and non-farm sectors pertains to the top-income brackets *vis-a-vis* other brackets. In both sectors, the top-income brackets have less burden of indirect taxation than do the respective middle-income groups. In the farm sector, the top-income bracket paid indirect tax which was as a proportion of its income even less than the tax paid by the low-income group (see Table 13). These inter-class disparities within the individual sectors appear substantial. In the farm sector, while the incidence on the top-income group ranged between 0.8 per cent and 1.8 per cent of income during the three periods under study, the incidence on the low-income group ranged between 2.8 per cent and 5.9 per cent, and on the middle income group it ranged between 4.1 per cent and 9.9 per cent. Similarly, in the non-farm sector, while the incidence on the top-income group ranged between 4.2 per cent and 7.1 per cent, that on the middle-income groups ranged between 5.6 per cent and 12.5 per cent.

The above results may, on the surface, appear to contradict the results of the studies undertaken by the Taxation Enquiry Commission and the Tax Research Unit in the Finance Ministry of the Government of India, referred to earlier. These studies have worked out separately for 'rural' and 'urban' sectors the per capita indirect taxes as a percentage of the per capita consumer expenditure under various expenditure size-groups. Their results show that all the expenditure groups in the 'urban' sector have paid higher indirect taxes per capita, as also higher taxes as percentage of consumer expenditure, than the corresponding expenditure groups in the 'rural' sector. Moreover, these studies have shown that within the 'urban' and 'rural' sectors too, there is an increase in incidence with the increase in expenditure size. The present work is also based on the results revealed by these studies, but there is an important difference in the criterion adopted for working out the incidence patterns. While these studies have put out figures of indirect tax incidence in per capita terms and only in relation to consumer expenditure, the present study is concerned with incidence per unit of income earned by the various income groups. For instance, the top-income group has a very low proportion of the population and a high saving-income ratio, with the result that the tax per capita and the tax as percentage of expenditure per capita give a different picture compared with the tax per unit of income earned. There is thus no contradiction in their results and the results of the present study.

INTER-CLASS INCIDENCE OF DIRECT AND INDIRECT TAXES TOGETHER

The aggregate picture of direct and indirect tax burdens together on the various income groups of farm and non-farm sectors is shown in Table 15. In order to examine the extent of intersectoral disparity in the incidence patterns, the ratio of tax burdens on non-farm income groups to tax burdens on corresponding farm income groups is depicted in Table 16. The important conclusions are summarised below.

First, the low-income group in the farm sector paid generally more tax as a percentage of its income than the low-income group in the non-farm sector. Thus, while the tax incidence on the farm sector low-income group ranged between 4.1 per cent and 7.5 per cent during the entire period under study, that on the corresponding non-farm sector group ranged between 3.1 and 6.5 per cent. In terms of the ratios presented in Table 16, the ratio of incidence on the non-farm low-income group to that on the comparable farm group worked out to 0.76, 0.92, and 0.87, respectively during the three periods. The important reason for this intersectoral disparity among the low-income groups is that the non-farm low-income group paid no direct tax, and that the incidence of indirect taxation, though generally higher on this group than on the comparable farm group, did not fully compensate for the lower level of direct tax burden borne by the farm group.

Secondly, the differences between the incidence levels of the middle-income groups (Rs 3,001-25,000) in the two sectors do not appear significant except during the first period when the non-farm middle group paid about 7.5 per cent of its income as tax while the corresponding farm group paid only 5.5 per cent of its income — the ratio working out to 1.36. Thereafter, the total tax burden on these groups in both sectors has increased, the proportion of tax burden to income rising from 7.5 per cent in the first period to 14.6 per cent in the last period in the non-farm sector, and from 5.5 per cent to 11.6 per cent in the farm sector. But, because of faster growth in the incomes of this group in the non-farm sector, the relative tax burdens between the groups of two sectors have dwindled to levels as low as 1.10 during the second period and 1.26 during the last period. This phenomenon of the burden differential being marginal among the middle groups is true of both direct and indirect taxes — and hence, true of the aggregate picture of incidence.

Thirdly, the income group in which the non-farm sector parts with a far higher proportion of income than does the farm sector is the top-income group. This group in the non-farm sector generally paid about 25 per cent of its income as direct and indirect taxes together, whereas the corresponding group in the farm sector paid less than 10 per cent of its income during the periods under study. However, while there is certainly a glaring intersectoral disparity between the top-income groups in the two sectors, its significance for the revenue potential of the farm sector is limited because the size of the income in the top-income bracket in the farm sector is very small. Hence, if the top-income group is excluded as it should be since it is insignificant in the farm sector, the data do not appear to show 'inequitous' burden against the non-farm sector.

It is found that the overall tax incidence on households in the farm sector earning less than Rs 25,000 per annum worked out to 4.5 per cent, 6.6 per cent, and 8.5 per cent, during the first, second and third reference periods, respectively, as against the corresponding incidence of 4.6 per cent, 6.8 per cent, and 9.2 per cent, in the non-farm sector. Thus the relative incidence ratio has always been only a little more than unity, i e, 1.02, 1.03, and 1.08, indicating that, viewed strictly from the viewpoint of 'equity', the farm sector does not appear to have been significantly under-taxed relative to the tax incidence on the non-farm sector. True, there is the top-income group in the non-farm sector which bears the bulk of the direct tax burden, but the concept of 'equity' entails the juxtaposition of comparable income groups in the two sectors. Since the top-income group is almost non-existent in the farm sector, and in the non-farm sector the progressive system of direct taxation brings in the bulk of the revenue from this group, it is unjust and misleading to include the top-income group in working out the average incidence of taxation in two sectors. If this elimination process is adopted, empirical evidence casts serious doubt on the thesis of under-taxation of the farm sector.

CONCLUSIONS

To sum up, the conclusions of this study are:

(a) While more than 90 per cent of the direct tax burden on the farm sector is borne by its low and middle-income groups, about 75 per cent of the direct tax burden on the non-farm sector is borne by its top-income group.

(b) The intersectoral differences in direct tax burdens are observed in respect of two income groups. First, the low-income group (earning less than Rs 3,000 per annum) pays no direct tax in the non-farm sector, while in the farm sector the corresponding group does bear some direct tax burden. Secondly, the top-income group (earning above Rs 25,000 per annum) in the non-farm sector pays a substantially larger proportion of its income as tax than what the corresponding group in the farm sector does. Of the three income groups, direct tax incidence on the middle-income group (Rs 3,001-25,000) in the non-farm sector was generally only marginally higher than on the corresponding group in the farm sector.

(c) In respect of indirect taxes, not only intersectoral but also intra-sectoral 'inequity' is observed as between certain income groups. As for the intersectoral differences, all the income brackets studied, (low, middle, and top) have paid as indirect tax higher proportions of their respective incomes in the non-farm sector than in the farm sector, but the extent of these differences in their incidence pattern does not appear to be significant, except in respect of the top-income group. The major intra-sectoral difference pertains to the top-income brackets *vis-a-vis* other brackets. In both sectors, the top-income brackets had lower incidence of indirect taxation than the incidence borne by the respective middle-income groups; and in the farm sector, it was lower than even the tax paid by the low-income group. This has obviously arisen from the differences in the distribution of income between savings and consumption expenditure at various income groups.

(d) The inter-class incidence of direct and indirect taxation together leads to the following conclusions:

(i) among the three income groups, the low and middle income groups in the non-farm sector do not appear to have significantly higher incidence than the incidence on the corresponding groups in the farm sector;

(ii) the top-income bracket in the non-farm sector, on the other hand, bears a far higher incidence of taxation than does the top-income group in the farm sector; and

(iii) if the top-income groups are excluded from the overall picture on the ground that the income earned by them in the farm sector is an almost insignificant part of the whole, empirical evidence does not seem to show any intersectoral disparity in tax incidence between farm and non-farm sectors.

Notes

1 In this section we concentrate on the household income of farm and non-farm sectors. In other words, corporate entities and tax incidence thereon, which are broadly a feature of the non-farm sector, are excluded.

8 It is possible because the NSS data and the Income-tax Revenue Statistics are generally available for every year from the beginning of the fifties.

9 K R Ranadive, *op cit*, pp 132-134.

10 The phrases 'large', 'lower', 'higher', etc, are used in this paragraph in the context of the NSS data on consumer expenditure.

11 To be specific, high-income households start "from the last but one expenditure bracket". P D Ojha and V V Bhatt in *Reserve Bank of India Bulletin*, *op cit*, p 1351.

12 K R Ranadive has pointed out that a methodological error had crept in the Ojha-Bhatt study. They had assumed that the limit of Rs 3,000 per anum falls "within the last but one expenditure bracket". See P D Ojha and V V Bhatt in *Reserve Bank of India Bulletin*, *op cit*, p 1351. This is incorrect. As Ranadive has brought out, "limit of Rs 3,000 *does not fall* in the penultimate bracket in any of the years for either the rural or the urban area". In all the years, the limit fell in the last bracket of Rs 55 and above. See K R Ranadive: 'The "Equality" of Incomes in India', *op cit*, pp 127-128.

13 See P V Sukhatme: "Feeding India's Growing Millions" (Bombay: Asia Publishing House, 1965), pp 22-24; also S S Madalgi: 'Foodgrains Demand Projections: 1964-65 to 1975-76', *Reserve Bank of India Bulletin* (Volume XXI, Number I, January 1967), pp 21-35.

16 K R Ranadive, *op cit*, p 133.

17 P D Ojha and V V Bhatt in *Reserve Bank of India Bulletin* (September 1962), *op cit*, p 1356.

18 See NCAER: All India Rural Household Survey: 1962 (Occasional Paper Number 13), pp 21-22 (Tables 7 and 8).

19 See NCAER: All India Rural Household Survey: 1962 A Summary Statement on Income Distribution in Rural and All India), *op cit*, p 13. Incidentally, the NCAER have tried to explain away the differences between the Ojha-Bhatt study and their own by referring to the former's assumption regarding zero savings among low-income households (with income less than Rs 3,000 per annum). "The basic assumption made in the RBI estimates is that rural and urban households in the lowest income brackets have zero saving on balance is clearly inconsistent with the survey results in India or with survey results in other countries, which indicate that the lowest income families in any year have net dissaving." (*Ibid*, p 13.) This is an exaggeration of the reality. From the NCAER survey results themselves, it has been observed that there is a large proportion of low-income households making positive savings. Against this, there are dissavings by "the lowest income families" referred to above. What the Ojha-Bhatt study had assumed was that the income range of Rs 1-3,000 is sufficiently wide enough to see that these two would cancel each other out, which is evident from the survey results of the NCAER themselves. While they have made no reference to the apparent inconsistency in applying the type of NSS expenditure data employed by the Ojha-Bhatt study to derive household income distribution, the NCAER have referred to the third aspect of over-reporting of expenditure on foodgrains consumption only in a footnote (*Ibid*, p 13).

20 It is possible to assume different exemption limits for farm and non-farm sectors, for it may be argued that the monetary value of per capita subsistence requirements for the farm households is lower than that for the non-farm households. But the limit of Rs 3,000 is itself considered low. Even if this limit is raised for the non-farm sector, say to Rs 4,000, the conclusions drawn here are not at all affected.

Blundell Eomite Paints

BLUNDELL Eomite Paints' chairman, E B Calvert, told shareholders at the annual meeting that both sales and profits for the first five months of the current year had exceeded those recorded in the same period last year. This, indeed, is satisfactory as far as it goes since during the year ended June 1971, the company achieved a 49 per cent advance in pre-tax profit following a 9 per cent rise in sales. But looking to the uncertainty following the emergency in the country, Calvert could not make any forecast of the final trading result for the year as a whole. He pointed to a number of steps the management had already taken to increase the company's share of the paints market and to enhance profitability. Notable among these has been the greater emphasis on a wider distribution of decorative materials, rendering more efficient service to stockists and users in all parts of the country. Moreover, product-range has been rationalised and non-profitable lines have been eliminated. Efforts have been aimed at improving service to industries; the company already enjoys a "substantial" share of the market for industrial finishes. In addition, owing to difficult credit problems faced by the paints industry and the highly competitive nature of the business, the placing of a private debenture issue of Rs 30 lakhs will relieve the company of the substantial annual repayments falling due under the previous loans. Substantial rebates, received as a result of completion of outstanding income-tax assessments for a number of years, would reduce the burden of interest payments on loans needed for financing the company's operations.

Expenditure-Elasticities of Intersectoral Consumer Demand in India

R Thamarajakshi

The dynamics of the agriculture-industry linkages are determined, among other things, by the relative values of expenditure elasticities of inter-sectoral consumer demand. When investments are undertaken in a developing economy, they result through the multiplier in increased money incomes.

A priori two phases may be distinguished in the consequent changing pattern of expenditure. Where average incomes are to start with very low, a very large proportion of the increments are spent on food or other agricultural consumption products; in the second phase, after the backlogs of hunger and malnutrition have been cleared, there operates an inverse relationship between incomes and the proportion spent on food.

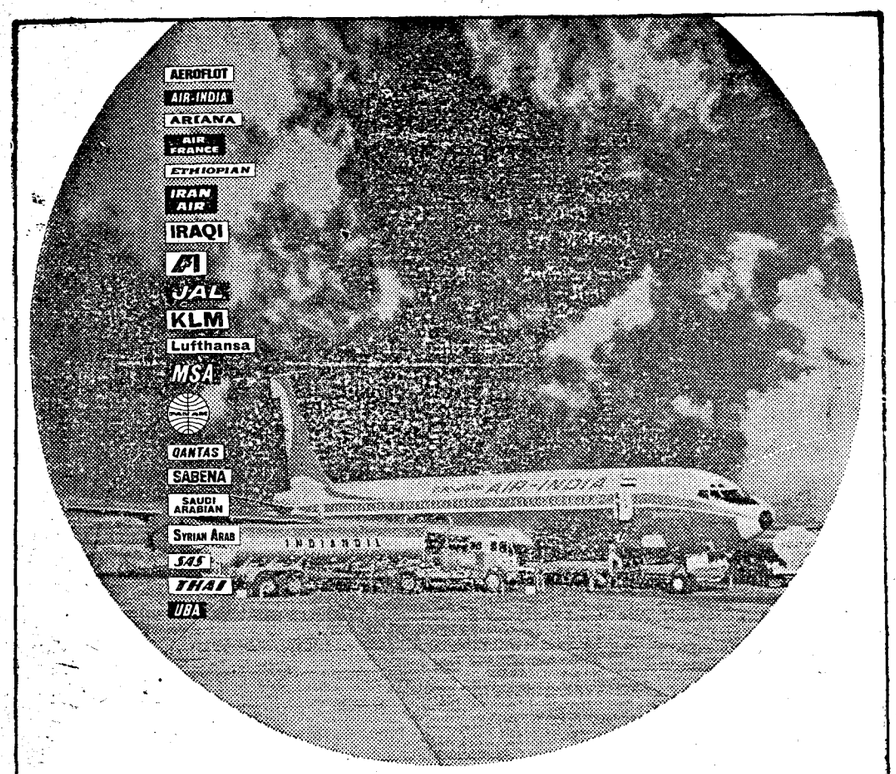
To test this hypothesis, this paper estimates the expenditure elasticities of demand in the agricultural and non-agricultural sectors for the agricultural and non-agricultural products.

It is found that at the outset the expenditure elasticities of demand, of the agricultural and non-agricultural sectors, for the agricultural and non-agricultural products, have remained more or less stable. Against this backdrop of stability, however, the expenditure elasticities of demand of the agricultural and the non-agricultural sectors, for the non-agricultural products, have shown a tendency to rise. Moreover, the expenditure elasticities for the non-agricultural products are consistently higher than those for the agricultural products for both sectors.

[This paper is based partly on the author's doctoral dissertation "Agriculture-Industry Relationships in the Indian economy, 1948-49 — 1958-59", submitted to the University of Delhi in 1963. The views expressed are those of the author.]

THE dynamics of agriculture-industry relationships are determined *inter alia* by the relative values of the expenditure elasticities of intersectoral consumer demand. In developing economies, investments are undertaken which, through the operation of the multiplier, result in increased money incomes. *A priori*, two phases may be distinguished in the changing pattern of expenditure, consequent to the generation of new incomes. In the first phase, an economy which is in the initial stages of development may have such low average incomes that a very large proportion — or conceivably the whole — of the increments in income, might be spent on food and other agricultural consumption products. This is the pre-Engelian phase[1] when the proportion of total family outgo spent on food actually rises with increases in incomes. But after backlogs of hunger and malnutrition are cleared up, Engel's law relating income and food consumption would come into its own, and an inverse relationship would operate between incomes and the proportion spent on food.

In other words, in the first phase, the relative increase in expenditure on food would be higher than (a) the relative increase in total consumption expenditure and (b) the relative increase in expenditure on non-food items; and the income elasticities of demand for food and other agricultural consumption products would be greater than unity and higher than the income elasticities of demand for the non-agricultural consumption products. In the second phase, this position is reversed, and the income elasticities of demand for food and other agricultural consumption products may be expected to be less than those for the non-agricultural consumption products. This paper examines this theoretical hypothesis in the context of the Indian economy during 1951-61.



The attempt here is to estimate what may be more appropriately termed the '*expenditure elasticities*' of demand. This is because of the fact that the National Sample Survey[2] (NSS) whose information form the basis for our work, presents data on the pattern of consumer expenditure, not by income levels, but by expenditure classes. It is true that the income elasticity of demand for a product can be derived by adjusting the expenditure elasticity of demand for that product with the income elasticity of the national consumption expenditure. However, in the absence of an authentic estimate of the latter, it is decided to estimate only the expenditure elasticities of consumption. Incidentally, it may be pointed out that, to the extent that savings are effected by individuals, the expenditure elasticities of consumption may represent overestimates of income elasticities of demand.

In this study, the economy has been considered under two broad sectors, *viz*; agriculture and non-agriculture. The agricultural sector includes crop and animal husbandry, and all that is not agricultural in this sense is termed the non-agricultural sector. The classification of consumption products as

KEEPING A NATION ON THE MOVE

As many as 20 airlines of international repute avail of INDIANOIL's expert refuelling service. In the growth of India's transport and communications, INDIANOIL has been playing a distinct role. But that is not to belittle its contribution to the nation's agriculture and industry.

In a short span of a decade, INDIANOIL has emerged as the biggest oil refining and marketing organisation in India—meeting more than half of the nation's total requirements of petroleum products.

With a chain of refineries processing indigenous crude, a vast pipeline transportation system, and a countrywide storage and distribution network, INDIANOIL has ensured an uninterrupted flow of oil for India's defence and development.

As part of the nation's planned development INDIANOIL ceaselessly strives to take the country towards self-reliance and self-sufficiency in petroleum.

agricultural and non-agricultural has been made with reference to the major commodity groups given in the Reports of the NSS. The NSS gives the pattern of consumer expenditure in rupees per person, for a period of 30 days, by 12 major categories of consumption, and by monthly per capita expenditure classes for rural and urban areas. This study is based on the published reports of the NSS for 16 rounds of survey, spanning 1951-52 to 1960-61. For the purposes of our study, the items foodgrains (or cereals and cereal substitutes), milk and milk products, meat, egg and fish, and other food, are included under 'agricultural products'; the remaining items, *viz*, edible oil, sugar, salt, clothing, fuel and light, rent, taxes, and miscellaneous goods, have been taken to constitute non-agricultural products.

It is then assumed (i) that the pattern of consumer expenditure, observed by the NSS in the rural areas, is representative of that obtaining in the agricultural sector and in the less organised sub-sectors of the non-agricultural sector (*viz*, forestry, fishery, small enterprises and construction) and (ii) that the pattern observed by the NSS in the urban areas is true of the rest of the non-agricultural sector as well (i e, constituted by the sub-sectors of mining and quarrying, factory establishments, services, etc). This has had the following procedural implications for our study. By the above assumption, expenditure elasticities estimated for the rural sector are also the elasticities for the agricultural sector. As for the non-agricultural sector, since it consists of organised and unorganised sub-sectors, the expenditure elasticities for the non-agricultural sector may be deemed to be an average of the estimates for the rural and the urban sectors.

With these clarifications, we may now proceed to estimate the expenditure elasticities of intersectoral demand for agricultural and non-agricultural products.

The double-log function of the form log $y=a+b \log x$, where x is the per capita expenditure on all commodities, y the per capita expenditure on agricultural/non-agricultural consumption goods, and b the elasticity co-efficient, was fitted to the family budget data of the NSS for 1951-61, and for the rural and the urban sectors. It was found that the log-linear function provided a good fit and explained more than 97 per cent of the variations in the dependent variable. The derived

TABLE 5: PERCENTAGE OF TOTAL EXPENDITURE SPENT ON AGRICULTURAL PRODUCTS

Per Capita Expenditure Classes	Rural Sector	Urban Sector
0-8	82.43	81.48
8-11	81.50	79.55
11-13	79.17	75.48
13-15	78.26	75.29
15-18	78.32	73.12
18-21	74.55	70.48
21-24	76.88	70.25
24-28	70.21	67.19

34-43	63.46	60.14
43-55	54.09	56.40
55 and above	42.09	45.57
All classes	61.71	60.96

Source: Based on the sixteenth round of the NSS.

estimates of expenditure elasticities are given in Tables 1 and 2.

As already mentioned, the elasticities of the rural sector may be deemed to be the elasticities of the agricultural sector too. On the other hand, the expenditure elasticities of the non-agricultural sector have been derived as a weighted average of the rural and the urban elasticities, weights being the population in the unorganised and the organised sub-sectors of the non-agricultural sector during this period.[4] The expenditure elasticities of the agricultural and non-agricultural sectors for agricultural and non-agricultural products for 1951 to 1961 are given in Tables 3 and 4.

The following inferences may be drawn. At the outset, the expenditure elasticities of demand of the agricultural and non-agricultural sectors, for the agricultural and non-agricultural products have remained more or less stable during this period — as may be observed from the low standard deviation and co-efficient of variation in each case. Against this backdrop of stability, however, the expenditure elasticities of demand of the agricultural and the non-agricultural sectors, for the non-agricultural products, have shown a tendency to rise.

Secondly, the expenditure elasticities for the non-agricultural products are consistently higher than those for the agricultural products; this is true of both the sectors, for the individual years, and hence for the entire period of the study. In fact, whatever be the sector, the elasticities are higher than unity in the case of the non-agricultural products and less than unity in the case of agricultural products. This implies (a) that the marginal propensity to spend on the non-agricultural products

TABLE A

Round of Survey	Period of Survey	Year to Which the Information Has Been Taken to Correspond in this Study.
4th	April 52 — December 52	1951-52
5th	December 52 — March 53	1952-53
7th	October 53 — March 54	1953-54
8th	July 54 — March 55	1954-55
10th	December 55 — May 56	1955-56
11th and 12th	August 56 — August 57	1956-57
13th	September 57 May 58	1957-58
14th	July 58 — June 59	1958-59
15th	July 59 — June 60	1959-60
16th	July 60 — August 61	1960-61

is higher than the average propensity to spend on these products and (b) that the average propensity to spend on these products is rising with the total expenditure on all products. In the case of the agricultural products, on the contrary, the marginal propensity to spend is lower than the average propensity to spend, and hence the average propensity to spend on the agricultural products must decline as total expenditure rises. This becomes clear when we study the percentage of consumption expenditure on agricultural consumption goods in the different expenditure classes of the rural and the urban sectors of the economy during 1960-61 (i e, the sixteenth round of the NSS).

TABLE B: ESTIMATES OF POPULATION IN THE SUB-SECTORS OF THE NON-AGRICULTURAL SECTOR OF THE INDIAN ECONOMY 1951-52 TO 1960-61

(in Millions)

Year	Population in Forestry, Fishery, Construction and Small Enterprises	Industry and Rest of the Economy
1951-52	28.41	75.20
1952-53	28.95	76.89
1953-54	29.50	78.62
1954-55	30.06	80.38
1955-56	30.63	82.19
1956-57	31.22	84.03
1957-58	31.82	85.01
1958-59	32.43	87.83
1959-60	33.05	89.80
1960-61	33.68	91.81

It may be observed from Table 5 that, in both sectors, the percentage declines *almost* consistently with rising total expenditure levels, thus indicating a declining curve of average propensity to consume agricultural products *vis-a-vis* total expenditure.

Notes

1 On the basis of a study of expenditure of a group of German families, Ernst Engel found that "the poorer a family is, the greater is the proportion of the total outgo which must be used for food", C C Zimmerman, Ernst Engel's "Law of Expenditures for Food", Q J E, November, 1932, pp 78-101.

2 Government of India, Cabinet Secretariat, Reports of the National Sample Surveys of Consumer Expenditure (NSS).

3 The period of the NSS Survey, and the year to which the information has been taken to correspond in this study, are given in Table A.

4 The estimates of population in sub-sectors of the non-agricultural sector have been worked out by the author in a different paper. For details, see R Thamarajakshi: 'Inter-Sectoral Terms of Trade and Marketed Surplus of Agricultural Produce 1951-52 to 1965-66'. *Economic and Political Weekly*, Volume IV, Number 26, Review of Agriculture, June 28, 1969. These estimates are given in Table B.

Capitalist Development in Agriculture

Further Comment

Utsa Patnaik

I AM glad to see that Ashok Rudra has been sufficiently provoked to reply to my critique; but disappointed to see that his reply (November 6, pp 2291-2292) does not answer my main methodological criticism, which clearly has not been understood. Perhaps my exposition was unclear; let me restate the central point at dispute as simply as possible.

Consider the following two propositions:

Proposition 1. There exists among the various classes within the non-capitalist agrarian economy, a small but growing class which may be identified as capitalist.

Proposition 2. Agriculture is characterised by complete or near complete polarisation into two main classes, capitalists and wage-labourers.

To a Marxist, these propositions are the same as the following statements, respectively: (1) Elements of capitalist development may be identified within the given mode of production, which is non-capitalist. (2) The non-capitalist mode of production no longer exists, but has been transformed into the capitalist mode.

Clearly, proposition 2 is infinitely stronger than 1. To my knowledge, those who have talked of capitalist development have referred always to 1 and *never* to 2.

Now, Rudra stated that his objective was to see whether in Punjab, among peasants with more than 20 acre holdings, it was possible to "define scientifically and identify empirically" a category of capitalist farmers. In short, his declared aim was to examine proposition 1. At no time did he formulate proposition 2 or state that it was to be examined.

The statistical criterion of strong positive association between the various variables set out by him, however, is *not* relevant to proposition 1. It is relevant *only* to the completely different proposition 2. This argument is set out at length in my Note and this is my main theoretical criticism of Rudra's work. Rudra has put forward his 'negative' results as being relevant to proposition 1, whereas all that these results show is that polarisation has not occurred in Punjab, i e, proposition 2 does not hold. The results have no relevance to the question of whether a category of capitalist farmers can be "defined scientifically and identified empirically", because his statistical method is misconceived as a proof or otherwise of this question.

To sum up, Rudra set out to throw light on 1, but actually disproved 2, while thinking he had disproved 1. To say that your results prove or disprove one thing when they do not and are relevant to something quite different, is surely highly misleading.

From his reply, it is now clear why Rudra thinks he has proved something he has not. He takes propositions 1 and 2 to be identical. For him, the development of a capitalist class within a given non-capitalist mode of production, is the same as polarisation and transformation of the entire mode of production into a capitalist one. So for him, the truth of 1 cannot be established unless we first establish the truth of 2. He treats proposition 2 as a necessary condition for proposition 1. Unless polarisation has occurred and production relations have been transformed, we cannot talk of a capitalist class. Thus, he states "... *as long as there is no polarisation*, we cannot say that capitalist development has taken (sic) place .... the changes that have taken place *are largely of a quantitative order, within the framework of the production relations and class structure as has been existing from before. The emergence of a new class would imply that the transformation of quantity into quality has taken place.* I would suggest that such a transformation is yet to take place." (My italics; no one except Rudra says capitalist development "has taken" place; what is argued is that a process of capitalist development is taking place — a very different emphasis.)

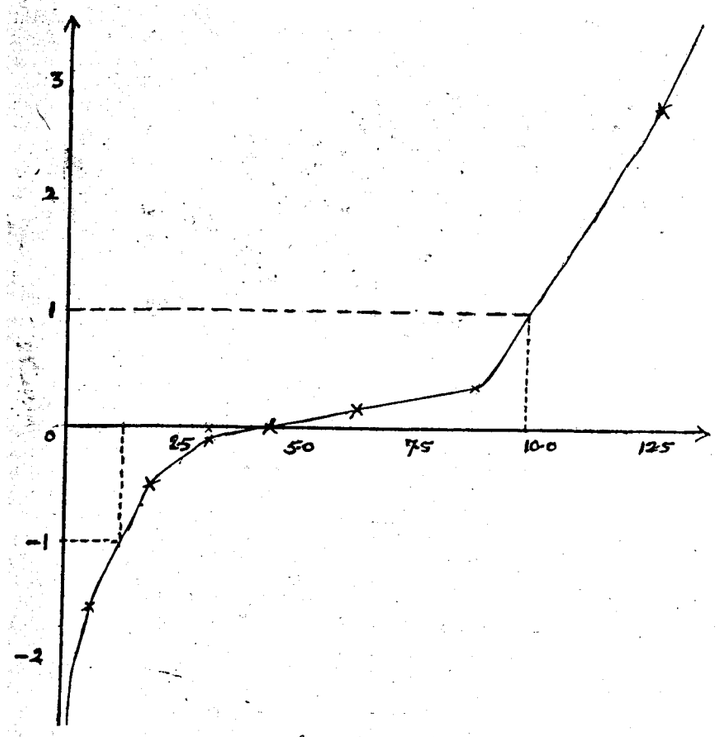
On what theoretical basis does Rudra take proposition 1 and 2 as identical; what is the implicit theory of historical development which leads him to think that we cannot talk of a new class emerging unless production relations have been transformed already, and that class is already dominant? It is certainly not Marxist theory. Marxists recognise the growth of a bourgeois class within the feudal mode of production in W Europe, for example, for some centuries before feudal production relations and the feudal mode was transformed. Qualitative changes can take place *within* a given "framework of production relations", without necessarily transforming that entire framework. We can certainly talk about a new capitalist class emerging within a given non-capitalist mode of production. I have argued that the nature of this capitalist development may be such in Indian agriculture that the mode of production may never be transformed into a capitalist mode. In short, while proposition 1 might hold today proposition 2 may never be true at any time. Certainly no Marxist would dream of taking 1 and 2 to be identical, as Rudra does.

Rudra's implicit theory turns up again when he defines classes, and insists that "all the important variables relating to farm economics" grouped by holding size, must show discontinuities at the same points before we can talk of classes. (Like Moliere's bourgeois who talked prose all his life without knowing it, says Rudra, Marxists have been talking of such discontinuities without knowing it.) Let us be quite clear on one point: Rudra's concept of class has nothing to do with the Marxist concept, although again he *thinks* he is talking of the Marxist concept. Rudra says "one talks of classes *based on size* (of holding) ... in Marxian literature". What does size of holding have to do with the Marxist concept of class? Which "Marxian literature" is he talking about? Where did he get this strange idea from?

The Marxist concept of class is *not* an empiricist one, i e, it does not look at data grouped by holding size and then define classes on the basis of discontinuities in the data. The Marxist concept of class is derived from Marxist theory, which looks at every producer in the light of his position within the system of production relations — the conditions of ownership of the means of production, of employment of labour, and appropriation of the product. Three classes in agriculture may be defined on the basis of the type of production relation involved: (1) the capitalist farmer possessing means of production and employing wage-labour for profit, or the rural bourgeoisie. (2) The self-employed peasant possessing the means of production and producing with family labour, neither hiring-in labour nor hiring-out except to a small degree: or the rural petit-bourgeoisie. (3) The landless peasant possessing no means of production and hiring-out for wages: or the rural proletariat. In addition semi-feudal relations are represented by the big landlord leasing out his land to petty tenants of type (2) and (3) and deriving rent from them.

The entire agricultural population in the real world would not be exhausted by the above pure conceptual types or classes; for there would be large numbers of holdings which produce with a combination of family and hired labour, and which represent intermediate categories. As I have pointed out, "classes do not and cannot exist only in their pure form".[1] Thus we have (a) poor peasants, who do possess limited means of production but are primarily exploited through wages or rent. Thus a household may have 1 acre of land, but be forced to labour for wages to a larger extent than working on this land; or it may take 2 acres on crop-share, paying the product of half or more of its labour-days as rent to the jotedar. These groups may be regarded as a semi-proletariat. (b) rich peasants, who may work in their fields, but who employ wage-labour to as great or greater extent than they work themselves (or who obtain as rent as much as they produce themselves). These groups may be regarded as a proto-bourgeoisie (or semi-landlords).

The "main variables relating to farm economics" grouped by size, would never show discontinuities at the same two points for each variable, in any country at any time, (except as a matter of a remote chance). Whether or not such discontinuities exist, is irrelevant to the Marxist concept of class. When Rudra says that the actual data grouped by size must show discontinuities, he is putting forward *his own* empiricist definition of class which has nothing to do with the Marxist concept of class. All his talk of discontinuities, etc, springs from a fundamental and serious misconception, that Marxists define classes "on the basis of" farm-size. It is not really my job to give elementary lectures on Marxist concepts; anyone who wishes to find out what the concepts are can easily do so, and if he wishes to criticise the concepts in public like Rudra, he would be well-advised to first make sure that he has got them right. I fear that Rudra is in a worse position even than Moliere's M Jourdain; he thought he knew what he was talking — Marxist prose — whereas all along he has been declaiming non-Marxist poetry of his own composition.



Given data on labour-exploitation, we can always put forward empirical dividing-lines between rich, middle and poor peasants — again, whether the data is discontinuous or not, is irrelevant. As an illustration take the data on labour-hiring for West Bengal, 1956-57, from the Studies in the Economics of Farm Management (Table 1). From this we can derive the ratio of net labour-days hired-in to family labour-days on farm (y) and plot it against farm size (x). The function f(x) is continuous, and cuts the x-axis (Figure 1). According to Rudra, there are no rich, middle or poor peasants, since he asserts "if in actual statistical analysis one failed to discover discontinuities one will have to give up the idea that there are indeed three classes ... If there are no discontinuities then f(x) would intersect the x axis at some point. In that case there would not be a class of middle peasants."

Applying a Marxist concept of the rich peasant, as one who exploits as much or more labour as he and family

* I thank Maurice Dobb and Amiya Bagchi for comments on my original article. The views expressed in that article and here are my own.

FIGURE 1

$$y = \frac{\text{net labour-days hired-in}}{\text{family labour-days on farm}}$$

x=farm size, acres.

members work on their land, for rich peasants $y \geqslant 1$. Poor peasants perform labour for others to as great or greater extent than they work on their land, so for them $y \leqslant -1$. Middle peasants, while they may hire-in or hire-out labour, do so to a smaller extent than they work on their land; for them—$1 < y < 1$. From the graph (Fig 1) rich peasants operate on average 9.8 acres or more, poor peasants 1.25 acres or less and middle peasants are in between. (Note: this table understates the numbers of poor peasants and overstates that of middle peasants because it does not include data on sharecroppers. The latter pay the output of half or more of their labour-days to the jotedar. Many peasants operating more than 1.25 acres would be sharecroppers and therefore should be included in the poor peasant rather than middle peasant category.) For the totally landless labourer, y is infinitely low; for the capitalist employing no family labour in field work at all, y is infinitely high. When capitalist development is taking place, sections of the rich peasants turn themselves into capitalists, sections of the semi-proletariat get pushed down into the class of landless labourers, and sections of middle peasants join the ranks of the semi-proletariat. With complete polarisation with capitalists and labourers, the curve would no longer exist.[2]

Please note that while we are putting forward "discontinuities" at the *conceptual* level between rich, middle and poor peasants based on the degree of labour-exploitation, we do not need any discontinuities in the actual data to define these categories; nor is our definition "based on" size of holding. If the data on labour-hiring was grouped by some other index — say annual value of output — we could categorise rich, middle and poor peasants equally well by applying the criterion of labour-exploitation, as above.

Rudra declares that he is not going to "accept any hypothesis even if it were propounded by Marx or Lenin, unless it passes the test of empirical verification". Very good. But surely, if Marxist propositions are to be empirically tested, a minimum requirement is that the investigator must know what those propositions are, the meaning of concepts such as 'class', 'mode of production', etc, which Marxist theory employs? We do not question the need for empirical verification of hypotheses: we do insist however that the hypotheses must be correctly stated. To substitute one's own empiricist concepts for Marxist concepts, as Rudra does, and then to declare that there is no empirical proof of 'Marxist' propositions, is really a bit too much for anyone to swallow. Behind every empirical study is a theory, which determines what questions are asked and how one sets about answering them. Rudra never made his theory explicit in his original article; we had to work backwards, as it were, from his statistical method to show that the implicit theory underlying it was non-Marxist. From Rudra's reply to my comment it is now clear that he is using his own concepts which are not derived from Marxist theory. We have no objection to anyone holding to a non-Marxist theory of historical development or employing a non-Marxist concept of class: but when the person concerned insists that he is talking about Marxist concepts, this becomes very misleading and the source of confusion must be pointed out.

In fact Rudra's implicit, non-Marxist theory would land him, logically, in a very strange situation. In no country, in no historical epoch, would the statistician ever find discontinuities in the important variables relating to farm economics grouped by size, at the same points for each variable.[3] He would therefore *never* be convinced of the existence of classes. The proletariat in alliance with the poor peasantry might overthrow Tsarism in Russia; the poor and middle peasants might overthrow feudalism in China. But through it all, the statistician poring over his $y=f(x)$ and trying to make "best estimates" of non-existent discontinuities, would remain convinced that no classes existed because — on his definition of class — there was no "empirical proof" of their existence. It is a sad thought.

The remaining points are subsidiary to the basic methodological difference between Rudra's approach and what I understand to be the Marxist approach. Unfortunately my arguments have been so misrepresented by Rudra that they require restatement, tedious though this is for all concerned.

(1) "Let us go to a village consisting of all very small farmers, say an Adivasi village .... For each of the variables concerned there will be some average and ...some above the average. All these farmers should be regarded as capitalists of a certain degree, whatever be the absolute values of these variables, however low the average and, therefore, however low the observations falling above the average. The richest peasant...must there be treated as a pure capitalist." How absurd! And if this had been the criterion for identifying capitalists than I had put forward, it would indeed be absurd. Here, Rudra has distorted and misrepresented my criterion (without wishing to, I trust), by lifting it out of its context and by interpreting it in a way one would not have believed possible. Ironically, he has even distorted his own criterion in the process:

(a) Firstly, both Rudra and I are dealing with peasants with more than 20 acre holdings, which made up the top 5-10 per cent of all holdings in any village. The vast majority of peasants are excluded at the outset. The cultivators in the Adivasi village who are "all very small farmers" would not even enter my sample, or his. (*Unless* I had independent information that one or more of them cultivated intensively using more hired than family labour and using machinery: in which case I might include these particular peasants in my sample.)

(b) In my 'long lecture' on concepts, I set out the *necessary* conditions for a peasant to be considered potentially capitalist: namely, rich peasant status at least (primarily or entirely wage-labour based production), sale of most of output (more than 50 per cent), and investment in productivity-raising techniques, (positive values for fertilisers and machinery): I had not considered it essential to set out these conditions afresh when criticising Rudra's criterion, especially since he himself had put forward "modern capital equipment" as a variable.

All holdings which do not satisfy these necessary conditions drop out of the sample and we are left with the set of potential capitalists. (In my sample all holdings were rich peasant at least; seven had no machinery and were excluded, one more sold less than half its output and was also excluded). Even the richest peasant in an Adivasi village is not likely to satisfy these conditions, particularly the one of possessing machinery (e g pump-set, power-tiller, tractor, thresher, powered cane-crusher, etc).

(c) The 'average' values of variable in my criterion refer to the average for this truncated sample, made up of potential capitalists. To qualify as a pure capitalists, I suggested, a holding must have, for each and every one of the 6-7 variables specified, values higher than the average value (calculated for the holdings satisfying the necessary conditions in 6). This criterion is highly restictive: of 58 potentially capitalist holdings in my sample, only 9 qualified as 'pure' capitalists.

This method of identifying capitalist farmers may not be the best one: if anyone can think of a better method, I would welcome the suggestion.

(2) How is it any better to group data by annual value of output rather than size, Rudra asks, and why should grouping by size of holding blur scale effects? It is better to group by value of output because this is a more accurate index of the bigness of the farm as an economic unit, than in area; it also gives a better idea of the differentiation within the peasantry into rich and poor peasants.

Clearly, size of farm in itself is not an indicator of rich, middle or poor peasant status; the direct indicator is the extent of hired relative to family labour. All the available data grouped by size (e g, the Farm Management Studies) shows however, that above a certain level of farm size which varies regionally, hired labour predominates over family labour; the limit may be 10 acres in Bengal, while it is 40 acres in Punjab. Therefore it seemed reasonable to Marxists to take the farms above these limits as roughly corresponding to the rich peasant holdings in the absence of direct data on labour-hiring. (This incidentally may be the source of Rudra's misconception that Marxists "talk of classes based on size of holding".)

My argument is that size of farm even as a rough indicator of rich peasant status, is no longer good enough in the present situation when techniques are changing and intensive cultivation by some groups is taking place. If production techniques are intensified (more irrigation, triple cropping, mechanisation) then a farm may get smaller in terms of area, and *at the same time* get bigger as an economic unit, expand in terms of output and the extent of use of hired relative to family labour. To illustrate this point I gave the example of the intensively cultivated 8-acre holding in my sample which produced more, used more hired labour, and invested more, than the 53-acre farm which qualified as a rich peasant holding. Clearly the 8-acre holding is rich peasant too: if grouped by size, however, it would never be included with the 53-acre holding. If grouped by value of output, however, it would be correctly classified along with or even above the 53-acre holding. We could then go on to apply our criterion for identifying capitalist holdings to both.

This point is important since typically the areas of fastest capitalist development are around growing provincial towns in India. High-value vegetables, fruits and dairy products for urban markets can be produced by intensive methods on small areas. A holding growing these products may be quite small in area but large as an economic unit, in the value of output, extent of hired labour, etc. A 10-acre holding of this kind can be more

TABLE 1

x Operated Holding, Acres	Labour-Days Hired-In Per Farm	Labour-Days Hired-Out Per Farm	Net Labour-Days Hired-In Per Farm (1—2)	Family Labour-Days Per Farm*	y (3÷4)

NA = not available.

* This is the estimated family labour-days spent on farm work (crop production and other work) per farm; the total labour-days per farm is first derived from col 2 and data on percentage of total labour-days hired out (Table A-11); the percentage of total labour-days spent on farm work, from the same table, is then applied to this.

good banking and social welfare through their guidelines. It is gratifying to note that, in spite of the guidelines provided by them, several banks have gone ahead with schemes for financing investments like tractors for purposes of 'custom service'. They finance not only farmers but even those who do not own any land to buy tractors and provide services to others in respect of both farm and non-farm uses.

UBI NOW INTRODUCES

Monthly Income Fixed Deposit Scheme

ENJOY INTEREST INCOME EVERY MONTH AT FIXED DEPOSIT RATES

All you have to do is to deposit with UBI Rs. 3,000/- or above for a minimum period of 3 years. You start getting the benefits from the very next month.

This is how it works

★ Draw interest every month; no more waiting for longer periods.
★ Ensure regular income month after month...
★ Supplement your income.
★ Enjoy fixed monthly income keeping your principal intact.

DEPOSITS	MONTHLY INCOME ON DEPOSITS FOR		FIXED DEPOSIT INTEREST RATES
	3 YEARS	ABOVE 5 YEARS	
Rs. 3,000	Rs. 16.25	Rs. 18.12	3 years... 6 1/2 % p.a.
Rs. 10,000	Rs. 54.17	Rs. 60.42	3-5 years... 7% p.a.
Rs. 50,000	Rs. 270.83	Rs. 302.08	Above 5 years. 7 1/4 % p.a.

Partial Perception

WHAT is the purpose of the customary mid-term appraisal of every five-year plan? The obvious answer would be that these assessments enable pinpointing of shortfalls in performance and suggest major corrections of course necessary to achieve the objectives of the plans. In practice, however, things do not quite work out like that. By the time the mid-term appraisal is completed three of the five years of the plan are over and it is too late for significant corrections of course or for major new investment start-ups to have an impact during the plan period. This is, of course, particularly true of the mid-term appraisal of the Fourth Plan, presented to Parliament this week, which has been overtaken by such cataclysmic events as the influx of refugees from Bangla Desh and the India-Pakistan war. As the Minister for Planning admitted in his statement to Parliament, "it will not be realistic at the present time to formulate a reasonably clear outline of the prospects for the remaining period of the Plan". In the circumstances, the major utility of the Planning Commission's effort is likely to be in the contribution it could make to the formulation of the basic approach to and the broad strategy of the next plan.

If the mid-term appraisal is to be seen from this standpoint, then the painstaking examination of shortfalls in individual areas or industries cease to be its most interesting aspect. Instead, when the experience of the plan so far is seen in the whole, what stands out is its failure to pull the economy out of the low-saving, low-investment stagnation into which it had settled some half a dozen years ago, towards the end of the Third Plan. The plan had aimed at raising the rate of investment from 9.9 per cent of net domestic product at market prices (NDP) in 1968-69 to 13.1 per cent in the 1973-74 and the rate of saving from 8 per cent to 11.9 per cent, implying a decline in dependence on foreign saving from 1.9 per cent of NDP to 1.2 per cent. In fact, however, there has been a slight decline in the rate of investment and only a marginal increase in the rate of saving during the first two years of the plan. The mid-term appraisal notes that the rate of saving in the household sector, which accounts for the bulk of the savings in the economy, is barely 7-8 per cent of household disposable income and concedes that there are formidable constraints on household saving. At this point, the appraisal appears to momentarily put its finger on the crux of the problem when it says that several of these constraints "relate to the rather high degree of inequality obtaining in society". The upper strata of the population, particularly the new rich thrown up by the two decades of planned development, have the means to afford "living standards and patterns obtaining in the highly developed countries" and, what is more, they "set in motion a chain reaction which eventually engulfs even those who cannot afford one square meal a day".

The Planning Commission deserves to be complimented for discarding the common notion that inequality of distribution of incomes has at least the merit of yielding a higher rate of saving. Unfortunately, this insight does not get reflected in the appraisal's approach to dealing with the problems posed by the plan's working so far. Surely, what it has to say about the impact of the consumption levels of the upper strata of the population has some relevance for the sort of structure of production which should be created in industry and elsewhere? Commodities and services consumption of which set in motion the kind of "chain reaction" mentioned above should have no place in this structure. And yet, when it comes to discussing the slack in growth of industrial output the appraisal simply joins in the chorus for liberal issue of industrial licenses and indiscriminate expansion of capacity.

If, in the above instance, the Planning Commission fails to recognise the threat to a higher saving and investment rate from the structure of production, elsewhere it also does not grasp the opportunities for stepping up investment created by particular successes in the sphere of production. In its discussion of the prospects in agriculture, it talks of the threat of "accumulation of excessive stocks of cereals" as a result of the relatively successful experience in cereals production so far in the plan. Now, the use of food stocks for stepping up the rate of economic growth has been a much-discussed subject ever since the inception of planning in the country. Surely, if the present stocks of cereals appear excessive, it is only because a very substantial proportion of the population whose intake of cereals is well below the bare minimum necessary for survival, has not the money incomes to get at these "excessive" stocks at the going prices? The Planning Commission, instead of adding its voice to the complaints about the burdensomeness of the food stocks, should be concerned with devising ways to use the so-called "surpluses" of foodgrains (and of a few other necessities of life which could be deliberately created) to push up investment and expand employment in the economy.

Yugoslavia

Crushing the Corollary

TO satisfy to some extent the local aspirations of its various peoples, after the Second World War Yugoslavia was declared a federation of six republics by Tito. In the sixties, a great measure of economic and political decentralisation was granted to the republics under pressure from local Communist Party units. Decentralisation was also seen as a means of increasing productivity at every level including the factory shop-floor. Greater political freedom followed as the obvious partner to the decentralisation policies. Tito and his Party thought that they had opened a new chapter in the development of socialism and in the resolution of the problem of nationalities. The encouragement of greater productivity by such proven capitalist methods as bonus incentives and profit-sharing created a momentum of its own.

Croatia as well as some of the other republics began to demand, through their Communist Party units, greater shares of national investment and foreign exchange. In Croatia, the demands were much more pointed and specific and called for a radical decentralisation and liberalisation of the Yugoslav foreign trade, foreign exchange and banking system. The Chairman of the Croat Communist Party and professor of economics, Savka Dabcevic-Kucar, told her Party Central Committee that Croatia accounted for 28 per cent of the country's export earnings, 59 per cent of its transport revenues, 72 per cent of tourist revenue (most of it in foreign exchange) and 34 per cent of the foreign exchange remittances from Yugoslav workers abroad. The implications of Dabcevic-Kucar's recital of statistics was clear: Croatia should have a much greater say in how and where the foreign exchange was to be allocated. From the Croat viewpoint, the foreign exchange earnings should have been ploughed back into the areas that had earned them. Finer Marxist sentiments like considering whose need was greater were completely forgotten and so was the fact that four of the other republics (Slovenia being the exception) have lower per capita incomes than Croatia.

The Croat demands are, however, not merely nationalistic. They are symptomatic of a wider malaise which has followed in the wake of Yugoslavia's neo-capitalist policies — the growth of a highly acquisitive, consumer-oriented society, greatly attracted to Western goods and fashions. The Croat demands are only natural in the context of Yugoslav policies. But instead of countering these demands by process of re-ideologisation, Tito has chosen to regard them only as a threat to his power structure and to meet them with repression. In the Yugoslav happenings of 1971 there are certain parallels with what happened in Czechoslovakia in 1968. There also, the Communist Party encouraged the growth of a grasping, acquisitive society. The logical demands flowing from such a growth were crushed by the Russians. In Yugoslavia, it is not the Russians but the initiator of the whole process, Tito, who is now repressing the corollary to his own peculiar variant of 'socialism'.

Irrigation

Water Is Wealth

IN their article in the Agriculture Review section of this issue, Eric Gustafson and Richard Reidinger point out how the spread of the use of new seed varieties and modern inputs in agriculture has put a premium on predictability and controllability of water supply and how this has led, in areas where ground water conditions permit it, to farmers turning to the tubewell as a preferred source of irrigation. Confirming this, the Mid-Term Appraisal of the Fourth Plan, released this week, reveals that in the first three years of the Plan (1969-72) extension of minor irrigation is expected to cover 4.26 mn hectares while major and medium irrigation projects are likely to account for only 1.56 mn hectares.

Of course, 'minor irrigation' is a ragbag which covers all schemes costing less than Rs 25 lakhs. But the spurt in minor irrigation in the last few years has been the result mainly of private investment in tubewells and in energisation of wells. Thus in the three-year period 1966-69, a total of 175,000 private tubewells were bored. This compares with the total number of such tubewells at the end of the Third Five-Year Plan which was only 80,000. Subsequently, another 190,000 tubewells are estimated to have been added in the first two years of the Fourth Plan. Similarly, the number of pumpsets in operation increased from 6.5 lakhs in 1966-67 to 10.9 lakhs in 1968-69 and further to 16.4 lakhs at the end of 1970-71. The proliferation of private tubewells has taken place not only in areas which are without any other source of irrigation but also in the alluvial tracts already commanded by existing canal systems where ground water is available in copious quantities, making the sinking of tubewells by individual agriculturists an attractive proposition. Thus, from being largely a publicly-owned and provided service, irrigation is rapidly becoming a privately-owned facility and an object of very large private investment.

The inequalities in agriculture based on differences in size of holdings are now getting magnified by possession of private means of irrigation or the lack of them. This consequence of the introduction of new crop varieties and use of modern techniques of cultivation should have been obvious enough at the outset. Yet while financial institutions like the Agricultural Refinance Corporation, the Land Development Banks, the Central Co-operative Banks and now the commercial banks have been pressed to provide the wherewithal for the sinking of private tubewells and energisation of wells, little attention has been paid to the provision of controlled irrigation to farmers whose holdings are too small to justify private tubewells or who do not have access to institutional finance for the purpose.

Pakistan

In the Ring

THERE has been a spate of directives flowing from the President of Pakistan's office since Zulfikar Bhutto took over. Passports of the infamous 20-odd families have been impounded. The princes in Pakistan, too, have been deprived of their purses and privileges. The ban on the National Awami Party (NAP) led by Wali Khan has been withdrawn. Several top generals have been dismissed, although one of the two most aggressive generals, Gul Hassan, has been made acting commander-in-chief of the Pakistan army and the other, Tikka Khan, has been kept on, in spite of being the officer most responsible for the debacle in East Bengal.

Does all this amount to any significant diminution in the power of those two groups which in unison have so far controlled the destiny of Pakistan—the landed Punjabi gentry who predominantly make up the officer-class of the army and the bureaucracy, and the big business families based in Karachi, many of whom are migrants from among the mercantile Muslim communities of coastal Kutch and Gujarat. For the army, the loss of East Bengal has meant a disastrous loss of prestige but for the business families the damage has been far more tangible in the shape of the loss of a major field of exploitation—an area which supplied some cheap raw materials, much foreign exchange and, most important, a captive market for the products of West Pakistani industry. While the industrial units remain in the West, their products will become increasingly difficult to sell in a substantially reduced market and the loss of foreign exchange is likely to mean that these units might have to do without vital spare parts and modernisation of their machinery. Deprived of their easy takings from East Bengal, the business families could blame the army for bungling in Bengal and come to a tacit agreement with Bhutto whereby he could take up radical postures regarding the business houses but in substance avoid hampering—if not actually furthering—their interests. But since the business houses of Pakistan have been used to operating in a much more direct manner with the congenial encouragement of the army, it is unlikely that they will be able to work out a more 'sophisticated' and devious mode of operation with Bhutto, who will have to take several symbolic measures to assuage public opinion, a quantity on which he is much more dependent than are the army or the business elite. The danger is that the businessmen may take the symbols to be the substance and react by cementing their bonds with an army which has been defeated but is not devoid of power. To prevent yet another army take-over—this time, perhaps, by younger and more politicised officers—Bhutto is likely to keep the army occupied by maintaining tension with India, both diplomatically and by engaging in minor border skirmishes.

Since the level of political consciousness in West Pakistan is not very high, Bhutto's radical postures will probably lull many of those who voted for him for quite some time, especially in view of the fact that India can always be said to be the reason for economic stagnation in Pakistan. And economic stagnation there will be, as Bhutto cannot risk cutting down the very high level of defence expenditure because this would alienate the armed forces. Apart from the army, the other focus of opposition to Bhutto is likely to be the fissiparous tendencies of the tribal provinces of the North-West Frontier and Baluchistan. By releasing and consulting the most popular leader of the North-West Frontier Province, Wali Khan, Bhutto has tried to head off regional troubles but once economic disaffection grows, resentment is likely to take the form of regionalist demands. In this connection some more per capita income figures, province-wise, may be relevant. The 1968-69 figure for what was then East Pakistan was Rs (Pakistani) 460, for the North-West Frontier Rs 360, for Baluchistan Rs 455, for Punjab Rs 614 and for Sind (including Karachi) Rs 854.

The Press

And Now Price Control

SO far the Government's overt objectives in relation to the Press have been limited to encouraging small newspapers and discouraging concentration of ownership of newspapers. To this list has now been added the protection of newspaper readers against being overcharged. On Monday last the Government introduced in the Lok Sabha a Bill, which was passed the next day, taking powers to control the prices of newspapers. The statement of objects of the Bill referred to the fact that a number of newspapers had recently raised their prices much in excess of the two-paise excise duty (on newspapers and journals with a circulation of over 15,000) which came into effect from mid-November. An appeal had been made to newspapers, through a statement in Parliament, not to increase prices by more than the excise duty. This had little effect, except on papers published from Calcutta which revoked price increases which they had earlier announced. Even in the case of these papers, however, it was not so much the appeal by the Government as the strike by newspaper vendors which had the desired effect. Thus having failed to persuade newspapers, the Government has now taken statutory powers to fix prices "in order to make available to the public newspapers at fair prices".

And how are these "fair prices" to be determined? The task has been simplified by in effect assuming the prices prevailing on the eve of the levy of the excise duty to be "fair" and limiting the regulatory power to increases in prices over these levels. Even so since, as mentioned above, a number of newspapers have hiked up their prices after the levy of the excise duty and many more may be expected to do so during the two-year life of the present legislation, it would be interesting indeed to see how the Government proceeds to determine what is "fair" and what is not in all these cases. Clearly, the price per copy—which does not as a rule cover costs, the difference being fully or partially made up by advertising revenue—cannot be judged in isolation from the total economics of the newspaper business in question. And in the context of the recent Supreme Court judgment on the prices of passenger cars, the imagination boggles at the kind of elaborate cost investigations that may be called for before any orders of the Government regulating newspaper prices may be expected to stand the test of judicial scrutiny.

There is, however, an even more interesting aspect of the matter. In the course of the debate on the Bill in the Lok Sabha, the Minister of State for Information and Broadcasting agreed with the suggestion of a Member that the price-page schedule ought to be reintroduced and said that the Government was aware of the need to fix a relationship between the price and the number of pages of a newspaper. Now, the objective of the price-page schedule is to create a price differential in favour of the smaller newspapers by *forcing* the bigger ones, which offer a larger number of pages, to charge a higher price. The reasoning runs roughly as follows: the bigger newspapers with their larger advertising revenues are able to offer newspaper readers a larger number of pages for the same price; the resultant gain in circulation enables them to secure further advertising. By compelling newspapers offering a larger number of pages to charge a higher price, the expectation is that the higher circulation-larger advertising cycle can be made to work in favour of the smaller newspapers.

How does all this fit in with the Government's present attempt to control the price of newspapers? If a number of the bigger newspapers in the country have raised their prices—as they have—this should, according to the logic of the price-page schedule, have widened the price differential in favour of smaller newspapers, thereby affording them the opportunity for making a bid for higher circulations. But as far as one can gather what appears to have happened is that the smaller newspapers have followed the lead given by the larger ones, preferring the bird in hand (larger circulation revenue from a given level of circulation) to the two in the bush (eventually larger advertising revenue following a rise in circulation). And for all one knows about the price-elasticity of demand for newspapers (and of demand for particular newspapers), they are probably right.

What all this seems to suggest is that the Government needs to acquire a far better understanding of the circumstances of the functioning of the Press than it has today, before it launches on legislation in fulfilment of ambitions, though altogether laudable, objectives—whether these be the encouragement of smaller newspapers or the snapping of the ownership nexus between industry and the Press.

Fragile Work of Art

THE United States which began by appearing to fight off a devaluation of the dollar has ended by fighting for, and securing, a larger devaluation than its international trade competitors in the Group of Ten were initially prepared to concede. The United Kingdom and France, for instance, have, by agreeing to the 7.9 per cent devaluation of the dollar, while leaving their old gold parities unchanged, conceded a competitive advantage to the United States which is definitely larger than what both countries were prepared to countenance even a few weeks ago and which both might soon discover is larger than they can afford. The Belgians and the Dutch have also accepted larger-than-expected appreciation of their currencies (13.5 per cent) in relation to the dollar. The currencies to appreciate the most have been, of course, the yen (17 per cent) and the D-mark (13.5 per cent), though there is a lurking suspicion that this leaves the D-mark still undervalued. In any event, the franc's advantage over the D-mark has been cut from about 12 per cent to 5 per cent. It has been estimated that, in return for abandoning the 10 per cent surcharge on imports and the buy-American tax incentive for investments, the US has on average secured a 9-10 per cent appreciation of the major currencies against the dollar which could lead to a $7 billion improvement in its current balance.

In retrospect, it does appear that the US was wise not to insist on tying up revision of exchange parities with major trade concessions by the European Economic Community. Its immediate expectations of the Community are modest and more substantive trade concessions have been held over to be negotiated later with the expanded Community. The US has also not accepted any commitment on the convertibility of the dollar so that the proposed price of gold of $38 per ounce will remain an accounting price. Instead, the Group of Ten have called for negotiations through the IMF for evolving an international monetary system based on man-made reserve assets instead of on reserve currencies or gold. As an immediate measure of reform, the 'band' of permissible fluctuation of exchange rates has been widened to 2.25 per cent on either side of the fixed rate. The contribution that this is likely to make to the viability of the new exchange rate structure can be, however, exaggerated. Movement of currencies even within the permissible limits is bound to give rise to complaints of 'unfair' attempts to secure trading advantage. All in all, therefore, the West German economics minister, Karl Schiller, was right to describe the new structure of parities as "a fragile building, a fragile work of art".

The Rupee

'Going Stable'!

WHILE the US has bargained to secure as large a devaluation of the dollar and as large a depreciation of its value in relation to the currencies of its major trading partners as possible, the Government of India has gone to great lengths to avoid giving the impression that the rupee was being devalued. Of course, the Government's critics have been as ridiculously sensitive about the devaluation of the rupee. More than one Member of Parliament has taken the Government to task for having devalued the rupee under "political pressure of some Western countries".

This may well have been one instance when there was perhaps no direct political pressure on the Government; nevertheless political considerations appear to have mainly determined the decision to snap the rupee's link with the dollar established in August this year, when the world's major currencies were 'floated'. Yet it would have been ridiculous to go back to the pre-August 15 parity of Rs 18 to the pound since, among other things, this would have resulted in an 8.6 per cent appreciation of the rupee in relation to the dollar; so the fish-nor-fowl solution was decided on of settling for the rate with the pound which had been reached on the eve of the announcement of the new parities for the major currencies by the Group of Ten. This gave us the emotional satisfaction of the rupee actually appreciating by 3 per cent in relation to the dollar while in relation to the other currencies it depreciated by between 4 per cent (in relation to the Italian lira) and almost 12 per cent (in relation to the Japanese yen). And yet, of course, the rupee had not been devalued!

In fact, all this sensitiveness about the devaluation of the rupee was entirely uncalled for. It should have been obvious that what had happened was a realignment of the values of the world's most industrialised capitalist countries. We were under no compulsion whatsoever to immediately react to this development. In the circumstances, the link with the dollar could have been maintained (or, to use the Finance Minister's coy expression, we could have continued to "go stable with" the dollar). As a result, the rupee-dollar rate would have remained at Rs 7.50 and the rupee would have benefited to the full extent of the appreciation of the other major currencies in relation to the dollar. Any immediate problems this gave rise to in respect of individual items of export or import could have been taken care of by changes in export incentives or export-import duties. The Government could then have waited and watched the impact on our balance of payments of the new structure of exchange rates of the currencies of the industrialised countries in the context of developments such as the drying up of US economic aid or UK's entry into the European Common Market. This would have also made it possible for the Government to consider, against the new exchange rates, the pros and cons of a major reform such as the introduction of a dual exchange rate with a more attractive rate to induce, say, larger private remittances and tourist earnings (significant proportions of both of which, one suspects, today flow into the 'unofficial' market for foreign exchange).

Deposits

In Aid of Non-Banking

IN 1966, the Reserve Bank prescribed a ceiling on the 'clean' deposits which non-banking, non-financial companies collect from the public, confining them to 25 per cent of the paid-up capital and reserves of the borrowing company. The measure had three aims: first to limit use of clean loans and so to offer some protection to the depositing public; second, to ensure that the cushion of clean loans did not neutralise the control on commercial bank advances; and, finally, to compel the companies accepting public deposits to report regularly to the Reserve Bank.

These aims were largely defeated because the ceiling on deposits did not cover 'unsecured loans' which companies take from their shareholders and from the public against signatures of

their directors or former managing agents. Consequently, a company wanting to overtrade or facing a margin squeeze could still have recourse to unsecured loans. In fact, according to the latest available data, against deposits of about Rs 275 crores with reporting non-banking, non-financial companies, their unsecured loans from the public were Rs 125 crores.

It was only when certain public and private limited companies recently defaulted on repayment of deposits and loans that the issue was again brought into public view. The Reserve Bank has now imposed a ceiling on unsecured loans of 25 per cent of paid-up capital and reserves, to be effective from January 1. The ceiling applies to unsecured loans from the public and shareholders, but not to loans from directors who may tap loans from the public and shareholders. The ceiling does not embrace firms or HUF businesses which tap public funds. The ceiling is in addition to the 25 per cent prescribed for deposits. In fact, unsecured loans are now to be covered by the term "deposit" and be for a minimum term of a year.

Is the ceiling on unsecured loans a corrective measure? It may be viewed as such since the scope for resorting to unsecured loans from the public is being legally circumscribed. In the process, however, the Reserve Bank is now regularising unsecured loans tapped in excess of the deposit ceiling! In effect, the Reserve Bank is doubling the ceiling on "deposits". Here, account should also be taken of the time the new regulation allows for liquidation of unsecured loans in excess of the ceiling —that is, in excess of the deposit-cum-unsecured loan ceiling of 50 per cent of capital and reserves. The excess has to be worked off in three annual instalments by April 1, 1975.

This general criticism apart, the point to be noted is that the Reserve Bank "regulates" deposits and unsecured loans, but exercises no control over them. The Reserve Bank's concern is confined to prescription of ratios and does not extend to how the funds tapped from the public by companies are used. This is the essential difference between the Reserve Bank's regulation of banking companies and of non-banking, non financial companies. The distinction between the two is not clear to the public. In fact, the public tends to assume that since deposits (and now unsecured loans) are regulated, their funds with companies are as safe as with banks. The Reserve Bank in its wisdom has asked companies soliciting deposits and loans to give out certain information to the public about their financial position. The companies give this information and boldly advertise that they are conforming to the Reserve Bank's regulations—a clear case of hidden persuasion! What is not so widely known to the public is that the Reserve Bank does not really keep a tab on the borrowing companies. Perhaps the Reserve Bank should make a modest investment in publicising this fact as also the fact that its system of information collection yields it company data that are at least three years out of date.

Given the system of data collection, the Reserve Bank cannot with the best of intentions (the phrase is used here loosely) either minimise the risk of the lending public or prevent borrowing companies from using non-banking funds to get around credit control. Indeed, one wonders why the Reserve Bank encumbers itself with such perfunctory regulations. Instead why does it not straightaway refuse to allow companies in the organised sector, which have ready access to commercial bank funds, to tap non-banking funds? After all, the Reserve Bank's purpose is to spread banking—not non-banking.

Leather Exports

Market Diversification

LEATHER and leather manufactures have become important foreign exchange earners for the country. In terms of foreign exchange earned, they rank very close to commodities such as iron and steel, engineering goods, and iron ore. Their demands for import entitlements or cash subsidies are almost negligible. After the 1966 devaluation, like exports of engineering goods, exports of leather goods too rose remarkably.

Exports of leather were worth Rs 95 crores in 1969-70. In 1970-71, however, they declined to Rs 80 crores, on account of the cyclical trend in exports reflecting changing fashions and the tight monetary conditions in Europe. During the last few years, there has been a shift in favour of exports of semi-finished and finished leather goods and away from exports of raw hides and skins. Exports of finished leather and leather manufactures increased from Rs 28 crores in 1967-68 to about Rs 37 crores in 1970-71. The East European countries — particularly, the USSR and Czechoslovakia — which have emerged as prominent markets for Indian leather and leather goods accounting for nearly three-fourths of the total exports, import mainly chrome tanned leather and footwear. The West European markets, too, have recently shown increasing preference for finished leather garments, especially suedes of all types made of cow and goatskin. During the 1960s there was also considerable market diversification. The share of the UK declined from over one-half of total leather exports in 1961-62 to about one-fourth by 1969-70. The USSR, Italy, and France, emerged as important markets, absorbing about two-fifths of the total exports of these goods in the last two years.

The 10 per cent import surcharge by the US, now removed, adversely affected exports of leather and leather goods directed to that country as well as re-exports of our leather from the European countries manufactured there into end-products and then directed to the US market. Exports of leather and leather goods earned foreign exchange worth Rs 45 crores in April-September 1971 as against the target of Rs 100 crores for the whole year 1971-72.

It is too early to say whether this target can yet be reached in the disturbed conditions consequent to the dollar devaluation. The Fourth Plan target for leather and leather goods is Rs 125 crores by 1973-74, but possibilities of pitching it higher, at Rs 160 crores, are also being discussed. The Rs 160 crore target appears rather unrealistic, however, in view of the inadequate infrastructure for producing the desired finished goods in sufficient quantities and of required high qualities. Even the export target of Rs 125 crores by 1973-74 is based on the assumption of a substantial shift in favour of finished leather and fabricated leather products including leather footwear. The industry is still dependent on imported machinery for manufacture of finished leather and leather goods suitable to market preference of the West, so that import licences would have to be adequately and promptly issued for it. Recently measures have been taken, like provision of subsidised air-freight to some categories of leather goods, the demand for which changes swiftly with changing fashion. Even so, steps would be necessary to remove some of the anomalies in the rate structure of air-freight, if this facility is to contribute much towards augmenting exports of some of the varieties of leather goods dependent on rapidly changing fashions in world markets.

CAPITAL VIEW

A Moment of Profound Change

Romesh Thapar

HOW the focus shifts from point to point.... Now, we are in the midst of intense speculation about what goes on in Islamabad. Much will depend on the composition and character of the civilian-cum-military (you cannot really separate them in Pakistan!) group which will begin the process of restoring the shattered structure left behind by a discredited military junta. These developments have a vital bearing on the future of the cease-fire announced by India following the liberation of Bangla Desh.

The Yahyas and the Bhuttos will come and go, and so too will the juntas of various description, but we have at last arrived at a point in the modern history of this subcontinent when a somewhat lasting solution has to be found to the costly confrontation between India and Pakistan. At this moment of decision and change, the cease-fire will become a tenuous thing if the new realities are not accepted by the new rulers of Pakistan. Bangla Desh has come to stay. And Kashmir cannot be treated in the old terms, and on a basis which permits renewed hostilities as and when the Pakistani Army has been re-equipped by Washington or Peking. Briefly, the results of the recent war are seen to provide the possibility for a prolonged peace on this subcontinent—China notwithstanding.

The higher direction of the war, and the steps taken following the collapse of the Pakistani Army in the East, suggest that there is a full understanding of the fact that this is a moment of profound change. To think otherwise would be tragic folly. Fortunately, we are not ruled by Jan Sanghis who have already disassociated from the ceasefire and begun a fevered, underground agitation for the subjugation of West Pakistan. By and large, sanity prevails and makes a mockery of these political adventurers.

It will be difficult to derail thinking in India. Apart from the fact that Indira Gandhi is not easily controverted today—to put it mildly—there are at least these new dimensions to political consciousness which have developed over the last few months:

First, there has been a tremendous impact on the mind of India of the startling fact that a majority of the people of Pakistan opted for friendship and brotherhood with us. A year ago, no one would have believed in this possibility. The scenes of fraternisation in Bangla Desh between the Indian Army and the people are extraordinary. Imagine what this means to the future of this subcontinent, if we nourish the seed that is sown.

Second, it is becoming clear that large opportunities now open to the Muslim masses of India to shed their fears (genuine and otherwise) about their future and to find the opportunity to work actively in the building of a genuinely just, secular and democratic society. The stirring has already begun and is likely to have wide repercussions.

Third, there is at political levels a better realisation of what caused the break-up of East and West Pakistan. In this there are many pertinent lessons for the thinking Indian. We, too, belong to a sensitive federal structure and must learn to respect the inherent rights of our many cultures. The chauvinists, whatever their pretensions, must be located and stamped out by concentrated political and educational activity. When we forget our fundamental commitments and allow emotion to run away with us, as in the matter of language or eating habits, we spark tremendous tensions. Let the story of Bangla Desh be a warning to these potential genocidists.

Indira Gandhi, in the coming months of consolidation for economic tasks and electing the new state assemblies, is likely to build solidly on these new dimensions of political consciousness. No quarter will be given to those who hamstring policy and implementation with vapid euphoria, loud-mouthed chauvinism and the slogans of Right and Left which are rooted in thinking which has little relevance to the realities of present-day India. This is the moment of profound change our many millions have been waiting for in formidable tolerance and patience.

Already mobs of flatterers and fawners are besieging the citadels of power. This is only normal nad natural. We watch to see what fate befalls them. Only when we know the results of these skirmishes will it be possible to point to the trends of the future. As in war, so in peace the higher direction must be broadly above reproach. Then, and only then, will we have emerged into the sunlight.

Dreaming? Yes—and why not! After all, 1972 is upon us, and we are in the twenty-fifth year of our freedom.

December 20

LETTERS TO EDITOR

Domestic Resource Cost

IT is not clear to me whether the 'Reader' who wrote a letter in your issue of December 4 on "Domestic Resource Cost" agrees with the view that the shadow exchange rate provides the acceptable upper limit for domestic resource costs. The rest of us would have benefited a great deal if he had indicated his position and the reasons therefor before posing questions for others to answer. Since I did not raise the questions on shadow exchange rate and on the use of the domestic resource cost criterion for evaluation of capital projects, let me leave the task of clarification on these points to Messrs Dave and Subramanyam in case they feel inclined to do so. I shall only add that the objective of my first article ("Competitiveness of Indian Steel Exports", May 29, 1971) was modest in that I merely applied the concept of domestic resource cost to evaluate the export competitiveness of few steel products. While this evaluation could also have been done using the usual rate of return approach, I suspect that the project analysis required for this purpose would have entailed the use of price, cost and technological data which are more difficult to come by. On the other hand, I feel that the use of the domestic resource cost criterion is simpler and easier to apply although it has its own limitations.

I should comment briefly on the Reader's concern about my failure to acknowledge the earlier economic work on the subject of domestic resource cost. This indeed is a regrettable omission except for the fact that the focus of my earlier article was on the evaluation of certain exports and I brought in the domestic resource cost criterion only as a tool to aid the analysis. Since many variations of this concept exist, and are reasonably well known, I did not think it necessary to take up space to trace the antecedents of the concept and survey the literature on the subject. I might mention that in a short paper I presented on "Measurement of Comparative Advantage" at the Bombay University Seminar on 'Industry in the Fourth Plan' held in March 1971, I had attempted a brief survey of this sort in which appropriate tributes were paid not only to Bruno, but also to Belassa, Gorden and others. I say this only to assure the Reader that I have not claimed in my writings any proprietary interest in this concept. Lesser people might be pardoned if they use terms like "my" or "our" to distinguish between variations of criteria which they might have adapted or applied in specific contexts.

SAMUEL PAUL

Ahmedabad

[With reference to the letter by "A Reader", S A Dave and V V Bhatt point out that the following footnote to Table 1 of their article "Criteria for Evaluation for Capital Projects" (Review of Management, August 1971) had been inadvertently omitted in printing:

"The criterion suggested here is based on an earlier work by Michael Bruno. See his 'The Optimal Selection of Export-Promoting and Import-Substituting Projects' in UN, 'Planning the External Sector: Techniques, Problems and Policies', Report on the First Interregional Seminar on Development Planning, Ankara, Turkey."

The omission is regretted.

Ed.]

Prospero Is Stunned

LIKE the Indian Maoists who want to import revolution into India from China, Farrukh Dhondy wants to import the black revolutionary struggle into Britain following the way the Black Panther party has conducted its struggle in the United States. In one of his pieces ("Prospero Is Stunned" November 13, 1971, pp 2309-11), he gives an example from the Black Panther programme dealing with court trials: "We want all black people when brought to trial to be tried in a court by a jury of their peer group or people from their black communities as defined by the Constitution of the United States." This demand by itself is admirable, but one point which the Black Panthers seem to have forgotten and which Dhondy has also very conveniently overlooked — tried under what system of justice and in whose courts? Under a system of justice, whereby the ruling classes protect their domination through their courts, will black juries make a difference? Black juries can also be bought off.

A closer reading of other points of the Black Panther Party programme further reveals the misconception — equality for blacks but essentially within the same socio-economic framework, i e, the same exploitative, racist system. And this is why, in spite of all their rhetoric (and good organising work), the Black Panthers in the United States are now split down the middle and a spent force. Dhondy's article seems to follow the same rhetoric and slogan-mongering. For instance, "Mangrove Nine", the "man", — words and phrases borrowed from the US Black Panther vocabulary.

While Dhondy has clearly exposed (as if it needs any more exposure) the white racist nature of British society, he wants to fight it by black racism, by viewing everything in terms of black and white and thinking no further. At least the US Panthers did come down heavily, theoretically anyway, on black racism. (Bobby Seale, "Seize the Time — The Story of the Black Panther Party", London, 1970; see the chapter on "Why We Are Not Racists".) But many of the more avowed black racists in Britain in positions of leadership of some black organisations do not belong to the ranks of the poor oppressed black worker, who accounts for roughly 85 per cent of Britain's black population. They are, in fact, owners and operators of small shops, garages, restaurants, etc — part of the bourgeoning black petty bourgeoisie in Britain. While a black bourgeoisie has existed for some time in the United States — Garvey, du Bois, Booker T Washington being their earliest spokesmen — it is just beginning to rise in Britain. This black petty bourgeoisie also feels oppressed and discriminated against because of its skin colour and its tiny economic status, and can shout very loudly against the system; but when it comes to organising and fighting for the real interests of the much worse off majority of fellow blacks (who have the most obnoxious jobs, like stoking furnaces and sweeping streets), the farthest it can go is to opt for social democracy. In such instances, where the basis of the racist nature of Britain society can be exposed by illustrating the clearly racist bias of institutions like the police and the courts, all they can think of is black juries.

In this and another article ("Tory Nationhood Defined", April 24, pp 861-2), Dhondy talks in glowing terms of 10,000 black people marching last March against the latest Immigration Bill. Surely Dhondy has lived long enough in London to know that black people have been marching and signing petitions and memoranda since 1961. This was the year of the first bit of racist legislation in the form of a private bill of a Conservative MP, Cyril Osborne. Ten years later, in spite of innumerable marches, petitions and memoranda, the laws have got progressively more racist. Viewed in this perspective, voluntary repatriation (an unofficial form of which already exists) followed by compulsory repatriation is on the cards. Also, the British police, past masters in subtlety and sophistication, have by now perfected the art of turning a demonstration, even if 10,000 strong, into a ritual to allow the demonstrators to let off steam and ease their conscience. Dhondy deludes himself and others if he thinks a demonstration moving down deserted shopping centres and the West End of London on an empty Sunday afternoon could have stopped the Bill.

Dhondy is very conscious about promoting the solidarity of the black people in Britain with other oppressed peoples all over the world, but a solidarity built from above is not going to serve the purpose he desires. How about first thinking and working towards solidarity with other oppressed people in Britain. Since this requires a far greater amount of hard work it's so much easier to see things in terms of black and white.

Despite Capacity and Markets

Hansavivek

ASSOCIATED CEMENT COMPANIES' production of cement, at 5.42 million tonnes during the year to July last, was almost the same as that in the previous year — despite capacity having been increased from 6.2 million tonnes to 6.68 million tonnes by extending capacities at the Kymore, Chaibasa, Wadi, and Chanda works, which were thus in operation for the whole year. Production might have been 'substantially higher' but for the accumulation of clinker stocks because of transport difficulties for the outward movement of cement and the inward movement of coal. 'Acute' wagon shortage also impeded despatches. Sales were higher. Yet gross profit was lower owing to cost inflation. Dividend distribution was, therefore, once again short-earned. Having completed all major expansion schemes which added some 3 million tonnes of annual capacity, the company is now concentrating on rehabilitating and modernising its factories. Recently, it applied for industrial licences for expansions at Bhupendra and Wadi works and for establishing a new cement plant in Rajasthan.

Good progress has been made in the installation of the cement grinding and packing plant on a turn-key basis for Kuwait Cement, which is expected to be commissioned soon. For the export contract with the State Organisation for Industrial Design and Construction in Iraq, for the supply, erection, and commissioning of a wet process plant with a capacity of 700 tonnes per day, import licence has been received and orders placed abroad for delivery of the necessary units directly at site as well as for import of components for incorporation into machinery to be made in India. A number of other tenders have been submitted for complete cement plants abroad. At the same time, satisfactory progress has been maintained in the execution of indigenous orders. The company has undertaken erection of two bauxite calcining kilns for **Bharat Aluminium**, replacement of the live-ring and shell section of the Krupp kiln at Satna Cement, erection of Lepol grade cement plant with a capacity of 1,000 tonnes per day for Saurashtra Cement, and erection of rotary dryer for Indian Copper.

A 'letter of intent' has been secured from Hindustan Copper for supply of a copper ore crushing, grinding, and beneficiation plant of 1,000 tonnes per day capacity to be installed in Bihar. This is an entirely new field, which holds promise of further business as demand for machinery required for the ore-processing industries is likely to grow in the future. The second unit of the iron ore pelletising plant, supplied to TISCO, is under erection. ACC has received government approval to make rubber machinery in collaboration with a Czech firm and is seeking approval for collaboration with an Edinburgh firm to manufacture paper machinery.

ACC-Vickers-Babcock, in which ACC has 49.8 per cent interest, earned a lower net profit compared to the preceding year owing to labour unrest at Durgapur that forced a lock-out for 70 days. Tata-Robins-Fraser, whose 20 per cent equity capital is owned by the company, has shown better results. At the year-end, TRF had contracts and merchandise orders on hand worth about Rs 10 crores.

The company has withdrawn its application to government for permission to pay a remuneration not exceeding one per cent per annum of the net profits with a limit of Rs two lakhs to be paid to the Directors (other than the managing director and whole-time directors) as the directors say they have decided not to avail of this remuneration. Also, the board has decided to pay commission at 0.01 per cent of the net profits to the managing director and the whole-time directors together subject to a maximum of 50 per cent of their respective salaries, instead of 0.25 per cent per annum as already sanctioned by shareholders. As remuneration in excess of specified limits would now become disallowable by virtue of the amendment to the Income-tax Act by the Finance Act 1971, it is felt that almost the entire commission would be disallowed to the company while conferring only a 'nominal' benefit on the recipients after tax.

KESORAM INDUSTRIES experienced long-drawn-out strikes in its textile and rayon sections. Finding the price structure of grey or unprocessed cloth 'completely uneconomical', installed capacity of the various processing departments is being increased to about 90 per cent of total production. The new processing machines are expected to be commissioned by the middle of next year. With the adoption of the National Water Supply Scheme by the union government, demand for cast iron spun pipes has improved appreciably. The company has also maintained a reasonable level of exports. The management is considering manufacture of ductile pipes, as the world trend is changing in favour of these pipes. The labour situation at the spun pipes and foundries section also deteriorated last March and there was a partial strike, followed by lock-out, for about 6 weeks during the following two months. The refractory plant's working showed some improvement, following satisfactory demand. An agreement has been concluded with the workers' union on the closure of the engineering section whose assets are to be sold out. The cement section performed well, consequent to higher production of clinker and cement and increased despatches of cement. The second unit of the plant has been commissioned after unduly long delays in deliveries of machinery by suppliers. Full production is expected to be achieved soon. The possibility of setting up a cement factory in Rajasthan is being explored. Mining lease has been secured from the state government. An industrial licence and clearance under the MRTP Act is being sought. The working of the registered office at Calcutta remains suspended.

RICHARDSON HINDUSTAN proposes to offer a gift of shares to the shareholders on a five-for-fourteen basis, besides keeping the dividend unchanged at 10 per cent for the seventh year ended June last, following further improvement in results. The whole of the dividend is exempt from tax. To encourage cultivation of mentha arvensis in the Terai region of UP, the company has developed and launched community farming and scientific farming programmes. Demonstrations are given to farmers on proper use of fertilisers, suckers, pesticides and improved tools and implements. Fertilisers, suckers, and technical help, are also offered to those who wish to cultivate mentha arvensis under these programmes. Nearly 3,000 acres have been brought under mentha cultivation, thereby providing employment to 15,000 farmers and labourers during season. Plans are under way to extend this coverage substantially. The company's agricultural research centre at Bilaspur has formulated plans for evolving new disease resistant strains of menthol. The chemical research centre at the Kalwa factory has perfected certain modifications in the process for manufacture of menthol which would result in increasing the yield of menthol from mentha oil by about 5 per cent. The centre has also developed peppermint flavour of international quality from locally grown mentha arvensis which has replaced the imported flavour. The pharmaceutical research centre has evolved a manufacturing process for local manufacture of certain imported ingredients used in the company's products. Export sales rose from less than Rs 3 lakhs to over Rs 8 lakhs during the year.

MYSORE CEMENTS has appointed Bharat Chemical Agency as regional agent for the sale and distribution of cement in Maharashtra on an overall commission of Re 1 per tonne on sales effected by it or through its stockists. The firm consists of three partners who are the wife and two sons of D P Mandelia, a director. The appointment is subject to the consent of IDBI. Moreover, section 33 of the MRTP Act may require registration of the agreement. During its 13th year ended June 1971, Mysore Cements' clinker production increased from 3.68 lakh tonnes to 3.70 lakh tonnes and cement output from 3.65 lakh tonnes to 3.99 lakh tonnes. Cement despatches were up from 3.59 lakh tonnes to 4.07 lakh tonnes. Both sales and profits were also higher. The directors, however, complain that profitability is being adversely affected by further increases in the manufacturing cost, withdrawal of tax credit certificates, and removal of the cement industry from the 'priority' list. The company has applied for permission to set up a new plant with a capacity of 4 lakh tonnes at Itarsi or Damoh. A ropeway is proposed to be installed at a cost of Rs 1.30 crores for transport of limestone, and certain modifications to the plant are to be carried out at a cost of Rs 50 lakhs to raise production by about 50,000 tonnes per annum. Both these schemes are expected to be completed by mid-1973. The company claims that its cement is in good demand in the Middle East countries and that it had signed an agreement with STC in 1970 for export of cement but that STC has not arranged the shipping so far.

GENERAL ELECTRIC COMPANY OF INDIA has received government consent for issue of 35.50 lakh equity shares as bonus shares on a two-for-one basis. The company has also been sanctioned issue of 11.62 equity shares of Rs 10 each at a premium of Rs 6.50 per share. The latter issue is expected to be made soon after the accounts for the year ending March 1972 are ready. A further announcement in this respect will be made by the company.

ANNOUNCEMENT

We announce change of brand name

Spartan

to

Addisons

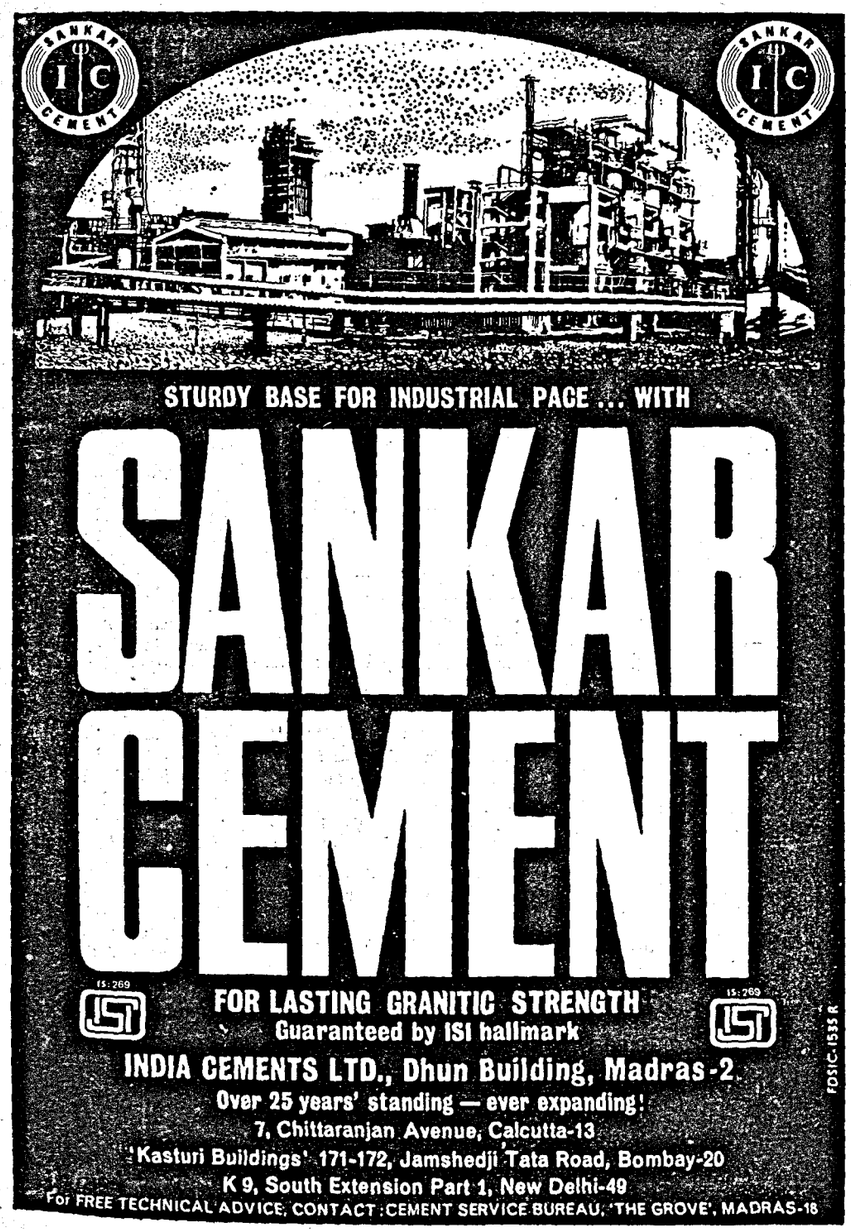
for all our paints and ancillaries known to you for over 20 years. In future, ask for all our products under the brand name ADDISONS. The same excellence and superfine quality of all our products will continue to be maintained as hitherto.

ADDISONS PAINTS & CHEMICALS LTD.
SEMBIAM, MADRAS-11.

Significance of Bangla Desh

Dhananjoy

IT may be too early to assess the full implications of the emergence of Bangla Desh as a sovereign independent republic. Much will depend on the nature of the elite that will determine the policies and programmes of the new state. The task of ensuring political stability, economic development and social change in that war-torn land is going to be enormously difficult to accomplish and it is not impossible that Bangla Desh will have to experiment with a variety of political systems before it finally settles for one that will be meaningful for its impoverished people. Equally formidable would be the problem of defining the international role of Bangla Desh. It is obvious that the birth of Bangla Desh means the death of the South Asia policies of quite a few great powers. The Indo-Pakistani balance could not be sustained by them despite their best efforts; its collapse could appear to them as the beginning of precisely the kind of fluid situation in which they have to pursue their rivalries and competitions with redoubled vigour. The foreign policy of Bangla Desh will have to be conducted with a high degree of skill and efficiency to ensure that it does not become the hotbed of international intrigue. In any event, it is certain that there will be many moments of anxiety about the future of Bangla Desh in the minds of those who wish to see it evolve along their preferred ways.



Yet it would be utterly wrong to permit these and other uncertainties to detract one's attention from the historic significance of this momentous event. In fact, it may be difficult for us who have just lived through this experience to grasp the revolutionary content of what has been achieved at perhaps too insignificant a price. For one thing, Bangla Desh is the product of a successful armed struggle the like of which had not been witnessed by the peoples of this region in their recent history. From the Meerut Mutiny of 1857 to the Calcutta uprising of 1969, the lesson derived was that armed struggles do not succeed. This was further adding to the built-in cultural preferences of our people for political apathy and inaction. By demonstrating that such struggles need not always end in failure, Bangla Desh may have already made a great difference to the political culture of the peoples of this region. There is another sense in which Bangla Desh may well turn out to be a revolutionary phenomenon. By attaching far too great an importance to the inviolability of the integrity of the existing states—however illogical or irrational their structures—, the international community had evolved an ethos which was fundamentally conservative. The emergence of Bangla Desh has dealt a deadly blow to the prevalent international bias in favour of the *status quo*.

Far More Dynamic than Pakistan

Such broad generalisations apart, it is possible to enumerate more specific considerations which should make the emergence of Bangla Desh an event of historic significance. Unless the Bangla Desh revolution is totally betrayed, this new state will find its rightful place among those nations of the world which are struggling to eradicate the various sources of inequity and injustice in the structure of today's international society. Many of the 104 states who virtually voted against the birth of Bangla Desh may soon be pleasantly surprised to have in their midst a vigorous young nation whose international stance is far more dynamic than Pakistan's. Of equal relevance would be the patent reality illustrated by the birth of Bangla Desh that cynically conceived combinations of great powers can do but little to alter the course of history. The period of struggle for Bangla Desh was also the period of a basic realignment of international forces. That at least one segment of the realigned forces wished to prevent the success of the struggle in Bangla Desh is obvious enough. Their defeat symbolises the defeat of the idea that old style power politics, which takes little account of the deep-rooted urges and aspirations of downtrodden peoples, could still be of some relevance.

Potentially the most hopeful of all the implications of the emergence of Bangla Desh is that it might mark the beginning of a new pattern of relations among all the states of this region and all the peoples who inhabit this peninsula. Because we had got used to it, we hardly ever realised the evil consequences of the utterly unproductive relationship between India and Pakistan. Faced with its unresolvable crisis of identity, Pakistan found it impossible to conceive or even agree to the evolution of normal friendly and co-operative relations among peoples who had so much in common with each other. A restructuring of this subcontinent was necessary, if only to liberate the peoples of India, Pakistan and Bangla Desh from their debilitating commitment to the politics of fratricidal conflicts. Bangla Desh has exploded the two-nation theory; in doing so, it has created the conditions for a fundamental rethinking regarding our mutual relations—not only in Bangla Desh and India but also in Pakistan. In fact, no matter what may or may not happen to India and Bangla Desh, the traumatic experience of December 1971 is bound to modernise and radicalise political attitudes in West Pakistan. There is every reason to hope that such developments will pave the ground for the creation of friendly, co-operative and purposeful relationships among the peoples of this region.

Nothing is of greater importance for the future than India's policies and postures towards Bangla Desh. We have helped Bangla Desh to its freedom and heaven knows that there are too many people with the fervour of the half-educated in this country to make one feel reassured that we shall not mess up this task of creating friendly and fraternal relations with the highly sensitive people of this young nation. It is idle to deny that the breakdown of Pakistan makes India the most important and effective power in this area. That is what makes the need for self-restraint and moderation even greater than before. So long as the arrogance of the Indian was the arrogance of the weak it posed no special problems for our relations with our neighbours. The slightest evidence of arrogance in this hour of India's triumph will unite the rest of the world against us. Bangla Desh must be left entirely free to work out its destiny; any Indian suggestion that it may know the problems of Bangla Desh better than the Bengalis can only end up in disaster.

American Concern for Kashmir

(From a Special Correspondent)

THE deliberations of the Security Council are always tinged with a shade of unreality. This is because everyone, including the speakers, know that whatever the pious platitudes uttered or the resolutions passed there, no effective steps are taken by the UN unless there is at least a tacit agreement among the big two over the course of action. Moreover, when it comes to backing the resolutions with military action, this can be done only with the support of at least one of the two major powers.

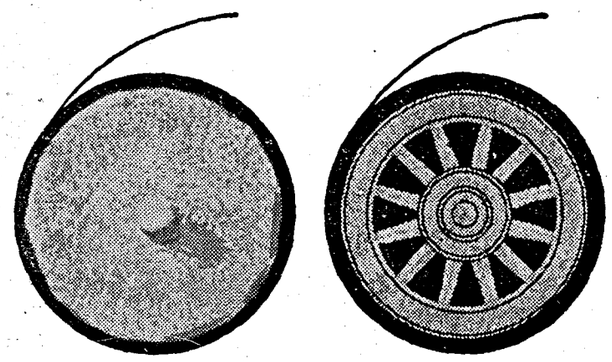
In these circumstances, the debate in the Council on the military conflict in the Indian subcontinent, resumed after the completion of the Indian military objectives in Bangla Desh and the unilateral cease-fire thereafter, had an even greater air of unreality. For one thing, the military operations were already ended, without any role being played by the Security Council in their termination. Secondly, it was clear by then that no supporter of Pakistan, whatever the oratory of its representative in the UN, felt sufficiently strongly to mount a rescue operation in aid of that country. After all, Pakistan did not accept cease-fire happily but was forced to do so by the turn of events. Hence, even though in the resolution finally passed by it the Security Council decided to remain seized of the matter, it is reasonable to suppose that it will not be in a hurry to discuss this problem again.

Significant Resolution

The resolution adopted by the Security Council is, therefore, significant not because it tells what the Council will do next but because it reveals the latest thinking of the various countries regarding the Indo-Pakistani problem. As the deliberations progressed, it became evident that most of the supporters of Pakistan had already written off Bangla Desh as lost to Pakistan. This was suspected by many even earlier and the debate and the subsequent resolution and the fact that it nowhere mentions East Pakistan by name only helped to confirm this view. What the US and its associates seemed to be concerned about was the preservation of the western part of Pakistan, together with the parts of Kashmir it holds, as one entity. This was also borne out by the American officials at the UN and elsewhere, who, in their background briefings to the press, claimed credit (partly by the *Enterprise* showing the flag in the Bay of Bengal) for forcing peace on India and preserving the western part of Pakistan.

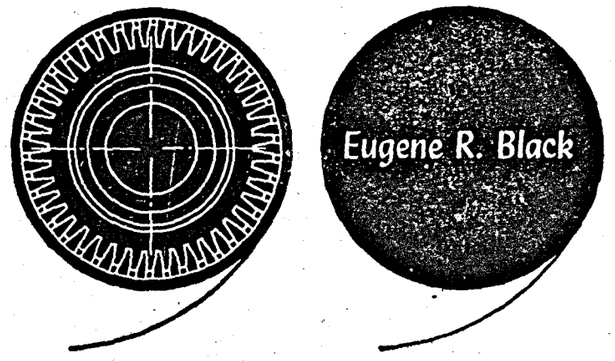
Geopolitically Intolerable

The resolution bears out the American concern for Pak-held Kashmir. It specifically asks both sides to fully respect the cease-fire line in Jammu and Kashmir as agreed upon in 1948. Pakistan has gained only minimally in Jammu in recent hostilities whereas India has made notable gains, particularly in the Kargil sector. Thus it is clear that the force of the resolution is directed against India. Actually, a cease-fire line is just what its name implies and has not the sanctity of an international frontier. So if after a fresh bout of hostilities, it changes somewhat, this should not create any special grievance. But the fact that the UN resolution mentions by name only the changes in the Kashmir cease-fire line is noteworthy. It again confirms the view that in the eyes of US and China, Kashmir as an integral part of India and the consequent physical separation of Pakistan and China on the one hand and the contiguity of India, Afghanistan and the Soviet Union on the other would be geopolitically intolerable. One may expect active hostility of the US, in addition to that of China, if the Kashmir question comes up again for discussion. A major gain from India's point of view was that the resolution does not ask for an immediate withdrawal of forces to their original position but only for a withdrawal as soon as practicable. This again show that the Americans have reconciled themselves to the realities of the situation.



An incident worthy of notice was the speech made in the Security Council by Ceylon, a non-member, by its own request, essentially reversing its earlier vote in the General Assembly cast in opposition of the Indian position. Perhaps it was a genuine change of heart, or the result of the mounting public opinion on the Ceylonese government at home. But it could also be a portent for the future about the course of events on this subcontinent, where India has emerged as the only local power that counts. It is conceivable that hereafter its neighbours would be more careful of India's susceptibilities.

All in all, the discussions and the resolutions in the General Assembly and in the Security Council of the UN showed once again that the best way to succeed diplomatically is to succeed militarily first. Our diplomats had comparatively an easy time because the armed forces completed their task in good time. By offering to cease fire unilaterally in the west also, the Indian government not only kept the initiative in its own hands but also won the support of many countries who would rather avoid facing an issue as long as there are no actual hostilities.



This, however, is not likely to make India any more popular with the US. A big power can hardly consider itself big if it can have no direct hand not only in making war but also in making peace in a part of the globe. More seriously, the US government must have realised that by stopping all aid and by parading the gunboats along the Indian coast, it had used its last card against India short of actual physical intervention. On the other hand, India still holds a few aces in its hand, notably the threat to freeze American assets in India.

The Dulles of the Seventies?

Just as one of the reasons at least why Anthony Eden launched his Suez misadventure was his looking upon himself as a latter-day Churchill, similarly it is conceivable that Nixon looks upon himself as a Dulles of the seventies. After all, in the fifties when Nixon was the vice-president, by bluster and worse, the US government did succeed in getting its way in Guatemala and Iran, to name only two cases. Moreover, it has to be conceded that India's past record was such that an American president could reasonably believe that the bluster and the threats would work. If the inside stories (since made public) are to be believed, the Indian government was wavering till the very last moment at the time of liberation of Goa. With such past history, the high degree of sophistication in diplomacy and the firmness exhibited this time by the Indian government (quite apart from the military prowess) is worthy of respect, though of course the strong and consistent support of the Soviet Union was a major contributory factor.

Development is proceeding in spite of the cultural attitudes, social institutions and political conflicts which sometimes seem to be such immovable barriers. It is not a smooth, uninterrupted progression, to be sure; rather, growth appears more as a series of fits and starts. "And yet," as Galileo is supposed to have said, "it moves!"

Reactions to the War

Harish Chandola

SINCE the beginning of this month, over two million people of Indian origin in Malaysia and Singapore have been spending a good deal of their time sitting hunched over their radio sets, listening eagerly to every scrap of news from the India-Pakistan war front. Their conversation centres on the war and they openly express their joy and satisfaction over the tidings of Indian victories in the eastern sector. They feel proud that India is able to wage a successful war and their chauvinism while backing a country they have long ago forsaken knows no bounds.

The attitude of about nine million Chinese in Malaysia, Indonesia and Singapore is generally sympathetic to India. But this has been a negative kind of sympathy, born out of the Chinese dislike for the Muslims, who besides being the 'original' people of this region, also constitute its majority. The Chinese find themselves overwhelmed by the Muslims, a situation they dislike, but have to accept.

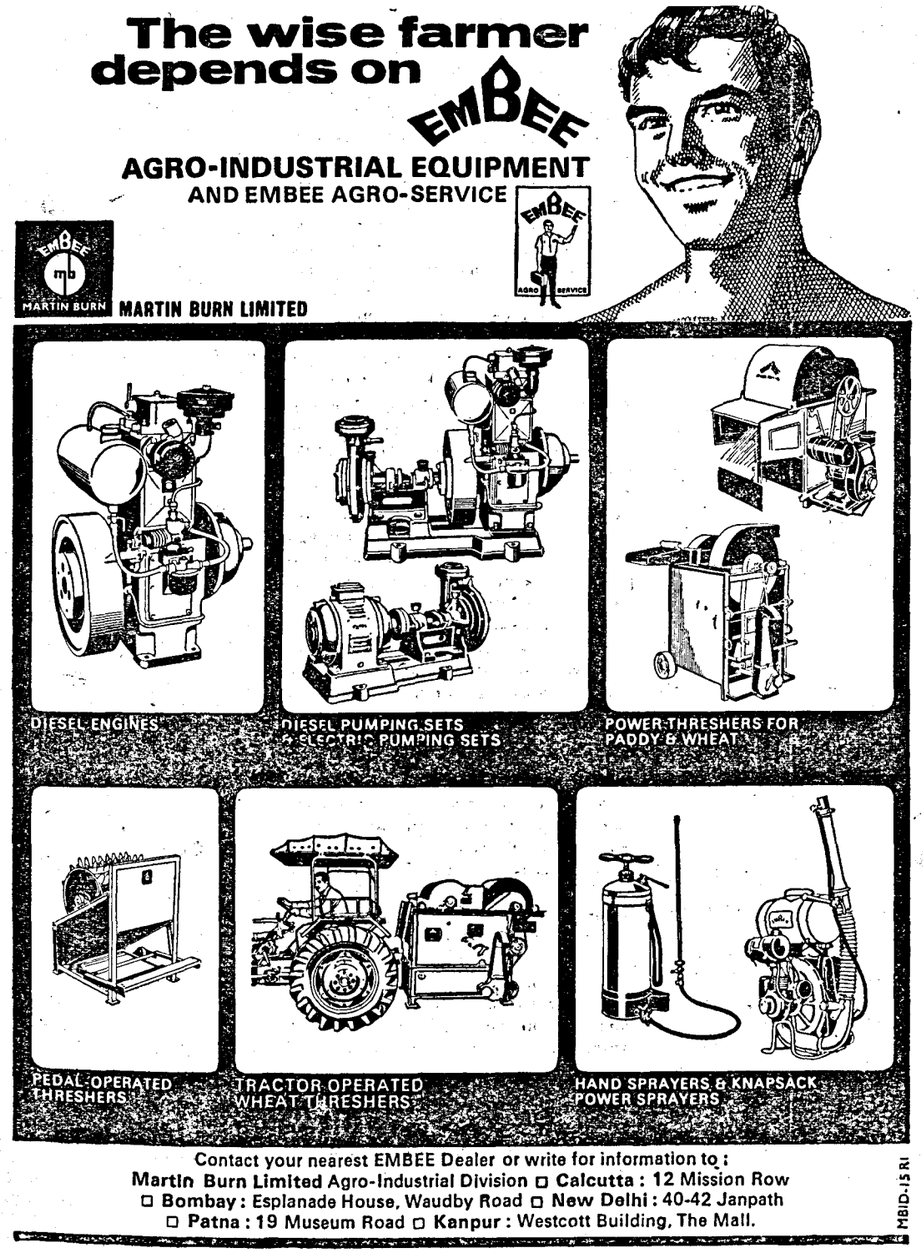
Of late, however, the Chinese newspapers in this region have been playing up Russian support to India. The result is that the Chinese are slowly coming to believe that the war is the result of Soviet incitement. If one asked a Singapore Chinese taxi driver what he thought about the war, he would probably say that the Soviet Union was behind it. The Muslim population of this region is of course greatly worried about the result of this war. They wonder whether Pakistan will lose its status of an Islamic state.

More important than the reaction of the population, is the attitude of the governments of this region towards the conflict. Except the Singapore Government, all the others have appealed for an immediate cease-fire, and two of them — Indonesia and the Philippines — have offered their good offices to bring the fighting to an end. The Singapore Government has officially said nothing, but its abstention from the UN General Assembly cease-fire resolution of December 8 is definitely an indication of its sympathy for India. Privately, both in Delhi last month and here earlier, the Singapore Prime Minister, Lee Kuan Yew, had made no secret of his support for India on Bangla Desh and also on its other problems with Pakistan.

The Military Government of Thailand has banned all comments on the India-Pakistan fighting in its newspapers. It has stated that both countries were its friends and it would not want to offend either. Thailand's biggest English-language daily, *Bangkok Post*, has however carried comments which were favourable to India, from other newspapers like *The Guardian* of London. The Indonesian Government, too, wants its newspapers to refrain from commenting on the Bangla Desh struggle or the India-Pakistan fighting. Jakarta newspapers have, however, printed guarded comments expressing their anxiety about the future of Pakistan. Because Malaysia and Indonesia have not come out on the side of India in the present crisis, one cannot say that they have adopted an anti-Indian attitude. They are still sympathetic to India. In spite of their overwhelming Muslim populations they have not taken a pro-Pakistan position.

Both these countries have to contend with rabid Islamic political parties. The religious leadership, consisting of teachers and preachers of Islam, and the Islamic political parties find it difficult to accept the possibility of the disintegration of Pakistan as an Islamic State. They are fully aware that without the religious sentiments of its population, Pakistan would lose its present basis of existence. This prospect of Pakistan not remaining a staunch Islamic state frightens the politico-religious leaders in Malaysia and Indonesia. These leaders would like their governments to come out in favour of Pakistan. But the Malaysian and Indonesian governments have withstood these internal pressures.

Surprised by Indian Resolve



There is no doubt that the South-East Asian countries have been surprised by the determination India has shown in militarily helping the people of Bangla Desh to establish a country of their own. They are still more surprised to find India not reacting to the UN General Assembly resolution for a cease-fire and withdrawal of forces. They believe that this is a marked departure from the usual Indian pattern of behaviour. There is, however, great concern over the possibility of the conflict becoming a long drawn out affair or of other powers getting involved in it. This would create a serious situation in the area, they think, and might even drag some of them into the conflict directly or indirectly. This, they believe, would be a tragedy because only last month the five (Indonesia, Malaysia, the Philippines, Singapore and Thailand) who form the Association of South-East Asian Nations (ASEAN) had declared this area a region of peace, freedom and neutrality at their Foreign Ministers meeting at Kuala Lumpur. They were considering seeking guarantees of non-interference from the super powers in the internal affairs of the region when the India-Pakistan fighting broke out. This conflict has been a setback to their plans for creating a neutralised South-East Asia.

All of them believe that one of the super powers — the Soviet Union — now fully backs India. One Thai newspaper, in spite of its neutral position on the fighting, has called on the Soviet Union to "disengage itself from its conflict and leave the area alone". Indonesia resents the Soviet military presence in the area and its leaders have made several statements in the past against the growing naval strength of the Soviet Union in the Indian Ocean. These countries believe that if the fighting continues, the Soviet naval presence in the Indian Ocean is bound to increase, thus jeopardising the chances of neutralising South-East Asia. Therefore the leaders of these countries are all the more keen to seek a cease-fire and get the conflict stopped. It would not be correct to consider this attitude as anti-Indian. It would be more accurate to call this an attitude of concern.

In contrast, the US attitude of holding India responsible for starting the fighting is reflected in the publicity material widely circulated by the US Information Service in this region. For instance, the USIS has been circulating only those US newspapers editorials which criticise India and predict dire consequences for it. The USIS also gave prominence to the speeches of the US Ambassador to the UN, George Bush, in which he accused India of being the first to send troops "across the border of East Pakistan". US commentaries favourable to India have not been included in the USIS handouts.

(More despatches follow the Review of Agriculture.)

[This was written before the cease-fire.]

Nationalism and Marxism

Vinayak Purohit

THAT the demand for the dissolution of Vishal Pakistan was not a neo-imperialist urge of the puny compradors of India, that American imperialism had recently taken too many body blows from Vietnam to pursue successfully its out-of-date policy of preserving the *status quo* in South Asia, that the Soviet Union had coolly calculated upon the non-viability of the old Pakistan and had no hesitation in utilising an opportunity for exposing the Sino-American collusion to its own advantage, that in the conditions of nuclear stalemate it was possible for the biggest post-War liberation movement to succeed in Bangla Desh, that with its 55 crores India was in a position to throw its weight decisively into the scales whether it was a permanent member of the Security Council or not, these and other aspects of contemporary reality were lost sight of by some elements of the Indian Marxist movement.

Historically Conditioned

Now, like all errors committed by thinking beings the errors of Indian Marxists are historically conditioned and their lack of sympathy for nationalist feeling is the root cause of their short-sightedness. Though Marx had written a good deal about India in the *New York Herald Tribune* and elsewhere, the direct impact of his writings on India during the late nineteenth century and early twentieth was minimal. It was the indirect impact promoted by the Communist International that finally overtook India. This happened in the twenties. Thus the version of Marxism that reached India was *ab initio* Stalinist, a version that centred upon "the theory of socialism in one country", upon preservation of the nationalist interests of the Soviet Union underneath a specious plea of international solidarity and requiring the sacrifice of national interests by non-Russians. The next two high tides of Indian nationalism coincided with the ultra-left and people's war periods, respectively, of the early thirties and forties. During the ultra-left period of 1928 to 1933, all the non-communist progressives, including socialists and anti-imperialists, became "social-fascists" and during the 1942 movement, Comrade P C Joshi was, according to ex-Comrade Batliwala, hand-in-glove with Home Secretary Maxwell. It was also during the forties that the CPI welcomed, and agitated in favour of, the Pakistan of yesterday. (Parenthetically, we may even note that the term "social imperialism" is derived from ultra-left Stalinism — the source of much of Mao's thought.)

Two other feebler Marxist currents lapped the shores of India during the middle thirties and forties. The earlier assumed the shape of the Congress Socialist Party in 1934 and the latter resulted in the formation of the Bolshevik-Leninist Party of India, Burma and Ceylon in 1940. The Trotskyist stimulus was largely imported from Ceylon and was not to strike deep roots in our native soil. The Socialists started well. So well that their 1934 Draft Programme would today horrify Limaye-Raj Narain and Co by its extremist stance. It must also be conceded that the Socialist appreciation of the Indo-Pak problem, particularly the position taken by Lohia, was far more sensitive than that accepted by any other Indian Marxist trend. Nevertheless, the Socialists soon enough fell prey to conflicting pulls exercised by Stalinism and Reformism.

Bogus Cosmopolitanism

The Stalinist and Reformist seeds did not fall upon entirely infertile soil. Already within the Indian intelligentsia there flourished a bogus cosmopolitanism which masqueraded as large-hearted big-minded thought systems. "India's destiny to synthesise the scientific culture of the West with the spiritual culture of the East", "India's role as the bridge between the West and the East", and such other variants were in the air. Just as Marx saw in the rise of German philosophy the failure of the German bourgeoisie to conquer the spheres of economics and politics, so that the conquest of heaven became a substitute for the helplessness on earth, similarly the Indian compradors rationalised their acceptance of and desire for British collaboration in the joint exploitation of India by advocating Indian aptitude for assimilation of diversity, by disguising pro-British feelings with internationalist small-talk, by characterising as fissiparious every tendency that disrupted the partnership of international finance capital with local banias and dubashes. Of course the precise terms of collaboration were negotiable. There were two principal alternatives that were explored. The first we may briefly term as the 'Babu Culture Syndrome' which found its home in the eastern and northern parts of the country, in the area largely covered by the Permanent Settlement land tenure system. Here the Stalinist overlay covered a pseudo-internationalism sported by the rootless scions of landlord families, anglicised offsprings employed by managing agency houses and sophisticated members of 'the steel frame'. The second we may term the 'Bania Culture Syndrome' located in the western and southern parts of the country, where the ryotwari land tenure prevailed. By and large the victims of this Bania complex were the Socialists who elevated Gandhi's non-violence and decentralised democracy into absolutes and who deluded themselves by exaggerating the partial struggles launched by the Congress into matters of life and death ("Do or Die" was quite a popular slogan with them some years ago!). It is possible that up to a point the Banias were more militant than the Babus, because the traders and industrialists of Bombay had pitched their demands a little higher. But the Bombay Socialists were as mistaken in treating the Congress as a truly nationalist organisation as the Bengali communists were in treating the Third International as the representative of the world proletariat. For the world had changed.

Prevailed against Overwhelming Odds

After the eighteenth century it became increasingly difficult for the bourgeoisie to carry out bourgeois-democratic tasks. And in the twentieth century, the proletariat, supported by the poor peasant, appeared as the carrier of historical compulsions. Socialist and bourgeois-democratic tasks were henceforth telescoped and national liberation struggles had to be waged more and more often by armed Marxists. In fact wherever the Marxists did succeed in combining nationalist and communist platforms they prevailed against overwhelming odds. Every successful revolution of this century revealed this pattern and there was not one case where this pattern was contradicted. The gains of the Great October Revolution would have been lost, equally in 1917-21 as in 1941-45, had the Bolsheviks failed to galvanise the masses on the basis of passionate

nationalism. The performance of the Maoists against the Japanese certainly showed up the hollow gestures of the Kuomintang and induced the people to shift allegiance to them. Vietnam could not have fought so long without patriotic fervour. Cuba did find anti-Americanism to be a very useful tool in its struggle for survival. Yugoslavia could not have remained a unified nation had it not addressed an anti-Russian nationalist appeal to its constituents.

Capitalism's Weakest Links

Unfortunately, though rather inevitably, the capitalist system had been breaking up at its weakest links, in backward Russia, Asia, Latin America and Africa. The planned economies that emerged in an unbroken series — Russia, Eastern Europe, North Korea, Mongolia, China, North Vietnam, Cuba, Tanzania — were beset with such acute problems of peace, primitive accumulation, industrialisation and foreign trade that they were the least capable of practising true international fraternalism. Thus we are faced with a complex dialectical situation. The march of the socialist revolution creates conditions in which workers and poor peasants come to lead national liberation movements. These whilst performing socialist tasks within their own national boundaries at the same time seek to retard liberation movements elsewhere. On the other hand, the exhaustion of the capitalist system creates conditions in which make-shift 'Latin-Americanised' regimes emerge, which at greater or lesser speed move on to socialist tasks.

The weakness of the Indian Marxist movement has been that it has not yet shed its colonial cosmopolitanism, not yet discarded its legacy of Stalinism, and not yet discovered the gearing mechanism whereby nationalist energy can be used for major social engineering purposes. Timorousness in the face of nationalist challenge has been its bugbear. It the Marxists retain their faint-hearted attitude in the new conditions confronting them at the end of the latest Indo-Pak war, they will surely go under, at least for quite a while.

It is obvious that if the royalist Government-in-exile led by Prince Sihanouk can be a progressive force, Mujibur Rahman's petty-bourgeois party could be treated as still more progressive, if not as almost revolutionary! It is certain that the Chinese masses did not make tremendous sacrifices to place in power a clique which condones genocide in Bangla Desh, encourages Bandaranaike to murder young Guevarists in Ceylon and aids the assassins of innocent trade-unionist, in Sudan. Further, it is possible for India to have correct diplomatic relations with Peking without participating in a sell-out of Vietnam and Laos that the Chinese nearly succeeded in achieving in Geneva in 1954 and 1962. In short, from a purely nationalist Marxist angle, friendly feelings towards the Chinese people are compatible with disapproval of some of the policies of the Chinese government.

Similarly, without losing sight of the long series of betrayals of revolutionary movements by the government of the Soviet Union (including the Chinese Revolution of 1925-7, the Spanish Revolution of 1935-7, of the Greek Revolution of 1945-7, and the Czech Liberation Movement of 1968). Marxists could welcome Soviet help in reconstructing Bangla Desh. If they would only think out problems to the end, it might become apparent that the most sanguine amongst the "social-imperialists" was hardly likely to aim at 'colonising' the vast Indian subcontinent. It may be that in a most treacherous manner the Russians failed to deliver nuclear knowhow to the Chinese after promising to do so in the late fifties. It may be that they have signed "unequal treaties" with China sanctifying territorial acquisitions. Indian Marxists can have precious little interest in such quarrels since they are in no position to redraw the map of the world, at least for the time being. And by the time that they could make helpful suggestions about the alignment of frontiers beyond the Great Wall, the world would surely have changed beyond recognition.

Self-Defeating Tactic

The Leninist tactic (it was only a tactic, let us emphasise) of "revolutionary defeatism", of placing the task of defeating the bourgeoisie at home at the top of the programme, was apposite in the imperialist Europe of 1914. It was even more appropriate for the Russia of 1917 which was an empire harbouring a score of oppressed nationalities. But to apply this tactic mechanically in the semicolonial India of 1971 would be self-defeating. The discomfiture of the home bourgeoisie is an element of importance in any Marxist programme. (Nay more! Some may even desire chaos in order to expedite the birth of the Nietzschean "dancing star", in the language of Ram Manohar Lohia.) However within the reality that is India the problem of poverty is as intractable as the problem of genuine national freedom. To liberate the country from the grip of foreign capital, to determine politically our terms of trade, to escape from the controls imposed by the World Bank, and the International Monetary Fund are tasks that are as incapable of being resolved in the existing set-up as the task of freeing the masses from the burden of grinding poverty. To achieve genuine independence, India will have to go socialist.

That there is some danger in uncritical nationalism is not denied. For instance, Madhu Limaye, who is these days very fond of lecturing to gatherings of Rotarians and Lions, has said that "even at the risk of concentration of wealth, the Government should permit big industries to exceed their licensed capacity at this juncture." (*Times of India*, December 16, 1971.) But any Marxist tyro could guard himself against such shameless reformism — for war means planning and planning demands more nationalisations and expropriations, and effective planning certainly does not permit "concentration of wealth". In any case, Limaye does not belong to the category of committed Marxists.

Given the background of the Babu and Bania syndromes, the dangers of allowing Chinese and Russian chauvinism to play a role in the internal politics of India is greater than comprehended by simple-minded reformist nationalism. The CPI and CPM hardly lag behind the Socialists in propagating parliamentary illusions. Reformists and Stalinists, even the best of Stalinists who are known as Maoists, have often in the past joined forces and will do so again. (We cannot digress here to examine the possibilities of the Italo-Chilean path of evolution. The writer pleads guilty to the charge of having visualised in 1967 such a possibility in India. In the context of our absurd level of per capita income, such a course, it now appears to me, to be excluded.)

Danger of Reformist-Stalinist Alliance

The danger is greater because the recent Indo-Pak war has firmed up certain trends that were taking shape. The Sino-American rapprochement has been wide-ranging. Gittings has reported from Peking, through *The Guardian* (London), that according to the Chinese the principal contradiction in the world today is that between Russian social-imperialism and the revolutionary movements of the third world. This new contradiction has replaced the earlier one between US imperialism and the awakening peoples of three continents who swayed world politics in the fifties and the sixties. If this is so, and if Japan is induced to join the Sino-American game, then the progressive role of China in South-East Asia has ended.

At the other end of the super power triangle, Russia has hardly two more years in which it might seriously endeavour to keep her two major adversaries off-balance. By 1975, Russia would have made a far-reaching deal with a resurgent West Europe and thereafter would neither be willing to, nor allowed to, make independent forays into Africa and the Middle East, if not generally in the developing world. Thus, since Pakistan is now a Middle Eastern state, the Russo-Afghan drive to free Pakhtoonistan must be got under way within the next two years. The problem may be taken as urgent for other reasons as well. The new Pakistan of Bhutto will be seeking revenge and will be unstable. If the Libyan and Egyptian parallels hold good, the pleasure-loving volatile Bhutto already compromised by association with the Bangla Desh debacle is going to prove unsatisfactory. A more puritanical and fanatical colonel will surely be found sooner or later. At the same time the US and China will be seeking ways and means of rehabilitating their lost prestige in this part of the world. The best defence being offence, a free Pathanland is the need of the hour for Soviet foreign policy. At worst the terrain from Gilgit through Peshawar to Quetta offers excellent prospects for tying down American and Chinese forces in an endless guerilla war, provided, of course, puffed up India keeps out of this superpower imbroglio. Otherwise India would bleed to death on the Khyber Pass much sooner than the others. Whether the Pushto-speaking tribals of the region really desire such independence and whether they have also been exploited as ruthlessly as the Bengalis during the last quarter century, are questions which need investigation. Let us hope that Indian Marxists will interest themselves in these problems dispassionately.

Nothing save the debris of the colonial and Stalinist past should make the Indian Marxist feel despondent. After the euphoria of the moment has evaporated it is more than likely that a confident self-reliant populace will aspire higher and make impossible demands upon the Indira government. "The 'revolutionary urge' increases either when a steady rise in the standard of living is sharply checked and turned into a painful and obvious decline; or when a gradual rise in the standard of living comes after a period of great discomfort. In the latter case the working man has recent memories of suffering and a small increase in comfort and leisure gives him energy and strength to express his resentment" (Raymond Postgage, "How to Make a Revolution", p 43). In this perceptive statement, we might substitute "nationalist pride" for "standard of living" for, as we all know, man does not live by bread alone.

LONDON

Ripple and Wave but Not the Tidal Current

Farrukh Dhondy

ON the front page of the Sunday newspapers a few weeks ago, a photograph appeared of six white beauties, entrants from various countries in this year's Miss World contest held in London. The caption under the picture told you that the second from the left — light-skinned, straight-haired and fashion-nosed — was supposed to be Miss Jamaica. She wasn't black; yes, she was beautiful, and unlike Naipaul, she wasn't a winner.

V S Naipaul is to the literary tradition of English, what Miss Jamaica is to the world of beauty contests. Given the standards set, his proportions are impeccable, his gifts evident. We have them again in his latest book*, the fresh eyes and aquiline nose of well-formed prose down which he looks, this time at several creatures he's captured and set loose on alien, confusing continents.

The book is a sequence of three stories sandwiched between two slices of a personal diary. The journal prologue takes Naipaul from Greece to Alexandria on a sort of ship of fools, the epilogue gives him a few days in tourist Egypt. The first story brings a domestic servant from Bombay to Washington, the second transplants two brothers from the Caribbean to London and the title story follows Bobby and Linda, two English people, on an itinerary of argument and cultural paranoia in a trouble-torn republic of Africa. The characters are defined for the most part in negatives, by the gentle crises of their lives revealed in semi self-consciousness, by their lacks and by their losses. Only in the diary does the controlling consciousness surface, aware of and attendant to the ripple and wave of several cultures, uninterested in the tidal currents that underlie them.

The journal fragments give the reader the sort of experience from which the stories grew, and leave me with the feeling that somehow the writer cannot stand the pressure of his own critical heart beat, that had he been able to expand these fragments into a thesis, we would have had another area of shade if not of darkness. The fragments would have been collated into yet another indictment of a continent under western eyes.

As it is, the book takes the safer way out. It works within the limits Naipaul has set himself as a novelist, in a territory of pathos with political judgments secreted in the spleen of the writer's manner. The dust jacket claims that the book is a political-moral statement. Well... yes. In the way that Evelyn Waugh's novels about Africa are political, but lacking that security of standpoint which makes Waugh's characters symbols of political energies he disapproves of. Naipaul's opening is reminiscent of Waugh : "In this country in Africa there was a president and there was also a king. They belonged to different tribes. The enmity of the tribes was old, and with independence their anxieties about one another became acute. The king and the president intrigued with the local representatives of white governments. The white men who were appealed to liked the king personally. But the president was stronger; ..." For Naipaul, this political fairy tale suffices for a context within which to tell the story of Bobby, a gay boy from Oxford who works for the president, and Linda, the wife of a hack London broadcaster who

* "In a Free State", Andre Deutsch, London, 1971; £ 1.75.

becomes something big in republican radio. Bobby gives Linda a long lift home to the security of the expatriate 'compound' on the day that the king, secessionist, makes a break for it from the potbellied soldiers of the president. Bobby's consciousness as he drives picks out this and that, man and mud, strains away from the racist jokes, cliches, generalities, banalities which make up Linda's life and the life of the compound. The strain gives him being. Through Linda's contradictory texture of memsahibness, Naipaul causes the basic humanness to settle. As they drive the kaleidoscope of the fairy tale is replaced by the traveller's flistamatic and we get snapshots of a road-crash, military lorries, soldiers with rifles, smiles, frowns, an American 'adviser' directing traffic past the wreckage. We realise, with the characters, that the president's army have found the king. The whole scene takes with precision the fragmentariness of the political event. And yet, the political framework of the fairy story remains. All Naipaul's implicit pronouncements arise out of its structure and neither Bobby and Linda nor the narrator can avoid them.

When he writes about the Caribbean again, in 'Tell Me Who To Kill, the second story of the sequence, he deepens the insights of "Miguel Street". The Caribbean writer looks again with sharp eyes into the mechanics of soul of a black family, its humble status, its simple social tragedy. Two brothers come to London from the islands, one studies and the other supports him. For the first time Naipaul is looking not at the emigre but at the immigrant, uneasy, unfamiliar and locked within himself. Almost imperceptibly, convincingly, Naipaul brings to life a ghost of hatred in the elder brother. "Tell me who to kill" he asks? But the writer gives him no help. He doesn't want to tell him. May be he doesn't know.

Who does know? Will they tell the mystified reader of Naipaul? And why proceed with these absurd questions while reviewing a book? For the reason that we go to Naipaul with a certain expectancy each time. We, the expatriates he's talking about, do and must. Whether Naipaul likes it or not we are his essential audience. We read him as the American in exile reads Henry James. We read him because if he is dealing with us relevantly, we have sometimes asked ourselves whom we must kill. From Franz Fanon or Aime Cesaire or George Lamming, one comes away with the feeling that they know, the feeling that the secret will be passed on and one day their sons will shout it. Not because they are rhetoricians in a cause, not even because, as developments of a continental tradition, they are engage. Something much more fundamental than that. Through the works of Fanon ond Cesaire and Lamming, one sees the essential antagonisms that have shaped the souls of the people they are talking about. Supreme moral-political vision (to use the words of the blurb). If we demand that ultimate sympathy of sight from a novelist for the people he is talking about, if we demand insights into the social crucibles of their being, it is to these writers we must go rather than to Naipaul.

It is Naipaul himself, through all his work as novelist, journalist, historian, who demands this comparison. By taking the Bombay domestic servant of his first story, "One Out Of Many", to America and studying his bewilderments, Naipaul has set up a comic conversation between cultures. Santosh, cook, bearer, pavement sleeper, ganja smoker, is transplanted in his master's diplomatic baggage to Washington. After some trouble with the toilet in the plane (one of Naipaul's recurrent focuses of cultural comparison) Santosh lands in what he feels is a city overful of *hubshis*. He adventures through a misunderstanding of a black girl's affection for the smell of weed that haunts his body, through a guilty sexual encounter with the black sister who cleans his master's flat, through a misevaluation of a group of Lord Krishna's valets who freak out in the public squares of the city, through a black riot, the city burning, through a job as a cook in an Indian restaurant and finally to alienated rest in the home of the *hubshi* woman he marries for a passport. No doubt Santosh is supposed to be symptomatic and not representative. But symptomatic of what? Does anything here or elsewhere in Naipaul tell us anything valid about the alienations he recreates? Like all Naipaul's characters, Santosh comes alive not in the charm of sympathy, but in the spell of a sneer.

This is perhaps because Naipaul's characters are all emergents from a transient planetary age of mimic men. If we understand his characters better than he does, as I feel I understand Santosh and the other benighted of an Area Of Darkness, it is because the world has caught up with mimic men and is steadily decreasing their significance and the significance of looking at people through this assumption. Its moment of importance has gone. We demand of an artist, especially a writer, that he have his finger on the pulse of the essential creation of his time, more so today than ever before. The sustenance that Naipaul drew from the English literary tradition is now inadequate and starves his vision. His inclusion of characters from a Chinese circus visiting Egypt in the epilogue, is tantamount to an admission that he has no way of dealing with the creatures of this new creation. Naipaul is a writer struggling to keep pace with the changing myths of his times. He has the keen eye of the lame boy left out of the ball game: "Then all the Chinese rose and chattering, laughing softly, shuffled out of the echoing hut with their relaxed, slightly splayed gait. They didn't look at me; they appeared scarcely to notice the hut. They were as cool and well-dressed in the desert, the men in suits, the girls in slacks, as they had been in the rain of Milan. So self-contained, so handsome and healthy, so silently content with one another: it was hard to think of them as sightseers."

On this last page of the book he has come up against the inadequacy of the tradition he has espoused. How to ask a man to desert the mistress he has been married to? How to prescribe for him, without encouraging intellectual bigamy, the other waiting in the wings for a long time, and tell him that she must be the mistress of his house before it is put in order?

Nireekshak

JUDGED by the resentment, bordering not unoften on revulsion, that has been expressed by newspapers against the American stand on the war in the subcontinent, the greatest casualty of the war—besides Pakistan itself, of course—has been the American 'image' in the Indian editorial mind. The disenchantment with American 'democracy' has been complete, and when a lone voice was raised in its defence the owner of the voice, D F Karaka of *Current*, immediately attracted the provisions of the Internal Security Act. Karaka's offence, obviously, was not that he expressed his belief in the virtues of American democracy and 'aid' as that he doubted some of the values of the Indian way of life. This might conceivably have passed muster in normal times but could not, as he found to his cost, in times of emergency. Karaka is probably the only journalist whose freedom of expression has been curtailed by physical detention during this war.

The Press Council did put out an announcement advising editors and correspondents to exercise 'restraint and moderation' in their writings so as to avoid publication of 'prejudicial information' that may strengthen the enemy's resolve or provide him material for demoralising propaganda. However, the announcement came on the same day as the headlines proclaimed the surrender of the Pakistani forces in Bangla Desh and the offer of a cease-fire in the west by Indira Gandhi. It was too late a reminder for the editor of *Current* if he needed one and, as the war ended the next day, apparently useless also for the others. In any case, this damp squib of the Press Council was not the most interesting fall-out of the war. That distinction, as Lyceus of *Bharat Jyoti* hinted, should probably go to the statements of the Indo-American Chamber of Commerce criticising Nixon's attitude to India.

Anyhow, whether or not the "shrinking of Pakistan ... represents in a very real sense the shrinking of American influence in South Asia", as *Fress Press Journal* asserted in an editorial summing up the 'consequences' of war, there is little doubt that Indo-American relations have taken a steep plunge. "No rhetoric of President Nixon's hired intellectuals", *Free Press* snorted, can hide the reality of the American loss. "And in this context the feverish movements of the US Seventh Fleet in the Indian Ocean project only the image of an America whistling in the dark." As for Indo-American relations, "it is just as well that the Nixon Administration has bared its teeth against India in a manner that leaves no room for ambiguity, for behind the smile of yesteryears the reality was no different", it said.

Ammunition from the UN

It was the UN debates on the war situation, both in the Security Council and in the General Assembly, that provided ammunition for most comments on American policy. The General Assembly resolution was "a vast irrelevance", said *Hindustan Times*, adding: "It is totally unrealistic, completely outdated, incomplete, and biased". A few days later (December 15) the Delhi daily was even more forthright in expressing its annoyance. "Look, look! another ostrich", it commented. "Mr George Bush did not mask what is increasingly revealed as the United States' undisguised partisanship on a complex issue the merits of which it is determined to ignore." The US attitude is "shocking, surprising and sickening" exclaimed *National Herald*. "Mr Nixon and his administration have been so coarsened by the brutal war they have been waging in Vietnam ... that they have become so dead to human rights (and) recognise nobody's right to freedom except their own and that of their stooges ...".

"The UN resolution may be safely ignored", remarked *Amrita Bazar Patrika*, for "Bangla Desh is a reality which no UN resolution or Big Power frowns can obliterate ... But what cannot be ignored is the emergence of a new Axis—Washington-Peking Axis ..." For, while "the immediate target of the Axis may be India ... it may have its global strategy as well". China and the United States are "partners in annoyance", according to *Statesman*. Their interests "may not be identical, but evidently both find it annoying that something should happen to disturb the existing Asian scheme when they are on the point of deciding how the scheme should be perpetuated or modified to their mutual advantage ... They cannot bear the thought of the obscure millions of East Bengal creating a major distraction when the shape of the world is going to be changed by a Sino-American rapprochement." As the paper saw it, "China may not have a great deal of goodwill to lose in this part of the world; but the damage Mr Nixon has done to USA's long-term interests in this subcontinent is beyond belief."

There were a few comments also on the withdrawal of American military and economic assistance. "It is no surprise that the Nixon regime has frozen all aid to India", noted *Deccan Herald;* "the surprise would have been if it had not. New Delhi would certainly have anticipated this arm-twisting exercise ... It clearly betrays the psychology of a bully, who thinks that by blackmail and strong-arm tactics he can compel submission by what he thinks are his weak victims .... [However] the days when the US could manipulate the affairs of other nations through overt and covert bribery are clearly over", it added. "What price aid?", asked *Nagpur Times*. The suspension of aid by the US and Japan are "in the nature of international pressures on India to toe the line .... It suits everybody's purpose if India continues to be weak, divided, and dependent on foreign powers. But India is no longer in a mood to oblige .... Disillusioned and grown wiser by experience, India has realised that while it is desirable to win friends wherever possible the greatest friends who can stand by us are ourselves."

And *Times of India* wrote: "Mr Nixon is making a greivous mistake if he thinks he can make this country reverse the course of its policy in regard to Bangla Desh by such means. India will be only too glad to do without aid which is used in this cynical manner to maintain an untenable balance of power in the region and deny it its place in the sun ... The Indian people will in fact welcome the US decisions insofar as it forces the country to learn to stand on its own feet and play a role in the subcontinent proper to its size, stable polity and potential strength." But then, does "a dunderhead like Nixon", as the most widely recognised friend and champion of America in the Indian press, Frank Moraes, has described him, understand all this? Nixon has even the temerity to "unfortunately lead the great American people", Moraes moaned. Well, whaddya know!

Pavlovsky, "Soviet-Indian Co-operation," *International Affairs*, January 1970, p 46.)

Two controversial corollaries of the theory of peaceful co-existence—peaceful transition to socialism and the concept of national democracy—were part of the CPI's thinking before they were incorporated into the body of international communist thinking. These concepts originated in the CPI under obvious Soviet inspiration. For instance, before the 1957 statement of 12 communist parties in Moscow referred to the possibility of peaceful transition, the CPI had initiated action for such transition immediately after the 20th Congress of the Soviet party in 1956 which had first referred to it. In 1957, the Chinese delegation put up a stiff fight against the dangerous revisionism implied in this Khrushchevite innovation. The Soviet leadership wanted to make peaceful transition the general rule while the Chinese were prepared to concede it at best as an exception, as latter-day polemics disclosed. In 1957, India and Indonesia were among the countries holding out the best prospect of peaceful transition, according to the Soviet leadership. About ten years later, the Soviet leadership saw similar chances in Burma.

The concept of national democracy is claimed to be a distinct Indian contribution to Khrushchevite revisionism because the CPI had been advocating a national democratic front in India even before the 1960 meeting of world communist parties mentioned national democracy in its declaration. The 1960 declaration described national democracy as a form of transition to socialism in developing countries of the peace zone where the national bourgeoisie played an objectively progressive role and deserved socialist economic and diplomatic support. The national democratic state was one that won complete economic independence from imperialism and was ruled by a broad anti-imperialist front that included the national bourgeoisie. Though the Chinese were signatories to this declaration, their assessment of the character of the national bourgeoisie in the Third World underwent a significant change in 1959. They thought the liberalism in the national bourgeoisie in general had spent themselves out and there were comprador tendencies in the national bourgeoisie in general. It would be well to remember that the CPI-M's main difference with the CPI relates to the programme and the CPI-M is for a people's democratic revolution while the CPI wants a national democratic state. The more specific issue is the place of the national bourgeoisie in the front to secure the tasks of democratic revolution. The CPI is even prepared to let the national bourgeoisie and the working class share the leadership of the national democratic front albeit during a transitional period while the CPI-M is firm about the hegemony of the working class throughout. Nizami's book has no place for these issues which are relevant to the CPI's foreign policy. After all, a party's attitude to the government's foreign policy depends on its understanding of the class character of the government in question.

Sino-Soviet Dispute

To a large degree, the Sino-Indian border conflict was a function of the Sino-Soviet ideological dispute in which peaceful co-existence (with its two corollaries, peaceful transition and national democracy) was one of the main issues. Thus the contrasting attitudes of the two communist giants to India's ruling classes became one of the factors in the Sino-Soviet differences. The Soviets had regarded India as one of the best show-cases of a national democratic state in the making.

In the escalating ideological conflict, the Chinese challenged the Soviet positions on a higher plane in 1965 through Lin Piao's theory of people's war which was a counterblast to the theory of peaceful co-existence and its corollaries.

It is significant that when the Chinese called for the implementation of the strategy of people's war in the Third World (mid-1967), they chose to call for the overthrow of the regimes in three countries where the Soviets had regarded peaceful transition possible—Burma, India and Indonesia. In India, the Naxalbari peasant uprising provided the Chinese the occasion to call upon the CPI-M to repudiate the parliamentary system, get out of it and embark on armed struggle.

The international communist movement today is indeed polycentric. Between a bloc of parties in total agreement with the Chinese ideological positions and another bloc in total agreement with the Soviet ideological positions there are ruling and non-ruling communist parties which have asserted their ideological independence of the rival blocs. The CPI-M happens to belong to this category while the CPI's alignment with the Soviet positions has never been in doubt. The CPI-ML, India's first regular Maoist party formed in 1969 endorses the Chinese positions *in toto*. But even the Maoist movement is becoming polycentric and several Maoist groups and parties find themselves at odds with Peking.

The author's detatched unconcern for all this makes his study a sterile exercise in splendid academic vacuum. It fails to understand the correlates of a communist party's foreign policy.

Sheikh Mujib and Deja Vu in East Bengal

The Tragedies of March 25

Harry W Blair

In the White Paper that the Government of Pakistan published in August 1971, it was asserted that the Awami League of Sheikh Mujibur Rahman plotted in conspiracy with India an uprising that was to take East Bengal out of the Republic of Pakistan.

Reports from the scene indicate otherwise.

There seem to have been no contingency plans at all in case Yahya decided to crush Bangla Desh by force, and resistance to the West Pakistan troops in those early days of March and April was almost non-existent.

Why did Sheikh Mujib and the Awami League not include some plan for the worst? It is the thesis of this paper that they did not because the whole chain of events that took place in March of 1971 repeated almost exactly a similar sequence from March of 1969.

Everything must have looked almost the same to Sheikh Mujibur Rahman in early and mid-March of 1971 as it did two years previously. As to the immediate future, imposition of martial law, forced cessation of political activity, and even a few firings on protesting mobs of students and workers had become the standard fare of politics in East Pakistan, after all, and would only set things back for awhile. After the hiatus, there would be time enough for continuing the Awami League drive for autonomy. In any event, the election showed that the League was uncontestably the will of the Bengali people, a will that would surely in the end prevail. Preparations, then, were not made for what to do in case the army wanted to do more than merely keep order.

But instead of reimposed martial law came cataclysm.

IN the White Paper that the Government of Pakistan published in August 1971,[1] it is asserted that the Awami League of Sheikh Mujibur Rahman plotted in conspiracy with India an uprising that was to take East Bengal out of the Republic of Pakistan. "The operational plan was worked out in meticulous detail: it was arranged that on a signal from the Awami League headquarters in Dacca, the armed uprising would begin... Early hours of Friday morning [March 26] were fixed as the zero hour for the armed uprising." It was only a few hours before this "zero hour", the White Paper continues, that President Yahya Khan ordered the army into action to forestall the plot, put down the insurrection, and thwart the treasonous secessionists.[2]

Reports from the scene indicate otherwise. There were a number of foreign correspondents present in Dacca at the time to cover the talks going on between the Sheikh and President Yahya over the formation of a government and constituent assembly, and there is a consensus among their despatches that the Awami League could not have made any serious plans for insurrection and secession.[3] As the army was fanning out over the city of Dacca to strike in the early evening of March 25, the Sheikh himself was in the process of issuing directives to get the jute exports moving again after the administrative paralysis of early March. When he learned that the army was shooting up the city and hunting down all Awami League members, he waited calmly at his home to be arrested.[4] There seem to have been no contingency plans at all in case Yahya decided to crush Bangla Desh by force, and resistance to the West Pakistan troops in those early days of March and April was almost non-existent.

Why did Sheikh Mujib and the Awami League not include some plan for the worst? It is the thesis of this paper that they did not because the whole chain of events that took place in March of 1971 repeated almost exactly a similar sequence from March of 1969.[5] In both years the regular bureaucracy throughout the province had come to a complete halt in its activities, and there were stories of peasant *jacqueries* in the countryside. Actually, these stories were highly exaggerated, for a parallel *de facto* government under Awami League-oriented student groups managed to keep order in most of the rural areas while they defied curfews and demonstrated in the cities. Sheikh Mujibur Rehman addressed huge public throngs, and became the symbol of Bengali resistance to rule from the western wing of the country. Yet in some ways he was more led than leader, for student pressure forced him into taking a more radical stance in his negotiations with Islamabad than he would have preferred. Mujib's strongest political rival in the West, Zulfikar Ali Bhutto, accelerated the crisis by boycotting efforts to return the country to popular rule. Against this background, the army steadily increased its troops and firepower in the East through emergency airlift and by ship, and in the end the military intervened.

The denouement came on exactly the same day in both years, March 25. In 1969 it was the imposition of martial law and a temporary cessation of political activity, but soon afterward the Sheikh was able to resume his campaign for provincial autonomy. When the same pattern of events reappeared in 1971, he may well have thought that at worst there would be another period of martial law after which things would be back at the starting point. He was wrong. Instead of martial law came the slaughter of hundreds of thousands, the expulsion

Milk co-operatives as an instrument for social change

In Kaira, people of all castes line up in the same queue day after day.

Social changes are not easy to bring about by legislation. Especially in tradition-ridden, custom-bound villages. But equal partnership in a milk co-operative seems to work miracles. When people of all castes learn to stand together in a queue at a milk collection centre—day after day after day—another blow is struck at social inequality and intolerance. And a life style slowly begins to change—for the better.

Amul has shown the way.

ASP/ABF/SP.13

of millions from the country, and the spoliation of the province.

The underlying causes in both sequences were much the same, but the immediately precipitating factors were somewhat different. In November 1968 pent-up resentment at the decade of authoritarian rule of Ayub Khan finally broke loose with a series of student riots in Rawalpindi. Supported by the charismatic Zulfikar Ali Bhutto, students and intellectuals elsewhere in the western wing joined in the dissent, and despite Bhutto's arrest, soon the rebellion had spread all over the province.[6] In December the unrest appeared in the East, and several general strikes occurred, first in Dacca, and then in the province as a whole.

Mujib was in jail at the time as part of the "Agartala Conspiracy Case" that the Ayub government was pressing, charging that Rahman and others had plotted with Indian government officials to detach the eastern wing of Pakistan. Leadership in the anti-Ayub agitation fell to his leftist rival Maulana Abdul Hamid Khan Bhashani, who organised and publicised the general strikes.[7]

As 1969 began, opposition leaders from both wings of the country formed a centre-right Democratic Action Committee to conduct more co-ordinated agitation against Ayub, and student groups in East Pakistan converged to establish a Student Action Committee to do the same at the student level. Politicians, students and labour unions all participated in the growing crescendo of general strikes and demonstrations that paralysed the province. Events in the western wing proceeded at more or less the same pace, and after initial reluctance, Ayub announced on February 1 that he was willing to meet with opposition political leaders at a Round Table conference to discuss the current crisis and possible solutions. Bhutto was releaed from prison on February 11, and Ayub proposed to allow the Sheikh to attend on parole from prison (meanwhile continuing the Agartala Conspiracy Case against him!). Bhutto declined to participate and, after some hesitation, Sheikh Mujib refused the offer also, demanding that the charges against him be dismissed altogether. Agitation continued to escalate in the East, and on the night of February 18, thousands of people ignored the army curfew in Dacca and roamed the city, the first such large-scale defiance in Pakistan.[8]

On February 21, Ayub announced that he would withdraw from politics after his present term of office, and the next day he dropped the Agartala case and released Sheikh Mujib. The Sheikh then agreed to attend the Round Table talks (though Bhutto still refused), held on February 25 and again beginning on March 10.

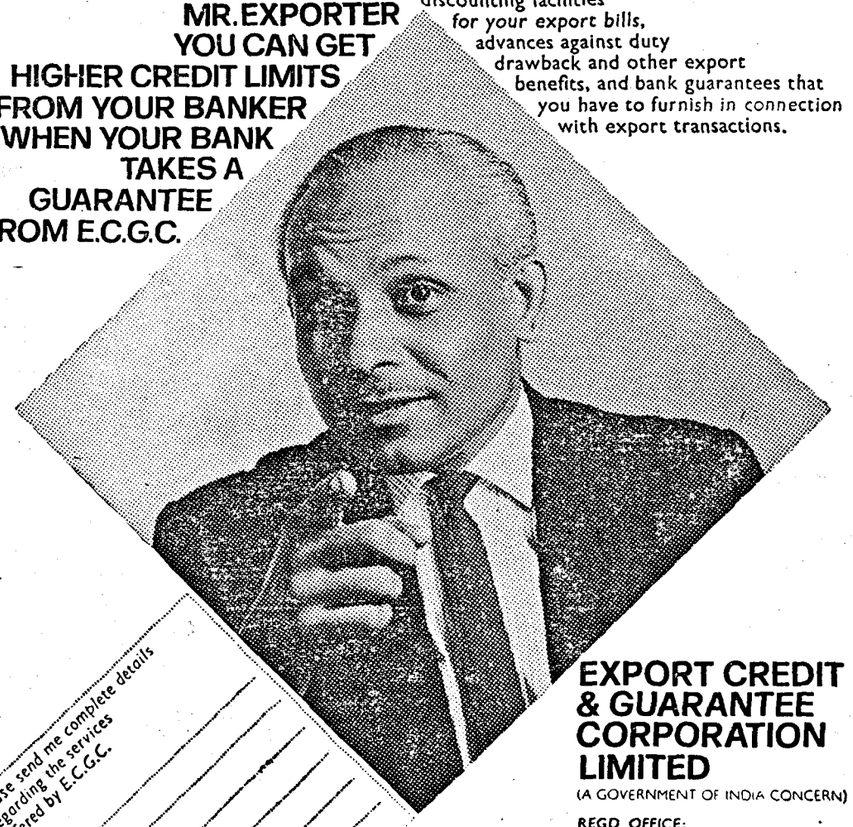
In the second chain of events, Sheikh Mujib was active from the outset. National elections, postponed from their original date in October because of serious flooding in East Pakistan, were held in December, with those elected to be under a mandate to draw up a new constitution for the country.[9] December 7, then, which in 1968 saw the first of the general strikes in East Pakistan, was in 1970 the date of the first direct franchise national election ever held in the country. The Sheikh's Awami League won an overwhelming victory, capturing some 72 per cent of the votes and 167 of the 169 seats allotted to East Pakistan in the assembly, over half of the country's total of 313 seats.

The fact that the Awami League had an absolute majority in the assembly upset a number of calculations quite badly. When Yahya agreed to conduct an election in which seats would be allocated on the basis of population, no one thought that the Awami League would win virtually all the seats in the eastern wing. When this did happen, Sheikh Mujib had the chance to form a government strictly confined to his own party, and write his own constitution. Bhutto's Pakistan People's Party, though the largest group from the West with 84 of its 144 seats (including about two-thirds of those assigned to Punjab) could be shut out entirely. On February 15, Bhutto served notice that his party would boycott the National Assembly when it was due to begin meeting on March 3. Yahya, faced with the possibility of a constitution that would leave Punjab's interests out of account, announced 48 hours before the assembly was to meet that the meeting would be postponed.[11] The mood of the Bengalis changed immediately from euphoria to outrage. Shejkh Mujib called a general strike, which completely paralysed the province for several days and precipitated a number of firings by the army.

Both the anti-Ayub agitation and the smashing electoral victory of the Awami League sprang from the same root, the increasing discontent and resentment in the East over perceived exploitation by the West, especially the Punjab. During the first 20 years of Pakistan's independence, the bulk of investment and budgetary resources had gone to the western wing, a disparity that was reflected in differential growth rates.[12] In the summer of 1968, for example, official figures were released showing that while in the West per capita income had grown from Rs 366 in 1959-60 to Rs 463 in 1966-67, it had increased in the East from Rs 278 to only Rs 313 over the same period.[13] Certainly the fact that much of this western development was financed by the retention of foreign exchange earnings from East Pakistan's jute exports did nothing to lessen feelings of exploitation. And Bengali underrepresentation in the bureaucracy added considerably to these feelings. Despite repeated official proclamations in favour of parity for the two wings in government service recruitment, East Pakistanis amounted to only 36 per cent of the members of the elite Civil Service of Pakistan in 1968, and in other branches of the bureaucracy, similar disparities prevailed, and Westerners, mainly Punjabis, filled most of the positions.[14] Against this background, the Awami League's Six-Point programme for provincial autonomy had great appeal in the East,[15] and it was on the basis of the Six-Points that the Sheikh built his campaigns both times.

In both years, as March began to unfold, the patterns of events became more and more alike. In 1969 the general strike had created an almost complete vacuum of authority in the province. Monem Khan, the Governor, refused even to step outside his headquarters during March, and his authority did not go beyond his office door. Police and civil servants stayed away from their posts, partly in obedience to the strike call, partly out of fear of peasant reprisals against those who had supposedly used their positions under the Ayub regime to exact exorbitant bribes and protection money from the citizenry. Stories of lootings, arson, rape and summary executions by "people's courts" spread quickly.[16]

Soon, however, it became apparent that the whole province had not become consumed in an orgy of mob violence. The rampages, in fact, were confined to only four of the more than 70 subdivisions of the province. For the most part, the Student Action Committee, with its 300,000 and more adherents under the direction of Tofail Ahmad, a law student at Dacca University, managed to keep the peace. Except for several well-publicised incidents, student "peace committees" were able to keep peasant discontent in check.[17]



In the 1971 sequence, the halt in

Your export business depends to a large extent on how much credit you get from your banker. But the credit limit that your banker allows you may fall short of what you require to expand your business.

What you probably do not know is that your banker may be willing to raise your credit limit substantially if he can get your borrowings covered under an E.C.G.C. guarantee.

E.C.G.C. guarantees can help you in securing: packing credits, discounting facilities for your export bills, advances against duty drawback and other export benefits, and bank guarantees that you have to furnish in connection with export transactions.

MR. EXPORTER YOU CAN GET HIGHER CREDIT LIMITS FROM YOUR BANKER WHEN YOUR BANK TAKES A GUARANTEE FROM E.C.G.C.

Please send me complete details regarding the services offered by E.C.G.C.

bureaucratic activity was even more complete. Immediately after Yayha's postponement of the National Assembly, Sheikh Mujib called for a general strike. He renewed the call several times and then at a mass rally in Dacca on March 7 requested a week-long strike over the whole province. The first evidence of the totality of the response came the very next day, when the Chief Justice of the Dacca High Court (the highest judicial authority in the province) refused to administer the oath of office to Yahya's new Governor for the East, General Tikka Khan.[18] For the remainder of the month, civil servants abandoned their official posts. The province was governed through a series of directives issued from Awami League headquarters. These directives spanned the entire spectrum of public activity from keeping all schools closed to specifying the hours during which banks could communicate with the western wing by teleprinter.[19]

There were numerous charges from the West that mobs of Bengalis were rampaging through both city and countryside in a manner reminiscent of the alleged atrocities of 1969. Non-Bengalis and those who resisted the Awami League directives were beaten, robbed and killed in another orgy of violence, according to government reports.[20] In fact, there does seem to have been considerable violence and even mayhem perpetrated against non-Bengalis after the catastrophic events of March 25, but before that, the Awami League with its student allies had the province under an almost complete parallel government, which kept the peace reasonably well.[21]

As a crowd drawer, Sheikh Mujib has had few equals anywhere. In the subcontinent, where perfervid political oratory is still a widely practiced and popular pastime, crowds of one hundred thousand are not uncommon. Mujib's audiences have been variously estimated at up to two million.[22] Even allowing for the hyperbole that is a part of crowd counting, his popularity has been immense.

His remarkable hold on the public affection did not give him the ability to act as a free agent in either sequence of negotiations with the leaders of the West, however. Just after his release in February 1969, he found that the price of the enormous support he received from the Student Action Committee was the widening of the Awami League's Six Points to include an eleven-point list of student demands. The added points included such items as nationalisation of banks and big industries, and withdrawal from the CENTO and SEATO security pacts, scarcely matters close to the heart of the middle-class oriented Sheikh.[23] In his negotiations with President Ayub at the Round Table conferences, Mujib appears to have found himself rather boxed in by his followers. Ayub is reported to have offered Mujib the prime ministership if only he would moderate his autonomy demands. But if the Sheikh were to retain his political future, the least he could have settled for was full autonomy for the East according to the Six Points (which included provincial control over taxation and assignment of tax revenues to the central government's military forces) and a directly elected legislature based on population. Ayub refused to concede this much, and the Sheikh had to return empty-handed to Dacca in mid-March.[24]

Indeed, there is some indication that Mujib's very freedom from jail was a result of his giving in to the will of his following. Several sources report that at first he was willing to attend the Round Table conferences on parole, but his militant followers would have none of it: he would attend as a free man or not at all. Accordingly, the Sheikh refused to come to Rawalpindi unless all the Agartala Conspiracy charges were dropped.[25]

In 1971 there was a good deal of speculation that the Sheikh's followers would pressure him into declaring independence right away when, on February 28, Yahya postponed the National Assembly meeting. There were certainly indications that something momentous would occur at a rally planned in Dacca for March 7.[26] In the event, Mujib steered shy of proclaiming independence. Instead, he demanded that Yahya turn over power immediately to the elected National Assembly, rather than waiting until the assembly wrote a constitution, as specified in Yahya's Legal Framework Order setting up the election and assembly.[27] During the next few days the Awami League virtually took over the administration of East Pakistan, and on March 15, President Yahya flew to Dacca to confer with Mujib on the possibility of opening the National Assembly on March 25.

The available accounts of the conferences are confusing. From the beginning on March 16 down to the end on the 25th, contradictory reports of progress, virtual agreement and deadlock emerged from Dacca.[28] It appears that Bhutto refused to countenance any scheme whereby the Awami League would form a government, whether constituent assembly or parliament, without him and his Pakistan People's Party. Mujib in turn, standing on customary parliamentary procedure, would not accept the prime ministership of a coalition government, but claimed his right to organise the assembly by himself, since he had an absolute majority of seats.[29] Probably as a compromise, the Sheikh then broached a proposal described later by Yahya as a scheme

> whereby Martial Law would be withdrawn, Provincial Governments set up and the National Assembly would, *ab initio*, sit in two committees — one composed of members from East Pakistan and the other composed of members from West Pakistan.[30]

When both the provincial committees had finished their constitution drafting, they would meet as a National Assembly to frame the constitution for the country as a whole.[31] The two men seem to have tentatively agreed to this plan, but Bhutto, who arrived in Dacca on March 21, objected strongly, insisting that the proposal be changed so as to provide that

> no law or constitution could be *presented* in the National Assembly unless approved by a majority of the members of *each* wing.[32]

In this way Bhutto would hang on to a veto power for himself, the Punjab and presumably the rupee-hungry army budget, which regularly consumed well over half of federal expenditures, and which would probably be cut severely by a Bengali-dominated parliament.[33]

The Sheikh was unwilling to back down, and at this point, with a substantial portion of his supporters clamouring for an immediate declaration of independence, he probably could not have given in. Thousands of workers and students were demonstrating daily in Dacca and elsewhere, and the annual "Pakistan Day" celebrations scheduled for March 23 almost turned into a Bangla Desh independence day. Bangla Desh flags went up all over Dacca (including Mujib's house), and demonstrators tore up the national flag.[34] It would have been difficult indeed to give the West a veto power over Bengali hopes for autonomy at this stage.

Throughout both months of March, there was a steady influx of troops by air and sea to beef up the small contingent of soldiers on regular duty in the East. At the onset of the 1969

crisis, only the 14th Division of the army was stationed in the East, but as the month wore on, C-130 transport planes from the Pakistan Air Force were used to ferry in additional troops, and there were reports of soldiers travelling in civilian clothes being flown across India on commercial flights of Pakistan International Airlines.[35] In addition, several shiploads of troops and equipment sailed the long route around India to reinforce units in the eastern wing.[36]

In 1971 it was again the 14th Division that was on hand in the East when the crisis began to build up.[37] This time it was a good deal more difficult to fly in reinforcements from the West, though. On January 20, several hijackers had forced a plane of the Indian Airlines Corporation to fly to Lahore in West Pakistan, and had demolished the plane after it had landed. In retaliation, the Indian government banned Pakistani overflights, a prohibition still in effect in March.[38] Thus Pakistan had to fly its troops all the way around Cape Comorin to the eastern wing. Still, available planes and ships were pressed into service, and thousands of soldiers were flown in, again in many cases dressed as civilians for the flight.[39]

In sum, everything must have looked almost the same to Sheikh Mujibur Rahman in early and mid-March of 1971 as it did two years previously. As to the immediate future, imposition of martial law,[40] forced cessation of political activity, and even a few firings on protesting mobs of students and workers had become the standard fare of politics in East Pakistan, after all, and would only set things back for awhile. After the hiatus, there would be time enough for continuing the Awami League drive for autonomy. In any event, the election showed that the League was uncontestably the will of the Bengali people, a will that would surely in the end prevail. Preparations, then, were not made for what to do in case the army wanted to do more than merely keep order.

Instead of reimposed martial law, came cataclysm. Karl Marx observed that

> Hegel remarks somewhere that all facts and personages of great importance in world history occur, as it were, twice. He forgot to add: the first time as tragedy, the second as farce.[41]

Marx may have been wrong as well. Perhaps he should have said, "the first time as tragedy, the second as catastrophe".

Notes

Economic Research has an estimate of the *net* value of agricultural income per acre of land, by states. The net value of agricultural output for individual states has been computed by deduction on account of (i) cost of seeds, (ii) cost of manure, (iii) cost of repair and maintenance of implements and other operational costs (*not* wages), (iv) water charges, (v) cost of feed of livestock, (vi) marketing cost, and (vii) depreciation of implements and other fixed assets used up in the process of production, from the respective estimates of gross value of agricultural output.[4] In other words, it is simply the so-called *net value added* per acre of agricultural land.

These data, in terms of index number, appear in column 7 of Table 1, where the all-India index is set at 100. Surprisingly, columns 3 and 7 again have a positive relationship: the higher is the productivity of land, the larger is the percentage of rural population below the level of subsistence.

III

Table 1 is not a random sample; nor does it satisfy the essential assumptions of correlation analysis. Nevertheless, without imputing any probabilistic connotation, we present in Table 2 the rank correlation co-efficients simply as a succinct statement of the positive relationship observed between the rural poverty on one hand, and four significant factors, on the other. Furthermore, for whatever may be its worth, it may be mentioned that all these correlation co-efficients are "statistically significant at 10 per cent level of significance".

IV

To sum up, we are therefore led to the following tentative hypothesis: Geographically, the higher productivity of agricultural land is associated with a higher concentration of land holding. Consequently, in those areas the employers of rural labour have a superior bargaining power which they exercise so as to drive a large proportion of rural population below the line of poverty. To put it differently, it is not the productivity of land, but the exploitation of man that goes a long way in accounting for the staggering dimension of rural poverty in India.
