In all conscience, we do need very radical measures to make an impact on the problem of poverty and unemployment. The only pertinent issue is what is a relevant radicalism in the Indian context? Take the case of land ceilings. The more excited the debate on the question grows, the more sterile it becomes. Irrespective of the area of 'surplus' land that the ceiling may release — and I still adhere to my oft-repeated view that it is unlikely to be significant for mitigating land hunger — let us agree that equity demands imposition of ceiling on land ownership. In regard to the level of the ceiling, the pertinent point is not the source of irrigation or its perenniality, but the quantum of maximum socially permissible income which a farmer may be allowed to earn from (self) cultivation of land. Once the income-ceiling is determined, conversion ratios could be worked out to arrive at its land equivalent based on the average productivity of each type of land — dry or seasonally or perennially irrigated. When the question of land ceiling was first mooted, this was the ultimate criterion which was thought of for the determination of the ceiling level. To the best of my knowledge, this point has hardly been mentioned in the shrill debate raging on the issue. Should an honest, hard working, progressive, enterprising farmer who cultivates his own land be allowed a *net* income equivalent, say, to the salary of the custodian of a nationalised bank inclusive of all the perquisites or that of a deputy secretary to the government or a head clerk in a commercial firm? Should the income be adequate to permit investment in land improvement, say, for digging a well and installing a pumpset? If no substantial private investments in land is to be permitted, responsibility for it will have to be assumed by the State. There need be no objection to this, provided all its financial and organisational implications are fully grasped. But is this necessarily the most radical and the prior-most programme under the prevailing agrarian situation? If one's radicalism emanates from concern for the poor rather than from a desire to deprive the better off, there are at least half a dozen equally, if not more, relevant and urgent items of land reform which need to be undertaken: protection of tenants and share-croppers from evictions — as a step preceding transfer of ownership of the leased land —, social control of exploitation of ground water which at present is almost an exclusive preserve of the rich farmer, not to speak of wealth tax and progressive income-tax on agricultural incomes, which ironically is being opposed even by the *nouveau* radicals. And what about the persistent advocacy of high procurement prices for foodgrains? I have characterised lower food prices as instant socialism, inasmuch as it enables the poor to purchase a little more food at the same price and at the same time it curtails the income on the farmer with a large marketable surplus. It should also be remembered that nearly half the foodgrain consumption of rural households is purchased. Perhaps this type of radicalism is either too complex to comprehend or is just not glamorous enough.

Moreover, while our ear lobes turn crimson while talking of monopoly houses, our reaction to the dismal performance of the half a dozen programmes for the weaker sections of the population evokes no more than a cynical shrug of the shoulder.

Empathy for the Poor

Only the other day, the Prime Minister while referring to the importance of reducing concentration of economic power, emphasised that "all these are merely the means to give a better life to our people". Development goals must be defined, she added, "in terms of progressive reduction and eventual elimination of squalor and inequality, of malnutrition, disease, of illiteracy and unemployment". What proportion of our radical thought is being devoted to these issues? Do we seriously believe that lower land ceilings will provide a "better life" to landless labourers or, for that matter, to share-croppers and tenants-at-will? Or that the nationalisation of big monopoly houses in the country will reduce the number of people living below the poverty line? There may be some tenuous link between the demolition of the peaks and the strengthening of the foundation. But will the foundation be strengthened by planting the public sector on the peaks? It is not the demolition to which one is objecting, but to the scant attention paid to the problems directly relevant to poverty and unemployment.

It can be legitimately argued that in the absence of an egalitarian institutional framework within which property is owned and incomes are earned, gains from all development, however broad-based, will somehow be garnered by the privileged few. Even so, it would be naive to assume that once economic concentration is broken, gains from development will automatically flow to the weaker sections. If "high growth rate has been, and is, no guarantee against worsening poverty and economic explosions", should we take it for granted that the break-up of monopoly power will provide such a guarantee. No land legislation, however drastic, will provide even an acre of land to a handful of landless labourers, and even nationalisation of all the monopoly houses will not give additional employment to the unemployed and the underemployed in the rural areas. But in the meantime, one can surely try to make the life of the poor more bearable: to begin with, by providing in each village clean drinking water, a dispensary and free primary education. Radicals may dismiss this as petty welfare, but surely this is not what the election manifesto suggests. Are we satisfied that political thought and action devoted to the problem of eradicating poverty and unemployment are adequate? As a first step would it be legitimate to suggest that every person elected to the Parliament, the State Assemblies and the Panchayats on the slogan of *Garibi Hatao* should adopt at least ten villages from his constituency and ensure that land reform legislation is effectively implemented in his adopted villages? and, more importantly, consider himself accountable for the performance of all schemes introduced for the benefit of the weaker sections

of the population: crash programme for rural employment, minimum wage guarantee schemes, scheme for the small farmers, marginal farmers and landless labourers, for soil and water conservation, for custom service needed for the *new technology* and for credit and input supply? This would be more genuine evidence of one's socialist faith than merely trampling on the monopoly houses. There is no need to 'stand *economic theory* on it head' for reduction of poverty. It is more a question of economic workmanship, ideological orientation and, above all, empathy for the *poor*, which the Father of the Nation vainly tried to instil in our political leadership.

PERSPECTIVES—II

Is There a Choice?

D Ghosh

THE Government of India is behaving like a person who has been standing too long at one spot; as the latter has a tendency to shift the weight of his body *alternately from* one foot to the other, the former is at intervals changings the emphasis in planning from quicker progress to better distribution and conversely. Recently the stress has been on better distribution. Incidentally, the GNP has come in for some rough handling as if the deficiencies *in its measurement* are responsible for the slow growth of our economy!

Little Choice

But the hard fact is that in a poor non-socialist economy like ours there is little choice between the two objectives of planning. On the one hand, any measurable attempt to distribute the national income more equitably will reduce *its size*, so that as the exponents of capitalism correctly point out, we may, in the end, redistribute poverty rather than prosperity. On the other hand, the standard of living of the masses is so low that any endeavour to depress it in the interests of rapid advance would be criminal. Finally, there is no indication that left to itself capitalist development will some day eliminate inequality or poverty. "Let us suppose", says Richard Titmus, "that we are back in the Census year 1951... How many of us would have then dared to suggest that in 1966 one child in four would be regarded as living in poverty and three elderly persons in ten would also be living in poverty, that American Society would be moving towards a more unequal distribution of income and wealth, that many grey areas would have become ghettos..." (p 161, "Issues of Redistribution in Social Policy" in "Commitment to Welfare", London, 1968).

But these are limitations peculiar to the capitalist economy in which unequal *incomes are the source* of saving, the spring of enterprise and the precondition of progress. The source will dry up and the spring become inactive if there is heavy taxation or extensive public interference. One cannot reach the Socialist State *via* the Welfare State; for the former is not just a modified, humanised version of the Capitalist State. It is a fundamentally different set-up in which production relations are so organised as to reduce inequality in income distribution *ab initio*, the differences that still persist being further cut down by differential taxes on consumption. The socialist society has no need to adopt relatively inefficient labour-intensive methods of production in order to promote equality of *incomes* nor to put clamps on the expansion of capital-intensive techniques with a view to restrain monopoly. It almost bypasses the problems of capitalist public finance; under it incomes do not accrue in the first instance to private persons and organisations to be then transferred to public fisc by a costly, painful system of taxation. All incomes accrue to the State in the first instance and the requirements of public expenditure, including public investment, are met in part directly out of resources at its disposal, in part out of the proceeds of a comprehensive system of turnover taxes.

All this is of course made possible by the socialisation of production, the keystone on which the socialist economy rests. In practice and in theory there is no other route to the socialist Society — and only in such society will the poor cease to be with us eternally.

DAVID VITAL

The Survival of Small States

Studies in Small Power-Great Power Conflict

Professor Vital examines the problems of the small state when confronted by a major power. He begins with a general analysis of the question, then uses three paradigms to illustrate his theme: Czechoslovakia against Germany in 1938; the Arab-Israel-USSR conflict; and the **modus vivendi** between Finland and Russia, which is considered as pointing to the future pattern of small power-great power relations. £2.00

ARTHUR MACEWAN

Development Alternatives in Pakistan

A Multisectoral and Regional Analysis of Planning Problems

In this volume Mr MacEwan uses a multisectoral, regional linear programming planning model to examine the full implications of several alternative development programmes for the period of Pakistan's Third and Fourth Plans. *Harvard* $9.00

Development Policy II: The Pakistan Experience

Edited by WALTER P. FALCON and GUSTAV F. PAPANEK

The contributors draw on their experience as advisers to the Pakistan Planning Commission. Walter Falcon, Deputy Director of the Development Advisory Service, Centre for International Affairs, Harvard University, and Joseph J. Stern provide a general summary of Pakistan's development. The volume then focuses on specific economic issues. *Harvard* $9.00

Muslim Rule in Kashmir

V C Bhutani

A History of Muslim Rule in Kashmir 1320-1819 by R K Parmu; People's Publishing House; pp xiv+461, appendices, bibliography, glossary, index and map; Rs 40.

AFTER 25 years of sustained research *into the original sources of the* history of Kashmir the author of this book has succeeded in presenting a heavily documented, full length study of Kashmir under the rule of Muslim sultans and governors for a period of five hundred years. Tara Chand says in his foreword, "The work is not likely to be superseded for many years". This view will be readily endorsed by most readers. The sources of the mediaeval history of Kashmir are in Sanskrit, Persian and Kashmiri for the most part but there are also inscriptions and coins and relatively recent western travelogues and British records. From beginning to end the work is the result of monumental hard work and conscientious evaluation. Parmu has excelled in reconstructing his study from variegated sources which he has used with skill and confidence. Students of history have passed under a lasting debt for this remarkable framework of the history of Kashmir on which it will be possible to base many more studies into each single subject and aspect.

Historian's Business

Starting with a very useful introduction to the sources, the early history and the geography of Kashmir, the study has had of necessity to be woven round the political history which occupies by far the greater part of the work. This is not to suggest that Parmu has neglected the religious, social and economic life of the people of Kashmir. About one tenth of the space is devoted to those aspects. This may have been inevitable because it appears that even the chronology of Kashmir during the period under study was not generally agreed. The book is strewn with numismatic and epigraphic minutiae which Parmu uses to establish his views and conclusions about chronology and other matters. He often joins issue with those whose views have, in the author's opinion, wrongly held the ground so far and whom he coolly proceeds to correct.

Before offering comment on some aspects of the study I beg to request Parmu's attention to some aspects of the practice of the historian's craft. It is a historian's business to stay close to his subject and not stray away from it. He must constantly keep his focus sharp and clear. He should form his judgment about men and matters under review on the basis of evidence before him and be strictly historical and not didactic. Then, the historian writes history and offers evaluation according to his best lights but he must remember that it is not open to him to write with an eye on the present or an objective for the future. The moment he takes the present or the future into account he ceases to be free or impartial even as much as it is possible to be free and impartial. Objective history is probably never written because a historian's personal predilections, proclivities and prejudices must necessarily affect both his judgment and writing. But that does not entitle a historian to enunciate and establish for his guidance some specific directions or biases. History subjected to opinionated ideas ceases to be history and becomes propaganda. It is not a historian's duty to subserve even what he himself believes to be the best interests of his country or nation. The historian's personal regrets and happinesses with characters and events of which he writes, even when based on strictly historical evidence, have no interest for students of history and constitute no valid observations that could be considered comments or views. Nor is it necessary for him to relate his history to the present or offer suggestions for the future. He must keep his eye firmly on the past of which he writes, although he may rightly take advantage of hindsight which he obtains by being removed a century or two or more from the period of his study.

As it is Parmu goes out of the way to record his approval or dissatisfaction with the action of this sultan or that governor. He often allows himself the luxury of delivering a moral judgment. For instance Sukhjewanmal comes in for a com ent like this, "A great catastrophe assuredly overtook him finally *as it had to* and he met the fate *which he deserved*" (p 358, emphasis added). Ahmed Shah Abdali's first governor of Kashmir had to leave Kashmir because he had oppressed the people with his tyrannical rule driving them almost to the brink of rebellion. His deputy fell victim to the machinations of Sukhjewanmal who then proceeded to rule Kashmir for the betterment of the lot of the people. He crushed all persons who were either Abdali's agents or in his favour and repudiated Abdali altogether, acknowledging the titular Mughal emperor of Delhi as the sovereign. He defeated the forces which Abdali sent against him. By changing his religious policy of toleration he provoked Muslims of Kashmir to unsuccessful revolt. Abdali returned shortly thereafter with the victory of Panipat and liquidated Sukhjewanmal, defeating him, blinding him and killing him under an elephant. Historians may form different views about Sukhjewanmal's conduct during his nine years' rule but it is hardly possible or permissible to say, as Parmu says in effect, that it served him right. It is obvious from the remark quoted that Parmu subscribes to some theory of historical inevitability and political morality.

Military Strategy

Parmu offers advice on military strategy and says that Kashmir is open to attack by the Ladakh-Zojila, Gurez-Burzel and Domel-Baramulla routes, specially the last. "In anticipation of any enemy attack from this side it is most essential to render the Uri bulge militarily invulnerable" (p 214). 1965 notwithstanding, it is naive to suggest defence strategy when all that Parmu has before him is the invasion of Kashmir by the Kashgharis in 1532-33 by the Ladakh-Zojila route. Parmu as a historian would have done well to leave these matters to the general staff and concentrate on history.

There are numerous other instances of such comments which are entirely uncalled for. Parmu hardly ever loses an opportunity which he can use to offer advice or to suggest correlation or comparison to modern usage (e g, p 356, fn 12). Consider: "In 1946 the government controlled price of salt in Srinagar was only a rupee for five seers, while in 1947-48, owing to the aggression of Pakistani raiders, the local stocks of salt and tea were depleted to the extent that both these commodities became as precious as silver and gold" (p 423). Parmu, however, only meant

to emphasise Kashmir's dependence on external supply of salt.

Discussing the economic conditions in Kashmir he tells us, "Throughout the middle ages every government was judged by one simple test, the price of *shali*". *Shali*, or unhusked rice, was the staple food of the people and it was rightly the standard of judgment. Parmu mentions the prices from the reign of Avantivarman (855-883) to 1946 but fails to tell us what it was worth in the contemporary economic conditions. How are we to understand anything when we are not told about the varying value of *dinar* from the time of Avantivarman to the time of Shahjahan? One looks in vain for an explanation of the remarkable phenomenon by which the price of *shali* per *kharwar* (literally, an ass load, equivalent to 177-129/175 lbs, *vide* author's glossary) rose from 200 *dinars* in the time of Avantivarman to 300 *dinars* in the time of Zain-ul-Abiden (1420-1470), 2,900 *dinars* in 1587, 2,400 *dinars* in the reign of Shahjahan (1628-1658) and finally 28,000 *dinars* in 1946 (not taking into account prices in years of famine). (4,000 *dinars* appear to have been equivalent to a rupee in 1946, *vide* p 422.)

Finally, although it is minor matter that footnotes end without their terminal full-stops, the production of the book is marred by a proof-reading which is generally indifferent and often incompetent (which may not be entirely the author's fault). But the author himself shows an admirable ease in dispensing with all considerations of grammatical accuracy, not to speak of syntax, punctuation and malapropism. He often literally translates an idiom or phrase taken from an Indian language without considering its effect in the language which he is writing. The *monstra horrenda* of the author's composition is the use of words which mean anything but that which he appears to understand them to mean (e g, 'appraised', p 231, line 7). Besides, the author has a style which makes the book extremely unreadable. We often find long passages or long sentences where it was possible to convey the meaning more precisely with fewer words.

Parmu appears to be at pains to emphasise one aspect of the life and thinking of the people of Kashmir (by which he means the valley only, though), namely, the golden spectacle of tolerance, peace and good-neighbourliness among Muslims and Hindus and among Sunnis and Shias. He remembers, whenever the context permits, to remind his readers what he believes to be the instances of Hindu-Muslim inter-socialisation, including intermarriage (which is remarkable). One piece of evidence over which he expatiates with obvious pride and relish relates to the conversion of what were probably once Hindu temples into shrines of Muslims (pp 433-35). These temples-cum-*ziarats* were held in high respect by both the communities. He uses modern political phraseology which denotes concepts or connotations which did not exist in the mediaeval ages, e g, secularism, communal, etc. The book, however, is replete with instances of forcible conversions of Hindus to Islam and the persecution of Hindus by most of the sultans and governors. Greatly to the relief of the readers and to his own credit, an occasional Zain-ul-Abiden or Akbar (1586-1605) governed with exemplary impartiality and even-handed justice. Against these two great names must be set down the far too numerous fanatics like Mirza Haidar Dughlat (1540-1550), the Chaks (1550-1586) and the Mughals after Akbar. Barring the golden ages of Zain-ul-Abiden and Akbar whom the author extols as apostles of peace, prosperity and rectitude, the history of Kashmir during the greater part of the period under review was indeed witness to the activities of many a Muslim missionary, e g, Saiyid Ali Hamadani who was a remarkable mystic and a *Sufi* and believed in peaceful propagation of Islam, his less tolerant son Saiyid Muhammad Hamadani and Mir Shams-ud-din Iraqi of the Nurbakhshiya order who laid the foundations of the Shia sect in Kashmir and sowed the seeds of lasting Shia-Sunni discord which went on increasing after Akbar and under the Later Mughals. The Afghan kings sent trusted Muslim lieutenants as governors most of whom were fanatical and bigoted. Under Afghan governors there was hardly even the possibility of communal peace in the valley.

To contend in the face of such overwhelming evidence that Hindus and Muslims lived happily together is to ignore the historical truth. Parmu, however, is only following the philosophy of his mentor, the famous and senior historian Tara Chand who will be remembered for fifty years of historical research beginning with his classic "Influence of Islam on Indian Culture" (Allahabad, Indian Press, 1936), originally written in 1922 in the era of Hindu-Muslim fraternisation over the sinking cause of the *khilafat* under the leadership of Gandhi who is now acknowledged to have failed in this respect. Tara Chand's theory of the synthetic or composite nature of Indian culture is faithfully continued and re-echoed by Parmu when he seeks to highlight those aspects of the history of Kashmir which appear to him to show Hindu-Muslim amity and harmony and to play down those that militate against that view. The two communities, in Kashmir as elsewhere in India, had their distinct social, religious and cultural personalities and conflict was inherent in the cultural and regional variety to be found in the subcontinent. It is ahistorical to seek to put a gloss over the division and differences which indeed existed. The whole object of the proponents of the unity-in-diversity idea had been to promote intercommunal cohesion in India in order to rouse them to a singleness of purpose for the withdrawal of British rule from India and to counter the movement for the division of India on the basis of the two nation theory. It may be possible for some people to sympathise with that object, although many others may be opposed to it, but in spite of being understandable it is now an unnecessary and futile exercise in wishful thinking. The theory of composite culture, like its counterpart of the two nation theory, has outlived its utility and should be laid to rest. Even so it speaks volumes for the lasting appeal of the popular theory of composite culture that Parmu emphasises cultural variety and compatibility while making no secret of his pride in and admiration for the cultural distinctiveness and achievement of Kashmir. Compositeness is probably now only a euphemism or camouflage for regional assertiveness. When a historian allows himself to keep this constantly in view how far indeed must he have travelled from his legitimate function of history writing?

Parmu is also the author of a chapter on Kashmir under the independent Muslim sultans from Rinchan Sadruddin to annexation by Akbar in "A Comprehensive History of India", Volume V, "The Delhi Sultanat (A D 1206-1526)" (New Delhi, People's Publishing House, 1970). The scholarship of the editors, Mohammad Habib and Khaliq Ahmad Nizami, has made up for Parmu's proneness to disregard elegance of expression, to relate history to modern usage and to preach Hindu-Muslim unity, in spite of occasional lapses into these areas. Dealing with the political history of Kashmir (pp 733-781), this chapter is a noticeable improvement on Parmu's more detailed book reviewed here.

Eurocentric Security by Omission

(Contributed)

International Security—Reflections on Survival and Stability, edited by Kenneth J Twitchett; Oxford Paperbacks, London, 1971; pp 148; £ 1.

THE book is a collection of four essays on contemporary problems of international security. As the preface itself suggests, the essays are designed to offer an introduction to, and analysis of, international security problems and to examine the prospects for developing greater stability in the world of tomorrow.

The opening chapter, "Strategies for Security: Some Theoretical Considerations", is contributed by Twitchett. He discusses the popularly accepted concepts of security arrangements, the interplay of super powers and their relations with smaller states. In doing this, he treads on familiar ground but the analysis, nevertheless, is balanced. Economic security and insecurity are acknowledged as an integral part of the problem of military security. It is accepted that the poor, non-white peoples of the world, perhaps, could and do see the world through different kinds of lenses from those of the rich white world.

The stated models for security are: security by collaboration, the unilateralist approach, collective security as evinced by the United Nations and the efforts to have a European security arrangement guaranteed by the US and the USSR. In describing these, Twitchett makes two remarkable observations which are both open to challenge and criticism. Firstly, he writes of "China's forbearance" with regard to what he calls "American activities in Indochina" and secondly, he states that the Afro-Asian countries as a whole, and individually, are too bogged down by their problems to carry any weight in the international arena. As regards the Chinese forbearance and role in Indochina, how long will Western governments and intellectuals delude themselves of the realities in Vietnam? Will they ever admit that the patriotism and nationalism of the Vietnamese people is not dependent on any outside power and that it is the sacrifices and heroism of an entire people which have defeated the Americans in Vietnam. It is no use pretending that China or the Soviet Union are fighting in Vietnam; they are not. It is the nationalism of an Asian country that has defeated Yankee imperialism. The sooner this is understood, and grasped, and admitted, the better it will be for the Western nations, so that they could then adjust their plans and policies and come to terms with reality.

Nixon went to China, perhaps, with the hope that he could return and tell his people that the key to Vietnam lay in Peking and that he had made progress in extricating with honour his countrymen from Vietnam. This probably carried weight with his 'silent majority' and was also swallowed by many Western theorists. But such simplistic theories and conjectures have been proved wrong again by the facts of Vietnam. Alas for Nixon and his gaming theory experts, the world has changed qualitatively. If Vietnam is a reality that has defeated and humbled the 'mightiest' nation of the world, might it not be possible that other Vietnams could spring up in Asia, Africa and Latin America? How would the nicely interwoven and 'sophisticated' — but essentially simplistic — balance of power and other theories be peddled then?

The essay, "Towards a More Dangerous World" by Neville Brown, is an attempt at surveying the current nuclear balance between the US and the USSR. In this, the interaction between the arms race and the problems of development in the have-not countries are briefly discussed. The author rightly points out that most studies concentrate on visualising what the world will look like in AD 2000 and projecting that advances in science and technology will somehow solve all the world's problems. However, his own concern is the 1970s and 1980s.

In describing the state of nuclear weaponry, there are some errors of fact. In discussing the drawbacks of the Polaris/Poseidon submarine as a strategic delivery platform when compared to the land-based Minuteman it is not individual missile costs that are relevant but the total system's costs. The system's cost of the land-based ICBM is more than that of the Polaris/Poseidon submarine, particularly when compared in terms of military effectiveness and vulnerability. Secondly, he states that by firing one missile the submarine betrays the position of the other 15 missiles that it carries. Betrays how? How can the enemy hit back accurately when the submarine has moved away at 30 knots in a multi-dimensional plane after firing one of its missiles? This, perhaps, is not a major point in an analysis which on the whole is well done.

The security functions of the United Nations are discussed by Alan James. The role of the UN, the constraints on its working and its apparent limitations are examined. As such what the UN offers is a marginal contribution towards security, an increment which in itself is small but which may be invested in specific circumstances with considerable and perhaps crucial significance.

In writing on the "Problems of Security in Europe", Peter Nailor is really joining the ever growing band of intellectuals who are obsessed and preoccupied with the over-magnified problems of European security. In this sense the book as a whole is Eurocentric, focusing on the problems of the two super powers and the states of Europe. For the well-informed reader the essay merely covers all too familiar ground. Issues facing NATO and the proposed European Security Conference have been endlessly discussed. After all, the prosperity of Europe is central to any discussion by the have nations, particularly in the context of the challenge of a Japan, a China and perhaps an India!

Insofar as this book is an attempt to link together four essays with a view to discussing the problems of international security it succeeds in presenting an essentially European view of the world. The thesis is that the Soviet Union, the United States and Europe, grudgingly, perhaps, Japan and maybe even China, are the fulcrums around which international security hinges. This is another far too simplistic view which has been over-subscribed to and over-stated.

This book does not fail to mention that since World War II almost all the wars and conflicts have been fought on the soil of the have-not nations. But the book fails — deliberately, perhaps — to mention the view that these conflicts and tensions were, and have been, engineered so that the rich of the world can keep the poor where they are. What has been the role of the big interventionist powers and of Western capitalism since the last World War in creating instability and tensions amongst the have-not nations? Has 'stability' for the have nations not always meant the preservation and increase of their affluence at the cost of the have-not nations? The book deserves to be read, partly because of its refusal to ask many significant questions. An Asian, African or Latin American would read it with many reservations. Indeed, until the basic fundamentals of the situation are recognised among the have nations and acted upon, there is very little chance of greater stability in the world of tomorrow.

Mid-term Poll in a Working Class Constituency in Tamilnadu

E A Ramaswamy

This study of an election in a working class constituency shows that the voting behaviour in this constituency, consisting primarily of highly unionised textile workers and their dependents, was significantly influenced by the union and political affiliations of the workers.

Elections here were just one more arena where the leaders of bitterly hostile unions, leading equally hostile political parties, could test their strength. Traditional allegiances, such as to one's caste, village and kin group, seemed to have no more than marginal relevance in this context.

[*The data for this paper were collected as part of the research project on the Mid-term Poll undertaken by the Department of Sociology, University of Delhi, under a grant provided by the Indian Council of Social Science Research. The project was directed and the paper edited by A M Shah and Anand Chakravarti.*]

Introduction

THE present study of the electoral process in Singanallur Assembly constituency in Tamilnadu in the Mid-term Poll of March 1971 is essentially a continuation of my study of the electoral process here in 1967 (Ramaswamy: 1971).[1] My main task then was to show that voting behaviour in this constituency, consisting primarily of highly unionised textile workers and their dependents, was significantly influenced by the union and political affiliations of the workers. Elections were just one more arena where the leaders of bitterly hostile unions, leading equally hostile political parties could test their strength. Traditional allegiances, such as to one's caste, village, and kin group, seemed to have no more than marginal relevance in this context.

The Singanallur Assembly constituency comprised the highly industrialised municipal area of Singanallur and the villages in the *firca of Circar* Samakulam, a primarily agricultural region. Nearly 70 per cent of the 100,939 voters in the constituency were resident in the municipality. Singanallur was part of Coimbatore Lok Sabha constituency. As in the previous elections, my primary focus of interest was the electoral process among the industrial workers in Singanallur municipal area.

The trade union scene in Singanallur had not undergone any radical change between 1967 and 1971. The balance of power between the unions remained unaltered. The Coimbatore District Textile Workers' Union (TWU), which owed allegiance to the Praja Socialist Party (PSP), continued to be the most powerful union with about 10,000 members. The faction fight within the TWU had caused the supporters of the Samyukta Socialist Party (SSP) to establish their own union. The membership of this union, however, came mostly from mills outside Singanallur. The National Workers' Union (NWU), which owed allegiance to the Congress Party, also managed to retain its identity, in spite of the split in the Congress. It was now identified with the Old Congress. Some disgruntled leaders of NWU had crossed over to the New Congress with a handful of members and started a rival union. The Communists continued to be divided into two camps, each with its union. The Dravida Panchalai Thozhilalar Munnetra Sangam (DPM), controlled by the Dravida Munnetra Kazhagam (DMK), continued to be a weak union in spite of four years of DMK rule and sustained attempts by the party to bolster it up.

Political alignments in the constituency had, however, changed considerably. The DMK-led alliance, which routed Congress in 1967, turned out to be just an electoral pact. Once the elections were over, the DMK with its massive majority in the Legislative Assembly, had no need for the support of its allies. Disillusioned with the DMK, the Swatantra Party and the Communist Party of India-Marxist (CPI-M) formally quit the alliance. With the announcement of the Mid-term Poll, the DMK was once again after an electoral pact. The major parties in the new alliance, now called the Progressive Front, were the DMK, the Communist Party of India (CPI), the PSP, and the New Congress. The Old Congress, still a major force in Tamilnadu, joined hands with the Swatantra Party and the SSP to form the Democratic Front. The Mid-term Poll in Tamilnadu was essentially a contest between these two rival fronts.

In Coimbatore district an additional force on the election scene was the Coimbatore Agriculturists' Association, an interest group formed in 1970 to resist a proposed raise in agricultural power rates. Led by a former Congress minister, and clearly anti-DMK, the Association fielded ten candidates for the Legislative Assembly and supported Democratic Front candidates in constituencies where it did not contest.

The Candidates

In Singanallur the main contest, as in 1967, was between top-ranking trade union leaders. The PSP, representing the Progressive Front, fielded Subramaniam, Secretary of TWU. A Brahmin from Kerala, Subramaniam had taken over the leadership of TWU in 1963 when the old guard was expelled for lack of commitment to the PSP (Ramaswamy: 1969). Subramaniam was a powerful leader of the PSP and his loyalty to the party was beyond question. The choice of a Brahmin to lead the largest union in an industry where Brahmins are hard to find is extremely significant. It underscores the close links between trade unions and political parties, as well as the irrelevance of traditional loyalties in the trade union context.

The Old Congress, representing the Democratic Front, nominated Subbaiyan, Secretary of the NWU. A soft-spoken man opposed to fire-brand unionism, Subbaiyan had risen in the union hierarchy because of the patron-

age he received from a prominent mill-owner. There was widespread pessimism in the union as well as district party organisation about his vote-catching ability. Subbaiyan's nomination was calculated to prevent the New Congress from gaining a foothold among organised labour in the district. Never in the past had the Congress nominated a trade unionist to contest from this constituency. The NWU leaders, sore at their claims being ignored, had been lukewarm in their support for the Congress candidates. The Old Congress hoped to retain its hold over NWU by nominating a leader of the union. Further, in the past the Congress candidates in this constituency had always been from the indigenous Tamil-speaking caste of Gounders, which controlled the district party organisation. The Telugu-speaking Naidus, who predominate in the region and constitute a substantial proportion of the leadership and rank and file of the NWU, had tried for the Congress nomination in vain. Subbaiyan was a Naidu and this could help the party retain the loyalty of his castemen and seek votes for him on the grounds of caste unity.

Although the contest was primarily between the candidates of the two Fronts, there were two other candidates. One was a former mill worker contesting on the CPI(M) ticket. The other was a disgruntled DMK member who, resenting the allocation of the constituency to the PSP, filed his nomination as an Independent. He was subsequently expelled from the party for opposing the official Progressive Front candidate.

The mainstay of Subramaniam, a rank outsider to the constituency, was his position as Secretary of the TWU. His appeal was as a staunch unionist and prominent PSP leader. The TWU members, with their deep union and political commitments, could certainly be expected to stand by him. His campaign was run by the stalwarts among the second level leadership and rank and file of the union.

Subramaniam's relations with his allies were less happy. Ever since the thumping victory of DMK in 1967, its relations with TWU had been fraught with tension. The TWU leaders had never made a secret of what they thought of the DMK: to them it was the very embodiment of vulgarity in politics. While it was necessary to align with the DMK for the sake of political gain, this was no more than a marriage of convenience. The DMK, now heady with electoral success, was seeking to bolster up the DPM, its trade union wing. The TWU could not take kindly to this. Further, the DMK in its new role as the ruling party, displayed a vested interest in production and industrial peace which the militant TWU found inconvenient. What sparked off this latent tension was the controversy over the naming of the prestigious Employees' State Insurance Hospital in Singanallur. The DMK government made known its intention to name it after the late C N Annadurai, founder of the party. The TWU, incensed by this, contended that the DMK leader counted for nothing among mill workers. It demanded that the hospital be named after N G Ramaswamy, founder of the TWU and the doyen of trade unionism in the district. The DMK, willing for a compromise, offered to name the building after Ramaswamy and the hospital after Annadurai, and instal statues of both at state expense. Unable to accept this, the TWU called an industrywide strike. The TWU leaders (including Subramaniam) and about a thousand workers were arrested by the police. They were subsequently released, and the hospital remains to be named.

Relations between the TWU and the DMK were further estranged when the SSP extended its support to an agitation by agriculturists in Coimbatore district against a proposed raise in power rates. The DMK's refusal to concede this demand triggered off violence all over the district. The police opened fire at a number of places and several agitators, including Subramaniam, were arrested.

Subramaniam's relations with the New Congress were also somewhat strained. Sometime in 1969, elections were held to the Singanallur municipality. The undivided Congress annexed 18 of the 31 seats, while the PSP secured eight, the DMK five, and the CPI(M) one. One of the Congress councillors was elected Chairman of the municipality. Later, six of the Congress councillors, including the Chairman, crossed over to the New Congress, and the rest owed allegiance to Old Congress. Following this, the PSP attempted, although without success, to unseat the Chairman.

Subbaiyan, like Subramaniam, counted primarily on the support of his unionists. He could also depend on the organisational strength of the Old Congress whose councillors had done exceedingly well in the Singanallur municipal elections. The SSP promised him complete support. Many leaders of the SSP-led union were active in his campaign, more to spite Subramaniam and the PSP than out of any loyalty to Old Congress. This support, however, did not mean much since the union had little following in the area. Nor could Subbaiyan benefit from the support of the Swatantra Party or the Agriculturists' Association.

The Campaign

Much of the expense and effort in campaigning was incurred to build up a favourable image of the candidate. The electorate did not take seriously the candidate whose flags and banners they did not see, whose speeches they did not hear, and whose election offices were deserted. The ingredients which went to make up a favourable image were well known. Lavish display of flags and banners, frequent street corner meetings, and at least occasional visits by the candidate to each village and ward in his constituency were essential. The number of campaign vehicles plying for a candidate was of great significance. For several weeks before the poll, conversation frequently centred round the size of the fleets of rival candidates. The drivers of campaign cars were carefully chosen. They distributed leaflets, tied banners and, in a remote village, even addressed the audience when the main speaker did not turn up. It was the ambition of every candidate to coax panchayat presidents, faction leaders, big landowners, and such other prominent men to board his campaign car. This was considered to be symbolic of their support for the candidate. People talked derisively of those who boarded the campaign cars of more than one candidate. On the day of polling, urchins, with party symbols pinned on their shirts, blocked all approaches to polling booths and mobbed every voter who turned up to exercise his franchise. Nobody believed that a voter could be influenced at this late stage; yet the absence of a candidate's supporters in front of the booths was taken to mean that he did not expect to win.

In the case of both the major candidates the campaign at this level was run mostly by prominent members and local level leaders of the respective trade unions. Unionists with deep political commitments were particularly active. Often they had little immediate gain in mind. On the contrary, campaigning implied, at the very least, loss of pay for days spent away from work.

Another important link in campaigning were the reading rooms and clubs which mushroomed in the constituency. Usually named after Tamil matinee idols, and occasionally politicians, they were to be seen almost in every street. The members were usually young men who were out of school or college and did not have very much to do. They generally spent their time playing carrom, reading magazines and party journals, or gossiping. It was the DMK which initially built its organisational network around such reading rooms. The Congress, having learnt its lesson from its defeat in the last election, had also taken to this form of organisation. The reading rooms of the DMK and Congress, named after rival matinee idols, could be seen facing each other on the opposite sides of the street. During elections these reading rooms organised campaigning in their respective localities.

A striking feature of campaigning at this level was the near total avoidance by the candidates and their supporters of personal attacks on rivals. In contrast to the earlier elections, personal animosities, inter-union hostilities, and discrediting rivals by raking up the problems of textile workers were relegated to the background. Current issues, such as bank nationalisation and abolition of privy purses, figured prominently. Attention was focused on the professed policies of the two rival fronts and the pronouncements of their leaders. Invectives were directed against Karunanidhi, Chief Minister of Tamilnadu, and Kamaraj and Rajagopalachari, the Democratic Front leaders, rather than against the candidates contesting in Singanallur. Words such as 'progressive' and 'reactionary' were freely used. The DMK and the PSP, representing the Progressive Front, sought to convince the electorate that the choice was between progressive socialist policies and reactionary conservatism which would perpetuate the privileges of a minority. The Old Congress, however, saw the choice as one between a clean and responsible government on the one hand and perpetuating the power of the corrupt DMK in the state on the other. Although, as we shall presently see, the candidates activised all the established and time-worn channels of gaining support, the elections were not fought primarily on local issues.

There was another, more personal, dimension to campaigning. It was not enough to exhort voters from party platforms. They had to be won over through channels which were meaningful to them. The point of departure for this kind of campaigning was the detailed figures of voting in the previous general elections, and any other election which may have taken place in the intervening period. Since these figures were available individually for each polling booth, comprising about 1,000 voters on the average, it was relatively easy to figure out how different aggregates of the electorate voted. These aggregates were factions, castes, local groups, groups of unionists, groups of mill workers, supporters of a political party, or kin groups. The different aggregates had to be approached differently if the candidate was to have a chance of winning them over.

The individual voter was at the same time a member of more than one aggregate and was exposed to competing pressures. Which of these proved more compelling was not a matter of individual choice. At least in the case of Singanallur it was possible to work out a rough hierarchy of loyalties which influenced voting behaviour.

The TWU member was normally expected to vote, along with the members of his household, for Subramaniam. If, in addition to being a TWU member he was also a PSP supporter, his loyalty to the candidate was further reinforced. He was then expected to take leave from the mill for a week or so and engage in campaigning. Factions within the union and rivalries between the leaders were generally relegated to the background on this occasion. Political cleavages within a union certainly surfaced during elections. But such cleavages were rare since political differences generally led to a formal split and the emergence of a rival union. Some TWU members certainly voted against Subramaniam because of a personal grudge, or because their sympathies were with a rival political party. Their numbers were, however, seldom very large.

The TWU, or any other union for that matter, was not homogeneous in terms of the caste composition of its membership. Subramaniam was a Brahmin and the number of Brahmins in TWU could be counted on fingertips. More significant, Subbaiyan was a Naidu and there were many Naidus in TWU, among the leadership as well as the rank and file. Nobody expected that the electoral behaviour of the TWU members, with minor exceptions, would be guided by their caste. Making a serious dent into a rival union's membership by appealing to caste loyalties was quite unthinkable.

Kinship, unlike caste, was widely regarded as an overriding loyalty which may cut across union and even political affiliation. It was believed that voters who were not amenable to any other influence could be pressurised through their kin. The support of close kin was expected almost as a matter of course. A close kinsman working against a candidate was considered sufficient to damn him. One could hear frequent references to this or that candidate in a particular election who was not supported even by his own mother's brother. Several prominent campaigners of both the major candidates claimed that even Rajagopalachari, the elder statesman and Swatantra leader, believed in the supremacy of kinship ties. During the 1967 elections Rajagopalachari was the sworn enemy of Congress. His son was, however, contesting as a Congress candidate. When asked why he did not oppose his son, Rajagopalachari is reported to have said, "In Indian culture it is not *dharma* to work against one's son. I did only what our culture required of me." Both Subramaniam and Subbaiyan activised their and their supporters' kinship networks. They arranged leave for several of their unionists so that they could visit villages where their close kin were living and try to win them over.

Money was believed to be an important attraction for many voters. Fears were frequently expressed that a well-to-do rival might upset all calculations by purchasing votes on the night before the poll. In Singanallur both the major candidates had collected donations from workers and millowners in order to finance their campaign. Their resources did not permit any large-scale purchase of votes. Nor could everyone's vote be bought. Only some categories of voters were susceptible to such incentives. An almost universal belief was that Harijan scavengers in the employment of the municipality responded only to direct inducements. Feeding them on the night before the poll was believed to be the only way of bagging their votes. This was expensive since entire streets, including those who did not have a vote, had to be fed. On the eve of the poll, milling crowds of Harijans could be seen near the PSP election offices in Singanallur, waiting to be fed. The feeding continued till the small hours of the morning. The Harijans were then herded straight to the polling booths and lined up for voting. The Old Congress, realising that the Harijan votes were slipping out of its hands, made a desperate attempt to win over at least a section of them. Lacking the resources

to start rival feeding centres, Old Congress supporters summoned municipal employees who supervised the scavengers and offered them bribes. Many Old Congress and SSP leaders expressed the view that Harijans would not see sense unless given a good beating.

Conclusion

Out of a total of 100,939 voters in Singanallur constituency, 72,468 (71.8 per cent) exercised their franchise. Subramaniam, polling 35,888 (49.5 per cent) votes, scored a clear victory over Subbaiyan who claimed 20,848 (28.8 per cent) votes. The CPI(M) candidate polled 8,209 (11.3 per cent) votes, and the Independent candidate, 1,653. The invalid votes amounted to 5,870.

In the absence of booth-wise polling figures, precise estimates of how different categories of voters voted are impossible. Subramaniam's victory is attributable to the strength of the TWU in the constituency. However, he could not have secured such a massive majority without the support of the DMK. This becomes evident if we take into consideration the votes polled by the DMK and the PSP in the elections to Singanallur municipality. Although the DMK secured only five seats it had polled 9,622 votes out of a total of 45,657. As against this the PSP, which claimed eight seats, had polled only 7,676 votes.

Although the DMK leaders were initially hesitant to support Subramaniam, they activity supported him in the later stages of the campaign. The expulsion of the Independent candidate from the DMK certainly helped, since his *locus standi* in the party was now in question. The PSP, for its part, had warned DMK of withdrawal of support in a neighbouring constituency from which a DMK minister was contesting. All the same, it appears that the bulk of the DMK supporters sided with Subramaniam, setting aside local squabbles. The poor performance of the Independent candidate also lends credence to this view. It was alleged that he had been bribed by the Old Congress in order to split the DMK votes which may otherwise have been polled *en bloc* for Subramaniam. If this is so, his performance highlights the risks inherent in propping up candidates in the hope of splitting votes. Vote splitters can easily be spotted as the poll approaches. They tend to drastically slow down the tempo of campaigning in the hope of cutting down expenditure and saving some money. This substantially damages their position in the eyes of the electorate and few voters take them seriously. The Independent candidate did not organise a single meeting and his election symbol was rarely seen near any polling booth. If he had been a serious contender claiming the loyalty of DMK supporters, there is no doubt that Subramaniam would have lost many votes, although he might have still won.

In conclusion, it does not seem that the bulk of the voters in Singanallur perceived the situation any differently than in 1967. Although the candidates presented their candidature in terms of wider issues, many voters cast their vote in favour of a particular candidate for much the same reasons as before. The TWU and the NWU members still voted for their leaders. Some were influenced by their kin, and food was an important factor in bagging the votes of scavengers. In spite of all this, unlike in 1967, there certainly was an attempt to momentarily set aside local frictions, serious as they were, for the sake of larger political gain. This applies particularly to the DMK and its trade union wing, as well as the New Congress and the CPI. The voters on whom they had control did extend their support to Subramaniam notwithstanding their personal hostility to him and the TWU.

Studies in Planning Techniques

III—Decentralisation of Planning

R M Sundrum

The word 'decentralisation' has an attractive sound to it and it has become fashionable to apply it to planning. And there is no doubt that it is time for Yojana Bhavan to be relieved of some of its burdens. In fact, the case for decentralisation seems to be conceded on all hands.

But the spate of proposals for activating state planning boards, setting up planning cells in central ministries, and even planning from below at the district level do not reveal any specific programme for planning activity at these levels.

An attempt is therefore made in this paper to analyse the problem and suggest some ways of meeting it.

INDIA, as we have been told so often, is a large country. While this contributes to its strength in some ways, it also creates certain problems. When it started to plan its way to development, it was but natural to begin at the Centre. But now, two decades later, some of the purely technical difficulties of planning for such a large country from the Centre have combined with a changing political situation to demand a reconsideration. Let us review some of these difficulties.

Lack of Information

Perhaps the most serious problem, and one often cited, is the lack of information in New Delhi about the actual conditions prevailing in the rest of the country. The sheer distance between some states and the Centre and the slowness of communication over this distance has hampered the flow of information to the planners at the Centre. It may also be urged that, even if this information flowed steadily and promptly to the Centre, the sheer magnitude of the information would defeat any attempt to absorb it fully into the planning process. This is certainly a good argument against making all the planning decisions for the whole country at the Centre. However, it must also be recognised that this problem cannot be solved just by transfer of decision-making functions from the Centre to the states, for the necessary information may be lacking in the state capitals as well. On this score, the case for greater delegation of planning to the states depends on the states being able to get more of the required information. Even though the states may not have enough of this information at present, it is obvious that in principle the information for each state can be gathered more completely and analysed more fully at the state level than at the national level.

The next question relates to the making of decisions about the use of resources. While it is useful to have maximum co-ordination of decisions for planned development, it does not mean that, for this reason, all decisions have to be made at the Centre. For one thing, the amount of co-ordination that can be achieved is quite limited, and efficiency in the use of resources should not be sacrificed to any great extent in pursuit of an unattainable degree of co-ordination. The claims of co-ordination cannot, therefore, be held to deny some delegation of plan decisions to the states. Even if different agencies make decisions in different parts of the planning process, this does not preclude each agency co-ordinating its decisions with prior decisions of other agencies. What is needed is an efficient procedure for such co-ordination.

One approach is to say that there are some decisions which have a national impact and which, therefore, can best be made at the Centre while others, of more limited impact, can be made in the states. This way of posing the problem is useful for certain purposes but not quite accurate for, at least in theory, the states have a say in the making of decisions at the national level. The question then becomes one of the procedure involved, a question complicated by a number of political factors, such as whether the Indian Constitution is a federal one in the text-book sense, the role of a non-statutory body like the Planning Commission exercising such great influence in practice, and so on, which we shall bypass. Some students of Indian planning have been impressed by the efforts made in search of consensus in the planning process.[1] Our present concern will be mainly with the question of how far a decentralisation of some planning functions to the states will improve the efficiency of Indian planning as a whole, and which functions are best decentralised.

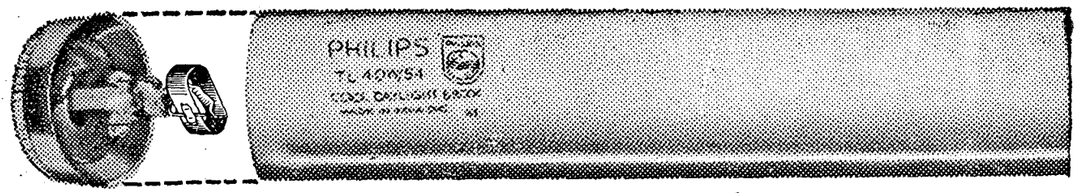
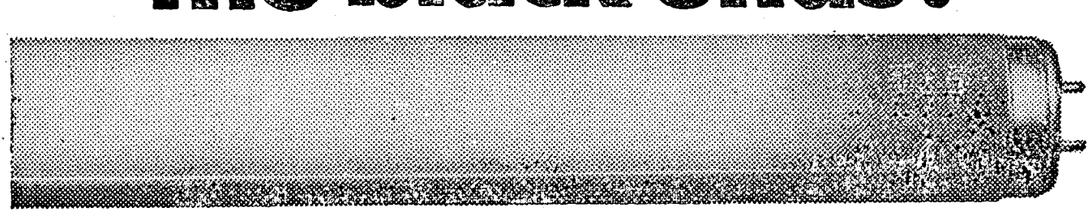
Total	14	10	40	6	6	24	100

Notes on Sectors: (1) Agriculture; (2) Community Development and Co-operation; (3) Irrigation and Power; (4) Industry and Mining; (5) Transport and Communication; (6) Social Services and Miscellaneous; (7) Total.



In the past record it is difficult to say which decisions were made where, except in a rather formal sense. Instead we might look at the sort of decisions which have been made in connection with the respective roles of the Centre and the states. Some light, not particularly illuminating, is thrown on this question by the classification of public sector plan outlays as belonging either to the state plans or the Central one. Table 1 shows the outlays allotted to various sectors in the state plans as a percentage of total outlays to these sectors. The decline in the states' share of agricultural outlays in the Fourth Plan was mainly due to the increase in the Centre's expenditure for new items, such as the contribution to agricultural finance institutions and the cost of the food buffer stock. The large central share in transportation and communications is understandable, but it is puzzling to see the predominance of the Centre in industry, not only in the organised sector but even in the village and small scale industry sector.

Allocation of Resources



Some further idea of the nature of the decisions made in planning for the states is given by some data on the allocation of resources in the various state plans. Up to the Third plan, the state plans "had been formulated by and large in terms of standard schemes which had been approved by the Central Ministries and the Planning Commission".[2] The results are shown in Table 2. The Table shows the great similarity in the allocation among the states, as is to be expected in following the standard schemes, which the states had been induced to follow by the grant of assistance from the Centre.

In the Fourth Plan, however, "it has been decided that there will be no schematic patterns of assistance . . . to avoid adoption of standard schemes unsuited to local conditions and needs . . . states will now have much

This great invention

spells the end of the black ends!

The New Philips tubelight with triple coil and anode ring does not blacken at the ends.

The triple coil and anode ring construction.
Ordinary tubelights have coiled coil electrodes at the ends. The new Philips tubelight has a thrice coiled coil—the triple coil. Around the triple coil is another new element—an anode ring. Together they give you better fluorescent lighting than you've ever seen before.

No end blackening.
Ordinary tubelights blacken at the ends, absorbing useful light. The triple coil and anode ring construction in the new tubelight prevents blackening.

Brighter, longer lasting light.
Tests prove that the new Philips tubelight is brighter. And it stays brighter longer than other tubelights. Its lumen maintenance is higher.

Good colour rendition.
Philips lamps balance brightness with good colour rendition. So you see things in the right light.

Modern integrated factory.
Every component of a Philips lamp is made in the Philips factory—the largest and most modern integrated lamp factory in Asia outside of Japan. So quality control is complete.

The next time you need a tubelight, buy the better tubelight. Philips.

Also from Philips: The TLF Reflectalite, a tubelight with a built-in reflector.

greater initiative in the formulation of schemes and programmes".[3] It has not been possible to see the effect of these new initiatives in full. The data in the Fourth Plan document show the allocation to some sectors and are summarised in Table 3.

At least as far as these sectors are concerned, the new initiatives do not seem to have introduced any greater variation among the states in their allocation of Plan outlays. This is because the Centre still retained its influence by earmarking funds by sectors, such as agriculture, major irrigation and power, elementary education and rural water supply, allowing switching of funds between projects in a sector but not between sectors.

TABLE 3: ALLOCATION OF PUBLIC SECTOR OUTLAYS IN STATE PLANS IN FOURTH FIVE-YEAR PLAN

CENTRE-STATE FINANCIAL RELATIONS

Perhaps the biggest issue in the question of decentralisation of planning has been that of centre-state financial relations. Three major factors have affected these relations. One is the division of revenue-raising powers between the Centre and the states as governed by the Indian Constitution; it has turned out that the thinking on this subject followed the provisions of the 1935 Government of India Act formulated by the British Government for the administration of a colonial economy, vesting strong financial control in the Centre, at a time when the provinces had limited governmental functions in the economic sphere.[4] The second factor is the role of the quinquennial Finance Commissions, established as a statutory body, to determine the share of states in the Central revenues; in fact, the Finance Commissions did not frame any general principles of allocation but recommended grants by and large on the basis of the revenue deficits of the states. The third factor, which was not clearly foreseen in the constitution-making days, but which has taken on a dominating significance with the advent of planning, has been the financial role of the Planning Commission in determining the size of the state plans and making provision for Central assistance for these plans. The subject has turned out to be a complex one, involving such strange concepts as 'loans' from the Centre to the states, which have an air of unreality, especially as the proportion of loans in total assistance has not been related to the needs or ability to pay of individual states. Much has been written on this subject, and we shall not attempt to cover it in the present studies. The main outcome so far has been that the states have become heavily dependent on the Centre for financial assistance in implementing the state plans. This is important for the study of planning, because of the extent to which the Centre can influence plan decisions when supported by financial assistance. The position in the Fourth Plan is summarised in Table 4.

Table 4 shows the great variability in the extent of Central assistance to the various state plans. This is because the allocation of Central assistance is only indirectly related to the size of the state plans. In fact, in the Fourth Plan, "it was decided that after providing for the requirements of the states of Assam, Nagaland and Jammu and Kashmir, the Central assistance to the remaining states for the Fourth Plan be distributed to the extent of 60 per cent on the basis of their population, 10 per cent on their per capita income if below the national average, and 10 per cent on the basis of tax effort in relation to per capita income, and that another 10 per cent be allotted in proportion to the commitments in respect of major irrigation and power projects. The remaining 10 per cent, it was decided, should be distributed among the states so as to assist them in tackling certain special problems, like those relating to metropolitan areas, floods, chronically drought affected areas and tribal areas".[5] It is interesting to see the results of this method of financing on the size of state plan public sector outlays in relation to their populations. The position for the Fourth Plan is given in Table 5. The per capita share of Central assistance is remarkably uniform, as implied in the principle of allocation. However, the per capita share of states' own resources varies widely, and, in spite of the considerable weight given to central assistance, leads to considerable variation in the per capita share of state Plan outlays. The per capita amounts of states' resources are naturally highly correlated with per capita state income (correlation with latest available income figures comes to +0.78). So, with a weak negative correlation of per capita central assistance with per capita income (—0.22), the per capita state Plan expenditures turn out to be highly correlated with per capita incomes (+0.65).

CONCEPT OF STATE PLAN

We must, however, recognise that the concept of a state Plan is a strange one. Its basic interpretation is that it consists of that part of the national plan whose implementation is, for some reason or other, assigned to the individual states. Therefore, the great interest in the size of the state Plan and the concern with getting finance for it, are somewhat out of place. These considerations would be more relevant if the benefits of a state Plan accrued in large measure to the state. That this is not so is already apparent in the remarkable uniformity of the allocation of plan outlays in the various states, even in the Fourth Plan, despite the great diversity in the needs and potentials of the states. This can also be seen in the case of particular projects. Take, for example, the case of power investment in Kerala's Fourth Plan. Out of Rs 258 crores of total Plan outlay, the allocation to power is Rs 76 crores, or 30 per cent. During the period 1960-69, the installed capacity in Kerala increased four-

fold, compared with an increase of two and a half times in the whole country. And during the Fourth Plan period, the capacity will again increase about 60 per cent, the same as in the whole country. Kerala is unlikely to use all this power within the state in the near future. So it is stated, "The objective of power schemes in Kerala during the Fourth Plan period will, therefore, be to make use of the hydro-electric power potential to the maximum extent possible to make available the power generated to different parts within the state and also to other states in the Southern region at cheaper rates".[6] The position of power investment may be compared with that of industry in the state Plan, on which the outlay is only 30 per cent of that in power, and this in a state where a more rapid rate of industrialisation is urgently needed to meet the growing problems of unemployment. It must be stressed very strongly that this is no criticism of the decision to develop the power potential in Kerala, but only to point out that when such a substantial investment is made in one state with benefits accruing to others, the size of a state Plan as something to argue about loses some of its significance. The essential point that emerges is that individual projects serving a number of states must be located in the most suitable parts of the country, taking account of the comparative advantages, the availability of data and the expertise and organisational efficiency for implementation. In addition, the choice of investments in individual states must also be concerned with their development needs and potentials. In the face of these problems, the largely financial approach to determining the size of a state Plan, based on the resources that individual states can raise and a largely neutral allocation of Central assistance, however convenient politically, is unlikely to lead to an optimum solution. Further, it raises again at the state level the inefficiencies of planning that arise when projects are framed to fit a financial constraint rather than fitting the financial arrangements to an optimum selection of projects.

Let us now consider a different approach to the decentralisation of planning. We abstract from the purely political issues and consider the question mainly on the basis of who is the best person or agency to perform any planning function and where. For this purpose, we distinguish, as we did in earlier parts of these studies, various types of planning decisions according to a hierarchical ordering of these decisions.

To begin with, we have the question of a strategy of development. In an earlier paper, the concept of a development strategy was sharply distinguished from the sort of perspective plan exercises carried on nowadays. Instead, a development strategy is a specification in broad terms of the goal aimed at for the achievement of self-sustaining growth at the end of a development phase and the broad directions of the movement towards this goal. The period involved may be envisaged as covering two or three decades. It will be concerned with the balance between agriculture and industry, the allocation of the labour force, the pattern of urbanisation, the levels of infrastructural facilities, the role of foreign trade, etc, in the final state. It will be concerned with the relative roles of capital and labour, the emphasis on human capital both for its own contribution and as a substitute for physical capital, the broad policies of resource mobilisation, the building up of institutions for all these purposes, etc, in the approach to the desired final state. And it will be concerned with the regional distribution of the development effort and achievements. It may be unrealistic to dream of complete equality over all regions and states, but the pattern of investment shown in Table 5 does not even move very far towards equalisation. As part of the development strategy, we have to consider what are the present regional imbalances in the way of development, and which of them to seek to remove and to what extent.

In spite of the frequency with which the word is used, the concept of a strategy is an elusive one. In view of the great uncertainties facing the less-developed country, a strategy cannot be spelt out in quantitative terms about the magnitude of investment, the allocation of resources, the actual projects to be implemented or their effects on such aggregates as the national income, in the form attempted in present methods of perspective planning. But once we leave this familiar ground, there arises the danger that the concept of strategy becomes too vague or emotive to serve as a guide to practical affairs. Some way must be found to give it a sharp definition. A possible approach is to consider it as a set

TABLE 5: PER CAPITA SHARE OF STATES' RESOURCES AND CENTRAL ASSISTANCE IN STATE PLANS: FOURTH PLAN

(Rs)

State	Per Capita Share in		
	State Resources	Central Assistance	Plan Outlays
Andhra Pradesh	43.4	57.8	101.2
Assam	28.3	149.3	177.6
Bihar	35.1	61.4	96.4
Gujarat	117.9	62.7	180.6
Haryana	154.2	82.6	236.8
Jammu and Kashmir	34.0	368.0	402.0
Kerala	41.1	86.2	127.3
Madhya Pradesh	31.2	67.5	98.7
Maharashtra	136.9	51.5	188.4
Mysore	63.2	61.8	125.0
Nagaland	11.9	83.3	95.2
Orissa	30.3	77.4	107.7
Punjab	138.1	72.5	210.6
Rajasthan	33.0	88.5	121.4
Tamil Nadu	83.1	52.9	136.0
Uttar Pradesh	50.5	60.5	111.1
West Bengal	23.8	51.9	75.7
Total	60.6	68.3	128.9

of principles which determine, not what particular projects will be undertaken, but rather how decisions will be made to include or exclude individual projects that may be proposed for implementation. Thus, the strategic principle that labour-intensive projects will be preferred to capital-intensive projects may be specified more sharply by assigning the amount of preference in the estimated rate of return that will be given to labour-intensive projects as against capital-intensive projects. This may be done by assigning shadow prices to capital and various categories of labour, except for the fact that the term 'shadow price' has come to be associated with elaborate optimising models which are somewhat unrealistic under prevailing conditions of ignorance and uncertainty. In order to apply the strategic principle in this way, project selection has to be based on a more strict regimen of cost-benefit analysis. Otherwise, the labour-intensive strategy will degenerate into the promotion of all types of labour-intensive industries, irrespective of their efficiency in the use of capital. Similarly, the principle of preferring export promotion to import substitution in industrialisation strategy may be more sharply defined in terms of a premium in the rate of return that will be given to export-promoting industries. Again, the decision to stress particular types of infrastructure may be spelt out in terms of a lower cut-off point in the rate of return applicable to infrastructure projects as against directly productive investment. An important element of a development strategy would also be the choice of a social rate of time preference to determine the balance between investments yielding their benefits in the near future and those yielding their benefits in the more remote future. These strategic parameters, in the form of rates of premium to be given to various desired activities, while specified tentatively to begin with, may varied over time in the light of emerging circumstances.

We have described the strategic circumstances in terms of project selection exercises. But an important element of a development strategy is the choice of general policies to be adopted by the government, especially in a country with a large role for the private sector and such a great deal of government control and regulation of the private sector. It seems essential that there should be some basic continuity in these policies, relating to income distribution, industrialisation, monetary and fiscal policies, etc, as D R Gadgil used to emphasise so much. To some extent, the strategic parameters may help in determining such policies, but they may also need to be supplemented in other ways.

NATIONAL CONSENSUS

On this interpretation of the concept of a development strategy, it is clear that its formulation is a task to be undertaken at the national level. It is not to be thought of as something to be done at the Centre instead of the states, but rather as something to be achieved by a consensus of the political leaders and technical experts all over the country. Thus the practical initiative in preparing the discussions may be taken by the National Planning Commission but it needs the full participation of state representatives in some such forum as the National Development Council. The specification of such a development strategy is therefore a part of the planning process that is best done by 'planning from above'. At the same time, the concept of a development strategy has its counterpart at the state level. Even while subscribing to the national development strategy each state is so different from the others in its initial resource endowment and in its final objectives that it will have to tailor the national strategy to its own circumstances. Thus, states with more acute problems of unemployment may stress industrialisation, especially of a labour-intensive type, more than others; states with very low income levels may have to use higher rates of time preference in the choice of investments in their areas; states, like Kerala, with abundant undeveloped forest resources may seek to give greater emphasis to that subject, and so on. This requires a strengthening of the planning apparatus at the state level for this purpose. K N Raj has argued that the present weakness of planning at this level has been due to the weakness of the planning machinery and personnel in the states and to the present techniques of plan formulation relied on by the Planning Commission.[7] But to a considerable extent, it is also due to the practice of concentrating so heavily on the Five-Year Plan as the basic feature of Indian Planning.

In the earlier studies in this series, the concept of long-term planning, as distinct from formulating a development strategy or carrying out perspective planning exercises, was suggested for some sectors, and it was also argued that certain aspects of educational expansion and agricultural development were particularly amenable to such planning. It was there proposed that National Planning Commissions in each of these sectors would provide suitable machinery for long-term planning. While the concept of a development strategy is largely an indivisible one, requiring only adaptations to individual states, the concept of a long-term plan in any given sector has to be built up out of a large number of constituent parts, consisting of specific projects for each local area in each state of the country. The planning process would start at the national level with the laying down of broad principles for determining the goals; then these would be considered in each local area, which would then make their proposals for the nature and phasing of the projects to be undertaken in each area. This would be done by involving the various local authorities who are supposed to take on developmental functions. In the process, these local development agencies would also report on any deficiencies in the present situation affecting the particular sector in their local areas. This information and these proposals would be assembled in successive stages at the district and state levels, and then put together at the national level. The important thing is that the national plan would then be based on sufficiently detailed information from the grass roots level provided by those in closest touch with the actual conditions, and that the local authorities would recognize the part in the national plan applicable to their local areas, and the effort being made to fulfil their aspirations. Once the plan is formulated, the local authorities could also be assigned their due role in its implementation in their areas. All this is a time consuming affair of the sort that cannot be telescoped into the time available for preparing successive Five-Year Plans. In connection with these sectoral long term plans, the time required would be reduced by the concentration on a particular sector at a time, and by the fact that the financial arrangements would not have to be made to balance with a pre-assigned figure.

Even in the context of such long-term plans decision-making can be decentralised in various ways. For example, the Education Commission has suggested the adoption of "a system of priorities at different levels — national, state and local. Programmes of national significance such as provision of good and effective primary education to every child, vocationalisation of secon-

dary education, postgraduate education and research, or education for agriculture and industry may be regarded as *national priorities* in the sense that decisions regarding them would have to be taken by the Centre in consultation with the states and, once they are taken, it should be obligatory on every state to implement them effectively and vigorously. In several other matters, and these would form the bulk of the decisions to be made, a system of *state-level priorities* should be adopted i e, each state may be left to make its own best decision in view of the local conditions. These would include problems such as making secondary education free of tuition fees and, in such matters, no attempt at a national uniformity need be made. In certain other matters, as for instance, in the provision of amenities in schools, and determining the type and scale of non-teacher costs, a system of *local priorities* may be adopted. The state governments may create appropriate authorities at the district and school levels and leave them free to take decisions, within the powers delegated, and best suited to the local conditions. There should be no need to expect any uniformity in these matters between one district and another and even between one school and another. A system such as this which centralises a few essential sectors at the national level would be much better than the present trend to take more and more decisions — crucial or otherwise — at the national and state levels. This sometimes results in the curbing of local initiative and disregard of local conditions."[8]

After some of the key sectors have been catered for by long-term plans, the next stage is one in which 'planning from below' begins to be important and to involve people's participation to a greater extent. This is the preparation for medium-term planning. Planning for the medium term has to come to closer grips with the financial constraints, but it is even more important to ensure that the content of plans of this type are closely related to the realities at the local level and ensure popular support and participation in the planning process. Popular participation may be analysed into, (1) the provision of information, (2) the opportunity to take part in determining plan content, (3) raising local resources to finance at least a part of the cost of projects clearly seen to benefit the local areas, and (4) co-operation in the implementation of the plan. Great hopes have always been attached to planning from below in India but it has on the whole been unsuccessful because the local authorities have been given little initiative, and that mostly in the implementation of decisions made at higher levels, and because the planning exercise at the local level has been heavily dominated by official personnel and points of view.

Flow of Information

The flow of information from the bottom to the top is a crucial requirement for efficient planning. In spite of endless forms being filled up all over the place, there is little evidence that the information collected is particularly relevant or that it is fully absorbed into the planning process at higher levels. The present plan exercises have all the hallmarks of being fitted into a financial framework with project details being worked out in the aftermath of the financial allocations, sometimes even after a plan has been formulated. What is required instead is for the information to help build up a shelf of viable projects for development. In the past, the information sought has tended to be about projects to be included in a particular Five-Year Plan. This in turn has depended too heavily on a judgment of the amount of financial resources likely to be available from higher levels of government, so that 'planning' at the district level has become an unmanageable replica of planning at the national level. It would be highly desirable that district planning be relieved of this constraint. Instead, the information aspect of local planning should concentrate on an analysis of the economic and social problems of the local area, and the sort of measures that can be taken to solve them, without reference to the question of including all of them in the next succeeding Five-Year Plan. This is already a complex task, involving the full co-operation of the people with local officials. Many students of Indian planning have discussed administrative problems concerning the role of local officials.[9] These problems have to be met by suitable administrative reforms. Apart from providing the information in a form that leads to identification of viable projects consistent with national and state development strategies, the local development agency can also share in the decision-making process by indicating its own order of priorities among suggested projects. These priorities can be strengthened in suitable cases by indicating the possibilities of raising local resources earmarked for particular projects in the local area. Greater resources can be mobilised by bringing the taxpayer nearer to deciding what service he will get for his money. This incentive can be increased by combining it with a system of matching grants such as those already in use in some states. As Arthur Lewis argues, "this does not involve decentralising control of operations to local authorities; it involves only decentralising financial decisions".[10] However, once a decision is made on the selection of projects, the local development agency can participate in their implementation.

The flow of information from local areas upward needs a lot of processing. The projects put up have to be subject to careful cost-benefit analysis. Solutions have to be sought to meet particular problems. Inadequate information has to be supplemented by further inquiries. New ideas from some areas have to be borrowed for application to other areas. Project proposals from each area have to be tested for internal consistency. Proposals from different areas have to be adjusted for a reasonable balance among areas. Problems arising from current proposals have to be foreseen and arrangements made to meet them. Then all the proposals have to be assembled in a form suitable for consideration at the financing level. The assembled proposals have to be tested for consistency with national and state development stategies. At this stage, greater consideration can be given to the phasing of the various proposals by classifying them into those falling into the next Five-Year Plan and those falling beyond. In view of the uncertainty of resource availability, some order of priorities must be imposed on the projects being considered for the next Plan. All this constitutes one of the most important functions of the Planning Boards at the state level. To discharge this function efficiently, it would be necessary to improve the lines of communication between the State Planning Board and the agencies responsible for planning at the district level.

In addition to these, planning at the state level will have to be concerned with additional projects of state-wide interest, affecting a number of local areas and dealing with matters not particularly concerning local areas, such as transport, industrialisation, urbanisation, etc. It will also be concerned with the policies of the state government affecting economic and social development in the state. It will be particularly concerned with the question of resource mobilisation in the state. This represents yet another important function of the State Planning Boards.

The next stage in the planning process will be the assembling of proposals from the states at the national level, repeating the process already done at the state level for district proposals. At this stage, the national planning agency will also add projects and policies of nation-wide interest.

Financial Considerations

The stage will then be set for the financial considerations. In the procedure described above, this consideration comes in at a late stage, rather than at the beginning as in the present practice. How much resources to raise and how to raise them will be determined partly by what is to be done. Every effort has to be made to raise resources to finance as many of the viable projects as possible. In present practice, an attempt is made to estimate the available resources as far as five years ahead. This is fraught with great uncertainty. If the estimates are over-optimistic, it would mean that plan commitments will not be fulfilled, affecting the credibility of the whole process. To make pessimistic estimates would be to reduce the plan size and scale of investments unnecessarily. One way of meeting this problem is to base the medium-term plan on clearly foreseeable resources, but to supplement it with annual plans of investment based on additional resources as they are foreseen year by year. In this approach, the annual plans will be additional to the other plans, instead of being annual segments of them. This would be a way of keeping up continuous pressure on resource mobilisation and channelling resources continuously into development. The success of this approach depends crucially on building up a shelf of projects.

Once the scale of plan outlays is determined by the projects selected to fit the maximum resources that can be mobilised, the national plan can be divided between Central, state and local plans. At present, the division is largely based on the resources raised by the states themselves and on the amount of Central assistance allocated to the states. The 'proper shere and functions of planned economic activity of a state' were once described by Dr Gadgil thus:

> "The fields of action of the Centre and of the states are, to a large extent, distinct. The Centre builds up and maintains the overall instrumentalities of national economic life such as the credit and the monetary system, the railways and ports. It also acts in relation to the basic requirements of the long-term plan of industrialisation, with emphasis on large industry and exploitation of mineral resources. The states are concerned, on the other hand, with acting on the total life of all the people in their charge and on all the diffused, dispersed small-scale units and activities. The Centre is concerned with highly concentrated action at a few strategic points; the states must affect all areas and localities, all the relevant fields and all units. The Centre is concerned with the strategy of the long-term plan and with initiating the crucial movements; the states have to engage themselves in transmitting the forces impelling economic development to all areas and units, and with concretising for the individual units the fruits of development. The generalised objectives of a state plan are, therefore, making possible, initiating and encouraging economic development in all activities and sectors, and areas and localities, and protecting the standard of living, and improving and ameliorating the situation, social and economic, of all individuals within their territories ... Another related differentiation in the Central and state action is that certain public-sector activities, in particular, those relating to production, are mainly confined to the Centre ... The sphere of action of the state lies in the realm of conservation and better utilisation of natural resources and provision of public utilities and social services".[11]

Although Gadgil probably intended this to be a description of the actual position, it looks more like an idealistic picture, one that may, in certain respects, be the goal to aim at by the development of suitable machinery at various levels. Appleby argued that power and irrigation undertakings "should be exclusively carried on by the Centre, without control being shared by the states"; he questioned the theoretical reason for putting health, agriculture and fisheries *exclusively* in the jurisdiction of the states, while leaving mining in the national jurisdiction; he was concerned that the "nation was crucially dependent on the states for actual achievement of the chief programmatic objectives".[12]

As against these theoretical approaches based on the proper roles of the various levels of government, a more relevant criterion would be that of assigning programmes to agencies best fitted to implement them in the present, while developing suitable machinery and organisation for their 'proper' roles over the longer run. This approach would incidentally remove some of the stings from the acrimonious debates on centre-state financial relations in connection with planning.

Planning and the Ministries

An important issue that has not been considered so far is the question of decentralising some of the planning functions from the Planning Commission to the various Ministries. The Study Team of the Administrative Reforms Commission on the Machinery of Planning has recommended that 'planning cells' be established in the various ministries. This recommendation has to be looked at carefully. It is not sufficient to appoint a few people in each ministry and call them a 'planning cell'. The more basic questions are how technical experts can help to improve the efficiency of overall planning; whether there is sufficient reason for specialisation of technical experts into planning staff and other staff; and if so, whether such a specialised group of technical planners has to be located in the Ministries or in the planning agencies. The technical experts surely have an important role in contributing to the planning effort; they are the best people to collect the basic information in each sector, to analyse the information to reveal the working of the economy in that sector, to evaluate the proposals put up by people at all levels, to consider the applicability of new technologies in various areas, to compare the relative merits of alternative projects and policies, and to present to the overall planning agency a comprehensive picture of each sector in relation to others, and once decisions have been made, to implement the selected projects. But as soon as we list these ways in which the technical experts can assist the planning effort, it becomes doubtful whether there is a strong justification for a planning specialisation among them; the functions listed are all integral aspects of the whole administrative process. In particular, the planning point of view has to permeate the staff of a technical service right through the hierarchy, instead of only at the top. There is more justification in specialising planners according to the sectors than for specialisation among technical experts. If there are to be planners specialised according to sector, the next question is where they should be located. The usual argument for locating a technical planning staff in the Ministries is that the Ministries 'have' the technical experts. This is no argument, for there

should be no difficulty in transferring to the central planning agency persons who have a special competence in relating a sector to overall planning. Another reason for locating the technical planning staff in the Ministries may be a desire to keep down the staff strength of the planning agency, but this is just a way of cheating ourselves. The real question is not whether the staff of the Planning Commission is too big, but what functions they perform, and how well they are organised to perform those functions. For instance, the State Planning Boards cannot perform the functions proposed for them without more staff than assigned to them at present. Once the functions of the planning agencies are determined, the balance of advantages may well be in favour of the technical planning staff being located in these agencies themselves.

Tax Performance of States

K V Nambiar
M Govinda Rao

While it would be difficult to quantify all the variables affecting the tax performance of governments, some of the major relevant variables, other than national and per capita incomes, such as, degree of urbanisation, extent of incomes originating in the industrial sector, degree of openness of the economy, etc, are capable of quantification either directly or though indirect methods. The choice of the relevant sets of variables would depend on whether one is doing inter-country comparisons or inter-regional comparisons within a country, subject of course to the general constraints of data availability.

In this paper an attempt has been made to evolve an operationally meaningful method of evaluating the tax performance of the states in India.

IN a federal system of government, proper evaluation of the tax performance of the different federating units should be a useful fiscal exercise especially in the formulation of suitable and rational criteria for the transference of resources from the federal to the regional governments. While the general and conventional technique of appraising the tax performance of governments has been on the basis of the variants of ratios of taxes to income,[1] such an approach has been found to be an unsatisfactory index of tax effort since it does not take account of other factors which are believed to affect taxable capacity, such as size distribution of income, sectoral composition of national output, patterns of governmental outlays, extent of urbanisation, degree of monetisation, etc, besides a host of other non-economic factors.

While it would be difficult to make statistical quantification of all the variables affecting the tax performance of governments, some of the major relevant variables, other than national and per capita incomes, such as, degree of urbanisation, extent of incomes originating in the industrial sector, degree of openness of the economy, etc, are capable of quantification either directly or through indirect methods. The choice of the relevant sets of variables would depend on whether one is doing inter-country comparisons or inter-regional comparisons within a country, subject of course to the general constraints of data availability. In this paper an attempt has been made to evolve an operationally meaningful method of evaluating the tax performance of the states in India.[2] Due to data constraints, our analysis has been confined to fifteen states.

METHODOLOGY

We have employed three methods: regression analysis (simple and multiple), measurement of income elasticity and incremental rates of state taxes. In the regression analysis, our dependent variable is the ratio of state's own tax revenues (T) to their net domestic product (Y). Share of Central taxes as well as receipts from inter-state sales taxes which are administered by the Central government have been excluded from the computation of state tax revenues. Our independent variables are per capita income (Yc), degree of urbanisation as measured by the ratio of urban population to total population (U), share of non-agricultural income in total state income (I) and per capita developmental expenditure (E). The period chosen is 1967-68. The ratio of urban population has been assumed to be the same as that revealed by the latest Census.

Since the regression analysis does not give a full idea about the individual performance of states over a period of time, measurement of income elasticity of state taxes and also their incremental rates for the period 1961-62 through 1967-68 has also been attempted. The states have been ranked on the basis of the results obtained under each of the three methods.

TABLE 1: SUMMARY OF REGRESSION RESULTS

	Tax Performance Measured by:	Taxing Capacity Measured by:	
(1)	T/y	= 1.979 + 0.003004 Yc (0.002504)	R^2 = .0997
(2)	T/y	= 2.000133 + 0.084203 U (.02781)*	R^2 = .4135
(3)	T/y	= 3.342121 + 0.012143 E (0.02311)	R^2 = .0208
(4)	T/y	= 1.17387 + 0.0553 I (0.0228)**	R^2 = .0321
(5)	T/y†	= 1.603272 — 0.0004912 Yc (0.002677) + 0.09476 U + 0.01882 E (0.03622)** (0.01900)	R^2 = .4801

* Significant at 1 per cent level.

** Significant at 5 per cent level.

† In the multiple regression, we have not used the variable of income originating from the non-agricultural sector inasmuch as we encountered the problem of multicollinearity with the index of urbanisation as measured by the ratio of urban population to total population. Since the latter was found to have a greater explanatory power, we have used this variable in working out the multiple regression equations. The extent of multicollinearity may be seen from the regression ranking given in Table 2 (columns 2 and 4).

TABLE 2: RANKINGS OF STATES ON THE BASIS OF VARIOUS INDICES OF TAX PERFORMANCE

States	Equations (1)	(2)	(3)	(4)	(5)
Andhra Pradesh	6	7	6	6	4

Tamil Nadu	2	3	2	4	3
Uttar Pradesh	13	9	12	9	9
West Bengal	12	14	9	13	13

REGRESSION ANALYSIS

The simple regression model is based on the least squares estimates of the co-efficients of the general equation given by:

(1) $Y_1 = a_1 + b_1 X_1 + u$

where Y_1 represents the variant of the ratio of tax revenues to state income (T/y) and X_1 the particular variable chosen. b_1 is the co-efficient of the concerned variable, a_1 is the Y intercept and u is the error term. The multiple regression model is based on the following equation:

(2) $Y_2 = a_2 + b_2X_1 + C_2X_2 + d_2X_3 + u$

where Y_2 is the variant of the tax share index (T/y), X_1, X_2, X_3, the different independent variables b_2, c_2, d_2, the values of their co-efficients and u is the error term. Table 1 summarises the results of regression analysis.

It will be evident from Table 1 that the explanatory power of the equation is much higher using the variable of urbanisation (U) as measured by the ratio of urban population to total population. The regression co-efficient is statistically quite significant (.4135) at much above 1 per cent level. This is true to a lesser degree in the case of income originating in the non-agricultural sector (I) used as the variable. Both with per capita income (Yc) and also the per capita level of development expenditures (E) as the variables, we obtain a poor fit. The R^2 in both cases is very insignificant. This contradicts a generally held hypothesis that income (in the sense of national income, and here meaning state income) and developmental expenditure are among the important determinants of tax performance of governments. At any rate, as far as the state governments are concerned, our results do not support such a hypothesis.

The results of the multiple regression analysis only help prove our earlier conclusion that degree of urbanisation is the major determinant of the taxable capacity of states. The β co-efficient value for this variable is superior in the multiple regression (.09476) to that obtained in the simple regression fit (.084203), thereby indicating a more positive slope for the curve. The regression co-efficient of 0.48012 obtained for the multiple regression test also brings out better the explanatory power of the equation. The state rankings that result from using the estimated co-efficients of tax performance are indicated in Table 2.

We may go into the rationale of the rankings after an evaluation of the income elasticities and incremental rates of taxes for individual states.

INCOME ELASTICITY AND INCREMENTAL RATES

The tax performance of states measured by regression analysis may not be a sufficient indicator of the ability and willingness of the different states to raise additional resources as it is likely to miss certain important factors. Moreover, the regression analysis presented above does not enable one to evaluate performance of individual states through a period of time. To get an idea about such factors it may be useful to analyse the income elasticity of the state tax structure and also the incremental rates of tax revenues. The term 'income elasticity' as used here is not in the sense of elasticity of a static function, but as the ratio of the percentage change in revenue to the percentage change in state income during the period 1961-62 to 1967-68. It thus takes into account the effects of both the changes in rate structure and also base structure on the productivity of taxes. Elasticity has been measured using the following equation:

$$\epsilon = \frac{\Delta T}{T} \Big/ \frac{\Delta Y}{Y} = \frac{\Delta T}{T} \cdot \frac{Y}{\Delta Y}$$

where ϵ stands for elasticity, Δ T for change in tax revenues, T for tax revenues in the base year, Y for state income in the base period, and Δ Y for change in state income.

The incremental rate is a more simple measure and relates change in tax revenues to change in incomes $\left(\frac{\Delta T}{\Delta Y}\right)$.

Though the mathematical relationship between the two is very close, the latter measurement has some advantages arising from the freedom of the incremental measure from the relationship to the size of the ratio of tax revenue

TABLE 3: RANKING OF STATES ON THE BASIS OF DIFFERENT PERFORMANCE TESTS

	Regression Rank (1)*	Income Elasticity (per cent)	Rank (2)	Incremental Rate (per cent)	Rank (3)
Andhra Pradesh	4	1.24	7	4.1	7
Assam	2	0.86	12	3.0	11
Bihar	10	0.59	15	1.8	15
Gujarat	12	1.46	5	4.3	5
Jammu and Kashmir	15	2.10	2	4.2	6
Kerala	1	1.56	4	6.8	2
Madhya Pradesh	11	0.99	10	3.0	12
Maharashtra	6	1.61	3	6.0	3
Mysore	8	1.35	6	4.7	4
Orissa	14	0.80	13	1.8	14
Punjab (pre-reorganisation)	7	1.02	9	3.9	9
Rajasthan	5	1.16	8	4.0	8
Tamil Nadu	3	2.29	1	7.6	1
Uttar Pradesh	9	0.91	11	2.8	13
West Bengal	13	0.77	14	3.3	10

* As per column 5, Table 2 above.

TABLE 4 : COMPARATIVE STATE RANKINGS ON THE BASIS OF DIFFERENT TAX PERFORMANCE CRITERIA

Rank	Regression Analysis	Elasticity	Incremental
(1)	Kerala	Tamil Nadu	Tamil Nadu
(2)	Assam	Jammu and Kashmir	Kerala
(3)	Tamil Nadu	Maharashtra	Maharashtra
(4)	Andhra Pradesh	Kerala	Mysore
(5)	Rajasthan	Gujarat	Gujarat
(6)	Maharashtra	Mysore	Jammu and Kashmir
(7)	Punjab	Andhra Pradesh	Andhra Pradesh
(8)	Mysore	Rajasthan	Rajasthan
(9)	Uttar Pradesh	Punjab	Punjab
(10)	Bihar	Madhya Pradesh	West Bengal
(11)	Madhya Pradesh	Uttar Pradesh	Assam
(12)	Gujarat	Assam	Madhya Pradesh
(13)	West Bengal	Orissa	Uttar Pradesh
(14)	Orissa	West Bengal	Orissa
(15)	Jammu and Kashmir	Bihar	Bihar

to state income. The values of the ratios obtained under these two methods and the ranking of states are indicated in Table 3. Col (1) of the Table also indicates the ranking of states on the basis of regression analysis which is based on col (5) of Table 2.

It will be seen that the pattern of states as emerging from our analysis presents an interesting picture. The rankings differ vastly in each case. The ranking on the basis of regression analysis is indicative of the gap between tax effort and the estimated tax potential. Thus, a high ranking in the regression analysis indicates that the particular state has been taxing very near to its potential. The states falling in this category are Kerala, Assam, Tamil Nadu, Andhra Pradesh and Rajasthan. Maharashtra may also be included in this group. However, their rankings on the basis of elasticity and incremental ratios happen to differ. While Kerala, Tamil Nadu and Maharashtra maintain their high positions, which indicate that their performance has been of a high order, and particularly so in the case of Kerala and Tamil Nadu, for Assam, Rajasthan and Andhra Pradesh the rankings are lower. This may be said to imply that their inadequate tax performance has been more due to their inability rather than their unwillingness to tax. The states of Punjab, Mysore, Uttar Pradesh and Bihar would come within the medium rankings on the basis of regression analysis. This would imply that compared with the former group of states, the untaxed potential in these states is more. However, the rates of exploitation in Mysore and Punjab have been much higher than those of Uttar Pradesh and Bihar which obtain low rankings in terms of elasticity and incremental rates. Then, we have an interesting cluster of states comprising of Madhya Pradesh, Orissa, Jammu Kashmir, Gujarat and West Bengal whose low regression rankings indicate a comparatively larger segment of untaxed potential. Between Madhya Pradesh and Orissa, which are relatively speaking less developed states, the performance of the former has been better as indicated by its higher elasticity and incremental ranking. It would, however, be difficult to categorically say whether their low tax effort has been either due to unwillingness or inability to tax. May be, the latter aspect is more relevant. In the case of Gujarat, while the performance of the state in recent years has been of a high order as measured by the elasticity ratio and incremental rate, its tax effort has not been able to sufficiently exploit its estimated tax potential. West Bengal provides the unique case of an industrially advanced state where the segment of untaxed potential would seem to be very high as indicated by its low regression ranking. Perhaps in this case, one could say, in a relative sense, that the state government has not been putting in adequate effort. The states may now be ranked as in Table 4 on the basis of our analysis.

NOTES

1 The US Advisory Commission on Inter-Governmental Relations, "Measures of State and Local Fiscal Capacity and Tax Effort".

2 For a general framework of relative measurement of fiscal performance of states in India, see K V Nambiar, "Fiscal Performance and Capacity of States", *The Economic Times*, August 17 and 18, 1971. While the methodology adopted by us in this paper may be described as a combination of that evolved by Jorgen R Lotz and Elliott R Morss in their paper "Measuring Tax Effort in Developing Countries" IMF Staff Papers, Vol XIV, 1967, and the one employed by Charles Montrie, Kenneth J Fedor and Harlan Davis in their article "Tax Performance within the Framework of the Alliance for Progress: A Comparative Evaluation", *National Tax Journal*, Vol XXIII, No 3, September 1970, we have also tried to introduce some modifications in their approach.

Ceat Tyres of India Limited

Statement of the Chairman, Mr P A Narielwala

THE following is the Statement of the Chairman, Mr P A Narielwala, to the Shareholders of Ceat Tyres of India Limited at the Fourteenth Annual General Meeting held in Bombay on May 18, 1972.

To the Members:

The year 1971 was a momentous year for our country. It was a year of considerable stress and strain on our economy as a result of the influx of nearly ten million refugees from East Pakistan, whom we had to house, feed and provide medical and other facilities. In December, the situation was further aggravated by the unfortunate war thrust upon us by the rulers of Pakistan which resulted in the defeat of Pakistan by our armed forces and the emergence of its eastern wing as an independent sovereign state of Bangla Desh. On the outbreak of war, the Company placed its entire production at the disposal of the Government in the Ministry of Defence. Not only were supplies under special arrangements rushed to the border areas irrespective of cost or inconvenience, but successful attempts were also made to increase the production in the sizes required by the Defence Services. We also donated a sum of Rs 1,25,000/- to the National Defence Fund, through the Prime Minister, for the welfare of jawans. Whilst congratulating our Prime Minister, Mrs Indira Gandhi, for her able and courageous leadership in steering the nation throughout the critical days of 1971, we also salute our armed forces on their brilliant victory over Pakistan.

Since the close of the year, as many as 16 of our States went to the polls last March and in most of these elections, the Congress party was returned to power with large majorities. This success is a mark of the confidence and trust our people have reposed in the Prime Minister. It is as much a personal triumph for her as it is a vote of the people to provide themselves with stable governments in their respective States.

SIGNIFICANT YEAR FOR COMPANY

For your Company, the year 1971 was also a significant year. Our expansion programme was completed in early July, somewhat ahead of my own anticipation, and before any of the other tyre companies had completed theirs; the additional plant and equipment went into production without any significant teething troubles; and we received full co-operation from labour and all other employees in the completion of the expansion and in our operations. The result has been a substantial improvement in the Company's output of automotive tyres, from 4,83,544 units in 1969 to 7,24,265 units in 1971 (the figure for 1970 was only 3,70,410 units due to the strike), and a handsome growth in its profits as the shareholders must have noticed from the Directors' Report and the Profit and Loss Account for the year 1971.

Your Board has fulfilled its pledge to the Shareholders that they would share in the Company's prosperity and it has accordingly recommended for your approval a higher dividend of Rs 15/- per share — an increase of 36 per cent above the dividend of Rs 11/- per share distributed in each of the years 1969 and 1970. The Company will be distributing a sum of Rs 45,54,000 to the shareholders by way of dividends as compared with Rs 33,39,600 disbursed in the previous two years.

With the plant continuing to run at more than its full capacity during the first four months of the current year, and a ready off take of the entire output, the shareholders may look forward to another successful and profitable year. With the constant stress that management has laid on the maintenance of quality control at every stage of production, your Company's products continue to enjoy a ready market both domestically and abroad.

BICYCLE TYRE PLANT

As mentioned in the Directors' Report, our Bicycle Tyre plant at Nasik will be ready to go into production during the second half of the current year. The civil construction work is expected to be completed before the onset of the rains. Machinery for the plant including the imported items are already at the site. If the quality of the tyres coming out from trial production is up to our satisfaction, "CEAT" bicycle tyres will be in the market during the last quarter of the year.

RAW MATERIAL SUPPLIES

Supplies of natural rubber were available during the year freely, but the rubber growers in Kerala have been bringing considerable pressure upon the Government of India to compel the automotive tyre industry to carry a larger inventory of rubber than is warranted for its requirements. Some surplus stocks had accumulated on account of reduced off take by some of the units in the industry which have suffered or continue to suffer from a drop in their tyre production from prolonged strikes and slow downs. We are of course co-operating with Government in carrying 3½ months stocks of rubber but a large inventory inevitably puts a burden on our financial resources.

The supplies of other raw materials are on the whole adequate, but the tendency on the part of the suppliers to resort to unilateral increases in prices is a matter of concern to us. We are unable to pass on to the consumers the increase in the direct material costs of our products, as the selling prices of tyres are regulated by Government and cannot be altered without consultation with them. The industry has on several occasions drawn the attention of Government, but there has been no response. We have recently seen newspaper reports that the Government of India has decided to enforce the three year old recommendation of the Tariff Commission that the rayon tyre cord manufacturers should reduce their prices, but no official communication has been received by the Tyre Industry.

EXPORTS

The exports of tyres in 1971 were a record for the automotive tyre industry amounting to Rs 706 lakhs. Your Company's exports amounted to Rs 209 lakhs. The Company has more than fulfilled the guarantee given by it to Government of exporting 10 per cent of its total production.

Although the performance of the Industry in exports is commendable, it is necessary to sound a note of caution that it may no longer be possible for the industry to maintain this tempo of progressively higher exports. This is because most of the developing countries to which we export, are establish-

ing their own tyre plants and which would lead to a reduction in the exports and secondly, because of the changes which the Government of India brings about in its export policy. From many forums and on many occasions the exporters have urged Government to follow a stable export policy and if a change is desired by Government it should have prior consultation with the exporters or the industry as the case may be. Unfortunately this advice is not heeded and when a sudden change is brought about, it only leads to disruption in exports and hardship to the exporters.

Duty Drawback

Recently Government has chosen to drastically reduce the duty drawback on nylon tyres with retrospective effect from 1st January 1972. The industry's commitments and contracts for exports are made months in advance and as the change in duty drawback was imposed without any prior consultation with the industry, the exports which have been so assiduously built up over the past few years are likely to be affected during the current year. The industry has made a suitable representation to Government against this change and has called for a review of Government's policy.

Furthermore, in the new import policy for 1972-73 announced recently, the import entitlement for nylon cord has been substantially cut, we believe, as a result of the representation of two indigenous manufacturers who have recently gone into production of nylon tyre yarn and cord. These manufacturers have claimed that they have the capacity to cater to the entire demand for nylon cord of the tyre industry. Whilst we welcome the establishment of this new industry in India, for which we have been pleading for the last few years, we doubt whether the two producers can meet the industry's needs. At present, the quality of only one manufacturer has come up to the tyre manufacturers' satisfaction after many trials and assistance from the tyre industry. The other manufacturer is still in a trial stage of production and his samples of cord have so far been found to be below the quality standards of the industry. It will be therefore hazardous for the tyre industry to depend on its requirements of nylon cord on only one manufacturer. As more than 80 per cent of the exports from India are of nylon tyres, the reduction in import entitlement of nylon cord might also lead to a further fall in the exports of tyres in the current year.

I had referred, last year, to the large number of Letters of Intent issued by the Government of India to State Industrial Development Corporations for setting up new automotive tyre factories in the country. I had expressed a fear that many of them might not fructify into industrial licences. Our fears have turned out to be true as only one letter of intent has been converted into an industrial licence so far. We do not see any tangible steps taken by the other parties to obtain industrial licences.

Whilst the present licensed capacity in the automotive tyre industry is about 5.2 million units, the capacity installed at the end of 1971 was for only about 4.8 million units. The production during 1971 reached 4.64 million units, an increase of 620,000 units over the production of 1970. Assuming that the full licensed capacity will be installed during the current year and some of the units which suffered in their production last year from labour troubles, power cuts, etc, would be able to utilise their capacities better, the production of tyres in 1972 is estimated to reach 5.5 million units. We therefore do not anticipate any shortage of tyres during the current year except in few truck tyre sizes. But the shortage is likely to arise in 1973 and will be felt more strongly in 1974, unless steps are taken to licence additional capacities.

New Tyre Factory

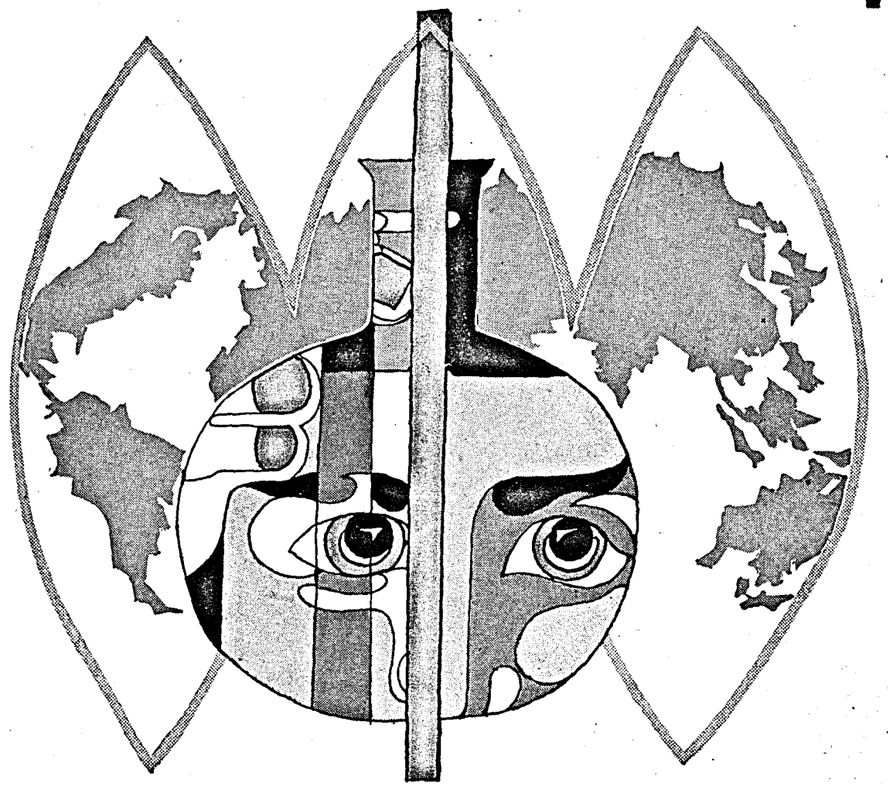
Our own application submitted to Government, last September, for a licence to establish a new automotive tyre factory for producing 400,000 tyres per annum in an underdeveloped area of one of the States, is still under Government's consideration. We live in hopes that it will be favourably viewed and a licence will be issued to us at an early date. As it takes anything between 24 and 30 months to install a new plant and put it into production, there is not much time left for Government to come to a decision and permit the existing units to expand and/or license new units.

At the Extraordinary General Meeting of the Company held in November last, there was a note of pessimism amongst some of the shareholders about the likelihood of a glut in the production of automotive tyres in the country and a caution to the Board about venturing into further expansion of our capacity. I had then assured the shareholders that the demand for tyres would continue to grow both in the domestic and export markets. We are also of the view that a small surplus in the licensed capacity of the industry is desirable as it will serve as a safeguard and a cushion against plant stoppages and a recurrence of shortages. If our application for a new factory is approved by Government, I can assure the shareholders that we will take urgent steps to proceed with its erection and to go into production as soon as possible to meet the growing demands of defence, road transport organisations, OE users and our other valued customers for our products.

Generous Support

The results of 1971 bear ample testimony to the confidence your directors have always had in the future of your Company. I am glad to report that our offer of 30,360 new right shares to the Indian shareholders at a premium of Rs 100/- per share was oversubscribed and we received application moneys for Rs 66.44 lakhs. We are grateful to all our shareholders for this generous support. I must however express my regrets for the delay that has taken place in completing the allotment of the new shares. This has been due to factors beyond our control; because of a prolonged strike in one of the banks in Andhra Pradesh, we could not receive from our bankers all the application forms for the new shares in time. It is only this month that we have received the final bank statements, and have taken in hand the work of completing the allotment. In the course of the next few days, the shareholders will receive their share certificates for the shares applied for by them together with the cheques for the refund of moneys received in excess of the shares available with the Company for allotment.

Before I conclude, I would like to convey on your behalf and on behalf of the Board, our appreciation to our employees at all levels for their hard work during the year under review, in completing the erection of the new plant and helping us to produce these excellent results. To our network of dealers and customers throughout the country as also to our distributors abroad, we offer our thanks for their continued and unstinted support to our products. The Board has also placed on record its warm appreciation to our Managing Director, Dr A Tealdo, whose untiring efforts have contributed in no small measure to the success of the Company's operations and to its progress from year to year. I am sure you would wish to join the Board in conveying your thanks to Dr Tealdo for his valuable services to the Company.



Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

What's this sign a symbol for?

New ideas in engineering. They originate at L&T where a group of engineers design, manufacture and install plant and equipment for major industries—chemical and pharmaceutical, food and dairy, minerals and oil, pulp and paper, steel and cement, power and irrigation. The L&T sign also symbolises complete plant construction based on process know-how from clients and collaborators—plants seen through from greenfield site to final commissioning. In short, the L&T sign symbolises the development of every vital industry in India.

The Apple-Cart

SO OFTEN was it said that in Vietnam the Americans and the Russians were fighting a war by proxy. This theory should now finally be put to rest with the publication of the Soviet-American communique at the end of Nixon's visit to the USSR. In it the two sides mention their respective positions on Vietnam, and at the same time state that the Vietnamese must be left alone to decide their destiny. The Russians calls for an immediate cessation of the bombing of North Vietnam and the unequivocal withdrawal of all American and allied forces from the south; the Americans re-affirm their call for the release of prisoners-of-war, an internationally-supervised cease-fire and a subsequent withdrawal of American troops within four months. But Vietnam appears to be rather a troublesome footnote to the otherwise excellent state of *rapport*, if not bliss, between the two powers. There is not even a polite divergence of world-views as there was in the separate statements issued by the Chinese and the Americans at the end of Nixon's visit to China. The rest of the Soviet-American communique and the complementary joint declaration shows a remarkable convergence of views on almost everything on earth and in space. There is little reason to think that behind this similarity of views there might be a serious difference of interests.

And what could be more symptomatic of their joint power interests than their symbolic limitation of strategic arms — which does not even pretend to limit the destructive power of their nuclear armoury but merely stipulates a numerical and therefore largely meaningless limit to the inter-continental ballistic missiles and ballistic missile carrying submarines that the two sides can possess. Although this agreement is meaningless in terms of the curbing of destructive capability, it acquires great significance if it is regarded in terms of establishing the confidence of each side in the strategic and political intentions of the other. In nuclear strategic terms the two sides have, through the agreement, ensured that each believes in the retaliatory power of the other and so each can assume that the other will not make a first strike against it. Thus by agreeing to the continued good health of each other's nuclear armouries the two have not only insured themselves against a security threat from each other, but have also tacitly agreed that they have also very little to fear from each other in the political-ideological field.

More pertinently for other countries, especially in Afrasia and Latin America, Nixon stated in his broadcast from Moscow to the Soviet people that the two major powers must ensure that small countries do not drag them into dangerous confrontations with each other. The logical corollary to this form of reasoning is either that the two countries should jointly dominate smaller nations or that they should quietly divide the small countries of the world into their respective spheres of interest. Or, perhaps, a judicious mix of the two would be wisest. This, of course, assumes that other major potential centres of military-economic power, *viz*, Peking, Tokyo, Brussels, and also some minor, but zealously independent, centres like Hanoi would allow themselves to be manipulated by a Moscow-Washington or even a foreseeable Moscow-Washington-Peking axis. It also assumes that the basic identity of interests between the United States and the Soviet Union will hold, whatever the internal political changes within the two countries. Recently, there have been some indications that the Brezhnev-Kosygin team's overtures to the Americans are not completely welcome to Defence Minister Grechko, security chief Andropov and former security chief Shelepin, who is also known to be an articulate party theoretician.

Despite all these doubts, the power position of the two countries which is undisputed as yet — though Peking is not too far behind — warrants a joint, and when necessary a jointly domineering, approach towards 'troublesome' small powers. But the apple-cart could be easily upset by any small upstart which might be willing to take much greater political-military risks because it does not have as much to lose as the obese giants.

Foreign Trade

Proliferation of Agencies

THE latest annual report of the Ministry of Foreign Trade begins defensively with a narration of "some important adverse factors beyond control" that are said to have affected export performance. In spite of the uncertainties on the international monetary scene, and the shortfalls in supplies of iron and steel and raw cotton, which are mentioned as the prominent adverse factors, exports from the country, it is claimed, fared much better during the year than in any of the post-1966 devaluation years. Unfortunately, the Ministry's figures fail to substantiate this claim — simply because the Ministry still wants to cling to its statistically inflated export figure for 1970!

The report lays stress on "a certain degree of continuity and stability" in policies so as to provide an environment conducive to growth of exports. The claim is repeated that industrial licensing policy and import policy continued to accord high priority to expansion of export-oriented production. At the same time, the import policy for 1971-72 was designed to save imports, encourage import substitution and to promote exports. There is much attachment to 'canalisation' of imports and exports through public sector agencies, though the claim that 70 per cent of imports are being canalised through the public sector appears to be exaggerated. The enthusiasm for expanding the public sector's role in exports is to be seen in the decision to canalise exports of mica through the MMTC, notwithstanding its poor performance in exporting iron ore. The Project and Equipment Corporation was registered as a wholly-owned subsidiary of the STC to promote exports of sophisticated engineering and railway equipment and also for undertaking complete turn-key projects abroad. The Tea Trading Corporation was set up a few months ago to market tea in packs as well as blended instant and green tea in India and abroad. In view of the keen competition at home and abroad and the importance of brand names and the established channels of distribution, the Tea Corporation's task can only be described as uphill — and that too with considerable optimism. The government has also expressed an interest in canalising exports of textiles. In view of government's obvious anxiety to increase the number of public sector agencies to handle foreign trade the question needs to be asked whether it has carefully considered the organisational and functional aspects of these agencies.

About the STC, the Ministry's report claims that it "has continued to play a pivotal role in diversification of India's export trade, affecting exports to the existing markets, exploring new areas, maintaining exports of traditional items, promoting long-term exports of new items and generally assisting the private trade to export difficult-to-sell items" (p 120). It is curious that this catalogue of the STC's activities should make no mention at all of its import operations, though during January-October 1971 imports accounted for nearly 70 per cent of its total business. As regards the MMTC, of the estimated turnover of Rs 280 crores during 1971-72 imports are estimated to be nearly two-thirds. Even as regards the Projects and Equipment Corporation, imports constituted nearly two-thirds of total turnover. It needs to be explained why all these public sector agencies are burdened with import activities if their primary responsibility is to promote exports. One explanation for assigning both export and import (and in respect of the STC even domestic trading) activities to public sector agencies appears to be that this enables them to offset their losses on exports with profits on sale of imported items. However, from the point of view of efficiency and motivation for minimising losses on exports it would be better perhaps to have separate state agencies for imports and exports. The losses on exports would then be clearly seen as will be the profits earned on imports.

The Ministry's report is silent on the follow-up measures that were supposed to be taken in persuance of the Export Policy Resolution presented to Lok Sabha on July 30, 1970. The Trade Development Authority set up to promote exports of a selected range of products by identifying competent production units and offering them a package of services is the single important development in export promotion during the last few years. But in spite of its ambitious objectives it is unlikely to make more than a marginal contribution to growth of exports. The other development worthy of attention is the setting up of working groups to draw up export production plans in respect of items having reasonable export potential. There are 10 such working groups which are expected to identify products with export potential, review existing capacity and production, estimate internal and foreign demand, etc. None of these has, however, submitted its report so far.

The Ministry's report takes credit for sundry reforms in many fields like minimising administrative delays in the payment of cash subsidies and duty drawbacks and efforts to make readily available indigenous as well as imported raw materials on a limited scale. It also talks of the government's efforts in the field of publicity and dissemination of what it considers to be useful information, training of personnel and sending and receiving of delegations. What impact these activities have had on promotion of exports is nowhere assessed.

It is interesting that in an important economic ministry such as the Ministry of Foreign Trade, the need for setting up a Policy Planning and Co-ordination Division to handle "work relating to export policies, export planning, co-ordination, technical assistance, management services for export, state trading and barter deals and overseas investments by Indian entrepreneurs" was felt only last year. The new division, according to the report, has been given an important role to play in the evolution of policies and their periodic evaluation and review and in maintaining co-ordination and contact with other divisions as well as other organisations which have been set up under the Ministry of Foreign Trade to assist export promotion. All this work the new division is supposed to do with a staff composed of an Economic Adviser, a Deputy Economic Adviser and two Research Officers and a small subordinate staff!

On account of printing problems, publication of this issue has been delayed. This is regreted.

Britain and Rhodesia

Muddling Back

MYOPIA or the inability to see much beyond one's nose has been a common ailment among the colonial powers and the colonist residue lording it over the natives in the colonies. Part of this lack of perception shows up in their constant underestimation of the degree of nationalist fervour in African or Asian countries. The constitutional settlement which was envisaged for Rhodesia by the British in consort with Smith's little coterie of white men, conceded the likelihood of a parity of African seats with the number of European seats in the lower house of the Rhodesian legislature in about 30 to 50 years, qualified by a liberal sprinkling of ifs and buts. The proposed settlement also conceded the possibility of African rule at some remote, indeterminate date. In fact, the fruition of these concessions admitting the existence of a majority African population were to be totally dependent on the goodwill of an avowedly white racist regime. And to top it all — this speaks volumes for the rather stupid racial arrogance of the British as well as their kith and kin in Rhodesia — the Africans were expected to be politically docile and naive enough to accept such vague eventualities.

Not surprisingly, there was a violent African reaction against these proposals when a commission 'to assess' their acceptability visited Rhodesia earlier this year. But it was still hoped the commission would provide a conveniently equivocal answer and allow the British Government enough leeway to wash its hands off the whole bothersome Rhodesian affair, including the trade sanctions.

The commission has now given a clear verdict stating that most Rhodesian Africans and, therefore, the majority of Rhodesians regard the terms of the proposed settlement as unacceptable. The Tory Government in Britain has found itself with no alternative but to accept the verdict and to shelve temporarily any thoughts of legally recognising Rhodesia as a sovereign state. Sanctions are, also, to be continued. The pro-Smith diehard caucus in the British parliament consists of only about 30 Conservative MPs, a number of whom have also been against British entry into the Common Market and have come under increasing fire from their own party for disloyalty and indiscipline. They are unlikely now to risk further party opprobrium on the Rhodesia issue. This means that the Tory Government will not find it difficult to maintain the *status quo*, i e, abide by the myth that Rhodesia is still a British colony and continue the half-hearted sanctions. This will not be done for any moralistic reasons, but because there are some fears that some African countries, particularly Nigeria, to which Britain exports much more than it ever could to Rhodesia, might take a dim view of Britain's withdrawal of sanctions. And in any case, British exports to Rhodesia can always be routed through South Africa, so as to avoid the embargo.

Bangladesh

Government by Patronage

A Correspondent writes :

FOR some people, the fruits of liberation have not been long in coming. In his May Day broadcast to the nation, in which he reiterated his determination to lead the country to socialism, Sheikh Mujibur Rahman announced a pay rise for government servants which would cost the government 30 to 35 crore takas annually. He also announced the abolition of land revenue on holdings upto 25 *bighas*. All arrears of land revenue on these holdings are also to be written off. This decision is estimated to cost the government 70 crore takas a year.

The immediate question that arises is about the wisdom of the government, faced with the urgent tasks of rehabilitation and reconstruction, permitting such large-scale erosion of its revenues. Among the first acts of the government after liberation was the constitution of a planning commission consisting of economists and others with impeccable credentials. But so far the commission's existence appears to have been largely symbolic. Apart from the Sheikh's May Day announcements, this is confirmed also by other circumstantial evidence such as, for instance, the painfully slow rehabilitation of the transportation system and the continuing absence of satisfactory arrangements for running many of the jute and textile mills and other industrial units abandoned by their former West Pakistani owners. The disorganisation of currency and finance also persists, hindering both internal and external commerce. And there are few signs of a public distribution system for the basic necessities of life in short supply.

Even if the case for affording relief to certain sections of the people at the expense of the exchequer is conceded, it is not at all clear that those picked by the government for favourable attention are the most deserving. It is true that the salary increases to government servants have for the present been limited to those drawing upto 335 takas per month. Also, in real terms the benefit of the increases has been more than wiped off by the rise in prices since the liberation. Similarly, the remission of land revenue, it may be said, will benefit the more modest land-holders. But the special attention paid to government servants and land-holders has to be judged in the context of the government's increasing reluctance to talk about what, if anything, is being done to rehabilitate those uprooted during the liberation struggle, including the many who had fled to India.

In the circumstances, it is difficult not to see the pay hike for government employees and the remission of land revenue as part of the pork-barreling, the most outstanding example of which so far perhaps is the import policy announced last month. The policy is tailor-made for distributing official patronage through the Awami League. An arbitrary limit of 20,000 takas has been placed on single import licences and it has been decreed that at least 10 persons from every thana would be given licences. And to be eligible, applicants for licences have to get certificates of good conduct from the local member of the Constituent Assembly, who is an Awami Leaguer in almost every case!

The preoccupation with dispensation of political patronage is a sign of the government's failure to get down to the tasks of reconstruction and development; it also reflects growing political nervousness which does not at first sight square with the Awami League's monopoly of power in the country and Mujib's monopoly of it within the League. However, both monopolies are rather less solid than they appear. The urban middle class at any rate is becoming aware, and critical, of the regime of corruption and favouritism ushered in by the Awami League as well as of the factionalism within the League. The League's youth wing, the Chhatra League, was openly split on the eve of the recent elections to the Dacca University students' union in which it was soundly trounced by the pro-Moscow National Awami Party. As for Mujib, his place as the father of the nation seems secure enough, but his performance as the head of the government is increasingly coming in for questioning. Mujib himself is not unaware of these developments; the shrillness of his recent attacks on the 'enemies of the people' allegedly conspiring to subvert the independence of the country bears testimony to this.

The National Awami Party of Muzzafar Ahmed is seeking to exploit the dissatisfaction with the Awami League to present itself, if not as an alternative, at least as a force capable of providing the much-needed stuffing to the political system. The party's strategy is to give full-throated support to Sheikh Mujib and his "socialist" policies, but to call attention at the same time to the corruption and the other failings of the Awami League and the administration and to emphasise how these heighten the danger of subversion by "Left extremists and communalists". By implication the NAP projects Sheikh Mujib as a supra-party national leader — an image which it helped to promote by persuading him to address the inaugural session of its national conference on the 19th of this month. Without asking for a place in the government for the party, the national conference issued a call for "joint political action" by the "progressive" section of the Awami League, the pro-Moscow Communist Party of Bangladesh and itself.

Political Prisoners

Is the Fig-Leaf Showing ?

THE Minister in the Ministry of Home Affairs disclosed in reply to a question in the Rajya Sabha the other day that upto the end of April this year 4,666 persons had been detained under the Maintenance of Internal Security Act. The Act came into force on July 2, 1971, replacing the Maintenance of Internal Security Ordinance promulgated two months earlier. It empowers the Central and state governments to detain without trial or recourse to the normal legal processes any person with a view to preventing him from acting in a manner prejudicial to the security of the country. The maximum period for which a person may be detained is 12 months, but the period can be stretched indefinitely by the government issuing fresh detention orders.

The Minister's reply included a table which is interesting enough to bear reproduction here, The table suggests that of the 4,666 persons detained, 1,619 had been released till April 30, 1972, leaving 3,047 persons still in detention on that date. These figures, it is important to remember, do not cover Jammu and Kashmir which has its own preventive detention law and to which the Maintenance of Internal Security Act does not extend. As expected, West Bengal accounts for the bulk of the detentions, though Gujarat's 286 does come as a surprise.

Name of State/Union Territory	No of Persons, Detained upto 30.4.1972	No of Persons among Them with Known Political Affiliation	No of Detenus since Released
Andhra Pradesh	40	22 Naxalites and other extremists	40
		6 Majlis-e-Ittehadul Muslimeen	
		3 Jamaat-e-Islami	
		3 Tameer-e-Millat	
Assam	123	13 Naxalites and other extremists	26
Bihar	22	10 Naxalites and other extremists	14
Gujarat	286	Information is being obtained	286
Haryana	8	1 Naxalite/Extremist	8
Kerala	32	19 Naxalites and other extremists	24
		2 Jamaat-e-Islami	
Mysore		3 Jamaat-e-Islami	24
Maharashtra	31	Information is being obtained	28
Manipur	5	1 Jamait-e-Ulema-e-Hind	4
Madhya Pradesh	9	—	8
Orissa	1	1 Naxalite/Extremist	—
Punjab	103	Information is being obtained	51
Rajasthan	64	Information is being obtained	52
Tamil Nadu	4	Information is being obtained	4
Uttar Pradesh	6	2 Republican Party of India	
		Information is being obtained	
West Bengal	3829	Information is being obtained	1001
Arunachal Pradesh	1	—	—
Chandigarh	1	—	1
Goa, Daman and Diu	1	—	1
Mizoram	1	—	—
Delhi	47	1 Jamait-e-Ulema (dissident group)	47
		13 Jamaat-e-Islami	
		1 Anjuman-e-Ahmediya	
		18 Naxalites and other extremists	

Two significant facts emerge from the table. First, of those detainees whose "political affiliations" were ascertained, almost all were identified either as "Naxalites and other extremists" or as belonging to Muslim organisations like the Jamaat-e-Islami. Indeed, of the 119 detainees information about whose political affiliation was given by the Minister, 117 belonged to these two categories — 84 were classified as Naxalites and other extremists and 33 as belonging to various Muslim organisations. Surely, this is suggestive of where, in the government's view, lie the major sources of threat to the country's security?

Second, and even more significant, is the fact that out of the 4,666 persons detained without trial, the Minister could give information about the political affiliations of only 119. This is truly amazing, if one considers that action under the Maintenance of Internal Security Act would be taken essentially on the basis of the political affiliations of the individual concerned. One would thus expect that the government would have a pretty good idea of a detainee's political affiliations before it decides to incarcerate him. And yet the Union Home Ministry appears to be aware of the political affiliations of only 119 of the 4,666 persons whom the Central and state governments had thought fit to detain without trial in the interests of the security of the country, in respect of as many as 4,317 of the remaining, information was still being "obtained"!

It would be altogether too complacent to assume that this reflects no more than bureaucratic sloth. As it is, the individual is practically defenceless against the government's actions under the Maintenance of Internal Security Act. The framers of the law did try to clothe it in a fig-leaf of decency by providing, first, that the reasons for detention had to be communicated to the detainee within 15 days of his detention and, second, that every detention order had to be reviewed by an advisory board which would send its report to the government within 10 weeks of the date of detention. The Minister's inability to provide information about the political affiliations of all but a very small number of those detained raises serious doubts about how far even such tenuous concessions to legality as are incorporated in the Maintenance of Internal Security Act are operative in practice.

Power

Patratu Debacle

N K Singh writes :

FOR the last one and a half months Bihar is in the grip of a severe power crisis. The power station at Patratu, which caters to the needs of the Chotanagpur industrial belt, and the one at Barauni, which serves the equally important region of north Bihar where a green revolution is in full swing, are generating only 110 MW of power between them. The Patratu power station, with an installed capacity of 400 MW, is generating only 44 MW and the Barauni plant is generating 66 MW out of its capacity of 145 MW.

The Bihar State Electricity Board has, since its inception, lost about Rs 40 crores, even though electricity tariffs in Bihar are among the highest in the country. While the BSEB gets electricity from the Damodar Valley Corporation at 2 paisa per unit, it supplies power to its consumers at 35 paisa per unit. Repeated allegations have been made in the state legislature and outside that the Board is bristling with both inefficient and corrupt officers. But, thanks to the high-level support that such elements enjoy, no action has been taken against them.

The crisis at the Barauni thermal power station is not as serious as that at Patratu which is operating at 11 per cent of capacity. The debacle at Patratu has severely hit the production programme of industries in Chotanagpur region where are located some key industrial units like Heavy Engineering Corporation, National Coal Development Corporation, Tata Iron and Steel and Bokaro.

Besides highlighting the gross inefficiency of the BSEB, Patratu is also a reflection of our over-reliance on foreign collaboration. This is not the first time that the plant has failed to ensure uninterrupted power supply. The investment of Rs 60 crores made so far on this gigantic project has not yielded supply of even 100 MW of power uninterruptedly for a few months. The original project report, prepared after an agreement with the Soviet Union in 1962, had envisaged the installation of the 400 MW capacity by 1967. But there has been a delay of at least five years in the commissioning of the plant's full capacity and in the process the cost of the project has gone up by nearly Rs 12 crores.

The Patratu power station consists of four units of 50 MW each and two units of 100 MW each. The four 50 MW units were commissioned between 1966 and 1970; one of the 100 MW units went on stream in June 1971 and the other 100 MW units only in May this year. Many factors contributed to the delay. The Ranchor Committee, appointed to go into the working of the Bihar State Electricity Board, had exposed the gross mismanagement at almost every stage of the planning and execution of the project. At the very start, a number of components from Russia were received in "semi-finished condition and required a good deal of machining and matching". As a result, many flaws cropped up. It was pointed out by the Committee that no arrangement had been made by the government for inspection of the equipment during manufacture. Nor was there a cell at the project site for "proper planning, evaluation and quality control". And there were far too many contractors who "often fell out with each other causing dislocation of work". To make matters worse, "the contractors had very few skilled technicians with experience of turbine work".

Two of the four 50 MW units got damaged as a result of a series of accidents and breakdowns in April this year. Once other 50 MW unit had been shut down for "capital maintenance" and the 100 MW unit was shut on May 2 owing to slag formation in its second boiler. The other 100 MW unit was commissioned on May 3 but it had to be closed down after just three days. At the moment of writing only one 50 MW unit is working, generating 44 MW of power.

According to the Chief Engineer of the plant, non-availability of spare parts from the Soviet Union is one of the main reasons behind the trouble. But what ails Patratu most is lack of coordination and understanding among those who control its destiny. Some top executives of the State Electricity Board and of the Patratu power plant are not getting on well together and the working of the project has suffered on this account. A no less important cause of the frequent breakdowns is the lack of skilled operating staff. The BSEB had spent several lakhs of rupees on sending some 50 engineers abroad for training in the operation of thermal power plants, but not even half of them have been posted for manning the station. Even the Chief Engineer is a novice. No wonder, an SOS had to be sent for Russian experts when the four generating units broke down in quick succession.

Talepiece: The boilers of Patratu station are so designed that they can burn low grade coal with high ash content and also coal washery byproduct. The site of the station was itself selected because of its proximity to the coal-bearing belt of South Karanpara which abounds in low grade coal. Paradoxically, one of the causes of the recurrent power crisis has been the failure of the BSEB to feed Patratu with low grade coal!

Tyres

Task for NCST

PRODUCTION of automotive tyres expanded threefold between 1960 and 1971. And yet the industry's central problem remains to be squarely faced. The problem is that of technology. Of the seven companies in the industry, all have foreign technical collaboration and all but one have financial collaboration as well. (The exception is Inchek Tyres, set up with Czechoslovak collaboration.) Though production of tyres in the country started way back in 1936 and despite the manifold expansion of output in the last decade, the tyre industry remains completely tied to imported technology.

Over the last few years the government has issued expansion licences to six existing units and to as many as 10 new parties, including the Industrial Development Corporations of Punjab, Gujarat, Andhra, Tamil Nadu and Orissa. Only one solitary license out of the 10 issued to new parties has been taken up for implementation. And, sure enough, this is being done with foreign technical collaboration! The unit in question is being put up by the Modis at Modipuram in collaboration with a West German firm. The large number of idle tyre licences bear testimony to the government's casual approach to industrial planning. It was not vidently realised at the time that handing out licences to new parties would achieve nothing unless some action was taken simultaneously in regard to the problem of technology.

Once the unimplemented tyre licences began to be an eye-sore and became the subject of criticism, govern ment spokesmen have been making desultory statements about "purchasing" technology for making tyres and tubes. In a statement in the Lok Sabha two months ago, the Minister for Industrial Development announced that the government had decided to set up a centralised agency to purchase foreign knowhow for tyre manufacture and make it available to units in the country. What has happened to the idea? Like so many so-called 'decisions' of the government, has it been quietly forgotten—once the purpose of satisfying some inquisitive Member of Parliament was served? If the National Commission on Science and Technology is seriously looking for gainful employment, here is a matter for it to give immediate attention to.

Or else the experience of the last few years is certain to be repeated. WWith all the recent exapansion in capacity and the licences under implemention, the chairman of Ceat Tyres anticipates a general tyre shortage to re-emerge next year (for text of speech, see May 20, pp 1039-40). The timing may be off by a year or so but the prognostication is otherwise valid. In fact Ceat Tyres, having completed the first round of expansion with admirable despatch, has applied for licence to set up a new 4 lakh tyres unit. No doubt those of the other existing producers who have not already done so, may be expected to do the same. And unless the government can find an answer to the problem of making available the technology to prospective new entrants into the industry, worsening shortages, a booming black-market and public criticism will once again force the issue — as happened three years ago.

Company Affairs

Unbecoming Reticence

OF all the Union Ministries, the Ministry of Company Affairs — which from August 1970 has been given a status independent of the Ministry of Industrial Development — appears to be the most reticent about its working, judging from its skimpy Annual Report of barely 35 pages. Of the three most important pieces of legislation regulating business activity, *viz*, Industrial Licensing, Company Law and the MRTP Act, administration of the last two is the responsibility of the Company Affairs Ministry. Of these, the working of the two year-old MRTP Act has generated much controversy, a lot of it because the Ministry has been unnecessarily reticent about the manner in which it is administered. Even Company Law needs some important modifications to regulate changing corporate practices as well as to make it effectively serve the broader social objectives of regulation of corporate activities. One would, therefore, have expected the Annual Report of the Company Affairs Ministry to give a more detailed resume of the problems faced in the administration of these two acts and the measures proposed to be taken to tackle these problems.

As regards the administration of the MRTP Act, the Ministry seems to have made up its mind to give the minimum possible information. The government, it needs to be remembered, has also not published the MRTP Commission's reports on cases referred to it or even a summary of them. Perhaps the reason is that the Ministry has yet not evolved definite procedures and decision-making criteria for exercising its powers under the Act. By way of information on the MRTP Act all that the Annual Report gives is the following :

(i) After the enforcement of the MRTP Act, 828 companies have been registered under Section 26 which requires compulsory registration of undertakings which by themselves or together with interconnected undertakings have assets worth at least Rs 20 crores or which are dominant undertakings with assets worth at least Rs 1 crore.

(ii) 7,050 trade agreements have been registered under section 35 which requires compulsory registration of restrictive trade agreements falling within section 33.

(iii) As regards the administration of anti-concentration provisions requiring prior government approval of substantial expansions, new units and mergers/takeovers, what the annual report reveals is summarised in the Table. The information reveals nothing about how many applications were referred to the MRTP Commission for investigation and advice, how many of those referred were approved or rejected by the Commission, in which cases the Commission's opinion was divided or unanimous, how many of the proposals made by the largest ten business houses were decided without reference to the Commission, etc. In fact, nowhere in the Annual Report, is the role played by the MRTP Commission in the administration of the Act, particularly in respect of control of concentration mentioned. This probably reflects the seant importance the Ministry attaches to the existence and working of the Commission.

Since the Ministry finds itself on surer grounds in the administration of the Companies Act, it is less tight-lipped. However, even here most of the information given is of the routine kind, providing no insight into the working of and effectiveness of the Companies Act. The report mentions that the Ministry is actively considering amending the Act to tighten some of its provisions in the light of "certain undesirable" trends and practices which have come to its notice. But one is given no idea of what these "undesirable trends and practices" are and which provisions of the Act need to be tightened and how.

Guest Keen Williams

Rather More to It

FOR the first time in the 50 years since Henry Williams started manufacture in Calcutta, Guest Keen Williams, the company subsequently formed with principal shareholder, achieved a turn-Guest Keen and Nettlefolds of UK as over of Rs 50 crores in 1971. GKW was badly affected in 1967-68 when the railways, its major customer, cut back on orders. GKW went off the dividend list in those two years. It has now recovered, and its Rs-10 share, quoted as low as Rs 12-13 in the recession, is back in strength at Rs 35-36.

GKW's chairman is optimistic about the company's capabilities, and defends the high liquid resources maintained by it on grounds of "inflation, high tax rates, and growing volume of business" In his speech, a point of interest which is left insufficiently elucidated pertains to the proposed 1 for 2 bonus issue. The chairman discloses that the government has turned down the request for bonus issue on the ground that Rs 1.11 crores of total Share Premium Account was "created by consideration other than cash" which it will not permit to be capitalised. Without much further clarification, Maitra maintains that this policy raises many important points which affect "both our company and yourselves as shareholders, for it effectively freezes a part of our Share Premium Account for many years to come".

In 1960, GKW made a right issue at a premium of Rs 18.50 per share of Rs 10. Guest Keen and Nettlefolds of UK, the principal shareholders, paid their part of the premium not in cash but by giving over their subsidiary, Sankey Electrical Stampings, to GKW. Hence the Share Premium Account that is now being proposed to be used to issue bonus shares was really sizeably created by 'considerations other than cash' and cannot be allowed to be capitalised again into the hands of the British collaborator.

What K C Maitra could have illuminated GKW's shareholders about is the operations of Sankey Electrical Stampings which GKW accepted in payment and which has not performed well and has had much labour unrest. What does GKW propose to do to put this part of the company on its feet?

Capital View

Romesh Thapar is abroad. Capital View will be resumed on his return. — *Ed.*

Sailing into Further Earnings

Hansavivek

CENTURY SPINNING, which is already engaged in the manufacture of textiles, rayon yarn, sulphuric acid, carbon-di-sulphide, tyre yarn, caustic soda, salt, and cement, intends to take on further lines of activity. The Memorandum of Association is being altered to include, many more diverse lines — among them shipowning, shipping, air transport, road transport, haulage contractors, contractors of all kinds of buildings and structures including roads, railways, pipelines, dams and projects, and even the rendering of general, administrative, secretarial, advisory, consultancy and engineering services. It is stated that the company incurs expenditure of Rs one crore annually on freight and cartage to move salt from Saurashtra and to import pulp and sulphur, etc, for its rayon tyre cord and chemical divisions at Kalyan. Another Rs 16 lakhs are spent on transport of salt from Jamnagar to other ports. It is argued that the company would thus save on this by undertaking the transport itself; and, of course, it could also utilise the remaining space for booking cargo for others. Century has been receiving inquiries from Iraq, Indonesia, and other countries, for supply of management services to parties there. The company has been, in fact, negotiating for setting up a composite textile mill in Indonesia with equity participation in the form of capital goods; it also proposes to supply administrative and technical services to run the mill

The company's industrial licence application to undertake manufacture of 30,000 tonnes, each, of chemical pulp and paper was referred to the MRTP Commission. On completion of its detailed public inquiry, the Commission recommended — *vide* its majority report — that the company should be granted the industrial licence. The project, involving a capital outlay of about Rs 30 crores, however, is now proposed to be set up in the joint sector. In regard to the application for the seamless pipe project the government has informed the company that it proposes to set up a unit for the manufacture of seamless steel pipes and tubes in the public sector. If, for any reason, the proposed public sector project does not come up, government will again invite applications for consideration. The company has been granted a 'Carry on Business' licence for manufacture of portland cement with an installed capacity of 6,00,000 tonnes per annum. The plant is expected to go into production during the second half of 1973. The company has secured a contract from Zuari Agro Chemicals to set up phosphoric acid handling and storage facilities. The contract, valued at Rs 70 lakhs, is expected to be completed during this year.

Century's working during 1971 showed contraction of margins. While net sales increased by about 5.5 per cent to Rs 48.39 crores, gross profit decreased by over 18 per cent to Rs 11.88 crores. The textile mills experienced a rise in costs owing to increases in prices of cotton and labour charges. The working of the rayon plant has considerably improved following modifications and improvements to the machinery and equipment. In accordance with the voluntary agreement with weavers, the company is now expected to supply 70 per cent of the production at fixed rates, instead of the 60 per cent of production it was supplying upto last year. In addition, as before, 10 per cent of the output is being offered at concessional rates against exports of rayon fabrics. The position of raw materials is causing concern, Last year, the imported pulp released to the company was 'far less' than its requirements. The working of the tyre cord plant continues to be satisfactory. The company has approached government for permission to further expand its weaving capacity of tyre cord fabrics. The Tariff Commission is again going into the cost details of tyre yarn, since there has been a 'steep' increase in the cost of production. Last year, Century exported nearly 21 per cent of its production of tyre cord to industrially advanced countries, such as Holland, Austria and the UK.

KILLICK NIXON produced much better results for the year to November last, with a 55 per cent rise in gross profit at Rs 55 lakhs — following only a 12 per cent increase in net sales at Rs 5.20 crores. This was owing to the continued rationalisation at the steel files factory and improved performance of the engineering and furnace factories — in spite of cuts in quotas of imported materials and components, shortages, delayed deliveries and poor quality of raw materials, expiry of collaboration agreements, and consequent changes in trade names. Production and sales of files in terms of quantity were in fact lower compared to the previous year, but better realisations in the home and export markets lifted the turnover and brought about an appreciable improvement in the operating results. The working of the prestressing and machinery divisions was also satisfactory. The volume of business in imported as well as indigenous drilling equipment showed an increase. The steel sales division had a successful year, with record business resulting from a more liberal import policy of government to meet the shortage of steel. Sales of aircraft spaces were also satisfactory, despite a cut in import licence. Offtake of domestic appliances slackened last year owing largely to the imposition of excise duty on pressure cookers. The kitchenware range has been expanded, and two new types of irons are expected to be introduced shortly. Turnover of other products handled by the marketing divisions showed continued improvement. The shipping and clearing and forwarding departments also fared well. Export turnover declined, although the outcome was better than in the previous year owing to better selection of items. Diamond exports negotiated by the company were the highest ever, although more recently these exports have been handled on a commission basis. The company has given guarantees on behalf of the subsidiary, associated, and erstwhile managed, companies for the grant of cash credit and/or loan facilities for a maximum amount of Rs 6.02 crores. This figure includes a guarantee of Rs 60 lakhs given jointly and severally with Kohinoor Mills and other parties in respect of cash credit facilities to Navjivan Mills. The balance sheet of Navjivan as at December 31, 1970, disclosed that the paid-up capital and reserves together amounted to less than Rs 59 lakhs, while the accumulated losses amounted to over Rs 1.43 crores without providing for arrears of depreciation, doubtful debts, advances, etc. It is stated that the outcome of the company's guarantee on behalf of Navjivan is contingent upon that company's 'future successful working'.

SHRI AMBICA MILLS has completed modernisation and expansion of its unit number 3. The process house at unit number 1 has been reorganised and expanded. A Zimmer rotary screen printing machine and a few other processing machines have been installed. In order to provide sophisticated preparatory machinery for weaving sections, efforts are being made to obtain import licences. The company has been successful in exporting its fabrics, and is exploring newer markets. The tube division continued to face 'acute' shortage of raw materials. The government's decision to allocate steel on the basis of licensed capacity provided the company with steel for barely one shift. The licensed capacity was doubled to 25,000 tonnes per annum, but allocation of steel was not changed during the mid-year owing to procedural difficulties. The plant ran partially only on imported raw materials, which resulted in an inadequate margin. The company has already taken steps for doubling the existing licensed capacity in view of the government's announcement of liberalisation for fuller utilisation of existing plant and machinery. The allocation of steel quota is likely to improve thereafter. The machinery manufacturing division fabricated its first continuous bleaching plant which was installed at Arbuda Mills, the subsidiary. Efforts are being made to further diversify the production programme to include specialised and sophisticated machinery. The cylinder division commenced commercial production last year, but the inadequate supply of LPG sheets from HSL and TISCO hampered the working. The production programme is being diversified to include cylinders for various chemicals. Ambuja Chemicals began production of emulsions for various textile industries. Programmes for the modernisation of the manufacturing and research activities is continuing. Ambica's net sales advanced by 11 per cent to Rs 17.60 crores, but its gross profit declined by 19 per cent to Rs 228 lakhs as a result of a sharp rise in costs. Arbuda also experienced the same trend with consequent reduction in profit despite higher production and sales.

AHMEDABAD ADVANCE MILLS' gross profit last year was halved at Rs 46 lakhs, despite an 18 per cent rise in net sales at Rs 9.66 crores. This was mainly due to the steep increases in cotton prices and further increases in other costs which, together with the credit restrictions, diminished margins in the cotton textile business. The metal division at Navsari had to contend with raw material shortages and power cuts. Apparently, the disturbed conditions in the border areas also had an adverse effect on the company's working. The company is going ahead with the expansion of the metal division. A rights issue of equity shares was made last year to yield Rs 21 lakhs. Steps are being taken for issue of further debentures worth Rs 1.5 crores and for a foreign currency loan equivalent to Rs 93.25 lakhs from ICICI. Orders have already been placed with Hindustan Steel and Bharat Heavy Electricals for supply of a 2 hi/4 hi reversible cold rolling mill at about Rs one crore. This plant is scheduled to be delivered in July next year. Clearance from the capital goods committee for the import of a Sendzimir mill, a continuous annealing pickling line and metallurgical laboratory equipment has been received. The import licence is, however, still awaited. A plot of land adjoining the metals division was purchased last year for about Rs 5 lakhs for the expansion scheme. The company has built up a sales organisation of its own for the products of its metals division.

Policy and Decision-Making in Government

V A Pai Panandikar

ONE of the basic justifications for modern public bureaucracies has been the policy and decision-making functions which such organisations are especially designed and equipped to discharge. To Max Weber, the father of bureaucratic theory, organised career based bureaucracy was the epitome of efficiency, and truly the only available instrument for rational and efficient performance of the functions of a modern government.

Theoretically, policy and decision-making is supposed to be done in the government by the bureaucracy under, of course, the overall supervision and direction of the elected representatives of the people. These in our case would be the Ministers and the Cabinet as a whole. However, the bureaucracy is supposed to be the "expert" group with the necessary educational, technological and other relevant embellishments to provide the real knowhow for policy- and decision-making.

Main Components

The main theoretical components of policy- and decision-making may be described as follows. First of all, there is the basic or primary function of anticipating and if necessary even "discovering" the policy needs of the country, and hence of the government. In others words, the bureaucracy is expected to "scan" the environment including the emerging social needs to arrive at some tentative understanding of the changing socio-economic values, and thus anticipate or sometimes even "discover" the broad policy needs of the country.

Secondly, having done so, the bureaucracy has to systematically develop the various alternatives or choices —that is to say identify the different manners in which the political (policy) needs of the people can be met In particular it has weigh carefully the pros and cons of each of the alternatives in terms of the objectives and their "attainability".

Thirdly, the bureaucracy is expected to suggest a specific choice of alternatives or in other words suggest a "policy". Policy in this context would be a generic course of action within which specific or individual decisions could be made to achieve the desired objectives.

Fourthly, as the expert group and directly concerned party, the bureaucracy is expected to decide upon the instruments of implementation. This would involve indication of how the policy objectives can be achieved through specific administrative machinery either existing or through specifically designed instruments of implementation, which may be broadly termed as "administrative policy".

Fifthly, the bureaucracy is expected to apply the generic policy to specific instances—decision-making in individual cases. Generally speaking this is supposed to occupy the maximum time and effect on the part of the bureaucracy as a system of policy-making and its implementation in government.

One final addendum to this list is that in order to perform all these functions, the bureaucracy has to organise suitable "scanning" and "memory" instruments both for policy and decision-making. Without effective scanning mechanisms no bureaucracy can anticipate the policy needs, while in the absence of a proper memory and retrieval system, the available information and knowledge would not be made use of in actual practice for day-to-day operations of government.

Actual Situation

The real and pertinent question is: what is the policy and decision-making process in actual practice?

With very little hesitation one can say that there is today hardly any "policy anticipation" in the government. Even in the most organised agencies of the government, there are no mechanisms and no personnel designed for or capable of handling such a task. Indeed the function itself does not exist and whenever an anticipatory question is raised, the normal reaction is: why bother about a problem until it has arrived? Nor is there an understanding that for "anticipation" to function in policy-making, the government needs to examine a series of developments on a national plane, both institutional and behavioural. This would inevitably imply the use of research technology. But the orle of research technology. But the role of research in articulating policy needs is nearly absent in India and almost ironically the only organised attempts to collect data on the citizen clientele and their preferences seem to be made by the soap and cigarette manufacturers and distributors.

In the absence of such policy planning work, the development of alternatives of policy choices in the government is based on the "knowns" which necessarily confines our policy horizons to the beaten tracks and to a few and limited alternatives. In fact it means that here is really no hope for new alternatives to be developed. How can they be developed unless we have better facts and new interpretations, and we are willing to look at national and international experience for developing our policy options?

Within this context of the reality of policy-making, it is easy to understand how the identification of a choice would be. In the neatly bureaucratised system in the government, an important factor that dominates is status. In deciding upon the actual alternative or in other words in making a policy or policy-type decision, the judgment of the Joint Secretary is *ipso facto* superior to that of the Deputy Secretary, and of the Secretary to that of the Joint Secretary. In such a status-based policy-making system, the objectives, the means and the substance itself, all become secondary.

To aggravate the problem further, the question of considering an appropriate instrument of implementation or the generic problem of administrative planning and policy has never been asked with any seriousness. At most the problem is discussed in terms of the difficulties of getting necessary personnel skills. Without denying the crucial importance of personnel, any identification of the problem in purely "manpower" terms is not only simplistic or even simple-minded but it also betrays a total ignorance of the role of the administrative system as a whole and of the need for articulating administrative policy to support substantive policy. Indeed, the two cannot even be separated.

It is, therefore, not surprising that in the government there is little application of policy to individual cases and there is much of "deciding" the individual cases. Rarely is there a thread of

policy running through the decisions. As is well known, the preoccupations are much more with "precedents", regardless of their policy relationships. One can cite but infinite examples as to how decisions are made in the most sophisticated ministries and departments without any organic link to policy, and how often there is no trace or even a mention of what the policy is or supposed to be in the field.

The Administrative Reforms Commission's Report on the Machinery of Government did make several useful recommendations regarding the function and the organisation for policy planning, etc. These are still languishing in the rusty stacks of the Secretariat if they have not already been moved out to the National Archives. The story in all the ministries and departments runs on familiar lines. "We know what policies the country needs", and therefore, no agencies or even people have been given the responsibility to examine, evaluate and anticipate policy needs. As a result the "memory" that is left in the government and practised is not policy memory but the memory of precedents and decisions retained and nurtured by the "sections" in the government.

Inevitably, therefore, the decision-making in the government is done by the LDCs, the UDCs, and the Assistants — at best by the Section Officers. And that is the ultimate reality for the five hundred and sixty million citizens of this country.

II

The traditional view that "the decisive reason for the advance of bureaucratic technical superiority over any other form of government" and its non-va'idity in India in key respects has been gone into above.

The case for a higher civil service[1] ever since the British imperial days has been made in terms of the expanding needs of government for specialised and diverse skills, especially higher policy level skills which cannot be procured from the open market. These skills are necessary to make decisions of one time character, or unique decisions. Essentially then, these would be policy decisions or decisions of an individual and fundamental nature and having implications for policy itself. Generally speaking in the developing countries which are still in the process of basic political and economic change, the component of such 'non-programmed' decisions by government would be much higher than in the developed countries where the areas and spheres of drastic or major change in any sector of national life would be of such less magnitude and significance.

The case for the higher civil service in India has also been made on the basis of the need of the government for a core of highly trained and developed groups of persons at different levels of the administrative hierarchy performing both the higher executive functions as well as the policy roles in the secretariat and other key agencies. Since such personnel are not available in the open market, they have to be developed on a career basis through deliberate exposure to executive and policy work. Such a system also has the advantage of maintaining continuity in administration.

Another argument which is sometimes presented, but not with adequate force, is that citizen relationships can only be effectively handled by highly trained and 'superior' personnel who have the necessary experience and attitudes. To what extent are these claims valid and applicable to the higher civil service in India?

Scrutiny of Record

It is by now reasonably established that the policy needs of the country are rarely examined within the administrative system; that the machinery of the government and hence the higher civil service is neither organised nor equipped for the purpose. In fact even today there is little recognition in the elaborate corridors of the secretariats of the need for anticipating and organising for such a role and working towards it. There is a great deal of evidence that such policy thinking and the consequent questioning of conventional wisdoms is deliberately discouraged, sometimes even punished.

Besides, any scrutiny of the recent administrative history of India reveals virtually no new important policy measure which could be attributed to the foresight of the higher civil service. Contrast this with the British civil service which conceived the national health service or its French counterpart which gave birth to the European common market concept and its organisation.

It is well known that the bulk of the important policy measures in India have tended to emerge in recent years from outside the civil service. Most often the genesis of new policy has been in the political parties on the basis of 'popular' needs. Sometimes important policy suggestions have also come from a select group of universities and research institutions.

Perhaps the relatively successful areas of higher civil service operations have been in the executive branches. That is to say in areas where policy content has been lower and implementative content higher. In other words, the present higher civil service could, at best, be expected to achieve an acceptable degree of results in the traditional sectors of governmental activities like law and order, revenue collection and other activities of routine or repetitive character. Even here, however, the relationship of the civil service with the citizen clientele has been none too happy and the bureaucratic attitude has often smacked of feudal and imperial overtones leaving many adverse scars on the citizen clientele.

In other words the performance record of the higher civil service in crucial areas such as policy planning and formulation, achievement of broader planned and programmatic goals and a reasonably effective citizen relationship makes sorry reading. What was considered the great legacy of British rule in India is now the greatest liability to India.

One question which may be legitimately asked is whether the necessary changes could not be brought about with the existing framework. There is nothing in the present administrative scenario of India to suggest that there is a prospect of significant change in the higher civil service and its movement towards essential functions and role. In fact the opportunities available to the higher bureaucracy to adapt themselves in recent years, have been frittered away by their preoccupation with grabbing as much as possible for themselves and by bickering among themselves. Even worthwhile reforms have been nullified by the vested interest sitting in judgment over the suggested changes. All this only goes to show that the higher civil service has neither mentally nor professionally reached a level from which it could be expected to fulfil its responsibilities.

Comparative View

Curiously enough the experience of many a developing country is none too dissimilar. Through clever backstage manipulation many bureaucracies in the developing countries have sought to nullify the rights of the citizen or the needs of the state. To some extent even the Chinese experience seems to be similar. Han Suyin for example notes "today in China, in spite of a communist revolution, in spite of seventeen years of socialised education, one can still find attempts at the resurgence of feudal bureaucratism[2]."

The only conclusion inevitable from a close look at the recent performance of the higher civil service in India is that it is not only incapable of undertaking the tasks which justify its existence but that its entire character and orientation is detrimental to the development of an effective system which meets the national needs. If the purpose of such an expensive system is to provide expert and new policy advice to the government, it is in no position to do so. If the rationale is that there is no other source of such skills available, even then the case is feeble. In fact the present higher civil service with its iron grip on the administration and financial resources, has made it almost impossible for other groups to develop in the country which can fulfil the nation's urgent needs. Besides, the experiments in the last two or three years to co-opt properly qualified individuals from outside into the highest levels of government have demonstrated for the first time that the essential roles at these levels can be met well, if not better, by carefully selected persons from outside.

In other words, the present higher civil service is not only incapable of performing its own role but it is also an impediment to the growing needs of the country especially since more and more responsibilities are to be shared by the government for the development and growth of the country. The need for a group or groups of people who have the capability of providing such services and thereby serving a crucial function continues to remain.

Alternatives

What then are the alternatives? Insofar as requirement for policy personnel is concerned, by far the most important potential source would be the political parties. Except, perhaps, for the leftist parties, few including the ruling party have made much effort to build professionally competent cadres of such persons. Most of the national parties can indeed afford to organise small research cells around which can be built a group of 'sympathetic' professionals and thinkers who could help the party concerned to develop their policy frameworks and potential policy executives.

The time has also come to utilise the services of many a national research institution to help the assessment — including anticipation — of policy needs. Several existing institutions, especially in fields like economics, are already engaged in such activities. However, quite often the direction from the ineffective bureaucracy for such work has been lacking. Many a time there has been a lack of appreciation of the role such institutions can play. As a result, even the limited work that has been done has remained unutilised. In passing it may also be added that there is sometimes even a studied unwillingness on the part of the higher civil service to make adequate use of such institutions and personnel, often for petty and parochial considerations of service interests.

Finally, in several areas where existing national competence in academic or professional groups is not adequate or the institutions are found lacking, it may even be desirable to create or establish new institutions. This, however, should be done after the potential of the various available alternatives has been adequately utilised.

Action Need

The action need now is to remove the highest echelons of the secretariats from the clutches of the ineffective higher civil service and to bring in professionally competent individuals, perhaps through party cadres, perhaps through academic institutions, or other sources, including professional groups and institutions. This need not mean that no one in the civil service should be eligible. Rather such eligibility should be of an individual and not of the service which has cut at the very roots of professionalism and merit in the governmental bureaucracy of today.

Hopefully the political parties will include in their election programme an administrative *manifesto* which will seek to destroy the vestiges of feudalist bureaucratic arrogance and the anti-democratic system which has been perpetuated through the higher civil service. Without such a plan, the prospects for the future of the socio-economic goals so crucial to the success of democracy in India are bleak.

In short, the higher civil service in India is not only unnecessary but dangerous. Unnecessary because the crucial functions which the higher civil service is supposed to perform in assisting the state and the people of India to achieve their socio-economic goals, is simply not being discharged by it. Dangerous because it has systematically over the last twenty-four years denied the people of India their rights and access to power for fulfilling their aspirations, and any further continuance of the system will subvert the long-term national objectives of making a smooth and natural transition towards a functioning democracy.

Notes

1 While India has *no* single higher civil service as such, the term is used here to connote all organised groups or services from whom the higher secretariat and other positions are presently manned. These include the IAS and all other central services which are on 'deputation' to the Central Government and similar personal at the state level.

2 Han Suyin, "China in the year 2001" Penguin, London, 1970, p 21.

FROM OUR CORRESPONDENTS

NEW DELHI

Taming the Trade Unions

AT last the government appears to have cleared the decks for introducing the proposed new industrial relations legislation. The Union Labour Minister, R K Khadilkar, has been working hard towards this end for nearly two years. The Labour Ministry will now present a bill to the next session of Parliament to replace the existing Industrial Disputes Act passed as far back as in 1947. This has been made possible by the results of the conference of State Labour Ministers earlier this week and the coming together of the INTUC, the AITUC and the HMS (led, r spectively, by the Congress, the CPI and the Socialists) to form a joint National Council of Central Trade Unions (NCCTU).

The intervention of the Prime Minister and the indefatigable energy shown by the Union Labour Minister have been responsible for this outcome. For, only a fortnight ago the three central trade union centres had fallen out and had gone back on the "limited accord" that they had arrived at last year. The State Labour Ministers, on their part, continue to be very jealous of their rights in the formulation and application of labour laws and would not have easily surrendered any part of the authority vested in them under the Industrial Disputes Act now in force. It was something of a personal triumph for R K Khadilkar

that he was able to bring round both the trade union leaders and the State Labour Ministers to accept the proposed new industrial relations law for which he has been canvassing support ever since he was appointed Union Labour Minister.

The proposed industrial relations law has been sought to be described as a half-way house between the existing law — which invests the government with unlimited initiative and power in the the working of the machinery of conciliation, arbitration and adjudication — and the unfettered play of collective bargaining between trade unions and employers. The National Commission on Labour had held that the existing disputes settlement machinery was cumbersome and had an *ad hoc* character. In addition, it was prone to be influenced by the political predilections of the government of the day because of the discretion vested in the government in the matter of referring disputes for adjudication. The Commission had proposed the creation of an independent judicial machinery, in the form of Industrial Relations Commissions, at the Centre and in the states which would exercise all the powers of conciliation, adjudication and certification of unions as representative unions. It had also proposed the constitution of standing labour courts to deal with disputes relating to rights and obligations under the existing laws as well as interpretation and implementation of awards.

The differences between the recommendations of the National Commission on Labour and industrial relations law now on the anvil are, however, vital. Most important, while Industrial Relations Commissions and standing Labour Courts are proposed to be set up under the new law, the authority of the Central and state governments in the regulation of industrial disputes would be maintained intact. Further, strict legal curbs are to be enforced on the right to strike.

The new law will provide for a prior strike notice of 14 days. At present this is required only in the case of public utility services. It is also proposed to amend the Trade Union Act of 1926 to provide that a strike ballot open to all members would be organised by the union and that the strike decision would be supported by two-thirds of the membership of the union.

As for the disputes settlement machinery, under the existing law the initiative for referring a dispute for adjudication rests entirely with the government. The main change proposed here is that in the absence of settlement through direct negotiations, in a non-essential industry or service either party may approach the Industrial Relations Commission for adjudication. This would not, however, affect the government's right to intervene at any stage in a dispute and to refer it for adjudication by the IRC. The government' right to do so is absolute in industries or services declared essential by the government. Strikes and lockouts in public utility services are to be prohibited. The principle underlying the government's approach appears to be that the workers' right to strike is not total or unqualified. In terms of collective bargaining the new law is thus clearly regressive. It would place greater curbs on the trade union movement and its growth. It would obliterate all worthwhile distinction between essential and non-essential industries and services and place them on par in respect of the workers' right to strike.

The only advance, if it can be so termed, over the existing industrial relations set-up would be in respect of recognition of unions. The present *ad hocism* in this sphere has been the cause of much tension in the trade union movement. The new formula for recognition has been evolved by agreement between the three trade union centres and will be given a statutory basis. Though it is still hedged in by many conditions, the right of a representative union to be recognised by the employer as the sole bargaining agent is to be admitted. Conflicting claims for recognition would be settled through verification, as at present. Only, where the results of verification prove to be inconclusive, the issue would be settled through secret ballot. This is clearly a compromise between the INTUC and the other two trade union centres. The INTUC had insisted on verification of membership as the sole criterion for recognition. The other two had wanted recognition to be decided by secret ballot of workers.

The limited accord between the INTUC, the AITUC and the HMS, the setting up of the central council of the three centres and the proposed new industrial relations law have been hailed by the Labour Ministry and some others as "historic". This is clearly an exaggeration. The major factor which has made these developments possible has not been any consideration of the interests of the workers or the trade union movement, but the re-emergence of Congress dominance and the willingness of the CPI and the Socialist Party to play the roles of junior partners to the Congress. The prospect of trade union unity as a result of these developments still remains very much uncertain.

There is no escaping the fact that the three trade union centres which are a party to the present accord do not, despite their claims of representing the larget chunk of the organised trade union movement in the country, constitute the entire trade union movement. The CITU led by the CPM, the UTUC of the RSP as well as the HMP under the leadership of the former SSP remain outside the accord and have denounced it sharply. Even the accord among the three is not firm and free of strains. The Congress has acquired more or less complete control over the INTUC. At the same time, several former socialist leaders, particularly of the HMS, have recently joined the Congress. They do not want to quit the HMS after joining the Congress but are being pressed by the Congress leadership to do so and strengthen INTUC. The position of the HMS is particularly fragile on this account. As for the AITUC, though in the political field the CPI readily accepts its position as a junior ally of the Congress, it claims a more equal status in the trade union sphere. CITU and HMP leaders have charged that the joint council of the three trade union centres will be an instrument at the service of the government to isolate the militant trade union movement in the country. As the new industrial relations legislation, with its stringent restrictions on militant action by workers, is enacted and enforced, this criticism may win considerable support among workers.

■

The government appears to be caught in a dilemma in regard to the giant Kudremukh iron ore project. The project was conceived several years ago. It is the first iron ore project for which, ignoring the protests of Indian experts, financial and technical collaboration was sought with American and Japanese interests. The project report, drawn up by the National Mineral Development Corporation in collaboration with the Marcona of the USA and the MON Group of Japan, envisages a capital investment of as much as Rs 208 crores (as against Rs 177 crores anticipated earlier). The two foreign groups will hold 40 per cent of the equity and the World Bank has indicated its willingness to extend a loan of over Rs 100 crores.

The foreign equity participation and technical collaboration have been justified on the ground of the sophisticated technology to be employed in the project. For the same reason management control, particularly on technical matters, will vest with the foreign parties, especially the Americans. This the government finds somewhat embarrassing in the present political context. Kudremukh, when fully developed, is slated to be the biggest iron ore mine in the country with annual raisings of 20 million tonnes of magnetite ore and 7.5 million tonnes of concentrates.

SOUTH

New Trends in Tamil Nadu

Mohit Sen

IT might have seemed that there was no state with greater stability than Tamil Nadu. Not only had the DMK a substantial majority but its relations with the ruling Congress at the Centre were also quite excellent. Indeed, it could be said that Indira Gandhi was attempting to convert the Congress into an all-India DMK, what with the talk and action appealing to the semi-submerged sections, while the DMK was becoming an indistinguishable part of the mainstream of all-India politics.

Matters appear somewhat different after the events of the recent past. The DMK and the Congress have drifted apart and the DMK has again raised the slogan of 'autonomy'. It might look as if one is back to 1967 or even earlier as far as this particular state is concerned. But this is only true as far as certain surface phenomena are concerned. It is not at all the case if one analyses the deeper and the shaping trends.

Never a Left Party

It should be borne in mind that the DMK was never a Left party based on the toiling people, much less the working class. It was and remains a democratic party based on a big section of the petty bourgeoisie, appealing to the vast unorganised urban poor as also to the middle sections of the rural population in the relatively more backward areas of the state. The middle Tamil bourgeoisie, especially the new rich elements, also provided ballast for it.

The fluctuating and opportunist character of the petty bourgeoisie scarcely needs underlining. Its inherent tendency is to go off at a tangent as soon as it attempts to function on its own. Only when certain other powerful opposing forces are in the field and engaged in a tussle does it fall behind one or another of these forces. And it should certainly be the endeavour of the Left to see that it falls behind the relatively more progressive contender.

The DMK's tangential trajectory was manifested, above all, in two facts. One was its attempt to impose itself on the working class and that, too, in the more organised sectors. When this met with heavy resistance it decided on strongarm methods with the help of the state power. And this proved to be its undoing. The united resistance not only of the Simpson workers directly involved but of the organised forces of the class as a whole forced it to beat a retreat and take its hands off the workers. This was almost a classic case of the working class asserting itself against the arrogance of the so-called middle class. This assertion had also the invaluable result of exposing that a good deal of sham exists behind the glittering facade of the DMK.

The other fact was that relying upon an all-pervasive corruption and refusing to go in for democratic structural transformations the DMK hoped to alleviate the distress in the state by blackmailing the Centre. It had in the immediate period following the split in the Congress certainly secured a great deal more than its legitimate share. When it found that this blackmail was no longer paying in the post-1971 period, it took up the slogan of "autonomy".

Role of the US

Here another factor has to be taken into account. This is the role of the US imperialists — Karunanidhi is not only a frequent visitor to the USA but has made statements there which place him in the category of the clients of that country. One of the more important aspects of the US neocolonial offensive against our country is its drive to fragment our unity. This is what it is attempting in West Bengal and this is what it is trying in Tamil Nadu. This underlines the danger of the DMK's opportunism in resurrecting the plea for autonomy. This plea is being raised not because the Centre interferes in Tamil Nadu to prevent the proclamation or implementation of radical reforms nor because it holds up development efforts. It is being raised as a diversion exactly at a time when US imperialism is also in need of this diversion.

It is, of course, absurd to write off the DMK as a whole as a democratic and progressive force. The plea for autonomy is not likely to automatically capture the imagination and minds of all its members and cadres, much less its vast mass following. The trend towards radicalism, the mass desire for an end to poverty and scarring inequality which has swept across our country do not stop at the frontiers of Tamil Nadu or the gates of the DMK. If the sense of deprivation had previously taken a separatist form following the withdrawal of the Telugu and Malayalam-speaking districts, now the possibility of moving away from deprivation can take the shape of struggle for fulfilment of the radical speeches and pledges of the DMK leadership. But it is precisely by stressing on this that the Left parties can influence and bring about desirable changes in that party.

It is most unfortunate, therefore, that precisely at this moment sections of the CPI(M) leadership have decided to woo the DMK on the basis of its revived plea for autonomy. It is symptomatic but tragic that when the DMK adopted an anti-Right stance the CPI(M) opposed it and now when it takes up a posture that plays directly into the hands of the US imperialists the CPI(M) begins approaching it.

Feelers to Kamaraj

It is also to be regretted, but also not to be wondered at, that a section of the Congress leadership should have thought in terms of a rapprochement with the Syndicate with the spurious plea that Kamaraj is different from his colleagues. He may well be. As an individual he is welcome to join any party or front provided he subscribes to its programme or platform. But the idea was to link on to his organisation just because it was an anti-DMK force with a mass base. The desire to return to the ministerial bungalows irrespective of pledges and policies was all too palpable. Even if the Congress in the state has officially turned its face against this manoeuvre, it will not do to forget two points. One is that this manoeuvre failed also because Kamaraj was not all that willing. The other is that those who wanted this manoeuvre are still powerfully entrenched in the Congress.

It is to be noted that just when all this was going on the working class was also continuing its actions. And even more significant, in Thanjavur district, almost two lakhs of agricultural workers turned out to greet the second conference of the Bharatiya Khet Mazdur Sangh. If these two facts and actions could be co-ordinated, the very face of Tamil Nadu would be radically altered. And not Tamil Nadu alone.

SAIGON

Report from the Battlefront

Harish Chandola

IT will be naive to believe that the mining of North Vietnamese ports and the frenzied bombing of its road and rail links with China will turn the tide of the war in South Vietnam. Even if these acts are performed to perfection and succeed in stopping the flow of military equipment to Vietnam (which really is an absolutely impossible task), how long will it take the stoppage of fresh supplies to affect the war? The US stopped bombing North Vietnam four years ago and it is common knowledge that during those four years military equipment has freely been flowing in. So even if the US manages to cut off fresh supplies, the stock of four years is already in the pipeline for the liberation struggle and it will be a long time before this is exhausted.

The South Vietnam People's Liberation Armed Forces (PLAF) and the North Vietnamese use their supplies with extreme economy and to maximum effect and do not spend them freely like the Saigon and US troops. They are conscious that their country does not produce major items of equipment and is dependent on supplies from outside which often have to be paid for. Aware of this all the time, they fight with skilled frugality and achieve maximum results with the minimum waste of material.

Nor does the saturated bombing by the US much effect their ability to fight. Though they have perfected methods of shelter against the worst bombing and of continuing their fight, the bombing takes a large toll of civilian life, the victims being mostly old people and children. Fighting personnel, however, seldom get killed in bombing raids, because of their alertness in putting into practice the techniques of survival.

Vietnam has long been the experimental ground for testing new military weapons and tactics. Since weapons do not fight by themselves and however advanced they might be their effectiveness still depends upon those handling them, one need not discuss the weapons here, but the tactics.

From what I have seen of the battles so far, I can say that the PLAF have absolutely no fear of the US and South Vietnamese aerial attacks, have complete control of the situation when they start fighting because their attacks and operations are elaborately planned, use their manpower and ammunition with great economy and their units are 'independent' and not tied down to tactical support like the units of their adversaries.

I recall several daily battles around the town of Chon Thanh. It was the PLAF which attacked the Saigon troops and never the other way round. The PLAF chose the place of their attack with great care and thus dominated the fighting. They did not consider aerial bombing as something against which they had no defence. They considered it as one of the routine hazards of war. To avoid being bombed the PLAF always kept the fight very close to Saigon forces so that it would not be possible for planes to bomb them without bombing the Saigon troops also. Whenever Saigon troops withdrew to let the aircraft bomb the liberation forces, the liberation forces used another stratagem to confuse the bombers. The Saigon troops upon withdrawing had to mark their new positions by using smoke grenades. The smoke indicated to the planes the positions of Saigon troops so that they would not drop bombs on them. But the liberation forces too started using smoke grenades, with the result that it became impossible for the airmen to determine which positions to bomb and which not to bomb!

A far more reliable means of surviving the intense bombing is the preparation of well dug-in positions. The liberation forces always prepare such positions before they launch attacks. I have seen them re-emerge to continue their battles from precisely the same positions which a few minutes earlier had been thoroughly bombed from the air.

The other important factor is the positioning of their troops for attacks. They never seem to commit all their forces to a battle point, as they always maintain adequate reserves carefully scattered at supporting positions all around the edges of the battlefield. From these reserve positions their casualties are evacuated very quickly, unlike those of the Saigon troops, and fresh troops committed to the battle to maintain constant pressure at the main battle point. The result is that the strength of the liberation forces is never diminished at the main battle-point.

But above all what the liberation forces have is courage and a keen sense of judgment exercised by all, and not merely by the unit commanders. In the midst of battles, I have seen PLAF men courageously climb trees to locate the positions of Saigon soldiers and to call in their mortars to hit the enemy. In Kontum when the airfield there was under attack, I was constantly shouted at by the US military advisers for coming to the fighting zone without a helmet and a flak-jacket (bullet-proof jacket protecting one from shrapnel mainly). All the Saigon and US troops wore these along with anti-mine boots. But I have seen from a distance, men of the liberation forces moving about in the midst of battle wearing only soft-hats, shirts and trousers, and perhaps not even shoes (from the distance at which I was in the fighting I did not see them wearing shoes). And yet they won the battles.

The PLAF defeated many well known military tactics of the US and Saigon troops in the Dong Ha-Quang Tri battle, namely, airborne support, positional defence, mobile defence by tanks and infantry and multi-line defence. In Quang Tri, the US was unable to put into effect the 'helilift' tactic, considered by the US military as the 'latest discovery' and a big leap forward in mobility and firepower. This tactic, according to US calculations, has four advantages: It enables swift transportation and landing of troops to secure sudden superiority over the adversary; it provides short range and vertical fire support; it facilitates the supply as well as removal of troops and it enables quick withdrawal in adverse conditions.

In Quang Tri the helicopters failed both to ferry Saigon troops in for rescue missions or to whisk away the battered army. This was because the PLAF chose to fight in close combats and possessed an effective anti-aircraft force and formidable artillery firepower that kept in check all the airfields and helicopter landing grounds in the area.

The tactic of defence in big clustered positions, also failed. Because Saigon troops were previously easily wiped out in their small and medium-sized positions, the US had this time ordered them to gather into big clusters of positions so as to be able to react more effectively. The US command believed that with such defence complexes as in Dong Ha, Ai Tu, La Vang and Tich Tuong, the PLAF could not overrun the garrisons overnight and that the US could provide efficacious air support and rush in reinforcements in daytime. But by co-ordinating the actions of their various arms and services, the PLAF smashed the Saigon troop concentrations of regiment and even brigade size. They attacked by day and by night on a wide front and with amazing swiftness, splitting the Saigon forces and wiping out one position after another.

The tactic of mobile defence by tanks and infantry has also proved ineffective. At the Dong Ha-Quang Tri defence complex, the US command had deployed a big defensive force inside heavily-guarded strongholds and also organised strong mobile units of tanks and infantry. Saigon troops were stationed at one place in daytime and at another at night. Such a mobile defence outfit was usually made up of electrically detonated mine-fields on the outer perimeter, a row of tanks and finally infantry troops.

But in the face of a big-scale attack, this tactic did not work either. The Saigon troops who were used to fighting from entrenchments, could not put up any substantial resistance when fighting outside their fortifications. Instead of co-ordinating their fight, the panic-stricken tankmen and infantrymen fought one another. More than once their fleeing tanks crushed their own soldiers. Assaulted from many directions the Saigon troops were at a loss finding out where to focus their fire. Therefore, their force was scattered and their reaction capability which was already weak even inside the fortifications, became still weaker in open terrain combat.

The tactic of multi-line defence also failed. To face the PLAF's quick assaults, the US command ordered this tactic both as a counter-measure against lightning attacks and as a means to gain time for an orderly withdrawal. In Dong Ha-Quang Tri, the US-Saigon defence was thus established in a multi-line system from the north to the south along Highway One.

In their attacks on Dong Ha-Quang Tri, the PLAF fought the Saigon forces from both the front and rear lines and launched simultaneous frontal and flank attacks. This prevented the Saigon troops from providing mutual support.

On the causes of the failure of the US tactics, the North Vietnam Army newspaper, *Quan Doi Nhan Dan*, said: "Any tactic, however good, must rely on the men who apply it. The Saigon troops, with their low morale, poor capacity for big operations and bad co-ordination, cannot effectively apply any tactics, including the one called 'orderly withdrawal'".

THE FOURTH ESTATE

Prime Ministerial Pep-Talk

Nireekshak

THE Prime Minister's speech at the golden jubilee celebrations of *Ananda Bazar Patrika*, Calcutta's influential Bengali daily (circulation: about 320,000), was the most forthright indictment of the profession in recent months. She said: "...it does seem as if our editors and journalists have by and large convinced themselves that they have reached the top, hence there is no longer the reformist zeal of the best journalists of olden days. Increasing prosperity has taken them further away from the people. Today they are more anxious to be heard and to give advice to the legislature and the government rather than to find out and report the trends in different fields of activity. Even from the professional yardstick, it is unfortunate that our newspapers should be content to devote only five to six per cent of their space to social change — a fact to which I drew attention seven years ago... For some reason our press is unduly interested in this narrower politics. My officials tell me that in the last few weeks, ten times more questions were put to them on the so-called impending cabinet reshuffle than about economic policy. I leave it to the journalistic profession to remedy this state of affairs."

That Indira Gandhi made these remarks at the *Ananda Bazar Patrika's* jubilee celebrations was not without significance. The paper, not very long ago, was known to be an inflexible critic of the Prime Minister and her party. Then suddenly some months ago it changed and became less hostile to the establishment. Two other Calcutta newspapers in which a similar transformation came about rather suddenly were *Statesman* and *Hindustan Standard*. (The latter is part of the *Ananda Bazar Patrika* group.) Was this change of heart voluntary or under pressure from the government? According to Niren Ghosh's allegation in the Rajya Sabha on May 11, the government had put "pressure on *Hindustan Standard* and the *Statesman* for writing critical articles" and now "they are completely toeing the government line." The Prime Minister's presence at the *Ananda Bazar Patrika's* golden jubilee celebrations along with the Governor and Chief Minister of West Bengal may be an indication that it is no longer a staunch critic of the powers-that-be in New Delhi and Calcutta and that Niren Ghosh's allegations in Parliament have some substance.

Monopolising a Theme

Indira Gandhi's pet theme of concentration and monopoly in the newspaper industry also figured in her speech at the celebrations. "Newspapers should not be house magazines for big business. We want the press to be an independent industry which is not subservient to other industries," she said. Close on heel came the reported recommendations of the ministerial committee on the diffusion of ownership of newspapers. According to them, the diffusion bill as envisaged earlier — which had provisions like employee-share-holders, etc — was likely to create legal and other complications. The ministerial committee, whose members are Mohan Kumaramangalam, H R Gokhale, Uma Shankar Dikshit, Nandini Satpathy and K V Raghunatha Reddy is said to have recommended that an amendment in the Company Law limiting the holding of shares of newspaper units by big business should meet the purpose at the moment. The committee is also reported to have suggested that newspapers should be barred from investing their funds in any industry other than that connected with newspapers and journals. While the former recommendation may effect Tata-Mafatlal's *Statesman*, Birla's *Hindustan Times* and Goenka's *Indian Express*, the latter is likely to have some bearing on the *Express* group of newspapers only. It was revealed in the Lok Sabha recently that the *Indian Express* group had invested over Rs 4 crores in industrial enterprises in no way connected with the newspaper business. This is said to be the highest investment by a newspaper company in non-newspaper ventures. Generally it is the other way round. *Indian Express*, it is said, was able to perform this miracle by soliciting public loans at high interest rates and then directing the funds to profit-

able ventures, some of which it is alleged were of purely speculative nature. (See "When Will RBI Step In?", *Economic and Political Weekly*, May 20, pp 1003-4.)

The sermons of the Prime Minister and the findings of the ministerial committee about the gross interference of big business in the newspaper do not, of course, reveal the defaults of newspaper which call themselves 'champions of socialism'. It was revealed in Parliament that out of the 51,527 establishments with provident fund facilities, 8,400 were in arrears. The Jan Sangh-RSS English daily, *Motherland*, did a follow-up story and came out with the disclosure that one of the 8,400 defaulters is a newspaper intimately connected with Indira Gandhi's family. According to the right-wing daily, "The *National Herald* has failed to deposit a sum of Rs 3.2 lakhs. With a salary bill of less than Rs 2 lakhs a month, and provident fund at 8 per cent of salary, the *National Herald* has obviously not deposited the employees' provident fund money for something like two years!" A major default by any socialist standard. A shocking state of affairs in a newspaper whose editor, M Chalapathi Rau, has in his own right been and is the champion of the working journalists' fight for better professional standards and financial security.

The big newspapers have found a way out of the newsprint order which requires them to restrict their pages to ten. The Supreme Court's stay order, which was granted to them early this month, is only valid till July 19 and, therefore, using their ingenuity they have come out with special 'pullout' editions known as 'consumer service'. These 'pullout' editions are, in fact, advertisement sheets in tabloid-size, inserted into the usual newspaper. According to *Statesman's* Managing Director, C R Irani, this is the only method to retain heavy advertising in his newspaper. In the long run, it is conceded by all big newspaper managements, these devious ways are nothing but irritants to a government which has already made up its mind about the future of big newspapers.

Indo-Bangladesh Tensions

The interim period between the D P Dhar-Aziz Ahmed talks at Murree and the Indo-Pak summit expected in Delhi in June is proving to be full of speculation and controversy. Bangladesh figures prominently in the speculation. One of the conjectures is that growing tension between India and Bangladesh on matters of trade has resulted in the delay of the Indo-Pak summit. As Ranajit Roy of the *Hindustan Standard's* New Delhi Bureau put it, "Mr Bhutto may be hoping that these tensions would steadily increase and Dacca may be persuaded to have a dialogue with Islamabad." Whether these tensions will eventually affect the Bhutto-Indira Gandhi meeting is now gradually surfacing in the press. And for the first time even leftist newspapers are making attempts to probe the factors that have generated these tensions between India and Bangladesh. *Patriot's* Dacca correspondent has reported, "Traders and businessmen of Bangladesh have made common cause with Maulana Bhashani, who has now under his wings both extreme right and left elements, in running down the Indo-Bangladesh Treaty and the Trade Pact. For over a month now these forces have been indulging in the propaganda that both the treaty and the trade pact affect Bangladesh adversely and should, therefore, be scrapped. Of late some of the local dailies have also fallen victim to this line of propaganda. The Dacca Chamber of Commerce, which had earlier attacked the provisions of border zone trade and jute export in the pact, has now chosen to attack the provisions relating to fish trade between the two countries."

Another indication of growing tensions between India and Bangladesh was the first anti-Indian rally in Dacca which was organised by students during D P Dhar's recent visit to the Bangladesh capital. The official Bangladesh news agency, BSS, did not report the incident which was the first of its kind since the liberation of Bangladesh. Neither did the Indian news agencies, judging from the fact that only one newspaper carried the item. *Amrita Bazar Patrika*, which has a news bureau in Dacca, reported the incident prominently on its front page. It said, "Students brought out an anti-Indian procession today demanding the return of the Indian emissary Mr D P Dhar. The demonstrators paraded through the streets of Dacca shouting the slogan 'D P Dhar go back'. Their main contention was that no engineers should be brought from India and Bengali engineers should alone be employed. Moreover, no gas should be exported from the Teetas Gas Project, they demanded. Later, representatives of the demonstrators met two Ministers of the Bangladesh Government, Mr Mushtaq Ahmed and Mr Moffiuddin Chowdhury ...".

The devaluation of the Pakistani rupee is given by *National Herald* as having given Pakistan "a competitive edge over India's exports..." It has been generally conceded that now Pakistan will be at an advantage in selling its textile products at low prices in international markets. But India can take some comfort from the fact that Pakistan's export potential after the December war is extremely limited.

MP in Hospital

Members of Parliament normally make news by their contributions to the proceedings of the two houses. Recently a backbencher in the Lok Sabha hit newspaper headlines for what allegedly happened to him at New Delhi's VIP hospital, named after the British Viceroy, Willingdon. The MP, C P Shailani, according to one version, was manhandled by the hospital staff. Another account, alleged that the watchman of the hospital and Dr Ramakant of the Casualty Department were assaulted by the MP. The incident figured in Parliament but Union Health Minister Uma Shankar Dikshit's timely intervention, ordering an inquiry into the incident, and the Prime Minister's 'pulling-up' of the MP involved, kept the temperature of the over-sensitive MPs from boiling over. For most Delhi newspapers and metropolitan dailies it was the lead story. In reporting as well as in editorial comments, Willingdon Hospital did come in for criticism but no one spared the MP either. According to the hospital staff, some VIPs demand too much attention at the expense of other more serious cases. This brings in the issue of medical ethics and doctors at the Willingdon hospital seem justifiably concerned about it, as press reports indicate.

o o o

Statesman's Calcutta Notebook had this interesting item: "Reporting the fighting in Vietnam, a contemporary carried an agency message stating that 'the two generals held responsible for the defeat of the South Vietnamese forces on the far northern front were *fired* today'. So far, if in rather an American than an English medium, so good. But the paper's Bengali equivalent understood something quite different by 'fired'. It wrote and headlined, 'Saigon-e dujon general-ke- guli'. The unfortunate generals had now been shot."

Regulating the Bureaucracy

Mohammed Imam

Administrative Law in India by S P Sathe; N M Tripathi, Bombay, 1970; pp 294 + xxxviii; Rs 22.

ADMINISTRATIVE law, says Chief Justice P B Mukharji in his foreword to this book, still remains ideologically confused in spite of many attempts to define and explain it. In his view, 'the law that regulates administration in its impact on the subect', is perhaps a simple but incomplete definition of the nature of administrative law. The growth of the bureaucracy in the modern state and society is largely responsible for the growth and importance of administrative law. The purpose of administrative law is to control administrative actions and to correct them insofar as they affect or tend to affect the rights or interests of individuals. It is a branch of public law embodying principles, methods and machinery devised to achieve the above stated objective. Its need in India is no less and, barring a few exceptions, its growth can hardly be said to have failed to keep pace with the ever-growing need for it. Although administrative and legislative controls of administrative actions form part of this important branch of law and it is a practice to include them in any book dealing with administrative law, for the greater and more substantial part it consists of those principles of law and techniques which the courts have evolved over a period to correct administrative actions and to give adequate relief to the individual concerned.

Administrative law is ideologically confused primarily because it is judge made law. Judge made law, its nature and process of evolution being what they are, is incomparable to statute law in matters of brevity, clarity and policy consistency. There is no confusion so far as the object of this law is concerned. The uncertainty concerns the scope and extent of judicial interference with administrative actions. Hitherto the courts concentrated, in developing this law, on the form or nature of the administrative actions and this resulted in the inadequacy of judicial remedies against certain forms or kinds of administrative actions, namely, ministerial, administrative, discretionary, etc, notwithstanding the fact that they affected or tended to affect the rights or interests of the individual. This was more due to judicial self-restraint and historical reasons. In the development of administrative law the courts are giving up the approach of 'form of action' and are giving their most anxious consideration to the substance on which the action operates or the effect of such an action.

Judicial techniques and methods, not to speak of reasoning, have never been consistent in their reach and one can see in this judicial endeavour the main object for which these were devised, *viz*, to prevent injustice being done by an illegal administrative action. The hands of the courts under Article 226 of the Indian Constitution are not tied to issuing specified writs only. The Indian High Courts can issue any order, direction or writ for the enforcement of fundamental rights or for any other purpose. The power of our courts is constitutional and for certain purposes. The development of this branch of law by the courts cannot be explained in terms of its common law principles. It is unfortunate that the courts in India have adopted the 'form of action' approach and allowed the content of their power to be circumvented by the common law notion of judicial review. They are, however, slowly drifting from this position. It is now for the academic lawyers to examine this trend and deduce principles and general concepts from it.

In the book under review, the author has analysed and explained the subject under different headings, namely, classification of administrative action, legislative powers of the administration, control of delegated legislation, judicial control of administrative tribunals and quasi-judicial bodies, administrative discretion and the controls, judicial remedies, privileges and immunities of the state, public corporations and the Indian Ombudsman (*Lokpal* and *Lokayukta*). The book explains the subject with reference to decided cases upto the date of its publication and has the merit of explaining various topics with clarity, and of being handy and easily comprehensible to undergraduate students of law.

The first chapter is about the classification of administrative actions: the need for classification, various tests that are deducible from the cases decided by the courts for distinguishing legislative, administrative, judicial and quasi-judicial functions, and the difficulties that are present in the classification of these functions. Not all administrative actions were brought under the superior jurisdictions of the courts and the courts took to classifying administrative functions to find out whether the challenged action was of the type to which their jurisdiction extended. Due to the recent decisions of our Supreme Court, namely, *ACC* v *P N* Sharma, AIR (1965) SC 15, *State of Orissa* v *Dr (Miss) Bina Pani Dei*, AIR (1967) SC 1269, *Divisional Forest Officer, South Kheri* v *Ram Sahnehi Singh*, CA 1638/1969 decided on 15 1 1969 *Rampur Distillery Co Ltd* v *Company Law Board*, (1970) 2 SCR 177 and *A K Kraipak* v *Union of India*, (1970) 1 SCR 457, and of the English courts *Ridge* v *Baldwin* (1964) AC and *In re K(H) (an Infant)*. (1967) 1 All ER 226, perhaps it may be said that the need for classifying administrative action no longer exists, although the courts now and then continue to pay lip service to this concept.

In view of the fact that the jurisdiction of the High Courts under Article 226 is wide enough to issue any order (and is not necessarily confined to issuing one or more of the specified prerogative writs) to any person or authority throughout the territory over which their jurisdiction extends for the enforcement of any of the rights conferred by Part III of the Constitution and for any other purpose; that it is one of the fundamental rules of our constitutional set up that every citizen is protected against exercise of arbitrary authority by the state or its officers; that the jurisdiction of the administrative bodies is increasing at a rapid rate and the concept of rule of law would lose its vitality if the instrumentalities of the state are not charged with the duty of discharging their functions in a fair and just manner; and that the restrictions on fundamental rights under Article 19 in order to be valid must be reasonable both substantively and procedurally and irrespective of by what form of action the fundamental right is violated, the most appropriate test for judicial review of administrative action seems to be not whether the authority is under a duty to act judicially but whether the authority has the power to determine questions affecting the rights or interest of the individual or resulting in miscarriage of

justice — involving civil consequences. Any form of action, be it quasi-judicial or administrative, which produces these effects may be open to question on the ground that there was failure to comply with the principles of natural justice. The requirement of compliance with the principles of natural justice may need to be relaxed when an action is taken for safeguarding the security of the state or in the interest of public order or where an action is expressly excluded from judicial review by statute, provided such a statute does not suffer from constitutional infirmity.

The limitations upon the legislative powers of the administration have been considered in the light of American experience. Our courts, following the American practice, have denied to the executive, in *In re Delhi Laws Act, 1912,* AIR (1951) SC 332, the power of essential legislative function. But there being no definition of what constitutes an essential legislative function, the doctrine of 'non-delegability of essential legislative functions' can hardly be said to be a substantial check on the executive. 'Essential legislative function' is reduced to a mere statement of policy laying down adequate standards to guide the exercise of delegated legislation. The views of the book's author, and of Chief Justice Mukharji, expressing doubts about the wisdom of this judicial policy cannot but be shared.

The other checks on delegated legislation are both judicial and parliamentary. Parliamentary control of delegated legislation is becoming more effective in this country. Judicial control is confined to considering whether the subordinate legislation is, *ultra vires.* 'Reasonableness' as a ground for considering validity remains to be accepted by the courts. It is always possible for the courts to say that parliament or the state legislatures cannot be deemed to have intended to authorise the executive to make an unreasonable rule.

The grounds — for challenging the decisions of administrative tribunals and quasi-judicial bodies — such as, *ultra vires,* lack of jurisdiction, declining jurisdiction, determination of jurisdictional and collateral facts, and the rules of natural justice, have been considered briefly. Under the requirement of compliance with the principles of natural justice lies the assumption that the decision that results from following these principles would be a just one. Very often the cases that come to the courts reveal how unrealistic this assumption is and emphasise the need for supplementing these principles by the requirement to render a reasoned decision or a speaking order so that it becomes possible for the courts to determine whether in substance justice was done by the decision of these bodies. Such a view has been taken by the Supreme Court in *Hari Nagar Sugar Mills* v *Shyam Sunder* AIR (1961) SC 1969, in respect of the decisions of the tribunals coming in special leave appeal under Article 136, and by the High Court of Gujarat in *Testeel Ltd,* AIR (1970) Guj 1, and by the High Court of Madras in *Thiruvengadam,* AIR, (1970) Mad 34 in respect of decisions and orders challenged under Article 226 of the Constitution. To make the matter clear, the author suggests that the requirement for the administrative bodies to give reasoned decisions may be statutorily inserted in the General Clauses Act.

Until lately in the view of the courts, the exercise of administrative discretion was, apart from questions of its constitutionality, largely unquestionable, as it could be challenged only on grounds of improper purpose, *malafide* and leaving out relevant considerations or taking into account irrelevant considerations. After the *Barium Chemicals* and *Rohtas Industries* cases, the exercise of discretionary power is no longer so immune from judicial review. Pharases like 'in the opinion of', 'if satisfied' and 'reasonable cause to believe' are no longer taken to suggest the vesting of discretionary power. The courts are, however, yet to be seen examining the manner in which the discretion is exercised. This attitude of the courts is reflective of the very same formal approach and underlying it is the assumption or the trust that if certain given conditions are satisfied, the exercise of discretion must be deemed to be proper. This judicial restraint justifies and provides the necessity for having an institution popularly known as the Ombudsman, the proposal for setting up an Indian equivalent of which is contained in the *Lokpal* and *Lokayuktas* Bill, 1968. The powers and procedures to be followed by it are explained and discussed by the author in a separate chapter.

The discussion on judicial remedies is mainly confined to the nature and scope of traditional writs and civil remedies such as injunction and declaratory action. The jurisdiction of the courts in India is not confined to issuing these writs. They can issue any direction, writ or order and this power is in great measure being exercised by them. An analysis and study of such other types of directions, orders and writs is called for so as to ascertain the principles underlying them and the purposes for which and the circumstances in which they have been issued.

The setback to the principle and policy laid down in *State of Rajasthan* v *Vidyawati,* AIR (1962) SC 933, caused by the decision in *Kasturilal* v *State of UP,* AIR (1965) SC 1039, as to the extent to which the state is liable for the tortious acts of its servants committed in the discharge of their duties has been presented lucidly in the book. This exposition can be relied upon to reiterate the demand voiced in many quarters to remedy the situation by suitable legislations. The Government (Liability in Tort) Bill, 1967, does not provide an adequate answer as it contains a long list of actions of the government that are exempt from the scope of the Bill and the resultant position does not seem to be an improvement. The liability of the state under a statute as a general proposition that came to be eventually established in *State of West Bengal* v *Corporation of Calcutta,* AIR (1967 SC 997, and the privilege of the state to withhold documents from the courts (greatly reduced in content now), are explained briefly but satisfactorily. The suggestion is added that special privileges, immunities and preferences may be retained by the state only insofar as the special features of the state's functions require them. In all other respects the state should, in the eye of the law, not be different from a private individual. Should not this principle be statutorily provided for or judicially read in the general principle of rule law or deduced from the preamble and the scheme of our Constitution, particularly from the guarantee of equality before the law?

Bank of America

BANK OF AMERICA has announced plans to establish a multi-nationally owned, regional merchant bank with headquarters in Singapore. Swiss, British, French and Singapore banks have already agreed to participate in the proposed merchant bank. They are: Union Bank of Switzerland, Zurich; Kleinwort, Benson, London; Banque de Paris et des Pays-Bas S A, Paris and Overseas Union Bank Singapore.

The merchant bank, with initial authorised capitalisation of US $10.65 million, is intended to serve the south-east Asian area. It is expected to open late this year. The planned merchant banking institution expects to engage in discounting bills of exchange, short and medium term lending, acceptance and money markets operations, underwriting, syndicating loans, financial counseling and investment services.

Studies in Planning Techniques

IV—Planning the Distribution of Income

R M Sundrum

One of the great concerns of Indian economic policy from the very beginning has been with reducing economic inequalities among the people, but little has been done to express this concern in a practical way through the techniques of planning.

It is only recently, as more data on income distribution have become available and been subjected to a great deal of analysis, that we have become more aware of the problem and more concerned to make it an important objective of practical policy.

There have already been a number of studies of the actual position and of various lines of policy which might be followed to deal with it. The present paper is an attempt to bring these together in a broad framework of policies as an aid to reconsider the techniques of planning for this purpose.

The general conclusion to which this paper hopes to attract attention is that planning for equalisation must strike at the root causes of inequality and that the sources of inequality and the possibilities of reducing them are scattered all over the economy.

These have to be identified more closely to estimate the equalising power of various specific policies. Once this is done, it will be possible to orchestrate them in various combinations so that what we gain in equalisation, we do not lose in development.

For this purpose, it is also necessary to see the role of these policies in a time perspective. It is highly probable that drastic measures for equalisation may be self-defeating and damaging to growth prospects at the same time.

ONE of the great concerns of Indian economic policy from the very beginning has been with reducing economic inequalities among the people, but little has been done to express this concern in a practical way through the techniques of planning. It is only recently, as more data on income distribution have become available and been subjected to a great deal of analysis, that we have become more aware of the problem and more concerned to make it an importanat objective of practical policy. There have already been a number of studies of the actual position and of various lines of policy which might be followed to deal with it. The present paper is an attempt to bring these together in a broad framework of policies as an aid to reconsider the techniques of planning for this purpose.

The problem of income distribution in a developing country such as ours is rendered particularly difficult by the fact that our primary concern is still with economic development. The difficulty is accentuated by the generalisation drawn by Kuznets that inequality tends to widen in the earlier phases of growth and to narrow only in its later phases.[1] This generalisation, of course, is based on what may be called the 'natural history' of the process, i.e, the process as it works out in the natural course of events, when equalisation has not been a primary objective of policy. But it is still useful to show the nature of the challenge to policy-making when greater equality becomes an integral part of our planning for development.

In this, as in all matters of long-term policy, it is useful to have a clear idea of the ultimate objective we should aim at. The goal is clearly not one of complete equality, whatever that might mean. This is important because some of the most fashionable measures of inequality are based on comparing the actual distribution with an equal distribution. In the sort of mixed economy most people have agreed upon, which leaves a good deal of scope for free enterprise and private initiative, the ideal is rather what Arthur Lewis has described thus: "If one is concerned with incentives for effort, as any serious thinker must be, the emphasis naturally rests on equality of opportunity rather than equality of reward. The latter survives only in the form of a concern to eliminate extremes from both ends of the income scale. Equality of opportunity centres these days on trying to ensure that every young person shall have equal access to the fullest education from which he can benefit, and thereafter equal access to every job, irrespective of tribe, class, race or religion. If incomes were based only on opportunity, the result would be poverty for the handicapped and the unlucky, and riches for the talented or the lucky. Here the sentiment for equality of incomes comes in to cut off both ends."[2] This certainly is a noble objective, worthy of our utmost endeavours, but it is also a distant objective. In fact it is worthy of the most anxious concern whether this is realistically achievable by the end of the development phase, towards which current planning efforts have to be directed. However, it is a bit academic to debate this aspect of the matter; what is unquestionably clear is that this is the goal towards which we must hasten with all deliberate speed. In particular, this view of the ultimate goal provides us with an instrument of study and a test of policy, namely to consider how far particular observed income differentials are based on inequality of opportunity and to consider how far each act of policy narrows or widens the inequality of opportunities.

Key Elements

There are, of course, many important influences on inequality of incomes and inequality of opportunities which

require deep analysis of sociological and political phenomena. These aspects have tended to be neglected in much of the recent discussion. They require intensive study by experts, and an effort must be made to incorporate their findings in our planning process. The present study is, alas, confined to the economic aspects, because of the author's limitations. They are also important aspects. On this understanding, let us consider some aspects of the process of change in the distribution of incomes. Some of the key elements in this process may be described symbolically as follows:

$$I_t = A.I_{t-1} + R.W_t \quad \ldots (1)$$

$$W_t = W_{t-1} + R.I_{t-1} \quad \ldots (2)$$

where I_t stands for the distribution of income at time t; W_t for the distribution of wealth at time t; A is a matrix which shows the effect of the production system on the distribution of incomes from work; R a matrix which shows the effect of incomes from property on the distribution of total incomes, and B is a matrix which shows the process of private wealth accumulation, i e, the effect of income distribution on changes in wealth distribution. Equation (1) shows that the distribution of income at one point of time on the distribution in the previous period, modified by the influence of the production system. It also depends on the wealth distribution, and the way wealth influences income. Equation (2) shows that the wealth distribution at any time depends on the distribution in the previous period, and the effect of the previous income distribution. Differencing Equation (1) and substituting Equation (2), we get

$$I_t = (1+A+R.B)\ I_{t-1} - A.I_{t-2} \quad \ldots (1)$$

This second-order difference equation hints at the cumulative tendencies operating in the process of change of the income distribution, but this way of considering the matter is too aggregative to be of practical use, and it would be idle to pursue this much further.

A useful beginning to the study of the various policies that can be deployed is to consider their main points of focus, such as the elements described in the above equations. This will help us to appreciate the quantitative significance of the equalising power of each policy approach, and also to clarify in our minds the time periods involved in achieving perceptible effects. On this basis, let us look first at the variable I_t, describing the income distribution to begin with. It represents a position we are dissatisfied with and which we wish to change in the direction of greater equality.

A good deal of the world literature on the subject has been concerned with fitting general mathematical functions and trying to discern some universal laws of motion in the process. This approach tries to summarise the pattern of inequalities at any time in terms of some statistical constants, corresponding to the parameters of the mathematical functions being fitted. Useful as this may be in studying some long-term aspects and to make some broad international comparisons, it is not a particularly useful basis for policy studies, as the inequality of income distribution in a country such as ours is the result of too many disjointed influences and requires action at so many different fronts. Some other measurements, more directly related to the actual forces at work and reflecting the role of particular policies, are needed.

In recent years, there has been considerable discussion of some aspects of income distribution in India. On the one hand, there has been concern with the concentration of economic power at the upper end, and there has been fair unanimity that, in spite of all the countervailing measures sought to be implemented, this concentration has increased during the period of our plans. At the other end, there has been great concern with the extent of poverty. This has been measured in various ways. This 1962 Study Group defined the minimum standard of living as a per capita consumption level of Rs 240 (in 1960-61 prices) a year, at a time when the average for the whole country was Rs 280; on this basis, the proportion of poor people was between 50 and 60 per cent. More recently, Dandekar and Rath have defined the poverty line in terms of nutritional adequacy, i e, ability to consume 2,250 calories per capita daily. Using an all-India average consumption of foods, they estimated the annual cost of such a diet at Rs 170 per capita in rural areas and Rs 270 in urban areas, at a time when the average consumption expenditures were Rs 260 and Rs 360 in rural and urban areas respectively. On this basis, they found that 40 per cent of people in rural areas and 50 per cent in urban areas were poor.[3]

There are some conceptual difficulties with the definition of poverty in such terms. The concept is based on a nutritionally adequate diet determined nationally, with the cost of this diet varied from state to state according to local prices. This has two consequences. In states where the average income is itself low, the proportion of the population below this level is found to be large. For example, Dandekar and Rath find that 90.75 per cent of the rural population of Kerala were poor in this sense in 1961-62. The other difficulty is that this concept does not take account of regional differences in the sort of foods from which people derive their calories. In Kerala, again, the main source of calories for the population is cheaper than the foods used elsewhere, so that a nutritionally adequate diet could be obtained with a lower consumption expenditure and the proportion of poor people would not be so high. It may, however, be argued that it is a reflection of the greater poverty of the people of Kerala that they have to resort to cheaper foods for their nutrition. There are, therefore, some difficulties in applying such a definition of poverty to measure differences in inequality between states. It is still a reasonable compromise for a study of policy issues at the national level and reveals a seriously disturbing situation.

The large proportion of people living below the minimum standard of living is due to the low level of income of the whole country and to the unequal distribution of income. Each explanation indicates its own line of attack on the problem. The extent to which the extent of poverty can be reduced by overall growth has been worked out in the long-term perspective underlying the Fourth Plan. Its target is an increase of Net Domestic Product from 1968-69 to 1980-81 at 6 per cent annually, and of total private consumption at 5.3 per cent annually, or 86 per cent over the whole period. As population is projected to increase by 31 per cent, this implies an increase of per capita consumption by 42 per cent, i e, from Rs 488 in 1968-69 to Rs 693 in 1980-81 (in 1967-68 prices). Assuming the same pattern of inequality, the per capita consumption of the second poorest decile would increase from Rs 230 to Rs 320; it would still be 25 per cent less than the minimum standard of living, estimated at Rs 430 in 1967-68 prices. Another way of looking at the problem is that the proportion of poor people would decline only from 55 per cent to 35 per cent. The effect of the projected growth alone on the extent of poverty is not very encouraging, even if it can be achieved fully. Hence, the concern with measures to change the income distribution.

Past trends in the extent of poverty have not been very encouraging either. Ojha[4] and Bardhan[5] have argued that the extent of poverty in rural areas has increased in the past decade, while Minhas[6] holds the contrary view. In a comprehensive study, Vaidyanathan[7] has concluded that there has been some decline in the degree of inequality (as measured by the Lorenz Ratio) in the past decade, but because per capita real consumption also declined in the rural areas, being about 16 per cent lower in 1967-68 compared with 1960-61, the proportion of the rural population below a given level of per capita consumption expenditure has increased appreciably during this period. The position is worsened by the fact observed in recent studies that when prices rise, they rise faster for the poor than for the rich.[8]

Policy Goal

This leads to the question of what should be our goal for equalisation policies in the future. In the long period, we have defined it in terms of equality of opportunity. What about the short-term in which the overall income changes will be small? We may think of the task as one of rotating the income distribution curve around a point, say P, acting as the fulcrum, so that incomes above this point are reduced, and those of persons below this point are raised. The tendency in much recent discussion has been to locate this point at a high level but this, by itself, would make little difference to all those below that level. To make a perceptible impact, the fulcrum has to be located much lower down. The argument then becomes one between the very poor and the not so very poor. Even if a 'ceiling and floor' approach, such as that suggested by Dandekar and Rath is followed, there will be the problem of reconciling the middle groups to little change in their low consumption levels, until the economy has adjusted to the fast population growth and reached a higher standard.

Let us now consider policies acting directly on I_t. The traditional instrument of income redistribution in mixed economies has been redistributive taxation. If it can be used at all, it can act fast, but this is countered by its limited scope. Income tax in India covered in 1966-67 only about 1.5 per cent of households and about 5.7 per cent of the national income, and there is no extensive system of transfer payments. The effective degree of progression has not changed very much in the past, so that, as Ved Gandhi has concluded for the period 1950-51 to 1963-64, "income-tax has been regressive and inequitous intertemporally".[9] While an equitable structure of progressive taxation is an essential element in an equalisation programme, it must be recognised that its role is quite limited. If the economic system persistently generates a very unequal distribution of income, the tax system by itself will be unequal to cope with the situation; to do so, the tax structure has to be so progressive as to seriously affect incentives.

While transfer payments to the poor have played a negligible part in India, a great deal of progress has been achieved in a wider distribution of social services. As a result, the distribution of consumer welfare has been equalised to an extent not revealed by studies based on the distribution of consumption expenditures. This has, in fact, been the major contribution of recent policies to greater equality. However, there is much more to be done. The quality of the services provided for the poor is much below that provided for the better off. The emphasis on higher education has been at the expense of the early fulfilment of the constitutional target for primary education for the poorer classes. The provision of such necessities as water supply and public housing for the poor and rural areas has lagged behind the corresponding provision for urban areas. Beyond all this, there is a limit to the possibilities of substitution of public goods for private goods, so that equalisation policies have to go well beyond the provision of social services.

One further point to note is that even if greater equality of distribution of money incomes can be achieved quickly, it will take a much longer time for the economy to adjust its production pattern to the consumption pattern corresponding to the changed income distribution. Equalisation policies will therefore have to be phased to synchronise with policies to change the production structure. We may also consider an emphasis on equalisation of consumption rather than incomes. This means increasing the savings rates of the richer. As these savings get invested in wealth accumulation, it means postponing the problem of inequality to a time when we may be better able to cope with it.

A factor which might be discussed at this stage is the effect of the sort of inflation that we have been having in India. The usual text-book answer is that inflation has income regressive effects, but the problem has to be studied in more detail. Here we have the basic difficulty that we do not quite understand the causes of the inflationary process in India. Planning seems to be based on a 'monetary' theory of inflation, but the increase in money supply between 1950 and 1967 at 5.6 per cent points a year does not quite explain the increase in wholesale prices at 3.8 per cent points, together with an increase in real national income at 3.7 per cent points a year. Between 1951 and 1963, consumer prices increased at 2.7 per cent points annually, but money wages of factory workers increased by 3.8 per cent points, giving them an annual rise of 0.7 per cent in real wages; hence a cost-push theory of inflation has been advanced by Weintraub.[10] From 1964 onwards, prices increased much faster between 11 per cent and 16 per cent, but these were years of agricultural shortfalls. Some sections in the agricultural sector benefited but who—farmers or traders? According to the text-books, fixed income groups always suffer but many of then repair the damage fairly rapidly by the operation of the cost-of-living clauses. Further there has always been the suspicion that one important group of fixed income earners, the government servants, have been overpaid, considering the general poverty of the country. As Gadgil said, in the late fifties, "India continues to have, therefore, one of the most non-equalitarian systems of payments to the higher public officials."[11] In spite of all this, there can be no question that inflation affects large sections of poor people adversely. If it is decided that inflation to some degree is inevitable, then it is urgently necessary to protect the living standards of poor people against these effects.

Distribution of Wealth

The next group of policies to explore is that connected with the distribution of wealth. It is clearly an important factor influencing the income distribution. A highly unequal distribution of wealth leads to a highly unequal distribution of income. At the same time, an unequal distribution of income leads to inequality in wealth distribution. In India, as in most countries, wealth is more unequally distributed than income.[12] In rural areas, where land accounts for over

two-thirds of all assets, a 1961 estimate showed that the top 5 per cent of land-owning households held 36 per cent of the area, while the bottom 86 per cent held only 40 per cent of the area. It was also found that 25 per cent of rural households were agricultural labour households, i e, households depending on agricultural wage employment as their principal source of livelihood; 60 per cent of these had no land, while the remainder operated small pieces of land. In urban areas, the main form of wealth is residential property. It has been estimated that 53 per cent of urban households owned the houses they lived in, but the value of these houses varied so greatly that the concentration ratio of the value distribution was about 0.68. Further, the top 10 per cent were thought to own all rented property bringing the concentration ratio to 0.79. After this, the next major item is business assets, owned by about 1.7 million persons, with a concentration ratio of about 0.75. Financial assets may be broadly classified as currency and deposits, shares in joint stock companies, and government securities. Little is known about the ownership of currency, but it is interesting to note that the proportion of currency and deposits in the net investment of household savings in financial assets rose from 47 per cent in 1954-55 to 87 per cent in 1970-71. Shares in joint stock companies were owned by 0.19 million persons in the household sector, with a concentration ratio of 0.57. Government securities were owned by only 0.03 million persons in this sector, with a concentration ratio of 0.46

What can be done about the inequality of such wealth distribution? Excessive wealth concentrations may be nationalised, but there is little that can be done by redistribution, with the important exception of agricultural land. The total supply of land is so limited, and there are so many legitimate claimants for it that the approach through redistribution is the obvious route. Another possibility is the sharing of business assets with workers. This is not only an equalising measure but would also give workers a greater stake in the enterprise in which they are employed.

As the possibilities of redistribution of wealth, with the exception of land, are so limited, let us consider ways of regulating the effect of unequal wealth distribution on the income distribution i e, the effect of the matrix R. Income from wealth can be taxed more heavily than income from work, and also more progressively. In this connection, the role of wealth taxes is important. Wealth taxes have been yielding about Rs 10 crores in recent years, but Krishnan has estimated that by eliminating the large number of exemptions, the yield could be raised to between Rs 200 and Rs 300 crores. Wealth taxes can be looked at from two points of view—as a means of the progressive nationalisation of the more concentrated forms of wealth and as a more efficient means for the higher taxation of income from property. But any such approach to wealth taxation must be based on a long-term view of the desired pattern of private wealth ownership in the country. If agricultural land is expropriated and redistributed, it discriminates in favour of holders of wealth in other forms. Individuals must hold their wealth, especially from hump savings, in some form or other, and the forms in which they hold it depends on the rate of returns expected from them; the taxation of wealth must be planned so that the resulting returns lead to a desired pattern. Just now, there seems to be an excessive incentive to hold wealth in the form of urban residential property, thus diverting resources from other uses. The 1964 Perspective Plan expected Government to increase its borrowing from household savings from 20 per cent in 1960 to 40 per cent in 1965; this was not achieved; in order to achieve this, securities must be made more attractive than they are now, compared with other forms of assets. It may be worth experimenting with value-linked bonds, even with low rates of interest, to reassure savers against the fear of inflation.

We now consider the effects of income distribution on wealth accumulation, i e, the effect of the matrix B. This constitutes an important link in a cumulative disequalising tendency. Once a family has a level of income beyond its consumption needs, it saves, accumulates wealth, increases its income, saves more and so on. The higher the level of income over consumption needs, the more strongly this tendency operates. On the other hand, a family starting with an income below its consumption needs, dissaves or reduces its consumption standard, leaving the next generation worse off. This process has to be studied in its life-cycle pattern. Every family goes through a process of expanding family size; to maintain its living standard, its earning capacity must increase correspondingly. This is difficult for most families in the rural sector, so long as their income depends only on the size of their landholdings. It can only be achieved by sufficiently widespread agricultural development, raising productivity of the land, or by providing adequate alternative employment to rural workers. In order to study the extent of these trends, it would be highly desirable to relate household earnings or consumption expenditures according to the age of the head of household.

In this connection, it is interesting to study the relationship between living standards and household sizes. In rural areas, the average household size in the lowest decile is 5.87 compared with 3.78 in the top 5 per cent; in urban areas, the average household size in the bottom decile is as large as 6.09 compared with 2.25 for the richest 5 per cent. Dandekar and Rath conclude that "there is therefore little doubt that the size of a household is an important factor in pushing it down the ladder".[13] The relationship is more complex, as we see if we take income as the dependent variable. This is done in Table 1, which shows a U-shaped curve; per capita consumption declines as family size increases up to a point, and then increases thereafter. The data used were taken from Vaidyanathan, referred to above.

Finally, we turn to consider the effect of the production system on income inequalities. i e, the effect of the matrix A. Here, it is convenient to consider individual aspects of the system rather than the aggregative position at the national level. This will be more conducive to direct attention to specific policy decisions that can be taken to improve the position. There is, however, one qualification that has to be borne in mind in using this sectional approach, for equalisation according to some aspects might be cancelled by factors affecting other aspects. Take, for example, the effect of educational improvement between two periods shown in Table 2. The Table shows the change in proportions in four educational categories : U (with less than primary education); P (with primary education); S (with secondary education); and H (with higher education) of the workers in the labour force, and the changes in average incomes between the two periods. The educational expansion has reduced the proportions in the lowest category and increased it in the

higher categories, and average incomes have increased unequally. The result is still an increase in the co-efficient of variation from 98 per cent to 99 per cent, with the Lorenz Ratio almost the same. This, however, is just a cautionary point to indicate the complexity of factors entering into the transitional stages of the process of equalisation.

TABLE 1 : HOUSEHOLD SIZE AND PER CAPITA CONSUMPTION EXPENDITURES IN RURAL INDIA

Household Size	1958	1964-65
1	31.8	38.3
2	26.5	31.4
3	23.4	28.0
4	21.4	26.3

** Average of rural and urban data, using 1961 Census populations as weights.
† National Sample Survey of India, 17th Round, September 1961 to July 1962.

REGIONAL INEQUALITIES

Let us begin by considering the regional inequalities. Some data are summarised in Table 3. The difficulties of measuring per capita income, especially at the state level, are well known. It is therefore useful to supplement the income estimates by using the per capita consumer expenditures collected by the National Sample Survey. The inequalities between states in consumer expenditures (co-efficient of variation 13.4 per cent) is lower than that in incomes (co-efficient of variation 17.5 per cent); the two series are quite highly correlated (co-efficient of correlation +0.75). Urban expenditures are generally higher than rural expenditures, except in the case of Punjab, but there is great variation in the urban-rural disparity among the states.

There is also some evidence that these disparities have been increasing over time. The inequality of consumption expenditures in rural areas among the states (co-efficient of variation 16 per cent) is about the same as that in urban areas (co-efficient of variation 15.6 per cent), but an interesting fact that emerges is that the per capita expenditures in urban and in rural areas among the states have a weak negative correlation (co-efficient of correlation —0.22). The inequality in rural living standards among the states depends to some extent on the population presssure on the land, but this relationship is rather weak (co-efficient of correlation +0.38) a great deal of the variation must therefore be attributed to variations in the quality of the land, availability of inputs like water, etc, agricultural practices and non-agricultural incomes. It has not been possible to explain the variation in urban expenditures among the states; there is some evidence that it tends to counter-balance the differentials in consumer expenditures in the rural areas of the same states. Of course, all this is subject to the reliability of the data. Future prospects for reducing the inter-state differentials are not very promising. They depend to a great extent on the relative amounts of investments in the various states. But as seen in a previous paper, because Central assistance is largely neutral (co-efficient of correlation —0.22) and states' own resources are highly correlated with state income levels (co-efficient of correlation +0.78), the overall Plan expenditures in the states are also highly correlated with state income levels (co-efficient of correlation +0.65).

Urban incomes are higher than rural incomes, and the disparity has been increasing over time. This reflects to some extent the neglect of agricultural development in the period covered by the statistical data. Agricultural development plays a crucial role in the drive towards equality, both by promoting fuller employment in the rural areas and by raising the output of goods most needed by the poor in all areas.

It is now well established that inequalities among farmers in rural areas are largely a reflection of the uneven distribution of land. Consumption expenditures are more equally distributed than land-holdings. Vaidyanathan has shown that the output of animal husbandry is more evenly distributed

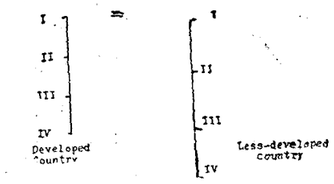
than land. This points to the role that the further development of animal husbandry, focused on the smaller and less productive farms, can play in ameliorating the effect of the unequal distribution of land.

Agricultural labourers, without any land or with very little land, are among the poorest of the rural population. Special policies are required for the improvement of their condition. The question is whether they should be absorbed more fully into the agricultural sector or whether non-agricultural employment should be found for them. To provide more agricultural employment requires giving an even more labour-intensive bias to agriculture. Outside the agricultural sector but still within the rural areas, a strong case has been argued for employing them and other underemployed rural poor in rural works programmes. The success of this depends on building up a shelf of projects in all parts of the country. There are also questions of how tightly they should be organised for non-agricultural work and over what areas in the neighbourhood of their homes they should be employed.

There is then the question of whether there is any disequalising tendency in the application of the new agricultural technology. Some such tendency has occurred as a result of the concentration of intensive development efforts in particular districts; the effect of this could have been reduced if the government could have absorbed a greater proportion of the benefits accruing to a particular section of the people. However, the effect would reduce in course of time as development efforts spread to more areas. There is however the question of whether the new technology gives a greater benefit to larger farms; the evidence available so far is inconclusive.

Urban Areas

We turn now to consider some aspects affecting inequalities in urban areas. Although average incomes in urban areas are higher than in rural areas, income distribution is more unequal in urban areas, so that the proportion of poor people is the same, or even higher, in urban areas. In urban areas, even more so than in rural areas, the basic source of inequality is that between the employed and the unemployed. In rural areas, outright unemployment is less common and poverty is more due to underemployment. There is also a lot of underemployment in urban areas, especially in the service sector, where the situation is closer to disguised unemployment. As one commentator has put it, the poor cannot afford the luxury of unemployment. Even so, there is considerable open unemployment in urban areas. This is ultimately traceable to the fact that industrial employment, which in any case, grows more slowly than industrial production or investment, is also growing more slowly than the urban labour force. In the case of the urban labour force, the high rate of natural increase is reinforced by a steady rural-urban migration. This has been mostly attributed to the push factor of population pressure on the land in rural areas, but this assumption is worthy of further study. The flow of rural-urban migration may be more responsive to the actual, or imagined, difference between employment opportunities and income expectations in urban and rural areas. It has, therefore, to be seriously considered whether even the wretched conditions of the poor in urban areas provide an excessive incentive to rural migrants. To some extent, it may even be that policies to promote employment in urban areas actually increase the volume of unemployment by inducing a higher rate of in-migration. Part of the problem may have to be tackled by deliberate urbanisation policies. In the past, the share of small towns in urbanisation has actually been declining. Policies to promote the growth of such small towns may have beneficial effects on agricultural development in their rural hinterlands and on employment opportunities for rural migrants.



The role of small-scale industries has also to be considered as an equalisation policy. Lydall and Dhar[14] have argued that the productivity of capital is lower in these industries. Efforts should therefore be made to improve their technical efficiency. Also, the role of such industries in the training of entrepreneurs should be studied.

Another aspect of income inequalities affecting urban areas is the share of wages and salaries in value added in manufacturing industry. According to the UN Study of the Growth of Modern Industry, for 1963, this share is, on the average, about 48 per cent for the developed countries, and about 28 per cent for the less-developed countries. The proportion for India is given as 47 per cent, but this is not quite comparable because the Indian figures, unlike those of other countries, give value added in manufacturing net of depreciation.

Yet another source of inequality in urban areas is the different educational levels of workers. Educational progress has been sought after as a great equalising force. In fact, as Kuznets has pointed out, a considerable part of the trend towards equality in the later phase of economic growth in the developed countries has been due to the greater investment in the training and education of labour.[15] And Indian development strategy has also been based on this premise. But past developments raise some serious doubts as to whether the educational expansion has had an equalising effect on the whole. One problem is the extent of inequality in the access to education, a problem to which attention has been drawn by the Education Commission. It is not only a matter of the difficulty of poor families in meeting educational costs, but also the lag of primary education, in quantity and quality, behind other levels. Under these conditions, educational expansion, far from being an equalising force, may actually promote inequality. As Lydall has confirmed in his studies, "societies in which education is more unequally distributed will exhibit a wider dispersion of earnings than those in which it is more equally distributed".[16]

The other problem concerns the earnings differentials between the more and the less educated workers. These differentials are greater in less-developed countries than in developed countries.[17] The situation may be illustrated as in Figure 1. In this figure, the wages of the highest level I workers in the less-developed country is placed at the same level as in the developed countries, as they would be if they were free to migrate in search of personal advancement. However, the lowest level IV workers have earnings determined by the relative affluence or poverty of their countries. As a result, the salary differentials by education in the less-developed countries are higher than in the developed countries. The greater differential for the more educated workers in the less-developed countries is also due to the greater scarcity of such workers. In many countries, these differentials tend to persist from former periods of scarcities, as in colonial times, when the high-level manpower needs were mostly met by expatriates. In a period of such rapid educational expansion as has occurred in India, the more important question is the speed with which these differentials are reduced as a result of educational expansion.

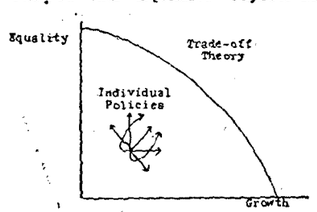
Figure 1: Earnings Differentials by Education

The process of narrowing down of differentials has been very slow. This has been a cause of the phenomenon of educated unemployment. Unemployment in agriculture may be explained in terms of the musical chairs game, with more players than chairs, corresponding to more workers than jobs. In the case of educated workers, however, Blaug *et al*[18] have applied a dynamic model (due to Arrow and Capron) based on a queuing process; the unemployed corresponding to queues in the process of adjusting wages to the supply-demand position. The slower this process, the longer the queue, i e, the greater the unemployment. The adjustment process has been described by Arthur Lewis: "The process is inevitable, if painful and dangerous. It is painful because it requires that the young people coming out of schools and universities continually adjust their expectations downwards, and this is a frustrating process. It is dangerous because this frustration may erupt politically".[19] It is the role of planning to make this process less painful and less dangerous.

The slowness of the adjustment process has a number of effects on inequalities. One effect is that, as Blaug *et al* have tried to show, the private rates of return to more education are greater than the social rates of return, giving rise to a great pressure of private demand for higher education, which in turn, given the present 'open-door' policy, forces an excessive expansion at the higher levels at the expense of quality, and at the expense of primary education. Another effect is that at these high salary expectations of educated workers, their absorption in the private sector is slowed down, leading to greater problems of unemployment. Yet another effect is to raise the cost of public services and to reduce their equalising effects, and at the same time, reducing the pace of development and again reducing the trend towards equalisation by that route.

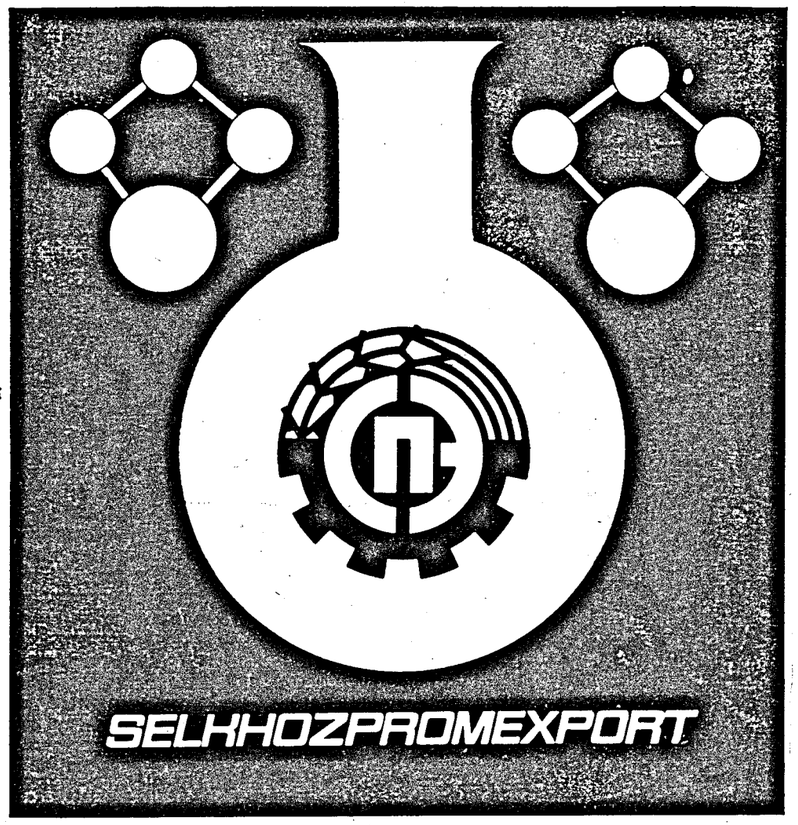
In most countries, the public sector is one of the major employers of educated workers and this is even more so in the less developed countries like India. Because of this dominant position, the initiative for adjusting salary structures to narrow down the differentials and to promote the better and fuller utilisation of educated manpower has to come from the government itself. However, past Pay Commissions have failed to set the pace in the public sector, but have taken their cue from the private sector instead. The issues before the present Pay Commission have been amply discussed by Dandekar.[20] If, because of its restricted terms of reference, the Pay Commission is not able to relate the question of emoluments of government employees to the economic position of the country, the Planning Commission has to give the lead in formulating an integrated policy in respect of wages, incomes and prices.

The general conclusion to which this paper hopes to attract attention is that planning for equalisation must strike at the root causes of inequality and that the sources of inequality and the possibilities of reducing them are scattered all over the economy. These have to be identified more closely to estimate the equalising power of various specific policies. Once this is done, it will be possible to orchestrate them in various combinations so that what we gain in equalisation, we do not lose in development. For this purpose, it is also necessary to see the role of these policies in a time perspective. It is highly probable that drastic measures for equalisation may be self-defeating and damaging to growth prospects at the same time.



Growth versus Equality

The conflict between economic growth and income equality has always fascinated economists. There is a general feeling amongst us that the two are incompatible and that there is a trade-off between them. The growth of the national income is considered an economic objective, against which is poised equalisation, considered as a social objective. The two objectives were not advanced simultaneously in the natural history of the early stages of growth in the developed countries, but this does not constitute a universal law on the subject. The recent history of these countries shows many tendencies which have had positive effects on both objectives. These must be studied in detail in terms of individual policies, for policies vary in the effects on growth and equality. Even if some policies seem to advance one objective at the expense of the other in the short-term, their effects must be studied over a longer run as well, for then the two objectives may be reconciled. The possibilities are illustrated in Figure 2.



The options open to countries attempting development with their eyes on both objectives of growth and equality must, therefore be examined in some detail. In doing this, we leave out of the present consideration the political aspects, namely the threat of great and growing inequality to political stability, the pre-condition of economic growth. We must note, however, the wide ranging powers of modern governments, especially as it has come to be in India. In its more narrowly economic aspects, the case is generally argued in macro-economic terms at a high level of abstraction, thus: The propensity to save of individuals increases with their income; therefore, more equality means less savings and hence, less growth. In more sophisticated versions, it is recognised that the growth sought for is growth of consumption, so that growth of savings beyond a certain point may reduce growth of consumption, as discussed in the theorems on the optimum propensity to consume and the golden rule of savings. However, it is felt that in the early stages of growth, the level of savings is well below this critical point. There are a number of qualifications to this general argument once we look in more detail, especially in dynamic and macro-economic terms. For example, Harry Johnson has studied the effect of interdependence of consumption behaviour.[21] He has shown cases of what he calls an emulative society, as distinct from a competitive society, in which the effect of redistribution is to reduce aggregate consumption and increase savings.

In the macro-economic argument summarised above, it is assumed that growth depends only on savings and investment. But in the presence of unemployed resources, an increase of effective demand from consumption, at

Figure 2: Possible Effects on Growth and Equality Objectives

least in some sectors, could lead to increased activity, higher incomes and more consumption later on. It may seem paradoxical to argue for an increase in demand under the inflationary conditions that generally prevail in developing countries, but the argument cannot be rejected only on the strength of a general presumption. For example, it is not yet clear whether some patterns of agricultural development have not been impeded by lack of demand, and hence of incentives. Again, the general consensus of the OCED books on trade and industrialisation policies seems to be that import-substituting industrial enterprises have been producing expensive products for use by a restricted middle class and so production came up rapidly against the limits of the home market. It is thus possible that growth of capacity in some sectors might come up against a lack of demand even in the early stages of growth. This has been dramatically illustrated by the protracted industrial recession that has occurred in India in the last few years. It must also be remembered that in the balanced growth approach to development, agricultural development is emphasised not only to provide wage goods and raw materials, for industrial development, but also to

provide the demand for growing industrial output.

In the usual models, the emphasis is mostly on private savings of households. In a country like India, the government has taken on a special responsibility for savings and investment. This provides the main avenue for increasing savings rates at the same time as income distribution becomes more equal. In advocating this sort of policy in the fifties, Gaitskell argued that in an economy growing at 3 per cent a year, the amount of man-made capital doubles in 25 years and quadruples in 50 years; if all new capital were public capital, the private share of capital would be reduced from about 60 per cent to only about 15 per cent of the whole.

The balance between growth and equality also depends on the type of growth we pursue. Thus, the relative emphasis on agricultural development has important effects on equalisation. A more equal income distribution will increase the demand for agricultural products more than for industrial goods. Therefore, greater emphasis on agricultural development will promote both growth and equality for some time to come. In considering the case for emphasis on agricultural, and more generally rural, development, it is relevant to consider Kaldor's criticism of Indian planning techniques made at the time of the Third Plan.[22] He then criticised the habit of looking at the problem of resources so much in financial terms, and argued that it was foolish to count the outlay on rural schemes as part of some given outlay, so that any increased expenditure in this direction must go to reduce outlay on other kinds of investment. His argument was that such schemes were likely to be self-financing well within a single plan period by yielding quicker returns in terms of wage goods than other kinds of investment.

Within the agricultural sector, there is much room for equalisation policies. There is first the case of land reform. In the early stages after redistribution, there may be a fall in agricultural production, especially if the new operators are unaccustomed to efficient cultivation, but one of the strongest arguments for land reform is that greater security of tenure and ownership will increase the incentives to long-term improvements, leading to faster growth. Apart from land reform, another measure for equalisation would be to redress the balance of bargaining power between farmers and traders. Also the agricultural terms of trade play a crucial role in the balance between producers and consumers of agricultural products; the broad line of policy would be to secure benefits to consumers in the form of low prices, and to producers in the form of rising incomes, based on improvements of productivity rather than of high prices. Such a broad approach needs to be embodied more fully in the work of the Agricultural Prices Commission.

An important cause of poverty is unemployment or underemployment of a chronic character, and so an important equalisation policy has been employment creation. If jobs were created just to increase the incomes of the poor, we would have greater equality but less growth. If, however, the projects for which extra employment is created are high-priority development projects, then this equalisation measure would contribute to future growth as well.

Then there is the approach to educational expansion. When educational opportunities are widely distributed, they will promote equality and at the same time accelerate growth. In the past history of the presently developed countries, development was not based on a wide spread of education, but Kuznets has pointed out that the simultaneous growth and equalisation in these countries in their later phase of development has been based on a great expansion of education.

Economic growth by itself, as we have seen, will not achieve the objective of eliminating poverty in India as rapidly as we desire, but rapid growth will facilitate the many changes of the economic system and the production structure needed for equalisation policies. Therefore, together with such equalisation policies economic growth must be pursued by a relentless search for more resources and improvements of government administration to tackle problems not faced in the past twenty years of Indian planning.

Review of Management is published four times a year, on the last Saturday of February, May, August and November.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

Building on the Apex?

TO all appearances the 'managerial revolution' is here — with a distinct and significant social grouping of professional managers committed to 'efficiency' and 'results,' and bringing to bear on industrial working the analytical techniques yielded by the mathematical and behavioural sciences. Undertakings in the organised sector have what is termed 'an organisation structure', and even traditional family-managed business houses have begun to acquire the facade of a formal management. That the management function is recognised as an economically important one is seen from the fact of a flourishing market for professional managers where the terms of employment are highly attractive and entry not easy for the run-of-the-mill. It is widely recognised that to be a good manager you not only have to be competent in any one subject — be it economics or engineering — but need to acquire certain general qualities and motivations.

The institutes of management were set up in response to the growing demand for managers and over the years these have built up a capital of professionalism in research activity and training. It is a mark of their success that the number applying for admission to them have risen spectacularly and that industries have shown an increasing preference for their products in making appointments.

The conscious orientation towards efficiency and excellence must presume that merit and motivation decide entry into these institutes of training. Yet, as an article in this Review of Management underscores, with the best intentions in the world, there is a built-in bias in the selection process in favour of those with an urban, professional and English-speaking background. Of course, these are also the more affluent in our society.

It may be argued that 'merit' in the management context must inevitably encompass these attributes. Do the management schools themselves subscribe to this view? Not consciously, perhaps. What they emphasise explicitly is intelligence, a certain level of mathematical skills, capacity for logical reasoning, and facility in communication. The point, however, is that except for quantitative analysis, the rest has to take place in a medium, which happens to be English and in which a significant proportion of the candidates feel ill at ease. One may be very logical and sophisticated in one's mother-tongue but may fumble in a language that is not merely 'second language' but also has overtones of socio-cultural superiority and inferiority. It must be remembered, too, that this screening is a cumulative process that starts early in school, is carried over into college, and irrationally sieves through an alien medium the functional elite for the future. By the time graduates aspire to be trained as managers many with the relevant merits have already got left on the sidelines.

It is not simply that the management schools thus have an artifically limited catchment area. The question that needs to be focused on is whether the socio-cultural attributes of those who come out of these schools are adequate for the tasks of management in the socio-economic context of the country. If management is seen not as a series of technical decisions made in small conferences of 'professionals' and implemented with 'follow-up', but as a process of eliciting information, reasoning, evaluating and setting of goals, communication and team action, then the excellence in English and the particular social and material background which the educational system puts a premium on — with the inevitable, attendant elitism — may in fact prove a hurdle to the optimal functioning of the manager. It is in this light that the high professionalism that has set in has to be viewed.

Part and parcel of this professionalism is the tendency of managers — particularly those concerned with marketing and selling — to see their roles in limited though technically clever ways. The blinkers that an intense devotion to competence can put on an otherwise intelligent person may make him oblivious to the social and national relevance of the product he is making or selling. Indeed, the more unnecessary the product or the higher it is priced, the greater is the marketing skill deemed to be in making it acceptable — and the greater the work-pride. Management personnel often have no qualms to suggest in this dual economy — with its poverty-striken subsistence sector that has next to no purchasing power and its affluent sector with its 'surplus' purchasing power — that the social worthiness of a product has to be decided by the existence of demand for it. Nationalism then consists in indigenously supplying the goods that the smuggler might otherwise supply. Management education, by relying almost exclusively on reading materials from US business schools and modelling courses on the requirements of the free market economies, actively encourages this narrow conception of the manager's economic role in society.

Management Education

Ishwar Dayal

Management Education and Training in India, Vaikunth Mehta National Institute of Co-operative Management, Poona; Rs 20.

THIS is a collection of papers with a report on the proceedings of a conference on management education and training organised by the Vaikunth Mehta National Institute of Co-operative Management, Poona, from January 22 to 24, 1969. The invitees included educationists and executives from industry. The conference was held in five sessions — review of management education and training programmes in India and inter-institutional collaboration, management education techniques, training of trainers, research in management and collaboration between business and academics.

The first session reviewed the training programmes in some of the teaching institutions and business organisations represented at the conference. In addition, seven papers were presented. The paper by M N Rudrabasavaraj is comprehensive and could be seen as a theme paper for the conference. The author has reviewed the existing facilities for management education in the country and has pointed to the lack of satisfactory standards in teaching and in physical facilities and research in management. He suggests the setting up of a Management Advisory Council to replace the present Board of Management. While I see the problems of education as worthy of study, the solution recommended may have little impact on the system. Recruiting faculty and organising teaching material are tasks to be tackled essentially at the unit' level. To the extent the teaching institutions are indifferent to quality, and do not develop a reward and punishment system that evaluates the quality of teaching, an outside agency, even a Management Advisory Council, would be unable to make improvements in the present situation.

If it is accepted that education for professional careers should emphasise development of personal skills as much as knowledge of relevant concepts and theories, the organisation and administration of the educational system should reflect this concern in explicit terms. Among other things, such a system would require flexibility and tolerance on the part of the administration toward innovation and change in teaching methods and in organisational relationships. The examination system may also have to test the personal skills of the students with the same concern that is devoted to his knowledge of concepts and theories taught in class. If these considerations are important, as I believe they are, educational institutions must provide a large measure of autonomy and flexibility; they may have to ensure quality not so much by review of course outline, or centralised examination, but perhaps through a system of reward and punishment for the teachers.

Among other papers in the first session, K S Basu and Kamla Chowdhry have asked many relevant questions about management development. Having discussed the changing nature of the managerial job, Basu has asked three questions : who should be taught; what should be taught; and who should teach. In answering these questions, he has emphasised that teaching methods and material should be indigenous and should be evolved to suit local conditions. Kamla Chowdhry has quoted cases and autobiographical experiences to illustrate that the cultural factors in India are sufficiently different to require teaching methods and management development practices different from those used in the West.

Two other papers in the first session by Rudrabasavaraj and K K Mehta attempt to identify conditions necessary for developing people in organisations and give examples to illustrate their points. Three other papers by Sanyal, Dubashi and Prasad provide either a historical perspective of institutional activities or description of specific programmes.

In the second session, on the choice of teaching techniques, G P Asthana's paper discusses the comparative value of different teaching methods and quotes research data on knowledge and attitude changes in management education. Nahusharaj and Pereira discuss a method used by them to evaluate training and development in their company. Other contributors in this session, Ramaswamy, Dalvi and Jha have described different methods of teaching in education. In the report of the discussion in this session a wide range of techniques are listed.

The third session, on training of trainers, includes two papers. Dasgupta argues that the students should absorb a high degree of theoretical and practical knowledge of the field in which he chooses to work. He points out that a teacher has to be a specialist in a field of study related to management and emphasises co-operation between education and industry. He advocates teaching of management courses at the universities by executives. Rudrabasavaraj feels that the quality of teachers and of teaching is poor and suggests that research in management is necessary to improve teaching. Like Dasgupta, he strongly advocates closer association between business and teaching institutions and a programme of exchanging personnel between the two. Most ideas brought out in the papers are valid but the discussion avoids some issues. For example, what kind of experience is useful to either the executives or the academic? Exchange between the executive and the academic may be desirable, but the usefulness of the exercise would lie in explicit recognition of the kind of experience that could help each in doing the other's job better. In teaching management, some things are learnt better by doing research in industry and some others by doing a job of work. In the conference papers it is implied that experience in business enables an executive to teach management better than an academic. I think we have to clearly recognise that no one can teach just experience to students in a classroom, The executive has to have the ability to conceptualise his experience, and if he can do this, his contribution to the teaching of management could become significant.

The fourth session, on research in management, had one paper by M Ramsay but it has not been included in the proceedings and no reason is given for this omission. In the report of the discussion, the participants mentioned the research being carried out in their respective institutions and emphasised that without research the teaching of management was likely to become stale.

The fifth session, on business and academics, had three papers. Richardson describes the philosophy and practices of developing people in his organisation. Rao illustrates a deliberate plan to establish relations between the teaching faculty and others. Pande describes the many things his organisation has done to provide the academics with work experience.

The publication provides useful information about activities in different institutions. In retrospect, however, the discussions and the conclusions have died with the conference and no more is thought about them. There have been other conferences since that have discussed essentially similar things and perhaps come to the same kinds of conclusions. What then is the next stage?

What Makes a Manager—Merit, Motivation or Money ?

Baldev R Sharma

This article examines the process of admission of students to the two-year post-graduate programme at one of the institutes of management. Utilising the admission data for the last five years, a number of findings emerge.

Surely, merit and motivation are the only factors which are 'intended' to influence selection for admission. But that cannot rule out the 'unintended' consequences which might flow from some components of the selection process. The significant and dramatic trends repeating year after year make it naive to imagine that money is not influencing the making of a manager. The influence money has in determining the fate of a candidate is both indirect as well as unintended, although that does not make it any less important. The process through which this causal network really operates are identified here.

I

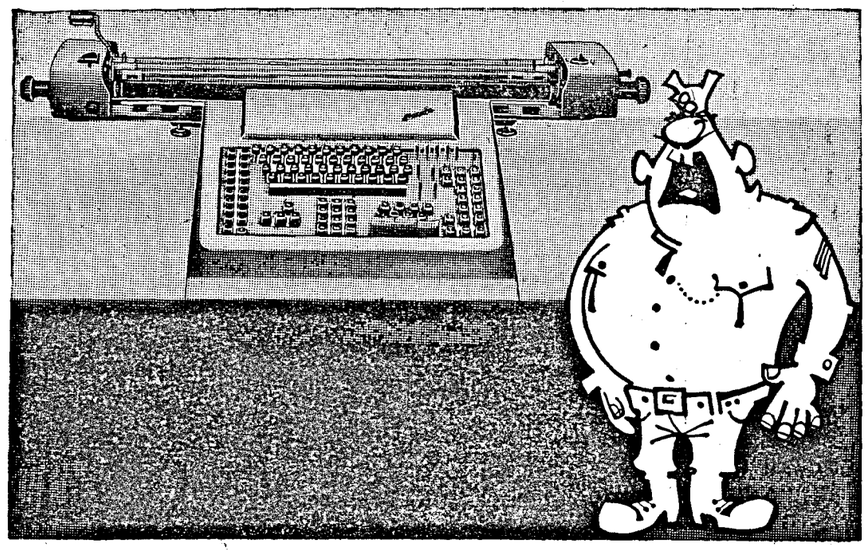
Introduction

THIS paper examines the process of admission of students to the two-year post-graduate programme at one of the institutes of management. Specifically, I will focus attention on the influence of family income on a candidate's chances of becoming a manager. To be sure, no school of management uses family income as an input for deciding whether or not to admit a candidate. Ideally, therefore, there should be no association between family income and a person's chances of getting selected for admission. However, sociological literature abounds in evidence of the many direct and indirect, subtle and not-so-subtle, ways in which a person's family income shapes his life chances. It is my aim in this paper to see whether such a thing is happening in relation to the admission process of the institute under study.

The institute selected for this study has been in existence for only nine years. The first batch of students for its two-year post-graduate programme was admitted in 1964, while the most recent batch was admitted in 1971. Before starting admission to each batch, wide publicity is given for the benefit of potential candidates throughout the country through advertisements in the leading English dailies. In addition, intimation is sent to various colleges and universities with a request to publicise the admission notice among their student population. Applications for admission are received from all over the country and from candidates with diverse educational backgrounds.

To be eligible to apply for admission, a person must have a bachelor's degree or its equivalent in any field of learning. Candidates who are in the final year of degree education are also eligible to apply, but they are admitted only if they have completed the degree examination *before* joining the school. Each year, a certain percentage of marks is prescribed as the minimum requirement for applying. Usually, a candidate is required to have obtained 50 per cent or more marks in more than one examination starting with the high school and ending with the degree examination.

The application form is quite comprehensive. It seeks information about a candidate's socio-economic background, educational record, work experience, extra-curricular activities, and motivation for a career in management. Up until 1969, candidates used to be evaluated on the basis of application data alone, after which about 500 candidates would be called for written tests, group discussions, and personal interviews. Final selection for admission was based on the cumulative performance of a candidate on all the selection items. In 1970 and 1971, written tests were introduced for *all* the eligible candidates at various centres in the country. Afterwards, the candidates were ranked in terms of their scores in application rating *and* written tests and the top 500 or so were called for group discussions and personal interviews.



Thus 1970 marked a shift in the admission procedure of the institute. Whereas, in the past, selection of candidates for interview was made only on the basis of educational record and other application data, beginning 1970 such data were supplemented by additional data on actual performance of candidates in two written tests. It has always been the policy of the institute to call candidates for tests and interviews at a number of carefully selected centres all over the country. This is to ensure that no candidate is discouraged from applying because of the high travel costs of going to the city where the institute is located.

The institute under study always had sufficient funds in the form of

* Throughout this paper I have used the figures shown in this column as the source of data.

Bankers! You'll love the rough, tough Sergeant-Major Null Control headquartered inside every ASCOTA Accounting Machine you buy!

With Sergeant-Major Null Control on guard-duty in your Ascota, Corporal Wrong Posting doesn't have a chance to creep by. Which is just fine, making Ascota the most reliable accounting machine there is

'NULL CONTROL' helps you in two ways:
- Warns you the moment an incorrect posting is made.
- Stops the machine instantly and returns the carriage to its starting position.

What more could you ask of such a lovable tyrant?

ASCOTA Accounting Machine comes to you with or without a typewriter, just as it suits you. It will suit you for other reasons too—each you can solidly bank on to render better service to increasing numbers of depositors.

Versatility With a choice of 5, 10, 15, 25, 35, 45 & 55 totalizers, ASCOTA can be custom-programmed to handle a variety of jobs in your bank. Current & Overdraft. Savings. Inward & Outward Clearing. Salary. Provident Fund. Branch Reconciliation. Supplementary.

Flexibility Simply by interchanging pre-programmed Control Panels, in just a matter of seconds, you can utilize the same ASCOTA machine for any number of different jobs.

Speed The blind-touch 10-key key-board and faster automatic totals speed up postings. Cut down operator fatigue. Shoot up productivity.

Service Prompt, expert service rendered by factory-trained technicians free for the first 12 months. Thereafter, under a fixed-price annual preventive maintenance contract.

For a demonstration, contact Blue Star today.

Available to actual users only, against Rupee-payment.

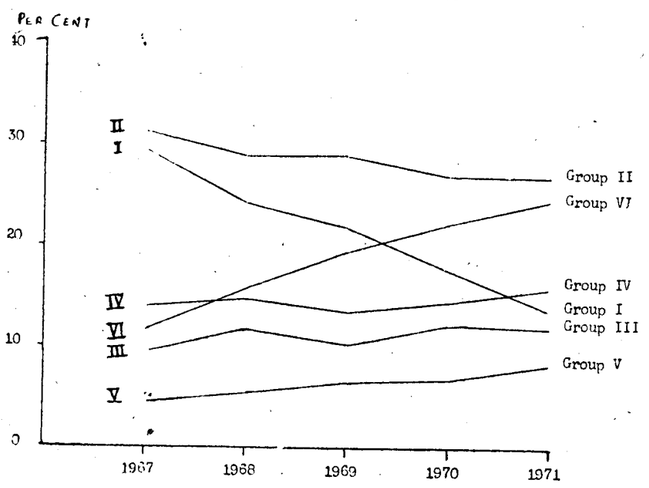
loans and scholarships to help needy students through the two-year post-graduate programme without much financial hardship. In fact, it has been the deliberate policy of the institute to ensure that no poor student, who is otherwise capable, is deprived of a career in management because of his poverty. Many admission procedures and activities are the direct result of this policy.

Every student who successfully completes the two-year post-graduate programme of the institute immediately gets employed in industry. This record of full employment of graduates is something unique to this institute. Among other things, it speaks of the high esteem in which industry holds the institute. The institute's placement office, which brings the potential employers and employees together, plays no mean part in making this possible. Moreover, the graduates are recruited at fairly high initial salaries, which are now in four figures. It is unsual for students with comparable education in other fields of learning to secure full employment and comparable salaries.

The two-year post-graduate programme of the institute is a full-time residential programme. The total cost of this education is between Rs 6,000 and Rs 7,000 for the two-year period. This amount includes tuition and other fees, room and board charges, cost of teaching materials, and other miscellaneous expenses. The loan and scholarship schemes already referred to enables a student meet the bulk, if not all, of the cost of his education.



Of the eight batches of students admitted to the institute so far, I have selected the last five batches (1967-1971) for purposes of this study. The first three batches (1964-1966) are dropped because data on family income of candidates for those years are not available. The question inquiring about the annual family income of a candidate was introduced in the application for admission for the first time in 1967.

For purposes of this study 'annual family income' has been classified into the following six groups:

Group I	Upto Rs 3,000
Group II	Rs 3,001-6,000
Group III	Rs 6,001-9,000
Group IV	Rs 9,001-12,000
Group V	Rs 12,001-15,000
Group VI	Over Rs 15,000

The reason for this classification was simply the availability of data in this form. Data on annual family income were taken directly from applications for admission. One may raise doubts about the reliability of data collected through such a source. While no one can swear by it, there are strong reasons to believe that application for admission is a reliable source of data on family income. The candidates for admission are told in writing that "the application is the key part of the admission process and that complete, careful and accurate answers to the questions are therefore extremely important". They are also cautioned that "incomplete or false information could adversely affect their chances or selection" and that "if they are admitted

FIGURE 1: PROPORTION OF CANDIDATES APPLYING FOR ADMISSION FROM EACH INCOME GROUP DURING 1967-71

to the programme on the basis of false information, it could lead to their expulsion from the institute". In addition, each application is attested by a Gazetted Officer of the Central or State Government, Justice of Peace, of Principal of the college attended by the candidate. The attesting officer is required to certify that the particulars given in the application (including the section in which family income is mentioned) are correct. In view of these considerations, I feel that the data on family income used in this paper are sufficiently reliable, at least for the purpose in hand. In any case, there seems to be no other source from which more reliable data on this subject could be obtained.

During each of the five years under study, there were some candidates who did not complete the column for annual family income. Fortunately, no more than nine per cent of the candidates fall in this category. The non-availability of data from such candidates is, therefore, not likely to adversely affect this study. At the same time it is important to recognise this fact as one of the possible limitations of the study. Detailed information about such cases is given in Table 1.

II

The Findings

Table 2 gives the number and percentage of candidates at different stages of the admission process. This information is presented for every income group, separately for each of the five years under study. Table 2A depicts a picture of the various income groups by adding up the five-year data.

Even though the six income groups are not equally represented at each stage of the admission process, there appears to be a fairly widespread representation of the various income groups—at least when we look at the cumulative picture of the five-year period. In other words, at every stage of the admission process there are quite a few candidates from each group. These overall figures highlight another thing. For every one candidate called for interview there were five who had applied for admission, while the ratio between those selected and applicants was 1:16. Actually the number of students finally admitted is even lower than those selected for admission. This is because everyone who is offered admission does not join the programme for one reason or another. If, therefore, we compare those actu-

Development is proceeding in spite of the cultural attitudes, social institutions and political conflicts which sometimes seem to be such immovable barriers. It is not a smooth, uninterrupted progression, to be sure; rather, growth appears more as a series of fits and starts. "And yet," as Galileo is supposed to have said, "it moves!"

FIGURE 2: PER CENT INCREASE OF CANDIDATES FOR ADMISSION OVER THE BASE YEAR 1967 FOR EACH INCOME GROUP

ally admitted with those who applied, the ratio comes to about 1:25. All this indicates stiff competition for admission to the institute.

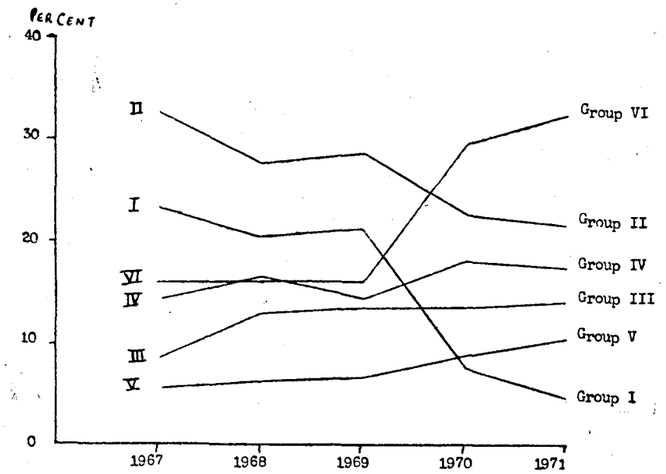
Looking at the total picture for the five years (1967-71), it also becomes clear that the various income groups have not been able to maintain their respective proportionate representation in the course of the three stages of admission. In fact, there are some marked shifts in the composition of candidates from one stage to the other. On the whole, it appears that the poorer candidates are the losers and the richer candidates the gainers in getting called for interview and getting selected for admission. The relationship between family income and the three stages of admission (as measured through the chi-square test) is signi..cant at the 0.001 level which suggests that these two factors are not independent of each other.

But total picture for the five years does not tell the whole story. When we compare the income distribution of candidates from year to year (Table 2), we notice some clear trends which are discussed next. For the sake of convenience, I shall discuss separately each stage in the admission process and then examine the overall trends.

(1) *Applicants for Admission:* With only one exception (in 1970) we notice a progressive increase in the number of candidates applying for admission to the two-year post-graduate programme of the institute. The overall annual increase has been of about 33 per cent, which has almost tripled the number of applications for admission in five years. On the other hand, the number of candidates called for interview as well as those selected for admission has remained more or less constant over the years, with the result that increasingly more persons have been competing each year for every one seat at the institute, the ratio moving from 1:9 in 1967 to 1:26 in 1971.

Table 2 helps us examine whether the rate of growth of applications from the various income groups has been uniform or not. My reading of the Table shows that it is not. The top two income groups (V and VI) have experienced maximum increase while the bottom two income groups (I and II) not only experienced no increase but suffered decrease in the proportion of applicants. The two income groups in the middle (III and IV) seem to show inconsistent and inconclusive trends, in that they neither substantially gained nor lost in terms of their proportionate representation over the years. As Table 3 shows, both analysis of variance (F) and chi-square (X^2) tests support the contention that the income composition of applicants for admission has significantly changed over the five-year period.

Figure 1 presents the findings discussed above in a graphic form. Again, the most dramatic trends are revealed by the two intersecting lines of the poorest (I) and the richest (VI) groups. It may, however, be pointed out that the decrease in the case of the lower income groups is not in terms of absolute numbers. From that point of view, barring one or two exceptions, *all* income groups have experienced varying degrees of increase in the number of applications. But the proportionate increase being not uniform in all cases, some groups have gone down while others have gone up over



the years in terms of their representation among the total number of applicants.

The trends over time, reported above, were examined by using a simple regression model. The regression line of proportion of applicants in a particular income group (y) on time (x) can be fitted by the equation $y = a+bx$, where y stands for proportion of applicants and x for the year, while a and b are respectively the intercept and the slope co-efficient of y on x. As shown in Table 4, income groups I, V and VI show changes which are highly significant, while the other groups show trends which are either not significant (Group III and IV) or not highly significant (Group II). Of particular significance are the b-coefficients for Groups I and VI which show the largest rate of change compared to any of the remaining four income groups.

Figure 2 shows cumulative per cent increase of applicants over the base year 1967 for each income group. Once again, the growth rates of the two extreme income groups (I and VI) mark a sharp contrast indeed. While Group VI registered a 503.2 per cent increase at the end of five years, the corresponding growth rate for Group I was only 35.7 per cent.

(2) *Candidates Called for Interview:* A candidate's decision to apply for admission is influenced by a number of factors, one of them being his 'desire' to seek a management career. Any attempt to explain the differential growth rates of various income groups at the stage of initial application, therefore, must include a discussion of the motivational factors. On the other hand, the decision concerning who is to be called for interview is made entirely by the institute and is, therefore, not affected by the wishes or desires of the candidates. As already noted, shortlisting of candidates for interview was initially done

FIGURE 3: PROPORTION OF CANDIDATES CALLED FOR INTERVIEW FROM EACH INCOME GROUP DURING 1967-71

on the basis of application rating alone (1967-1969) and later on the basis of application rating plus scores in written tests (1970-71). In both cases, the major criterion for judging the suitability of a candidate for interview was his academic ability.

There is no way of knowing whether there is any difference in the academic abilities of the rich and the poor. It is, therefore, natural for me to assume that no such difference exists. If this assumption is correct, we should expect that the proportion of candidates called for interview during a particular year from each income group roughly corresponds with their proportion among the applicants for admission. In this section I shall attempt, among other things, to examine the validity of this assumption. A careful examination of data in Table 1 shows that there is a proportionate decrease over the years in the case of the poor (Group I) and a proportionate increase in the case of the rich (Group VI) among candidates called for interview. For example, the proportion of candidates called for interview from group I went down from 23.3 per cent in 1967 to 4.6 per cent in 1971; on the other hand, the proportion of candidates from group VI went up from 16.0 per cent in 1967 to 32.4 per cent in 1971. The other four income groups (II to V) show trends which are by and large similar to those reported above in the case of applicants for admission.

As in the case of applicants for admission, the income composition of candidates called for interview has changed significantly over the last five years. As shown in Table 5, the chi-square (X^2) and the analysis of variance (F) tests indicate the existence of significant shifts over the years in the income composition of candidates called for interview.

In the previous section, I have shown that the proportion of candidates applying for admission from group I has been declining while that from group VI has been rising during the last five years. Now we have seen that candidates from group I stand fewer chances of getting called for interview than those from group VI. Therefore, even if the proportions of applicants for admission from these two groups were to be the same, their proportions at the time of interview are likely to differ to the advantage of group VI and the disadvantage of group I. Obviously, the academic ability which is used to shortlist candidates for interview is not randomly distributed among the

FIGURE 4: PROPORTION OF CANDIDATES SELECTED FOR ADMISSION FROM EACH INCOME GROUP DURING 1967-71

various income groups, certainly not in the case of the extreme income groups. Figure 3 presents the above findings *in a graphic form.*

Table 6 shows the results of regression analysis of the data presented in Figure 3. The procedure used for this analysis was the same as that described in the preceding section on applicants. The purpose of this analysis was to measure the yearly changes in the proportion of candidates called for interview from *each* income group and to determine whether the overall trends for different groups are significant or not, and, if yes, the magnitude of the observed change. Although the levels of significance of the six t-values are not entirely consistent with those reported in the preceding section, there is an overall similarity between the trends observed for candidates *called for interview* and those noted for applicants. This observation is based on two factors: (1) the b-co-efficients are the largest for the two extreme income groups (I and VI); and (2) the two middle-income groups (III and IV) show only insignificant trends.

As shown in Figure 3, the trend of "the rich getting richer and the poor poorer" is observed—particularly during 1970 and 1971. It may be recalled that these two years marked a slight shift in the admission policy of the institute, in that, beginning 1970 candidates were shortlisted for interview on the basis of written tests in addition to application rating. Does this mean that the poor candidates' performance in written tests has been lower than that of the rich candidates? It certainly appears so, but I shall test this hypothesis more systematically a little later in this paper. Meanwhile, let me sum up this section by saying that, as in the case of applicants for admission, there is a gradual per cent decrease in the case of the poor and an increase in the case of the rich candidates being called for interview over the years, especially during the last two years.

(3) *Candidates Selected for Admission:* What is said above for the first two stages of the admission process is equally true of the third stage, that is, of getting selected for admission. As seen in Table 1, the proportion of candidates selected for admission from group I has gradually dropped from 15.1 per cent in 1967 to 2.8 per cent in 1971. In the same way, group II has suffered a decrease from 30.7 per cent in 1967 to 14.2 per cent in 1971. Groups III and IV show inconsistent and *inconclusive* trends with fluctuations in the range of plus or minus 2-3 per cent. Thus, with progressive increase in the total number of applications over the last five years, the two middle-income groups have generaly maintained their proportionate representation at the last two stages of the admission process.

Group V also shows a somewhat inconsistent pattern. Although the proportion of candidates selected from this group rose from 9 per cent in 1967 to 15.3 per cent in 1971, their increase over the years has not been consistent. For example, in 1969 and 1970, candidates from this category suffered a slight per cent decline compared to their representation during the two preceding years. Thus candidates from group V maintained their proportion between 8.7 and 10.4 per cent during the first four years (1967-1970) and increased it to 15.3 per cent only in the fifth year (1971).

Group VI has been the gainer in the initial two stages of the admission process (application and interview) and it continues to be so also at the time of final selection. Such candidates constituted 20.5 per cent of all the selected candidates during 1967 but their proportion gradually

TABLE 8

Income Group	Linear Regression of Proportion of Selected Candidates (y) on Time (x)				
	Period	Linear Regression ($y=a+bx$)	$\bar{R}^2$	t Value of b	Level of significance (2 Tailed Test)
Group I	1967-1971(5)	$\frac{Sy1}{S} = 20.58 - 3.50x$	.830	−4.533	P<.05
Group II	1967-1971(5)	$\frac{Sy2}{S} = 33.58 - 3.82x$	.869	−5.256	P<.02
Group III	1967-1971(5)	$\frac{Sy3}{S} = 10.24 + 0.50x$	.223	1.466	(ns)
Group IV	1967-1971(5)	$\frac{Sy4}{S} = 13.92 + 0.96x$	.357	1.795	(ns)
Group V	1967-1971(5)	$\frac{Sy5}{S} = 6.99 + 1.09x$	.119	1.241	(ns)
Group VI	1967-1971(5)	$\frac{Sy6}{S} = 14.67 + 4.75x$	.958	9.549	P<.01

rose to 38.1 in 1971. The yearly shifts in the proportion of candidates selected for admission from different income groups were tested for significance by the use of chi-square (X^2) and analysis of variance (F) tests. As shown in Table 7, the income composition of candidates selected for admission over the years has significantly changed. There is, therefore, reason to believe that the gradual increase or decrease in the proportion of selected candidates points to some definite trends over time.

Figure 4 shows the growth trends in the proportion of candidates selected for admission from each income group. Three distinct trends are noticed in Figure 4. First, the four income groups in the middle (II-V) seem to be gradually converging until in 1971 the proportions of candidates from these four groups ranged between 11.9 per cent and 17.6 per cent—that is, within a narrow margin of 6 per cent. Secondly, the two extreme income groups (I and VI) show the reverse trend from that observed for the rest of the candidates in that these two groups neither converge with each other nor with any of the other groups. Instead, the gap between these two groups has progressively widened until, in 1971, the proportion of the rich candidates (Group VI) has reached a record high figure of 38.1 per cent, while that of the poor (Group I) has touched the record low of 2.8 per cent. Thirdly, the rapid per cent growth of the rich candidates (Group VI) and the equally rapid per cent decline of the poor candidates (Group I) can be attributed directly to the admission process, particularly during the last two years. It seems that the introduction of written tests beginning 1970, has enhanced the chances of the rich and diminished the chances of the poor not only in being called for interview but also in being selected for admission.

The yearly trends of the six income groups presented in Figure 4 were further examined through regression analysis. As shown in Table 8, groups I, II and VI show trends which are statistically significant, while the changes in the other three groups are not significant. Once again we find that the two income groups at the extremes (I and VI) are marked by large b-co-efficients, while the magnitude of change in the two middle-income groups is very small. The only difference between the findings of this Table and those of the earlier two Tables is with reference to group II

which, like group 1, shows a large and significant decline among the candidates selected for admission.

(4) *Conclusion:* Applications for admission to the institute under study have been gradually increasing over the years and have reached the threefold mark in five years. The increase in the number of applications is, however, not uniform for different income groups as much of the increase in both number as well as percentage of applications has come from the higher income groups (V and VI). Applications from the middle income groups (III and IV) have also increased in number. As, however, the *per cent* increase in their case has not been significant, the two middle-income groups have managed to maintain their proportionate representation among the candidates applying for admission over the years. The two lower income groups (I and II) also experienced increase in the number of applications, but the increase was so marginal that the two groups suffered a gradual *per cent decrease* over the years.

The total number of candidates called for interview and those selected for admission has been more or less constant over the years. As selection at these two stages is based on universal criteria of ability, one should expect that each income group would tend to maintain its proportionate representation (that is, as found among the applicants) in the course of the latter two stages of the admission process—assuming, of course, that there is no correlation between family income and ability.

The data clearly show that the rich candidates stand a better chance of, first, getting called for interview and, later, being selected for admission than the poor candidates. Generally speaking, therefore, the thesis of "the rich getting richer and the poor poorer" applies not only at the time of initial application for admission but also at the time of interview as well as selection. Does this mean that the rich candidates as compared to the poor are not only more motivated for a managerial career but are also more capable? This and many other hypotheses will be tested in the next section of this paper.

III

Analysis of Data

In the preceding portion of this paper I have tried to make a case for looking into the relationship between a candidate's family income and his chances of becoming a manager. I feel that a case certainly exists, if not for each and every candidate who applies, at least for those falling within the extreme income groups. Let us, therefore, examine the factors that account for the differential trends reported in Section II.

At every stage of the admission process, the two extreme income-groups (I and VI) have shown sizeable downward or upward trends which are statistically significant. Groups II and V have also shown significant trends, but these are either not consistently present at all the three stages of the admission process or these are small in magnitude. The remaining two income groups (III and IV) have consistently shown no significant trends at any of the three stages of admission.

In view of the above considerations, I have decided to compare only the two extreme income groups (I and VI) for further analysis of data. This decision is also influenced by the fact that the number of cases to be examined is very large and, therefore, somewhat unmanageable. Accordingly, I will examine only one-year data for the most recent batch (1971) to answer the several questions raised by the findings in Section II.

(1) *Applicants for Admission:* The questions that arise in relation to applicants for admission are essentially two:

(a) What accounts for the gradual rise in the proportion of applications from the higher income groups?

(b) Why is this growth not matched by a corresponding increase in the proportion of candidates from the lower income groups who have, in fact, suffered a decline?

It is difficult to find definite answers to the above questions. But it does seem that the lower base (11.9 per cent) from which the higher income groups started in 1967 accounts for the subsequent rapid growth of applicants from these categories. On the other hand, the lower income groups had a much higher base (29.2 per cent) in 1967 and, therefore, even though they experienced some increase over the years in absolute numbers, their proportionate representation among the applicants went on declining. Table 9 clearly brings out this fact.

But the lower or higher 'base' in 1967 does not fully account for the differential growth rates of the two income groups. It does not explain, for example, how at the end of five years candidates from group VI, even though they started from a lower base, could surpass candidates from group I not only in terms of percentage but also in absolute number. Clearly, something more than the initial differences in 1967 is at work here.

One explanation might be that, unlike the poorer candidates, the richer candidates turned to management education somewhat slowly and cautiously. But when such candidates became aware of the record of the institute in terms of both job security and high emoluments, they turned to management education in a big way. For a time in India the main ambition of a young man from higher income groups used to be to join the Indian Civil Service; later, everyone wanted to be an engineer; and today those aspiring for highly prestigious careers are attracted by management education.

One cannot say that the lower income candidates are less ambitious and that, therefore, their slower rate of growth can be attributed to this lack of ambition. Our data clearly show that, up until the last couple of years, the lower income candidates used to constitute the bulk of those who applied for admission to the institute. Their slow rate of growth can, instead, be attributed, first, to the large base that they had in 1967 and, secondly, to the fact that the higher income candidates are lately turning to management education in a big way. Upper middle and upper class people have usually had a monopoly in the world of professional occupations. Management as a profession being still something new in India, the initial cautious attitude of the higher income candidates in joining this profession is quite understandable. As the various institutes of management showed a good record of performance and industry responded favourably toward management graduates, it did not take higher income candidates very long to aspire and try for a career in management. If the present situation of management education continues, I expect the differential growth rates of applicants from the two extreme income groups also to continue, thereby further widening the gap between the two. In other words, much of the increase in the total number of applicants is likely to come, as in the past, from the high income groups while the lower income groups are likely to barely maintain their existing strength unless, of course, there is change in the environment or in the existing admission procedures.

TABLE 15

Characteristics	Percentage of Candidates in 1971: Poor (Group I)		Rich (Group VI)	
(1) Place of Permanent Residence				
(a) Rural (village)	14.1		1.5	
(b) Semi-Urban (town)	38.4		9.4	
(c) Urban (city of 1 lakh or more)	47.2		87.4	
(2) Father's Occupation				
(a) Professional (lawyer, doctor, engineer, professor etc)	2.0		8.9	
(b) Senior Government Officer	3.7	23.2	40.1	87.3
(c) Businessman (managerial)	17.5		38.3	
(d) Semi-Professional (librarian, social worker, journalist, novelist, etc)	9.5		2.1	
(e) White-Collar Employee (govt or business)	21.8		6.6	
(f) Agriculturist	28.7	76.8	1.5	12.7
(g) Blue-Collar Employee	2.6		0.9	
(h) Other (incl unclassified and unknown)	14.2		1.6	
(3) Studied at a Public School	12.6		51.3	
(4) Studied at a Missionary College	10.3		23.1	
(5) Medium of Instruction (English)				
(a) High School	19.2		75.4	
(b) PUC/Inter	47.4		95.4	
(c) Degree Examination	91.1		98.9	
(6) Educational Background				
(a) Engineering (IIT)	5.7		14.9	
(b) Engineering (Non-IIT)	31.3	37.0	22.1	37.0
(c) Commerce	15.4		17.0	
(d) Arts	10.0		18.5	
(e) Science	37.5		27.4	
(7) Over 20 Years of Age	48.2		30.7	
(8) Proportion Married	6.4		2.0	
(9) Proportion with Work Experience	10.6		12.9	
(10) Proportion of Scheduled Castes/Tribes	4.6		0.1	

Throughout the above analysis I have assumed that past academic performance and achievements are equally distributed among candidates from different income backgrounds, and that if some income groups are more likely to apply for admission than others it only reflects differences in their motivation. However, this assumption may not be true. As already indicated, the institute under study requires a certain minimum level of past academic performance (in various board and university examinations), failing which a candidate is not eligible to apply. It might well be that past academic performance above the cut-off point (which is usually around 50 per cent) is found more easily among the higher income than among the poorer candidates. If this is true, than naturally it is easier for higher income than for lower income candidates to show a more rapid growth at the time of application for admission. There is no way of verifying either of these two assumptions.

I have also assumed that no candidate is discouraged from applying for admission on grounds of cost of education. This assumption is based on the facts that there are liberal loan grants and several scholarships, and that admission tests and interviews are held at centres close to the places of residence of the candidates. Even this assumption may be false. Cost of education includes not only the actual cost (e g, room, board, tuition, materials, travel, etc) but also opportunity cost. It is well known that the practice of deferred gratification through prolonged education is more commonly found among the higher income groups than among the lower classes. This is because the latter are usually more anxious or more pressed to enter

the job market in order to support their families. If this is true, then the less rapid growth of applications from group I as compared to group VI could well be the result of financial constraints—even though indirectly.

(2) *Candidates Called for Interview:* The selection of candidates for interview is done purely on the basis of ability as demonstrated through marks in university examinations and (during 1970 and 1971) scores in two written tests. It has already been shown in Section II that, given a certain number of candidates who apply, those belonging to group I have fewer chances of being called for interview than those from group VI. Further, this situation is becoming even more acute with the passing of years. As shown in Table 10, however, the most dramatic differences between the two income groups occur only during 1970 and 1971.

Thus the criteria, used to measure ability in the selection of candidates for interview, have consistently favoured the rich (group VI) and acted against the poor (group I). Another way of saying the same thing is: In terms of the criteria used to measure ability in order to select candidates for interview, those from group VI have consistently performed better than those from group I. Since the differences between the two groups are specially pronounced during 1970 and 1971, it seems clear that the introduction in 1970 of written tests, as an additional measure of ability, has largely contributed toward creating disparity. In other words, it appears that candidates from group VI have on the whole performed better than candidates from group I not only in the previous board and/or university examinations but also in the written tests. Let us verify this conclusion.

The rich and the poor candidates for admission were compared in terms of their previous academic performance as revealed through marks obtained in the following four examinations:

(1) SSC/SSLC/HSE /Matriculation
(2) Higher Secondary/Senior Cambridge
(3) Pre-University/Intermediate
(4) Degree

A candidate can opt for one or two but not all of the first three examinations. Therefore, the number of cases falling in each category is smaller than the total number of candidates in each income group as previously reported. Similarly, the number of cases examined in the fourth (degree) examination is smaller than the actual because in this case there were many candidates who had yet to complete their final degree examination. Table 11 shows that the performance of the poor candidates did not significantly differ from that of the rich candidates in any of the four examinations listed above.

As already mentioned, one of the criteria used for shortlisting candidates for interview is application rating, which is based primarily on the previous academic performance of a candidate. Since, in 1971, application rating included work experience as an additional component, it seems necessary to compare the rich with the poor candidates in terms of their overall application rating scores as well. The mean scores of the two groups were compared by using t-test and it was found that the same did not differ significantly.

Thus, whether we compare the two groups in terms of overall application rating score or with reference to their performance in each previous university examination, they do not differ significantly from each other. And yet, we know that the rich candidates stood a better chance of being called for interview than the poor. Let us, therefore, turn to the other two components of the criteria used for shortlisting candidates for interview, that is, the two written tests. Obviously, if the previous academic record did not either help or hurt any of the two income groups, it must be one or the other of the two written tests, or both, which gave an edge to the rich over the poor candidates.

As shown in Table 12, the performance of the rich candidates was significantly better than that of the poor in each of the two tests. This combined advantage resulted in giving to the rich an edge of 62 points (14 per cent) over the poor in terms of the overall mean score which was the basis of shortlisting candidates for interview.

As a result of their superior performance in the two written tests, the rich candidates entered the second phase of the admission process with a proportion (32.4 per cent) much larger than that of the poor (4.6 per cent). Table 13 gives the mean scores of the rich and the poor candidates who appeared for interview in all the five selection items.

Even though, at the application stage, there was no significant difference between the mean *application rating* scores of the rich and the poor candidates, among those who actually qualified and appeared for interview, a significant difference existed in this respect. In other words, among those called for interview, the mean application rating score of the rich candidates was higher than that of the poor by a margin of 10 points (4 per cent), which was significant, even though among the applicants the difference in the mean scores was of just 3 points (1.6 per cent), which was not significant. On the other hand, whereas the differences between the mean scores among the applicants with regard to the two *tests* were quite large, the magnitude of these differences got considerably reduced among candidates called for interview. Yet, at the end of the first phase of the admission process, the rich candidates who appeared for interview still had a net lead of about 38 points (6 per cent) over their competitors from group I.

The performance of the rich and the poor candidates did not significantly differ in the group discussion test and the personal interview. Despite this, however, at the end of the second phase of the admission process, the rich candidates were able to maintain an edge over the poor candidates primarily because of their performance in the two written tests. The overall gap between the two groups was of the order of 53 points (6 per cent).

(3) *Candidates Selected for Admission:* The overall lead of 6 per cent which the rich candidates had over the poor among those interviewed also persisted among those finally selected for admission. However, as shown in Table 14, the internal composition of candidates within each of the two income groups underwent a considerable change probably as a result of the emphasis placed on some selection items but not on others.

The mean Application Rating score of the rich candidates selected for admission was significantly higher than that of the poor, even though among the applicants there was no significant difference in this respect. This is because among those called for interview the mean Application Rating score of the rich was higher than that of the poor. It may be remembered that candidates are shortlisted for interview on the basis of Application Rating score *combined with* scores in the two written tests and that it was in the written tests that the rich had secured a definite edge over the poor. Among those selected for admission, there was also a significant difference

between the quantitative test scores of the rich and the poor, but in this case it is the poor (instead of the rich) whose mean score is higher. There were no significant differences in the performance of the rich and the poor candidates selected for admission in sofar as the other three selection items are concerned. But there still remained a significant difference in the overall sources of the rich and the poor candidates in that the rich had a six percent overall lead over the poor.

Thus the poor candidates have been gradually losing the battle of admission to their competitors from the upper income group. Let me illustrate the magnitude of this problem. Suppose there are 1,000, applicants for admission from group I and an equal number from group VI, their chances of getting called for interview and being selected in 1971 were as follows:

Income Group	Number of Applicants	Number Qualifying for Interview	Number Selected
Poor (group I)	1000	37	8
Rich (group VI)	1000	146	60
All candidates	1000	109	38

IV

Conclusion

As stated in Section I, this paper is meant to examine the role of family income on a candidate's chances of becoming a manager. Utilising the admissions data for the last five years (1967-1971), I have shown in Section II the rapid growth of applications from the rich candidates (group VI) while at the same time the relatively minor increase in the case of the poor (group I). These trends were found to be very significant and, if allowed to continue, could radically alter the composition of the student population seeking admission at the institute. Already, in five years, the proportion of the poor candidates has dropped from 29 per cent in 1967 to 13 per cent in 1971, while during the same time, the proportion of the rich has gone up from 12 per cent to 24 per cent.

The different growth rates in the number and proportion of applications for admission from the rich and the poor cannot be explained entirely by attributing them to the differences in their numbers in the base year (1967). True, the rich started with a small base of only 186 applications, as against 459 from the poor; but the situation got reversed in a matter of few years until, in 1971, the number of rich candidates was almost double the number of poor candidates. A part of the explanation to different growth rates, therefore, lies in the fact that the rich candidates are more likely to 'want' to take up management as a career than the poorer sections of the society. I have tried to explain in Section III why the richer sections of the society only recently turned to management in a big way.

Even though the number of candidates called for interview has remained more or less constant over the last five years, their composition in terms of family income has not. Like applicants, those called for interview have also shown trends which clearly suggest that every year a larger proportion of the rich and a smaller proportion of the poor are qualifying for interview. The reasons for these differences are, however, entirely different from those responsible for differential growth rates of applicants. As shown in Section III, the rich candidates' performance in the two written tests has been significantly higher than that of the poor. Therefore, even though there were no significant differences in the application rating scores of the two groups, the superior performance of the rich in tests enabled them to march a lead over the poor candidates.

The performance of the rich and the poor candidates during the third stage of the admission process (group discussion and interview) did not differ significantly. And yet, the trend of "the rich getting richer, the poor poorer" was observed even among the candidates finally selected for admission. This is because final selection once again takes into account scores in application rating and the two written tests, which enable the rich candidates to carry forward the advantage they had in the two tests through the stage of final selection as well.

The title of this paper is in the form of a question, with the sub-title providing a clue to the possible answers. With the help of the data at our disposal, let us now try to answer the question: What makes a manager?

Everyone (including the candidates and the institute authorities) would like to belive that it is merit and motivation that determine whether a person should be selected for admission or not. Surely, these are the only factors which are 'intended' to influence selection. But that cannot rule out the 'unintended' consequences which might flow from some components of the selection process. Having looked at the significant and dramatic trends repeating year after year, it would be naive indeed to imagine that money is not influencing the making of a manager. Obviously, whatever influence money has in determinng the fate of a candidate is both indirect as well as unintended, although that does not make it any less important. Le us, therefore, identify the processes though which this causal network really operates.

A vast majority (87.3 per cent) of the rich candidates who applied for admission in 1971 came from large cities with a population of one lakh and above. Most of them (87.3 per cent) are sons of professionals like lawyers, doctors, engineers, and professors or of high ranking government officers or businessmen. A little over half of these candidates (51.3 per cent) had studied in public schools, while three-fourths of them had graduated from high school with English as the medium of instruction. Most of the rich candidates (95.4 per cent) started their college education through English medium and almost all of them (98.9 per cent) completed the Degree course with English as the medium of instruction. Of the 37 per cent rich candidates with engineering degrees, 15 per cent were the product of the prestigious Indian Institutes of Technology.

The poor candidates, on the other land, came primarily (52.5 per cent) from small towns or villages, the proportion of those hailing from big cities being 42.2 per cent (as against 87.4 per cent in the case of the rich). Most of the poor candidates (76.8 per cent) are sons of either agriculturists or white-collar employees in government or business, although a few are sons of semi-professionals or blue-collar employees. Both in terms of place of origin as well as father's occupation, therefore, the rich and the poor candidates hail from very different socio-cultural and not just socio-economic backgrounds. Only 12.6 per cent of the poor candidates had studied in public schools and less than one-fifth had had English as the medium of instruction in school. Even in college, less than half of the poor candidates *started* their studies through English medium, although nine-tenths of them *completed* their college education with

English medium. The proportion of candidates with previous background in engineering was the same (37 per cent) in the two groups, but relatively few (5.7 per cent) of the poor candidates had studied at Indian Institutes of Technology.

Except for some minor differences in relation to arts and science, the proportion of the rich and poor candidates coming from the other two backgrounds (commerce and engineering) was more or less the same. The proportion of engineers, for example, was exactly 37 per cent in each case. The poor candidates as a group were slightly older in age; more of them were married; and they had a higher proportion of scheduled castes among them than was the case with the rich. The comparative data for the two income groups is summarised in Table 15.

The selection procedures seem to have a dramatic effect upon some of the characteristics mentioned in Table 15. For example, while less than half of the poor candidates (47 per cent) came from big cities, among those who qualified for interview they constituted 74 per cent, and among those selected their representation went up to 80 per cent. The rich candidates from big cities also maintained or even improved their proportion through successive stages of the admission process (e g 87 per cent among applicants, 92 per cent among interviewees and 90 per cent among those selected). Thus there seems to be a clear preference for the candidate coming from large urban cities as opposed to one hailing from a village or a small town. Of the five poor candidates finally selected for admission, four came from big cities.

The second preference appears to be for a candidate with an engineering background. Whereas 37 per cent of applicants within each of the two extreme income groups were engineers, among those selected the engineers constituted 60 per cent of the poor and 70 per cent of the rich candidates. Among the engineers, there seems to be a further preference for the product of an IIT. Whereas only 6 per cent of the poor candidates were IIT graduates, their proportion among the interviewees and those selected rose to 35 per cent and 60 per cent, respectively. Even among the rich candidates, the proportion of IIT graduates rose from 15 per cent among applicants to 43 per cent among interviewees and 46 per cent among those finally selected.

The third preference seems to be for the product of a public school. Only 12.6 per cent of the poor applicants were the product of public schools, but among the interviewees and those selected the proportion of such candidates from group I went up to 30 per cent and 40 per cent respectively. Similarly, whereas 51 per cent of the rich candidates had studied in public schools, 61 per cent got called for interview and 63 per cent finally selected.

And, finally, there seems to be a preference for a candidate who has had his college education through the English medium. As many as 40 per cent of the poor candidates had had their college education through some Indian language. However, none of these candidates qualified even for an interview. On the other hand, whereas 47 per cent of the poor candidates completed college education through English medium, the proportion of such candidates went up to 96 per cent among interviewees and 80 per cent among those selected. Among the rich, the proportion of candidates with English medium remained more or less constant between 95 and 97 per cent during all the three stages of the admission process.

Needless to say it is expensive (1) to live in a metropolitan city, (2) to study engineering and technology (especially at a place like IIT), and (3) to go to a public school. The people who can afford such limited social facilities are the sons and daughters of high-ranking government officers, business managers, and professionals. It is this small group of the country's population which dominates the professional world in India. Many candidates from this group because of their unique socio-cultural and socio-economic backgrounds have their eyes set not only on the institute of management under study but also on schools of higher learning in the United States. The kind of objective tests that are used to select candidates for interview is well known to such candidates, who have taken similar tests before in the course of their school and college education as well as for admission abroad. In other words, such candidates, as compared with their not-so-fortunate counterparts, seem to be more 'test-wise'.

When, therefore, the candidates from group VI are able to grab a lion's share of the total number of seats at the institute, is this a function of their greater ability and motivation? I doubt this very much. In terms of ability, as we have already seen, there are no significant differences between the performance of the rich and the poor candidates in the course of their earlier school and college education. In terms of motivation, too, we have seen that large numbers of poor candidates have been wanting to get management education each year even though few of them were able to do so. If still group VI performed better than group I, it is primarily because they were more 'test-wise'. My answer to the question posed in this paper is, therefore, like this: It is merit, motivation *and* money that makes a manager at least insofar as the experience of the institute under study is concerned. Any attempt to reduce, if not eliminate, the role of money in the institute's selection procedure will, among other things, have to focus on the two selection tests that are being used at present.

Strategic Planning: Some Operational Considerations

S K Bhattacharyya

The process of strategic planning or formulation of objectives requires consideration of the external as well as the internal environments and of the likely state of competition for assessing the threats and opportunities that arise during the strategic plan period. The objectives finally set must keep in view (a) the minimal level indicated by the weighted average cost of capital and (b) the highest level theoretically attainable by exploiting all potential opportunities and by overcoming all future threats.

Such possibilities have, of course, to be reviewed in the light of the strengths and weaknesses of the organisation and to be related to the past performance of the unit.

The formulation of objectives is essentially a structured, formal process. The formal planning system needs to be carefully nurtured, particularly in the initial stages when it is being developed. But the organisation is then in a far stronger position than it otherwise would be.

[The author gratefully acknowledges the help received from J C Camillus by way of many suggestions and comments.]

THE formal planning process comprises three distinct types of planning activities:

(a) "Strategic planning' for deciding on the long-term objectives of the organisation,

(b) 'Action planning' for formulating the quantified level of achievement during the period of the strategic plan, with a view to providing effective co-ordination and communication within the organisation, and

(c) 'Operational planning' for developing performance targets, for a much shorter period — usually one year broken into months — in order to provide benchmarks for management control.

It should be obvious that each of the three components of the formal planning process shades off into the other since the strategic plan sets out organisational objectives, the action plan the desired level of achievements in terms of those objectives, and the operational plan the performance targets for ensuring achievement of the desired short-term results. However, in most real life situations, organisations have initiated their planning effort with operational planning (or budgeting), primarily for the following reasons:

(a) The operational plan or the budget relates to a much shorter period — usually one year — and, accordingly, involves consideration of imponderables of a much less complex nature. It should not be too difficult to appreciate that forecasting of trends five years out relating to operational or environmental imponderables is much more complex compared to the process of estimating likely trends one year hence.

(b) Most organisations, including those which do not have formal operational plans or budgets for the entire organisation, have to estimate the likely trends for short periods in connection with their functional operations, e g, marketing campaign, capital investment, expansion of production, etc.

(c) Operational planning or budgeting involves forecasting of essentially operational trends as compared to formal long-term planning which involves scanning of the external environment, particularly of social and political trends.

It is possible to rationalise that, before an organisation attempts any exercise in long-term or strategic planning, it must acquire adequate experience and confidence in short-term or operational planning. This, however, does not take away the fact that such short-term planning, carried out without formulation of precise objectives tends to be sub-optimal. Many organisations tend to bridge this gap by developing policy guidelines prior to initiating of the budgeting exercise; but even in such situations the formulation of policies without a long-term objective is somewhat less than ideal.

This article will explore the nature and process of strategic planning, and illustrate it with reference to the banking industry. Strategic planning is best defined by Anthony[1] as:

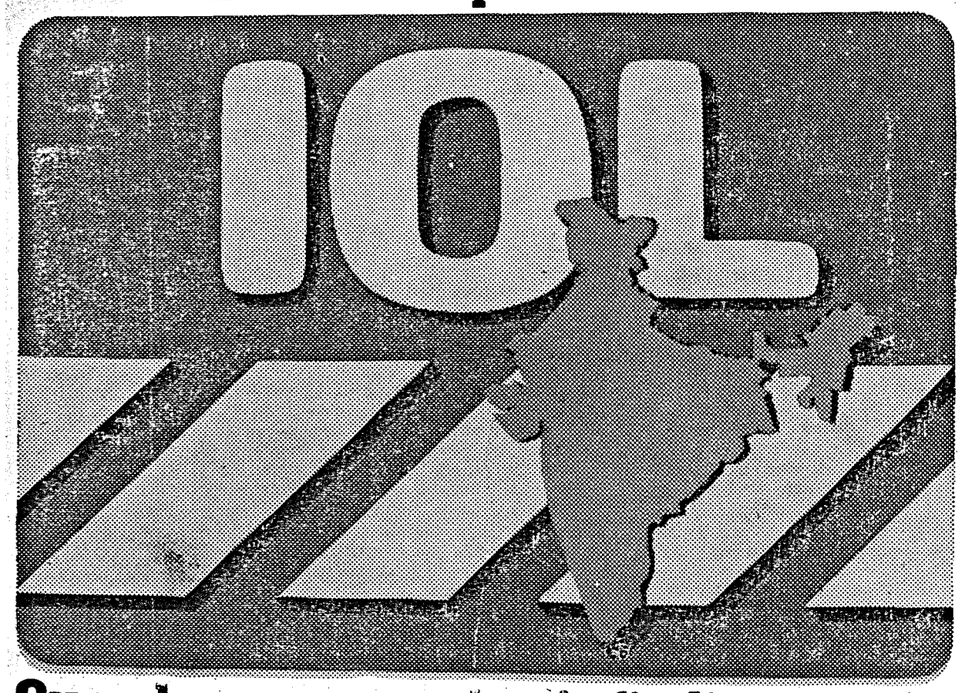
> "the process of deciding on objectives of the organisation, and changes in these objectives, and resources used to attain these objectives, and on the policies that are to govern the acquisition, use and disposition of these resources".

The critical factor in the formulation of objectives is the clear delineation of *the concept of the business* for which the objectives are to be determined. It is not unusual to come across viewpoints which define the 'business' of banking in terms of one, or a combination, of the following:

(i) to provide customer services;

(ii) to serve as an instrument of economic development, particularly development of industry, trade and agriculture;

(iii) to mobilise deposits; and



(iv) to provide credit.

It is suggested that none of the above provides a clear formulation of business of banking in the managerial sense, as they do not relate the needs of the customers to the unique services that the banking industry can offer. This uniqueness, or *distinctive competence* in managerial terms, is brought out in Mote and Shah's definition of the concept of the banking business as:[2]

> "*inducing* exchange of currency for liquid and convenient claims on the bank by paying a fair return".

If the above concept of the banking business is valid, it can be argued that the factors outlined earlier are the means rather than the ends or objectives of the banking business. It is contended that the objective of the banking business is best thought of in terms of optimising the value added by the banking process itself, evidenced by the generation of an optimal economic surplus. It can be argued, for instance, that the bank can improve its customer services by allocating additional resources (men, money, physical facilities, etc, in relation to the quantum of service demanded from it). But such a process, if carried out without a cost/benefit perspective, will inevitably lead to incurrence of extra cost per unit of banking service due to the allocation of additional resources, and lead to a net economic deficit rather than surplus. If this happens on a substantial scale, the banks' ability to provide customer services would become less and less — unless subsidised by other agencies. Similarly, a bank cannot indefinitely continue to mobilise deposits by offering high rates of interest without relating the economic effect of the mobilisation process in terms of deposit interests and processing costs as also the economic opportunities available to

Indian Industry: What will it require in the 80s?

Our advance planning is finding out the answer-right today.

A part of IOL is always a few steps ahead of the needs of Indian industry. That part represents the men who are busy working out today the role IOL will be called upon to play in tomorrow's India.

This involves a close-up and all-round scrutiny of the current needs and from there, projections into the future. The new industries that will come up, the existing industries which will boom and diversify and those that will totally change. And finding out their needs today will enable IOL to give the required products and services tomorrow.

IOL has always geared its resources and talents to the needs of industry in the past.

And for the 80s, IOL is ready and willing to meet the requirements of Indian industry right from now.

Indian industry needs INDIAN OXYGEN

IOL

M-68

it by way of advancing the funds mobilised at an incremental rate. In sum, while banks must allocate their resources to several activities outlined earlier, they must do so after considering the appropriate 'mix' of activities, in the light of their cost/benefit characteristics, so as to generate the largest quantum of economic surplus or profit consistent with:

(a) The constraints imposed by the social and political system in which they operate,
(b) The constraints of the economic and financial policies of the government of the country in which they operate, particularly those imposed by the central bank and the finance ministry, and
(c) The requirement of balancing short-term profitability with long-term growth.

It is not suggested that the concept of a business is immutable. It is perfectly possible — in fact it might even be desirable — to change the concept of the business so as to ensure viability in a changing world.

The Formulation of Objectives

Given the concept of the business at a point of time, the formulation of objectives will have to be thought of in one — or a combination — of the following, over the strategic plan period:

(a) Desired level of *profits* expressed in absolute monetary terms.
(b) *Return on investment* (ROI), expressing profit after tax as a percentage of capital employed or total assets.
(c) Profits to be earned per unit of capital, e g, *earnings per share* (EPS)
(d) Desired *growth* rate, either in terms of profit, return on investment, earnings per share *or* in terms of functional activities (e g, market share/sales volume or revenue/deposits/advances, etc).

The formulation of objectives will then require an examination of the business in terms of:

(a) the external environment in which the organisation is likely to operate.
(b) the internal environment likely to prevail within the organisation,
(c) the competition it will face, and
(d) its past performance.

External Environmental Trends:

This factor is perhaps the most comprehensive, in that, it involves the scanning of the entire spectrum of the social, political, technological and economic forces likely to have a bearing on the future performance of the organisation, the industry to which it belongs, and business generally, with a view to determining what the organisation can reasonably seek to achieve during the strategic plan period.

In the case of the banking industry, it is useful to think of the external environment in terms of four distinct categories:

(i) regulatory agencies,
(ii) social and political systems,
(iii) the economic and technological environment, and
(iv) the scale of activities of end-users of the services of the banking industry.

In relation to banks, the *regulatory agencies* would primarily be the finance ministry of the government and the central bank. In making strategic plans, banks would certainly require to consider carefully the policies which are likely to be adopted by the government in the light of the economic policies and which have a bearing on the banks' future activities. Obviously, any such attempt to identify likely trends would require scanning the long-term economic plans of the government and the political value systems inherent in governmental planning. In operational terms, banks would have to consider how central banking policies are likely to undergo changes in the context of probable changes in government economic policies. In this context, it would also be useful to consider the likely responses of the industry association to changes in governmental and central banking policies, and the strategies likely to be adopted by other major operators on the financial scene such as life insurance companies, investment trusts, etc.

The *social and political systems* in which banks operate are likely to have considerable bearing on the future external environment, since changes in such systems would be reflected in the expectations of the society regarding the operations of the banking system. It is, for instance, quite possible that the society and its political institutions might urge that banking policies be specially geared to the development of a priority sector, e g, agriculture; or the expectation might be that banks should provide funds to a particular sector as compared to others, e g, small entrepreneurs as distinct from big business. Social and political changes might also be reflected in consumption and savings habits of the people, which in turn will determine the demands made on banking organisations to meet such social and political expectations.

The *economic environment* is also likely to have significant bearing on future operations of banking organisations — changes in population, the rate of urbanisation, per capita income, spending and saving habits, growth in GNP, etc, are likely to have far-reaching effects on future banking operations. Economic policies relating to foreign taxation, import and export policies, balance of payments, etc, are also significant economic factors to be considered in formulating objectives.

Technological changes are so pervasive that it is quite difficult to make a conscious forecast of such changes. For example, the impact of computer applications might have far-reaching implications for the banking industry.

The major *end-users* of the banking industry are industry, trade and commerce; these require banking services and funds for their operations, while individual members of the society look upon banks as institutions providing security to their savings deposited with them and as providers of banking facilities. Obviously, trends relating to the future scale of activities of the industry, trade and commerce, as well as the level of economic earnings and activities of individuals, are likely to have far-reaching influences on the banking industry. In developing their strategic plans, banks will thus require depth studies of the future development and growth of industries generally, supplemented by detailed analysis of future trends in particular industries or trades served by individual banks. In addition to this, banks will have to consider likely changes in the agriculture as well as in the scale of activities of other institutions which have dealings with them. The important point to emphasise here is that planning for any industry cannot be considered in a vacuum, i e, only in relation to its own operations. Any long-term plan must be related to the likely changes in the activities of the end-users. These would substantially affect the volume, the revenue, and the cost of the business, of the industry providing the product or the services to the end-users.

Internal Environment:

Forecasting of the likely trends in the internal environment involves a careful consideration of the following factors internal to the organisation:

(a) the professional (or technological) competence and the quality of operational 'knowhow',
(b) the managerial expertise of the top management,
(c) the skills and values of the employees,
(d) the ability to raise the required resources for accomplishment of future tasks, such as the ability to attract and recruit the right kind of people in the various cadres, and
(e) the organisational climate and values relating to achievement.

It is not too difficult to establish the premise that, even within the same industry, there will be units which are more effective and efficient than others due to the leads they have in internal environmental factors listed above. In any planning process, a conscious stock-taking of such internal factors and forecasting of the future trends is essential in order to remedy any internal weaknesses that are present or likely to develop in future years as also to ensure

that the points of strength of the organisation are appropriately taken into account in formulating long-term plans.

Competition:

Any attempt at formulating long-term objectives must take into account the likely trends in competition, so that the organisation can effectively determine the future opportunities available to it, given the likely state of future competition. However, the concept of competition is so broad and has so many facets that it needs to be broken down into relevant components if it is to be operationally useful. It can be interpreted in traditional terms to include only those companies that serve the same market. It could, however, be expanded to include other organisations which serve similar customer needs through different products or services or those which utilise similar technology or those with similar management values and styles. An effective scanning of competition would, therefore, involve a look at similar products, similar technology, and similar management.

For units in the banking industry, other banks and financial institutions providing similar financial services and facilities relating to deposits, advances, remittances, etc, would obviously require careful consideration. The trends relating to institutions like life insurance companies, investment trusts, savings and loan associations, etc, which provide similar services, would also require to be studied in depth. Another element in competition would be postal savings banks, co-operative banks, and such like institutions which too have similar operational characteristics as banks. Finally, a bank must take into account not only the performance of these listed organisations, but also the performance of well-managed organisations outside the banking field, so as to ensure that even competition in terms of management abilities is taken into account in developing long-term plans.

Interface with Organisational Strengths and Weaknesses:

The formal analysis of the above three factors, i e, external environment, internal environment, and competition, would highlight the opportunities and threats which are likely to arise during the strategic plan period. For instance, if it is evident that, due to political consolidation and likely tempo of economic development, the per capita income is likely to go up sharply and the scale of industrial activity is likely to be stepped up, it is but natural to presume that banking opportunities available would increase significantly during such a period. How much of such increased opportunities will be available to individual banks would have to be worked out against forecasts about the likely state of future competition. However, the mere fact that opportunities and threats will arise cannot by itself help an organisation in the formulation of its objectives unless it consciously considers the strengths and weaknesses it has in conducting its operations. Many organisations find it useful to think of such organisational strengths and weaknesses in key operational areas. A typical listing used by a large organisation[3] includes:

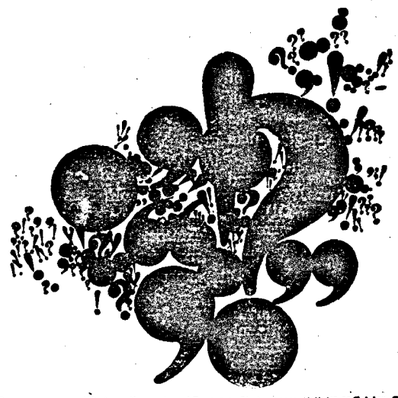
(a) *Organisation* — the way the major functional elements of the organisation relate to one another and to the major tasks of the organisation.

(b) *Technology or professional competence* — the level of professional or technical skill and the accumulated amount of pertinent knowhow possessed by operating departments.

(c) *Product or services* — those which are offered to customers.

(d) *Management* — the adequacy (related to the long-range goals) of the people in the first two levels — those who make the major decisions and supply the key leadership.

(e) *Operations* — the efficiency and effectiveness of day-to-day activities. This includes, but is not limited to, cost control, paperwork flow, productivity, etc.



(f) *Policies* — the significant attitude which the organisation characteristically takes towards its customers, employees, and products or services.

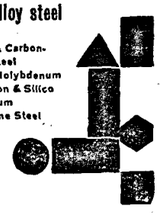
(g) *Distribution* — the way in which business is solicited and services or products made available to customers.

(h) *Facilities* — the physical assets which the organisation has available.

(i) *People* — the adequacy — both quantitative and qualitative — of all employees other than those covered under 'management'.

These organisational strengths and weaknesses are then the filters through which the three factors outlined earlier would have to be viewed, because only the conscious matching of the Company's strengths and weaknesses with the future opportunities and potential threats would lead to the formulation of a viable set of objectives.

Steel Grammar...



What use the genius of Tagore or Shakespeare, Voltaire or Tolstoy, D.H. Lawrence or Hemingway, had they been careless of punctuation? The Kabuliwala could not have been so lovable, Hamlet so pathetic, Lady Chatterley so elusive nor the Old Fisherman so inspiring!

The story of industry today is punctuated with the progress of alloy steel. It is a romantic story, not elusive. It is inspiring in every chapter of industrial development.

We are "steel people" and we are literally serious about it! We endeavour till our steel nerves nearly wither. But do we stop there? Certainly not! We pursue undaunted and we improve steel. alloy steel.

Today's industrial grammar is alloy steel

Process of Quantification of Objective

As highlighted earlier, there is a tendency to confuse the organisational objectives with those of activities (i e, what one does with what one should try to achieve) and targets (what one should attempt to achieve in short, if not in the immediate, time-frame rather than the overriding purpose of one's organisation). It would, therefore, be right to say that organisational objectives should be formulated either in terms of a desired level of economic surplus, or profits, or return on investment, or earnings per unit of capital, or of growth of any of these.

Any attempt to develop long-term objectives would also require consideration of two other factors, *viz*,

(a) the cost of resources for accomplishing the objectives, and

(b) the analysis of the benefit to be derived from having incurred the costs, consistent with the risks inherent in the operations.

The cost of resources is best thought in terms of weighted average cost of capital[4] which synthesises the expectation of the owners by way of dividends, the payment of interest to lenders or depositors, and the expected rate of return on internally ploughed-back funds. Obviously, in any long-term planning, the surplus needed for servicing the expectations of claimants in relation to each of the three aforesaid components of equity and the cost of servicing any future resources to be raised, must both be carefully considered. This weighted average cost-of-capital represents the 'floor' level of the objectives — simply because any lower level of achievement would lead to default in servicing the equity components. The 'ceiling', or the highest level of objectives, should be determined with reference to the range of economic opportunities which can be exploited by the organisation, either with its present resources or by acquiring required new resources, after due consideration of the likely state of future competition. The acquisition of new resources, particularly capital funds for new projects, would of course have to be justified by an appropriate cost/benefit analysis. In the case of manufacturing companies, this could be worked out either by adopting a net present value method (or by working out an internal rate of return) and in the case of a bank, by working out the long-term return on capital employed inclusive of deposits.

It is, however, true to say that irrespective of whatever may be the desired level of ceiling, it is unrealistic to assume that such a level can be entirely unrelated to the past performance of the organisation. While the basic assumption must be that the organisation will continue to show improvement in its performance, prudence demands a very hardheaded analysis of past performance in relation to sales volume, prices, costs performance (in the case of a bank, this would mean: deposits and their mix, advances and their mix, processing costs, operating costs, etc) to ensure that the level of objectives finally decided upon is an attainable one in the light of the past level of performance.

Summary

In sum then, the process of strategic planning or formulation of objectives requires consideration of the external as well as the internal environments, and of the likely state of competition for determining the threats and opportunities likely to arise during the strategic plan period. The objectives finally set must keep in view the minimal level (indicated by the weighted average cost of capital) and the highest level (theoretically attainable by exploiting all potential opportunities and by overcoming all future threats). Such opportunities and threats would naturally have to be reviewed in the light of the strengths and weaknesses of the organisation and related to the past performance of the unit.

Formal *vs* Informal Planning

The formulation of objectives outlined above is essentially a structured, formal process. It is necessary, however, that the differences, both in terms of concepts and potential performance between formal and informal planning, be carefully understood before initiating a formal planning system. Informal planning exists in every organisational situation. However, in most situations, it is triggered off by crises or by drastic changes in the environmental situations. The processes, by which alternatives are arrived at and evaluated, is not rational since there is no attempt to identify a conscious process of rationalisation. There is no systematic attempt to identify all the alternatives available, the results which are likely to arise from such alternatives, and the criteria for analysis and selection of alternatives. The content or the focus of the organisations' thinking on the future is in most cases either not specified or not clearly and comprehensively articulated.

Formal planning, on the other hand, is a distinct structured process. Not only is the content of the output of the formal planning process specified but also the relative emphasis or the elements in the content are consciously articulated. Implicit in this is a formal understanding of the responsibility of individual executives for accomplishing the various tasks necessary to execute the formal corporate plan.

The formal planning process is thus distinct from the informal one. The formal planning system needs to be carefully nurtured, particularly in the initial stages when it is being developed. The major advantages of formal planning over informal planning are:

(i) The organisation has more time to react to, and to take advantage of, the threats and opportunities in the environment. Implicit in this, too, is the fact that opportunities and threats are more likely to be perceived by the organisation.

(ii) It contributes towards development of an integrated approach for achieving specific objectives. This action has two elements, *viz*, "that all bases are touched" and that problems are seen and opportunities exploited, not individually but in an integrated and synergistic fashion.

(iii) Organisational management has to make the critical decision whether the time, trouble, and effort, required to initiate and administer the formal planning system, are more or less than the potential benefit such a system has to offer. Large diversified operations in a rapidly changing environment need the formal planning system to be able to survive. On the other hand, a small, closely-run, tightly-knit, flexible management, running as a single-product single-market company, may find formal planning more a hindrance than an advantage.

ANNOUNCEMENT REGARDING THE ISSUE OF EQUITY SHARES

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

Persons interested in full details may obtain copies of the prospectus and application forms from the brokers and bankers mentioned below.

THE SUBSCRIPTION LIST WILL OPEN AT COMMENCEMENT OF BANKING HOURS ON MONDAY, 5th JUNE 1972 AND CLOSE AT THE CLOSE OF BANKING HOURS ON WEDNESDAY, 14th JUNE 1972, OR EARLIER, AT THE DISCRETION OF THE DIRECTORS, BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON WEDNESDAY, 7th JUNE 1972.

SHALIMAR PAINTS LTD.

(Incorporated under the Indian Companies Act, 1882)
Registered Office : 1, Camac Street, Calcutta-17.

HISTORY AND BUSINESS :

The Company was incorporated in India on 16th December 1902 under the name Shalimar Paint Colour & Varnish Company Limited for the several purposes set forth in its Memorandum of Association including, in particular, the taking over of the business, goodwill and assets of the paint, colour and varnish manufacturing business of The Shalimar Works Limited at Shalimar and Goabaria in Bengal. By virtue of the operation of Section 24 of the Companies Act, 1956, the word "Private" became part of the Company's name from 1st April 1956. On 27th May 1961, by virtue of the operation of Section 43A of the Companies Act, 1956, the Company became a public company and the word "Private" was deleted from its name. On 18th September 1963 the Company's name was changed from Shalimar Paint Colour & Varnish Company Limited to Shalimar Paints Limited. The objects of the Company are to carry on the manufacture and sale of paints, colours, varnishes, enamels and synthetic resins.

The Company was the first large-scale unit to be established in the paint manufacturing industry in India. Since its inception there has been a substantial growth in its manufacturing capacity and range of products. Today it is a leader in its field and manufactures a wide range of sophisticated paints, pigments, resins, varnishes, oils and allied products.

The Company is a 75% held subsidiary of The International Paint Company Limited, U.K., the ultimate holding company being Courtaulds Limited, U.K. Courtaulds Limited is internationally renowned in the textile and chemical industry and as a member of the Courtaulds Group, the Company has been able to obtain considerable assistance in the manufacture of sophisticated paints and allied products entirely free of cost. The Company will continue to be a subsidiary of The International Paint Company Limited, U.K. after the present issue of shares.

The paints industry in India has made remarkable progress in the past two decades with an average growth rate of about 7 per cent per annum. This rate of growth is expected to be improved in the future. The Company's existing share of the market in the organised sector of the industry is about 13% and with its wide range of products it is in a position to take advantage of the expected increase in demand. The Company is also trying to develop markets overseas and has been successful in obtaining substantial orders from Russia and the Middle East countries. The proceeds of the present issue will be utilised in the business of the Company and with the strengthening of its capital base it will be in a position to increase its manufacturing activities in the future.

PLANT AND PRODUCTIVE CAPACITY

The Company's plant situated at Goabaria near Calcutta has an installed capacity of 14,210 tonnes per annum of paints, varnishes, lacquers and synthetic resins.

Computers as Aids to Management Decisions

Application to Linear Programming

V L Mote
B G Shah

The variables that need to be incorporated into management decision-making have increased manifold. At the same time, the magnitude of inputs that have to be committed to projects has increased considerably making sub-optimal decisions very expensive. Hence the need to use advanced methods to aid decision-making.

While there exist concepts and tools that allow a formal incorporation of these complex factors into decision-making, there has been a dearth of requisite data and a lack of capabilities to process the data quickly.

Computers have now made possible the application of formal quantitative methods as aids to better decision-making.

In this article are discussed some aspects of applying some of these quantitative concepts and tools to certain types of complex business problems. Specifically, the application of linear programming to product-mix planning in a textile mill and to scheduling problems in a transport undertaking are discussed.

MANAGERS have attempted to incorporate in their decision-making process as many variables as possible affect their decisions. In recent times, these decisional variables have increased manifold, because of competitive markets, rapidly changing technology, and Government regulations, controls and directives. Further, the magnitude of the various inputs that have to be committed to projects has increased considerably, making sub-optimal decisions very expensive. There is, therefore, an increased need for use of advanced methods to aid decision-making in the face of such growing complexities.

Academicians have contributed concepts and tools that permit a formal incorporation of these complex factors into the decision-making process. But there have been real limitations on the use of these concepts and tools — because of the enormous difficulties in generating the requisite data and the lack of capabilities to process the data speedily and inexpensively. But this has now been made possible with the emergence of computers which have enabled increasing application of formal quantitative methods for better decision-making.

In this paper we share our experiences of applying some of these quantitative concepts and tools to certain types of complex business problems. In the following we discuss the application of linear programming to product-mix planning in a textile mill, and later, to scheduling problem in a transport undertaking.

Application of Linear Programming to Production Planning Problem in Manjeshwari Mills

The Manjeshwari Mills (the name is fictitious) was a composite mill with 33,000 spindles, 618 looms, and dyeing, bleaching and processing plants. It was an old mill with antiquated machinery in the spinning and weaving preparatories, ring frame, and loom shed. It manufactured cotton fabrics of the medium category. Its sales grew at a compound rate of 7.5 per cent during 1960-70. The recent sharp increase in cotton prices eroded the small contribution[1] towards its fixed costs, and the management was concerned with stopping cash losses. It, therefore, approached us for advice on the following problems which it considered important:

(1) Installing a system to control costs;
(2) Examining the economics of working a third shift in the loom shed; and
(3) Identifying and setting the priorities in investment decisions.

Among these three problems, the management considered cost control as the most critical problem in the short run. Since there was little scope for immediate reduction in the major items of costs (cotton, wages, colours and chemicals, and stores), we concluded that the mill's major problem in the short run was that of improving contribution through change of product-mix. Such a review of the production programme (product-mix) required a creative search for new sorts,[2] on one hand, and optimal (not necessarily full) utilisation of capacities, on the other. Looked at from this broader angle, the review of the production programme not only required a reallocation of loom-shifts among sorts already produced but also involved finding rational answers to such questions as:

(i) Should the mill sell cloth or yarn or both?

(ii) Should it operate its capacities at the existing level of utilisation or change the levels of utilisation? If the level is to be changed, when should it be changed?

In specific terms, the problem was that of choosing among the following three alternatives:

(a) Should the mill maintain the *status quo*? (i.e, operate two shifts in loom shed (1236 loom-shifts)[3] and a partial third shift in the ring frame section (74,100)[4]

Warp	40,050
Weft	34,050
	74,100

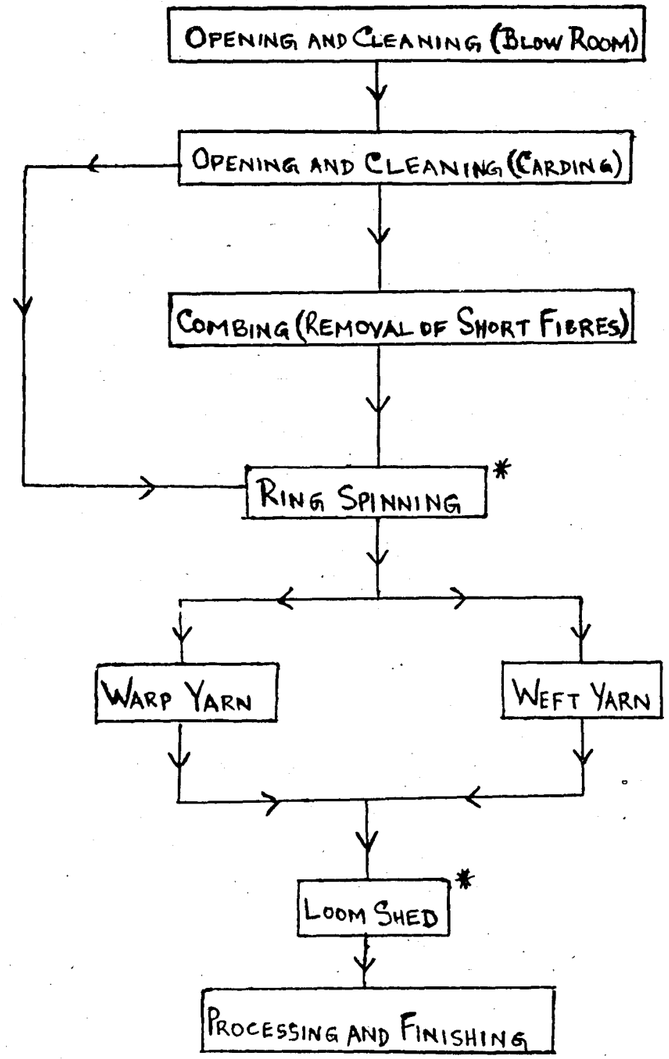
(b) Should a third shift be added in the loom shed (1736) *and* also should the entire ring frame department be worked in the third shift?

Warp	50,580
Weft	42,150
	92,730

(c) Should the entire ring frame department be operated in the third shift and two shifts be operated in the loom shed?

Warp	50,580
Weft	42,150
	92,730

The outcome of each of these alternatives would be different, since the contributions and fixed costs corresponding to each of these alternatives would vary. The first step in making a choice among the listed alternatives was, therefore, to determine the contributions and fixed costs attached with each of them. This amounted to determining the optimal production programme corresponding to each of the alternatives.



It will be helpful to begin the discussion on determination of an optimal production programme by outlining a partial flow process in a textile mill. The flow process will help in a better appreciation of the different manufacturing capacity constraints preceding and succeeding the loom shed which constitutes the pivot of the production planning in a textile mill.

The loom shed is the pivot of a production plan in a textile mill. Once the allocation of looms to different sorts is completed, the capacity requirements in terms of processes preceding and succeeding the weaving in loom shed are computed on the basis of well-defined technical relations. In operational terms, therefore, drawing up a production programme involves deciding which sorts to produce on which loom-widths — such that none of the manufacturing capacity constraints in the loom shed or the process centres preceding and succeeding it is violated. To draw up the production programme, therefore, we need data on (1) alternative sorts that can be manufactured and sold, (2) alternative loom widths on which these sorts can be woven, (3) available manufacturing capacities at different process centres, and (4) marketing constraints in terms of the maximum and minimum amounts of each of the listed sorts that can be sold.

We now discuss problem areas in collecting the above data. The first problem area was that of preparing the list of sorts to be considered for manufacturing. We consulted the mill's salesman and pursued a quick but exhaustive search for new sorts that were technically feasible for manufacture and sale in the light of prevailing market trends. A feasible list of some 20 sorts was thus drawn up. We had also to indicate the alternative loom widths on which these sorts would be woven. Appendix IV gives such a listing. For example, the sort group numbered 1,001 to 1,005 shows five alternatives of producing that sort. Sort number, 1,001 indicates the alternative of producing it on the minimum technically permissible loom width; while 1,005 indicates the alternative of producing that sort on the widest technically feasible loom width. As has been pointed out earlier, the profitability and capacity requirement of producing a sort will vary, however, depending upon the width of the loom allotted to it, because of different rates of output of the same sort on looms of different widths. Appendix 4 shows 70 different alternatives of looms allocation for producing the 20 sorts. Obviously, such a list is not good for all time. It needs to be revised and up-dated from time to time in the context of shifts in the market constraints and prices and availability of cotton, colours, and chemicals.

It was extremely difficult to estimate, properly, the minimum and maximum quantity of sorts that could be sold. There was a built-in tendency to regard maximium sales in the past of any sort as the potential size of the market for

DIAGRAM 1 : (PARTIAL) FLOW PROCESS

° Yarn spun in the ring spinning department is woven into a fabric in the loom shed. Basically, the weaving process consists of interlacing of yarn. The yarn which is vertical is called the warp yarn, while the yarn that runs perpendicular to the warp yarn is called the weft yarn. A typical loom shed consists of looms of different widths required for weaving fabrics used for shirtings or coating is normally 28/29" while that of sarees or dhoties is 47/48". Clearly, a loom of wider width is required for weaving a wider width fabric. Technically, however, there are upper and lower limits to the difference between the width of the loom and the width of the fabrics to be woven on it. As the width of a loom increases, its (loom) speed decreases. Accordingly, production per loom shift decreases as its width increases. Given the width of a fabric it is, therefore, customary to allot for its manufacture as far as possible a loom with technically required minimum width.

that sort. It needed some effort to bring out that what was relevant in defining the sales constraints was not the quantity of the sort which was sold in the past but the quantity that could be sold in the future — with or without additional sales promotion efforts. Our effort in this direction resulted in the enlargement of the sort list and in redefining of sales limits. Appendix IV shows the marketing constraints as were indicated by the salesman. These constraints are expressed in terms of loom-shifts per day. For instance, the salesman indicated that the maximum loom-shifts that should be allocated to the sort comprising the group 1,001-1,005 should be 300. This quantification of market potential for the sort (and likewise for other sorts) was based on his assessment that 300 loom-shifts per day of that sort could be absorbed in the market without depressing its assumed price.[5]

The next major problem that was faced in preparing data for the production programme was the measurement of available manufacturing facilities — particularly those which were most likely to prove bottlenecks. The discussions with the mill manager and the production manager showed that the critical manufacturing constraints of the mill would be :

(i) Cards (available capacity to produce 12,320 lb of yarn per day),
(ii) Combers (capacity to produce 2860 lb of combed yarn per day),
(iii) Warp and weft spindles in the ring frame department, and
(iv) Looms in the different widths.

Having surmounted these difficulties in collecting the data on production and marketing constraints, we proceeded with the determination of contribution and incremental costs attached to each of the three alternatives. Appendices I, II, and III give the production programme corresponding to the Alternatives 1, 2, and 3.

Table 1 shows the contributions and the incremental costs incurred under the alternatives 1, 2, and 3.

Analysis of the results showed that it was profitable for the mill to pursue Alternative 2 (operating three shifts in loom shed and ring frame). This alternative would increase the contribution by Rs 417 per day, i e, Rs 1,25,100 per year of 300 working days. But it involved recruitment of 100 additional workers. One can imagine how difficult it would be for the management to take a rational choice of the production programme without this kind of formal analysis.

We still have a problem of choice of alternative. Such a choice (of the production programme) had to be guided by the following considerations:

Alternative 2 involved employment of additional labour (100 workers). In the event of an adverse change in the economics of the third shift due to unfavourable change in cotton or cloth prices, etc, what problems would the additional labour force pose to the management?

Alternative 3 shows that the mill could make an additional contribution of Rs 109 per day without any additional worker being required. Under this alternative, the company would sell 2150.3 lbs sized beam yarn per day. Though this alternative yielded a lower contribution it did not have the risk of employing additional labour force.

The alternatives, intervening uncertainties and the outcomes are presented in Diagram 2.

After examining the relevant environmental data, the management assessed that cotton prices would go down and that cloth prices would stabilise if not increase. As for demand for cloth, it might not increase if the armed conflict with Pakistan materialised. The management therefore assessed that the chances of the economics of third shift proving adverse were slim, and the alternative 2 was therefore chosen.

At this stage, it will be useful to compare the linear programming approach with the company's current practice for drawing up a production programme. As can be seen, for drawing up the production programme, we had considered 70 alternative loom allocations to the 20 sorts. Traditionally, only the looms with the technically required minimum width are allotted to produce a particular sort, as it is less profitable to produce that sort on a loom with a larger than technically required minimum width. Thus, in a traditional approach, only around 20 alternative loom allocations would have been considered — instead of 70 that we considered. How such a traditional approach to loom allocation can lead to a sub-optimal programme may be seen from a study of Appendix I. In Appendix I, it will be observed that it has been decided to choose alternative 1,009, while alternatives 1,006, 1,007, and 1,008 are dropped. In other words, the computer has allotted looms with larger than the minimum required width to produce the sort comprising the looms group 1,006-1,009. Further, traditionally, it is common to allocate looms in a descending order of sort 'profitability', subject to marketing constraints. Even assuming that, instead of 'profit' we would now use 'contribution' for product-mix decisions, it does not follow that looms should be allotted to the different sorts in the descending order of their 'contribution' per loom-shift. In this connection, it is interesting to compare the programmes detailed in Appendices I and II. For instance, in Appendix II, sort 1,069 has been dropped and allocation to sort 1,067 has been increased, though the contribution per loom-shift of sort 1,069 is higher than that of sort 1,067.

An interesting conclusion that emerged from the interpretation of the production programme is that cards and combers were critical constraints and not the looms or the ring frames.[6] The criticality of the cards and combers became clear when it was estimated that the contribution per day could increase as follows for every lb of additional carded and combed yarn:

	Carded Rs	*Combed* Rs
Alternative 1	0.31	0.61
Alternative 2	2.17	2.46
Alternative 3	1.60	1.53

Thus the determination of the optimal programme helped us to answer all the three problems posed by the management, *viz*:

(i) It was profitable for the mill to run the third shift in the loom shed;
(ii) In case the management is unwilling to commit additional work force it should run three shifts in the ring frame and sell yarn;
(iii) The management should exercise close control on the efficiency of card and comber which have been identified to be critical constraints on the profitability; and
(iv) The pay-off on investment in cards and combers would be very attractive and certain.

In this sense the programme helped in identifying opportunities for investment.

These findings were accepted by the management and will be used as a basis for its product and investment decisions. The management is taking steps for developing skills within the organisation for applying linear programming for determining its production programmes in the future.

TABLE 1 : CONTRIBUTIONS AND INCREMENTAL COSTS UNDER THE THREE ALTERNATIVES

	Alternatives				
	1†	2	3	2-1°	3-1°°
Contributions	38,263	40,480	38,372	—	—
Change in contribution compared to Alternative 1	—	—	—	2,217	109
Increase in cost compared to Alternative 1	—	—	—	1,800	Nil
Increase in contribution compared to Alternative 1	—	—	—	417	109

*Extra contribution obtained by adopting Alternative 2 instead of Alternative 1.
°°Extra contribution obtained by adopting Alternative 3 instead of Alternative 1.
†The difference between the contribution resulting from a production programme prepared by a linear programming technique and that obtained from a production programme prepared in an informal way was of the order of Rs 7,625 per day.

DIAGRAM 2

Scheduling Problem in a State Transport Organisation

The second application was made to a scheduling problem in a State Transport Corporation. The State Transport Corporation had 10 divisions in the state. Each division operated a fleet of 300 buses on an average, and one of the important tasks was preparation of time-tables three times a year. In the preparation of these time-tables the first problem was to assess the demand for passenger buses, the load factor, and so on, to determine a list of trips to be operated. Technically, a 'trip' is a journey performed by a bus between two places ('starting place' and 'ending place') at specified timing. Thus the list of trips specified the starting place, ending place, the starting time and the ending time.

The number of trips, however, did not remain the same over a year. It fluctuated as demand for buses varied from season to season. The total number of trips operated by the Corporation also increased over the years because of the Corporation's deliberate policy of adding more and more routes and also of increasing the frequency of trips on the existing routes to meet the growing volume of traffic. Once the trips in each route were decided upon, the Corporation made a schedule indicating which bus should cover which trips.

KEEPING A NATION ON THE MOVE

As many as 16 airlines of international repute avail of INDIANOIL's expert refuelling service.

In the growth of India's transport and communications, INDIANOIL has been playing a distinct role. But that is not to belittle its contribution to the nation's agriculture and industry.

In a short span of a decade, INDIANOIL has emerged as the biggest oil refining and marketing organisation in India—meeting more than half of the nation's total requirements of petroleum products.

With a chain of refineries processing indigenous crude, a vast pipeline transportation system, and a countrywide storage and distribution network, INDIANOIL has ensured an uninterrupted flow of oil for India's defence and development.

As part of the nation's planned development INDIANOIL ceaselessly strives to take the country towards self-reliance and self-sufficiency in petroleum.

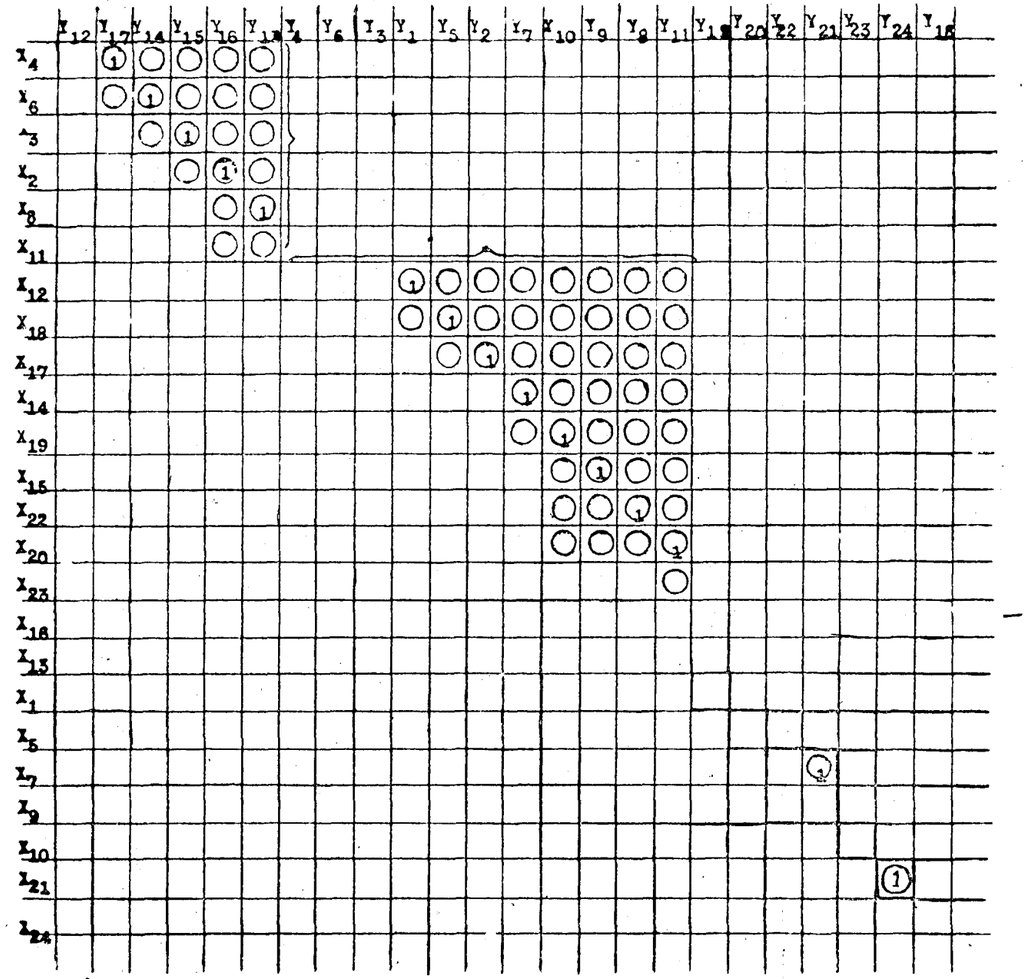
INDIANOIL

—a national trust for economic prosperity

INDIAN OIL CORPORATION LIMITED

Dattaram-IOC-7D

In other words, the trips were grouped in such a way that each group of trips could be operated by a single bus. Ideally, this grouping should be so done that the number of buses and crew requirements are minimised. In preparing such a schedule manually it became difficult to ensure that a minimum of bus and crew requirements were achieved. At present, in each division two persons spent a month on changing the time-table and 25 per cent of their time was spent on grouping the trips. A need was, therefore, felt to mechanise the entire work, ensuring that bus and crew requirements were minimised. To do this, it was necessary to develop an algorithm to group the trips so that each group of trips could be operated by one bus. In this paper, we shall focus our attention on problem of minimising bus requirements.



The problem was best illustrated by an example. We take this example from the trips operated from a depot of the State Transport.

The problem was to find the minimum number of buses required to operate these trips, and also to find which trip should be attached to which bus. It was required that there must be at least 20 minutes break between any two consecutive trips taken by a bus.

The solution to the problem was as indicated in Table 3.

The question that naturally arises is: Was this the best solution, in the sense that, the number of buses required could not be reduced by further regrouping of the trips? The answer is 'yes'. Perhaps this solution could have been obtained by a visual study of the data by an experienced scheduler. However, this becomes difficult when the number of trips are very large. For example in a particular division, the number of trips that a scheduler had

to plan for were approximately 1,500 to 2,000. A visual study of the data, therefore, would be neither feasible nor very effective. Fortunately, this problem can be formulated as a linear programming problem and the best solution worked out.

We sketch a method of attacking this problem.[7] The problem formulation is done exactly on the lines as an experienced scheduler would go about when confronted with such a problem. The first step is to identify the possible pairs of trips that a bus can make. Clearly, for a bus to be able to make the two trips, the following conditions must necessarily be satisfied:

(1) The ending point of one trip must be the starting point of the second trip
(2) The starting time of the second trip must be later than the time at which the first trip arrives.

For finding out the possible pairs of such trips, we proceed as follows. First, we arrange the trips stated in Table 2, according to their ending places. The ending places are ABD, SND, UPDL, NLS, KLP, STD, and ZLP. Further, for trips ending in each of these places we arrange them in ascending order of their ending times. This arrangement is shown vertically in Table 4. For example, the trips shown as X_4, X_6, X_3, X_2, X_8, and X_{11} all end in ABD and they are so arranged that they are in ascending order of their starting times. Similarly, other trips were shown vertically in Table 4.

We regroup these trips again according to their starting places, the starting places being in the same order as ABD, SND, etc. Further, within each of these groups, the trips are arranged in ascending order of their starting places. The trips so grouped are shown vertically in Table 4. For example, trips shown as

Y_{12}, Y_{17}, Y_{14}, Y_{15}, Y_{16},

and Y_{13} all start from ABD. This arrangement has given us a rectangular array as shown in Table 4. In this array, a circle shows that the two trips can be taken by the same bus. For instance, a circle in 4 and 17 in the table indicates that the same bus can take trip Numbers 4 and 17.

Placement of 1's in the circle indicates that these two trips have been grouped together and therefore, these trips should not be included in any further grouping of trips. Thus, each 1 indicates a grouping. The problem therefore boils down to how many 1's can be placed in the rectangular array so that:

(i) the 1's are placed only wherever there is a circle, and

(ii) that 1' is placed only once in either a row or a column.

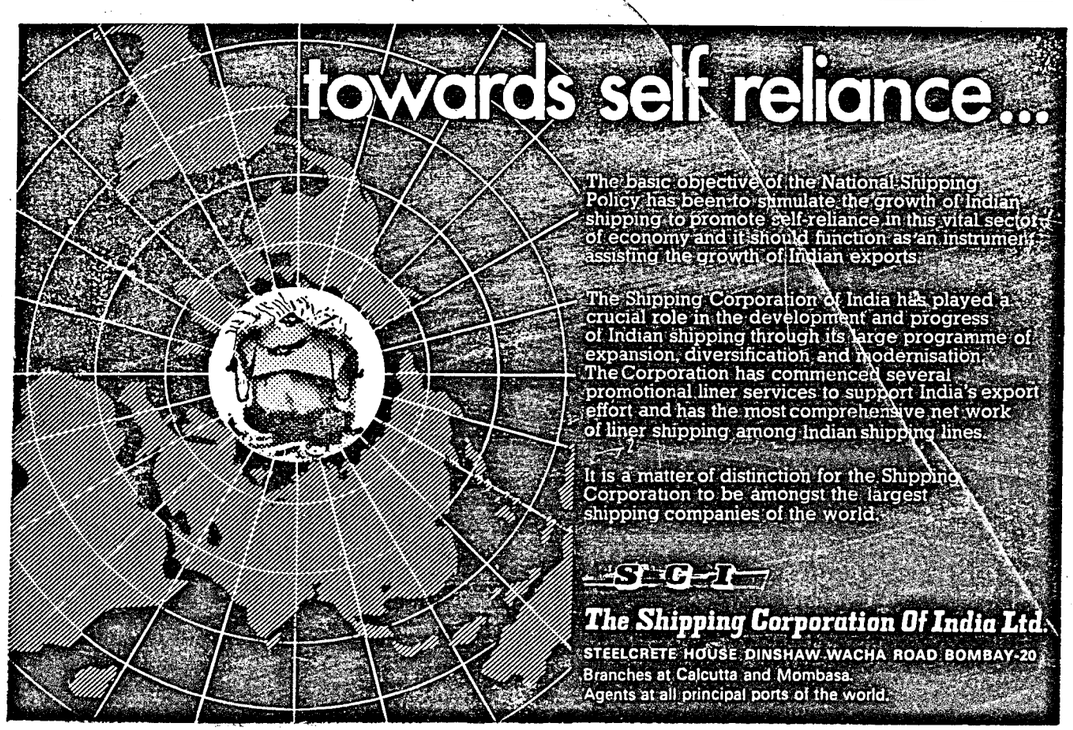
A computer programme was prepared to solve this problem and the preparation of a time-table for 1,500 trips was done barely in a minute and a half.

The management of the State Transport Corporation was more confident of optimal sceduling, even as the number of trips became numerous with such a scheduling programme being available. The dependence on experienced scheduler has been eliminated. The chances of optimal scheduling have been ensured. Optimal scheduling became particularly important in view of the large investment in the fleet of buses maintained for servicing the consumers. The Corporation is keenly interested in using linear programming as a planning tool, and steps are being taken to apply it in preparing optimal time-table.

Notes

1 Contribution is defined as the difference between the sales price (adjusted for damages) and the variable cost. In a textile mill in India, the variable cost, for practical purposes, comprises the costs of materials (cotton, dyes and chemicals, sizing and packing). The contribution per loom-shift is defined as contribution per metre multiplied by production of the sort per loom-shift in metres.

2 A 'sort' is specified in terms of: (1) Fineness of the warp and weft yarn used in the construction of the fabric of the particular sort, (2) Number of warp and weft yarn threads (ends) per inch of fabric, and (3) Width and length of the fabric. There will be as many sorts as there are different varieties of fabrics manufactured by a mill.



3 'Loom-shift': A loom-shift is defined as one loom working for eight hours.

4 'Spindle-shifts required per loom': To weave a particular fabric on a given loom, we need yarn both of warp and weft. For example, if a loom would produce 25 metres of cloth in one shift, then we need the necessary yarn to weave 25 metres of cloth. To produce this quantum of yarn, we need machine capacity in ring spinning in warp spindles as well as weft spindles. Thus for every loom we require certain spindle-shifts of warp and certain spindle-shifts for weft. This is what is shown in Appendices I, II and III.

5 This, of course, is to some extent a simplification of the problem. The problem could as well have been posed in terms of whether a reduction in price and a higher sales volume would be better than holding the price and restricting the volume. The reasons why the simplification was called for are that: (1) To formulate the problem taking into account the price-volume relationship would require solving a non-linear programming problem. At present, good computer packages are not available to solve a problem of that magnitude, (2) The decision-makers were not in a position to give the type of assessments required that would allow for a reasonably good determination of the price-volume relationship, and (3) Our experience in the past has shown that this is a reasonably good approximation.

6 A study of Appendices I, II, and III would support the statements. In Appendix II, for example, the capacity in ring frame and loom shed is unutilised because the capacities for carded and combed yarn become binding at the lower level of utilisation of ring frame and loom shed.

On Profit Maximisation in Public Enterprises in India

Ranjit K Sau

The basic purpose of the public sector in India is twofold: first, to help initiate and sustain a process of rapid economic development, and, secondly, "to carry out such an economic change as will eliminate the economic bases of the... exploiting classes". The pricing policy of public enterprises in India, therefore, has to be determined keeping in full view the context and the logic of the mission to be fulfilled.

Abstraction from the secondary attributes of a phenomenon and concentration on its basic scaffolding have always been the primary tools of all analytical efforts. However, any analysis of the pricing policy of Indian public enterprises that is blind to the crucial perspective is senseless, if not also harmful.

Here we shall analyse the pricing policy of public enterprises in India in the light of this recognition. To begin with, we shall go into the British and French schools of pricing policy, and then turn briefly to the debate in the Soviet Union, the socialist countries of Eastern Europe, and China. Finally, after this long tour, we shall return to India.

THE role of public enterprises depends upon the historical context. In a country like Britain or France the public sector performs a somewhat limited type of functions; the nationalised industries such as railway, coal, or electricity are presumably intended to provide services to the consumers at reasonable prices. Because if left to the private sector, these industries might have given rise to monopolies or oligopolies, with the associated problems of high price and restricted output. Indeed, profit maximisation as such is by no means the end of these industries while under nationalisation.

On the other hand, in the Soviet Union, for instance, the state sector assumes a much different character. Consequently, its pricing and output policies need not necessarily be the same as in, say, Britain or France.

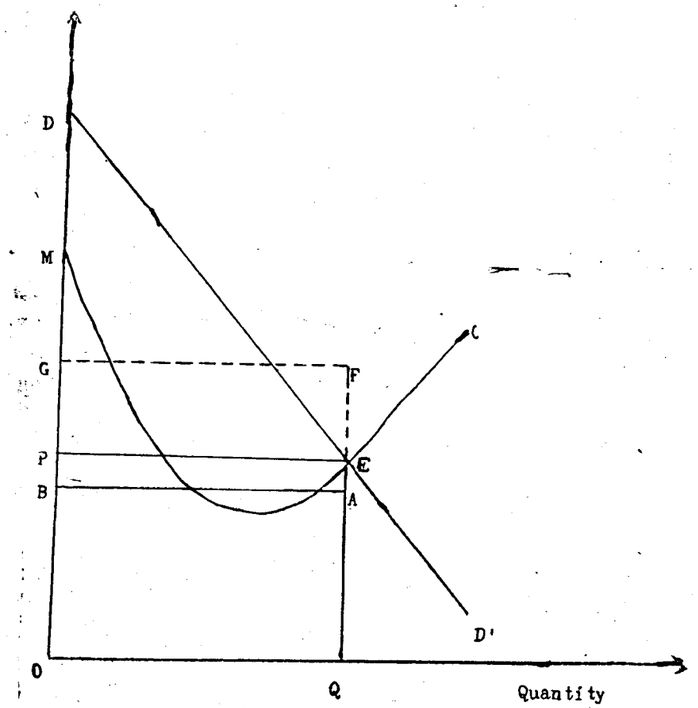
The Indian economy today fundamentally differs from the British, French, or the Soviet economy, for instance. Socialism is India's professed goal, but its economy is far from socialist as yet. It is predominantly semi-feudal in nature, with a capitalist sector of industries which is of relatively small size. The public (state) sector is now struggling to assert itself in the commanding heights of the economy. The basic purpose of the public sector in India is twofold: first, to help initiate and sustain a process of rapid economic development, and secondly, "to carry out such an economic change as will eliminate the economic bases of the... exploiting classes".

The pricing policy of public enterprises in India, therefore, has to be determined keeping in full view the context and the logic of the mission to be fulfilled. Abstraction from the secondary attributes of a phenomenon and concentration on its basic scaffolding have always been the primary tools of all analytical efforts. However, any analysis of the pricing policy of the Indian public enterprises that is blind to the crucial perspective is senseless, if not also harmful. Because, the task of the public sector in India is unique; by no means is it one of merely ensuring the Pareto optimality or restoring a tenuous second-best equilibrium. Its historic task is not a secondary attribute of the phenomenon. It is a fundamental one.

In the light of this recognition, here we shall analyse the pricing policy of public enterprises in India. To begin with, we shall go into the British and French schools of pricing policy, and then turn briefly to the debate in the Soviet Union, the socialist countries of Eastern Europe, and China. Finally, after this long tour we shall return to India.

I
Pareto Optimality and Pricing Policy

(1) Marginal Cost Pricing



In a perfectly competitive economy, the demand curve for a product reflects the marginal utility received by the consumers.[1] If the marginal cost is not equal to the price at any given output, it follows that some one can be made better off by expanding or contracting output as the case may be, without reducing the welfare of others. When price and marginal cost are equal, with an upward sloping marginal cost curve, the situation is Pareto optimal. This is well known, although the controversy is still inconclusive.[2]

Hicks argues further as follows.[3] Let DD' be the demand curve and MC the marginal cost curve in the Figure. The Pareto optimality requires that the price is equated to the marginal cost; hence the price is OP. Now the consumer surplus is given by area DPE. If the average cost is OB, the producer surplus is measured by PBAE. With a downward sloping curve, the consumer surplus is always non-negative; more specifically it is always positive at relevant prices. The producer surplus, however, could be of any sign, depending upon the relation between price and average cost.

Hicks defines the social surplus as an algebraic sum of consumer and producer surpluses. The consumer surplus being usually positive, the social surplus can be positive even if the producer surplus is negative. This has an important corollary, as explained below.

What do consumer and producer surpluses imply, anyway? The consumer surplus is the *net* benefit received by consumers in excess of what they pay for the product at the ruling price. Likewise the producer surplus is the net profit to the producer over and above the cost of production. Even if the producer surplus is negative (the average cost being FQ in the Figure), the social surplus can still be positive provided area DPE is sufficiently large. It follows that in such a case the consumers, in principle, could potentially compensate for the producer's loss (area PEFG), and yet remain better off. In this sense a positive social surplus necessarily implies a Pareto Optimal situation in terms of the Kaldor-Hicks compensation principle. Hicks employs this criterion not only for the pricing

FIGURE

policy of public enterprises but also for evaluation of public investment projects.[4]

Is it the short-run or the long-run marginal cost that is to be equated to price? Interestingly, it has been demonstrated by Boiteux and other French writers on public enterprise economics that the short-run and long-run marginal costs are indeed equivalent, given correct forecasting, i e, granted that the assumptions made about the future in calculating long-run marginal cost turn out to be valid.[5]

It is also interesting to note another aspect of the marginal cost pricing rule. If this rule is followed in an increasing cost industry like coal, for instance, it is the cost of the least efficient (marginal) mine that determines the price. On the other hand, in a decreasing cost industry, where the marginal cost is below the average cost, marginal cost pricing would entail loss to the producer giving rise to the need for subsidy.

(2) Second Best

Marginal cost pricing is a necessary condition for Pareto optimality. But in fact, prices are not equal to respective marginal costs in many industries. Should a public enterprise equate its price to the marginal cost, under such circumstances? This is a problem of what is called the second best.

Turvey argues that should the marginal cost pricing rule be violated in the rest of the economy, it would be still better to 'tackle' such deviations 'directly', rather than by one more deviation by the public enterprise itself. His "personal bias is towards aiming for the best rather than adjusting to the second best. This has the subsidiary merit of simplicity since it requires less knowledge on the part of those responsible for . . . pricing".[6]

However, when the departures from marginal cost pricing in the rest of the economy are unalterable, Turvey concedes that the public enterprise also should make appropriate adjustments in its pricing.[7] But precise theoretical formulations on this issue are not yet in sight.

(3) Budget Constraint

In a decreasing cost industry like railway, the equation of price to marginal cost would involve deficits for the enterprise. What should a public enterprise do if it is under legal obligation to balance its budget? Several solutions to this problem have been advocated. Prior to World War II, the pricing policy of the French railroads, for instance, was based upon the principle of price discrimination advocated by Colson:[8] tariffs *ad valorem* were the rule — this being supposedly equivalent to taxing inelastic demands and subsidising elastic demands — except when the pressure from other means of transportation imposed competitive prices. Reacting against this practice, Allais[9] suggested that all prices should be proportional to marginal costs irrespective of demand elasticities. The factor of proportionality would be so chosen as to bring about a break-even situation. This solution was presented by Allais as a "first approximation" to a "lesser evil".

Boiteux[9] and Debreu[10] have arrived at a different result. In short, they have recommended a set of fictitious prices, as opposed to the market prices, for the inputs used by public enterprises. As for the output price, its proportionality to the marginal cost depends upon the elasticity of demand.[11]

Foster, however, suggests a straightforward solution: equate the average cost to price so that the budget of the enterprise is in balance.[12]

II
The Law of Value under Socialism

The law of value here refers to the Marxian labour theory of value, which by itself is a topic of profound significance.[13] Our primary concern, however, is to see how far it is applicable in a socialist economy or in an economy in transition to socialism from semi-feudalism and monopoly capitalism.

(4) Labour Theory of Value

According to Marx, first in the early stage of the conversion of the "simple" commodity production into capitalist commodity production all commodities continue for some time to exchange "at their values", i e, labour-contents. But capitalism, having once found a foothold, soon proceeds to modify the way in which the law of value operates. The extension and intensification of capitalist competition leads to the formation of an average rate of profit, which means that equilibrium exchange ratios begin to diverge from embodied labour ratios in all cases where the organic composition of capitals concerned is different. Commodities now tend to sell in proportion to their "prices of production", instead of in proportion to their "values".[14]

Historically speaking, competitive capitalism inevitably paves the way for monopoly capitalism. Now the law of value suffers further mutations. If the fundamental economic law of capitalism is the law of surplus value, under monopoly capitalism, that is to say, imperialism, the fundamental economic law is "the securing of maximum capitalist profit through the exploitation, ruin and impoverishment of the majority of the population of the given country, through the enslavement and systematic robbery of the peoples of other countries especially backward countries", as Lange puts it.[15] "When we speak of a monopoly price", Marx wrote, "we mean in a general way a price which is determined by the general eagerness of the purchasers to buy and by their solvency, independently of the price which is determined by the general price of production and by the value of the products". Under conditions of monopoly, exchange ratios do not conform to labour-time ratios, nor do they stand in a theoretically demonstrable relation to labour-time ratios as is the case with prices of production.[16]

(5) Socialist Construction

The need for a certain transition period, or a period of socialist construction in a given country results from the fact that the transition from capitalism to socialism follows the political revolution which establishes the dictatorship of the proletariat, and launches the reconstruction of production relations — effected by it.[17] This period is marked by administrative management and administrative allocation of resources on the basis of priorities centrally established. Economic incentives, during this period, are replaced by moral and political appeals to the workers, by appeals to their patriotism and socialist consciousness. This is, so to speak, a highly politicised economy.[18]

Sooner or later this transition period of socialist construction in a country comes to an end. In the words of Lange: "The gradual reduction of political guidance of economic processes is an essential reflection of the process of maturation of the socialist society. The further away socialist society has moved from its capitalist heritage, as well as from the heritage of the period of transition, in which extra-economic force plays a decisive role, the more the guidance of economic processes becomes separated from the exercise of political government."[19] In other words, "the substitution of the methods of administrative and centralised management and development by new methods based on the utilisation of economic laws indicates the end of the period of transition and the beginning of the functioning of an established socialist economy."[20] It is extremely important to grasp the significance and duration of the transition period in a given country for a better understanding of the role of law of value there.

Soviet Union, for instance, has completed its period of socialist construction. It is therefore expected that the economic laws of socialism would now be in fuller operation there. By contrast, the situation in a country that is in the midst of socialist construction must be different.

The period of socialist construction in the Soviet Union began in 1917. The first post-revolution formulation of a theory of transition from capitalism to socialism was published in 1920 by Nicolas Bukharin under the title "The Economics of the Transitional Period". The second major formulation appeared in 1925 in the complicated economic situation created by the NEP; it was entitled "The New Economics". Evgeny Preobrazhensky was its author.

"Primitive socialist accumulation" is the basic concept of Preobrazhensky's theoretical scheme. "The economic equilibrium of the Soviet economy", he finds, "is settled on the basis of a struggle between two antagonistic laws: the law of value and the law of primitive socialistic accumulation." He continues: "By socialist accumulation we mean the addition to the functioning means of production of a surplus product which has been created within the constituted socialist economy . . . Primitive socialist accumulation, on the other hand, means accumulation in the hands of the state of material resources mainly or partly from sources lying outside the complex of state economy. This accumulation must play an extremely important part in a backward peasant country, hastening to a very great extent the arrival of the moment when the technical and scientific reconstruction of the state economy begins and when this economy at last achieves purely economic superiority over capitalism."[21] This law of primitive socialist accumulation, according to him, changes and partly does away with the law of value and all the laws of commodity and capitalist commodity economy, in the transitional phase of an economy such as the Soviet Union's its era of socialist construction.

As a concrete corollary of the law of primitive socialist accumulation, Preobrazhensky proposes a policy of high prices for industrial products and low prices for agricultural products so that through the medium of such 'non-equivalent exchange between town and country' the state will acquire the necessary funds for socialist industrialisation.[22]

Another landmark in the economics of transition from capitalism to socialism is Stalin's, "Economic Problems of Socialism in the USSR", published in 1952, where he clearly announces that the law of value does operate during the period of socialist construction, but it operates within the limits defined by the principle of socialist planning for balanced development of the national economy[23]

Meanwhile the Soviet economy has presumably transcended its period of socialist construction, and now it is on the way to communism. This perhaps partly explains the increased reliance on economic laws and less recourse to centralised bureaucratic interventions since the 23rd Party Congress in 1965.[24]

As for the pricing policy of state enterprises in particular, usually the Soviet practice was to base the prices on average (for the whole sector) prime costs plus some capital charges.[25] In Poland, the prevailing view seems to be that the marginal cost (measured by the average variable cost of the group of enterprises which have the highest cost in the industry) plus a charge to cover the fixed costs in the industry should determine the price as a rule.[26] In other socialist countries of Eastern Europe also usually the price as a rule is formed on the basis of the cost of production, average or marginal as the case may be.

A question which still remains unsettled is this: How to determine the surplus to be charged over and above the material and wage costs? There are four alternative approaches to this question: (1) The Value Model. In this model, the surplus is proportionate to the wage costs, the proportion being the same in all sectors. (2) The Price of Production Model. Here the surplus is related to the amount of fixed capital employed in each sector, the ratio of surplus to fixed capital being uniform in all sectors. (3) The Mixed Model. This is a cross between two earlier models in the sense that now the surplus is broken up into two parts corresponding respectively to 'social consumption' and 'productive investments' The first element is proportional to wage in accordance with the value model while the latter is related to the fixed capital as in the price of production model. (4) The Prime Cost Plus

Model. Here the price is formed with a mark-up on the prime cost i e, costs of depreciation, material inputs, and labour.[27]

A variety of experiments are being made both at theoretical and empirical levels for determining market prices, in the Soviet Union and the socialist countries of Eastern Europe.[28] A debate is going on in China as well on some of these issues.[29]

III

Primitive Pre-Socialist Accumulation

(6) The Indian Economy in Transition

It is imperative to realise that the Pareto optimality is not the major problem of India today unlike in, say, Britain or France as alleged. Nor is the Indian economy in the phase of socialist construction unlike the Polish, Hungarian or Chinese economy, for instance. The Indian economy is now in the pre-socialist stage, held in the firm grip of semi-feudalism and monopoly capitalism. The law of value hardly operates in India now, the prices being largely determined by monopolies of one form or another.

The immediate task of the public sector in India is to prepare the material base for transition to socialism. With this end in view, the public enterprises should help the process of primitive accumulation, a process which has to develop within the womb of semi-feudalism and monopoly capitalism. It is primitive accumulation in the sense that it is the historic basis instead of historic result of specifically socialist production; indeed it forms the starting point. We may call it the primitive pre-socialist accumulation; 'pre-socialist' because India has not yet launched the programme of socialist construction. Only the preparation for the socialist construction is under way.

What is the source of the primitive pre-socialist accumulation? It is not correct to ask as to whether it is industry or agriculture, town or country. The correct question is: Which section of the population is to pay for this accumulation, be it in industry or agriculture, town or country? The answer is obvious: The richer section of the population which thrives on feudal or monopoly capitalist exploitation has to alienate part of its surplus product. The more unequal the distribution of income and wealth, the more intense the degree of exploitation, larger is the share to be borne by the exploiting class.[30]

Finally, be it noted that even though this law of primitive pre-socialist accumulation phonetically rhymes with the Preobrazhensky-Trotskyite law of primitive socialist accumulation, it has nothing in common with the latter either in form or in substance.

Once the law of primitive pre-socialist accumulation is accepted, the pricing policy of public enterprises follows as a corollary, as we shall see in a moment.

IV

Pricing Policy in India

(7) Public Sector Investment

Since the beginning of the First Five-Year Plan (1951-52) up to March 1969, the total capital investment of the public sector of India was of the order of Rs 12,500 crores (Table 1). Of the total investment in central government enterprises (non-departmental), steel accounts for one-third, engineering for one-fourth, and chemicals and petroleum for one-fifth. Together these four groups claim roughly 80 per cent of such investment (Table 2). The public sector thus concentrates heavily on the basic and key industries which are the essential foundation for rapid industrialisation. But who are enjoying the fruits of industrialisation?

Table 3 reveals that one-half of the industrial consumer goods is consumed by only one-fifth of the rural and urban population, who are among the richest in the country. Accordingly, the bulk of the benefits of industrialisation in India accrues to a small group.

Steel is an interesting example. The public sector has invested a substantial amount in steel plants. Who are the main beneficiaries of steel output? We do not have detailed data about the final consumers of steel products by income groups. One indicator regarding the final consumers is provided by the Raj Committee when it observes

Table 1: Investment in Public Sector as at 31 March 1969
(Rs Crores)

A *Central Government*	
Enterprises	
Non-departmental	3902
Departmental:	
Railways	3797
Posts and Telegraphs	352
Nationalised Banks and RBI	100

90-100	23.91	26.0	9.5	35.5
Total	100.00	73.6	26.4	100.0

that in mid-1963 galvanised sheets commanded a price on the black market approximately 100 per cent and other flat products between 15 and 30 per cent above the government's controlled selling price.[32] Who are the main customers in the black market? "The principal customers for black market steel included manufacturers of such consumer goods as steel furniture, utensils, and automobile and bicycle parts."[33] In any event, there is no doubt that the upper income group consumers are the major users of steel in the final analysis. The same observation equally holds for all industrial consumer goods as confirmed by Table 3.

If so, there is no valid reason why the industrial enterprises in the public sector should not charge high prices for their products so as to maximise the surplus. A profit maximising pricing policy for public enterprises need not be inflationary by itself. In the first place monopoly capitalists in the Indian economy are already charging high prices. Under such circumstances, low prices for public sector output is not an effective means of combating inflationary tendency. In any case, a profit-maximising pricing policy by public enterprises can be a powerful instrument for the primitive pre-socialist accumulation.

The official policy of the Government of India on this matter is both confused and naive, if not deliberately deceptive. For instance, we are told that "conscious of its duty to the community", the government has started many enterprises which are little, or not at all, profitable. To quote at length: "A classic instance of such enterprise is the hundreds of irrigation works of all types built all over the country in which over Rs 1,950 crores have been invested during the twenty years ended 1968-69. It would indeed be desirable if the farmers agreed to pay reasonable water charges so that these dams could earn adequate return on this capital invested. But it has not yet been possible to get farmers to agree to this; as a result, the Government has to accept losses on the operation of these irrigation works. Yet, no responsible Government can refuse to build such dams just because they would not earn profits. In this context it should be noted that the government's loss in such cases is farmers' gain. This is not something which one should regret too much. And, one should not also forget the vital fact that but for the massive investment in such irrigation projects which in terms of profits criterion is to be regarded as utterly 'wasteful investment' the country would not be reaping today (1969-70) a fabulous harvest of 100 million tonnes of food-grains, as against a bare 50 million tonnes at the time of Independence. It is obvious that, in such cases, to concentrate criticism on the so-called inefficient working of such projects is to do them less than justice." So says an editorial of the organ of the Bureau of Public Enterprises, *Lok Udyog* (September 1969).[34]

First of all, let us examine the statement: "the Government's loss in such cases is farmers' gain". Who are these farmers who reap the gain? The extreme inequality of distribution of land in India is a well known fact. For instance, a bare 5 per cent of the rural households own as much as 40 per cent of the agricultural land.[35] If the benefits received by the rural households from irrigation facilities are proportional to their respective landholdings, the inevitable conclusion is that a handful of families monopolise the benefits so produced. Furthermore, if the story of the 'Strong and the Weak on the Sarda Canal'[36] is at all typical, then clearly the rich peasantry gets a big share of the irrigation facilities well above the corresponding proportion of landholding. The feudal landlords are not far behind either. There is evidence to the effect that as soon as irrigation works appear in a certain area the rents and landlord's shares go up sharply. In a word, whatever benefit arises due to the irrigation projects the lion's share of it ultimately goes to the landlords and rich peasantry. No wonder, "it has not yet been possible to get the farmers to agree to" pay reasonable water charges. After all, who dares to alienate the landlords and rich peasantry!

As for the contribution of the irrigation schemes to "a fabulous harvest of 100 million tonnes of foodgrains", no one at all doubts the important role of irrigation in this respect. It is all the more a strong reason as to why therefore the rich farmers must pay a high price for irrigation services.

It is of course, understandable why the Government would not raise the price of irrigation water, so long as the rural votes are delivered by the landlords and rich peasantry.

(8) Official Policy

According to the Bureau of Public Enterprises,[37] the guidelines regarding the pricing policy of the public sector enterprises, *inter alia*, envisage the following:

(i) For enterprises which produce goods and services in competition with other domestic producers the normal market forces of demand and supply will operate and their producers will be governed by the prevailing market prices.

(ii) For enterprises which operate under monopolistic or semi-monopolistic conditions, the landed cost of comparable imported goods would be the normal ceiling. Within this ceiling it would be open to the enterprises to have price negotiations and fix prices at suitable levels. If the landed cost is found/believed to be artificially low or in other exceptional circumstances it is considered necessary to have higher prices then the matter should be referred to the administrative Ministry for an examination in depth in consultation with the Ministry of Finance and the Bureau of Public Enterprises.

It is not at all clear in the above-mentioned policy statement whether or not public enterprises which produce goods and services in competition with other domestic producers should determine their output so as to maximise profit. In any case, what is the meaning of the rule: "normal market forces of demand and supply will operate"? Are the public enterprises in India so insignificant as to be passive price-takers in the market, i e, to be "governed by the prevailing market price" without at all affecting the market prices in turn? In other words, the policy statement begs the entire question; and it is vague enough to be meaningless.

Many imported items in India sell at a high premium. Hence one wonders why the landed cost of comparable imported goods is taken as the "normal ceiling". What should be imported and what should not be imported has to be decided upon keeping in view a number of factors, of which the relative world prices are just some of the elements, but not all. This policy need not be always mixed up with the pricing policy of public enterprises. It is conceivable that certain things should be produced at home — in the public sector; because domestic costs are lower. But that does not necessarily mean that their domestic prices should be lower than the landed cost of the comparable imports. Be as it may, the basic question still remains. What is the 'suitable level' for the price, even below the so-called 'normal' ceiling?

Briefly, it is our contention here that public enterprises as a rule should be advised to maximise profits where the major part of their products are consumed in the final analysis by the richest section of the community. Exceptions however, should be made, directly or indirectly for the consumers

belonging to the poorer sections. If the profit-maximising price for steel leads to a rise in the price of tractors, for instance, it would be better for the public sector to set up a tractor factory as well, and supply tractors to poor peasants at subsised rates, rather than to lower the price of steel as such.

The law of the primitive pre-socialist accumulation requires that a sizeable part of the surplus accruing to the richest section of the community be alienated by the state for its accumulation fund. Accordingly, public enterprises should charge high prices to the rich customers and maximise their profit thereby. This however does not mean that the criterion of profitability would be the sole guide for sectoral allocation of public investment. For if profit is taken as the only objective then one would reach the absurd conclusion that the public sector in India should produce whisky, rather than steel.

The sectoral and regional allocation of public investment is a strategic decision which has to be based upon the requirements for rapid, sustained, balanced development of the Indian economy. The tactical decision of pricing is to be made keeping in view the ultimate consumers on the one hand and the law of primitive pre-socialist accumulation on the other.

Wage Determination in Indian Manufacturing: 1950 to 1964

Pramod C Verma

The usual dilemma before a developing country seems to be having to choose between the competing objectives of social justice and economic growth. However, this paper claims that a judicious balance can be found in a situation of rising productivity which may lead not only to a higher rate of capital formation but also to a reasonable standard of living for the workers who can secure this by being organised.

It is argued here that the wage variation in the Indian manufacturing sector has been influenced by increase in productivity. Yet, there is need for a wage policy which not only provides for an equitable sharing in the gains of productivity but also ensures the containment of inflationary pressures in the economy.

[*The author wishes to thank R Seethalakshmi for her assistance in computation.*]

THE purpose of this paper is to study the growth of money wages in the manufacturing sector. In a developing economy, inflation is almost inevitable, with the consequence that, the purchasing power of money wages is always declining. This fall in real wages, unless counteracted by organised labour, might simply result in the impoverishment of an already weak section of the economy existing on the subsistence level. On the other hand, if industry has to accelerate the rate of capital formation, it might not be in a position to afford a higher rate of money wages. This, then, is the usual dilemma in a developing economy: to choose between the competing objectives of social justice and economic growth.[1] However, a judicious balance of these objectives can only be found in the situation of rising productivity, which could lead not only to a higher rate of capital formation but to reasonable living standard for the workers.

It is the contention of this paper that wage variation in the Indian manufacturing sector has been influenced by increases in productivity. This has led to an improvement in the monetary position of industrial workers, but there is need for a wage policy which not only provides for an equitable sharing in the gains of productivity but also ensures the containment of inflationary pressures in the economy.

I
The Model

The theoretical model adopted for the present analysis can be stated thus:

(1) $W = f\ (V, K, U, CP)$

where W = average annual wage per worker
V = value added per worker
K = fixed capital per worker
U = trade union membership
CP = consumer's price index

This formulation implies a multivariate hypothesis that the variation in average wage rate is influenced by changes in such factors as productivity, capital intensity, trade union membership, and cost of living.[2]

Economic theory postulates that an increase in productivity should, *ceteris paribus*, lead to a rise in average wage rate. If the product price were to remain constant or to increase, only labour and capital share the gain in productivity.[3] Thus wage and productivity are positively related and the latter assumes the position of an independent explanatory variable.

However, productivity is itself partly dependent upon capital intensity of the productive process. If that is so, capital intensity would appear to be another independent explanatory variable in wage determination, although both productivity and capital intensity are intercorrelated. These two variables create a situation in which there is likelihood that employers will be able to acceed to a reasonable demand for an improvement in wages.

However, the accelerating pace of inflation has the unfortunate effect of eroding into the level of real wages. In such circumstances, the more immediate concern of the workers would appear to be to try and neutralise this fall in real wages by asking for a raise in the money wages. The extent to which workers are in a position to exert pressure on the employers will depend upon 'trade union pushfulness'.[4] It is thus reasonable to argue that these variables, trade union membership and consumer's price index, should also exert independent influence on the trend in wages.

Two possible limitations of the present model should be recognised. First, there may be factors — other than the ones chosen for this analysis — which might have some influence on the dependent variable. Nevertheless, the explanatory variables, it is believed, represent not only the employers' ability to pay but also the workers' concern to offset a fall in real wages and to share in productivity gains. Second, the model refers to only one aspect of the labour market, *viz*, the demand for labour. Due to the unavailability of appropriate data, the variables relating to the supply of labour are not proposed to be considered.[5]

For the purposes of statistical verification of hypothesis, the following operational model is put forward:

(2) $W = \alpha + \beta_1 V + \beta_2 K + \beta_3 U + \beta_4 CP$

In this equation, regression co-efficients are indicated by $\alpha, \beta_1 \ldots \beta_4$, where $\beta_i \gtrless 0$ $(i = \overline{1,4})$. Moreover, this is a linear equation with $f_1, f_2, f_3, f_4 \gtrless 0$ (f_i = partial derivative of f with respect to the ith independent variable). In other words, it is expected that the regression co-efficient will have a positive sign. However, several variants of this model will be tested. In addition to the introduction of lags, first difference and log transformation of data will also be attempted.

II
Data and Results

The dependent variable in this study is 'annual average wages per worker'. The term 'wages' includes 'money value of benefits' and the average was arrived at, by adding 'wages' and money value of benefits' and dividing this total by the number of 'workers' (all the three terms are defined in Census of

Indian Manufactures, CMI, and Annual Survey of Industries, ASI, reports).[6] It is possible that the figure thus arrived might overestimate wages, since not all money value of benefits accrue to 'workers'. But there is really no way to determine the extent of overestimation involved.

Productivity is indicated by the net value added per worker. This is admittedly a partial productivity index, yet it represents the trend in growth of productivity. Capital intensity, based on the book value of fixed capital, is much more hazardous to accept as a realistic variable. It does, however, provide us with some indication. The data for productivity and capital intensity are drawn from CMI and ASI reports.

The third independent variable relates to trade union membership rather than to 'trade union density'.[7] Due to the uncertain nature of employment data, it was considered undesirable to compute the density figures. The data relating to trade union membership are based on the returns submitted under the Trade Unions Act, 1926. These returns are voluntary, and consequently some registered unions do not submit these returns for one reason or another. Thus, some underestimation might be involved in this case.

The final variable is consumer's price index published by the Bureau of Labour Statistics.[8] Although the index can be considered as fairly representative, there have been various revisions in its formulation, rendering it as somewhat inaccurate. Nevertheless, this limitation should not vitiate the nature of results obtained.

The data for this study cover the period 1950 to 1964. These are in the form of annual series. An inspection of the data will reveal that:

(a) Money wage have more than doubled over this period (the index number in 1964 stood at 225.1, with 1950 = 100); productivity reached a slightly higher level (index number in 1964 being 239); capital intensity outpaced all variables (index number in 1964 being 660); consumer's price index showed a moderate increase (index number in 1964 being 137 with 1949-50 = 100); and unionism displayed a respectable figure (index number in 1964 at 184, with 1951 = 100). Thus three variables — money wages, productivity and trade union membership — registered similar growth while consumer's price index lagged behind them and capital intensity went up more than sixfold.
(b) The annual rate of change tended to differ from one variable to another. After an initial rise in 1950-51, the rate of change in money wages showed a gradual decline until 1955 — when it picked up again. During 1955-57, a steady rate was maintained, only to slow down during the recession of 1957-59. There was a sudden spurt in 1960, followed by three years of fluctuation around the same trend. In 1964, there was again a sudden jump in the index. Changes in other variables did not uniformly follow those in money wages.

The ordinary least square method was applied to the data as the interrelationship among the variables was assumed to be of a linear nature. Both simple and multiple regression analyses were attempted. It is hoped that the inclusion of regression analysis will strengthen the validity of results.

Regressing the index of money wages on the indices of explanatory variables, the following results were obtained:

(3) $W = -338 + \underset{(3.32)}{0.51^{\circ}}\,V + \underset{(1.04)}{0.04}\,K - \underset{(1.71)}{0.10}\,U^{\circ\circ} + \underset{(1.92)}{0.599^{\circ\circ}}\,CP$

$\bar{R}^2 = 0.976$; SEE = 5.22; DW 1.861; DF 10

* Significant at 1 per cent
*° Significant at 10 per cent

In this equation computed t ratios are provided in parentheses. The t test suggests that the regression co-efficients for V, U and CP are significant while co-efficient for K is not. Only U does not have the expected sign. Moreover, the co-efficient of determination is quite high, indicating the explanatory power of independent variables. This equation seems to imply that productivity has the most significant relationship with money wages. This is confirmed by the simple regression analysis:

(4) $W = \underset{(2.28)}{16.93} + \underset{(17.53)}{0.81^{*}}V$

$\bar{R}^2 = 0.956$; SEE = 7.07; DW = 1.47; DF 13

° Significant at 1 per cent.

Similarly, the simple regression for consumer's price index improves the result:

(5) $W = \underset{(4.66)}{-83.58} + \underset{(12.75)}{1.94^{\circ}}CP$

$\bar{R}^2 = 0.920$; SEE = 9.54; DW = 1.013; DF = 13

* Significant at 1 per cent

The regression co-efficient for capital intensity (K) which was insignificant in equation (3), now becomes significant in a bivariate relationship with money wages:

(6) $W = \underset{(27.28)}{94.78} + \underset{(16.66)}{0.184^{*}}K$

$\bar{R}^2 = 0.952$ SEE 7.419; DW = 1.088; DF = 13

° Significant at 1 per cent

In the following equation, the co-efficient for trade union membership not only becomes positive but turns out to be significant as well:

(7) $W = \underset{(2.58)}{54.59} + \underset{(4.35)}{0.593^{*}}U$

$\bar{R}^2 = 0.561$; SEE = 22.38; DW = 0.484; DF = 13

° Significant at 1 per cent

In this particular case, the co-efficient of determination is not as high as in others.

Equation (3) through to (7) had assumed that no time lags were involved and that the data referred to the level rather than rate of change. Moreover, a linear relationship among the variable was also assumed. It is now proposed to drop these assumptions.

In equation 8, is it assumed that there is a time lag of one year in the effect of independent variables:

(8) $W_t = \underset{(1.353)}{98.801} - \underset{(1.084)}{0.125}\,V_{t-1} + \underset{(3.521)}{0.227^{*}}\,K_{t-1} + \underset{(0.244)}{0.034}\,U + \underset{(0.78)}{0.063}\,CP_{t-1}$

$\bar{R}^2 = 0.928$; SEE = 8.760; DW = 2.545; DF = 9

* Significant at 1 per cent

Compared to equation (3), the $\bar{R}^2$ is lower, the regression co-efficient for productivity is negative and insignificant, and the co-efficient for capital intensity is positive and significant. The implication, therefore, is that previous increase in capital intensity affects the present level of money wage rate. An analysis of bivariate relations shows that the co-efficients for all variables are significant, but this is particularly true for capital intensity:

(9) $W_t = \underset{(22.119)}{95.811} + \underset{(13.619)}{0.216^{*}}\,K_{t-1}$

$\bar{R}^2 = 0.934$; SEE = 8.392; DW = 3.337; DF = 12

* Significant at 1 per cent

It may be recalled that equation (3) was based on the data which related to level rather than to rate of change. The following result was obtained by computing the first difference in data:

(10) $\triangle W = \underset{(1.916)}{3.580} + \underset{(1.384)}{0.175}\,\triangle V + \underset{(0.709)}{0.039}\,K - \underset{(1.384)}{0.161}\,\triangle U + \underset{(2.454)}{0.501^{\circ}}\,\triangle CP$

$\bar{R}^2 = 0.389$; SEE = 3.869;

DW = 1.817; DF = 9

* Significant at 5 per cent

This result shows a very low co-efficient of determination but it highlights the correlation between the rate of change in money wages and the rate of change in consumer's price index. The co-efficient of determination improves, if lagged relation is assumed:

(11) $\triangle W_t = \underset{(4.216)}{6.490} - \underset{(3.433)}{0.122}\,\triangle^{*}V_{t-1} - \underset{(0.261)}{0.012}\,\triangle K_{t-1} - \underset{(1.215)}{0.091}\,\triangle U_{t-1} + \underset{(0.203)}{0.046}\,CP_{t-1}$

$\bar{R}^2 = 0.555$; SEE = 3.278; DW = 1.488; DF = 8

* Significant at 1 per cent

Although the rate of change in productivity has a significant value, the sign is negative. On the other hand, the co-efficient for consumer's price index becomes insignificant.

If the assumption of linear relationship is dropped in favour of a log linear relationship, the following results are then obtained:

(12) $\log W = \underset{(0.863)}{0.899} + \underset{(2.73)}{0.473^{*}}\log V + \underset{(1.61)}{0.145}\log K - \underset{(1.81)}{0.137^{**}}\log U + \underset{(1.36)}{0.331}\log CP$

$R = 0.968$; SEE = 0.039; DW = 1.713; DF = 10

* Significant at 5 per cent
** Significant at 10 per cent

Comparing Equation (12) with Equation (3), there appears to be no improvement either in the co-efficient of determination or in co-efficients of regression. Likewise, the introduction of lag in Equation (12) does not reveal any major improvement in result except for a slightly higher co-efficient of determination.

Till now, the dependent variable was *average annual money wage* based on the data contained in CMI and ASI. Two other possibilities may now be investigated. One is to compute the *average annual real wage* and the other to derive the *average annual earnings* based on the data collected under the Payment of Wages Act (PWA).

In the following results, the dependent variable is average annual wage (W_r) computed by dividing the index of money wages by the consumer's price index. The dependent variable ($_rV$) is value added per worker divided by the wholesale price index.

(13) $W_r = \underset{(29.594)}{1.012} + \underset{(6.563)}{0.91^{*}}\,V_r$

$\bar{R}^2 = 0.751$; SEE = 0.062; DW = 0.994; DF = 13

* Significant at 1 per cent

This equation indicates that real wages and real productivity are positively correlated. Result obtained in Equation (13) can be compared with that of Equation (3) discussed before. It is found that the co-efficient of determination, the regression co-efficient and the value of computed t ratio are lower in Equation (13). The extent to which money wages are correlated with value productivity appears to be higher. Nevertheless, the result shown in Equation (13) confirms the significance of real productivity in determination of real wages.

The final set of computations refers to annual earnings ($\bar{W}$), based on the data collected under PWA as the dependent variable. The independent variables are: $\bar{V}$ (physical productivity), U (trade union membership), and CP (consumer's price index).

(14) $\bar{W} = \underset{(1.107)}{22.047} + \underset{(1.654)}{0.123}\,\bar{V} + \underset{(2.358)}{0.169^{*}}U + \underset{(2.200)}{0.538^{\circ}}CP$

$R^2 = 0.918$; SEE = 4.613; DW = 1.180; DF = 10

° Significant at 5 per cent

In this result, the role of unionism in raising the money wage rate is highlighted. Consumer's price index is again found to be significantly associated with money wages. In the multiple regression analysis, the effect of physical productivity is seen to be insignificant, but in a bivariate relation, the regression co-efficient of $\bar{V}$ is highly significant. Generally speaking, these results tend to support the earlier findings. Additional results are provided in the Appendix.

III
Some Comments

Three variants of the dependent variable were used: average annual money wage per worker (W); average annual real wage per worker (W_r); and average annual earnings ($\bar{W}$). The data for the first two variants were drawn from the CMI and ASI reports, while those for the last variant were drawn from statistics based on PWA. Although all the three sources of data suffer from different types of weaknesses, it is noteworthy that the results do show some comparability. Moreover, several variants of the basic model were tested with a view to ascertain the effect of independent variables on the movement in money wages during the period under study. These exercises seemed to be useful in some cases.

Evidence suggests that, productivity and wages are highly correlated.[9] The regression co-efficient for V was found to be significant in most of the computations reported here. In Equation (3), the regression co-efficient for V was the most significant, and so was it in the log linear equation. The rate of change in productivity was not significantly correlated with the rate of change in money wages. Likewise, the previous level of productivity failed to show a positive relation with current level of money wages. Real productivity was highly correlated with real wages.[10] The results presented in this paper confirm the hypothesised effect of productivity on wages.

The relationship between capital intensity and money wages is somewhat less certain. In the multiple regression equations, the regression co-efficient for capital intensity turned out to be insignificant, but in a bivariate relation, it was highly significant. However, if a lag is introduced, this variable assumes an important role. The implication is that a previous level of capital intensity has some effect on the current level of money wages. The evidence then lends a qualified support to the hypothesis.

It is hazardous to offer any definite conclusion about the effect of trade unionism on money wages.[11] The results obtained from computations were not quite encouraging. In bivariate regression analyses, the co-efficient for trade union variable turned out to be positive and significant. Furthermore, in the multiple regression analysis based on the PWA data, this variable had a significant co-efficient.[12] However, in all other computations, the variable showed a negative value. Consequently, a weak relation between trade unionism and money wages appears to be supported by the findings.

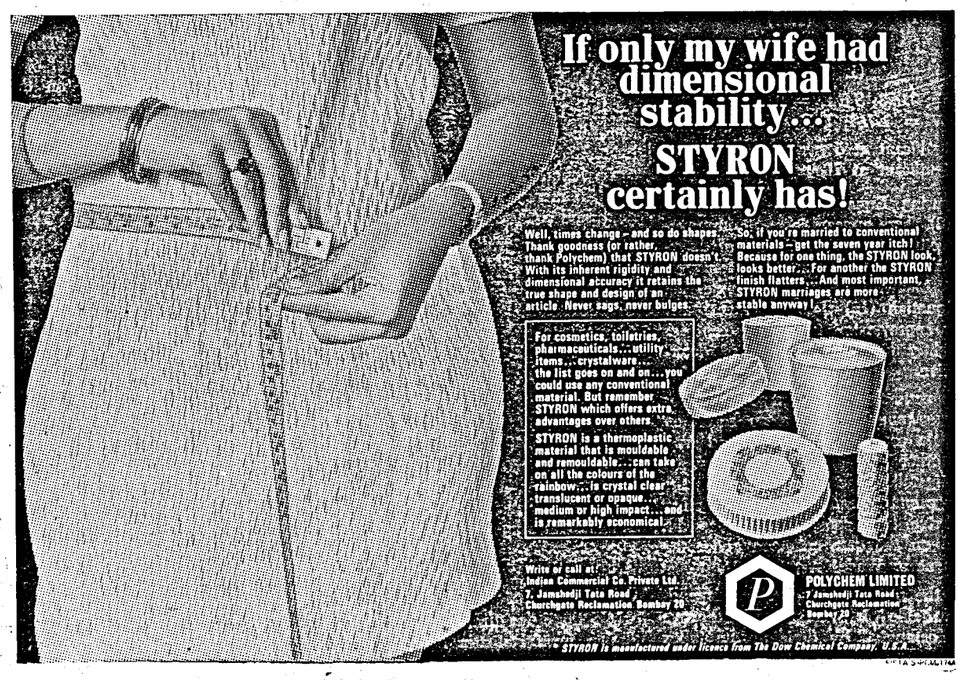
As expected, the consumer's price index was found to be significantly related to the money wage index. Moreover, the rate of change in consumer's price index was also correlated with the rate of change in money wages. The evidence seems to suggest that there has been some neutralisation in the effect of rising costs of living.[13]

This then constitutes another support to the hypothesis.

It is evident from the results of statistical analysis that both productivity and costs of living have significant influence upon the movement in money wages.[14] This substantive conclusion has some policy implications as indicated below:

(1) It is encouraging to find that productivity is a significant variable in the operation of wage system in the industrial sector. Wage policies which emphasise productivity could usefully be adopted at the level of the undertaking, and indeed at the level of economy. Moreover, this finding tends to uphold the view that economic factors do have, in practice, a determining influence on wages, despite the fact that non-market forces (particularly the State) have assumed a crucial role in wage determination. Whatever the *process* of wage determination (which, of course, differs from one industry to another), the *ex poste* data appear to suggest a strong confirmation of the economic hypothesis.[15]

(2) It is also rightly suggested that inflation accounts for a general environment in which real wages have a tendency to rise slower than real productivity, but the socio-economic policies of the State can to some extent counteract this trend. Professor H A Turner points out that, in theory, "the general level of wage will be held down by the labour surplus: average real wages will rise less than productivity, profits rise faster than wages, and wages for unskilled labour in particular be kept close to subsistence level".[16] However, Turner concludes on the basis of ILO statistics that facts do not necessarily conform to this theoretical position. The findings of this paper lead to a similar conclusion. It may even be suggested that the provision for increasing level of living should form an essential ingredient of wage policy.



(3) The possibility that, money wages may increase *pari passu* productivity changes, ultimately depends upon the price situation. A stability in price level tends to restrain wages from chasing the cost of living and to provide for some gains from productivity to accrue to the consumer. In an inflationary situation, both these objectives may be hard to achieve. Consequently, price stability would appear to be crucially linked with the relation between wages and productivity.

In view of the above arguments, a multi-dimensional wage policy appears to be called for. This wage policy should have definite guidelines for wages, productivity and prices. It is suggested that, if price stability is ensured, a productivity-based wage policy is likely to succeed even in a less developed economy.

3 The interrelationship between wages, prices and productivity have been lucidly presented by Salter. See, W E G Salter, "Productivity and Technical Change", Cambridge: Cambridge University Press, 1966.

4 A G Hines has considered the relation between trade union membership and money wages. See A G Hines, 'Trade Unions and Wage Inflation in the United Kingdom, 1893 to 1961', *Review of Economic Studies*, 1964.

5 It is not implied here that the supply of labour does not affect the determination of wage rates. In some theoretical formulations, for example, in the Lewis model it is assumed that the elastic supply curve of labour will tend to force the wage rate to the near subsistence level. For certain types of labour, this does not usually happen. See, W A Lewis, 'Economic Development with Unlimited Supplies of Labour', *The Manchester School*, May 1954.

6 The Census of Indian Manufactures was published for the period 1946-58. This census covered 29 major industries and, in these industries, included all factories registered under the Indian Factory Act, 1948, employing 20 or more workers on any day using power. In the Annual Survey of Industries, which started from 1959, 209 industries were covered. These included factories which employ 50 or more workers with power or 100 or more workers without power. Although there are several problems of coverage involved in the data based on CMI and ASI reports, these should not seriously affect the results of our computations.

7 The data are drawn from various issues of *Indian Labour Statistics*, published by the Bureau of Labour Statistics, Simla.

8 *Ibid.*

10 The relation between real wage and productivity is usually studied in the context of long-run stability of the share of wages in national income. See, E H Phelps Brown, 'The Long-term Movement of Real Wages', in John T Dunlop (ed), "The Theory of Wage Determination", New York, St Martins, 1964.

11 A J Fonseca, *op cit.*

12 Our results are in general agreement with those obtained by Johri, *op cit.*

13 This is emphasised by both Fonseca and Johri studies.

14 However, unlike the Fonseca and the Johri studies, the statistical results obtained here imply that both productivity *and* costs of living have influenced the movement in money wages. Fonseca's results were as follows:
$x'_1 = 0.18\ x_2 + 0.91\ x_3 + 2.09\ x_4$; R = 0.93
(where x'_1 = money wages; x_2 = the degree of unionisation; x_3 = the cost of living; and, x_4 = productivity).
Similarly, Johri found the following relationships:
r y x_1 = 0.75
r y x_2 = 0.88
r y x_3 = —0.02
R = 0.84
(where y = money earnings; x_1 = degree of unionisation; x_2 = consumer's price index; x_3 = physical productivity).

17 *Ibid*, page 12.

Straw Products

STRAW Products has reported a higher production at 36,380 tons against 34,629 tons. The sales of the Company have also reached a record figure of Rs 909.35 lakhs against Rs 767.96 lakhs in the previous year, thus depicting an increase of 18.41 per cent over the 1970 level. Profits before depreciation have improved to Rs 191.88 lakhs against Rs 177.58 lakhs, while profits pre-tax have moved up to Rs 136.48 lakhs against Rs 128.48 lakhs. As a result, the Directors have stepped up the equity dividend from 12 per cent to 13 per cent for the year ended December 1971. These results would have been still better but for the considerable and alround rise in the cost of production due to increase in wages and salaries, and rise in the cost of materials and services.

Besides a higher dividend, the Company has also issued bonus shares in the proportion of one new share for two shares held. The Company is growing fast. The gross block stands at Rs 1,410 lakhs and shows an increase of Rs 450 lakhs over the previous year. The first phase of expansion was completed last year by the commissioning of M G machine. The second phase is expected to be completed by the third quarter of 1972.

Trade Union Unity

S D Punekar

The decision taken by the INTUC, the AITUC and the HMS to set up a national council of central trade unions has been hailed as "epochmaking". The council, it is hoped, will help to promote inter-union co-operation and co-ordination, bring about unity among the working people and advance their interests.

To appreciate the limitations to which these expectations are subject, this article reviews, first, the history of the central organisations of Indian workers and, then, the experience of the recent moves for trade union unity.

THE decision taken by the three major central organisations of workers — the INTUC, the AITUC and the HMS — on May 21 to set up a national council of central trade unions has been hailed as "epoch-making" in the annals of the Indian trade union movement. With this the deadlock among the three national federations, which had till recently refused to come together on a common platform, has been broken. Now their decision to establish a joint council to hammer out a common approach to various issues has raised a number of expectations. The council, it is hoped, will help promote inter-union co-operation and co-ordination, bring about unity, advance the interests of the working people and further the development of the national economy on a democratic, self-reliant and non-monopoly basis. To understand the limitations of these expectations it may be useful to look at, first, the history of the central organisations of Indian workers and then the experience of the recent moves for trade union unity.

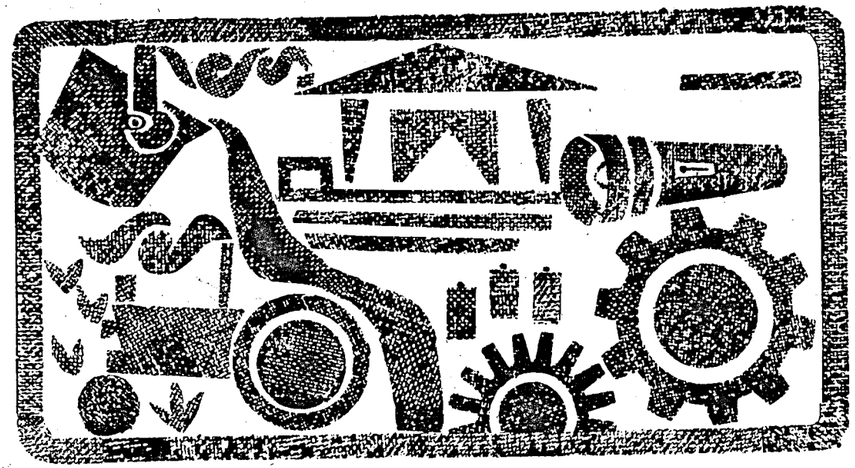
History of Central Organisations

The All-India Trade Union Congress: Modern trade union movement in India started with the establishment of the Madras Labour Union on July 27, 1918. Soon after a number of unions came into existence to demand higher wages for workers to offset the high post-War prices. However, the immediate cause for establishment in 1920 of the All-India Trade Union Congress, the first national trade union federation, was the nomination by the government of India of the Indian workers' delegate to the first International Labour Conference in Washington in 1919. As there was no central organisation of workers, the government nominated the delegate without consulting labour organisations.

Partly to claim this right to nominate Indian workers' delegates to international conferences and partly to co-ordinate the activities of a large number of trade unions which had been formed since 1918, the All-India Trade Union Congress was brought into existence. Its first session was held on October 30, 1920, in Parel, Bombay, under the presidentship of Lala Lajpat Rai, who incidentally was the President of the Indian National Congress in that year. Though the presidents of the AITUC were supplied by the Indian National Congress, the trade union organisation came under the dominance of communists after 1925. This drove the moderates to form their own organisation at the 1929 Nagpur session, presided over by Pandit Nehru. The organisation was called the Indian Trade Union Federation. In 1933 it changed its name to the National Federation of Trade Unions. In the meanwhile, the All-India Trade Union Congress was split; at the Calcutta session in 1931 under the chairmanship of Subhash Chandra Bose the communists walked out to launch their own Red Trade Union Congress. However, after many attempts, particularly by V V Giri, unity was brought about at Nagpur in 1938 between the AITUC and NTUF.

The Second World War created a serious problem for the AITUC, which consisted of a motley crowd of trade unionists with diverse attitudes towards the war. The Royists who wanted to support the British war effort walked out of the AITUC in 1941 to form the Indian Federation of Labour, which was recognised by the government as the representative organisation of Indian workers. Most of the non-communists in the AITUC were then in jail or underground. With the end of the war in 1945, the recognition accorded to the Indian Federation of Labour was taken away and given to the AITUC. This recognition was, however, short-lived.

The Indian National Trade Union Congress: Though a number of Congressmen were working in the AITUC, they could not "reform it from within". Hence, the Hindustan Mazdoor Sevak Sangh, the labour wing of the Indian National Congress, considered it desirable to have its own national federation and thus the Indian National Trade Union Congress was born in New Delhi on May 4, 1947. Its birth was blessed not only by Congress-minded trade unionists, but also by top Congress political leaders. Within a year, the INTUC was considered the most representative central organisation of workers. It has maintained that status since then.



Hind Mazdoor Sabha: The Socialists in the Indian National Congress, as well as those in the AITUC, were not happy about the labour policies of either of these two organisations and they formed a new organisation — the Hind Mazdoor Panchayat. The HMP, with the Royists-dominated Indian Federation of Labour, formed the Hind Mazdoor Sabha in December 1948.

United Trade Union Congress: Some of the radicals who came out of the AITUC with the socialists became dissatisfied with the principles and objectives of the Hind Mazdoor Sabha and formed their own separate United Trades Union Congress on April 30, 1949.

The four federations (the AITUC, the INTUC, the HMS and the UTUC) enjoyed for many years the status of recognition as Indian workers' central organisations. The criteria for recognition have been mainly two: (i) the central organisation should have a minimum membership of one lakh; and (ii) this membership should be spread out in at least in five states of the country. The latest verified official membership figures of the four central organisations are not available. The AITUC and the HMS have boycotted the verification procedure, whereas the INTUC is opposed to the secret ballot method. In fact, one of the most serious obstacles to trade union unity in India has been the verification *versus* ballot question.

Some years back the verified membership of the INTUC was about 10 lakhs (60 per cent), while the figures for the AITUC, the HMS and the UTUC were about 4 lakhs (18 per cent), 4 lakhs (18 per cent) and one lakh (4 per cent), respectively. The Central Ministry of Labour recently proposed that representation at the national level in tripartite conferences should be restricted to those central

In our little way...

we help India fight its war on all fronts

As India moves towards its goal of all-round development, we make our contribution. On the food front Union Carbide provides pesticides and polyethylene film which help the farmer reap a bigger, better harvest. On the home front we bring to you a variety of household articles ranging from batteries and flashlights to colourful containers made from our polyethylene. We supply raw materials and chemicals essential for the pharmaceuticals, paints, textiles, iron and steel and rubber industries. On the export front Union Carbide combs the five continents for new markets and its products reach more than 50 countries including the U.S.A. These are but some of the seeds that Union Carbide India Limited has sown to raise the standards of living of the people of India. Yes, in our little way we help India fight its war on all fronts !

UNION CARBIDE

sowing the seeds of progress

UC—1656D—203—CM

trade union organisations which command a minimum membership of four lakhs spread over a number of states and with a sizeable membership in a number of industries. If this criterion were accepted, the UTUC would cease to enjoy the status of even an "observer" in the tripartite, while the AITUC and the HMS might be on the margin.

Other Central Organisations: The Central Ministry of Labour, making a slight departure from the existing practice, has asked non-recognised trade union centres like the CITU (Centre of Indian Trade Unions), the HMP (Hind Mazdoor Panchayat) and the BMS (Bharatiya Mazdoor Sangh) to submit membership returns for verification. Of these, the Marxist-led CITU unions were till recently in the AITUC. The (Lohia) Socialist-dominated HMP unions were for some time with the HMS. Both the CITU and the HMP have been created by politicians dissatisfied with the "mild" policies of their erstwhile colleagues. The CITU has submitted its membership figures to the Central Labour Ministry for verification.

The Bharatiya Mazdoor Sangh is a right-wing organisation with some affinity with the RSS and the Jan Sangh. The BMS had its first session in 1967. At its third session held in Bombay on May 22 and 23, 1972 it claimed a membership of over six lakhs, spread over a number of states and industries. It has made headway in some of the unorganised sectors — for instance, among domestic servants.

Thus under the criterion of a minimum membership of 4 lakhs, the UTUC might go out, but three new organisations might come in. And the objective of unity, sought to be achieved by the three recognised centres (the INTUC, the AITUC and the HMS) might actually become more distant in the changed trade union picture. The Bharatiya Mazdoor Sangh has pleaded for a broader unity of all big unions, if necessary by even abolition of all central organisations. The HMP complains that the HMS, with which it wants to merge, has been indifferent to it. The CITU has criticised the formation of the National Council of Trade Unions as being not in the interest of the working class. Its president B T Ranadive, thinks that the formation of the Council is an attempt to stem the growing unity of the working class in joint struggles and also an attempt to forestall the unity of CITU, AITUC, HMS and UTUC to forge a common front against the Government's anti-labour policies. The Council, he fears, would be increasingly used by the government to get support for its policies and to isolate the militant trade union organisations. He criticised the INTUC and the AITUC leaders for their role in West Bengal where, according to him, they were either screening or indirectly supporting the semi-fascist terror directed against unions affiliated to CITU and UTUC.

History of Unity Moves

The agreement reached on May 21, 1972 to set up a national council of central trade unions is the result of one year's negotiations among the organisations. On May 18 and 19, 1971 the HMS called a conference of trade union organisations in Delhi. According to it, "in the pre-election phase, trade union development remained stalled and immobilised by internal dissensions, mounting bitterness and intensified inter-union rivalries". The post-election phase changed this picture, with a comfortable majority for the ruling party. The conference called by the HMS was aimed at opening a dialogue among the trade union organisations on various topical issues. The AITUC became the co-sponsor of the conference, which passed unanimously "a trade union declaration" setting out the immediate tasks of the working class movement. After the conference was over, the HMS delegation met representatives of the INTUC separately on May 19, when it was informed that the INTUC working committee had suggested the formation of a national consultative committee of INTUC and HMS. This committee was formed in June 1971. A similar committee of HMS and AITUC was formed in August 1971.

In the meanwhile, some of the steps taken or proposed by the Central Labour Ministry hastened the consultation between the three central organisations. So far the INTUC had enjoyed the sole right of representing Indian workers at international conferences. For the June 1971 International Labour Conference in Geneva, two nominees of the AITUC and the HMS were included in the Indian delegation, though with the status of observers only. In future conferences, non-INTUC men may get the status of delegates.

The Central Labour Minister, R K Khadilkar, used various means to bring about the trade union unity. He postponed the tripartite meetings and the verification dates to suit the convenience of labour leaders, requested them to evolve a formula for recognition of the bargaining agent, invited suggestions on matters of industrial relations and threatened that government would not wait indefinitely for the trade union centres to reach an agreement, but would bring in Parliament a comprehensive industrial relations legislation, amending the Industrial Disputes Act. A large measure of the credit for the agreement between the three major central trade union federations thus goes to the Labour Minister.

The powerful Ahmedabad group, which had founded and built up the INTUC, had all along disfavoured the idea of having a dialogue with the communists. However, now this group belongs to the Old Congress, whereas the INTUC is controlled by labour leaders owing allegiance to the Congress(R). The way for trade union unity talks was cleared with the diehard, anti-communist Ahmedabad group severing its connections with the INTUC.

Till two years back, the INTUC, dominated by the Ahmedabad group, had been opposed to any direct negotiations with the AITUC, because of the latter's pro-communist leanings. It even refused to negotiate with the HMS, because the latter was not agreeable to breaking all contact with the AITUC. However, with the diminishing importance of the Ahmedabad group and with the initiative taken by the HMS, the picture changed slowly. The first meeting of the three organisations was held on August 4, 1971 in Madras. On February 6, 1972 they reached "a limited accord", agreeing in principle to the setting up of a joint national council of trade unions. Often it seemed that the three trade union centres might not be able to reach an agreement on the crucial issue of recognition of trade unions. This issue has been causing bitterness among the centres and their affiliates at the industry level. Another point of dispute is in regard to the states of Maharashtra, Gujarat and Madhya Pradesh which are covered by the Bombay Industrial Relations Act. The provisions of this Act have given a privileged position to the INTUC which is, therefore, reluctant to apply the general formula for union recognition to these states. It, however, agreed that unions in these states might be covered by the new formula, but only after the experience gained in according recognition was found to be satisfactory.

The limited agreement reached on February 6, 1972 was the result of discussions on questions of industrial relations, recognition of trade unions

RECURRING DEPOSIT SCHEME

UBI offers

INCREASED RATES OF INTEREST

From 1st March 1972, you get more for your savings with **UBI** under the Recurring Deposit Scheme. Number of monthly instalments may be 48, 60 or 80, according to your choice.

- Savings grow by compound interest.
- Painless saving. Save any fixed amount from Rs 5/- to Rs 500/- in multiples of Rs 5/-.
- Small amounts, that neither keep nor serve real needs, grow to a useful sum.
- Also, you have the 12-month Festival Account to take care of your worries for festive occasions.

and joint industrial committees. Except on the question of recognition of unions — already governed by State industrial relations legislation — there were general agreement on all other issues. With regard to industrial relations, the trade union centres felt that the present system was totally inadequate and required immediate change. The best way to promote healthy industrial relations was to leave all disputes to be resolved through direct bilateral negotiations. The parties may agree to refer the dispute to voluntary arbitration or, failing agreement, workers should have the right of direct action, including that of going on strike. The centres also agreed that joint industrial committees at the national level should be set up in all industries and services to decide on all important matters concerning the industry and workers.

The limited accord was repudiated on May 6 by the three organisations. The INTUC stuck to the view that the states of Maharashtra, Gujarat and MP, covered by the BIR Act should be excluded from the operation of the national formula for union recognition. "The new formula should first be tried in areas and industries where there is no law governing union's recognition and thereafter, if experience gained in the working of the new formula is satisfied, be extended to areas and industries covered by the State laws on recognition." It suggested a two-year period for such an experiment. The AITUC and the HMS, on the other hand, refused to concede this point which they considered crucial not only for the states concerned, but also for the evolution of democratic norms for industrial relations all over the country. These two organisations also expressed the apprehension that the Congress and the government had, as so often in the past, veered round to the position of lending their support to INTUC to the disadvantage of other central organisations. They feared that a principled and objective approach would not be taken by the government while formulating the new industrial relations legislation. The AITUC accused the government of trying to "continue their old line of imposing INTUC, now in a rejuvenated form, on the trade union movement". The HMS also charged that "the INTUC has declined to continue the dialogue". The HMS stood for collective bargaining, recognition of a single bargaining agent and its choice by secret ballot. The AITUC and the HMS declined to join the national council except on the basis of equality and parity, whereas the INTUC demanded representation on various committees proportionate to membership.

Fortunately this set-back proved to be temporary and on May 21, 1972 an agreement was signed by the three organisations to set up a national council. It is hoped that at their next meeting on May 30, the machinery for implementation of the proposal would be set up.

As may be seen from the history of the trade union unity move, the sailing has not been at all smooth. However, in spite of heavy odds, a substantial achievement has been recorded, as far as unity is concerned. Not only have the three most important central organisations of workers come together and discussed the issues, but they have been able to put out a common programme from a common platform. Incidentally, the three trade union centres unitedly celebrated May Day this year.

Principle of Unity

It should not be forgotten, however, that the unity achieved is from the top and not from the bottom. It is necessary to inculcate the principle of unity among workers and their unit level unions, so that the foundation may be strong. Another important problem would be that of the other central organisations like the CITU, HMS and BMS. They are not recognised trade union centres and as such have been kept out of the trade union centres' meetings. It is possible that once the proposed national council is set up, it may negotiate with these organisations and may even extend invitations to them to join it. The CITU leaders have made it clear that they would not be bound by any formula adopted without their active participation. The HMP leaders are at present silent, while the BMS has once again pleaded for a broader unity.

The success of unity would depend on the activities of the national council and its three main sponsors. The ideological differences would still remain, but they should not come in the way of negotiations with the government, co-ordination of trade union activities and improvement in the working and living conditions of the labouring classes. The Indian trade union movement has to play an important role not only in bettering the conditions of workers but in the development of industry, the community and the nation. The national council of central trade unions, as the chief agency of Indian workers, could fulfil this role.

Report of the Auditors

To
THE PRESIDENT OF INDIA :

1. We have audited the attached Balance Sheet of **Syndicate Bank** as at 31st December, 1971 and the attached Profit and Loss Account of the Bank for the year ended 31st December, 1971 in which are incorporated the returns of 100 Branches audited by us, 164 Branches audited by other auditors, and the unaudited returns in respect of 243 Branches not visited by us, for the exclusion of which branches from audit, concurrence of the Reserve Bank of India was obtained.
2. The Balance Sheet and the Profit and Loss Account have been drawn up in forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of Banking Companies prior to nationalisation by virtue of the provisions of the said Act as read with the relative provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that :—
   (*a*) in our opinion and to the best of our information and the explanations given to us and as shown by the books of the bank :—
      i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1971; and
      ii) the Profit and Loss Account read with the notes thereon shows a true balance of Profit for the year ended on that date;
   (*b*) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
   (*c*) the transactions of the Bank which have come to our notice have been within the powers of the Bank; and
   (*d*) the returns received from the offices and branches of the Bank have been found adequate for the purposes of our audit.

Auditors' Report

To

The President of India,

1. We have audited the attached Balance Sheet of Canara Bank as of 31st December, 1971, and the Profit and Loss Account of the Bank for the year ended that date, in which are incorporated the Returns of thirty-one branches audited by us, of one hundred and ninetyone branches audited by other Auditors and the unaudited Returns in respect of three hundred and eightyseven branches of which seventyone branches were audited by us for the first half year ended 30th June, 1971, in accordance with the arrangement for the audit of branches approved by the Reserve Bank of India.

2. The Balance Sheet and the Profit and Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule to the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of Banking Companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that:

(a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank:
  (i) The Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1971;
  (ii) The Profit and Loss Account read with the notes thereon shows a true Balance of Profit for the period covered by the account;

(b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

(c) The transactions of the Bank which have come to our notice have been within the powers of the Bank; and

(d) The returns received from the Offices and branches of the Bank have been found adequate for the purposes of our audit.

NOTES:

(1) Provision in full for gratuity accruing on retirement of staff has not been made nor has the liability for the same been ascertained.

(2) In accordance with the past practice the Assets and Liabilities of the Foreign Branches (excluding Karachi branch) of the Bank including fixed assets and capital funds have been converted at the basic rate of exchange as on 31st December 1971.

(3) The Income-tax assessments in India for the years 1949 to 1958, which had been reopened as the Income-tax Officer differed with the method adopted in the past by the Department for allowing Double Income-tax Relief have been completed and the tax liability for these years and for the years 1959 to 1968 have been calculated by him according to the new method. As the Bank has disputed the action of the Income-tax Officer, no provision has been made for the additional liability arising from such assessments and other items disallowed in original assessments in respect of which appeals are pending. Provision for taxes for the years 1969 to 1971 has been made on the basis adopted all along in the past. The appeal relating to the year 1959, on the basis of which assessments for the past years were reopened and subsequent assessments were completed, has been disposed of by the Appellate Assistant Commissioner of Income-tax and the Bank's contention in regard to Double Income-tax Relief has been substantially upheld. The Department has gone on appeal against the appellate order.

(4) The Assets and Liabilities of the Karachi Branch of The United Commercial Bank Ltd., stand entrusted to the Custodian of the Bank. Such assets and liabilities continuet to vest in the Custodian of Enemy Property, Pakistan, and since no further information was available about the assets and liabilities in Pakistan after 27th August 1965, these have been incorporated in the Balance Sheet at their net book value (at pre-devaluation parity) as on that date.

(5) (a) Branch Adiustment account at Head Office has been reconciled upto 30th June 1970 and reconciliation upto 31st December 1971 is in progress. Reconciliation statements in respect of balances as on 31st December 1971 in the case of some branch and bank accounts are under preparation.

(b) The tallying of balances in some accounts as per General Ledgers with those as per Subsidiary Ledgers/Registers/Detailed Statements could not be completed at a few Branches.

Appropriate steps are being taken in this regard.

Figures for 1970 have been rearranged where necessary.

TOTAL Rs.	4,30,07,26,267.15	4,07,63,86,805

The above Accounts have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949.

United Commercial Bank

Report of the Auditors

THE PRESIDENT OF INDIA

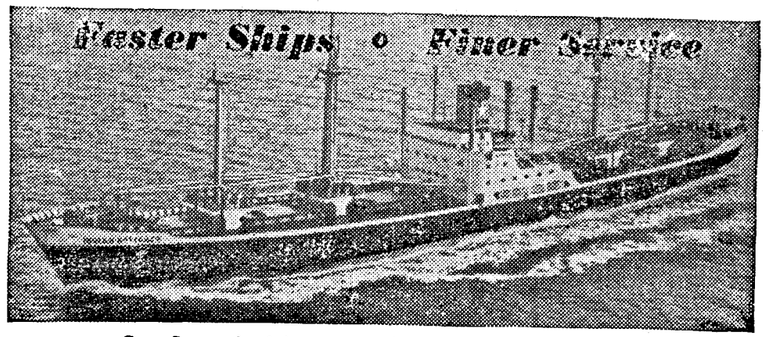
We have audited the attached Balance Sheet of United Commercial Bank as at 31st December, 1971 and also the relative Profit and Loss Account for the year ended on that date annexed thereto, in which are incorporated the returns of 61 Branches audited by us, 193 Branches audited by other auditors and the unaudited returns in respect of 250 Branches not visited by us, for the exclusion of which from audit, concurrence of the Reserve Bank of India, has been obtained.

The Balance Sheet and Profit and Loss Account have been drawn up in forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph and the notes on the accounts, we report that:—

(a) in our opinion and to the best of our information and the explanations given to us and as shown by the books and returns of the Bank:

(i) The Balance Sheet is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1971;

(ii) The Profit and Loss Account shows a true balance of profit for the year ended 31st December, 1971.



(b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

(c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;

(d) The returns received from the branches of the Bank have been found adequate for the purposes of our audit.

Calcutta,
29th April, 1972.

United Commercial Bank

Report of the Directors

The Directors have pleasure in presenting their Third Report along with the Accounts for the year ended 31st December 1971.

Before we take up a review of the Bank's operations during 1971, we express our deep sense of gratitude to our armed forces who fought valiantly and to those who laid down their lives in the cause of upholding the territorial integrity and national honour of the country in the short-lived December war. The Bank as a whole and its branches in the border areas in particular, so conducted business operations as to ensure smooth production and distribution of civil and military requirements and inspire confidence in the Nation's strength and solidarity. It also donated a sum of Rs. 3 lakhs out of its profits for 1971 to the National Defence Fund. In addition, many employees of the Bank contributed voluntarily their one day's gross salary to this Fund and also donated blood.

OPERATIONS OF THE BANK

The operations of the Bank in India and abroad recorded satisfactory progress during the year under review.

Deposits

The deposits and other accounts of the Bank at Rs. 337.44 crores showed an increase of Rs. 41.63 crores as against an increase of Rs. 38.28 crores in the previous year. The aggregate deposits of the Bank in India rose by Rs. 42.51 crores as against a rise of Rs. 36.95 crores in 1970. The number of deposit accounts in India went up from 10,60,000 to 12,41,000 recording an increase of 1,81,000 as against 1,48,000 during the previous year. Particular mention may be made of the Savings Bank Deposits which rose by nearly Rs. 15 crores during the year as compared to the rise of Rs. 11 crores in the previous year.

Of the total deposits of the Bank in India at the end of 1971, 147 branches, opened after 19th July 1969, accounted for Rs. 10.69 crores. A table showing the number of branches opened after 19th July 1969, their deposits and advances as at the end of 1969, 1970 and 1971 is given below :

		(*Rupees in thousands*)		
		31-12-69	31-12-70	31-12-71

With a view to ensuring involvement of all the members of the staff in the efforts for mobilisation of deposits, a scheme of cash rewards to the members of the staff was introduced in October 1971. As a result of this incentive scheme, the deposits during the last two months of the year increased by nearly Rs. 12 crores (average of Rs. 6 crores per month) as against an average monthly increase of Rs. 3 crores during the previous ten months.

Advances

The Bank's Advances and Bills outstanding on 31st December 1971 amounted to Rs. 228.86 crores, registering a rise of Rs. 11.71 crores during the year as against a rise of Rs. 54.33 crores during the previous year.

The smaller rise in the Bank's credit was due mainly to the slower growth of industrial advances during the year and to the policy followed by the Bank to restrict its credit expansion in a manner so as to reduce the Bank's dependence on the Reserve Bank, particularly during the busy season.

The credit-deposit ratio of the Bank in India which was in the neighbourhood of 81 per cent during the year 1970 was deliberately reduced to around 76 per cent during the year 1971. In bringing about this reduction, care was taken to ensure that the genuine requirements of industry were met.

The debts due by Directors or Officers of the Bank or any of them either severally or jointly with any other persons shown in the Balance Sheet under item (V) 'Particulars of Advances' represented loans and advances granted to officers of the Bank mainly for construction or acquisition of houses under the Bank's Housing Loan Scheme for the members of the staff, for purchase of conveyances like bicycles, scooters, motor-cycles, cars etc. The increase of nearly Rs. 23 lakhs in such advances is due, mainly to the inclusion of the advances granted to clerical staff in the earlier years, consequent on their promotion to officers cadre during the period under review.

PRIORITY AND PREFERRED SECTORS

The Bank formulated certain schemes for development of the priority/preferred sectors and availment of the advances under these schemes would have normally stepped up the Bank's advances to the priority/preferred sectors substantially. However, on account of certain practical difficulties the progress with regard to advances to these sectors has not been up to expectations.

As will be seen from Table A given below, during the year, 12,608 new accounts were brought on the books of the Bank taking the total number of accounts to 52,742 as at the close of 1971 as against 40,134 accounts at the end of the previous year. While the overall limits increased to the level of Rs. 84.92 crores as on 31st December 1971 as against Rs. 81.38 crores at the end of 1970, the availment figure showed a small drop of Rs. 0.93 crore from Rs. 53.67 crores to Rs. 52.74 crores. The decline in availments was mainly due to the fall under the export sector; the outstanding figure being Rs. 10.51 crores as against Rs. 14.57 crores at the end of the previous year.

During the year, 1,100 new Small-scale Industry accounts including Transport Operators were brought on the books of the Bank and the outstanding advances

to this sector at the end of 1971 amounted to Rs. 19.64 crores as against Rs. 17.91 crores at the end of the previous year.

In Agricultural finance, satisfactory progress was achieved by extending financial accommodation in 9,868 new Farm accounts taking their total at the end of 1971 to 34,522. The limits sanctioned and availment figures recorded an improvement of Rs. 1.65 crores and Rs. 1.51 crores respectively over the figures of the previous year. Loans to farmers through the Primary Co-operative Credit Societies increased to Rs. 1.19 crores in limits and Rs. 0.49 crore in balances outstanding at the end of 1971 as against Rs. 0.98 crore and Rs. 0.36 crore respectively at the end of 1970. The number of farmers benefited by such finance was 8,854 as against 3,309 in the previous year.

During the year, the Bank devised a Scheme involving an outlay of Rs. 18 lakhs to provide term loans to small cultivators in 35 villages located in the district of Hooghly (West Bengal) for sinking 350 Shallow Tube Wells and installation of Pump Sets. The Bank also worked out a Scheme involving an outlay of about Rs. 15 lakhs for providing loans to about 125 small farmers for cultivation of Mandarine Oranges at Mohapa village in Nagpur district. More such Schemes to suit the requirements of the various regions, particularly the States comprising the Eastern Region are being worked out.

The Bank took active steps to implement the recommendations of the Committee constituted by the Reserve Bank of India to review the special credit Schemes of banks with particular reference to their employment potential. The Bank is associated with a pilot project started by a Committee of businessmen, bankers and social workers in an effort to work out a way in which the unemployment problem in Calcutta may be mitigated. The main objective of the project is to foster and promote the idea of self-employment among the unemployed educated youth. Our Bank has financed some of the self-employment projects sponsored by this Committee. A novel experiment was made during the Puja festival in Calcutta in October 1971. Pavement Hawkers, some of whom were educated unemployed, were given financial help to set up stalls for sale of garments and other articles usually purchased during the Puja season. About 300 hawkers availed of bank finance aggregating about Rs. 1 lakh. The experience with regard to recovery of such advances has not been unsatisfactory. It is proposed to extend such facilities on a larger scale during the current year and collaborate with any scheme the Government of West Bengal and the Municipal Corporation might initiate for resettling the evicted Pavement Hawkers in designated areas.

During the year, the Bank contributed a sum of Rs. 12.50 lakhs to the Share Capital of the Industrial Reconstruction Corporation of India Ltd., which was established in April 1971 and is at present concentrating its efforts on the rehabilitation of Sick units in West Bengal. The Bank has helped in the reopening of four such Sick units in Calcutta by extending additional credit facilities under the Schemes approved by the Industrial Reconstruction Corporation of India Ltd. This has enabled rehabilitation of about 4,000 workers who became unemployed on account of the closure of these units.

BRANCHES

During 1971, 62 new branches were opened as against 70 branches in 1970 as shown in Table B below. Of these, as many as 35 were in rural and semi-urban centres. Out of 62 branches opened during the year, 23 were opened in the Eastern Region. The pace of opening of branches was slowed down during the third and fourth quarters of 1971, largely due to the inadequacy of trained man-power resources. This constraint on the opening of new branches is being sought to be removed by taking effective and urgent steps for man-power development.

The total number of branches of the Bank in India at the end of 1971 was 498, out of which 142 were located in rural centres, 161 were in semi-urban centres and the rest in urban centres and metropolitan cities. The number of branches in foreign countries remained unchanged at six.

It is proposed to open about 130 branches during 1972. Of these, 95 will be located in rural and semi-urban centres and 35 in urban centres and metropolitan cities. Emphasis is being laid on opening branches in the States in Eastern Region and the Lead Districts in the States of Himachal Pradesh, Rajasthan and Punjab.

LEAD DISTRICTS

The Bank has been allotted 23 districts under the 'Lead Bank' Scheme out of which 13 are in the States of Eastern Region, and 10 are in the three States of Northern Region. For the purpose of identifying growth centres for opening new branches and for assessing the economic activities in the districts, impressionistic surveys were undertaken for all the lead districts. The survey reports for all the 23 districts have since been completed and circulated amongst the bankers so that new offices can be opened in the identified growth centres. Out of the 130 branches proposed to be opened by the Bank in 1972, 57 branches will be in these growth centres.

A special study of Dhenkanal District in Orissa has recently been conducted in collaboration with the Agricultural Finance Corporation Ltd., for formulating special Schemes for economic development with a view to improving the living standards of this backward district. The Bank has undertaken a special study of the Lead Districts for bringing out the relationship between incomes and savings and to evaluate the saving prospects. This study is being undertaken to devise

special Schemes suited for different classes of the population, particularly in rural areas, for canalising their savings into the banking sector. It is hoped that during the coming year the incentive scheme referred to above and the special studies being made would help in augmenting substantially the deposit resources of the Bank.

WORKING RESULTS

The working results of the Bank for the year have been satisfactory. The gross income, after making usual and necessary provisions, showed a rise of Rs. 4.99 crores as compared to the rise of Rs. 4.13 crores in the previous year. On the Expenditure side, Interest paid on Deposits and Borrowings increased by Rs. 2.85 crores (Rs. 1.82 crores in the previous year). The rise in Establishment expenses was Rs. 1.36 crores as against Rs. 1.59 crores in the previous year. The expenditure on other accounts also increased by Rs. 0.40 crore as compared to Rs. 0.20 crore in the previous year's increase. The Net Profit of the Bank was higher by Rs. 0.38 crore at Rs. 1.80 crores. After transferring a sum of Rs. 43.25 lakhs to the Reserve Fund and providing Rs. 81.50 lakhs for Bonus to staff and setting aside a sum of Rs. 3.10 lakhs for donations, the balance of Rs. 52.60 lakhs has been transferred to the Central Government in terms of Section 10(7) of the Banking Companies (Acquisition and Transfer of Undertakings) Act, 1970. The amount transferred to the Central Government works out to 6.3 per cent on the compensation paid by the Government.

REORGANISATION OF ADMINISTRATIVE AND OPERATIONAL SET-UP OF THE BANK

By a notification dated the 1st September 1971, the Central Government appointed Shri V. R. Desai, Deputy General Manager of the Bank, as Custodian vice Shri R. B. Shah. Shri Desai was also appointed with effect from the same date as a member of the First Board of Directors of the Bank constituted by the Government of India by its notification dated the 18th July 1970.

In the last annual report it was indicated that the Board of Directors had taken on hand the reorganisation of the Bank's administrative and organisational set-up in the context of the growing network of Branches and the widening range of functions and services. The Scheme of reorganisation, which takes into account the need for functional, specialisation, decentralisation of administration and personnel development, was finalised in the first week of February 1972 and was put into operation from 1st March 1972. Under the Scheme, the Head Office set-up has been reorganised on a functional basis with three divisions *viz.*, Administration and Accounts, Banking Operations and Development and Planning, each under the charge of a Deputy General Manager. The branches of the Bank have been grouped into 15 Divisions and they have been placed under the charge of Divisional Managers. These Divisions have been further re-grouped according to the regions into six Zones and placed under the charge of Assistant General Managers.

The Bank, being Calcutta-based, has a special responsibility cast on it for the development of the Eastern Region comprising the States of West Bengal, Orissa, Bihar, Assam, Meghalaya, Tripura, Manipur, Mizoram and Nagaland which are all at present underdeveloped. This region has, therefore, been divided into two and each has been placed under the control of a senior officer of the rank of Assistant General Manager with headquarters in Calcutta. Arrangements are well in hand for filling up the posts at the Head Office requiring specialised knowledge and experience of handling important functions like drawing up of technically feasible and viable Schemes of industrial and agricultural development to suit the requirements of various regions. The Zonal and Divisional offices are also being manned with adequately trained personnel to implement such Schemes and for disposal of credit proposals promptly, particularly those coming from priority sectors.

Facilities for training of newly recruited clerks and probationary officers in banking procedure and practices are being augmented by starting additional training centres and enlarging the capacity at the existing centres. It is also proposed to have roving instructors to visit branches in each State, particularly the new branches established in the Eastern Region for the purpose of imparting training to all the staff at such branches bearing in mind the type of business available at those centres.

The Directors would like to thank the officers and other members of the staff for their continued co-operation and sincere and devoted service to the Institution.

For and on behalf of the Board of Directors,
V. R. DESAI
Custodian

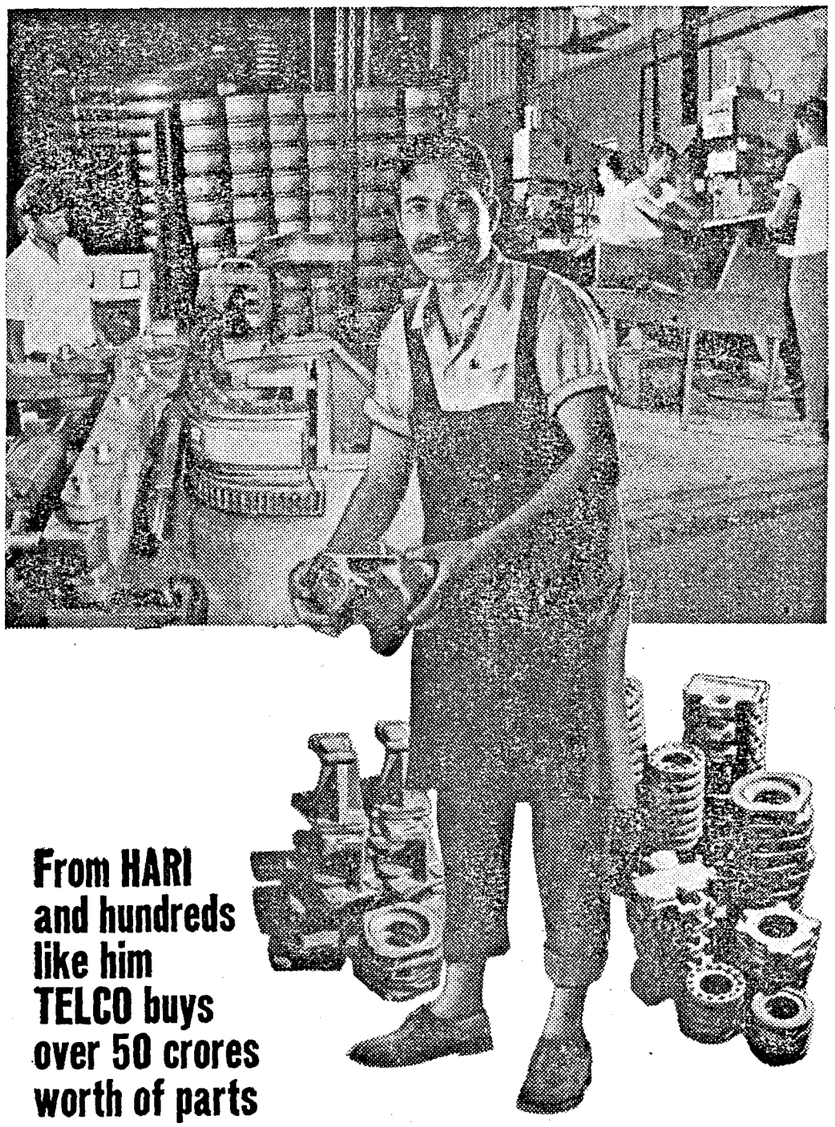
A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.



There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

May 27, 1972 Regd No MH — 1393

From HARI and hundreds like him TELCO buys over 50 crores worth of parts

The indigenous content of Telco products is well over 98%. And for their materials and parts Telco depends upon hundreds of small workshops and ancillary industries all over the country. In the early years there were few ancillaries but with Telco's assistance and know-how and in some cases even financial help, a very large number of units of varying sizes, both big and small, scattered throughout the country, are now producing high quality materials for Telco.

Telco products are being exported in ever increasing numbers and this has also paved the way for the export of indigenous ancillary products made by people like Hari.
The more vehicles Telco produces the more orders there will be for Hari and more opportunities for ancillary industries. And so the cycle goes on bringing wealth and prosperity to people throughout the country.

Playing to the Tune

THE Planning Commission's "Towards an Approach to the Fifth Plan", which was duly approved by the National Development Council this week, suggests that the Fifth Plan will virtually consist of two separate parts, the growth part and the anti-poverty part, with little connection between the two. It is explicitly stated that "these [the employment-generating and social welfare] programmes, while they are very important from the point of view of social justice, would nevertheless be a comparatively small part of the total Plan". The larger—growth — part would be concerned with ensuring "adequate development of agriculture, industry and transport and communications". About this part of the Plan the 'Approach' paper has practically nothing to say, from which it might be legitimately inferred that no major innovations or changes are proposed in regard to it. Except for two brief sections on 'self-reliance' and 'outlays and resource mobilisation', the rest of the paper is devoted to what are termed the 'intensive-employment programme' and the 'basic minimum needs programme' which together are to constitute the anti-poverty part of the Plan. Evidently, then, it is here that the Planning Commission sees the Fifth Plan as making a break with the past.

However, none of the specific programmes mentioned is really new. Thus the employment-oriented programmes are minor irrigation, soil conservation, area development, dairying and animal husbandry, forestry, fisheries, warehousing and marketing, small-scale industries, roads and special programmes for small and marginal farmers, etc. Similarly, the basic minimum needs programmes are elementary education, public health and family planning, rural water supply, home-sites for landless labour, rural roads, rural electrification and slum clearance and improvement in the larger towns. All these heads of development are to be found in the earlier plans. Wherein lies the innovation, then? Simply, in the very much larger outlays proposed for these programmes. What the Planning Commission has done is to propose a level of public sector outlay in the Fifth Plan which is high enough to allow for impressively large spending on the employment programme and the basic minimum needs programme and yet leave enough resources to finance *"adequate* development of agriculture, industry, transport and communications" (italics ours). For the present, thus, the newness of the approach to the Fifth Plan is entirely a matter of the assumption about the feasible level of public sector outlay.

This is acknowledged fairly early in the Planning Commission's paper. In the earlier plans, "the assumed conflict between growth and social justice" rested on the view that whatever surpluses could be mobilised were needed for "investments primarily directed at raising the future rate of growth". Now the situation was different. According to the Commission, "the economy now has reached a stage where larger availability of resources makes it possible to launch a direct attack on unemployment, underemployment and poverty, and also assure adequate growth". This is the crucial premise of the approach to the Fifth Plan. And so far it has been merely asserted, not established. It is only when the details of the growth part of the Plan become available that it will be possible to judge what is sought to be given up in terms of, say, investment in steel or machine-building or power generation to make possible the larger outlay on the Plan's anti-poverty part and what the implications of this would be in terms of growth of employment, income and consumption in future periods of time. On the face of it, after the patchy growth experience of the last nearly a decade, the Commission's assertion that suddenly the economy now finds itself in the happy position of being able to "launch a direct attack on poverty" and also "assure adequate growth" must be treated with scepticism.

Unfortunately for the Planning Commission, some of its other assertions in the 'Approach' paper are not exactly calculated to lend credibility to what it has to say. Take, for instance, the section on 'self-reliance'. The Commission is jubilant that the figures of net foreign aid, both including and excluding food aid, in 1971-72 were less than half the corresponding figures for 1965-66. And so, it claims, "with continued restriction of imports and promotion of exports, it will be possible to do even better than the Fourth Plan objective of reducing net aid in 1973-74 to half the level in 1965-66". There is not a sentence, not even a word, to suggest that the Commission is even faintly aware that this alleged progress towards self-reliance has been made possible entirely by the fall in the rate of investment and the virtual stagnation of industrial production.

In its Mid-Term Appraisal of the Fourth Plan, the Planning Commission itself had come to the conclusion that the Fourth Plan's requirements of net aid would be some Rs 470 crores higher than had been estimated at the time of

the formulation of the Plan. But now, hardly six months later, it takes such a rosy view of the achievement on the self-reliance front that it enthusiastically sketches the prospect of not merely reducing net aid to zero by the end of the Fifth Plan but of "elimination of gross aid as well"!

Indeed, if the 'Approach' paper has any worth at all, it is in assuring the reader that the Planning Commission has its heart where the Congress party wants it to be. But is that all that one has a right to expect of the Commission?

Joint Sector

New Dimension?

AFTER promoting a wide range of industries in the public sector, the government abandoned the 'commanding heights' policy in favour of the joint sector approach. Partly because it offered a respite from the predatory public sector, the joint sector became the rage. But apparently this is no longer true. Only recently Duncan Brothers, the Goenka house controlling jute mills, tea gardens and money spinners like Phillips Carbon Black, has offered to sell out its holdings in Balmer Lawrie, a former managing agency house with diverse interests, to Indo Burma Petroleum (IBP), a subsidiary of the government-owned Indian Oil Corporation.

Balmer Lawrie's equity of Rs 1.44 crores is held as follows: IBP 31 per cent, Duncan 22 per cent and Alex Lawrie, controlled by Duncan, 28 per cent. The balance is held by the public. Now, though the Goenkas control 50 per cent of Balmer Lawrie's equity, well-timed reports have recently appeared in the Press that dual control of the company has hampered its growth. Why precisely IBP participation in the management of Balmer Lawrie should have interfered with its growth remains unclear. In fact, Balmer Lawrie gets engineering orders from IOC because of IBP's intrest in it. But evidently the Goenkas have decided in the public interest — and their stake in the public interest is legendary in Calcutta — that dyarchy must end in Balmer Lawrie.

That Balmer Lawrie is in bad shape is clear from the fact that the Rs 100 shares of the company, which was priced above Rs 200 only a few years ago, are now quoted around Rs 94. Balmer Lawrie is evidently a sinking ship, though it does not follow that the dual control of the company or the presence of IBP directors on the board is to be blamed for this. But given the present state of the company, if IBP is to buy up Goenkas' holding in it, the price would have to bear some relationship to the market price of the shares. In this context, the reason for the price of the shares picking up from less than Rs 70 only two months ago to the present Rs 94 is perhaps too obvious to call for comment. To press home their offer, the Goenkas while proposing to sell their holdings to IBP have alternatively offered to buy out IBP's holdings in the company at a price higher than that at which they are prepared to sell their shares of IBP. Neither the Goenkas' buying and selling prices nor the difference between the two are known.

According to Dalal Street sources, the Goenkas acquired a large slice of their Balmer Lawrie holdings at a price in the range of Rs 125 to to Rs 175. This was prior to 1970 when IOC bought IBP from Steel Brothers. It is clear that in Balmer Lawrie the Goenkas struck a bad bargain. But this is the least of the reasons why they, alert to the public interest as ever, want to bale out of Balmer Lawrie. The proceeds of the proposed sale to IBP would be invested in establishing new industries in West Bengal! Now, IDBI, IFCI, IRCI and a host of other financial institutions are waiting to promote industries in West Bengal and public spirited promoters like the Goenkas could surely get public funds for investment in West Bengal and use their own funds to better purpose! Lest scepticism on this score gain currency, the Goenkas have announced that their negotiations with the Wadias over the take-over of Bombay Dyeing have broken down.

According to market circles, a scion of the Wadia family did oppose the sale of the prestigious profit-making textile company. But what is more likely to have held up the deal is that the major holders of Bombay Dyeing shares, or rather the shares of Bombay Dyeing's controlling company, could not agree to the negotiations. The majority of the shares of Bombay Dyeing are held by Nowrosjee Wadia and Sons. Though the Wadia family holds a large chunk in Nowrosjee Wadia, it is known that Shapoorji Pallonji and the Gazdar family together account for about 50 per cent of the company's shares. Whether negotiations for the sale of Bombay Dyeing to the Goenkas have broken down irretrievably is, however, not known. Of course, it needs to be added that purchase of Bombay Dyeing by the Goenkas is not tied up only with the negotiations with IBP over Balmer Lawrie. A part of the proceeds may come from the sale of a jute company to the Birlas. And to this has to be added the group's sizeable foreign exchange earnings.

Whatever the Goenkas' interest in selling Balmer Lawrie to IBP, with 31 per cent control IBP already has sufficient say in Balmer Lawrie's affairs. This is clear from the distaste shown by the Goenkas for dyarchy. Why then should IBP buy out the Goenkas? Besides, is not dyarchy the whole point of the joint sector idea, which is being fostered to reform the private sector and promote professional management? And yet IBP (that is, IOC) is said to have decided "as a matter of government policy" to buy the Goenkas' shares in Balmer Lawrie.

It is pertinent to ask why the public sector should buy out big houses' holdings in companies which they are, for one reason or another, anxious to dispose of. At this rate, the big houses could, theoretically speaking, sell out their interest in selected companies to financial institutions like the LIC and the UTI as well as public sector companies like IOC and in turn buy from them shares of other preferred companies to acquire or consolidate their control over the latter. Thus Indian Iron shares could be conveniently sold to HSL and the realisations used to bolster the finances of, say, a publishing company. In this pattern of exchange, the joint sector concept would acquire a new dimension, with the spheres of influence of the public sector and the big houses clearly demarcated by mutual arrangement.

Congress Party

Jantar Mantar

THE most enduring outcome of the All-India Congress Committee session this week may well turn out to be the decision to put up a new building in the capital to house the AICC. In typical Congress fashion, the decision was the result of a 'stray thought' of an AICC member. The new party president, Shankar Dayal Sharma, promptly issued an appeal for contributions to a building fund and someone else helpfully supplied a figure of Rs 1 crore as the likely cost of the building.

It is indeed a tribute to how well party members and leaders understand the way things work in the Congress today that in no time they had decided to name the new building 'Indira Bhavan' and to lay its foundation stone on November 19 which — as we are all expected to know by now — is the Prime Minister's birthday. This was nothing short of a masterstroke of strategy. For one thing, it effectively prevented any discordant voices from being raised questioning the propriety of the *garibi hatao* party interrupting its impassioned debates on the need to put an end to conspicuous consumption and high living to casually vote itself a multi-million rupee party headquarters. For another, it ensured the success of the drive for contributions.

In fact, in this latter respect the achievement was truly remarkable. According to newspaper reports, within an hour of the party president's appeal for funds Rs 37 lakhs had been pledged for Indira Bhavan. The most outstanding congregation of well-heeled plutocrats in the country that one can think of occurs perhaps at the annual sessions of the Federation of Indian Chambers of Commerce and Industry. Yet it is doubtful that the response at one of these sessions to a similar appeal by the FICCI president would have been either as quick or as munificent as it was at the AICC session attended by, to paraphrase the Union Minister for Steel, ordinary party workers.

However, for the *piece de resistance* one has to thank the spokesman of the Tamil Nadu Pradesh Congress Committee who declared that the Tamil Nadu unit of the party would contribute Rs 1 lakh to the building fund — *even though the party was not in power in the state*! The implications are obvious enough.

Joint Ventures

Murky Cost-Benefit

THE Estimates Committee's report on the working of the Ministry of Foreign Trade provides some interesting information about Indian joint ventures in other countries. Though many important details such as the amount and proportion of Indian equity and the production capacity of the joint ventures are not given, the importance of the report lies in being the first official source of information on the subject.

The study on the same subject by the Federation of Indian Chambers of Commerce and Industry released some months ago was a disappointing performance and did not achieve the FICCI's purpose in sponsoring it. The Minister of Industrial Development had charged that Indian industrialists participating in joint ventures abroad were not remitting dividends, royalties and technical fees earned by them to India and the FICCI study was aimed at refuting this criticism. Unfortunately, the study not only did not touch upon the issue of malpractices involving foreign exchange, it could give details of only some half a dozen joint ventures which had remitted their earnings to India. It is likely that the new group of office-bearers of the FICCI, who are known to be keen to improve the 'image' of the business community, were not able to persuade the Indian partners in the majority of the joint ventures to co-operate in the task of refuting the charges levelled against them. This was perhaps inevitable. What is more difficult to explain, however, is the complete absence of any reference to the allegation made by the Minister of Industrial Development in the Estimate Committee's report. Normally one would expect that a controversial question such as whether Indian parties in joint ventures abroad remit back to India earnings or divert them into unauthorised channels would attract the close attention of Members of Parliament. Why then the silence?

According to the report, a major consideration in government approving joint ventures abroad is the part such ventures play in promoting exports of machinery, components and raw materials. Since export of capital on a large scale has necessarily to be ruled out at this stage, the government insists that Indian participation in these ventures should be in the form of supply of machinery and equipment and technical knowhow. Some of the ventures would continue to help in export promotion by meeting part of their subsequent requirements of components or raw materials from India.

Upto October 1, 1971 the government had approved 126 industrial joint ventures of which 37 had been abandoned and 61 were at various stages of implementation. Of the 28 joint ventures that had gone into production, 14 had started production prior to 1969 and the other 14 had started production after that year. The Indian parties had so far invested about Rs 14.5 crores in the form of equity capital. Sales of components and other materials to these ventures from India for cash payment amounted to Rs 3.7 crores and Rs 1 crore had been remitted to India as dividends and other earnings. Remittances on account of technical knowhow, royalty and managerial fees had amounted to Rs 57 lakhs. The foreign exchange receipts obtained from the joint ventures are for the first time made available unit by unit in the report (Appendix XIV, pp 312-27).

Small Car

Not for the Gander

WHETHER on or off, the small car (once called the people's car) project is apparently destined to be a *cause celebre* in Indian planning. For long years it was the touchstone of the Planning Commission's commitment to priorities in investment. More recently the Commission was persuaded to relax its vigilance and the government decided on manufacture of small cars in both the public and the private sectors. Two units have been approved in the private sector. For the public sector, the government invited proposals from foreign manufacturers and, after reportedly elaborate tests, selected the models proposed by Fiat of Italy and Renault of France. Subsequently the government underwent another change of heart, deciding this time that from the standpoint of social priorities there was after all no case for manufacture of small cars in the public sector.

Much has been made of the latest decision as reflecting the government's new economics, *a la* Mahbub Ul Haq. The small car project has been described as the first 'casualty' of the alleged emphasis in government policy on production of mass consumption goods instead of luxury items. It has been suggested that in place of the small car project the government would permit increased capacity for the manufacture of buses and scooters which would benefit a larger number of people.

This is all very admirable, but there is one aspect of the matter which seems to have been overlooked. If manufacture of small cars is not to be taken up on the ground that it is the government's policy not to permit production of articles of luxury consumption, then this consideration should apply to both the public and the private sectors. In terms of the waste of investible resources and the deleterious effects on the climate of austerity that the government says it wants to foster, it is immaterial whether small cars are produced in the public or the private sector.

From a narrower viewpoint as well, the private sector small car units are going to depend overwhelmingly on public financial institutions for term finance and on one or the other of the nationalised commercial banks for working funds. Indeed, the rationale of bringing practically the entire network of financial institutions under government control has been that this would make investment decisions in the private sector conform more closely to national priorities. But despite all that, in the government's thinking what is sauce for the gander is not sauce for the goose! It would be 'unsocialistic' to set up a beer-making unit

promised a rational long-term policy which would ensure everything — increased cane supply, increased sugar production, remunerative price for the cane grower, reasonable profit for the industry and a fair price to the consumer. The Minister has at the same time hinted at a higher minimum price for sugarcane — to be maintained at least for three years — so as to prevent diversion of area under cane to other cash crops. This means that the consumer would have to pay a higher price next season, irrespective of whether sugar is controlled or free.

The Minister of State, Sher Singh, was criticised in the Lok Sabha for allowing the sugar industry to make "fabulous profits". When a member put a supplementary to a question the Minister pleaded for notice, but the Deputy Speaker pulled him up and asked him "to do homework better and come prepared". The way the Minister defended the government is worth quoting. Some of the sugar factories, he conceded, had made substantial profits. "Profits of sugar factories were dependent on cost of production of sugar which in turn were dependent on cost of cane, recovery of sugar, duration of the season, cost of stores, salary and wages, depreciation, maintenance and repairs, other overheads, return on capital employed and realisation for the sale of sugar... As these factors vary from factory to factory, the cost of production also varies within wide limits." How this peroration satisfied members is a wonder!

Though May is about to end, neither industry nor government has given out statistics of production, offtake and stocks for April. According to press reports, sugar production by the end of April had crossed 3 mn tonnes. Government estimates are that production in the whole season would be only about 3.10 mn tonnes. For the first nine months of the season, 2.95 mn tonnes of sugar have been released for distribution and stocks at the end of March 1972 were lower by a million tonnes at about 2.2 mn tonnes as compared to the position at the end of March 1971. The current season's production, it is now widely accepted, would fall short of requirements by at least a million tonnes.

Considering this, industry and trade have not behaved too badly. After the budget prices declined from Rs 305 to Rs 280 at the end of April. The government's decision to raise the tariff value by Rs 10 to Rs 200 was responsible for the subsequent spurt in prices to Rs 293. After that, in spite of the hot summer months and the marriage season, prices have receded to Rs 283. This good behaviour may have much to do with the general impression that area under sugarcane has increased by about 30 per cent and that production in 1972-73 would be about 4 mn tonnes. More than that, industry and trade have been told that partial decontrol would soon disappear. Industry which roared "hands off sugar" some months ago is quiet as a mouse. If the promised long-term sugar policy is one of decontrol, industry would get a first class chance to mint money, at least in the first few months of the season. So, if the government can stand up to the pressure for higher cane prices, there is no need for a change in policy till the prospects of higher production in the next season become clearer.

Labour

One More Instrument of Order?

Our Delhi Correspondent writes:

THE Union Labour Ministry's bill on compulsory gratuity has run into difficulties. The bill has gone through the Select Committee stage in Parliament; but certain issues have been raised within the government that have put new hurdles in the way of the Ministry's efforts to get the bill passed.

It has been represented by government departments that in case a strike is declared illegal, the services of the workers involved in such a strike should be treated as broken and that in that event the employees should have no claim to gratuity without their first completing five years of uninterrupted service. The Labour Ministry has been pleading that this will be too harsh a punishment, and that the gratuity should be regarded as a benefit for services already rendered by a worker — not a payment contingent on good behaviour during industrial disputes.

Another suggested 'punishment' is that a worker charged with damaging property should not be paid gratuity. The INTUC leaders are reported to have recommended a compromise on the issue, though the other trade unions are likely to reject such a stipulation outright. It is suggested that in case a worker is proved to have wilfully damaged plant or machinery, a judicially determined amount may be adjusted against gratuity as recovery of the damage done.

The riders on the payment of gratuity have been invoked drawing on the gratuity law first enforced in West Bengal. The Labour Ministry is pleading that these stipulations were made really for West Bengal in face of the special conditions prevailing there at the time and that they should not be made applicable now all over the country — or even in West Bengal where conditions, it is claimed, have very much improved.

Industrial Index

Weights Not to Blame

A Correspondent writes:

THERE is a general feeling, often voiced by government spokesmen while referring to the slow growth of industrial production in the last two years, that the official index of industrial production underestimates the real growth of industrial output because it does not allow for the changing share of different industries in total output. In a brief note to the seminar in New Delhi last month on the Data Base of the Indian Economy, organised by the Indian Econometric Society, T N Srinivasan and A Vaidyanathan bring out the fallacy of this view. The authors show that there is no bias in using the base year shares of different industries so long as the index purports to indicate the growth of total value added by the industries included in the index at constant prices.

This is illustrated by the example of an economy with just two industries, textiles and steel. Value added by textiles is assumed to double annually while value added by steel is taken to quadruple, so that the share of textiles in total value added declines from 0.90 in the base year to 0.69 in the third year. Three alternative indices are then computed with the changing shares of the two industries in value added in the first, second and third years as weights, but each index shows the same growth rate.

Srinivasan and Vaidyanathan point out that certain other problems could arise in the construction of an index of industrial production — among them (i) new industries may have come up since the base year, and (ii) technology in an industry or industries may have changed so that the relationship between gross output and value added is changed. The second problem is described as "very complicated", but the first would necessitate a change in the base to the latest year for which data are available. Not so a change in the share of different industries in aggregate value added in the industrial sector.

Progressively Out of the Woods

Hansavivek

COROMANDEL FERTILISERS' plant operated uniformly well throughout 1971. It also showed good improvement over the preceding year: production was about 247,000 tonnes which is 85 per cent of the rated capacity in terms of plant nutrient — marking an increase of about 12 per cent in total tonnage and 9 per cent in terms of plant nutrient over 1970. Production would have been better but for two breakdowns in the ammonia plant, resulting in a loss of 20 operating days' production, and a fire in ammonia preheater, resulting in a shut-down for 18 days. Power dips have already come down appreciably, and further improvement is expected. The 45-million litre water reservoir, commissioned in September 1971, has considerably reduced threat to operations due to municipal water stoppage. About 245,000 tonnes of the product was sold, showing an increase of about 5 per cent in total tonnage sold over 1970. A sizeable quantity had to be moved by road or rail-cum-road owing to transport difficulties. This led to increase of about Rs 36 lakhs in transport and handling costs. Despite 'steep' increases in cost of raw materials and higher Central levies, Coromandel made higher net profit of Rs 168 lakhs (Rs 55 lakhs) which reduced the accumulated deficit to Rs 2.37 crores. The aggregate estimated development rebate to be set aside out of future profits works out at Rs 10.4 crores. The directors say that they have been advised that, with the approval of financial institutions, they could consider recommendation of a dividend much earlier than the year in which development rebate reserve would have to be created, if adequate surplus was generated after the book loss is wiped out. Meanwhile, technical studies on the proposed expansion are in progress.

NATIONAL ORGANIC CHEMICAL INDUSTRIES LTD has secured an import licence for an additional naphtha cracking furnace of high ethylene yield to meet the anticipated additional market demand, mainly in terms of the ethylene glycol requirements of several new polyester plants due to commence operations shortly. A foreign exchange loan of over Rs one crore has been sanctioned by ICICI for the new furnace and other equipment. This unit is expected to be commissioned by early 1973. Last year, the company's production was affected to some extent in the first half owing to some technical problems, but these were overcome. With increased market demand for the full range of its products, NOCIL has produced good results. Substantial increase in sales of PVC resins resulted in the licensed capacity of 20,000 ton-

nes. The price line for the products was generally maintained — except for some escalations in contracts tied to base material costs following the new excise levies on chlorine and oxygen and increase in prices of naphtha and fuel oil. Prices of certain chemicals were reduced. With better performance, the company is paying a maiden dividend of 5 per cent. As at the year-end, statutory development rebate reserve was estimated at Rs 11.79 crores. Of this, only Rs 15 lakhs have been provided in respect of plant and machinery installed during 1971. Provision for earlier years will be made in subsequent years. Owing to technical problems with the ethylene refrigerations system in February, production of ethylene was reduced for six weeks prior to the planned maintenance shut-down in all plants in March last. Normal opration was resumed in the plants from mid-April. Production capacity of 2-ethyl hexanol in the alcohols plant has been increased to 10,000 tonnes per annum and that of n-butanol reduced to 6,000 tonnes per annum, in view of the expected increase in future demand for the former and surplus position for the latter.

WOOLCOMBERS OF INDIA, based in Calcutta, has purchased 8,000 equity shares of Swan Mills of Bombay and is seeking government approval to acquire further 32,400 shares in that company to make it a subsidiary. A few years ago, Jubilee Mills of Bombay was made a subsidiary by purchasing a substantial shareholding in it. Last year, Woolcombers achieved full production in all sections. The dye plant utilisation also showed further improvement. Both sales and profits were substantially higher compared to the preceding year, and the dividend has been stepped up. The company has exported some quantities of woolgrease to the UK and the US — for the first time from India. The plant for conversion of woolgrease to pharmaceutical quality lanolin is expected to go into production towards the middle of this year. The company's working in the current year too has been satisfactory. The plant capacity is fully booked for both merino and Indian wool for the full year.

MODELLA WOOLLENS has been granted a 'letter of intent' for an additional capacity of one million lb of wool tops and is awaiting licence for import of capital goods. The company has secured an import licence of the value of about Rs 19 lakhs for certain balancing equipment, which would enable it to achieve licensed capacity at its Chandigarh unit. Orders are being placed, and the imported machinery is expected to arrive towards the year-end. Meanwhile, construction of buildings for the installation of balancing equipment and for the expansion has been taken on hand. Production at the Thana plant suffered last year owing to labour unrest. The import licence for rags for the licensing period October 1971 to September 1972 was 'quite inadequate'. Import entitlements have been acquired at a premium of 65-70 per cent. Also, efforts are being made to acquire raw materials available in the country to maintain production. Modella's results for 1971 show substantial improvement over the preceding year. Dividend, stepped up by 2.5 per cent to 12.5 per cent, is covered twofold.

ZUARI AGRO CHEMICALS has had to contend with certain delays in the construction schedule as a result of a strike by the construction workers during March 1971 and lighting and shipping restrictions on account of the war in December last. A two-and-a-half month strike at the works of De Laval of the US resulted in a corresponding delay in the delivery of turbines for the compressors. The corrective measures taken by Toyo Engineering, *viz*, air-lifting the turbines and providing additional Japanese technicians, it is hoped, would enable the company to achieve mechanical completion as originally contemplated. Because of delays in completion of the Goa government's water scheme, water supply will not commence from July next. The deficiency of water during the initial period is proposed to be overcome by drawing water from a reservoir under construction which will impound water from the coming monsoon. The dredging work at the Marmugao harbour for providing facilities for unloading phosphoric acid has also been delayed. The first shipment is now expected to be received in December next, instead of in September as originally planned. This would delay the commencement of compound fertiliser production, but it is stated that all the ammonia produced during the period could be converted into urea and marketed as such. The overall project remains within the original budget estimate, despite increases in cost as a result of higher import duty and other levies by government and the additional expenditure that had to be incurred for accelerating the construction to recover the time lost on account of delays. Zuari stepped up purchase and sale of fertilisers, and its turnover shot up from Rs 89 lakhs to Rs 902 lakhs during 1971. Owing to 'meagre' margin on urea supplied by government, which was totally inadequate to meet the expenses of marketing, the company made a loss of Rs 30 lakhs against Rs 16 lakhs in the previous year.

SHALIMAR PAINTS, a subsidiary of International Paint of the UK, is increasing Indian participation in its capital by offering for subscription 4,11,700 equity shares of Rs 10 each at par. Out of these, 10 per cent shares have been reserved for subscription by whole-time directors and employees of the company, and the balance 90 per cent are being offered to the public. The present issued and paid-up capital is Rs 104 lakhs, entirely in equity shares. Incorporated in 1902, the company was the first large-scale unit to be established in the paint industry in India. The plant, located at Goabaria near Calcutta, has an installed capacity of 14,210 tonnes per annum of paints, varnishes, lacquers and synthetic resins. Shalimar's existing share of the market in the organised sector of the industry is about 13 per cent and it expects to take advantage of the anticipated growth in demand. Efforts are also being made to develop overseas markets; substantial orders have already been secured from the USSR and the Middle-East countries. During 1971, Shalimar's sales amounted to Rs 613 lakhs, profits before tax Rs 31 lakhs, and profits after tax and development rebate Rs 11 lakhs. The directors expect that the current year's pre-tax profits will 'definitely exceed' those for the last year and that they would be able to recommend a dividend of 'not less than 8 per cent' on the enlarged capital. The new equity shares would be eligible for dividend for 6 months for the current year. The entire public issue has been underwritten. The subscription list will open on June 5 and close on June 14 or earlier, but not before June 7. A sum of Rs 5 per share is payable on application and an equal sum on allotment. Sachindra Chaudhuri is the chairman of the company and I M Malkani the managing director. The issue is managed by the Merchant Banking Division of National and Grindlays Bank.

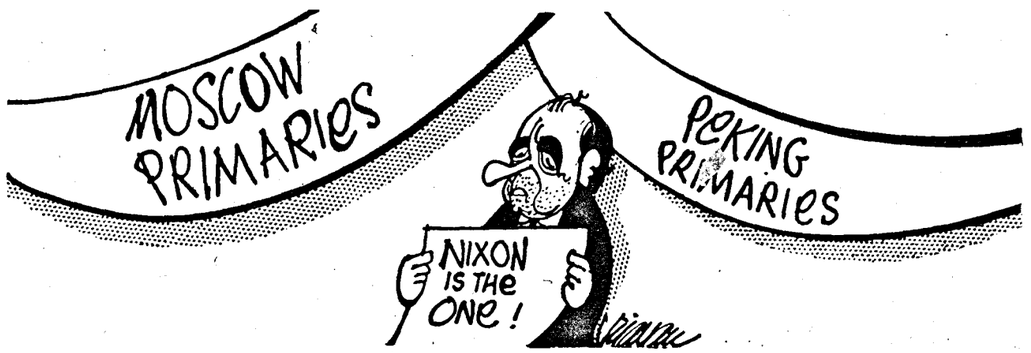
NEW DELHI

Admirable Goals, but No Policy Frame

THE National Development Council met this week, after a prolonged recess, to consider the first tentative approach to the formulation of the Fifth Plan. This might be regarded as an earnest of the leadership's determination to give a push to the development process, which has been beset with uncertainties ever since the end of the Third Plan. But this appears to be about all that can be said for the NDC session. The deliberations of the Council failed altogether to yield any new ideas for the development process in the remaining two years of the Fourth Plan or in the Fifth Plan.

The Planning Commission presented its paper titled "Towards an Approach to the Fifth Plan" to the NDC. There could hardly be any difference of opinion on the objectives outlined in the document. The size of the Fifth Plan is proposed to be double that of the Fourth Plan and sizeable allocations are proposed to be made for what are described as the basic minimum needs programme and the employment programme. This part of the 'approach' was thus readily endorsed by the NDC. The problems arose when more specific issues were posed such as additional resource mobilisation, the quantum and manner of distribution of central assistance and the policy-frame and the institutional structure for the Fifth Plan.

The proposed allocation of Rs 3,000 crores for the minimum needs programme and the Rs 7,000 crores for the employment programme, while seemingly very impressive, failed to carry much conviction. Comparison with the allocations provided in the Fourth Plan for similar programmes might actually show that proportionately they do not constitute any significant advance.



The Chief Ministers, as was to be expected, gave free expression to their reservations about raising their share of resources for the Fifth Plan. Even the Punjab Chief Minister, in spite of the progress that the state has made in agricultural production and the additional incomes that have been generated on that account, bluntly said that he found no scope for raising additional resources by way of taxation. The implication was clear enough — as on the question of procurement prices and land ceilings, the Chief Ministers are still not reconciled to the idea of levying an agricultural income tax or otherwise tapping rural incomes for raising resources for development.

The question of the quantum of central assistance and the manner of its distribution also remained a matter of contention. While the precise arrangements in this connection to achieve the objective of removing regional disparities have yet to be worked out by the Sixth Finance Commission, to be appointed shortly, and the Planning Commission, the Centre is making a bid to enlarge its power of control and supervision of state plans and deployment of resources, particularly those which flow from the Centre to the states. The Centre appears to be getting ready to use the allocations earmarked for the minimum needs programmes and the employment programmes to enlarge the scope of the Centrally sponsored schemes and Central intervention generally in the formulation and implementation of the state plans. In the context of the enhanced prestige and authority of the Central government this may appear quite feasible politically. But whether it will improve efficiency and encourage local initiative seems very doubtful. By enlarging the sphere of central responsibility and operation in the formulation and implementation of the plan, efficiency might actually suffer.

The essential weakness of the 'approach' outlined by the Planning Commission was best brought out by the Chief Ministers of Kerala and Tamil Nadu at the NDC meeting. They called for structural changes in the industrial sector, including wide ranging nationalisation measures. Though the Planning Minister did speak of change in agricutural property relations and ceiling on urban property, the Planning Commission's paper does not raise any of these policy issues and is content with presenting some tentative figures about the size of the Plan, the sectoral allocation of outlays and resource mobilisation. The result was that the NDC had no policy frame before it and the deliberations consisted of reading out prepared speeches by the Chief Ministers.

State Trading in Jute

The Foreign Trade Minister announced in Parliament recently that raw jute trade would be taken over by the government in a phased manner. This is a logical consequence of the decision to fix minimum support prices for raw

jute on a statutory basis. The Agricultural Prices Commission, which made the recommendation in favour of minimum prices being made statutory, has been also urging the setting up of a suitable agency to arrange the purchases of raw jute in the market so as to make the fixation of support prices effective. The Jute Corporation was accordingly set up last year. The present decision merely enlarges the scope of its operations insofar as it is expected to purchase upto 7 lakh bales of raw jute between July and September which is the period of heavy post-harvest market arrivals and also the time when prices are manipulated by the traders to the disadvantage of the grower. It is hoped that in the next two years, the Jute Corporation would be able to exercise a dominant influence on the raw jute trade, eliminating to a great extent the trading interests and the tiers of intermediaries which have been responsible for the wide fluctuations in prices and supplies of raw jute over the years. Since it will help to stabilise prices and supplies the decision to take over raw jute trade will benefit not only the jute grower but also the jute industry.

The government has sought to present the take-over move as part of the emerging arrangements for regulating the prices and supplies of the principal agricultural raw materials for the processing industries. It is now recognised that an attempt should be made to establish a structure of relative prices for agricultural commodities through a system of statutory support prices and trading through public sector agencies. The same system would apply to foodgrains. This will help protect the interests of growers, eliminate trading interests and intermediaries who play no role in the production process, cut trading margins and ensure supplies on a stable basis. Jute and cotton have understandably been the first to be covered by this policy. But it is proposed to be extended.

NORTH

Search for a 'Democratic' Decision

SINCE May 17, when the Punjab Chief Minister Zail Singh staged another *volte face* by announcing the postponement of the controversial Bills on urban and rural land ceilings, spokesmen of the vested interests have been unusually active. The consequent confusion does no credit to any party. Zail Singh is being subjected to pressure from both the landlord lobby, which seeks further liberalisation of the ceilings, and the radical Congressmen, who depict the 'watered-down' Bills as a betrayal of the party's socialist professions.

In the circumstances, a decision from the Union Government alone would help Zail Singh out of the dilemma. This is now eagerly awaited. The Punjab measures have, after all, to be fitted into an all-India pattern. Indira Gandhi informed an MP from Punjab last week that she was personally looking into the allegations against the state ministry on the ceilings question. Her centrist stand, together with her explicit warning to the ultra-radicals, indicate a convenient climbdown. The search is on now for a 'democratic' decision. Already, fear of ministerial instability as a result of the controversy seems to have gripped Zail Singh's mind—though there is no immediate danger to his leadership of the party. A large number of Congress legislators, however, do regard the 10-to-18 acre ceiling as too low for a state which ushered in the Green Revolution and is the nation's granary.

Despite their internal squabbles, the Akalis are out to exploit the opportunity offered them by the 'revolutionary' land reforms. Dilution of Congress policies may also help the Akalis politically. They bank on the support, tacit if not express, of the majority of Akali as well as Congress MLAs who are landowners and hence hostile to the lowering of ceilings. Several Congressmen are, after all, former Akalis with large holdings. The Jan Sangh, too, intends to capitalise on the issue. Describing the Bills as "a drama and a deception", it is planning a "mass agitation" in August. The Jats, who have a substantial representation in the legislature, can also be relied upon to support any move designed to maintain the *status quo*.

*

Both Punjab and Haryana are now confronted with the problems of foodgrain plenty. The bumper harvest was quite expected; what has caused some dislocation, however, is the sudden, unprecedented market arrival of freshly harvested wheat. Thanks to mechanical threshers, the farm operations have been speedy and efficient. The result has been a glut of the grain in all the important markets. On May 22, a new record of daily arrivals was set up with 1.53 lakh tonnes of wheat brought to the markets—against the previous record of 1.03 lakh tonnes, a year ago. Since the cost of storing foodgrains is mounting, the spell of hot, dry weather which has facilitated the transport of wheat to the markets has come as a boon to the farmers.

The procurement operations have been in full swing in both Punjab and Haryana, and this region's target is expected to be exceeded by about 5 lakh tonnes. Punjab may yield a surplus of 37 lakh tonnes and Haryana of 12 lakh tonnes. The stocks on the government's hands are, indeed, so large that, with the bins overflowing, school buildings are being used to store the grain. To the students' relief, the summer vacation has been extended by a week because of the surpluses.

*

Seldom functioning in a satisfactory way, the four co-operative sugar mills in Punjab are now facing a major crisis. Their accumulated losses seem to underscore that the experiment is a failure. The accumulated losses are Rs 232 lakhs, against the paid-up capital of Rs 235 lakhs. The Bill at Nawanshahar, for instance, has not even been able to repay the outstanding portion (Rs 23 lakhs) of the loan it took from a co-operative bank. Predictably, an official committee has been appointed to save the mills from collapse.

*

With Rajasthan MLAs accusing the Himachal Pradesh Government of blackmail, the controversy over the resettlement of the people displaced by the Pong Dam has got sharpened. Seeking shelter behind a letter sent in 1960 by Kairon, then Chief Minister of Punjab, Rajasthan contends that the number of families affected by the submersion of their lands as a result of the dam is only 9,400 — not 20,000 as claimed by the Himachal Pradesh Government. The wide difference in estimates, and hence in the amount of compensation to be paid to the displaced families — which has gone up from Rs 6.71 crores in 1960 to Rs 45 crores — remains unresolved. With thousands of people rendered homeless by the project (the main benefits of which will go to Rajasthan) the Himachal Pradesh Government finds itself in a difficult position. Failure to rehabilitate the uprooted according to various promises would embarrass the Government. Himachal authorities have declared all persons mentioned in joint 'khatas' (records) as 'individual oustees' entitled to land. Rajasthan argues that, if this basis is accepted, a group of persons losing 22 bighas of land in HP would be entitled to 475 bighas in the Rajasthan Canal area. Inevitably, Indira Gandhi's intervention has been sought in this matter too.

Approach to the Fifth Plan

THE Planning Commission's paper "Towards an Approach to the Fifth Plan", which was the main text for discussion at this week's meeting of the National Development Council, aims at the first systematic official formulation of the so-called new thinking on problems of planning and development. The Fifth Plan, according to the document, would not only be twice as large as the Fourth Plan in terms of the public sector outlay but, much more important, it would be qualitatively different from any of the earlier Plans in terms of its objectives, priorities and strategy.

The earlier Five-Year Plans, the paper says, assumed that a fast rate of growth of national income would by itself create more and fuller employment and produce higher living standards for the poor. It was also assumed that the scope of redistributive policies for reduction of disparities in income and wealth was severely limited.

The Poverty Line

The experience of economic development in the last two decades, according to the paper, had been that while the proportion of the poor, defined as those living below a basic minimum standard of consumption, had come down slightly, the absolute number of people below the poverty line today was just as large as it was two decades ago. These people living in abject poverty constituted between two-fifths and one-half of the country's population. If the government were to persist with the earlier strategy of relying on growth alone without directly tackling the problems of unemployment and income distribution, the Planning Commission estimates that it might take another 30 to 50 years for the poorer sections of the people to reach the minimum consumption levels.

The implicit assumption of a conflict between growth and social justice in the earlier Plans were based on the premise that whatever surpluses could be mobilised from the richer classes were needed for investments primarily directed at raising the future rate of growth. While there might have been some justification for this view in the initial years of planning, the economy now had reached a stage, the Planning Commission claims, where larger availability of resources made it possible to launched a direct attack on unemployment, underemployment and poverty, and at the same time to assure adequate growth.

The Commission estimates that at 1960-61 prices, private consumption of Rs 20 per capita per mensem would be needed to assure a reasonable minimum level of consumption. In present day prices, these figures would have to be multiplied by a factor of about 1.86. At present over 220 million people were living below this level, though the size of the problem and the absolute numbers of the poor varied from state to state. The main attack, according to the Planning Commission, would have to be on rural poverty since the urban poor were to a large extent an over-flow of the rural poor. A little less than half of the rural poor were landless labour and a little more than half were small and marginal farmers. The two categories overlap since small farmers also worked as agricultural labour.

The vital ingredient in a direct attack on poverty would be the provision of employment opportunities on as large and wide a scale as necessary. However, the generation of employment (with low per capita incomes) by itself would not be enough to provide a minimum level of consumption for the poor unless prices of essential goods such as foodgrains including pulses, edible oils, standard cloth, sugar and cooking fuels were stabilised. Ensuring stable and reasonable prices for these basic elements of consumption must, therefore, be one of the dominant objectives of the Fifth Plan. Price stability could be ensured only if production policies were also oriented to increasing availabilities of these items. The pattern of investment and the composition of output in the Fifth Plan would need to take account of this. At the same time, there would have to be a much more determined restraint than in the past on inessential consumption of the relatively well-to-do classes so that national resources were effectively mobilised for priorities. A consumption policy of this kind would have to include "an approach towards wages, incomes and profits".

However, even with all possible success in creating additional employment and ensuring stability of prices of essential consumption goods, the poor would not be able, with their level of earnings, to buy for themselves all the essential goods and services. The programmes for providing employment and incomes to the poor would, according to the Planning Commission, have to be supplemented by a national plan for the provision of social consumption in the form of education, health, nutrition, drinking water, housing, communications and electricity upto a minimum standard. Programmes for the provision of the means of social consumption would at the same time be important sources of additional employment so that their significance in a strategy of development involving a direct attack on the problem of poverty would be twofold.

Leaving aside the employment generation potential of an expanded programme of social services in the Fifth Plan, employment-intensive heads of development would include, according to the Planning Commission, minor irrigation, soil conservation, area development, dairying and animal husbandry, forestry, fisheries, warehousing and marketing, small-scale industries, including agro-industries, roads and social programmes such as the Small Farmers Development Agencies, Crash Scheme for Rural Employment and the Drought Prone Areas Programme.

In the Fourth Plan the outlay on these heads of development by the Centre and the States (including institutional finance) is estimated to be about Rs 3,600 to Rs 3,900 crores. In the last year of the Plan the outlay on these programmes would be around Rs 1,075 crores. In view of this, the Planning Commission considers it both feasible and necessary to provide for an outlay on these programmes in the Fifth Plan twice as large as that in the Fourth Plan. In addition, a further outlay of Rs 3,000 to Rs 3,500 crores is envisaged by the Planning Commission in the Fifth Plan on the national plan for providing the basic minimum needs in education, public health, nutrition for pre-school children, drinking water supply, rural home-sites rural roads, rural electrification and slum improvement and clearance in the larger towns. These two sets of programmes would thus involve an outlay of the order of Rs 10,500 to Rs 11,500 crores in the Fifth Plan. While these estimates are necessarily tentative, the Planning Commission regards them as indicative of the order of effort that would be needed to make a substantial impact on employment and to ensure progress towards the objective of *garibi hatao*.

Employment Programmes

The objective of maximum possible expansion of employment in the Fifth Plan raised a number of questions. These

are listed by the Planning Commission as:

(i) the maximum possible employment that could be provided in the rural areas in a way that the assets created increased productivity and welfare of the people;

(ii) the maximum employment that could be provided in urban areas in small-scale industries, trade and services;

(iii) the extent to which the present institutional, administrative, technical and financial constraints on the expansion of productive employment could be removed;

(iv) the extent to which the quantum of employment likely to be created would fall short of that needed to bring the poor upto the minimum levels; and

(v) any further measures that would be necessary to this end.

The general programmes for expanding employment opportunities would have to be supplemented by and co-ordinated with specific programmes to tackle the problem of the educated unemployed. Of course, many of the programmes for tackling rural unemployment as well as those for providing the means of social consumption would create employment opportunities for teachers, doctors, paramedical personnel, engineers, veterinarians, agronomists and other educated unemployed. In addition, the Planning Commission claims, programmes for surveys of natural resources and those in the fields of science and technology would substantially increase employment opportunities for the educated.

The expanded programme of employment generation would have to be supplemented by redistributing the means of production in favour of the poor, in part by providing the self-employed with the wherewithal to achieve greater productivity from land and also through a programme of land redistribution and "other transfers". To this end the Planning Commission calls for decisions on land policy as to the nature of the legislation and the process of implementation. Also, the problem of an appropriate balance in the redistribution of available surpluses as between farmers with small holdings and landless labour would have to be faced.

The employment programme for the rural areas would have to be so designed that it would meet the requirements of the small and marginal farmers and the landless labour after allowing for the effect of the land reform measures as finally decided upon. For this purpose, an assessment would have to be made "during the current year" of the impact of the envisaged land reform measures on the problem of rural poverty.

The credit structure would have to be such as would be capable of providing money to the smallest farmer and recovering it from him. Further, in order to expand to the maximum employment opportunities for rural landless labour and to cut down the degree of underemployment from which small and marginal farmers suffer at present, it would be necessary to reorient and integrate various schemes of rural development (such as minor irrigation, social conservation, area development, animal husbandry, forestry, fisheries, roads and certain special programmes like SFDA and MFAL, Crash Scheme of Rural Employment and the Drought Prone Areas Programme) into a comprehensive programme of land consolidation, land and water development, drainage and other infrastructural activities in the rural areas.

Social Welfare Programmes

As a first step to framing programmes of social welfare for the Fifth Plan, the Planning Commission proposes to identify the items of public consumption that need to be included in the list of basic minimum-needs and, after laying down the minimum acceptable norms for them, to work out a reasonable time-phasing for meeting these needs fully. It would also be necessary to work out (i) the order of financial outlays required to fulfil the above commitments, (ii) the financial mechanism to ensure that these outlays constitute a prior charge on the national resources, and (iii) the administrative innovations that would ensure efficient implementation of the programme.

The Planning Commission proposes the following "short and self-evident" list of basic minimum needs:

(i) elementary education for children upto the age of 14;

(ii) minimum public health facilities integrated with family planning and nutrition for children;

(iii) rural water supply;

(iv) home-sites for landless labour;

(v) rural roads;

(vi) rural electrification; and

(vii) slum improvement in the larger towns.

Elementary Education: The constitutional directive is that children upto the age of 14 should be provided with free and compulsory education within a period of 10 years of the commencement of the Constitution. That date was passed in January 1960. The likely enrolment at the end of the Fourth Plan would be 84 per cent in the age-group 6-11 and 40 per cent in the age-group 11-14, with wide regional disparities, particularly among girls. The Planning Commission claims that it should be possible to cover fully boys in the age group 6-11 by 1975. The problem in regard to full enrolment of girls would, however, pose special difficulties. The constraints, according to the Commission, are mostly social and the non-availability of women teachers in adequate numbers. In respect of the age-group 11-14, it is conceded that even by the end of the Fifth Plan it may not be possible to go beyond overall coverage of 50 per cent. The Commission calls for special efforts at accelerated enrolment to achieve the target of 100 per cent coverage in respect of boys in the early years of the Sixth Plan.

The Planning Commission considers a primary school within 1.5 kms and a middle school within 5 kms of each village an adequate geographical norm. At the same time, expenditure would have to be stepped up on items such as free text-books and midday meals. Adequate provision would have to be made for school inspectors and large expenditure would be necessary on the construction of class-rooms which, incidentally, would also provide employment. The Planning Commission calls for detailed state-wise plans, taking into account the conditions in each state covering the manpower, financial and other requirements for the implementation of the programme by the target date.

Public Health: In regard to minimum public health facilities, the Commission considers generalised norms such as improvement in the doctor-population ratio or the bed-population ratio or per capita expenditure on health as inadequate since the availability of health facilities in rural *vis-a-vis* urban areas had continued to be extremely lopsided. The present standard in respect of medical care in rural areas was one public health centre for a block population of 80,000 to 100,000 supported by 8 to 10 sub-centres, each serving a population of 10,000. Accepting this as the minimum, the Fifth Plan programme would consist in filling up deficiencies in construction of buildings, provision of staff, equipment and drugs in a co-ordinated way. Eventually, the coverage of a sub-centre would have to be reduced to a population of 4,000 to 5,000. The emphasis in rural health would have to be on prevention, family planning, nutrition and detection of early morbidity with adequate arrangements for referring serious cases to the tehsil or district hospital.

Such a multi-tier system could not be built on a national scale on the basis of the present expensive system of prolonged medical education. A new approach towards the raising of suitable medical and para-medical cadres for the lower tiers had to be worked out. It was necessary that health education was woven into the general education system. In order to provide an adequate number of doctors for the Fifth Plan programme and as advance preparation for a more intensive coverage later, it would be necessary to consider the revival of the 3-year medical diploma. Indigenous system of medicine would also have to be utilised for the purpose.

The Family Planning programme would need continued emphasis. Apart from the intensification of methods currently adopted, rapid progress would have to be made in integrating family planning with health and nutrition facilities. It was only in this manner that the concept of small families could be promoted on a durable basis among the people.

As part of the minimum needs programme, it would be necessary to take care of pregnant mothers and pre-school children so as to attack the problem of protein malnutrition at its roots. The old and the handicapped who, being unemployed, would not be brought into the mainstream of economic activity would also need to be taken care of. Outlays would have to be enlarged "to the extent feasible" on special programmes for this segment of the population.

Drinking Water: The Planning Commission estimates that in regard to drinking water about 150,000 villages out of a total of 567,000 villages suffered from either scarcity and health hazards or special problems such as salinity, iron and flourides. In addition, there were villages which did not have an adequate supply of drinking water or where the provision of water supply to Harijans and backward class was inadequate. Currently the states spent about Rs 40 crores annually on rural water supply. This provision had been increased by Rs 20 crores in 1972-73. In order to meet this basic minimum need by the end of the Fifth Plan, it might be necessary to step up expenditure to an average of Rs 100 to 120 crores per annum.

Roads and Electricity: So far roads and electricity in rural areas had more or less been conceived of as part of the productive infrastructure. By the end of the Fourth Plan about 40 per cent of the rural population would have electricity, though there would be very wide regional variations. The time had come, according to the Planning Commission, to recognise that roads and electricity contributed to the quality of life. It was necessary to aim at providing all-weather roads by the end of the Fifth Plan to all villages with a minimum population of, say, 1,500 people. Similarly electricity would have to be extended so that by the end the Fifth Plan at least 30-40 per cent of the rural population was covered in all the states. Planning for roads and electricity would have to be on an integrated basis. Village roads had to be properly linked to district roads and plans for rural electrification would have to be on a minimum cost-maximum population coverage basis, consistent with generation and transmission capacities.

Slum Improvement and Clearance: The approach to the problem of slums would have to consist in a mix of slum clearance and redevelopment *and* environmental improvements. Acquisition of land would be necessary for both types of schemes. A beginning had been made in 1972-73 with a Rs 20-crore scheme for slum clearance and re-housing and slum improvement in eleven cities: Calcutta, Bombay, Delhi, Madras, Hyderabad, Bangalore, Ahmedabad, Kanpur, Poona, Lucknow and Nagpur. In respect of the remaining areas, it would be necessary to identify problem cities and devise suitable programmes of urban development for their improvement.

Immediate Programme

In the light of the above, the immediate programme for action has been formulated by the Planning Commission as follows:

(1) States would be asked to prepare detailed district plans for ensuring full enrolment of all children upto age 11 during the Fifth Plan and spell out the expenditure required on teachers, buildings, text-books, midday meals and special incentives for the enrolment of girls. In regard to the age group 11-14, states would be asked to outline the maximum programmes for possible enrolment by the end of the Fifth Plan, the target being to push up the enrolment percentage to a minimum of 50 per cent in all states.

(2) The implications of reviving the 3-year medical diploma course would be examined in detail. States would be asked to undertake detailed planning to provide a primary health centre in each block with the full complement of sub-centres, adequate staff, equipment and drugs by the end of the Fifth Plan.

(3) States would be asked to draw up detailed plans for providing drinking water supply to all villages by the end of the Fifth Plan.

(4) States would be asked to estimate the financial requirements of providing all-weather roads to villages with a population of 1,500 or more. These plans would have to be ranked in order of priority, having regard to population, availability of main roads to which they could be linked and marketing requirements, so that a phased programme of road construction could be formulated.

(5) The backward states would be asked to work out, consistent with generation capacity, an "economical programme" for rural electrification to cover up to 40 per cent of the population.

(6) States would be asked to prepare master plans for slum clearance and improvement in respect of towns with a population of 5 lakhs or more.

(7) Finally, the states are to be asked to "authorise expenditure for technical investigations and preparation of suitable programmes and projects reflecting the new approach".

Both in regard to the intensive employment programme and the basic minimum needs programme, the Planning Commission emphasises the importance of implementation. There was need to avoid delays, leakage and waste. Part of the problem of implementation arose because programmes were not soundly conceived and properly structured. Co-ordination of the various schemes for rural employment and those for the benefit of small and marginal farmers and landless labour would ensure a more effective and fruitful implementation. There would also have to be considerable decentralisation of planning, decision-making and implementation, calling for an effective system of multi-level planning.

Outlay and Resources

As mentioned above, the Planning Commission envisages an outlay of Rs 10,500 to Rs 11,500 crores on the employment-oriented programmes and the programmes for provision of basic minimum needs. These programmes, the Commission adds, "while very important from the point of view of social

justice, would nevertheless be a comparatively small part of the total [Fifth] Plan". In order to ensure adequate development of agriculture, industry, transport and communications to support the above programmes and to safeguard sustained growth in the period beyond 1978-79, the total outlay, in the Fifth Plan period would be around twice that in the Fourth Plan. To firm up the content of the Fifth Plan, the Planning Commission proposes to work out profiles of investment and output in different sectors". But, it says, in order to carry out these exercises in the proper context, it was essential to have a prior consensus about the orientation of the Plan towards the provision of larger employment opportunities and basic minimum needs. To secure such a consensus was evidently the objective of the "Approach to the Fifth Plan" paper and the meeting of the National Development Council.

To finance an outlay of the required order, the Planning Commission estimates that it would be necessary to raise Rs 6,000 to Rs 7,500 crores by way of additional resource mobilisation, Rs 2,500 crores by the states and the balance by the Centre. This would compare with the resource raising effort of about Rs 4,000 crores undertaken in the Fourth Plan. To fulfil the target of resource-mobilisation, the Planning Commission calls for a comprehensive direct tax reform to (i) check evasion and avoidance of all kinds and make the tax system elastic to income growth and (ii) bring agricultural incomes within the tax net. The Commission urges that the last year of the Fourth Plan must be utilised to push through this comprehensive tax reform.

The resource mobilisation effort would have to take into account the need for mopping up surpluses arising from existing wealth. Large unearned incomes accrued in the urban areas from property and from transactions relating to land. The recent constitutional amendments had, according to the Planning Commission, cleared the deck for "an approach oriented to changing property relationships, both in urban and rural areas". Reforms in the tax system would have to take into account the redistributive aspects and ensure that a significant proportion of wealth as well as income arising from wealth was channelled into public resources.

Self-Reliance

Net aid in 1965-66, the last year of the Third Plan, was Rs 701 crores including food aid, and Rs 472 crores excluding food aid. The corresponding figures for 1971-72 are estimated at Rs 328 crores and Rs 202 crores, respectively. With continued restriction of imports and promotion of exports, the Planning Commission claims, it would be possible to do even better than the Fourth Plan objective of reducing net aid in 1973-74 to half the level in 1965-66. To achieve by the end of the Fifth Plan self-reliance in the sense of zero net concessional aid, the magnitude and kind of effort required on the different aspects relevant to the balance of payments would need to be carefully worked out. It would be necessary to examine the policy, organisation and resource mobilisation implications of this objective. It was only on the basis of such a thorough exercise that it would be possible to say whether the zero net aid position would be achieved without too great a cost in terms of growth and, if not, in what ways the investment pattern needed to be adjusted to fulfil the objective. More optimistically, if the exercise were to reveal that with some additional effort it might be possible to improve on the initial criterion of zero net aid, the Planning Commission would explore to what extent and in what fashion the objective itself would be enlarged in the direction of elimination of gross aid as well. In other words, it is suggested that to start with the exercises connected with the Fifth Plan would proceed on the basis of a zero net aid position by 1978-79 with the clear understanding that the implications brought out in the exercise would be reviewed once again before the final operative decisions were taken.

The objective of reducing net aid to zero implied that gross aid would be required only to the extent of repayments of principal and interest. To the extent that debt rescheduling was available, the requirements of gross aid could be reduced. Where debt repayments had to be met from free foreign exchange, debt relief was in fact equivalent to untied aid. For these reasons, the Planning Commission suggests that debt relief should be emphasised more and more as a preferred form of assistance.

Time Schedule

As an appendix to the Approach document the Planning Commission has worked out the following time schedule for the preparation of the Fifth Plan:

30. 9.72: Preparation of an Approach Paper on dimensional hypotheses for the Fifth Plan, the policy and resource (domestic and foreign exchange) implications of alternative rates of growth (macro and sectoral) and of other objectives such as employment, income distribution, regional balance, satisfaction of basic minimum needs, self-reliance.
10.10.72: Consideration of the Approach Paper by the Planning Commission and approval of guidelines for (a) preparation of a Draft Outline of the Fifth Five-Year Plan and (b) size and content of state Plans.
30. 4.73: First version of Draft Outline.
15. 5.73: Consideration of Draft Outline by Planning Commission.
1. 6.73: Consideration of Draft Outline by the National Development Council.
30. 6.73: Publication of final version of Draft Outline after incorporating the views of the National Development Council.
30. 1.74: Preparation of Draft Plan document after discussions with Ministries and states and after bringing the resources estimates upto date.
15. 2.74: Consideration and approval of Draft Fifth Plan by the Commission and by the Cabinet.
28. 2.74: Consideration and approval by the National Development Council.
31. 3.74: Publication of the Fifth Plan.

DAR-ES-SALAAM

Botswana Tries to Break the Ring

A K Essack

PRESIDENTS Kaunda of Zambia and Seretse Khama of Botswana have recently met again. No communique was issued, but there is little doubt that both are very concerned about speeding up the construction of the proposed Botswana-Zambia (Botzam) highway which is to link the two countries. The road is to be built from Francistown in Botswana to Livingstone in Zambia and will be 400 miles long. At the Zambesi river, which marks the border between the two countries, two terminals are to be constructed, one on each bank of the river. Ferry boats designed to carry lorries and heavy cargo are also part of this $ 6 million project. A bush road already exists between Francistown and the Zambian border. The new highway will, however, be an all-weather road.

The road has been visualised by the two governments for some years, but financial and political difficulties have held up the implementation of the project. While visiting Dar-es-Salaam in August, 1970, Botswana's Vice-President Quett Masire said, "Botswana is determined to have a road link, irrespective of other countries' opinions. I am on a trade mission and this is indicative of the desire to open more trade links with Zambia and Africa. The road link will be a much more practical and meaningful exercise..." The *Times of Zambia* commenting editorially, presciently sensed trouble for this project but pointed out that "the road has to be built whether Vorster and his right hand like it or not".

The South African Government, on hearing of this scheme, grew alarmed and tried to change the Botswana Government's mind by adopting a number of tactics. First it tried the gentle approach by attempting to bribe Botswana. It drastically increased custom's union payments to Botswana.

This did not change Botswana's attitude. So, to forestall further developments on the road project, the South African Government alleged that Botswana had no common boundary with Zambia. In fact, Botswana's border with Zambia comprises a 25-yard strip of the Zambesi river and this boundary has never been questioned. Vorster, the South African Prime Minister, is most unlikely to make this an international issue as he does not want to get South Africa involved again on the United Nations stage or at the International Court of Justice at the Hague. The Caprivi Strip, which is part of Namibia (South-West Africa), abuts the Botswana-Zambia boundary. But since the international court has declared the South African occupation of Namibia illegal, any South African claim to the Botswana-Zambia junction based on the the territorial extent of the Caprivi Strip can have no legal basis.

Realising this, Vorster again switched tactics. He wrote a confidential letter to Seretse Khama intimating that he would allow Botswana the use of the Zambesi crossing-point if Botswana formally agreed that the crossing belonged to South Africa. Botswana declined to fall into this trap.

Apart from these political complications, Botswana still has to find firm financial backing for the project. The US Agency for International Development (AID), which had earlier shown an interest in this project, is now dragging its heels. A hundred thousand dollar feasibility report has been completed. So has an initial survey, but probably due to South African opposition the Americans have not yet finally decided to finance the road. Like the South Africans, the Americans do not want Botswana to be freed from South Africa's economic stranglehold. The building of the highway would be a big step in increasing trade with black Africa, thus reducing Botswana's dependence on the minority regimes of southern Africa. The grandiose design of a southern African common market would also become more difficult to carry out. The common market is expected to embrace about 45 million people with South Africa acting as the 'mother country', supplying manufactured goods to countries like Botswana and getting cheap labour and raw materials in return.

At present, Botswana has a largely pastoral economy with cattle-skins and meat products as its principal exports, from which its 600,000 people eke out a meagre living. Like Zambia, it is almost totally surrounded by the white minority regimes of South Africa and Rhodesia and has no outlets to the sea other than those through these two territories. It was Zambia's go-ahead to the TANZAM railway project which encouraged Botswana to think of the BOTZAM road.

This road would be of great value, particularly now that Botswana is on the threshold of a big mining boom. Diamonds, copper and nickel have been discovered in feasible quantities. The Orapa diamond mine is likely to become one of the biggest diamond producers in the world. According to conservative estimates, it will be able to produce large quantities of industrial diamonds for the next 25 years. The Selibe-Pikwe project near Francistown will exploit copper and nickel ore reserves. This project is controlled by Bamangwato Concessions in which the Roan Selection Trust is the principal shareholder. The Botswana Government has a 15 per cent share in the project. Total investment involved is in the region of $ 170 million. What this means for Botswana can only be understood when it is realised that the annual gross national product of Botswana is about $ 60 million. Thus, at present, Botswana's GNP is about one-third that of the investment in this single copper and nickel mining project. There is going to be further investment in building up an infrastructure for the mining projects. Roads, railways, power stations, water supply systems, are all about to be constructed. The World Bank and several countries have decided to give loans to Botswana for these developments.

Botswana realises it is essential that its copper, nickel and diamond exports are never held up by South Africa or Rhodesia. For this reason the completion of the road to Zambia has become an even more urgent necessity.

New Cargo Liner for SCI

THE state-owned Shipping Corporation of India has taken delivery of a cargo vessel of 14,000 DWT. It has been named mv 'State of Meghalaya'. The maiden voyage of the cargo liner will be to Polish ports for lifting bulk urea for discharge at Indian ports. The liner has a high speed of 19.30 knots. It was built by the GDR shipyard, Schiffscommerz. The vessel has been equipped with all modern navigational aids and has MAN engine developing 11,200 BHP.

The acquisition of the vessel forms part of the development plan of the Corporation. The Shipping Corporation thus owns a fleet of 79 ships of a DWT of 1.4 million. The Corporation has also on order 37 ships with a total DWT of 14.48 lakhs with shipyards in India and abroad. By the end of 1975, all the vessels presently on order are likely to be delivered to the Corporation, and its tonnage is then expected to cross the three million DWT mark.

GNP!

Bimal Jalan

IT can only be the intellectual bankruptcy or *ennui* that seems to have gripped the country which explains why a fetchingly written, but rather obvious, essay by Mahbub Ul Haq should have generated the excitement that it has. For the Prime Minister to have quoted it without attribution is certainly noteworthy and one should not begrudge the merriment that people feel at the discomfiture of the mighty, However, it is really extraordinary that learned economists and commentators should see in this event the emergence of a new messiah, or attempt to find the ingredients of "new economics" in the half-baked and half-hearted propositions of a popular article.

The argument over GNP is an example of much ado over a non-issue. No serious economist has argued that you can have a noticeable increase in the standard of living of all the people in poor countries without GNP registering an increase over time. However, it is equally true that while one cannot have development without GNP, one can certainly have GNP without development, Kuwait, one of the richest countries in the world, is an obvious example. From the point of view of planning for development, the real economic issue with respect to GNP, therefore, is not whether to have it or not to have it, but the *time-pattern of growth in GNP.*

Since development of the economy has, to take place over time, there is a choice with respect to measures which would maximise growth in current income *year-by-year* and measures that involve some sacrifice of (potential) current income in order to maximise the *long-run* rate of growth. To illustrate the point with a simple example—a country may thus go in for production of maize, shoes, and artsilk because they have good markets or it can invest the same money in a steel mill which might reduce its dependence on volatile markets abroad and/or increase its long-term productive capacity. Both courses should lead to an increase in GNP, but the growth-pattern of GNP over time would be different. The choice would depend on a number of factors, among them the social discount rate. However, it must be stressed that those who take a longer-term view of development are not necessarily poohpoohing GNP; in fact they would argue that some sacrifice of current income and consumption in favour of long-term development would lead to higher aggregate income over time.

This is the real issue with respect to the growth of GNP, to which neither the GNP-lobby nor the anti-GNP lobby in the current debate has addressed itself. But, one might ask, what about the distribution of current income at any one point of time? Does the anti-GNP lobby not put more emphasis on that? Haq, for example, has argued that "the problem of development must be defined as a selective attack on the worst forms of poverty" and that "if pattern of production (and exports and imports) is geared to satisfying minimum consumption requirements and employ the entire labour force, higher production will itself lead to better distribution". (Incidentally, Haq's article has appeared in various places and is available in three sizes—long, medium, and short. The quotations are from the version appearing in the January issue of *Insight* magazine.) To those of us who despair of the normal processes of development to take care of the poor and the weak, this is a very attractive proposition. But let us examine the point more closely.

Employing the entire labour force to meet the minimum consumption requirements over the period of a decade is easier said than done. Neo-classical growth models notwithstanding, capital is not entirely malleable, and productive capacity for steel cannot be easily transformed into capacity for shirts and *vice versa*. Even if capital and labour were conveniently substitutable along a smooth production function in developing economies, it is still an open question whether spreading capital too thin will not perpetuate the conditions of low productivity and technological backwardness which is the essence of these countries' poverty problem.

Begging the Question

In countries where more than half the people do not have minimum food requirements or minimum standards of housing, where three-fourth of the adult population is illiterate, and where there are only 50 hospital beds per 100,000 population (as against 943 and 926 per 100,000 in centrally planned economies and developed market economies, respectively)—the examples could be multiplied—what does development defined as the "selective attack on worst forms of poverty" mean and involve? It hardly needs to be said that one cannot have more food without irrigation, more hospitals without doctors, more schools without buildings, more buildings without materials, more materials without factories, more factories without machines, and more machines without capital accumulation. This brings us back to the central problem of development—how, in what manner, and in what sequence planned action should be taken in order to increase the productive capacity and technological capability of the economy within the shortest possible time? The problem of endemic poverty cannot be solved without further development of the economy, and there is no point in obfuscating the issue and begging the question by redefining development as "attack on poverty".

There is, of course, something indecent about the extremes of wealth and consumption which exist side by side with widespread squalor in developing countries. Redistribution of current consumption and restructuring of the productive sector geared to that consumption is, therefore, necessary. But can this be brought about by simply redefining the development objective—without inquiring into the current social organisation and property relations that exist in these countries? When some 90 per cent of the manufacturing value-added originates outside the public sector, and some 88 per cent of the total disposable income is in private hands, what means is there for removing the "tyranny of the demand concept"? Would the textile mills switch to production of coarse cloth because minimum levels of consumption have been defined? Or, the farmer produce wheat simply because it is needed by the poor? It is not enough to quote Chinese examples; the question that needs to be faced is whether Chinese or Soviet-type results can be achieved without Chinese or Soviet-type methods and organisation in capitalist societies. It has become fashionable for development economists to ask themselves: "if the Chinese could do it, why can't we?" The answer is simple, if they would look for it.

Along with President Nixon, many of us have discovered China in the year 1972. However, it is a little odd to blame economic theory for the model of development that we adopted. China, Soviet Union and Yugoslavia—the current favourites of disillusioned economists—were all there, and so was "new economics". If some countries have succeeded in generating neither growth nor distribution, the blame is not of economic theory or Harvard advisers, but of the socio-political elite in these countries, which has inherited not only the vice-regal palaces but also the vice-regal modes of thought.

THE FOURTH ESTATE

From the Enemy Camp

Nireekshak

REPORTING war from the enemy camp is the latest breakthrough in the profession. Unthinkable till recently, an American journalist Anthony Lewis of *New York Times* is reporting the Vietnam war from Hanoi. When his first despatch with the Hanoi dateline appeared in the United States, Henry Luce's *Time* commented: "It was a sight not seen for many years in a US newspaper." Somewhat similar was the reaction in this country when *Times of India* reproduced Lewis's despatch on its editorial page, by courtesy of *New York Times*. Many were surprised that it was possible for an American newsman to cover war from a hostile territory.

Self-Imposed Censorship

True, Lewis has Hanoi's permission and guarantee for reasonable safety during his stay in North Vietnam. Yet it is a major breakthrough. Imagine an Indian reporter covering an Indo-Pak war from Islamabad. Even if Islamabad permitted it, not many newspapers in India would be tempted to avail of the opportunity. And in any case, the government of India would be sure to scotch the move at some stage. Self-imposed censorship by newspapers and governments' anxiety to manage the mass media seem to mark the general pattern in our part of the world.

Anthony Lewis's most sensational despatch from Hanoi—which Nireekshak read in *Times of India*—was reporting the North Vietnamese claim that it was clearing mines from the Haiphong harbour entrance and restoring partial ship traffic in the port. The despatch was embarrassing to the US government which lost no time contradicting the story and charging *New York Times* of "acting as a conduit of enemy propaganda" and challenged the right of the American public—in the words of the editor of *New York Times*—"to be informed about what the North Vietnamese are saying". But this did not deter *New York Times* from publishing more despatches from Lewis. The Managing Editor of *New York Times*, A M Rosenthal, in a statement said: "The *Times* will continue to seek and publish pertinent, essential information from every source rather than restrict itself and its readers to official US government statements as Mr Clawson [a Deputy Director of White House Communications] seems to demand." In this instance and also in the case of the Pentagon Papers, *New York Times* has justified the press's claim to be the fourth estate.

Passing the Buck

War apart, newspapermen in this country are prevented from covering peace meets. The incident of the government of India disallowing pressmen from accompanying D P Dhar on his peace mission to Murree and Rawalpindi is still fresh in memory when comes the news that there will be certain restrictions on newsmen covering the Indo-Pak summit later this month. The Press Information Bureau is yet to spell out these restrictions which would be known only a day or two before the summit. It seems that the government wants an undertaking from all newspapermen covering the Indira Gandhi-Bhutto talks that they will not report beyond the official briefing. In that case why allow them to hang round the summit! A handout a day should meet the government's requirement! The government wants to manage the news, but behind the facade of free reporting. In preventing newsmen from travelling to Murree, the blame was put on Pakistan though it was the government of India's own decision. Thanks to *Hindustan Times* and the UNI correspondent, Babu Bhaskar, the government's tactics were exposed.

The editor of *Hindustan Times*, B G Verghese, is the most recent visitor to Pakistan. He is the fourth Indian journalist to visit that country after the December Indo-Pak war. On his return, Verghese has written seven interesting articles in a series called "The Other Side of the Hill". Unlike the other three Indian journalists who had visited Pakistan before him, Verghese did not confine himself to the normal routine of interviewing Bhutto and a few other prominent personalities. He availed of the opportunity to go deep into the mood of Pakistan of today. This is evident from the insights and analysis of his articles which are full of optimism.

Through the Looking Glass

Says Verghese: "It is extraordinary how similar are the hopes and fears of India and Pakistan. To cross the border from one country to the other is literally to walk through the Looking Glass. This is the legacy of prejudice and hate. Yet there is a growing objective realisation that this enmity is irrational and unproductive and that co-operation could bring much contentment and progress on both sides...The subcontinent is a natural geo-political unit and resource region and given trust, trade complementarities can be created where they do not already exist. Pakistan needs ore and steel; India gas. This is only one of a series of mutually profitable exchanges that could be arranged. And interdependence would ensure that both sides play fair in their own self-interest. There is an opportunity today that must be seized to make a beginning towards a lasting peace. There is a completely new situation in Pakistan and on the subcontinent which calls for new thinking. The old stereotypes have been overtaken by events. It is legitimate to proceed with caution. But it would be tragic were history to record that India was unable to rise to the occasion and acted smaller than its size."

President Nixon's visit to Moscow was watched with great interest in this country. The biggest disappointment was the PTI reporter in Moscow. Or were there instructions to him that he should leave the coverage to TASS and Novosty, the Soviet news agencies? It seems that the PTI correspondent did send a few cables, but they were more in the nature of editorial comment rather than factual reporting. So they were killed by the desk. As a result, the important world event was reported in Indian newspapers through the Soviet and Western news agencies.

The US-USSR agreement on the freezing of inter-continental ballistic mis-

siles was perhaps the biggest achievement of Moscow talks. Most newspapers in India welcomed it, but *Patriot*, the pro-Moscow New Delhi daily, had this to say in its editorial: "If his [Nixon's] success in Moscow does not decrease his lust for destruction, what has been achieved there could soon begin to look much less important than it does now." Other papers examined the Soviet-American ABM Treaty more minutely. Said *Statesman*: "A quantitative restriction [on anti-ballistic missiles] will not prevent a qualitative escalation; the existing number of delivery vehicles may be able to carry both bigger and more numerous warheads unless there is a ceiling on payloads and a ban on the development of multiple-warhead missiles."

Hindustan Standard of Calcutta interpreted the treaty differently. According to it, "The agreement does not establish nuclear parity between the two super powers. The edge is clearly in favour of the Soviet Union whose nuclear superiority will not be disturbed by the terms of the Moscow pact. This must have been a bitter pill for Mr Nixon to swallow, for as a Republican hawk he had demanded that his country's objective should be to keep ahead of the USSR in the nuclear arms race. He has waived the claim not only because the responsibilities of office have produced a sobering effect on him, but because his primary aim now is to win a second tenancy of the White House."

Hindustan Times hailed the treaty saying that it is "a major breakthrough in Soviet-US relations" and observed. "The Moscow accord visibly highlights this situation of the super powers' increasingly avoiding mutual confrontation while steadfastly maintaining their respective spheres of influence. Does this mean transition to a new age when the world has been made 'safe' for 'small' wars such as the one in Vietnam in which the US has unloaded more bombs than in all of World War II?"

Most newspapers by now have forgotten those two young Bengali journalists, Deepak Banerjee and Surajit Ghoshal, who at the risk of their lives had entered East Bengal in the early stages of the struggle for Bangladesh and were captured by the Pakistani forces. Patna's *Searchlight* has not. In an editorial recently it indicted the government of India of not showing the sense of urgency in getting the two journalists released from Pakistani jail. The newspaper records External Affairs Minister Sardar Swaran Singh's statement in Parliament that the names of Deepak Banerjee and Surajit Ghoshal have been included in the list of civilians whose repatriation is being sought from Pakistan. But "a routine request", says *Searchlight*, "is unlikely to persuade Islamabad to release these two journalists whose only fault was that they were carrying on their professional assignment...The delay in their release may endanger their life...New Delhi should have felt greater responsibility about finding out the whereabouts of these two journalists and securing their immediate release than it has done so far."

Chief Ministerial Foibles

The Chief Ministers are good sources of news, any newsman will say. Their doings and undoings are carefully watched. Recently *Searchlight* of Patna reported an incident which showed how casual and indifferent is the Bihar Chief Minister, Kedar Pandey, to public engagements. The Bihar Chief Minister was to address a dinner meeting of the Bihar Chamber of Commerce at 8 p m. According to *Searchlight*, he arrived there past 11 p m when his hosts had given up all hope of his arrival and had begun eating. The CM, without any apology, joined them and later adressed them till past midnight as if it was all quite normal.

Free Press Journal of Bombay and *New Age*, official organ of the CPI, carried reports on Maharashtra Chief Minister V P Naik's "royal tiger-hunting" in the jungles of Kolsa between April 18 and 27. According to *New Age*, "The shikar camp of the Chief Minister was a lavish affair. The daily consumption was something like the following: 25 goats, 50 chickens, 500 eggs. The storeroom had a stock of ten bags of rice, ten bags of wheat, two bags of sugar. And it was piled roof-high with Coca Cola bottles. The shikar itself was in right royal fashion. There were 25 jeeps, eight trucks, ten cars and five police vans engaged in it. In all they consumed 1,400 litres of petrol and 600 litres of diesel. Vasantrao being a law abiding chief minister could not brook the prospect of poaching on the Tadoba sanctuary to bag his tiger. So, 300 people were engaged to beat the jungle and come up with one... Still, no tiger turned up and Vasantrao had to go home disappointed. Very bad indeed."

Dipak B R Chaudhuri

Nineteenth Report of the Commissioner for Scheduled Castes and Scheduled Tribes, 1969-70; presented to the Parliament of India in December, 1971; Rs 8.75.
Education of the Scheduled Tribes (1965-66) — A report by J P Naik; ICSSR Monograph; unpriced.
Education of the Scheduled Castes (1965-66) — A report by J P Naik; ICSSR Monograph, 1971.

THE fathers of the Constitution had envisaged the office of the Commissioner for Scheduled Castes and Scheduled Tribes as a key institution in the new Republic of India. Yet, almost one full year elapsed before the Government got round to selecting a substitute — a former party legislator — for Professor Nirmal Bose after he vacated the post. Similarly, the 19th annual report, prepared by Nirmal Kumar Bose and presented to the President on June 29, 1970, was laid on the tables of the Houses of Parliament as much as a year and a half later, in the second fortnight of December 1971. These delays merely reflect the casualness with which the entire problem of scheduled castes and tribes has been approached by the Government.

Article 338 of the Constitution provides for the institution of the high office of a 'Special Officer' — actually designated 'the Commissioner' — to be entrusted with the duty of investigating all matters related to the safeguards provided for the scheduled castes and tribes under the Constitution and of reporting on the working thereof to the President who is to cause the report to be laid before Parliament. The original conception of such an office, to protect the weakest sections of society, came from B R Ambedkar, in a memorandum submitted to the Constituent Assembly in 1947. According to this proposal, the status of the Special Officer was to be similar to that of the Auditor-General or of a Judge of the Supreme Court; and he was charged with the duty of preparing an annual report on the treatment of these minority communities by the public as well as by the governments of the Union and the states and noting any transgression of the safeguards provided or any miscarriage of justice on account of communal bias by the governments or their officers. The scheme also specifically provided for the placement of the Special Officer's reports before both the Union and the state legislatures for discussion.

Most of these proposals were endorsed by the concerned Advisory Committee of the Constituent Assembly. In the discussion on the Report on Minority Rights, the Chairman of the Advisory Committee described the provision for this new office as an 'administrative machinery' for ensuring that the guarantees and safeguards provided were made effective in practice, and categorically stated that the business of the Special Officer was to bring to the notice of the legislatures or the governments the defects or drawbacks in the protection of the rights.

The office of the Commissioner was created in November 1950. Even though the final wordings of Article 338 have not specified the full status of the 'Special Officer' (i e, the Commissioner), it is at least clear that he is to enjoy *independent* status. This has never in fact happened. The Commissioner was never actually invested with independent status or with the necessary powers envisaged under the Constitution.

Instead, the Commissioner was initially given the status of a Secretary of a Ministry of the Union Government. When the first Commissioner raised the question of his independent status, the Union Government decided to invest his office with the same status as that given to any other statutory office. The Commissioner was also declared 'Head of a Department' attached to the Home Ministry for purposes of parliamentary work. The arrangement continued upto 1956-57. The Commissioner's annual reports from 1957-58 onwards reveal a reversal of the government's earlier decision. Thus the 1958-59 report, mentions the recommendations of the Study Team on Welfare of Backward Classes and of the 48th Report of the Second Lok Sabha's Estimates Committee for according an independent status to the Commissioner's organisation. The Estimates Committee was particularly critical of the assignment of non-statutory functions to the Commissioner's office. The first Commissioner himself continued to maintain upto his last reporting year (1960-61), that it was desirable to attach 'adequate statutory, defined powers' to the post.

The question of the status of the Commissioner was raised time and again in Parliament also, and it is interesting that on one occasion the Minister claimed that the Commissioner was administratively under his Ministry and that he was just an officer of his Ministry. Again, notwithstanding the recorded stand of the first Commissioner right upto 1961, a memo of the Ministry of Home Affairs, dated February 19, 1960, claimed that "the Government have obtained the views of the Commissioner on this recommendation (by the Estimates Committee) and reviewed the whole position. They find the Constitution does not contemplate giving the Commissioner for Scheduled Castes and Scheduled Tribes an independent status like that of the UPSC or the Election Commission". The Government also strongly justified the assignment of non-statutory functions of the Commissioner for which he was made directly subordinate to the Ministry concerned. (See 137th Report of the Second Lok Sabha Estimates Committee.)

Thus, the Commissioner's organisation was gradually reduced to the position of a subordinate office of the Union Government. The result was that he slowly became powerless *vis-a-vis* not only the various state governments but also the various offices of the Union government. He has been powerless in practice even to collect the basic data required for an assessment of the situation by him. He has thus found it difficult to fulfil his constitutional duties. The annual reports are records of his bewailings and beseachings year after year.

When he became Prime Minister, the late Lal Bahadur Shastri transferred the office of the Commissioner and the Department of Social Welfare to the newly-created Department of Social Security attached to the Law Ministry.

Subsequently, in July 1967, the office of the Commissioner for Scheduled Castes and Scheduled Tribes was reorganised by placing the field organisation and executive agency of welfare work under a newly-created 'Directorate General of Backward Classes Welfare' in the renamed Department of Social Welfare. This reorganisation was

unpopular with the leaders of the two scheduled groups. The departmental note on the 1967 reorganisation, however, claimed that the matter had been discussed with the Commissioner and that he had agreed to the new scheme. This claim has to be judged in the context of a note, which was circulated by the Commissioner at the time of reorganisation, in which he had clearly stated that he was definitely opposed to the proposed reorganisation. He had even quoted a Law Ministry note (prepared in 1951) that had argued that it is necessary in the light of Article 338 that the Commissioner should have his own staff for ascertaining facts on the working of the safeguards provided under the Constitution.

Despite the handicaps regarding secretariat status and creation of the new Directorate-General, Commissioner Nirmal Kumar Bose did manage to bring out a few valuable annual reports which add much to our knowledge of the problems and the social and economic developments of the 'backward classes'. Yet the national press and social science circles hardly took any notice of all this useful information.

Bose was fully aware of the limitations of his data-collection powers. The very first sentence of the 18th report reads: "One of the difficulties in presenting a report every year arises out of the fact that adequate material is not always available". In another chapter, he observed: "Instances of non-co-operation on the part of certain authorities point to the necessity on the part of the Government to issue instructions to all the Ministries/Departments and also a request to the state governments, to ensure that the Commissioner receives full co-operation from them as regards the supply of the facts of cases referred to them and also the relevant records if asked for without any delay or demur"

In fact, the Fifth schedule of the Constitution requires the Governors of eight states to present annual reports to the President on the administration of the "scheduled areas". In the 18th report of the Commissioner, it was pointed out that several states Governors were delaying submission of such reports by about two years — though the due date for submission is within three months of the close of the financial year. In the latest report, too, Commissioner Bose discloses that the Governor's report on the administration of scheduled areas of Gujarat for 1967-68 was submitted to the Union Government on September 11, 1969 — about 14 months after the due date.

In the circumstances, instead of trying to cover the entire ground relating to the development of the scheduled castes and scheduled tribes Bose endeavoured to "deal more or less exhaustively with selected topics every year" In the 18th report, he dealt with the issues of education, land, and untouchability. Education and untouchability again figure in the 19th report. The latest report adds two valuable chapters on "Housing" and "Impact of Panchayat Raj" as they relate to scheduled castes and scheduled tribes.

Evidently, the changes in the administrative structure brought about by Panchayati Raj and its objective of democratic decentralisation, tend to ignore the special interests of the weaker sections. These interests tend to suffer in the actual implementation of the Panchayat Raj programme. The prevailing economic and social dominance of higher castes and classes and the direct dependence on them of the weaker sectors for their livelihood, have effectively carried these relationships over into the Panchayati Raj system. The progressive objective of the original idea has thus remained on paper. For instance wherever responsibility of primary education has been transferred by government departments to panchayat samitis, the special measures taken for the educational advancement of the weaker sections have in fact been ignored.

A number of other studies and research findings confirm the above conclusions. In the matter of administration of Tribal and Harijan Welfare Programmes, the process of democratic decentralisation and the developmental activities at the village level have often meant a setback for the backward classes. Zilla Parishads and Panchayat Samitis which have been entrusted with Tribal Development Blocks are dominated by powerful vested interests composed mostly of non-tribals. The landlord, the moneylender, the forest and PWD contractor, and the liquor vendor — all dominate the lives of the backward classes and are not enthusiastic about programmes for weaker sections.

The problems of landless agricultural labourers, who come mainly from the two weaker sections, and *jhum* or shifting cultivation, also attracted the annual review of the Commissioner. His staff conducted field surveys during October and November of 1969 in different parts of Assam and UP to assess the present conditions of the scheduled castes and scheduled tribes with special reference to their land problems, their economy, and their indebtedness. The information on bonded labour comes from these surveys and reports of state governments.

After covering all the areas with tribal concentrations of 66.6 per cent or more and with Tribal Development Blocks, only about one-third of the total population in the country are seen to have been benefited. The Commissioner has recommended that the important scheme of *ad hoc* assistance to other tribal pockets, known as sub-blocks, which was introduced in 1966-67, should cover a large number of tribals living outside the TDB as well. Bose has observed that the economic backwardness of scheduled caste persons is one of the important factors responsible for the practice of untouchability; it is, therefore, necessary that steps be taken to improve their economic conditions simultaneously with steps through education and propaganda to remove untouchability.

The 18th report of the Commissioner appended two valuable papers of A B Bose of the Planning Commission on problems of the educational development of the two weaker sections. The 19th report of the Commissioner provides valuable data on progress and obstacles in the educational development of the weaker sections. The information regarding wastage and stagnation in the Nasik schools should be useful to the state educational authorities in their planning. It is not enough to grant scholarships; it is even more necessary to reduce the wastage.

The Indian Council of Social Science Research has decided, meanwhile, to launch a major research programme on the problems of the scheduled castes and scheduled tribes. Ten states have been selected for the purpose. The education of the scheduled tribes will be studied in Assam and Meghalaya. Bihar, Gujarat, Madhya Pradesh, and Orissa, and that of the scheduled castes in Andhra, Maharashtra, Rajasthan, UP, and West Bengal.

The ICSSR has produced two monographs as background material. These have been compiled by its Member-Secretary, J P Naik, giving available data on the education of these communities. It is significant that the Compilation of data done by the Education Ministry in September 1971 provides the relevant data up to only 1965-66. Data of later periods are available at the Planning Commission. Comparative literacy figures would have been useful, whereas Naik has given the school enrolment figures. Also the Census Commissioner is a member of the ICSSR body, and the ICSSR should have better waited for the 1971 census figures before preparing its preliminary monograph — instead of basing its projects on 1961 census data.

Studies in Planning Techniques

V—Planning for Industrialisation

R M Sundrum

The Indian approach to industrialisation has been the subject of a great deal of controversy over the years; there is still no sign of any narrowing of the gap between different schools of thought.

To some extent, the discussion among economists has been one-sided; while those who place great reliance on market forces have been very articulate in their criticism of the policies actually followed in India, an equally cogent statement of the rationale behind these policies is not available. As a result, there has been some confusion of the role of planning in promoting industrialisation.

An attempt is, therefore, made in this paper to present a statement of the strategy followed in India and thus to arrive at the techniques of planning appropriate for the efficient implementation of this strategy. In fact, it is the contention of this paper that planning techniques have to be related to the underlying strategy of development, and should be evaluated in terms of such a strategy. Hence, it is a major objective of the present essay to formulate the chosen strategy in a coherent manner, as a step towards searching out ways to improve the techniques of planning being followed.

This is the fifth and last in the series of studies by the author in planning techniques.

A COUNTRY desiring to promote industrialisation as an important aspect of its development, has a choice of alternative strategies. For example, India could have chosen a strategy in which the basic production and investment decisions are made by individual entrepreneurs on the basis of the price mechanism, i e, a system in which the decisions obey the revealed preferences of consumers. For convenience, this may be described as the Market Strategy. In fact, this strategy has been rejected in India. We may debate the wisdom of this rejection, but what is inconsistent is to criticise the actual policies followed from the point of view of this strategy. Ultimately, the choice of a strategy is a matter of political judgment and in a democracy, every citizen is entitled to hold and express his own views on such political issues. What complicates the discussion, however, is the conviction of so many economists, especially those reared in the Anglo-Saxon tradition, that the market strategy is, in some way, demonstrably superior to any other alternative. This is a mistaken view, arising partly because of a failure to recognise the inherent political judgments in the choice of a strategy of development, and partly because the alternative strategies have generally not been formulated as clearly as the market strategy. We shall therefore attempt to outline some alternative strategies, including the one underlying the actual policies being followed in India, and try to show that they all have the same logical status as the market strategy, and that the differences among them are matters for political, rather than logical, debate.

In examining the logical basis of the various possible strategies, it must be admitted that the case for the market strategy is a powerful one. It is only by recognising this that we can appreciate the price paid by society in opting for some other strategy. The case for the market strategy of industrialisation derives ultimately from the classical prescriptions for free trade. Ever since its first enunciation the comparative cost theory underlying these prescriptions has itself been under attack, but the attack does not seem to have made any serious dent on it; it keeps recurring in various forms, especially in the form of criticisms of the policies followed in developing countries. It is too much to hope that the final demolition of this theory can be accomplished in the present paper, but an attempt must nevertheless be made to indicate some of its weaknesses especially in the application to developing countries. The heart of the case against the comparative cost approach to industrialisation is its 'static' nature. In its static setting, the classical theorem on the advantages of trading according to comparative advantages, and of production policies based on such trade, is an impeccable one. These policies can indeed be shown to maximise current production on the basis of a given factor endowment and a given distribution of income. The difficulty with the theory arises when it is applied in a dynamic setting, as e g, to a country in the process of development. This process involves so basic a transformation of the production and income structure, and so substantial an alteration of the factor endowment that a theory based on a given pattern of comparative advantages becomes hopelessly irrelevant. The main point of the development process is to change the pattern of comparative advantages. This emerges most clearly from the Heckscher-Ohlin view which locates comparative advantages in relative factor endowments, susceptible to change over time, rather than in the Ricardian concept of the 'peculiar properties of the soil', which are presumably more immutable. From this point of view, the practical question for a developing country concerns the way in which a country's comparative advantage should be changed over time, as a result of various policies.

Faced with this problem, economists have looked for some sort of dynamic comparative cost principle. It is not clear what this could possibly mean. Consider, for example, Roy Harrod's suggestion for what he calls "the dynamised version of the law of comparative costs":

> "What tradeable goods should be produced? There is a correct answer to this question, although one which it may be difficult to ascertain either by market forecast or by experience. Prior to the programme for expediting the provision of capital disposal and the growth of non-capital factors, there will have been a certain distribution of productive resources between exported and import-competing goods, including a null assign-

ment to many types of imported goods. The provision of additional capital disposal and of non-capital factors should lower costs in the industries to which they are applied. The conjunction of more capital disposal and other high quality factors with a given quantum of common labour power will reduce costs over certain range of increased output more in the production of some products than in that of others. The additional factors should be applied to the commodities of which the cost of production can be lowered more, over the range in which they can be lowered more. But that is just what is difficult to prognosticate. The introduction of additional capital disposal and other highly qualified factors may be regarded as *fertilising* the productivity of common labour.

I would suggest that it is *a priori* probable that the fertilising effects of the increased supply of these factors will be greater (a) where there are certain specific natural resources that gave the pre-existing factors a comparative advantage, compared with other countries, and (b) in those lines of production to which pre-existed factors were habituated."[1]

The search for a dynamic version of the comparative cost law in the above passage has clearly failed; after a very clear statement of the problem, we are left with *a priori* probabilities which have clearly not advanced beyond the static view of comparative advantages; these views have nothing in common with the powerful logic of the static comparative cost theorem.[2]

Beyond this point, free trade sort of policies part company with the comparative cost theory, on which they are so often based. We have next to consider the case that is sometimes made for free trade policies as particularly conducive to growth, quite apart from the alleged allocative efficiency of following static comparative advantages. Strangely enough, as Hla Myint has shown,[3] this is older than the comparative cost case for free trade and was in fact the basis of the advocacy of free trade by Adam Smith himself. The essence of the argument here is that free trade extends the market for individual industries in particular countries, promotes greater specialisation by wider division of labour, and by making industry more efficient, leads to faster growth. This is a more respectable argument, but if we look carefully into it, it does not provide any guidance as to which country should specialise in what industry; all that it suggests is that each country should 'specialise in some industry. This is why there is no strong economic argument on which to base negotiations for the harmonisation of industrialisation plans among countries seeking economic co-operation. Lacking such guidance, a country could follow free trade policies with the structure of production existing at a given time. This would be fine if there was any reason to accept this structure as particularly desirable; otherwise it would just perpetuate the results of a mere historical accident.

There is, however, another route by which to study the dynamic consequences of free trade policies on growth and development by considering the effects of factor price changes induced by trade on the growth of factor supplies, especially of capital accumulation. This is an analysis particularly suggested by the Hecksher-Ohlin theory of trade, and stimulated by the Samuelson theory of factory price equalisation. While a number of studies have been made,[4] no definitive results are yet available. The most intensive investigation to date is that of Stiglitz.[5] Studying the case of a small country which has a relatively low capital endowment to begin with, he concludes that "if the rate of time preference in the small country is larger than in the 'rest of the world', per capita consumption falls, while if the opposite is true it rises" (p 466). He, however, goes on to argue: "Should we, therefore, conclude that the opening of trade may have lowered social welfare?' Obviously not. The opening of trade has unambiguously increased the consumption possibility set of the economy and therefore the country is unambiguously better off. What has happened is that the opening of trade has changed the pattern of consumption over time, and more consumption may be taken earlier (if the country has a higher rate of time preference than the rest of the world)." This comment must, however, be considered in the situation where the social rate of time preference is lower than the private rate. Free trade will then have lowered welfare from the social point of view. As will be argued later, an important part of the case for some alternative strategy arises precisely from the decision that the social rate of time preference is lower than the private rate.

Before leaving the subject of the relation between specialisation according to free trade and economic growth, we must consider also the question of the uncertainties involved in heavy dependence on, trade. International trade these days is beset with political uncertainty, balance of payments difficulties and keen competition, which render export markets, especially for the primary products of developing countries, very precarious. At the same time, there is an uncertainty as to whether supplies will be available in sufficient quantities of imports as and when they are needed. Reliance on trade opportunities as the basis of a country's industrialisation involves a considerable degree of what we may call 'trade optimism', a question that depends ultimately on a political judgment.

So far, we have not come across any compelling economic arguments, from a dynamic point of view, for basing a country's industrialisation on market forces. We must, however, consider some further arguments. One argument for the market strategy is that "decisions can be made by those most closely concerned with the operation of particular industries",[6] on the basis of the price structure as it confronts them. There are two assumptions here. One is that the individual entrepreneur will make the most efficient decisions, because he is more knowledgeable about the particular industry he is dealing with. The second is that the price mechanism reflects the social interest faithfully. Given these assumptions, it can be argued that the individual entrepreneur in his search for private profit will make decisions which will turn out to be in the best interests of society as a whole, in other words, the argument of the 'invisible hand'.

Regarding the first point, while it is true that the profit motive is a powerful incentive for efficient conduct of industries, it cannot be categorically claimed that the private entrepreneur, will therefore make the best decisions, for he may simply not have the required technical knowledge or managerial ability. We have heard so much about the lack of entrepreneurial skills in the developing countries. It is, therefore, a question of fact, rather than of logic, to find out whether production decisions are better made by individual entrepreneurs than by any alternative methods.

Regarding the second point, there are a number of issues. In the first place, the price mechanism may not reflect the relative scarcities of goods and services because of various market imperfections. Secondly, the price mechanism reflects the structure of demand based on a given distribution of income, and in turn influences the future changes in income distribution in particular ways, so long as income distribution is a by-product of the production system. There is clearly room here for a social judgment on the appropriateness of such a distribution of income, and the production system based on it. Yet again, on questions of investment decisions, there is the problem of how accurately the individual entrepreneur estimates the future course of the price structure, at least over the life of the investment he contemplates.

The upshot of this discussion may be summarised as follows: a country would be well advised to follow the market strategy, if it believed that its dynamic comparative advantage coincided with its initial static comparative advantage; if it was satisfied with the existing production structure; if it had a high degree of trade optimism; if its social rate of time preference coincided with the private rate; if the current distribution of income and its changes were deemed socially acceptable: if it was believed that private entrepreneurs had sufficient technical and managerial skills, that new entrepreneurs would be recruited with sufficient competence and in sufficient numbers to the industries to be developed, and that these entrepreneurs were able to estimate the future evolution of the price structure more efficiently than any other method that could be devised; and if markets were believed to function well enough for the price system to reflect the relative scarcities of goods and services. A consequence of following a market strategy on the basis of these conditions would be that there would be no need for the State to do any planning to promote development.

It is doubtful whether any serious economist really believes that these conditions for following the market strategy are satisfied in a country like India at the present time. The above discussion is like flogging a dead horse but we have discussed the issues at some length partly to isolate certain concepts useful for the later discussion and partly also because some fragments of the case for the market strategy keep recurring in popular discussion. What is more likely is that economists relying on market forces would favour the market strategy with some important modifications. This gives rise to what we may call the Modified Market Strategies.

The principal reason generally advanced for modifying the Market Strategy is the failure of the price system to reflect the true relative scarcities of goods and services, as a result of imperfections in the working of the factor and product markets and of externalities in production and consumption. On the grounds that these distortions in the less-developed countries lead to an inadequate or sub-optimal rate of industrialisation, the modification of the market strategy most widely resorted to has been the imposition of protective tariffs. Where there are tariffs on both imported inputs and final products, the effective rate of protection is a better measure of the extent of encouragement than the nominal tariff on the final product.

In recent years, economists have tended to favour a system of taxes-cum-subsidies to deal with domestic distortions. This, in fact, is the form of a Modified Market Strategy that is recommended to developing countries by Little, Scitovsky and Scott.[7] They generally argue for the sort of industrialisation that is based on a country's comparative advantage; they go on to say that "a country can best learn its comparative advantage by having a price mechanism designed to search out that comparative advantage and by taking investment decisions in the light of it" (p 359). They concede a case for giving special encouragement to industry, beyond the level it would reach under free trade. They argue, however, that such encouragement should be given by policies of promotion, rather than of protection. They favour the promotion of industry in general by the improvement of markets and the provision of public services and the promotion of particular industries by subsidising labour employed in medium- and large-scale industries at rates per worker amounting in all to between 10 and 50 per cent of the unskilled wage bill. Quantitative restrictions are to be abolished on a permanent basis. Tariffs may be retained but only for revenue, not for protection, purposes; therefore, they may be levied at a flat rate of about 10 per cent on all consumer goods imports, but not on capital goods and raw materials; even then, they are to be counter-balanced by equipment excise taxes on domestic production. The balance of payments is to be managed by the 'normal' combinations of borrowing, deflation and exchange rate changes.

The authors admit that private entrepreneurs may have some difficulty in making accurate forecasts of future conditions affecting their decisions. They, therefore, recommend the use of 'indicative planning' by which "the government can see that the private sector is kept informed not only of the former's own investment plan, but also of its views about the probable growth not only of the gross domestic product but also of investment, production, consumption, imports, and exports, in particular sectors; these predictions being made in consultation with the relevant industries" (p 341).

The main concern of the Modified Market Strategy as recommended by these authors is with industrial efficiency. The concept of efficiency considered by them is based on the international price structure, the principal condition of such efficiency being that the domestic rate of transformation (DRT) is equal to the foreign rate of transformation (FRT). Hence the objection to tariffs as a way of dealing with domestic distortions. There is a persistent theme in their approach that high tariffs lead to inefficiencies, though the OECD study of Pakistan concluded that "a substantial amount of the protection received by various industries come in the form of high profits, rather than in the form of major inefficiencies".[8] Their preferred means of promotion for industry is presumably concerned, not with eliciting any particular rate of industrialisation, but only to correct for the extent of price distortions that have discouraged industrialisation in the past. But this is no simple matter. As the authors admit, "it is not at all easy to see how a very rational set of degrees of promotion, which should vary not only from industry to industry but even from firm to firm, can possibly be arrived at if administrators have to take notice of all the virtually immeasurable arguments that have been raised" (p 161).

The Modified Market Strategy would, therefore, adjust for the failure of one of the conditions needed to justify the Market Strategy. But we have argued that these strategies require many other conditions to be fulfilled. It is only when there is a broad-based political judgment that these other conditions are also fulfilled that the Modified Market Strategy becomes a suitable one to follow.

We have seen that the main concern of the Market Strategy and the Modified Market Strategy is not so much with any particular size and structure of the industrial sector that should be developed, but rather with the efficiency as they see it, of whatever industry emerges under their rules of the game. As an alternative, let us consider some strategies which are more concerned with achieving some desired size and structure of the industrial sector. The main question is how such an objective can be defined. The argument that the share of the industrial sector should increase in the course of development

has often been ridiculed as a false conclusion drawn from the historical correlation between the relative size of the industrial sector and the level of per capita income, and further confounded by citing the experience of countries like Denmark and New Zealand. But the statistical argument has become a bit more fashionable these days when clothed in the form of Chenery's regression equations, purporting to show some immutable 'patterns of industrial development'.[9] The attempt to follow these patterns may be described as an Imitative Strategy. There are some serious fallacies in following such a strategy. The basic fallacy is that these patterns have no claim to be optimal in any sense; to follow them would just mean copying the achievements and the errors of those who have gone before us — like the Chinese farmer who burns down a cottage every time he wants roast pig. Further, the conditions facing the less developed countries in the future are likely to be so different from those that prevailed at the time of the past experience summarised in these patterns. Also, a strategy based on these patterns is not a long-term one; we might use the targets suggested by these patterns as cogently for 1975 and 1980 as for the year 1990 or 2000. What we should be searching for is a target for a fairly long period of time that allows for the extra options in planning over such a long period. To do that, we have to delve deeper into the logic underlying the statistical picture.

Having seen the nature of some of the strategies that have been suggested for the less developed countries, and the problems of following them in a country like India, let us now try to define a strategy that is more applicable to India. It is one which is consistent with the broad thrust of the policies that have been followed in India during the period of the Plans, but because such a strategy has not been spelt out very clearly, there are some important divergences between actual policies and those implied by the strategy. In fact, it is the main purpose of the present essay to define a planning approach based on an explicit statement of the underlying strategy, as a basis for evaluating current policies and for searching out ways of improving these policies and making them more consistent with the strategy involved.

The strategy to be considered is based on a particular diagnosis of the nature of under-development in terms of a technological gap between the more developed and the less developed countries. In this view, under-development does not mean just a low level of per capita incomes compared with the developed countries, but a particular technological disparity as the cause of the low level of incomes, rather than such things as fundamental sociological factors, adverse terms of trade, over-population, etc. These other factors constitute formidable difficulties in the way of overcoming the technological disparity but are distinct from, and secondary to, the technological factor as a cause of underdevelopment. The strategy for development is concerned with measures to overcome this disparity. This disparity can be identified basically with the extent to which modern science and technology are harnessed to the production process. The extent to which this disparity affects the economy varies in different sectors. Broadly speaking, the disparity is greater in the industrial sector than in the agricultural sector, and therefore industrial development constitutes a greater problem than agricultural development. This does not mean that agricultural development can be neglected, for it provides the basis for industrial development, both on the supply and on the demand side. Industrial development requires an improvement of the human resources and of the material resources. But while a great improvement of educational levels is needed anyway, the improvement of skills for industrial development cannot be achieved only in the classrooms. To a great extent, it has to be achieved in the process of 'learning by doing'. Therefore, the improvement of human resources for industrial development has to proceed side by side with the building up of productive capacity. In the transitional phase, industrial production will be 'inefficient' compared with the more developed countries, but as productive capacity and the human resources are built up, the transitional phase will come to an end. The country will then have reached a stage when its production system has full access to modern science and technology, as in the developed countries.

The basic aim in this strategy is to increase the productive capacity of the economy as much as possible over a long but finite period of time, which may be thought of as the development phase defined in earlier papers in this series. Hence, for convenience, we may describe this as the Productive Capacity Maximisation Strategy — or PCM strategy for short. Or course, investment for increasing productive capacity can be maximised, by minimising consumption during the period in a sort of Stalinist approach. We shall, however, consider the case where it is the consumption of what are considered to be 'non-essentials' which is minimised, while the consumption of necessities is allowed to grow with the growth of population and according to consumer preferences. As shown in one of the last papers written by the late M Kalecki,[10] this approach gives the following relationship:

$$c_n = q + e(r-q) \qquad \ldots (1)$$

where c_n is the rate of growth of demand for consumption necessities, q the rate of growth of population, r the rate of growth of national income (so that r—q is the rate of growth of per capita income) and e is the average income elasticity of demand for necessities, depending on such elasticities for various classes of the population and on income distribution between these classes.

Although equation (1) shows c_n as a function of r, it can be re-written as follows:

$$r = \frac{c_n - q(1-e)}{e} \qquad \ldots (2)$$

This shows that r is an increasing function of c_n, i e, the higher the value of c_n, the higher the rate of growth of national income that can be achieved without an inflationary rise in the price of necessities consumed by the broad masses of the population. The first implication of this for our strategy is to maximise c_n. The second implication is to reduce q, the rate of growth of population, which will lead to a higher value of r for any given value of c_n. At first sight this leads to the absurd result that all investment resources should be diverted to increase the production of necessities. In fact, however, the value of c_n does not depend only on investment. The increase in production of necessities, especially of staple foods, will be limited by institutional factors, such as feudal land ownership, domination of peasants by merchants and moneylenders, the slow diffusion of improved technology, etc. The value of c_n cannot therefore be raised arbitrarily, and the allocation of investment resources to this sector should be such that c_n reaches the limit set by the institutional barriers at any time.

Once the value of c_n is determined at a high level, the national income can be increased at a fast rate, and even after allowing for the investment needs of the high value of c_n, there will be a growing surplus available for allocating to the consumption of non-essentials, the investment for increasing the production of non-essentials, and infrastructural investment. The next question is to determine the pattern of this allocation. The PCM strategy then chooses to maximise infrastructural investment and to minimise the rate of growth of non-essential consumption and the investment needed for that sector.

Let us consider the justification for such a strategy. Productive capacity is not needed for its own sake, but for the stream of consumption it makes possible. By stressing investment to maximise productive capacity, this strategy therefore seems to emphasise the value of consumption in the distant future compared with consumption now, i e, to be based on a low social rate of time preference, much lower than the private rate. This is a political decision and not one that is logically disputable. Indeed, all indications of welfare economics are that the private rate of time preference tends to exceed the social rate on many counts. But this way of stating the social choice is not quite accurate, for in the strategy we have defined, the low social rate of time preference is applied only to the consumption of non-essentials. As the broad masses of the population have only a limited ability to consume the non-essentials, it is the much wider consumption of non-essentials in the future that is highly valued compared with the limited consumption of these commodities now.

There is yet another aspect of the case for the PCM strategy. As shown in the various theorems on the subject, the 'optimum' rate of saving depends not only on the rate of time preference, but also on the estimated productivity of investment. The PCM strategy is based, not only on the choice of an intertemporal pattern of consumption as determined by a low rate of time preference, but also on a judgment that investments of the sort envisaged will yield large developmental benefits. It has recently become fashionable to decry the importance of capital as a factor in economic development and to concentrate on various social and institutional factors. These social and institutional obstacles to development are certainly important and policies must be followed vigorously to overcome them, especially as some of them are not as immutable as was thought. However, the deficiency of capital, especially in infrastructure, is still a basic problem. Two aspects of capital deficiency in a country like India are worth noting. One is the sheer quantitative deficiency. Table 1 gives some idea of the extent to which infrastructural capital and facilities in India fall short of the amounts available and taken for granted in the developed countries.

The wide gap between India and the developed countries is, of course, partly due to the fact that India is mainly agricultural while the developed countries are mainly industrial. This means that the actual constraint on current industrial production in India, compared with the developed countries, is not as great as that shown in Table 1, but it is still a serious one. India's comparative disadvantage in industrial production must therefore be attributed to a great extent to this largely remediable factor. It is therefore wrong to perpetuate the pattern of industrialisation on the basis of the country's present comparative advantages.

The second aspect of capital deficiency in India relates to the rate at which infrastructural facilities need to be expanded. As discussed in an earlier paper, there are two broad strategies—one to build in response to clearly foreseeable needs and the other to build ahead of demand and, in fact, to stimulate the demand. In the first case, the emphasis is on full utilisation of capacity as it is built up, while in the second, the emphasis is on increasing the capacity even when it is not being fully utilised. Of course, it would be ideal if capacity could be expanded at a high rate and starts being fully utilised as soon as it is installed, but this is not possible. It is the second of the two strategies which is chosen in the PCM strategy. Something must be said to justify this, as the charge of under-utilisation of capacity is one of the most persistent criticisms of Indian policies. One argument is that it would take a longer time to build up capacity, especially in infrastructure, than to stimulate the demand to use that capacity. Another argument, reinforcing the first, is that various infrastructural facilities act synergistically to facilitate production so that capacity in one form would be under-utilised when other forms of capital are inadequate. Yet a third argument is that there is a threshold in the amount of infrastructure and that it is only beyond this that they begin to be fully productive.[11]

The problem here can be considered as an example of the conflict between economies of scale and balanced growth. The argument has been stated by Sci-

TABLE 1: LEVELS OF PHYSICAL AND SOCIAL INFRASTRUCTURE
(around 1965-67)

Indicator	Developed Market Economies	Centrally Planned Countries	India (1965-66)
(1) Electricity capacity (kw per 1000 popn)	927	588	21
(2) Electricity production (kwh per capita)	3,951	1,778	74
(3) Railway density per 100,000 popn	104.2	69.9	11.8
(3b) Railway density per 1,000 sq km	21.8	10.5	18.0
(3c) Railway density per popn distance	47.7	27.1	14.6
(4a) Road density km per 100,000 popn	1,479.4	217.4	58.0
(4b) Road density, km per 1,000 sq km	309.7	32.5	88.3
(4c) Road density per popn density	676.9	84.1	71.6
(5) Commercial vehicles per 1,000 popn	49.8	13.3	0.6
(6) Percentage of population in urban areas	64.7	52.7	18.9
(7) Percentage of adult population literate	94.2	94.8	28.6
(8) Enrolment ratio in 1st and 2nd level education	88	84	51
(9) Numbers in 3rd level education per 100,000 popn	1,422	1,349	251
(10) Physicians and dentists per 100,000 popn	169	204	17

tovsky as follows: "Such conflicts can be resolved by sacrificing economies of scale for the sake of balance, by sacrificing balance—at least temporarily—in order to secure the economies of scale, or by striking a compromise between the two. In the first instance, investment will be less efficient, output smaller, and growth slower than they could be; whence it follows that it is always desirable to sacrifice balanced output or balanced growth, at least to some extent. This, indeed, is what usually happens... The several-year investment plans [of planned economies and of economies that plan their investments] of which one hears so much nowadays, may be regarded as plans for unbalanced growth, extending to several years so as to restore balance by the end of the period for which the plans are made. In the interim, unbalance manifests itself by the completion of productive capacity before the demand for its full utilisation has risen... The temporary excess capacity may have to be accepted in most cases as an inevitable cost of (temporarily) unbalanced growth for the sake of securing economies of scale."[12] In the case of infrastructural investment, the period needed to achieve balance at a sufficiently high level starting from the position such as in India, may well extend to decades.

At this point, we must consider what this implies for Industry. While the main item in consumption necessities is foodstuffs, this group also includes some industrial products, mainly textiles and housing materials. The production of these items should therefore be expanded *pari passu* with the maximum extent to which food production can be expanded. Apart from this, the industrial sector has to meet the needs for some of the major types of infrastructure and a large part of non-essential consumer goods. In dealing with these requirements, the approach of the PCM strategy is to stress the capital-goods sector. The building up of the capital-goods sector will lead to two types of advantages. It will enable the rapid expansion of the domestic production of the equipment needed to produce the requirements of infrastructure and other industries. Further, a larger domestic capital-goods sector will be in a better position to produce machinery of a labour-intensive technology more suited to domestic factor endowments, as Park and Todaro have pointed out.[13] And the second advantage is that it will help to reduce the rate of growth of non-essential consumption.

The case for a high allocation of investment to the capital goods sector as an essential condition for promoting long-term growth was fully discussed in the great economic debates that took place in the Soviet Union in the twenties.[14] A model for such an allocation applicable to India was given by P C Mahalanobis in connection with the drawing up of the Second Plan.[15] His model was somewhat simplistic, but the many criticisms that have been levelled against it have been equally simplistic; these criticisms seem more concerned with the theoretical elegance of the model than with whether the policy recommendations were appropriate. The fact that Mahalanobis is a physicist by training and a statistician by practice, or that he had been consorting with economists of socialist countries has really nothing to do with all this. In his formulation, he was trying to introduce one new consideration in making the important planning decision of the allocation of investment as between capital-goods and consumer-goods sectors.

There are a number of ways to go about this. We could start off by saying that we need to have a high rate of growth; this means that we should have a high rate of investment balanced by a high rate of saving. In a closed economy, the rate of saving determines the allocation of investment. In fact, according to the two-sector model of Mahalanobis in its steady state, we have

$$s = \frac{rB_k}{B_c B_k - r(B_c - B_k)} \quad .. \quad (3)$$

and

$$P_k = \frac{sB_c}{B_k + s(B_c - B_k)} \quad .. \quad (4)$$

or more simply

$$P_k = r/B_k \quad .. \quad (5)$$

where s is the savings ratio, r the desired growth rate, P_k the allocation of investment to the capital-goods sector, and B_c and B_k are the reciprocals of the capital-output ratios in the consumer-goods and capital-goods sectors respectively. Now, how can the savings rate be raised in order to accelerate growth? We can proceed along the route of fiscal policy, i e, by levying more taxes and channelling the proceeds to investment. This by itself may not be sufficient. So measures may also be taken to discourage consumption, especially of what are considered as non-essentials, by price policies—e g, by higher taxes on particular commodities. Not enough has been done along these lines in India, but even if they had been followed, it would have been difficult to ensure that they would have made a sufficient impact, because of our ignorance about actual behavioural relationships and the weakness of our tax administration. In any case, the results would be very uncertain, so that it would be difficult to determine the allocation of investment so as to achieve complete balance, sufficiently in advance.

The alternative approach would be to start off with a high allocation of investment to the capital-goods sector, and then pursue policies to bring voluntary savings to the level of investment implied by this allocation. In fact, according to the Mahalanobis two-sector model, if savings were made equal to investment, we would have

$$(\sigma - s_t)\, Y_t = (\sigma - s_o)\, Y_o \quad .. \quad (6)$$

where s_t is savings as a proportion of income at time t, and σ is the ratio

$$\frac{P_k B_k}{P_c B_c + P_k B_k}$$

as determined by the respective capital-output ratios and the allocation of investment to the two sectors. If σ is set at a level, high than s_o, then s_t will go on rising asymptotically towards this value of σ. At the same time, the 'productivity of capital' is given by

$$\frac{Y_t - Y_{t-1}}{I_{t-1}} = B_c - P_k(B_c - B_k) \quad .. \quad (7)$$

The result is that a high value of P_k will let the savings ratio increase steadily, but at the same time, it will reduce the productivity of investment, when $B_c > B_k$ as assumed. However, it is easy to see that the former effect wins out in the long run. Here again, we have to consider what happens if the voluntary savings ratio does not rise as rapidly as implied in (6). The result will be a rise in consumer goods prices and abnormal profits in that

TABLE 2: IMPORT AS PERCENTAGE OF TOTAL AVAILABILITIES

Category	1951	1957	1963
Consumer goods	4.4	2.5	2.5
Intermediate goods	17.4	25.9	12.9
Investment goods	56.5	58.8	36.3
Total	12.8	20.9	14.6

sector, but the real value of savings would have risen and a real amount of investment achieved. Obviously, this is not the ideal solution. While the change in relative prices would roughly be of the order of magnitude required for the desired rate of real growth, it would have been better if it had been achieved in such a way as to yield more revenue to the government than more profits to the producers of consumer goods. This is the price that is paid to achieve the planned rate of growth by this method. In following this method, therefore, a further effort should be made to see that the inflationary price rise is mostly confined to non-essential consumer goods, by distinguishing between the two categories of consumer goods, as suggested, in fact, by the biologist, J B S Haldane.[16]

We now have to consider how the possibility of foreign trade affects the allocation of investment. With foreign trade, the need for a lot of capital-goods to accelerate growth does not necessarily imply expanding the domestic capital-goods sector. It has been argued, e g, that whether it is capital-goods or consumer-goods which are produced at home rather than imported should depend on the comparative advantage position. The relative costs of making or buying capital-goods should certainly be taken into account in deciding the allocation of investment, but as argued earlier, current comparative advantages are not a very reliable guide to estimating these relative costs over any long period in a country in the process of development. What the strategy calls for is an attempt to build up India's comparative advantage in the capital-goods sector. Improvement of such comparative advantage requires action on many fronts, but one of them is to promote growth of the industry as a means to efficiency. This is a central point of the strategy, which is dismissed in a somewhat cavalier fashion by Bhagwati and Desai when they say, in the very last page of their book,[17] "You cannot have 'growth' first and 'efficiency' next; the two processes have to go hand in hand". On the contrary, there is substantial evidence to suggest that growth leads to efficiency[18] and this is what we wish to exploit in our strategy by stressing the capital-goods sector.

There is another aspect of the problem, namely to reduce our dependence on the imports of capital-goods. It is often said that Mahalanobis was unaware of the possibility of importing capital goods. This is a strange comment, in view of his specific statement "India's present dependence on imports of capital goods is a fundamental structural weakness, which must be corrected as quickly as possible" (ref 14, p 51). Further, he says, "It is neither necessary nor desirable that India should try to become completely self-sufficient in the production of machinery" (*ibid*, p 52). The import-dependence of various categories, derived from Padma Desai's study[19] of import substitution, is shown in Table 2. India has been heavily dependent on imports for her investment goods, and even after substantial import substitution, the import-dependence in 1963 was quite high. With this high degree of import dependence, the possibility of accelerating future growth would be severely hampered by the balance-of-payments constraint, and that is why for example, Reddaway supported the policy of a high allocation of investment to this sector.[20]

TABLE 3: FORMS OF EXCHANGE IN THE INTERNATIONAL TRADE BETWEEN DEVELOPED AND DEVELOPING COUNTRIES, 1967

(Billions $ US)

Form of Exchange	Value	Percentage
(1) Exchange of primary products for primary products	11.96	20.3
(2) Exchange of manufactures for manufactures	10.80	18.3
(3) Exchange of primary products for manufactures	35.32	60.0
(4) Exchange of goods for invisibles	0.84	1.4
Total	58.92	100.0

A criticism of this approach is based on the argument that the prospects of expanding India's export earnings have not been as pessimistic as feared, and that the fall in India's share of world trade has been due mainly to India's domestic policies. This criticism is advanced most fully by Bhagwati and Desai. They make rather heavy weather of the fact that this export pessimism was not spelt out in the early draft documents preceding the Second Plan, but was "invented *post facto* to rationalise this shift in investment strategy".[21] To those who have watched the increasing difficulty which the less developed countries have had in expanding their exports to the developed countries, the export optimism of the critics makes strange reading. They have even produced what they call 'somewhat optimistic estimates' of the overall improvement in feasible export earnings in the period 1951-60 on the assumption that India retained its 1948-50 average volume share of the major commodities and arrived at a figure of 16.5 per cent of the actual performance. They recognise that the world demand for India's traditional exports has been sluggish. In that case, for India to have retained its share of the world markets for its exports would have been at the expense of other less-developed countries; the outcome of such zero-sum games is surely not one to gamble on as the basis of a long-range development programme. Anyway, the prospects of traditional exports are not directly relevant to the problem of allocation of industrial investment, for this must be considered subject to the desperate need to increase savings. Hence, if the allocation to the capital goods sector was kept low, and a larger fraction of these goods imported, it follows that it is the industrial consumer goods which must be exported. It is only if the prospects of expanding these exports are bright that there would be a case for a low allocation of investment to the capital goods sector.

We must also take note of the fact that, apart from the dim prospects of export expansion, there is also considerable instability of export earnings, which justifies a concern to reduce our import-dependence for capital goods. Even this has been criticised. For example, I G Patel says, "An argument for autarky of this kind can lay little claim to rationality for it does not make much sense to determine one's day-to-day behaviour on the basis of what might be required in an ultimate emergency; and if the case is one of relative self-sufficiency in some line as a measure of insurance, it is at least arguable that there should be less emphasis on self-sufficiency in the case of things like machinery which can be run down for a few years than in regard to materials and essential consumer goods which exhaust their usefulness over a shorter span of time."[22] This is not a very conclusive argument. As we have stated it, the strategy would ensure the adequate supply of the essential consumer goods, and the choice is only between capital goods and the less essential consumer goods. Secondly, the struggle is not for maintaining a level of output by running down equipment but for growth. Hence if export instability only affected import capacity for the less essential consumer goods, the effect would be short-lived, but if it affected import

capacity for capital goods, it would have a lasting effect on the growth of the economy.

Much of the debate on import-substitution versus export-promotion has been conducted in terms of the foreign exchange and the balance of payments considerations, as if import-substitution was primarily a foreign-exchange saving strategy. In fact, however, it should be considered as a strategy for industrialisation. This is not just a case of moving facilely from one point to another on a transformation curve drawn on paper. It means a long-drawn out process of building up a number of industries and giving them time to improve their efficiency. The whole point of import-substitution as against export-promotion is that an import-substitution policy gives us more time to build up a certain level of efficiency whereas in the export field, you have to reach world levels of efficiency straightaway. Of course, the import-substitution policy involves some sacrifice of consumer welfare in the interim period, but this is part of the price the country has to pay for the development objective.

The preference for import-substitution does not mean a preference for autarky. The main objective is to reduce our dependence on what may be called the traditional form of exchange, which still dominates the pattern of trade between developed and developing countries. This is shown in Table 3 in terms of Hirschmann's classification of the forms of exchange.

Another consideration to bear in mind is the fact we have noted above that the drive for more savings involves a change in relative prices of capital goods, and the essential and non-essential consumer goods. This would be impossible under the various market strategies that have been proposed. To keep the domestic price structure of these relative prices in line with world prices, and yet achieve the sort of changes implicit in a high rate of growth is far too formidable a task to be lightly undertaken. We have, therefore, to give up the idea that the world price structure should guide the pattern of our industrialisation. Instead, we should determine the pattern to our requirements and then search out for the sort of price policies that would bring this about.

This conclusion has an important bearing on some current estimates of the price paid for the Indian pattern of industrialisation. To achieve a pattern of industrialisation different from that which would emerge from a laissez-faire policy the method adopted in India has been to operate some industries in the public sector and to regulate the others left to the private sector by a combination of tariffs, quantitative import restrictions and exchange control, investment licensing and prices control. Critics of Indian policies have persistently argued that these policies lead to inefficiency. There is, no doubt, a lot of inefficiency in the system and it would be useful to have some measures of this inefficiency. However, the prevailing method of measuring this inefficiency seems to be that of calculating various effective rates of protection of importable items. For example, Bhagwati, Desai and Panchmukhi have produced estimates averaging over 300 per cent in 1961 for a select group of Indian industries. The basis of these estimates is a comparison of the value added in these industries at domestic prices and at foreign prices converted at the official rate of exchange. Clearly, this cannot be taken as a measure of inefficiency for it does not allow for the price differences that are inevitable once the country has chosen a pattern of industrialisation different from the free trade pattern. The question to be considered is whether the control system involves a cost greater than the minimum needed to achieve the desired pattern of industrialisation. Such a cost may arise when production in the controlled industries is inefficient in some technical sense, and when entrepreneurs in these industries earn abnormally high profits. What we need are some estimates of such technical inefficiencies and of abnormal profits, in order that measures can be taken to overcome these inefficiencies and to absorb some of the abnormal profits into the public exchequer. Some such estimates made for Pakistan, under a similar system, indicate that the main factor was that of abnormal profits.[8]

The various criticisms of the Mahalanobis' model that have been advanced so far, however, have missed an important weakness of such models. This refers to the way the incremental capital-output ratios (or their reciprocals) are used. The ratio B_k in the capital-goods sector is taken as smaller than in the other industries. In his main calculations, for example, Mahalanobis takes $B_k = 0.20$, and the ratios in the factory sector, the household sector, and the services sector of the consumer goods industry as 0.35, 1.25 and 0.45 respectively. Why are there such differences? One reason is that the output-labour ratios in the various sectors are different. Thus, the

TABLE 4 : CAPITAL-OUTPUT RATIOS IN 11 SECTORS USED IN THE BOKAUS-PARIKH MODE

Sector	Capital Output Sector
(1) Agriculture and plantations	1.511
(2) Mining and metals	2.416
(3) Equipment	0.905
(4) Chemicals	0.875
(5) Cement and non-metal products	0.894
(6) Food, clothing and leather	0.551
(7) Electricity	6.259
(8) Transport	2.222
(9) Construction	0.153
(10) Housing	10.000
(11) Others and margin	0.156

consumer-goods sector is generally more labour-intensive than the capital-goods sector. This means that the policy of a high allocation of investment to the capital-goods sector leads to slower absorption of labour in the beginning to be made up by faster absorption due to faster overall growth later. But even this factor does not explain the fact that the household sector of the consumer-goods industry requires both less capital and less labour than the other sectors of this industry, so that it clearly 'dominates' the other two sectors. It was, therefore, a simple matter for Komiya to derive an 'optimal' solution concentrating all consumer goods production in this sector.[23]

However, if the parameters are to be taken seriously, some additional factor must be used to explain the differences in these ratios. One such factor is the different longevities or durabilities in the Wicksellian sense of the investments made in the various sectors. Industries with a low output-capital ratio are also likely to be those with longer life of capital. To the extent that this occurs in the capital-goods industry, the policy of a high allocation of investment to this industry is just a way of distributing productive capacity over a longer time in the future. It is clearly an aspect that should be taken into greater account in making long-term projections of alternative models.

This aspect of the problem is also neglected in the more elaborate CELP model which has been worked out in detail by Eckaus and Parikh.[24] The great diversity of the capital-output ratios used by them is shown in Table 4. There is no reference to labour. Depreciation of capital is based on the 'one hoss shay' assumption, the life of equipment being 25 years and of construction being 33 years, in whatever sector they are employed. An important aspect of the problem of allocating capital on the basis of its return over time is, therefore, completely neglected, even in their long-term models.

These models are basically different from that implied in the PCM strategy, mainly because their objective function is based on the levels of consumption. In some versions, a requirement is imposed on the rate of post-terminal consumption growth and this acts to some extent in favour of building up capacity for growth at the end of the plan period, but this action works in an indirect manner. For example, a high rate of post-terminal growth is achieved at the expense of the level of this consumption, by an actual reduction of consumption in the last part of the plan period. Again, it is instructive to look at the capital employed in various sectors in what they call their Guidepath-I Reference Solution. There is surprisingly little change over nearly 20 years.

The programming approach in terms of such objective functions obscures, rather than clarifies, some of the key issues of development. The ultimate objective is not so much a high rate of post-terminal consumption growth but a level of the productive capacity that overcomes the handicap that the country now suffers by its underdevelopment, i e, by the inability to exploit modern science and technology in its production system. The main idea is that the country should have greater options to determine the pattern of its consumption and the rate of its growth. In the process of building up this productive capacity, it is useful to distinguish a part of consumption, not only to promote consumer welfare, but also as a necessary element of the development effort. Some distinction such as that between essential and non-essential consumption has to be made. The principal political judgment involved is then the balance to strike between the expansion of productive capacity and the increase of non-essential consumption. Because the availability of even the essential consumer goods is so limited, the scope for choice may well be quite small, but it is within this limited area that the PCM strategy seeks to determine the allocation of investment. Although all production is for consumption, it makes quite a difference to planning in a finite period which of these features in our objective function.

Because the implications of this view of the PCM strategy may not be very clear yet, it may be useful to illustrate it by a simple numerical exercise. Let us assume that the output of essential consumer goods is always such that it satisfies the demand for it, assuming a constant value e, say 0.6, for the income elasticity of per capita demand. Taking population growth also constant at, say, 2 per cent per period, and substituting in Kalecki's equation (1) above, we get

$$C_t = (1.008 + 6r)\ C_{t-1} \quad .. \quad (8)$$

where r is rate of growth of net national product Y_t, and C_t is output of the essential consumer goods. We assume that the maximum rate at which C_t can increase is given by a constant m. In the early stages, savings may be insufficient to provide for the growth of Y_t implied by the maximum possible rate of growth of C_t. In this stage, we assume that all investment is allocated to the capital-goods industry and the essential consumer-goods industry only, and none for the non-essential consumer goods industry. Then the rate of growth of total output, given its relationship with C_t, may be derived from:

$$r_t = \frac{I_{t-1} + 0.008C_{t-1}\left(\frac{1}{B_k} - \frac{1}{B_c}\right)}{\frac{Y_{t-1}}{B_k} - 0.6C_{t-1}\left(\frac{1}{B_k} - \frac{1}{B_c}\right)} \quad ..(9)$$

A development according to this relationship is shown in Table 5 up to the period t = 4, with $B_k = 0.4$ and $B_c = 0.5$.

Thereafter, income growth is limited by the maximum possible rate of growth of C_t. If we take m = 0.05, this implies maximum r=0.07. At this stage, it becomes possible to allocate some investment to increase the output of non-essential goods N_t. However, if the output-capital ratio of this sector is taken as the same as for C_t, i e, higher than B_k, the system is unstable. This is similar to the well known instability of two sector models when $B_c > B_k$. In fact, we will then have

$$\left(s_t - \bar{s}\right) = \left(s_{t-1} - \bar{s}\right)\left[1 + \frac{rB_k}{\bar{s}(1+r)\left(B_c - B_k\right)}\right] \quad .. \quad (10)$$

where $\bar{s} = \dfrac{rB_k}{B_c B_k - r\left(B_c - B_k\right)}$

as in equation (3) above. The expression in square brackets will be positive and greater than 1. Also such an assumption is implausible on capital-theoretic grounds. We shall therefore assume that the output-capital ratio in the production of N_t is B_n, less than B_k. On this assumption, the growth of N_t can be traced easily by using

$$N_t\left(\frac{1}{B_n} - \frac{1}{B_k}\right) = Y_{t-1}\left(1 - \frac{r}{B_k}\right) - C_{t-1}\left[1 - m\left(\frac{1}{B_k} - \frac{1}{B_c}\right)\right] - N_{t-1}\left[1 - \left(\frac{1}{B_n} - \frac{1}{B_k}\right)\right] \quad .. \quad (11)$$

For the illustrative projection in Table 6 from t=5 onwards, B_n is taken as 0.3. It will be seen that the allocation P_k of investment to the capital-goods industry is high and increasing in the first phase and declines in the second phase. It will also be noticed that the savings rate increases rapidly at first, and more slowly later on. The underlying idea in this approach is to take advantage of the instability of the two-goods form of the model to achieve high rates of investment in the early phase, and then to approach a steady state in the later phase on the basis of the stability of the three-goods model.

We have had to discuss the PCM strategy at some length because it is generally not stated in these terms and because so much of current criticisms of Indian policies are not related to this underlying strategy. At the same time, some such clarification is needed to evaluate and improve upon the detailed policies being followed. Having done this, our next task is to derive the planning implications of the strategy. By this we mean the sort of broad economic policies to be followed and the planning framework through which they

TABLE 5 : DISTRIBUTION OF AVAILABLE CAPITAL BY SECTORS IN ECKAUS-PARIKH GUIDEPATH-I REFERENCE SOLUTION

(percentages)

Sector	1966-69	1984-87
(1) Agriculture	32.7	29.9

(10) Housing	17.9	10.3
(11) Others and Margin	3.6	2.2
Total	100.0	100.0

are to be implemented. These may be discussed under various heads as follows:

(1) *Long-term Goals*: The model presented above can be elaborated in various ways. Once the basic model underlying the strategy is adopted, an estimate can be derived of the size and broad structure of the industrial sector likely to emerge at the end of the development phase. To start with, there should be a policy decision about the classification of essential and non-essential goods. With this, the sizes of various industries in each group should be roughly estimated so that they are in some sort of balance with each other. Further, the structure within the capital-goods sector should be adjusted with a view to future growth. Although this is a risky enterprise, some quantification of the probable future size of various industries will be useful to plan their growth in the intermediate period. These estimates do not have to be very accurate and may be revised periodically with better information.

(2) *Savings Policies*: The next most important task is to set out the policies to achieve the growth of savings required by the underlying strategy. Because the strategy calls for a major increase in savings rates, this will involve some basic changes in the country's taxation, credit, investment, interest and monetary policies and the institutions through which these policies have to be implemented. The progress achieved so far has been far from adequate. Without a growth of savings corresponding to what is required, the attempt to follow the strategy will only lead to a disorderly and inflationary situation, with adverse effects on income distribution and even reducing the effectiveness of the instruments of policy. It is possible that without such an increase in savings, the growth of the industrial sector may even be less than if this strategy is not followed.[25] There is a tendency in the plan documents to take the savings propensity in the private sector as a datum. The required rate of savings simply cannot be achieved on this basis. In fact, this savings propensity is amenable to various instruments of policy, and they must be fully deployed to avoid under-utilisation of capacity, especially in the capital-goods sector of the sort that has contributed to the industrial recession in recent times.

(3) *Income Distribution Policies*: Because a more equal distribution of income is one of the major objectives of the country, various policies have to be followed, as suggested in an earlier paper. As the structure of industry depends greatly on the distribution of income, these policies have to be closely related to the industrialisation policies indicated by the chosen strategy. Progress on equalisation will inevitably be slow; therefore, every effort must be made to co-ordinate the long-term trends of industrialisation to the final goals of income distribution, rather than to the current situation. At the same time, income distribution policies should also be related to the required savings effort. It is generally assumed that the savings rate increases with income level. While this may be true at the highest income levels, it has to be checked at the medium income levels. This is particularly important because the strategy defined above calls for economising of the resources used for what have been considered as non-essential consumer goods.

(4) *Price Policies*: According to the PCM strategy, the pattern of industrialisation will be geared to certain long-term goals, significantly different from what would emerge under a laissez-faire system in which the structure of domestic prices remains aligned with the structure of world prices. This implies that in the intermediate phase, a balance between supply and demand requires a different structure of domestic prices. The required change in the price structure has to be estimated carefully, and a policy to ensure such a change has to be made an important instrument of public policy. It is only when such a change is deliberately brought about by suitable tax measures that the scarcities of various commodities will increase the tax yield to the State rather than high profits to the producers.

(5) *Investment Allocation Policies*: The PCM provides a rationale for the broad allocation of investment. Thus, in the early phase, the strategy calls for an adequate allocation to the essential consumer goods sector, and subject to this the maximum allocation to the capital-goods sector. This does not mean that the allocation of investment should be made only on the basis of such a purely macro-economic exercise. Within the allocation suggested by the exercise, every effort should be made to choose the most efficient individual projects in each major sector, so that the overall allocation does not relieve us of the discipline of cost-benefit calculations. The individual investment decisions in each investment planning period should be based on the results of the most intensive project appraisal studies. An important difference would be that the project appraisal can then be based, not only on current economic conditions but also on the goal towards which the economy is being moved. While it may not be possible to ensure full utilisation of capacity from the time it is set up, an effort should be made in the course of such project appraisal studies to minimise the losses due to under-utilisation as much as possible, by suitable phasing of various projects. The overall exercise would then serve as a rough guide, indicating the nature and extent of the preference to be given to the various types of industrial investments.

TABLE 6: MODEL OF INCOME GROWTH AND INVESTMENT ALLOCATION

t	Y_t	C_t	N_t	I_t	P_k	S_t	r_t

(6) *The Role of the Public Sector*: The role of the public sector in industry has generally been based on reserving certain key industries to the public sector, although the First Plan did say that "it is best for the public sector to develop those industries in which private enterprise is unable or unwilling to put up the resources required and run the risks involved, leaving the rest of the field free for private enterprise" (p 422). A demarcation of the line between public and private sectors based on the nature of the industries may be too rigid; it would be preferable to determine the respective roles of the sectors on wider grounds related to the basic strategy of industrialisation. Then individual decisions would be based on the relative merits of public and private sector operation in individual industries. In particular the possibility that some industries consist of units in both sectors should be explored, with the public sector counterpart providing a model or testing ground for the private sector firms. In this connection, it must be noted that, although the public sector took up 36 per cent of fixed investment in manufacturing in the Second and Third Plans, it still accounted for only between 10 and 15 per cent of total output in the factory sector. However, the main problem to be tackled is not so much the question of what industries are to be operated in the public sector, but the efficiency with which they are operated in that sector. Two decades of experience have clearly demonstrated that there is something seriously remiss in the present system of management by the personnel of the administrative service. A new approach to industrial management in the public sector is long overdue. The most common remedy often suggested, and restated, e g, in the Fourth Plan, is that "there is need to develop a cadre of professional managers with adequate expertise in the fields of financial, production, personnel and marketing management" (p 313). It is an over-simplification to suggest that the problems can be solved by choosing the right persons or persons with the right training to be managers; part of the problem is the administrative tendency to run the public enterprises as if they were departments of the government. Perhaps the time has come to make a cleaner break between ownership and management, and search for methods of the private management of publicly owned enterprises.[26]

(7) *Regulation of the Private Sector*: *(A) Short-Term Targets*: The regulation of industrial investments in the private sector has been based on short-term quantitative targets set by the Planning Commission. Target-setting in this manner has been severely criticised;[27] it may therefore be useful to re-examine the case for such targets. In doing this, we must separate the concept of short-term targets from that of long-term targets on the one hand, and also distinguish between the targets set and the procedure used to implement them on the other. The case for long-term targets for some magnitudes is conceded; e g, Bhagwati says, "Clearly targets embodying national objectives are of crucial importance. Among these can be counted: national income, level of employment, consumption ... With these must also be reckoned the objectives of raising the level of savings, improving the export performance and ensuring a steady investment in the capital-goods industries, all of which buttress the grand, forward-looking targets of an increased rate of investment and growth (and therewith employment creation and elimination of general poverty) in the stipulated 25-year perspective spanned by the entire planning process".[28] However, it is doubtful whether long-term targets for such things as the national income and export performance make much sense, for these are magnitudes whose variation is so much outside the control of our own policies. The essential thing is the volume and the broad structure of investment. This is what the PCM strategy lays down. Sometimes this is criticised as 'physical planning'. There are two aspects to this criticism, which are relevant — one, that in physical planning, the types of investment are chosen without reference to their economic justification, and two, that the volume of investment is determined without reference to the availability of a corresponding amount of savings. We have argued that within a prescribed total volume of investment, every effort must be made to choose the economically most efficient combination. A useful principle to apply for this purpose is to ensure some degree of inter-industry balance, such as that provided by an input-output matrix applicable to the level of the economy expected by the end of the perspective planning period. We have also argued that every effort should be made to raise the level of saving to the planned amount of investment.

Once the long-term targets are defined, it is a separate problem to decide how far this needs to be supplemented by shorter-term targets of industrial investment, and how such targets are to be derived. All that can be said is that the short-term targets must be such that they lead to the final targets; within this, there will be considerable degree of freedom in fixing the short-term targets. In exercising this freedom, the short-term targets must be determined as consistently as possible on the basis of inter-industry balances and the current pattern of demand. While the criterion of inter-industry balance is applied quite rigorously for the final targets, it cannot be applied to the same extent for the short-term targets, for different industries develop at different rates. Also, while the final targets are related to the more equal distribution of income planned for the end of the development phase, the progress towards this income distribution will inevitably be slow, and it may not be possible for the short-term targets to be fully consistent with the pattern of demand dictated by the current distribution of income.

The fixing of short-term targets will, therefore, be arbitrary to some extent. But still some targets are needed to avoid critical bottlenecks for key resources, such as foreign exchange, steel, etc. Because of the long time lags involved in securing extra supplies of these resources, their allocation must be tightly budgeted. However, because of the difficulty of getting a sound economic basis for specifying such targets, the present practice of fixing targets in great detail for individual industries may be relaxed, and targets laid down for rather broad groups of industrial investments, governed by the need to stay just within the constraints imposed by the key resources.

(8) *Regulation of the Private Sector: (B): The Control System.* Once even broad targets are laid down, some system of control of industrial investments becomes unavoidable. But when a control system is established to ensure that the targets are met, it can be used to serve other objectives such as regional balance, prevention of concentration of ownership, promotion of efficient entrepreneurs, etc. As a number of recent studies have shown, the control system as it has operated in recent years, has been a total failure in all these respects. Above all, the sheer bureaucratic delays in operating the control system have been a major disaster. It is clear that without a major revision of the administrative procedure involved, planning approach will just prolong the agony and cause unnecessary hardship. However, to

abandon the planning approach because of this administrative problem is like throwing the baby with the bathwater. The control system can, and must, be streamlined so that it acts efficiently and speedily on the basis of clearly stated criteria. To prevent concentration, both initial licensing and subsequent re-sales must be regulated. To give a fair chance to a wider range of applicants, a choice must be made from a list at appropriate intervals instead of a 'first come, first served' policy. To prevent delays, office procedures must be improved and decisions made at a single point instead of being dispersed over a number of offices. To promote regional balance, some decentralisation of the control system to state capitals or regional headquarters must be considered. To maintain a continuing watch on progress, statistical information must be collected and processed promptly. These are all feasible improvements, given the will to make the necessary administrative reforms. And this will must be exercised, for the very fate of the planning approach and the prospects of rapid development hang in the balance.

(9) *Regulation of the Private Sector: (C) The Promotion System.* While the system of short-term targets requires the operation of a control system, the control system alone is not sufficient to ensure the attaining of targets. When the demand for the key resources is excessive, the control system can be relied on to top it off, but when the demand is below the target, the control system cannot raise it to the required level. This is particularly the case when the demand in particular regions is below that desirable for regional balance. This requires a parallel promotion system. The existing promotion system consists of a number of institutions providing financial and technical assistance. The system has not been very successful, as shown by the continued tendency for regional concentration and the protracted recession in industrial activity. Here also a basic revision of policies and administrative procedures is needed.

To conclude, the above discussion shows that planning for industrialisation on the basis of the PCM strategy is not just a matter of allocating sums of money to various heads of investment expenditure. It requires the supporting action of a number of policies to influence the economy to move in a direction consistent with these allocations. While much needs to be done by planners in the more detailed design of these policies, the success or failure of the whole approach depends crucially on the quality of the administration. An administrative machinery still functioning on the lines of British days is not equal to the task. If this machinery cannot be re-modelled to serve the new functions of government, we might as well give up the hopes of rapid development, that the strategy we have chosen dangles tantalisingly before us.

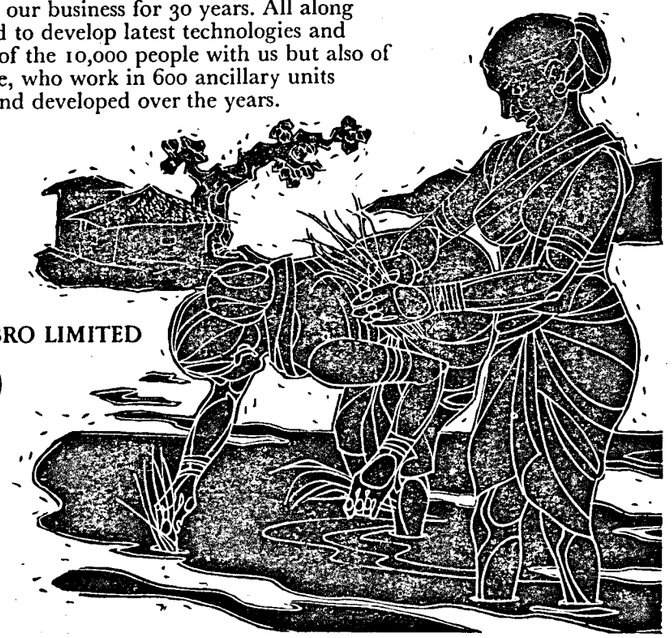
BANGLADESH IN SOUTH-EAST ASIA

THE EDUCATIONAL SITUATION

REVIEW OF AGRICULTURE



All the water we have can irrigate only half our cultivable land

so we're doing a striking job in search of water

We have about 1680 thousand million cubic metres of water. Because of the physical geography only one third is usable. Even if we used all the water it would irrigate only half our cultivable land. At present over 160 million hectares are cultivated. Only 28 million hectares receive irrigation. So we're going below the surface in search of water. The first water well drill was supplied by us 20 years ago. Today we manufacture them in India to the design of Westinghouse Air Brake Company, U.S.A. Of the 300 water well rotary drilling rigs in India, 200 are made or supplied by us.

Reaching for water is one field of our activity. Bringing it to the surface is another. That's a job for Johnston pumps. We've supplied several thousand Johnston turbine and submersible pumps in Southern and Western India—part of our endeavour to give irrigation a lift.

Development of industries is equally important. So we design, manufacture and instal plant and machinery for every vital industry. It's been our business for 30 years. All along we've endeavoured to develop latest technologies and talents—not only of the 10,000 people with us but also of the 10,000 or more, who work in 600 ancillary units we have assisted and developed over the years.

Second Start in Steel

THE government has, according to newspaper reports, set up what has been described as an inter-departmental committee to prepare an integrated long-term steel development programme. Comment on the merits of the decision will have to await more details, though on the face of it is to be doubted that an inter-departmental body is best suited to undertaking the task in question. Be that as it may, to the extent the decision reflects a revival of concern within the government for long-term planning in steel, it is to be regarded as a hopeful sign.

The facts of the steel debacle which began in the mid-sixties, if not earlier, are fairly well known by now. In the eight-year span between the end of the Third Plan and that of the Fourth in 1973-74, less than 2 mn ingot tonnes would be added to the country's steel capacity. Worse still, production of steel actually *declined* between 1965-66 and 1971-72. These facts are unlikely to come as a surprise to anyone. And yet the all-too-obvious link between the dismal performance in steel and the relative industrial stagnation of the last few years appears to have received precious little attention. For instance, how often does the fact of per capita availability of steel having gone down from 16 kg at the end of the Third Plan to 13 kg in 1971-72 find even passing mention in discussions of the industrial situation. Indeed, there has been greater readiness to see the opposite relationship between steel production and industrial growth, or the lack of it. Thus it has been pointed out, not without a sense of relief, that because of the slump in industrial investment and output the adverse consequences (as measured by the gap between steel production and demand) of the lag in expansion of steel capacity and the cost thereof in terms of foreign exchange expenditure on steel imports have been minimised! Even in more responsible quarters, the concern has been with ensuring that steel production kept pace with demand, or that at least too wide a gap did not develop between the two. Hence the repeated exercises in estimation of demand for steel — even as steel production stagnated. The vision of steel as a prime mover of economic development, which had informed the Second Plan's bold decision to raise steel capacity fourfold from 1.5 mn tonnes to 6 mn tonnes in the Plan period, appeared to have been completely lost.

Are things changing? With Bokaro at last in sight of the light at the end of the long tunnel and with the consultants' feasibility reports on the Vijayanagar and Visakhapatnam plants, as well as the smaller Salem special steels plant, in hand, the Steel Ministry is talking of adding two mn tonnes annually to steel capacity in the Fifth Plan. This is hardly spectacular, for it will still not take steel capacity much above 20 mn tonnes by the end of this decade, if even that. And what is more, as things are even this modest target looks almost a pie in the sky. Briefly the proposed bill of fare is somewhat as follows: expansion of Bhilai from 2.5 mn to 4 mn tonnes, achievement of 4 mn tonnes capacity at Bokaro and completion of the first stage of 2 mn tonnes each of the Vijayanagar and Vizag plants and the Salem plant of 0.5 mn tonnes. Considering that the first stage of Bokaro will finally have taken between 8 and 9 years since construction began in 1964-65, the Steel Ministry's expectation that the new steel plants would be completed by 1977-78 must of necessity be discounted, especially since the Planning Commission has, in the interests of hastening Bokaro's second stage, slashed the Fourth Plan allocation for advance action on these plants from Rs 110 crores to Rs 45 crores (not, of course, that had the original allocation been left intact it would have been fully used).

But before one gets lost in speculation about how long the new plants are going to take to build, there is a far more important (and not unrelated) issue to be considered. This is the cost of building steel plants which appears to have experienced virtually exponential growth in this country. Excluding cost of mines, township and other offsite facilities, Bhilai, Rourkela and Durgapur cost between Rs 1,600 and Rs 1,800 per annual ingot ton capacity. On the same basis, the current estimates for Bokaro are over Rs 4,000 per tonne at the 1.7 mn tonnes stage and, hopefully, Rs 2,800 per tonne at the 4 mn tonnes stage. As for the proposed new plants, the Steel Minister disclosed in Parliament last month that even operating at 100 per cent of capacity the Vizag plant would lose Rs 45 crores annually and the Vijayanagar plant nearly Rs 70 crores. Bokaro, it is evident, has set the standards in regard to the capital cost of future Indian steel plants at levels which are a multiple of those for comparable plants in the UK, Japan or the US (ranging from as low as Rs 900 per tonne or even lower to hardly more than Rs 1,200 per tonne).

Clearly, no viable development of the steel industry can take place unless a way can be found of bringing the cost of building steel plants back to earth

from these outer reaches of space. Here argumentation about the relative cost of expanding existing plants and of putting up new plants is largely irrelevant. For one thing, only a part of the required expansion of steel capacity can be secured through expansion; the rest has got to come from new plants. Further, the factors making for high cost are likely to affect expansion no less than the setting up of new plants.

The most important of these is the cost of equipment. It is, of course, common experience for project costs to go up with the extent of use of indigenous equipment. But what has happened in steel has no parallel in any other industry. It has been estimated that around 1966 the average cost of steel plant equipment was Rs 5,000 or so per tonne. Against this, it was originally estimated that the price of equipment supplied to Bokaro by Heavy Engineering Corporation would be around Rs 7,000 per tonne. Actually, the price of HEC equipment for Bokaro's first stage was finally settled at Rs 13,000 per tonne. This is not all. For the feasibility reports for the Vizag and Vijayanagar plants the price of equipment indicated by HEC is said to be between Rs 18,000 and Rs 20,000 per tonne, no less. HEC's inefficiency is, of course, legion. Not surprisingly, other domestic suppliers of steel plant equipment have happily accepted HEC's prices as norms. Indeed, even foreign suppliers are known to have jacked up prices on the basis of the high cost of Indian equipment. Along with the high cost of equipment, whether supplied by HEC or domestic private sector or bought from abroad, we have accepted (with Bokaro, once again, setting the standard) heavy design features for steel plants which are neither necessary for Indian conditions nor economical. Here the Steel Ministry could do worse than take the dust off Dastur and Company's painstaking cost reduction study done for Bokaro. In any case, immediate attention has to be given to reducing the costs of the Vijayanagar and Vizag plants to levels well below those indicated the feasibility reports.

There are, besides, problems of raw materials (the coking coal difficulties are fairly well known, but thanks to the policy of exporting the best quality lump iron ore our own steel plants will soon have to make do with lower grade ores and ore fines), of deciding the product patterns for the new capacity, of working out and meeting manpower requirements — all of which have to be viewed in a long-term perspective. Otherwise the setting of ambitious paper targets of expansion of steel capacity will serve no purpose. But as things are there is no agency with the necessary technical competence and political weight to undertake these tasks. The so-called inter-departmental committee referred to at the beginning cannot fill the role; above all, it will simply not be able to command the required expertise. Nor is the much talked-of holding company the answer, even if all the virtues claimed for it in respect of operational co-ordination of various aspects of building and working steel plants were accepted at face value.

This is a matter which deserves the urgent attention of the government just now when the country seems ready to make a second start in steel.

Aid

The More, the Merrier

ONE more meeting of the Aid-India Consortium has been held, and in keeping its recently acquired "good boy" status, this country has earned a favourable chit from the Consortium. The year 1971-72 was not among the best in recent years in economic performance. The agricultural harvest was less than good and industrial performance, at 3 per cent growth, was miserable. "Quick" estimates show that national income may have grown by only about 3.5 per cent, against 5-5.5 per cent in earlier years.

But the World Bank is willing to slur over all this. It attributes poor industrial performance to slackness in a few selected industries. It even praises our export performance — a tribute to the misuse of statistics. There is almost no reference to the performance of public sector units and to investment in private sector. Perhaps the Bank has been overawed by the economy's vitality in absorbing, without visible strain, the large inflow of refugees from Bangladesh and by the political finesse with which the Bangladesh crisis was met.

The World Bank is also possibly trying to advertise its independence of US policies. In earlier days, defiance of the US would have left India friendless in World Bank circles. Now the Bank takes pains to emphasise that its judgments are independent of the prejudices of the US administration. Consequently, the Consortium has agreed to the Bank's estimates of India's needs for 1972-73 : $ 700 million as non-project aid (including $ 200 million in debt rescheduling) and $ 500 million as project aid.

But what is deemed to be needed is not necessarily provided. And there are various problems already visible in obtaining the required funds. First, at the global level the US is notably uneager to continue to provide aid at even the old levels; evidence of this is the US reluctance to make its contribution to replenishing IDA funds. In fact many loan approvals of the World Bank are held up for lack of funds with IDA. Secondly, the US is still keeping up its hard stance on India. It is reported to have budgeted for only $ 90 million of aid for India for 1972-73. Thirdly, at the Consortium meeting itself, the US took a hard line, objecting to increasing the debt to be rescheduled from $ 100 million to $ 200 million. In fact this was the reason for the Consortium meeting breaking up without fixing a date for its next meeting, even though this is to be only about a month later.

India has declared the Consortium meeting a great success. Even as we talk more and more about self-reliance (and reduction in aid), every recognition by other countries of an increase in India's needs of foreign aid is considered an achievement. In fact, we are now also pleading for aid in local currency to the extent possible. Increasingly also, aid is not being related to development or growth; it is emerging as a means of keeping us where we are. The question to ask is : what is our estimate of foreign aid requirement in case the economy begins to move fast?

Foreign Companies

Data Gaps

IN any study of the finances of branches of foreign companies and foreign-controlled rupee companies, surely, one of the points on which one would expect information is their remittances abroad by way of dividends and other payments. Not so, according to the Reserve Bank. In its latest study on the subject, covering the year 1968-69, this aspect of the problem is not even mentioned. The study, published in the May 1972 issue of the Bank's *Bulletin*, purports to analyse the financial results of 223 branches of foreign companies and 378 foreign-controlled rupee companies in India. Nowhere does the study try to give any idea of the allocation of profits after tax in respect of the foreign-controlled companies. Even if it were to be accepted that actual remittances of profits abroad are not indicated in the balance sheets of the companies, the distribution of profits after tax as between 'dividend' and 'profits ploughed back' could be given.

Also, it should have been possible to derive from the pattern of shareholding what proportion of the dividend would accrue to the parent companies and would be 'remittable'. Nothing of the sort is attempted. True, the Reserve Bank conducts periodic surveys on India's 'International Investment Position' (the latest one, for 1967-68, was published in the March 1971 issue of the *Bulletin);* nonetheless it is natural to expect data on allocation of profits by foreign companies alongside other aspects of their finances.

This is not, unfortunately, the only fault that one can find with the study. The sample of branches and foreign-controlled rupee companies selected from the different industrial groups is hardly representative. This is particularly true of branches of foreign companies. Of the 233 branches of foreign companies studied, 110 branches are in plantations, 24 in manufacturing, 55 in trading and 34 in other industrial groups. How unrepresentative this is of the actual distribution of branches of foreign companies among different activities will be evident from the Table, taken from a study published in the Company Law Department's *Company News and Notes*. Thus while as many as 110 branches of foreign companies in the plantations group figure in the sample (against a total of 126 such branches in 1969-70), the sample contained only 24 branches of foreign companies engaged in manufacturing (out of 123 such branches in 1969-70). The Reserve Bank is apparently unaware of the shift in the concentration of foreign capital in India from plantations to other areas such as manufacturing.

The same fossilised approach is evident also in the industrial classification adopted for the study. As mentioned above, the sample is classified into four categories: plantations, manufacturing, trading and other industrial groups. Of the 378 foreign-controlled rupee companies in the Reserve Bank's sample as many as 311 were manufacturing companies. Yet no disaggregated picture of the manufacturing sector is presented, with the result that data on foreign petroleum companies, drug companies and textiles and machinery manufacturing companies, among others, are all clubbed together. Is it possible to draw any worthwhile conclusions from such data? The Reserve Bank's Investment Survey, referred to above, at least gives separate data for petroleum companies. A far more meaningful classification was provided in the Reserve Bank's study of foreign collaboration (1968) which gives data for as many as 13 groups/sub-groups of industries.

The penchant for aggregation and obfuscation is to be seen also in the clubbing together of all foreign-controlled rupee companies and presentation of global data for them. No distinctions are made between companies with different proportions of foreign capital holding—e g, between those which are wholly foreign-owned subsidiaries with 100 per cent capital held by the foreign holding companies, those subsidiaries which have between 50 per cent and 100 per cent foreign capital holding and those companies in which the foreign holding is in the 25-50 per cent range. The study published in *Company News and Notes* referred to above brought out that in 1968-69 88 out of 223 subsidiaries of foreign companies were wholly-owned subsidiaries. The Department of Company Law, the Industry Ministry and even many of the Reserve Bank's own studies make a distinction between subsidiaries of foreign companies and other foreign-controlled companies. The distinction is useful because in non-subsidiary companies even if the foreign shareholding is above 25 per cent the foreign investor does not always exercise effective control over managerial or financial matters (Firestone's travails in regard to Synthetics and Chemicals is a classic example).

TABLE: BRANCHES OF FOREIGN COMPANIES, 1969-70

	No	Assets (Rs crores)
(1) Agriculture and allied activities	126	217.0
(a) Tea plantations	123	214.8
(2) Mining and quarrying	8	27.5
(3) Processing and manufacture	123	294.3
(4) Construction and utilities	23	63.4
(5) Commerce	158	632.9
(6) Community and business services	77	47.9
(7) Personal and other services	14	3.1
Total*	529	1285.9

*Excluding 'aviation and shipping'.

Fishing

In Deep Waters

A Correspondent writes :

UNION CARBIDE's exports of fish have attracted attention, but not for a reason which the company is likely to welcome. It has been alleged that Union Carbide has been exporting fish to the United States at prices lower than those obtainable in the Japanese market. The complaint gains an edge from the fact that, according to these reports, Union Carbide's buyer in the US is the International Fisheries Corporation of New York which is reported to be interconnected with Union Carbide of US which has the controlling interest in the Indian company. It has also been alleged that the US importer sells the fish under its own brand names at prices much higher than what it pays the Indian exporter. Union Carbide has refuted the allegation that the exports to the US at lower prices are a means of making concealed foreign exchange remittances and has claimed that it is willing to export to any destination which offers a higher price provided suitable shipping facilities made available at Visakhapatnam port which is the company's centre of operations. According to the company, none of the shipping companies had so far complied with its requests that ships with refrigeration facilities call at Visakhapatnam on their Japan-bound trips.

Allegations against foreign-controlled companies of charging low prices for exports to their associates abroad or high prices for purchases from them are, of course, not new. The foreign oil companies have been suspected of paying high prices for crude supplied by their associates abroad and from time to time the government has had to make *ad hoc* reductions in the foreign exchange released to them for crude imports. This does create a piquant situation. For, the government is keen to push foreign companies into export-oriented activities. Thus according to the government's present policy, Indian subsidiaries of foreign companies are allowed to expand their operations provided they undertake to export 60 per cent of the incremental output. Another point that needs to be noted is that official regulations do not prohibit remittance of earnings or even repatriation of capital by foreign investors, though the government appears to be concerned about foreign companies persistently drawing upon reserves for remitting dividends. In view of the liberal provisions for remitting profits and other collaboration charges and payments, foreign companies certainly do not need to indulge in under-invoicing of exports to remit their legitimate earnings. In the circumstances, under-invoicing of exports (and over-invoicing of imports) by foreign subsidiaries is no way different from the behaviour other Indian ex-

porters (and importers) who indulge in under-invoicing (and over-invoicing) to finance unauthorised transactions in foreign exchange.

Coming back to fish exports, the prices offered by the Japanese for Indian shrimps are said to be higher than those ruling in the US. The present situation appears to have arisen as a result of the realignment of currency parities in the course of which the Indian rupee got devalued with respect to the Japanese yen but revalued upwards with respect to the US dollar. Even if Japanese prices are for the present higher than those obtaining in the US, the latter continues to be a major market for Indian shrimps. In fact, the complaints against Union Carbide appear to have a different basis from what it might appear to be at first sight. The fishing industry is at present dominated by small operators with limited capital and equipment at their disposal. They do not have sophisticated trawlers for deep sea fishing nor their own refrigeration facilities. These small operators concentrate on off-shore fishing, as a result of which the total catch is reported to be declining, especially along the Kerala coast. Already worried about their export prospects, the small operators have been trying to get all types of assistance from the government and also to build up a case against the entry of big operators like Union Carbide who, they fear, may take away their most lucrative business.

The complaints of the small operators are justified to the extent they are about the area of fishing. The government needs to consider why it should not stipulate that the foreign subsidiaries as well as the big Indian business houses (e g, Tatas, DCM) who are entering fishing in a big way should confine their operations to deep sea fishing, a given minimum distance away from the coast. Fish and fish preparations have a considerable export potential and it would not be in the interests of the country to restrict the entry of big operators into fishing so long as they agree to confine their operations to deep sea fishing, employing modern fishing crafts and advanced technical knowhow that are not available to the small operators who earn their livelihood through offshore fishing.

Coal

Wages, Wagons and Profits

A Correspondent writes:

THE price of coal supplied to railways, the major consumer of non-coking coal, has been the subject of regular annual debates. The collieries forced a showdown on this issue a few years back. The discussions for the current year, which were completed in April, did not provoke as much fierce controversy as in earlier years, but were nevertheless interesting in many respects.

Press reports suggest that the price of coal supplied to railways by collieries in the Bengal-Bihar area is being increased by Rs 2 to Rs 3 a tonne. Singareni coal is to fetch a price higher by Rs 1.7 a tonne; for coal in outlying areas a marginal revision of 37 paise per tonne has been envisaged. It is reported that the total increased expenditure for the railways will be of the order of Rs 1.6 to 1.8 crores.

There has been a steady increase in the price of coal year after year and neither the railways nor the government as a whole seems to be very much concerned about this as the increases are passed on to the railways' customers *via* fares and freights. There are two major reasons for cost increases leading to price increases in the case of coal — railway wagon availability and wage increases. Wagon availability is linked to the efficiency of the railways themselves. Wage increases follow the awards of the Coal Wage Boards.

The line-up in the price battle is interesting. The agitation for an increase in coal prices comes from all collieries, in both public and private sectors, and this is supported by the Ministry of Steel and Mines, the producers' Ministry; the railways, on the other hand, stoutly resist the demand. The curious fact, however, is that out of about 15 million tonnes of coal supplied to the railways, more than two-thirds is supplied by private sector collieries and only the balance by the public sector agencies, such as National Coal Development Corporation (NCDC), Bharat Coking Coal (which produces a small quantity of non-coking coal as well) and Singareni collieries. Thus one wing of the government aligns with the private sector — which is the main supplier and which stands to gain most from any price increase — against another wing of the government, the railways.

The matter becomes curiouser when we note that all these public sector agencies have fully and faithfully implemented the Wage Board Awards, with the result that their cost of production is much higher than that of private collieries. On the other hand, only a few private sector collieries, less than 10 per cent, have fully implemented the wage board awards. Nevertheless all collieries are lumped together and the price increase is considered on a uniform basis. A strong case is put forward by the Ministry of Steel and Mines on the ostensible ground of supporting public sector enterprises, but actually the real beneficiaries are private sector collieries!

It is reported that the demand for higher coal prices was gone into by the Bureau of Industrial Costs and Prices. The question of implementing Wage Board Awards by private collieries and relating the price increases directly with the extent of implementation of these Awards is also said to have come up for consideration. But linking of price increases with implementation of the Wage Board Awards seems to have been finally given up. On the other hand, quite recently, the Union Minister of Labour has stated that the government would take recourse to the Defence of India Rules for ensuring implementation of Wage Board Awards. Surely, the easiest way of disciplining the private sector collieries would have been to link the price increase with the implementation of Wage Board Awards and thereby to deny them the extra profits which they now run away with. The correct policy would be for railways not to purchase coal from collieries which have not given the wage benefits. When the government is not prepared to enforce even this simple measure of discipline, talking of Defence of India Rules which has so far been used only *against* labour and never in its favour, is only an empty threat.

By not regulating wagon movements, the railways, in paying higher prices to the collieries, pay for their own inefficiency. Private sector collieries thus seem to benefit both by railways' inefficiency and by cleverly teaming up with public sector agencies, who provide them a cover of respectability and who fight their cause against the railways.

Sugar

The Show Goes On

THE sugar industry has been known for its readiness to enter into "gentlemen's agreements" and break them as and when it suits it. It pushed up prices from Rs 185 per quintal to Rs 240 during the early part of the season. But then came the war with Pakistan and the declaration of emergency. The industry decided to accept voluntary partial control for the period of the emergency or six months, whichever was shorter. During this period it agreed to hand over 60 per cent of its production to the government for controlled distribution at the

ex-mill and ex-excise duty price of Rs 150 per quintal. The balance of the output was available to be sold in the free market.

Partial control became effective from January 1 this year. Accepting the scheme, the government forecast that the free market price would stabilise around Rs 240 per quintal. But in March prices were pushed up to Rs 305 and the government could do little about it. To some extent the government has been responsible for the up-trend in prices. It has periodically revised upwards the tariff value of sugar — from Rs 135 in October 1971 to Rs 210 by June 1972. The incidence of excise duty has thus increased from Rs 40.50 to Rs 63 per quintal. During the summer months, however, prices did not go up further in spite of restricted monthly releases and the fact that in the cities the ration quota has been cut from 2 kgs to 1.5 kg and later to 1 kg only.

Meanwhile, industry with the help of cane-growers was insistently petitioning the government for an increase in both the minimum price of cane and the levy price of sugar. When there was no response from the government, the industry decided to inform it that the voluntary agreement would expire on June 30. The government was thus forced to announce its policy for the remaining months of the current season. On June 10, industry's spokesmen declared that the levy prices ought to vary from Rs 123 to Rs 180 per quintal. A few days later the industry demanded that the government follow a system of zonal prices. The government itself announced its policy on June 15, instituting statutory partial control from July 1. The country is to be divided into 14 zones and levy prices are to be fixed, ranging from Rs 122.82 to Rs 183.70. In this context it is necessary to recall that the government had been almost forced to adopt decontrol because the Allahabad High Court had struck down the system of levy prices. According to press reports, several factories have already decided to challenge the government order.

That apart, fixing of levy prices by government experts at precise levels such as Rs 134.01 or Rs 152.98 smack of sham accuracy. Instead the number of zones could be easily reduced to four and the levy prices fixed as follows: zone I Rs 125; zone II Rs 135; zone III Rs 150; and zone IV Rs 175. Perhaps even better might have been a single levy price at about Rs 140.

A study of the financial results of 11 sugar companies made by the ICICI shows that their operating profit in 1970-71 increased by three times over 1969-70. A similar study of 42 sugar companies shows an almost 2.5 times rise in profits. And this happened in spite of a 10 per cent fall in production and seven months of depressed prices. On this basis the results for 1971-72 are expected to be still better.

Inflation

Who Pays ?

IN his annual statement to shareholders, the chairman of Hindustan Lever, V G Rajadhyaksha, refers to a major problem faced by all partially planned economies — that of ensuring that the relative profitability of different industries (or, more generally, different economic activities) is such as to achieve the socially desired allocation of investment resources. In their anxiety to keep down the prices of basic producer-goods (e g, steel, cement) or of essential consumer goods (e g, coarse cloth, life-saving drugs), governments resort to price controls while prices of less essential commodities are left free to be determined by the market. In a general inflationary situation this makes the essential consumer goods (and basic goods) industries less profitable than the rest and, therefore, less attractive to entrepreneurs and investors alike. An even less desirable situation arises when the price controls on essential goods cannot be effectively enforced so that while prices are pegged at the point of manufacture, the goods in question are not available to the consumer except in the 'black' market at prices much higher than those fixed by government. In this case, the objective of price control is defeated and yet fresh investment in the industry and expansion of production are thwarted.

Serious as the problem is, it does not admit of easy solutions. Given the extreme inequality of distribution of incomes and the abysmally low purchasing power of as much as one-half of the total population, the gap between social and private cost-benefit calculus is inevitably too wide to be bridged either by physical controls (which Rajadhyaksha disapproved of) or by a regimen of taxes and subsidies.

Understandably, Rajadhyaksha is concerned primarily with the impact of price movements on his company. It is his contention that "the burden of inflation in the case of your Company has been borne not so much by the consumer of its products, or by its employees, as its shareholders". On the face of it, the picture is a sombre one — after adjusting for the rise in the wholesale price index, while Hindustan Lever's turnover between 1961 and 1971 expanded by 45 per cent, its profits actually declined by 33 per cent. It follows axiomatically that the company's costs went up faster than its sales realisation, but how much of this is to be blamed on inflation *per se*? Is it not true that some of the company's investment decisions are at least partly responsible for the decline in profitability?

The last few years have been marked by persistent and large increases in the prices of manufactures. In this context, it would have been useful indeed had Rajadhyaksha given us a systematic account of trends in costs and selling prices in respect of Lever's different product groups. He does not attempt this, unfortunately. The company's efforts to improve operational efficiency — for instance, the introduction "over the last few years" of a system of management by objectives (MBO) — are mentioned in general terms. It is also claimed that the consumer has been to a great extent protected from the impact of the rise in costs, though it is difficult to be convinced that Levers actually sells its soap at "a price subsidy".

Rajadhyaksha says that "between 1960 and 1970 the average cost of management employees rose by 70 per cent and the cost of non-management employees by 131 per cent, while the wholesale price index rose by 82 per cent". This could be taken to suggest that while non-management employees managed to more than protect their real earnings, management employees actually suffered a loss of earnings in real terms — a rather startling thing to have happened. Or could the explanation be that the management cadre of the company expanded rapidly over the period so that at the end of it a larger proportion of management employees, being younger and newer entrants, were on the lower rungs of managerial salary scales, thereby depressing the average cost per management employee? Again, a significant part of the increase in the average cost of management employees, it is likely, took the form of perquisites the monetary value of which, as everyone knows, is grossly undervalued by both companies and the Income-Tax Department (it being customary, for instance, to value use of the company's car at Rs 1,800 per annum).

CAPITAL VIEW

Summer and Summits

Romesh Thapar

WHAT can one report from the Capital these days? Nothing really, apart from the Nandini Satpathy exercise in unfortunate Orissa. And that's now a happening made to order. Boring, to say the least.

For several weeks, an extraordinary 'heat wave' has driven the policy-makers, the file-pushers and the over-lapping secretariats into a kind of stupor. The dust hangs in the air, radiating further heat. There's no cool in the evenings. The airconditioners, where they exist, are ineffective. The desert-coolers, more sensible at this time of dry heat, are also fighting a losing battle. And water is reduced to a trickle in the taps. It's clear that we really didn't have a system that works. The summer months are proof. And it certainly gets worse every year, despite all the urban planning chatter we hear.

To make matters even more paralytic, huge chunks of the government are absent, junketing within the country or outside. Ministers, Secretaries, Assistants, Specialists, Advisers, wives and what have you are touring. We shouldn't really deny the 'servants of the people' this break in service because the heat is of a kind that really makes nonsense of work. The English were realistic; they took the government to the hills. Where is that idiot politician who said airconditioning is a luxury?

It's good to know that someone in the hierarchy at least had the good sense to change the venue of the Indo-Pak summit from the oven that is Delhi to the heights of Simla, even though the hill station appears to be on the verge of a water famine. We hope that, by then, the so-called 'heat wave' will recede and the monsoon will start moving along its appointed path.

Interest in this summit is hardly discernible. Maybe, this is due to the deliberate underplay in the Press and the wise decision not to speculate on President Bhutto's likely attitudes. A very complex psychological stituation has to be dealt with at the summit. Indira Gandhi will need all her skill to assert her fundamental positions regarding the future and yet not tend to dictate. There are too many people around who have a stake in the failure of the summit. We would do well constantly to remind ourselves of this.

A sample of the kind of tactics that are employed was demonstrated by the planted and tendentious story about India 'handing over' a certain number of POWs (including General Niazi!) to Bangladesh. The intention was to excite the Pakistanis to withdraw from the summit and significantly, an Indian news agency was used to push the story with a Dacca dateline. Leading newspapers will have to watch their step and realise that lack of vigilance on sources of news is today tantamount to playing the game of our enemies, within and without. In fact, a probe into this POW story, and the news agency set-up, would have a salutary affect.

Indo-Pak summitry invariably sparks activity among the communalist sections of India's 60 million Muslims. On this occasion, they have seized upon the projected reform of the so-called Aligarh Muslim University to launch a widespread agitation in the North. The idea obviously is to organise a 'situation' around the end of the month. These calculations are likely to misfire as the very much more significant *detente* with Sheikh Abdullah and his friends is likely to have a more pertinent bearing on the summit.

The attempts to make mischief between India and Bangladesh, the fanning of the old and now irrelevant passions which thwarted Indo-Pak understandings, and the sinister moves somehow to revive communal clashes within India (now embracing the third largest concentration of Muslims in the world!), is part of a single effort to disrupt the trend towards peace and co-operation in the subcontinent. Unless we see these happenings in this light, we will not be able to understand them or confront them.

We are certainly getting back to hard realities. The summit compels us to assess the future of the subcontinent and the various possibilities or alternatives that open before it. The heat takes us back to 1965 and 1966 when the pattern of a sluggish monsoon was similar. We live on the edge of disasters, and this should make us firmly determined to think rationally, in a coherent perspective about our interlocked problems, national and international. In other words, communal emotions and activities will have to be blasted.

We will need several patient summits before we get things sorted out on the subcontinent — and they may well stretch into the winter. Let us hope that patience prevails and that climatic disasters do not compromise and embarrass us.

June 19

COMPANIES

For Greater Flexibility...

Hansavivek

MAHINDRA UGINE STEEL COMPANY applied for an industrial licence for substantial expansion of capacity some two years ago; it is still waiting for government decision. The existing plant facilities do not provide for any flexibility in terms of inter-dependence between the different production shops. The company is going ahead with its 'balancing scheme' to achieve full utilisation of the existing capacity. It is also intended to diversify MUSCO's activities. As a first step in this direction, the Memorandum of Association is being amended to include a wide variety of businesses. Among these, manufacture of cold drawn and ground bars and sections, polished steel, silver steel, bright bars and shaftings, ball and roller reces, wheels, tyres, axles, welded, seamless and extruded ferrous and non-ferrous tubes, sections and profiles, manganese-alloys, electro-metallurgical and electro-chemical products. Also proposed are the businesses of mechanical, electrical and marine engineering and the manufacture of chemical products and plant, equipment and machinery required by the iron and steel industry, and the establishment of agencies for the sale of any materials. The management intends to establish as soon as possible a merchanting division to handle some of these products to pave the way for diversification into new fields of business.

During its ninth year ended December 1972, MUSCO showed good improvement in production, sales and profits. Ingot output rose by 10 per cent to 37,691 tonnes — in spite of inadequate availability of heavy melting scrap, overall deterioration in the quality of melting scrap, and continuing shortage of certain essential inputs. The output of saleable finished steel increased by 22 per cent to 31,828 tonnes because of cogging and re-rolling of bought-out ingots and blooms. Last year, the company established the manufacture of stainless steel bars, high temperature steels, valve steels, peeled carbon, free cutting and alloy steel bars.

The company has switched over completely to the reducing balance method of computing depreciation for all items of fixed assets. This has necessitated an additional provision of Rs 150 lakhs. During the first quarter of the current year, sales at Rs 267 lakhs were about Rs 22 lakhs higher compared to the same quarter last year. It is stated that utilisation of the spare capacity of the rolling mill may not be possible to the same extent as that of last year owing to difficulties experienced in procurement of adequate quantities of bought-out ingots and blooms. The effective outstandings against firm orders stood at 15,100 tonnes as at the end of March last, spread over for delivery upto the end of the year.

MOTOR INDUSTRIES COMPANY received an industrial licence in August 1971 for carrying out its fifth expansion — partly in Bangalore and partly in a new factory at Nasik. Kreditanstalt fuer Wiederaufbau, Frankfurt am/ Main, West Germany, has agreed in principle to provide the company with

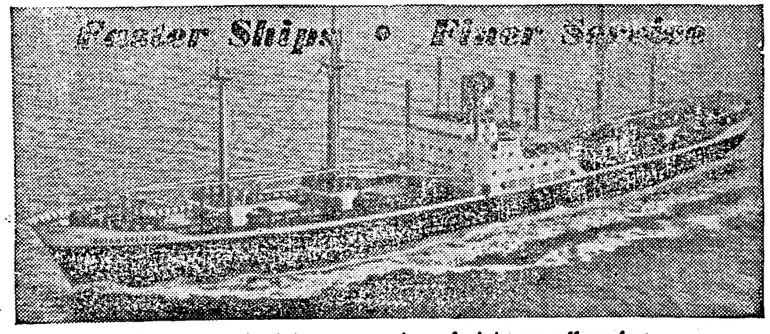
* Profits adjusted against arrears of preference dividends and depreciation.

DM 21.36 million out of West German project aid; matters pertaining to the rupee financing are also in an advanced stage of settlement. Only after all aspects of financing are completed will the directors be able to take steps for the issue of bonus/rights shares which the shareholders have been long expecting. Meanwhile, MICO turned out good results for 1971, with a fair improvement in sales, margins, and profits. The unchanged dividend, at 17.5 per cent, was covered more than twofold. Exports, increased from Rs 80 lakhs to Rs 122 lakhs. The current year's potential for exports, however, does not appear to be bright — owing to the general setback to the "economy of many countries in the world"!

ENGLISH ELECTRIC proposes to issue 2,50,000 equity shares of Rs 10 each at a premium of Rs 3 per share as rights to the existing Indian shareholders in the proportion of one new equity share for every two equity shares held as on August 17 next. The company has produced good results for the year ended March 1972. According to preliminary figures, profit before tax aggregated Rs 1.49 crores against Rs 1.07 crores in the year before. After-tax profit was Rs 60 lakhs (Rs 49 lakhs). The Board has recommended a dividend of 18 per cent.



JESONS ELECTRONICS, a new company, is setting up a project at Ghaziabad in UP for the manufacture of 60 million dry batteries per annum in technical and financial collaboration with Yai Dry Battery of Japan which has been making dry cells for the last 80 years. Of the total estimated project cost of Rs 1.98 crores, Rs 65 lakhs will come from share capital. The promoters and their associates have taken equity shares of Rs 20.5 lakhs and equity shares of the value of Rs 5 lakhs have been reserved for the Japanese collaborator. The company is offering for public subscription, through a Prospectus, equity shares of Rs 24.5 lakhs and 9.5 per cent redeemable cumulative preference shares of Rs 15 lakhs. The entire public issue is fully underwritten. The subscription list is to open on May 19 and close on May 30 or earlier, but not before May 23.

Jesons would be the first unit in Northern India to make metal jacket leak-proof dry cells, which are preferred by most users to the conventional type. According to Raunaq Singh, a director, although the plant is scheduled to go on stream only by April next, the company has already negotiated in advance sale of 60 per cent of its production to a "world renowned radio manufacturer". Demand for dry batteries has been steadily rising and is likely to go up to 1,100 million cells per annum by 1974-75, whereas actual production in 1971 was around 500 million pieces against the installed capacity of 600 million pieces. The managing director, R J Agarwal, expects the company to pay a maiden dividend of 10-12 per cent for 1974-75, the first full year of production.

A Correction

Among the authors of 'Uncertainty Analysis in Capital Investment Decisions — Some Aspects' (June 17, p 1186), the name of Venkutai H Patil was misprinted as Venkutai H Patel. The error is regretted.

Institutional Intervention in Company Affairs

K T Merchant

TILL a couple of years ago, financial institutions like the LIC did not take any interest in the management of companies in which they held shares. The managements had their way as the Board of Directors mostly consisted of their own nominees, all belonging to the small 'charmed circle', there being hardly any really 'independent' directors. In rare cases, where there were 'independent' directors, they were in a helpless minority and quite ineffective. Thus, the interests of the small shareholders were neither represented nor safeguarded. The Company Law Board was and is supposed to be a watchdog and is expected to act in their interests but it interpreted the law narrowly, took a technical view of things and more often than not rubber-stamped the decisions of the management. All this, coupled with the general apathy of the vast majority of scattered shareholders and the strong entrenched position of managements which always armed themselves with a large number of proxies, enabled managements to ride roughshod over opposition, when there was any. Directors nominated by the government, banks and institutions which had given loans to the companies concerned sat on the Boards for the specific purpose of safeguarding the repayment of the loans and did not bother about any other aspect of management. As one of the leading institutional lenders told this author, they were not there to manage the company for others.

When the managing agency system was abolished with effect from April 3, 1970, the government did not give any guidelines or envisage any alternative pattern of management with the result that the erstwhile managements brought into being a new set-up of presidents, vice-presidents, chairmen, vice-chairmen, managing directors and functional directors (for different departments like technical, finance, marketing, etc) with very high salaries and all sorts of perquisites. Most of them have hardly any qualifications, yet they are styled professional managers on the specious plea that they have worked or have been associated with their companies for a number of years. In many cases, this has become a family affair and sons or relations without much experience come to occupy very responsible positions. If a thorough study were made, it will be revealed that the new set up is much more costly and more detrimental to the interests of the small shareholders and the community at large, as it has raised the cost structure still further, and that without eliminating any of the disadvantages of the managing agency system.

The Shareholders' Associations, especially the one in Bombay, are dominated by share-brokers and as such their interests are not the same as those of the small shareholders, as can be judged from their utter passivity at crucial junctures at annual general meetings of companies. Auditors, who are nominally appointed by shareholders at annual general meetings to report to them on the accounts and financial management of the company, are usually nominated by managements. They confine themselves to the narrow limits of the law and rarely report on important points which, morally, they ought to bring to the notice of the shareholders — e g, writing off of huge sums as depreciated investment. They defend themselves by saying that they have met all the legal requirements and thus join hands with managements in converting the minimum legal requirements into the maximum service expected of them. It is by now common knowledge that but for this kind of attitude on the part of auditors, scandals like the Dalmia and Mundhra affairs would not have occurred and very prosperous companies reduced to bankruptcy. If auditors performed their duties towards the shareholders as they ought to most of the sins of omission and commission of managements would come to light in the normal course whereas now they do so only when there is a split in the management (all directors are to be assumed to be part of management) and a proxy fight takes place. This happened when Kilachands and Firestone in Synthetics and Chemicals, and Chinais and Kapadias in National Rayon fell out and much dirty linen was washed in public. This brought to the notice of the shareholders many sins of omission and commission of managements vitally affecting their interests. But at such times the gimmick of higher dividends is resorted to by managements to distract the attention of shareholders, and to throw a smoke-screen round their doings exposed during the proxy war.

In the circumstances, the common shareholders were happy to note the increasing interest recently taken by institutional shareholders like the LIC in the affairs of companies. This was first seen in their success in preventing Larsen and Toubro from giving a fabulous salary to their managing director. The two recent cases in which LIC has taken a keen interest are National Rayon and Synthetics and Chemicals. With a view to safeguarding the interests of the common shareholders, it intervened to prevent the proxy wars being carried to their logical conclusion. Such intervention by LIC ought to be for, and on behalf of, shareholders to set matters right and not merely to patch up differences between the two factions within the management and to maintain the *status quo*.

In the case of National Rayon, the dispute had gone to the Company Law Board as both sides had complained against each other and invoked action under sections 250 and 409 of the Companies Act. The Company Law Board, after hearing both the sides and studying the report of their Inspection Officer under section 209, appointed two government directors under section 408 of the Companies Act, one of whom was T A Pai, then Chairman of the LIC, who had played a leading part in bringing about a compromise and preventing an open fight at the annual general meeting last year. But the shareholders have been kept in the dark about the findings of the CLB which are not easily accessible to them. A request by the present writer for a copy of the report was met with the reply that it would be duly published in the department's journal, *Company News and Notes*, a copy of which would be sent to him. This is still to arrive.

Both sides published a few extracts from the CLB's findings favourable to themselves in their proxy fight so that the correct picture was not available to shareholders. The fact that apart from nominating two directors under section 408, no further follow-up action has yet been taken by the CLB to compel the management to reimburse the financial losses suffered by the company on account of negligence as reported in the Inspection Report (*vide* para 32 of the CLB award dated May 7, 1971) seems to show that the CLB have failed to

protect the interests of the shareholders and the public at large. One fails to understand the inaction or apathy of the CLB especially in view of its categorical statement in para 31 of the abovementioned award that "the disclosures in the Inspection Report under section 209 and the actions of the present Board of Directors clearly indicate that the affairs of the company are being conducted in a manner prejudicial to the interest of the company and to the public interest."

It is, therefore, absolutely necessary that the CLB's findings must be published and made easily accessible so that shareholders can have a correct picture regarding the allegations and counter-allegations and be in a position to judge for themselves.

A very important point in this connection is that the so-called compromise formula about the constitution of the Board effectively gagged the mouths of shareholders at the annual general meeting as they were not allowed to criticise the management in the light of facts exposed during the proxy war. One of the government directors had promised to bring about radical changes in management. However, nothing concrete seems to have been achieved though a year has passed. Shareholders are still in the dark about the whole question of radical transformation of management. Last year, despite adverse financial ratios, the dividend was increased to Rs 32 by the management as a sop to the shareholders, while the other side had proposed a still higher dividend. Surprisingly, despite the continued adverse financial results, dividend has been stepped up this year by Rs 8 under the guise of a Silver Jubilee Bonus — this time a clever device to please and win over the shareholders by the other side. One wonders what role the government-nominated directors played in this regard. One understands that after the amendments to the articles of association at the last annual general meeting, Kapadias' attempt to capture the management were foiled in the Board by a majority of only one. But one cannot say as to how long such a precarious majority will last.

Regarding the promised radical changes in management, the only information one gets from the Report is contained in four brief lines on p 3 under the heading 'Management'; "The Board is seized of the question of providing a well-knit organisational set-up for the company with a view to facing new challenges and achieving better results. To that end Messrs Kirloskar Consultants Ltd have been appointed to go into the matter. Their report is still awaited. Shri R Rajgopalan, an eminent management consultant, was also appointed to go into the set-up of financial administration. Shri Rajgopalan has submitted his report and his recommendations are under study". After one whole year of operation of the so-called compromise formula, which prevented shareholders from seeking information on the basis of the facts brought to light during the proxy fight, this is all that they are told. Nothing is said about the financial losses suffered by the company as a result of financial mismanagement. The annual report is silent about this except for a small para on p 4 under the heading "Alleged Losses" informing the shareholders that "some shareholders, through their solicitors, served notice on the Company to take steps to recover the amount alleged to have been lost in past years due to the negligence of the persons then in management. The Board, after the consideration, have written to the then Managing Agents, *viz*, Messrs Chinai & Co Private Ltd, in the matter and are awaiting their comments". This kind of dilatoriness makes one sceptical about the effectiveness of the Board of Directors in safeguarding the interests of small shareholders. It was expected that the Board would have studied the report of the Inspection Officer of the CLB and the order dated May 7, 1971 and initiated suitable action to get the losses reimbursed to the company.

In the case of Synthetics and Chemicals also the intervention of the LIC effectively prevented the shareholders from putting questions to the management on the basis of information revealed during the proxy fight. A committee was appointed with leading officials from the financial institutions as members. The committee submitted its report a few days back. When at the annual general meeting of the company on June 12 the present writer suggested that the shareholders be taken into confidence and told about the main recommendations of the committee since the committee had been appointed by and on behalf of the shareholders, the Chairman of the company took shelter behind a technicality to argue that the committee had been appointed by the Board and that it was to report only to the Board. As such, the Board would consider the report and then inform the shareholders. In all probability, this would mean that nothing would be known to shareholders till the next annual general meeting. If the Board were serious about it, it could have considered the report and taken a decision on it in time for this year's annual general meeting. The report is known to be a brief one and it was submitted on June 9. Annual general meetings of companies are usually preceded by a meeting of the Board of Directors and so this brief report could have been placed before the Board and the shareholders informed of the recommendations of the committee. The attempt by the management to postpone consideration of the issue makes one suspect that the report is adverse to it.

In the light of the above facts, it is not clear what purpose so-called intervention by the LIC serves. Things happen behind the scenes and in meetings of the boards of directors; no inkling of these is available to the shareholders who are effectively prevented from raising issues or asking questions at annual general meetings on the specious plea that the past should not be raked up and that the compromise arrived at would set everything right. But in these calculations the possibility of the two sides coming to an understanding seems to have been ignored. In that eventuality, the LIC and government nominated directors find themselves in a small and helpless minority.

Intervention by institutions like the LIC ought not to be to maintain the *status quo* but to effectively check mismanagement and safeguard the rights and interests of small shareholders. For this, it is necessary that they should make their policy clear, categorically assert that they are intervening in the interests of and on behalf of the shareholders. Moreover, they should not arrive at face-saving formulas behind the scene but should take the shareholders into confidence. They must also insist that reports by committees and/or experts or consultants be made available to shareholders and not be regarded as confidential documents to be considered by the boards of directors alone. They should also see that the necessary changes in management are brought about in as short a time as possible and not let matters drag on for more than a year as has happened in both the cases referred to above.

Another related issue is that of the role of directors nominated by LIC and/or government who would be always in a minority on the boards of companies. To what extent and in what way can they exert the necessary influence on the managements? Alertness on the part of shareholders and a vigilant public opinion alone can help.

NEW DELHI

No Policy on Agricultural Prices

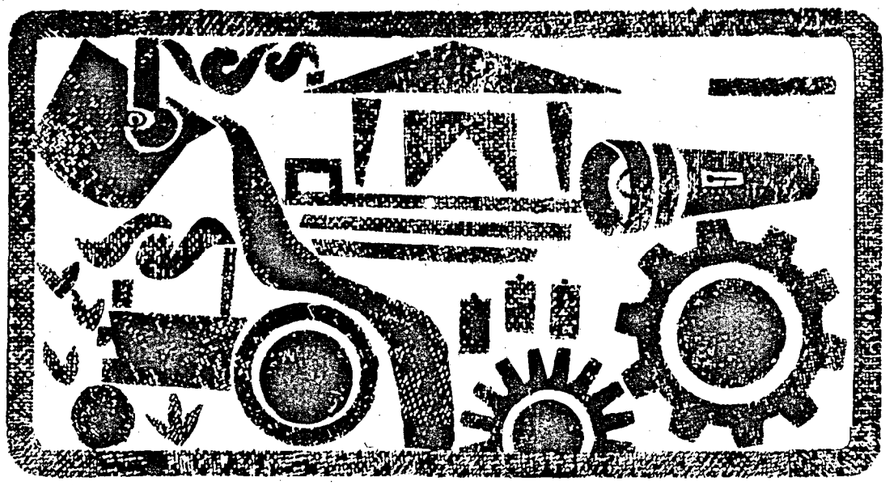
WITH the exodus of Ministers and Members of Parliament from the capital the public debate of recent months on questions such as land ceilings and the approach to the Fifth Plan has been stilled. Among those who left New Delhi in a hurry were three Ministers, two of Cabinet rank and one a Minister of State, who thought that the presence of all three was essential at Stockholm for the conference on pollution, if only to tell the conference that the problems posed before it were of no particular importance or interest to this country at its present stage of development. Meanwhile, the tension in political and ministerial circles over a possible Cabinet reshuffle also evaporated as soon as the Prime Minister left for her foreign visits. The reshuffle is now not expected till after the Indo-Pakistan summit at Simla.

Anxiety over Prices

The debate on the broad approach to the Fifth Plan, which was stated to be the primary purpose for which the Planning Commission presented its paper "Towards an Approach to the Fifth Plan", has proved to be a non-starter in the circumstances. It may now revive, if at all, only when the Planning Commission's draft of the full-fledged approach document, promised for September, becomes available. Meanwhile, anxiety over the price situation is beginning to show strongly in certain official and Planning Commission circles which go so far as to question the wisdom of the recent preoccupation with ceilings on land and urban property and the large allocations for special employment programmes as the principal parameters of the *garibi hatao* programme of the Congress. These doubts have become particularly vocal after the publication of the latest wholesale price index which shows an increase of 6.2 per cent in the past 12 months compared to a rise of only 1.4 per cent in the corresponding period of 1970-71. If the present trend in prices persists, as appears most likely, the current year may end up with a price rise of as much as 9 to 10 per cent.

The sharpest increase in prices has been recorded in foodgrains, the rise being 12 per cent in last 12 months. This is very disquieting when seen against the fall of 4 per cent in the foodgrains index in the corresponding period of 1970-71. Several factors have gone to push up foodgrains prices, but the principal one is the high procurement price, particularly of wheat. Meanwhile, the Agricultural Prices Commission has been persuaded to grant increases, even though modest, in the statutory minimum prices of other crops. In the last few months the Commission has submitted four reports on statutory minimum prices for jute, sugar, cotton and the kharif crops. In all these it has recommended an increase in statutory minimum prices. The Commission's reasons for recommending the increase are different in each case. In the only case where the Commission attempted to bring down the high levels of procurement prices, those of wheat, the political leadership did not think it advisable to accept its recommendation.

The APC has suggested an increase of about Rs 2 per quintal in the statutory minimum price of raw jute to keep the raw jute prices in alignment with prices prevailing in Bangladesh. In the case of sugarcane, the increase is intended to raise and stabilise sugarcane production in competition with production of wheat and rice. The increase in the statutory minimum price of cane supplied to sugar mills comes to about 12.5 per cent on an average and is brought about by adjustment of both the recovery content and the price per quintal. The basic level of recovery attaching to the minimum price has been reduced from 9.4 per cent to 9 per cent and the price at that level has been increased from Rs 7.37 to Rs 8 per quintal. For cotton, the minimum statutory price has been fixed for *kapas* instead of for lint as used to be done in the past on the ground that the very purpose of the statutory minimum is to protect the farmer. By knocking off the lowest range of conversion ratio from *kapas* to lint, the statutory minimum for *kapas* has been revised upwards. For kharif cereals, the minimum price for rice has been increased by Rs 2 per quintal while it has been maintained for the coarse grains at last year's level.



The basic intention of the APC in recommending these moderate increases in the statutory minimum prices is to establish a structure of relative prices which will prevent, to the extent it is possible to do so with this device, acreage shifts in favour of one or the other crop resulting in imbalances in agricultural production. The pull of wheat, because of the technological advance in its production and its profitability, was the principal factor which the APC had in mind in making these upward revisions. It is argued that the fixation of statutory minimum prices, even at a level higher than in the past year, should have no adverse impact on the general price level since their influence will be very limited. What influences the price level is not the statutory minimum prices so much as the procurement prices.

It is in regard to procurement prices that the APC has been trying to achieve, though without success so far, a certain measure of levelling down. The tendency on the part of the government, under the influence of the farmers' lobby, has been to obliterate the distinction between the statutory minimum and the procurement prices and treat the latter as in fact the minimum support prices. This happens once the commitment is made that all the producer brings to the market would be purchased at the fixed procurement price. Such commitments have been freely given by the Food and Agriculture Ministry and the Union Government While moderately increasing the statutory minimum prices in the case of a number of crops in an effort to prevent acreage shift adverse to their production, the APC is now seeking to resist the tendency to jack up the minimum support prices further to the level of procurement prices. Hence its anxiety to keep the distinction between the statutory minimum price and the procurement price.

Major Policy Change

If the APC is to achieve its purpose, however, there has to be a major policy change in the whole concept and manner of fixing procurement prices. Fixing a statutory minimum which will guarantee the farmer that level of prices for all that he produces has certainly to be done through by an agency like the APC on the basis of data about cost of production and returns. But the use of the same agency for fixing procurement prices, particularly when the supply situation is not too tight and public sector agencies are in the field for the purposes of open market purchases, would appear to raise some questions. Fixation of procurement prices through the

In our little way...

we help India fight its war on all fronts

As India moves towards its goal of all-round development, we make our contribution. On the food front Union Carbide provides pesticides and polyethylene film which help the farmer reap a bigger, better harvest. On the home front we bring to you a variety of household articles ranging from batteries and flashlights to colourful containers made from our polyethylene. We supply raw materials and chemicals essential for the pharmaceuticals, paints, textiles, iron and steel and rubber industries. On the export front Union Carbide combs the five continents for new markets and its products reach more than 50 countries including the U.S.A. These are but some of the seeds that Union Carbide India Limited has sown to raise the standards of living of the people of India. Yes, in our little way we help India fight its war on all fronts!

Towards a Cultural Policy: A Minority Viewpoint

Sudhir Chandra

UNDER the sponsorship of the ministry of education and the auspices of the Indian Institute of Advanced Study, a seminar groped for a week 'towards a cultural policy for India'. In spite of the initial doubts of many participants, the seminar was able to produce a statement that represented a substantial measure of consensus, a real achievement indeed. The discussions in the seminar, the draft of the statement and the final form of the statement, however, raised important issues which, it seems, admit of very difficult solutions, if at all they can be solved by pure human volition. The statement, at any rate, did not offer very sound solutions, and left many ends loose.

On Egalitarian Lines

A significant strain that ran through the pronouncements of almost every participant was that the formulation of a cultural policy for India would depend on our view of the society that we want for ourselves. Equally significant was near unanimity about the desirability of socialism as the ideal pattern for our society. Which in plain words meant that the base of society had to be changed before a specific kind of superstructure could be raised. The idea, as the statement put it, was to reconstruct society on egalitarian lines. Having thus committed themselves the formulators of a cultural policy should have felt logic-bound to at least hint at the possible strategy of the desired social reconstruction. They attempted this neither during the long discussions nor while drafting the statement.

The discussion on three papers dealing with education made it clear. Everybody agreed that educational reforms could at best tinker with social structure, and that a system of education was linked with the social system. Yet, in spite of this realisation, everybody wanted to bring in major educational reforms in order to restructure society. This found expression in the final draft of the statement which called for nationalisation of education and the abolition of the present elitist education as a means to usher in an egalitarian society and stop 'brain drain'. No one bothered how education could be nonelitist and egalitarian if the society was elitist and nonegalitarian. Besides, the assertion that the introduction of nonelitist education would *ipso facto* end 'brain drain' clearly implied that the consequent decline in our educational standards would be an effective disincentive to foreign countries to attract our scientists and scholars.

This exercise in putting the cart before the horse would have been amusing but for the fact that the participants were educated men and many of them held positions of responsibility in the country. This particular circumstance made the exercise alarming. Instead of taking their clue from an analysis of the processes of social change, these intellectuals referred to the new confidence and to the formidableness of progressive forces at the moment. One of them even argued how a single individual, to the utter shame of the country's intellectuals who had always obstructed her, had generated that confidence. In a spell of contrition, as it were, they seemed to think that all that needed to be done was to strengthen the government to the extent of making it totalitarian and the egalitarian social reconstruction would descend from the top. They ignored the constraints within which any individual or party must necessarily work. They also ignored how economically powerful groups manage to safeguard their vital interests in every possible garb — even the garb of socialism — by manipulating political power at the top without directly exercising that power. This is all the more easily manageable in a democracy.

Spurious Egalitarianism

Moreover, nationalisation of education may mean substantial negation of the rich cultural diversity that we are committed to preserve and promote. And abolition of privileged educational institutions would mean — unless of course we have elevated the level of millions, which is bound to take a very long time if our performance in regard to our old pledge for universal primary education is an index — that in the name of a spurious egalitarianism we shall have destroyed whatever excellence we have been able to attain so far. Also disturbing is the implication that since the country will need excellently educated men even after it has destroyed quality at home, men and women will be sent abroad to equip themselves to serve the country's various needs. Given the socio-economic fabric that we have, it is not the best talents in the country who will be sent to foreign universities. More often than not the sons and daughters of the wire pullers will get this chance, thereby perpetuating the inegalitarian system of which their fathers and mothers are the prominent beneficiaries. There can be no safeguard against this unless the right sequence of developments follows. And the right sequence is: a social reconstruction bringing in its wake an overhaul of the educational system Once this reconstruction has been achieved, there will exist no need to attempt a massive levelling down.

Nihilism and Alienation

The silence about the mode of achieving this social reconstruction, whether calculated or otherwise, created the suspicion that the statement would strengthen without doing a whit about egalitarianism, the totalitarian trends that are already visible in the country. For, without suggesting a strategy of social transformation, it pleaded, in its draft form, for nationalisation of education, nationalisation of agencies of distribution and exhibition of films as a first step towards the nationalisation of the film industry, and condemned the trends of nihilism and alienation in our arts and literature in order to emphasise that creative activity could not be divorced from national values. With the state empowered to regiment the minds of its citizens through a uniform system of nationalised education, people will no longer have the advantage of different systems competing with one another and fertilising the thought processes of men. Radio and television — the most extensive mass media — already under government control, and films following suit (so might the newspapers if the current trend continues), where will be the opportunity for dissent to grow and revitalise national life except through stray geniuses who also would find going inordinately hazardous in their underground cells? And to plug every possible source of dissent and to complete the hegemony of the state over every aspect of human life, artistic creativity must not be divorced from national values. Who will, in such a situation, prescribe national values? Particularly when two such powerful concepts as nihilism and alienation are condemned as socially undesirable.

It is remarkable that only a tiny minority of the participants could visualise the drastic consequences of the original draft. The minority, fortun-

ately, was vocal and insistent. The result was that the clause of participatory management was inserted in the proposal about nationalisation of education; nationalisation of agencies of distribution and exhibition of films as a first step towards the nationalisation of the film industry was altogether dropped; reference to nihilism and alienation was deleted and the sentence about the undesirability of a divorce between artistic creativity and national values was, at the instance of a prominent artist, substantially toned down to form part of a sentence that dealt with the excellence of artistic production.

These were definite gains in view of the original recommendations of the draft statement. But more significant was the fact that in spite of being in a very small minority, the advocates of the freedom and dignity of the individual were able to extract these concessions. It seemed that whatever language these proponents of 'social reconstruction' might employ, they were not prepared to face the charge of recommending what might lead to regimentation and totalitarianism. They tried to argue that this interpretation of their proposals was not correct, and having discovered that in the arena of argument they had been worsted, they tardily conceded these points. Obviously, whether as a matter of expediency or as a result of conviction, even the intellectuals, who would strengthen totalitarianism in the name of egalitarianism, had to accept willy-nilly the logic of freedom and democracy. This is cheering. But not so cheering. The ponderous verbiage used to advocate 'democratic socialism' makes it difficult for most people to perceive how democratic and socialistic this democratic socialism would be.

The crux of the matter is: can you hope for a massive voluntary act of simultaneous self-abnegation from those who enjoy positions of power and plenty in the country? If you cannot, are you prepared for a bloody revolution? And how will you plan a violent revolution in a country of India's size? More important than that, has any revolution in the world so far succeeded in establishing egalitarianism in one stroke — or at all? And if social reconstruction on such a grand scale is possible neither by violent revolution nor by the use of the ballot paper, is it not a gain to retain and vigilantly safeguard your freedom and dignity to the best of your capability in this ever losing tussle and refuse to succumb to totalitarian trends in the fond hope of being able to live in the millennium that all visionaries have been imagining without realising? Better the gradual actualisation of equality and social justice than the certainty of being condemned to live in an 'animal farm'.

SINGAPORE

Bangladesh's First Contacts with South-East Asia

Harish Chandola

THE number of joint communiques issued during the recent visit of the Bangladesh Foreign Minister, M Abdus Samad, to countries of South-East Asia should indicate that the visit went off well. Burma, which rigidly adheres to its policy of not saying anything publicly, relaxed its caution a little this time and issued a joint communique on May 25, 1972, on the conclusion of the four-day visit of Samad to Rangoon; Malaysia issued one on June 6; and surprisingly Singapore, which shuns involvement in such formal exercises, also issued on June 8, the day Samad concluded his visit to this region.

Samad's visit could only be described as an attempt to establish first contacts with these countries, all of whom have recognised Bangladesh but none, of whom has yet sent a diplomat to Dacca. By undertaking this visit, Samad has assured himself that these countries are friendly to Bangladesh and though they are engrossed in their own problems, they have goodwill for the newborn country.

Samad knew in Rangoon that the birth of Bangladesh made Burma particularly happy. When Pakistan controlled that area, it used to create problems for Burma, by inciting the Muslims of the border Arakan region to form fanatic organisations like Razakars which caused conflicts with the Buddhist majority. Pakistan also used to indirectly encourage the smuggling of Burmese rice from the rich Akyab area. Now Bangladesh would not do these things. The other reason given by the Burmese leaders to Samad for Burma feeling happy over the creation of Bangladesh was however somewhat strange. They told him that Burma had as its neighbours either very large countries, like India and China, or countries where war and insurgency raged, like Laos and Thailand. They were therefore happy to see the coming into being of a manageable neighbour, Bangladesh, which could truly be treated as an equal and which at least for the time being was free of a major conflict.

Burma had recently played a role helpful both to Bangladesh and China. First China had sought Burma's help in withdrawing the staff of its Consulate in Dacca. Later, in March and April, Bangladesh had obtained Burma's help in bringing back the Bengali members of the staff of the Pakistan Embassy in Peking, including the Ambassador, K M Kaisar. Bangladesh is looking forward to recognition from China. Its application for membership of the United Nations will come up for consideration in September this year, when the General Assembly meets. But it as yet does not know how China, one of the five Permanent Members of the Security Council, is disposed to Bangladesh's admission to the UN. Bangladesh therefore wants Burma's help in finding out in Peking if China will react favourably to Bangladesh's overtures to establish relations with China. This help the Foreign Minister is reported to have sought during his visit to Rangoon.

There is a good deal of optimism in Dacca about China recognising Bangladesh soon. This optimism is based on the reports of K M Kaisar who was Pakistan's envoy in Peking until a few months ago and who being a Bangladesh man has now left the service of Pakistan and joined the Dacca Government. Kaisar's reports, it is said, have stated that China was critical of the policies of the Soviet Union and India towards Bangladesh, but not of Bangladesh itself. One has now to wait and see what reaction Burma obtains in Peking to Bangladesh's desire to establish relations with China. Only then will one know if Kaisar's hair-splitting assessment of China on the one hand continuing its criticism of India and on the other wanting friendship with the Bangladesh government is correct.

Samad was received very cordially in Kuala Lumpur. Since it recognised Bangladesh three months ago, Malaysia has on its own made several gestures of help to that country. Malaysia was the first Islamic country to recognise Bangladesh. It also sponsored Bangladesh's admission into the World Health Organisation. Malaysia has also promised to sponsor Bangladesh's admission to the UN and all its specialised agencies. Soon after the independence of Bangladesh, Malaysian students who were earlier studying there on Pakistani scholarships and who had left the country during the fighting, began returning to this new country to complete their courses. Had the Malaysian Government not encouraged them to return they would have gone elsewhere to complete their studies. Malaysia has also promised to send two rubber experts to Bangladesh to help it develop rubber plantations. Under Pakistan, a few rubber plantations were started in Rangamati and Chittagong areas. Bangladesh intends to bring more area under rubber and Malaysia has offered it help in doing so. The two countries have also decided to co-operate in the field of jute and rice technologies. Malaysia had earlier decided to nominate its ambassador to Rangoon to be its concurrent High Commissioner to Bangladesh. Bangladesh, it appears, was not happy with that and has asked for the appointment of a separate Malaysian High Commissioner to Dacca.

In the joint communique issued in Singapore, the two countries agreed to establish diplomatic relations at High Commissioner level. But the Singapore Foreign Minister is reported to have made it clear to Samad that while Bangladesh was free to appoint a diplomat of whatever rank it wanted in Singapore, Singapore was not at the moment planning to send a diplomat to Dacca. Later, Samad announced that Bangladesh would soon be sending a Trade Commissioner to Singapore.

Samad's main argument during his visit to the three countries was that Bangladesh was part of South-East Asia, and that the countries of this region should accept it as such. But it appears that this argument was not accepted anywhere. Leaders of Malaysia and Singapore told reporters that they considered Bangladesh as part of the Indian subcontinent and not of South-East Asia. Samad had a strange argument for getting his country accepted as a South-East Asian nation. He had informally said that Pakistan had been made a member of the South-East Asia Treaty Organisation (SEATO) because Bangladesh which was part of South-East Asia was then a part of Pakistan. But this argument was not taken seriously.

The timing of Samad's visit to this region made some political observers here think that he was making this tour to balance the effect of the Pakistan President, Bhutto's visit to Arab and African countries, which have not recognised Bangladesh. These observers seemed to think that Samad by making this visit intended to show that while Pakistan was still lobbying for Arab and African support for Pakistan's position on the conflict on the Indian subcontinent, Bangladesh was already winning friends, particularly among its South-East Asian neighbours.

Trouble in the Family

With his own community (people of Bangladesh origin) however the Minister had some awkward moments in Singapore. A tea reception was held here for the Minister, the expenses of which were paid by a businessman of Bangladesh origin in Singapore. The invitations to the reception were sent out in the name of the Bangladesh Ambassador to Jakarta who was here. He had invited members of the Bengali community in Singapore, including citizens of India and Singapore. This had led people to wonder if the reception was a calculated attempt of the Ambassador to enlist the loyalty of all Bengalis living abroad to Bangladesh? The Ambassador had also arranged that the two factions in the Bangladesh community here should present two separate addresses of welcome to the Minister. One address was by a businessman who presented the Minister with a donation of Singapore $ 5,000 for the Bangladesh Prime Minister's Relief Fund, and the other was read by a salesman of a bookshop. The salesman had brought cyclostyled copies of his address which he distributed among the guests and it talked of traitors and "Pakistani quislings" among the Bangladesh community in Singapore, against whom the salesman said he and his friends were struggling in this very city. This address was evidently an attempt to start a witch-hunt in the small Bangladesh community here on the basis of individual feelings. The Minister too deplored this and said he would have been happy if just one welcome address had been presented.

THE FOURTH ESTATE

Spare the Rod...

Nireekshak

VIOLENCE by political opponents or criminal elements is happily rare in this country, but there have been instances when violence or threat of violence has been used to intimidate newspapers and journalists. Some three years ago, in Maharashtra, a PTI reporter, Iyer, was allegedly murdered while investigating a big smuggling racket in which a central cabinet minister was said to be involved. In Punjab, during the days of Sardar Partap Singh Kairon, newsmen were often beaten up or threatened if they wrote things unpalatable to the powers-that-be in that state. But, by and large, such physical pressures on the press have been rare though there is a tendency towards their increasing use.

The most recent example of physical pressure being used on a newspaper is that of *Alai Osai*, an independent Tamil evening daily published from Madras, whose office and printing press were attacked on June 16 by some 100 political agitators who, it is said, were unhappy with the paper's anti-DMK stance. A director of the newspaper, who happened to be on the scene, was assaulted by the mob which also ransacked the news-room and the composing room, smashed up vehicles belonging to the newspaper and set fire to a few of them.

Impartial observers have blamed DMK for the vandalism and police for its inefficiency. However, the strongest condemnation has come from the leftist-dominated Indian Federation of Working Journalists. It has demanded that the Tamil Nadu government should immediately pay compensation to the newspaper and the staff for the losses suffered by them.

Many in the profession will recall that the trend of organising demonstrations before newspaper offices was first set by the IFWJ itself. Such demonstrations had begun with legitimate trade union grievances but later on political issues also figured in them. Nireekshak remembers one such demonstration led by V K Krishna Menon to the *Statesman* office in New Delhi on the issue of bank nationalisation. In Bombay, the Shiv Sena emulated the

example and used political agitation as a means to threaten newspapers. The *Indian Express* was its main victim. Now DMK is making use of the same weapon in the south.

Nevertheless, it is a dangerous trend which can threaten the freedom of the press. The IFWJ and the National Union of Journalists should come out more unequivocally to condemn political vandalism which is increasingly being used to threaten newspapers' freedom. In this they (IFWJ and NUJ) should not discriminate between political parties or newspapers or journalists.

With Nandini Satpathy's departure from the Union Ministry of Information and Broadcasting, the big newspapers are feeling a little more relaxed. The newsprint controversy has receded into the background while the press ownership diffusion bill is as good as dead, according to an authoritative source. As a result, *Statesman*, which had withheld increments to its staff for nearly six months has allowed the increments with retrospective effect. The *Indian Express* management, or Ramnath Goenka to be more precise, has made up his mind on his group's next Editor-in-Chief in succession to Frank Moraes who retires this November on his 65th birthday. The former editor of *Hindustan Times*, S Mulgaokar, is said to be his choice. Mulgaokar is the most professional among the editors of the leading newspapers. He has been a desk-man and a field-man and is, above all, a good layout-man. He changed the face of *Hindustan Times* in the late 50's. And now one looks forward to his making the *Express* a livelier newspaper. Moraes will continue to be associated with the paper as its West European correspondent based either in London or Paris.

Ever since A B Nair was made to quit the Managing Directorship and editorship of *Free Press Journal* the newspaper has been in one financial jam or the other. Karnani, who has taken over as Managing Director, has been making frequent air-dashes to Bombay and has partly succeeded in giving a new lease of life to the paper. New appointments and better pay scales for existing employees are now on the cards. And the performance of the staff in recent months no doubt justifies this. *Free Press's* local coverage has improved tremendously. Madhu Shetye, its enterprising reporter, has the local administration in the dock with some excellent pieces of investigative reporting. Two of his exposures have been about the CIDCO and the alleged bunglings in the Maharashtra Rajya Text Book Bureau. However, R K Karanjia apparently has different views about the paper and has resigned from its board of directors to which he was elected only last year. The indicates that many more changes in the *Free Press* set up are in the offing.

Speculation on the forthcoming Indo-Pak summit has been making front page. From *Patriot's* and *Motherland's* "tough line" to *Hindustan Times'* "optimistic approach" and in between *Statesman's* news items predicting "hard bargaining at Simla" there have been enough reports to cause confusion. Yet the optimism generated by the summit is such that few newspapers predict the possibility of a complete failure. Taking its cue from Nixon and Brezhnev, who during the US-Soviet summit exchanged expensive presents like an American Cadillac and a Russian speedboat, *Times of India*, has in a lighter vein suggested that presents exchanged between Bhutto and Indira Gandhi should be carefully selected. According to *Times*, a Kashmiri shawl from the latter would be the best. *Motherland* reports yet another fabulous feast — a 20-course dinner in the capital organised in honour of the new Congress president, Shankar Dayal Sharma, and Yashpal Kapoor, MP. According to *Motherland*, "Nearly 500 guests, the socialist elite of Delhi, including some cabinet ministers and chief ministers, turned up for the show in a way reminiscent of the historic dinner by a Maharashtra Congress MLA some time ago." After listing in detail the mouth-watering menu, the Jan Sangh paper adds: "Ironically, the dinner followed hours after the Lok Sabha was given a grim account of famine in Orissa where a woman had turned cannibal and also after the Prime Minister's oration at the NDC meeting in the morning where she had exhorted her partymen to do something for the poor and do it quick."

REVIEW

Industrial Conflict and Political Revolt

N R Sheth

Industrial Conflict in Malaya: Prelude to the Communist Revolt of 1948, by M R Stenson; Oxford University Press, London; pp x + 271; £2.50.

IN the book under review, the author describes the development of labour politics and trade unionism in Malaya during the 1930s and '40s in the context of the social, economic and administrative changes in the country. The study is based on sources of recorded information such as the Press and company documents as well as interviews with people concerned with industrial relations.

The author first provides a historical background of the development of industrial labour in Malaya which in the beginning consisted largely of Indian and Chinese immigrants. The Indian workers who were mostly recruited under indentures were bound to employers through labour contractors in a feudal relationship. While the Chinese immigrants were somewhat more independent, they were recruited as members of all-inclusive social organisations. The supply of labour was manipulated by employers according to their needs, since the government hardly intervened in labour problems.

This traditional system began changing towards the end of the nineteenth century in the wake of expansion of industry, decline of indenture and mobilisation of local labour for industrial activity. Subsequently, political changes in China and India generated social and political awareness among immigrant labour. A trend towards unionism began in the 1920s, although the emphasis was mainly on political ideology and social welfare rather than on pro- and social welfares' rights. The Depression of the 1930s gave rise to a chain of events. Workers were increasingly influenced by progressive ideas in the outside world through modern means of communication. Spontaneous labour associations and work-stoppages became the order of the day. The deep-seated social and economic grievances of workers came out into the open. Union leadership went into the hands

of the Chinese-dominated Malayan Communist Party (MCP) and educated Indians, both of whom were responding to political changes in their respective homelands.

Employers were understandably reluctant to respond to workers' demands. Government played a dubious role. On the one hand, it intervened in labour disputes with a view to solving them; on the other, it used police to round up "agitators" who created trouble for employers. Conciliatory legislation was enacted to handle labour disputes, but it could not be implemented due to the dominance enjoyed by employers and the colonial government's anxiety to control workers under the excuse of protecting them during the Second World War.

Short-Lived Success

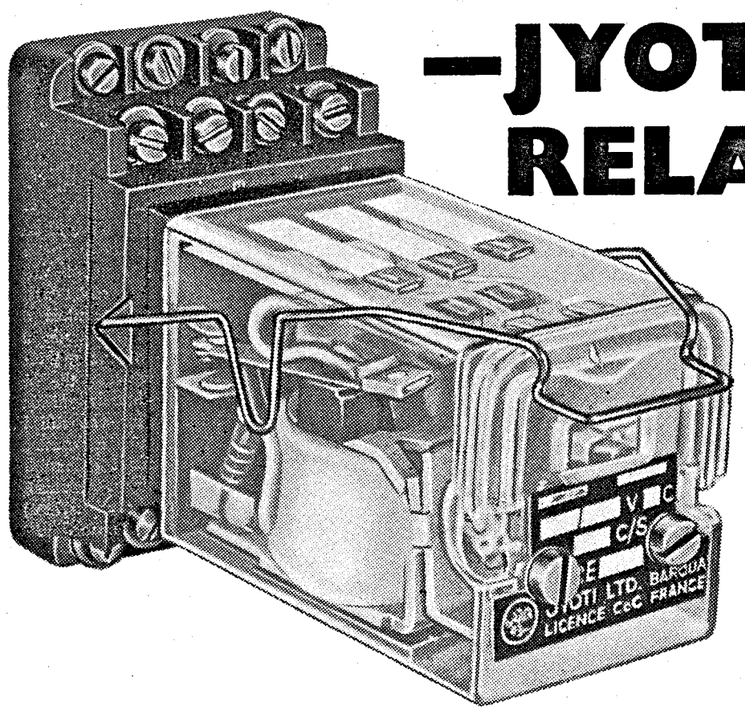
During the Japanese occupation of Malaya (1941-45), MCP became stronger due to Chinese hostility towards Japan. With the reinstatement of the British rule, MCP evolved a policy of pursuing civil struggle to acquire political power. Hence it organised a large number of trade unions which indulged in frequent strikes and demonstrations. However the British Military Administration used high-handed methods to curb MCP activities. During the post-war period, although workers' bargaining power increased, the general economic crisis in the country blocked any significant gains on their part. However, the trade union movement continued to gain influence among the workers under the command of MCP and culminated in the formation of a strong Pan-Malayan General Labour Union.

However, this success of trade unionism proved to be short-lived. The MCP failed to attract local Malay labour. The British regime realised the growing force of MCP and hence built up an alliance with the local aristocracy as well as labour against the communist-controlled trade unions. The government propounded a progressive policy towards unions and at the same time advocated the need for independent unionism to counteract communist dominance over labour. On their part, employers brought strong pressure on government to resist union demands, enforce law and order, and restrict union activity. The employers' strength arose mainly from centralised financial control over industry by European houses. The economic situation in 1947 helped employers to resist union demands which they had to concede in earlier years.

Simultaneously, sections of the working class were disillusioned with the MCP-led unions due to their failure to deliver the goods. There was thus a division among the ranks and leadership of the communist unions. The communists then decided to resort to an armed struggle against the British. They tried to dislocate industrial activity by stoppages and violence. The government decided to adopt decisive measures to curb the violence and disruption. However, the communist attempts at armed revolt met with limited success, as it could not convince workers, or even union leaders, of the need for armed struggle. The government successfully re-established the restrictive, paternalist pre-war regime by promulgating emergency regulations and a Trade Unions Ordinance. With this, the majority of workers were left unorganised.

This is as far as the main story goes. In a postscript, the author describes the development of labour organisations in the post-1948 era and discusses the prospects of the labour movement in the seventies. A new, orderly form of trade unionism emerged in Malaya in the fifties and began articulating the workers' economic and organisational interests. Employers also learnt to accept the inevitability of trade unionism and responded to workers' demands. However, unions have so far achieved only moderate success, as they have little political influence. Apart from this, the author observes, "the industrial workers have had... little moral claim to greatly improved conditions in a society where the majority are peasants with an even lower standard of living" (p 241). One wonders how far this opinion would be accepted by workers and trade unionists in developing societies. The author believes that trade unionism in Malaya at present is in a condition of crisis, as it cannot achieve much for workers in the face of the prevailing economic stringency. His suggestion for the success of trade unionism is that unions should more effectively act as welfare agencies and co-operate with employers and government in raising output. Perhaps this solution can help unions to keep their membership strength. Whether this is an accepted organisational objective for trade unions in countries such as Malaya is open to question. The argument "let us first raise the size of the cake at the current level of distribution; we shall later quarrel on distribution" is as simplistic as it is attractive. Consistently with this argument, the author winds up his study with the following remarks:

> "There is no example in any European or other society of rapid agricultural or industrial expansion being initiated in conditions of widespread effective, popular control of government and strong, militant, independent worker organisations. To the extent that they are undergoing a process of economic transformation similar to, if more difficult than, that of many European countries in the nineteenth century, it is unlikely that Malaysia and Singapore will prove exceptions to the rule" (p 251).



Begging the Question

This indeed is begging the question. Stenson's formulation is logically unexceptionable in terms of economic history. But this is not sufficient, since social realities cannot be wished away. The phenomena of "widespread, effective, popular control government" and "strong, militant, worker organisation" are facts of life in some societies (typically, India) in the process of development. The economic aspirations of people in these societies have to be achieved in the context of existing governmental and trade union structures, not by uprooting these structures.

On the whole, the book under review is a scholarly historical study. For those of us who still believe that trade unionism is a function of one or the other overriding condition (such as poverty, employers' intransigence, politician's urge for power, etc) this study is an excellent education in the complex interaction of a variety of social, economic, political and historical forces.

One wishes that the author had tried to make the book more readable than it is. Those who have a limited knowledge of Malaya are likely to get lost in the maze of historical data running through the book. The author assumes considerable acquaintance with the social and economic background of the employers and *sultans*. Moreover, for a long time one has to struggle hard to figure out the status and role of the British in Malaya. One is left blissfully vague about the precise membership of MCP and the unions affiliated to it. Long abbreviations stare you in the face wherever you are; one wonders why the author did not care to put the legend on abbreviations in the alphabetical order. The legend does not include a few abbreviations such as WFTU (p 138). I still need to be properly introduced to a fellow called Brazier (p 80) about whom there are lavish reports in the seventh chapter.

Give your precious electrical equipments REFLEX-ACTION PROTECTION —JYOTI RELAYS

Jyoti relays sense faults in electrical network and initiate tripping of the circuit breaker.

Choose from the following ranges:

* Inverse definite minimum time over-current and earth fault relay.
* All or nothing auxiliary relay.
* Induction type time delay relay.
* Constant time delay and instantaneous three phase over-current relay.

Review of Agriculture is published four times a year, on the last Saturday of March, June, September and December.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication

Stereotype Norms

THE so-called new economic policy and the new goals that have been set for the Fifth Plan have yet to make an impression on thinking in the Ministry of Agriculture. The report of the Ministry for 1971-72 makes as much clear. What distinguishes the Approach to the Fifth Plan in the government's own view is not the proposed doubling of public sector outlay as the acceptance of the objective of meeting the 'basic minimum needs' and providing employment as an essential part of overall growth strategy. Agricultural policy and programmes should be expected to be the first to show the impact of the changed emphasis. After all, agriculture supplies the major ingredients of the basic minimum needs — foodgrains, edible oils, cotton — and numerically the overwhelming majority of the two-fifths to one-half of the total population who live below the 'poverty line' are to be found in the agricultural sector. Any 'direct attack on poverty' through widespread employment creation will vastly expand the demand for agricultural goods, particularly foodgrains, and require a reorganisation of agriculture.

The Agriculture Ministry's evaluation of past performance and its outlining of future programmes for increased production are, on the other hand, encased in stereotype norms. The expansion of agricultural production, from which it derives such obvious satisfaction, continues to rest essentially on the narrow base of HYV wheat, has been concentrated in Punjab, Haryana and Western UP, and has been limited by and large to the bigger farmers. Moreover, with most of these farmers covered by HYV, the impact of the latter on production is tending to level off. More significantly, the increase has been sustained by a high level of prices supported by government procurement operations. The programme for rice, still the major crop, is yet trailing behind. One does not know — the Ministry's claims notwithstanding — how much of the increase in rice production from 40 million tonnes in 1968-69 to 43 million tonnes expected this year is attributable to the HYV programme and how much to favourable weather conditions and the larger farmers taking to systematic application of inputs. The Ministry's report has trotted out stock explanations for the lagging HYV rice programme: that rice remains a kharif monsoon crop and HYV must have measured water administration, that HYV rice is less fine which fetches lower prices in the market and hence renders it less attractive to farmers. The report does mention a fetchingly named 'mini-kit' programme consisting of distribution of a 2-kg package of two types of HYV rice seeds to 18,000 to 20,000 farmers, backed by the necessary additional extension staff. A better bet may be the inducement to Punjab farmers to grow kharif rice, which may be reinforced by the marketing problems that further expansion of wheat production is likely to come up against immediately. Production of pulses has been stagnant and the report has no special ideas for raising it, apart from repeating the cliche that pulses are an important source of protein particularly for the low-income groups and that "efforts to bring about substantial increase in [their] production . . . have been stepped up". What about the pull of high support-price cereals which have taken acreage away from pulses — and from cash crops, for that matter? Oilseeds, sugarcane, cotton and jute have also failed to show any breakthrough in production, though it is accepted that a sustained package programme can make a sizeable impact on their yields.

It should be clear by now that if foodgrains production has to be raised by about 4 or 5 per cent annually over the next decade (against the 2.9 per cent or so achieved between 1949-50 and 1970-71) so as to reduce the percentage of those below the poverty line to 15, and if this is to be achieved without the cash crops losing ground, use of high-yielding varieties and improved cultural practices would have to become far more widespread than it is today. Price policy adjustments such as those reflected in the recent upward revision of minimum support prices of rice, cotton, jute and sugarcane, have a role to play. But, far more important, an extension effort of a quite different scale and quality will be required. Where is this to come from? The Agriculture Ministry at any rate shows little awareness of the magnitude of the task at the village level, even less concerned does it seem about the sorts of institutional constraints that have stood in the way of the effective functioning of the extension network. These constraints will be felt all the more as attempts are made to reach out to the small farmers with credit and inputs, which will have to be done as these farmers must be brought increasingly within the compass of the new technology.

Land Ceilings as a Tax on Agriculture

A Note

P N Junankar

In this note I have tried to show that land ceilings are conceptually equivalent to a wealth tax on agriculture.

The case for ceilings on equity grounds is very strong and that on efficiency grounds is also fairly strong.

Thus if we treat ceilings as 'just another tax' some of the opposition to it may weaken.

THE current discussion on land ceilings has concentrated on the distributional (equity) aspects of the measure. In this paper I would like to discuss the implications of ceilings on agricultural land in a broader context. I will look at both the equity and efficiency aspects of the imposition of land ceilings. Although I am aware of gross simplification, I shall assume that any measures passed by the Government are implemented effectively. It is well known that implementation of land reforms requires efficient administration and legislation that is retroactive. In the next section I will suggest that legislation on land ceilings is analogous to a form of (wealth) taxation and can therefore be studied in that context. This is, apparently, the first time that the subject is being looked at in a public finance context.

I

Ceilings and Taxation

Agriculture is in a favourable position *vis-a-vis* industry since it is not subject to any direct taxes. Assume that (a) all land is homogeneous and farmers face competitive conditions so that input and output prices are given, (b) there are non-increasing returns, (c) there is a positive discount rate and (d) there is certainty. Then there would be a one-to-one correspondence between 'permanent income' (the present value of the future stream of income) and the size of the farm. Now assuming no compensation, we can construe ceilings as a tax on permanent income when the tax rate is zero before some critical value and one after it. Since most of the existing suggestions include compensation as one of the features it implies that the tax rate after the critical value is greater than zero and less than one if the compensation paid is partial. It is feasible to work out a system of progressive taxation such that the amount of compensation paid decreases at the margin with the excess of the acreage over the ceiling.

II

Effects of the Tax

In this section I will look at the effects of a land ceiling on (a) equity and (b) efficiency.

(a) *Equity:* There are three aspects to keep in mind. Firstly, equity within agriculture, secondly, equity, between agriculture and industry (remembering that agricultural income is not taxed otherwise), and thirdly, equity on an individual basis. It should be noted that since income from non-agricultural sources is taxed we can compute, given our assumptions, the wealth tax equivalent. Agricultural income is not taxed which is *one* source of inequity. In the Table below I list the likely effects of the imposition of a land ceiling, ignoring the sources of revenue used for compensation purposes. Once we worry about where the finances for compensation come from we are unable to say anything unambiguously.

Thus we can say that, if we ignore the sources of finance for compensation payments, a land ceiling would lead to a more equitable distribution (except in case 2 when there is no change). This seems to have been the main justification for land ceilings. I will now turn to the aspect of efficiency which has not got as much attention in the literature.

(b) *Efficiency*: The effects of a ceiling (tax) on efficiency will be considered under two heads:

(i) Static/short-run
(ii) Dynamic/long-run

The static case is easy to deal with. Given our assumptions of homogeneity, certainty and no technical change a ceiling (tax) is a once for all event and therefore has no dis-incentive effects. As long as changes in the ceiling (tax) or the compensation rates are unforeseen there would be no problems. As it is a once for all tax there would be no shift of resources from agriculture to industry. People would not move from agriculture to industry because of our assumption of effective retroactive legislation. The compensation payments received would move to industry, but they *may* have been collected in industry and hence there would be no net changes. If the compensation payments were collected in agriculture there would have been a once for all shift from agriculture to industry. In addition, there is fairly good evidence for an inverse relation between farm size and productivity. Thus a land ceiling combined with redistribution would lead to an overall improvement in agricultural productivity. Thus on static grounds the case for a ceiling (tax) is very strong.

TABLE: LIKELY EFFECTS OF IMPOSITION OF LAND CEILING

(1)	Within Agriculture (2)	Between Agriculture and Industry (3)	Individual Basis (4)
(1) No compensation (with or without redistribution)	x	x	x
(2) Compensation (full) without redistribution	—	—	—
(3) Compensation (full) with redistribution	x	x	x
(4) Compensation (partial) with or without redistribution	x	x	x

Notes: x indicates an 'improvement', i e, treatment is more equitable. — indicates 'no change'. 'Redistribution' refers to the land collected in excess of the ceilings which it is assumed would be given to small land owners, tenants, or landless labour. Industry refers to all non-agricultural activities.

The dynamic/long run case is more difficult to analyse. It is impossible to say a *priori* what the effects on savings, investment and innovations would be because of changes in distribution within agriculture. What can be said is that since agriculture is not taxed at all now and if the Government wished to tax it either by an agricultural income tax or a ceiling (wealth tax) both of these methods would have various repercussions. A wealth tax is likely to have fewer adverse incentive effects than an income tax.

Thus land ceilings have no dis-incentive effects in the static case (unlike an agricultural income tax) while the long-run case is indeterminate. In fact we have reason to believe that ceilings would improve agricultural productivity.

III

Conclusions

In this note I have analysed the subject of land ceilings at a fairly high level of abstraction to derive some firm conclusions. I do not think those conclusions would be contradicated for a more 'realistic' model. Since there is a well recognised body of literature on the theory of public finance it seems to me that we can apply its principles to the subject in hand.

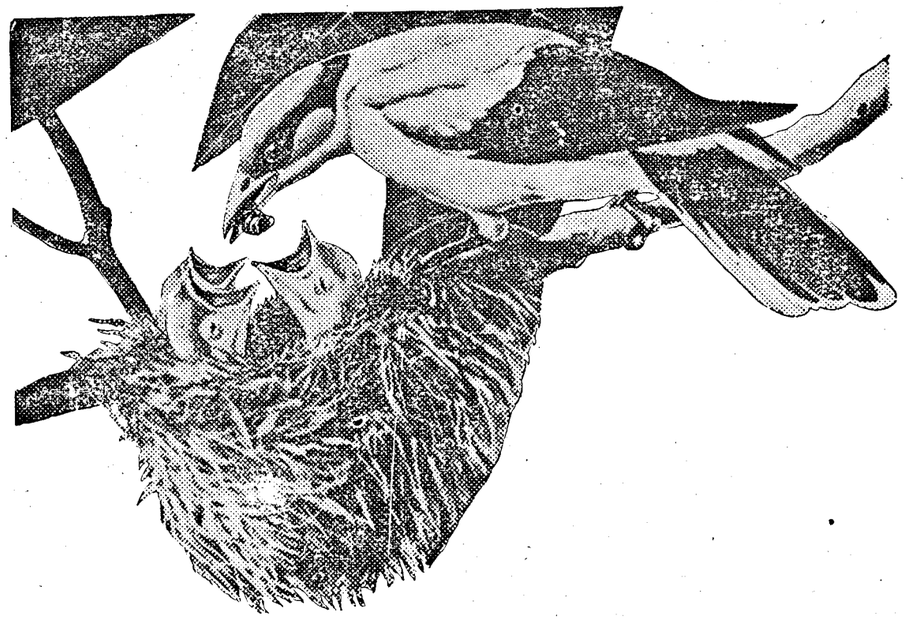
In this note I have tried to show that land ceilings are conceptually equivalent to a wealth tax on agriculture. As we saw earlier the case for ceilings on equity grounds is very strong and that on efficiency grounds is also fairly strong. Thus if we treat ceilings as 'just another tax' some of the opposition to it may weaken.

Ceiling on Agricultural Land-holding

Its Economic Rationale

C H Hanumantha Rao

A redistribution of land and capital resources from the large to the small and marginal farms is likely to raise total output and employment owing to the larger availability of labour per unit of land and capital among smaller farms. More equitable distribution of land would thus result in more employment and income for small farmers apart from contributing to the more efficient use of the available resources.



The contribution of the proposed ceilings on agricultural land-holdings consists not so much in the 'surplus' land that is likely to be made available for distribution among the landless as in arresting or slowing down the growth of capitalist farming in agriculture. A substantial contribution of the current drive for ceilings is to be found in the sale of land by the big land owners and in their reluctance to acquire more land in future.

If this be made the major objective of ceilings — as it ought to be — then ceiling on ownership holdings as presently contemplated will have to be combined with ceiling on operational holdings and ceiling on the future acquisition of land.

APART from the requirements of social justice, the case for a ceiling on agricultural land-holding in the present Indian context derives from considerations of economic efficiency as well. The supply of land as a source of income is extremely scarce in relation to the demand for it or, to put it differently, the man-land ratio in agriculture is very high owing to the meagre opportunities for employment in the non-agricultural sector. Considerations of equity and welfare require that the scarce commodity — in this case land — be rationed out among the members needing it. But scarcity is not a sufficient condition for a factor to be rationed out in this manner. In the industrial sector, for instance, quite a few material factors are scarce in supply and yet no one advocates that they be employed in small family-managed units by breaking up the existing firms. Nevertheless, such a break-up is advocated for agriculture because, unlike in the modern manufacturing sector, the technological conditions of agricultural production are such that land can be cultivated equally or even more efficiently in small units. Land as a factor of production is perfectly divisible. So are other inputs like water, labour, improved seeds, fertilisers, etc. Machines like tractors may not be required on a large scale where the man-land ratio is quite high. But if necessary, the size of such machines can be ordered to suit the farm size, or, alternatively, they can be hired. Another factor favouring a farm ceiling is that the entrepreneurial or managerial talent required for farming is not in short supply. As such, the additional units created are likely to be managed equally or even more efficiently when compared to the existing large units, if credit is extended to them on reasonable terms from the financial institutions.

SMALL FARMS MORE EFFICIENT

It is not surprising, therefore, that the research work done in the last decade and a half on the economics of farm size has revealed small farms to be more efficient than large farms. The percentage of area irrigated, the cropping intensity or the percentage of cropped area to the area held, the labour input and the output per acre were invariably higher among small farms when compared to large farms. Large farms were found to combine more land with less labour — a technique which is out of line with the factor endowments obtaining at present in India. If large farms cannot use as much labour per acre as small farms

At Shriram Chemicals
a worker doesn't live by his wages alone.

Workers at Shriram Chemicals get a lot more to live by. In addition to just wages. They, alongwith their families, participate in national and religious programmes sponsored by the company, get interest-free loans for purchase of costly utility items, scholarships for children's education, handsome rewards for higher productivity, necessities of life at subsidised rates, house rent and conveyance subsidies.

These programmes are a tradition at Shriram Chemicals.

owing to the high cost of labour or to the managerial and supervisory bottlenecks associated with labour-intensive techniques, then a redistribution of land from the larger to the smaller farms would raise total output and employment. This was the basic conclusion we had arrived at by analysing farm management data pertaining to the mid-fifties in the book "Agricultural Production Functions, Costs and Returns in India". It was observed in this study that if such a redistribution was considered politically not feasible, then an alternative way of making effective use of land among large farms was to intensify the use of capital inputs including machinisation. Such a tendency, i e, the development of capitalist farming was already in evidence in the early sixties. The development of capitalist farming could result in large farms using more capital and less labour per acre when compared to the small farms. This would adversely affect employment and income of the poorer sections and would amount to misallocation of resources because output can be raised by redistributing the available land and capital among the small and marginal farms with surplus labour. Therefore, in the context of the growth of capitalist farming, efficiency of farm size should be judged not by output per acre but by the factor proportions, e g, land-labour and capital-labour ratios. In a situation where there is widespread unemployment and underemployment, farms using more capital in relation to labour cannot be regarded as efficient even if they produce more output per acre. And such a technique would not be in keeping with the requirements of distributive justice.

Some of the latest available evidence regarding the efficiency of land-use in relation to farm size in Ferozepur (Punjab) — the seat of green revolution — shows that the percentage of holding irrigated, the cropping intensity with respect to operated area, the net area shown as well as the net irrigated area (columns 4, 5 and 6 of Table 1) and the labour input per acre (total of family and hired) decline with the increase in the size of holding. These facts point to the same tendencies which were noticed in this district in the mid-fifties. In regard to output per acre held, however, there does not appear to be any systematic tendency in relation to the farm size. Thus in regard to the traditional techniques of land-use, e g, irrigation, multiple cropping and the application of labour, small farms continue to be more efficient than the large farms. However, large farms have stepped up output per acre by taking a lead in the adoption of the new technology and by intensifying the use of capital inputs. Table 2 shows that the percentage of cropped area under the High-Yielding Varieties is highest among farms above 75 acres. The lowest magnitudes in this regard relate to farms below 10 acres. The lowest figures of labour input as well as the highest figures of fertiliser input per acre relate to the two largest holding size groups. Column 5 of this Table shows that the ratio of expenditure on fertilisers to the exepnditure on labour (including the imputed value of family labour) rises with the increase in the size of holding. Farms above 75 acres account for the highest output per cropped acre. These facts bring out sharply the increasing substitution of capital for labour among

large (capitalist) farms.

It is clear from the above that a redistribution of land and capital resources from the large to the small and marginal farms may raise total output and employment owing to the larger availability of labour per unit of land capital among smaller farms. More equitable distribution of land would thus result in more employment and income for small farmers apart from contributing to the more efficient use of the available resources.

Impact of Long-term Growth

It is often argued that even though redistribution of land may increase output and employment in the short-run, the growth of output and employment may slow down in the long-run owing to the reduction in savings and investment as the small farmers consume away a larger proportion of their income than do the large farmers. Even if we assume that the so-called "trade-off" exists between better distribution and growth (i e, an improved distribution of income may slow down the growth of output), this proposition remains uninteresting because the "growth rate" is an aggregate magnitude which abstracts entirely from the distribution of gains. For, it is quite possible that as a result of improved distribution even if the overall growth of output is slowed down, the share of the poorer classes may remain higher in the long-run when compared to what they would have obtained in the absence of redistribution and with a higher growth rate. In such a case, the slower growth implies a cut into the share of the richer classes. Therefore, the concept of "trade-off" between growth and distribution has little meaning when certain sections gain at the expense of others. It is not like a trade-off, say between income and leisure when an individual (or a class) sacrifices some leisure in return for additional income or *vice-versa*.

However, the proposition that improved distribution on must slow down the overall rate of growth is itself open to serious doubts. If better distribution reduces investible surplus because it increases the consumption by the poor, it may, for the same reason, raise their efficiency. When the consumption levels of the poor are very low, the efficiency of labourers may increase significantly with rise in their consumption. Rise in the efficiency of labour would mean an improvement in the output-capital ratio. It is not inconceivable, therefore, that the decline in savings, if any, as a result of improved distribution may be more than compensated by improvement in the output-capital ratio, so that output may grow faster with an improved distribution. Further, such a growth process ensures that the gains of development accrue to the poorer sections.

A more fundamental objection to the "trade-off" proposition is that it assumes that the institutional and behavioural patterns would remain unaffected by so radical a change as redistribution of land. A community which can effect a radical redistribution of income and wealth is usually capable of bringing about the required changes in institutions and behavioural patterns for mobilising more savings by cutting down inessential consumption. Such a community can also introduce and absorb technical changes which would not otherwise be possible. The experience of other countries suggests that the phases of radical redistribution have been dynamic in respect of other innovations as well, so that growth has in fact been higher in periods following redistribution.

The contribution of the proposed ceilings on agricultural land-holdings consists not so much in the 'surplus' land that is likely to be made available for distribution among the landless us in arresting or slowing down the growth of capitalist farming in agriculture. A substantial contribution of the current drive for ceilings is to be found in the sale of land by the big land owners and in their reluctance to acquire more land in future. Insofar as large land owners lease out land to the small tenants and share-croppers, the latter may automatically acquire ownership rights with the imposition of ceilings at fairly low levels.

A strong tendency for the development of capital farming has been in evidence in certain high-growth pockets of the country where the green revolution has made the greatest impact. Considerations of equity as well as of efficiency require that such tendencies are curbed. If this be made the major objective of ceilings — as it ought to be — then ceiling on ownership holdings as presently contemplated will have to be combined with ceiling on operational holdings and ceiling on the future acquisition of land. Despite a ceiling on ownership holding, a capitalist farmer can outbid the small and marginal farmers in the land market and enlarge his operational holding by leasing in land. It is not without significance that in Punjab and in certain other regions of the country, large farmers as a group lease in much larger area from the small farmers than they lease out to them. A ceiling on operational holding at the same level as that on ownership holding may improve the bargaining position of the small and marginal farmers in the land and capital market and may thus help to improve their income and employment. Similarly, a ceiling on the future acquisition of land at a substantially lower level than the existing ceiling would tilt the land market, and with it the capital market, in favour of small farmers. A family should be permitted to buy land in future only to the extent that its total holding after such acquisition will not exceed, say, 5 or 7.5 acres or a certain proportion of the existing ceiling. This measure should be combined with the provision of loans from the public financial institutions on liberal terms for the purchase of land.

Alfred Herbert (India)

ALFRED Herbert (India) is setting up a Rs 1.87-crore project at Bangalore for manufacture of intermixes, shear strip type tyre presses and tube presses for automobiles, and presses for cycle tyre and tube manufacture — most of which are not made in the country to date. Technical knowhow will be obtained from Francis Shaw of UK. The project is expected to go on stream by November 1973. The cost of the project is expected to be met with share capital (Rs 30 lakhs), deferred payments on plant and machinery (Rs 48.25 lakhs), term loans (Rs 24 lakhs), short term bank borrowings (Rs 33.78 lakhs) and retained earnings (Rs 51.32 lakhs). AH(I) is at present a wholly-owned subsidiary of Alfred Herbert of the UK. The paid-up capital is Rs 30 lakhs and existing reserves amount to about Rs 47 lakhs. It is proposed to raise additional capital of Rs 30 lakhs by offering, under a Prospectus, two lakh equity shares of Rs 10 each at a premium of Rs 5 per share. Of these, 10,000 shares have been reserved for subscription by employees of the company and the public is to be offered the balance 1.9 lakh shares. The subcription list will open on May 24 and close on June 5 or earlier, but not before May 29. Incorporated in West Bengal in 1919, AH(I) has been engaged right from its inception in the marketing and rendering of technical services of imported and indigenous machine-tools, industrial machinery, rubber and plastic machinery, pulverising equipment, machine shop equipment, small tools, etc.

Farm Size and Productivity

A Fresh Look

N Bhattacharya

G R Saini

This paper attempts to examine disaggregated farm management data for individual farms, separately for each sample village, and to apply rigorous tests for the correlation between farm size and gross value of output per acre.

Also examined is the correlation between gross cropped area and gross value of output per acre of gross cropped area.

IN earlier communications to this journal, Rudra [10, 12] suggested that the inverse relationship between holding size and productivity observed in Indian agriculture could be a spurious statistical relationship, arising due to the process of aggregation over villages involved in presenting farm management data. He also stressed the need for careful statistical tests of significance, particularly tests based on rank correlation co-efficients.

The aim here is to examine disaggregated farm management data for individual farms, *separately for each sample village*, and to apply rigorous tests for the correlation between farm size and gross value of output per acre. For the sake of interest, we also examine the correlation between gross cropped area and gross value of output per acre of gross cropped area.

The data relate to Ferozepore district in Punjab for the years 1955-56, 1956-57, 1967-68 and 1968-69 and to Muzaffarnagar in UP for the same years and also for 1966-67. Our investigation throws light on the changes in the size-productivity relationship in these regions brought about by the "green revolution".

I
Introduction

The inverse relation between holding size and productivity per acre in Indian agriculture was revealed by the Farm Management Studies [1], and many efforts were made to explain this phenomenon which had important consequences for economic policy (See, for instance Sen [2, 5]; Mazumdar [3, 7]; Hanumantha Rao [4, 8]; Khusro [6]. Some other references are available in Saini [13]).

The existence of the inverse relation has been widely accepted and attributed, among other factors, to higher intensity of cropping for the smaller holdings where the proportion of irrigated land is relatively high.

Sen [5] had expressed doubts about the statistical basis of the observations around which the discussion was taking place. Rudra [10] carried forward the work of Rao [9] and showed that the inverse relation between farm size and productivity did not exist in any of the 20 completely surveyed villages from Punjab, Haryana and Western UP analysed by him. Rudra [12] applied rank correlation tests to the averages of productivity given in the Farm Management Studies [1] separately for farms in different size-classes. He showed that the size-productivity correlation was not significant in many of the cases. (However, too many of his rank correlation co-efficients were negative and and any overall test would give a 'significant' verdict.) Besides challenging the uncritical use of linear regression methods and advocating rank correlation methods in this place, Rudra raised a fundamental question by suggesting that the inverse relation between size and productivity did not exist *within* any particular village but arose when the data for different villages were aggregated in the Farm Management Studies [1]. This called for rigorous examination of disaggregated data.[1]

Hanumantha Rao [11] pointed out that in Rudra [10] the measure of productivity—value of output per acre of gross cropped area — was different from that usually employed, and this choice might be responsible for Rudra's finding.

Saini [13] analysed disaggregated data for many regions and years; fitted regressions of the form $\log y = \alpha + \beta \log x$, where x = farm size and y = value of output; and showed that, on the whole, the estimates of β were significantly less than unity. But his work did not clear up the doubts raised by Rudra, because for any given region and year, Saini used the observations from all the villages for fitting the regression.

It was in this background that we undertook this analysis of disaggregated farm management data, selecting two regions affected by the "green revolution", viz, Muzaffarnagar in UP and Ferozepore in Punjab. We analysed data obtained from these regions in the fifties as well as in the late sixties with a view to examining how far the relationship between farm size and productivity has been affected by the "green revolution". For the sake of interest, we have examined two relationships throughout: (i) between farm size (A) and value of output per acre(V/A) and (ii) between gross cropped area (G) and value of output per acre of gross cropped area (V/G).

II
Methodology

Rudra's doubts about the effects of aggregation on the size-productivity relationship can be cleared by carrying out separate analyses for the different sample villages and testing the correlation between size and productivity *within* each village. Admittedly, the sample size is small, about 10, for any given village and statistical tests of significance would lack the power of detecting departures from the hypothesis of zero correlation. But this cannot be avoided; and when the tests have been carried out separately for all the sample villages for any region and year, one can combine these tests by standard statistical procedures to obtain an overall view and this combined test would be more meaningful and possibly more 'powerful' than the usual test based on all the observations from all the villages.

The first step was to plot scatter diagrams showing (i) V/A against A and (ii) V/G against G, on arithmetic scale and also on double-log scale, separately for the holdings within each sample village. In most cases, the correlation was quite small and it was difficult to choose between the linear relationships and the log-linear relationships. We fitted both, so that there were four sets of regressions. What is

more important, the scatter diagrams did not reveal non-linearities. Nevertheless, we supplemented the regression analyses by computing Kendall's rank correlation co-efficients between V/A and A and between V/G and G, separately for each sample village.

Tables 1 and 2 present the results. Denoting the regress and by y and the regressor by x, we fitted least squares regression of the form $y = a + bx$ for each village, computed the correlation co-efficient r, and applied the t-test for the null hypothesis of zero correlation (or regression) co-efficient.[2] For the sake of interest, we also present in these Tables the results of the usual analysis based on the observations from all the villages taken together. The rank correlation co-efficients τ are also presented for each sample village. Two-sided tests were applied for judging the significance of all the results in Tables 1 and 2.

Table 3 presents the overall χ^2-tests applied for combining the village-wise tests in Tables 1 and 2 for the different regions and years. For each computed value of t we found the probability p of Student's t with n—2 d f falling below the computed value. Only the *lower tail probability* was used here, taking the alternative hypothesis as one-sided, *viz*, that the true correlation was negative. If p_i denotes this probability for the i-th sample village, then we used $\chi^2 = -2\Sigma \log_e p_i$ (with degrees of freedom equal to twice the number of sample villages) for combining the village-wise t-tests. The hypothesis of zero correlation is rejected if this χ^2 is significantly large (Fisher [14] pp 99-101).

A similar procedure was applied for combining the tests based on τ, but as the underlying sampling distributions were discrete, a device was necessary to make the p_i's uniformly distributed over (0, 1) under the null hypothesis. Let us write $S = \tau . n(n-1)/2$, where n is the number of sample holdings in a village. Then the test of significance of τ reduces to a test of significance of the 'score' S. The device can be explained through an illustration. Suppose, for instance, n = 10, so that $n(n-1)/2 = 45$, and computed $S = -17$. Then the lower tail probability p_i cor-

Note: Degrees of freedom are k—1 and n—2k for F's in col (8) and 2(k—1) and n—2k for those in col (9). Asterisks denote significance at different levels as in Tables 1 and 2.

responding to this S is obtained as the sum of the probabilities P(S =—45), P(S =—43) ,..., P(S =—19) plus a *random proportion* of P(S = — 17), all probabilities being computed under the null hypothesis of independence.

In some cases where the correlations seemed to be positive, the tests were combined in an alternative manner by taking the p_i's as the *upper tail* probabilities; here the alternative hypothesis is that the true correlation co-efficient is positive. These results are also included in Table 3.

In the second part of this communication we investigate the effects of aggregation over villages. Denoting the true regression for the i-th sample village by $y = \alpha_1 + \beta_1 x$, i = 1,... 10 or 15, we applied standard analysis of covariances tests of homogeneity of the village-wise regression lines for each region and year. This means we examined whether or not the size-productivity relationships for the different villages could be specified by a simple relation $y = \alpha + \beta x$. The scatter diagrams mentioned above suggested a more realistic model where α's were different for different villages but the β's were constant. Because of variation in soil fertility and other factors, the regression lines for different villages seemed to vary markedly in respect of height above the x-axis, but not so much, apparently, in respect of the slope. Standard analysis of covariance procedures were applied to test the suitability of this model. These analysis of covariance tests involve the subtle assumption that the deviations of individual farm observations from the true linear regressions have the same variance for each sample village. This seemed to be more realistic for the logarithms of V/A and V/G than for the original variables.

III
Results

We first examine the *within village* relationship between farm size A and productivity V/A on the basis of the results exhibited in Tables 1 and 3. Later we consider the relationship between gross cropped area G and value of output per unit of gross cropped area V/G (*vide* Tables 2 and 3). Such examination is facilitated by the simple averages of the within village correlation co-efficients and rank correlation co-efficients set out in Table 4.

It should be noted the farm size A and gross cropped area G were measured in acres for the years 1955-56 and 1956-57 but in hectares for 1966-67, 1967-68 and 1968-69. So all the regression co-efficients in Tables 1 and 2 are not comparable between the two sets of years.

We used official farm management data with one correction: For holding number 10 of village no 3 in Muzaffarnagar, for the year 1956-57, the figure for A was changed from 4.34 to 27.05 acres after scrutinising the data. The value of G, it may be noted, is 39.23 acres.

Most of the village level t-values in Tables 1 and 2 are non-significant, as the sample sizes are very small. We shall, however, take an overall view for each region and year. One approach could be to count the number of positive and negative values in the columns of correlation co-efficients and to apply the sign test. Using a two-sided test, we can say that the size-productivity correlation is significant if at least 9 out of 10 or at least 12 out of 15 village-wise co-efficients in a column have the same sign. The combination of probabilities tests in Table 3 are, however, more powerful.

Correlation between A and V/A: The within village correlation and rank correlation co-efficients are, on the average, about — 0.2 or —0.3 for Muzaffarnagar in all the years; and in every case, the χ^2-tests in Table 3 give a clear 'Significant' verdict. The negative correlation between farm size and productivity is therefore clear for this region in the sense that such correlation is observed *within* most of the sample villages and could not have arisen due to the aggregation over villages.

In Ferozepore, however, the average correlations are closer to zero and far from significant, excepting for 1956-57, when the correlation was about —0.1 and two of the three types of co-efficients were significant according to Table 3. But, on the whole, the size productivity correlation is not at all clear for this region.

There is little evidence of any time-trend in the within village correlation or lack of it in either region. Apparently, the green revolution did not affect the picture in either region upto the year 1968-69.

Interestingly, the three measures of correlation seem to have equal values, broadly speaking. Actually, the correlation co-efficient between the logarithmic variables tends to be slightly larger, numerically, than the other two types of co-efficients.

Correlation between G and V/G: The position is different if farm size be measured by gross cropped area (G) and productivity by value of output per unit of such area (V/G).

For Muzaffarnagar, the average within village correlation seems to be significantly negative for all the years upto 1967-68, although there are exceptional results. Thus, the correlation was a little low for 1956-57 and two out of the three types of correlations were not significant for this year. For 1968-69, on the other hand, all the three measures of correlation are, on the average, positive and one of them significantly so, by the one-sided test.

In the case of Ferozepore, the correlations are again closer to zero, but mostly positive. An exception is the average correlation between log G and log (V/G) for 1956-57; this is actually significantly negative. The results for 1968-69 deserve special attention. The average correlation co-efficients are of the order of 0.15, although the average rank correlation co-efficient is only —0.055, and the average correlation between G and V/G turns out to be statistically significant.

On the whole, the correlation between G and V/G tends to be less clearly negative or more clearly positive than that between A and V/A, and in 1968-69, the former correlation seems to have *become* positive in both the regions. This means a change from negative correlation to positive correlation in the district of Muzaffarnagar and from near zero correlation to positive correlation in the district of Ferozepore.

IV
Effects of Aggregation

The above findings from separate village-wise analyses may not at first sight be different from those obtained by the usual approach. But this impression is not wholly correct. This can be seen by comparing the average within village correlation co-efficients in Table 4 — their significance can be seen from Table 3 — with the correlation co-efficients and associated t-values in the all-village rows in Tables 1 and 2. There are some notable differences in the magnitude of the correlation: thus, the correlation co-efficient between A and V/A in Muzaffarnagar during 1968-69 was —0.145 if all the 150 holdings be considered together, but the *average* within village correlation was —0.232. The former was non-significant — it would be significant at 5 per cent level if a one-sided test were used — while the latter was significant at the 1 per cent level according to the χ^2 in Table 3. Also the average within village correlations

between G and V/G are *numerically* larger and statistically clearer in several cases, e g, for Muzaffarnagar 1967-68 and 1968-69. Again for Ferozepore in 1956-67, the all-village correlation between log G and log (V/G) appears to be numerically larger but it is far from significant, while the average within village correlation is statistically significant. Such instances point to the insensitive character of the test based on the all-village analysis.

Table 5 sums up the analysis of covariance tests mentioned in Section 2. It can be seen that in most cases the hypothesis of equality of slopes (β's) is tenable while that of homogeneity of village-wise regressions (i e, equality of both α's and β's) is usually rejected. Thus, the intercepts are frequently different from village to village and the usual model is $y_{ij} = \alpha_i + \beta x_i$ where i denotes village number and j the holding number. This could in fact be anticipated, as different villages have very different levels of productivity owing to soil fertility and other factors. Actually, the variation in α's explains a much higher proportion of the variation in productivity than does the influence of farm size or gross cropped area.

Whether the model is $y_{ij} = \alpha_i + \beta x_{ij}$ Or $y_{ij} = \alpha_i + \beta_i x_{ij}$, that is whenever $H_o(\alpha_1 = \ldots = \alpha_k; \beta_1 = \ldots = \beta_k)$ is rejected the usual test of size-productivity correlation (Saini [13]) is invalid as the data from all the villages are mixed together without any attempt to take account of between village variation in the regression line. Also, whenever the α's vary appreciably from village to village, this usual approach gives an insensitive test.

An important lesson can be drawn from the above for regression analyses based on farm management data. Even if one does not carry out completely separate village-wise analyses (as done here), it may often be necessary to introduce dummy variables representing changes in the intercept from village to village, as the general level of the variable may fluctuate from village to village. If this is not done, the analyses will frequently be invalid and the true relationships distorted by the aggregation over villages.

V

Concluding Remarks

We have only made a beginning here of a careful statistical analysis of size-productivity relationships. The analysis can easily be extended to other regions. One can bring in irrigation and other variables and/or carry out separate analyses for different crops, with a view to explaining the observed correlations between size and productivity. One can also analyse in the same manner farm business income per acre of farm size and see how this varies with farm size. This would reveal the effects of the green revolution on the distribution of income among cultivating families.

Notes

1 Conceivably, the *within village* correlation could be close to zero but the between village relationships might be different and might produce a spurious relationships might be different and all the viillages are mixed together. By *between village* relationship we mean the relationship between the village-wise averages of the dependent variable and the corresponding *averages* of the independent variable.

2 Throughout this investigation, we ignored the complications of the sample design of the Farm Management Studies and applied methods valid for simple random sampling with replacement.

Tata Iron and Steel

TATA Iron and Steel Company is making a public issue of 8 per cent mortgage debentures (1983-87) of a total amount of Rs 15 crores to raise part of the finance required to renovate and modernise its works at Jamshedpur. The subscription list will open on June 26 and close on June 29 or earlier, but not before June 28. The debenture issue, the biggest by a private sector company so far and TISCO's first to be offered to the public, is fully underwritten. Five major public sector financial institutions have jointly agreed to underwrite the issue to the extent of Rs 10 crores, without stipulating any condition for conversion of any part of debenture subscription into equity shares. Interest will be payable half-yearly, and the debentures will be redeemed at par by drawing of lots in five equal annual instalments commencing June 30, 1987. Some two years ago, TISCO proposed a Rs 20-crore debenture issue which ran into rough weather owing to insistence by the public sector institutions upon the right of conversion into equity shares of a part of the proposed issue as a condition of their support to the issue. The company's management opposed this on the grounds that the issue was not intended to finance any large new project but was only a continuing programme of replacement and improvement, that the company had a very low term debt-to-equity ratio (0.05:1), and that government's price policy precluded any appreciable increase in distributable profits out of which the additional dividend on converted debentures could be paid.

On the Allocative Efficiency under Risk in Transforming Traditional Agriculture

Uma K Srivastava

Vishnuprasad Nagadevara

Agricultural sectors in the less-developed countries of Asia, Africa, and Latin America are undergoing a spread of new seed varieties and an intensive application of fertiliser and irrigation inputs. It has been observed that, in the allocation of modern inputs, farmers apply a discounting factor on the expert advice because yields diverge considerably from those claimed by the agricultural scientists.

It may be hypothesised that, in recent years, farmers may not be efficient in resource allocation in the pure profit maximisation sense as they are in a transition process of adopting new techniques whose outcomes are not so certain from the traditional wisdom, but they may still be found to allocate resources efficiently if the risk elements are taken into account.

This paper aims at evaluating the allocative efficiency under: (i) the classical profit maximisation criterion with no risk of any sort, and (ii) an alternative criterion incorporating risk because of the probabilistic nature of estimates of production co-efficients. The data used in this paper pertain to the production of two varieties of wheat, Mexican and Local (Desi), in Punjab (Ferozpur) for 1967-68 and 1968-69. The sample size comprised 150 farmers selected on a stratified random basis.

[The authors are indebted to Earl O Heady for his valuable suggestions and encouragement. Their thanks are also due to V A Sposito of the Statistics Department, Iowa State University, for the programming help in evaluating an integral by Monte Carlo procedure.]

IN the context of allocative efficiency[1] in traditional agriculture, T W Schultz hypothesised that "there are comparatively few significant inefficiencies in the allocation of factors of production" [13]. This hypothesis has been widely supported empirically by cross-section production function analysis of Chennareddy [2], Hopper [6, 7], Sahota [10], Welsch [15], Wise and Yotopoulos [17], Yotopoulos [18], and Saini [11]. However, the use of the classical profit maximising framework to test the allocative efficiency of traditional agriculture implicitly assumes that factors of risk and uncertainty are not significant in explaining resource allocation. Factors of risk and uncertainty have, of course, been emphasised theoretically in case of both modern and traditional agriculture [5, 16].

Risk elements faced by farmers could be of several types. Dillon and Anderson have recently developed a framework to evaluate the effect of risk factors owing to the probabilistic nature of production co-efficients estimated from the cross-section samples [3]. This framework provides an alternative criterion for evaluating the allocative efficiency in terms of expectation of an opportunity loss suffered by an average farmer relative to the expected profits. When some of the evidence of earlier studies was reprocessed under this alternative framework, the results indicated only a mixed support to Schultz's hypothesis [3].

The aspect of risk incorporated by Dillon and Anderson is even more relevant in the context of a rapidly transforming traditional agriculture. Agricultural sectors in the less-developed countries of Asia, Africa, and Latin America are undergoing a spread of new seed varieties, an intensive application of fertilisers and irrigation inputs. It has been observed that farmers apply a discounting factor on the expert advice in the allocation of modern inputs because yields diverge considerably from those claimed by the agricultural scientists [9].

Objectives and Data

Most of the previous studies referred above have been conducted during a period in which the techniques of production have been static. It may be hypothesised that, in recent years, farmers may not be efficient in resource allocation in pure profit maximisation sense as they are in a transition process of adopting new techniques whose outcomes are not so certain from the traditional wisdom, but they may still be found to allocate the resources efficiently if the risk elements are also taken into account. This paper aims at an evaluation of allocative efficiency under: (i), the classical profit maximisation criterion with no risk of any sort, and (ii) an alternative criterion incorporating risk because of probabilistic nature of estimates of production co-efficients.

The data used in this paper pertain to the production of two varieties of wheat, Mexican and Local (Desi), in Punjab (Ferozpur) for the years 1967-68 and 1968-69. The sample size comprised 150 farmers selected on a stratified random basis. The breakdown of the sample size in terms of producers of two varieties of wheat is as follows: 37 farms produced only local variety, 12 farms produced only Mexican variety, and 101 farms produced both in the year 1967-68;[2] during 1968-69, 11 farms produced exclusively local variety, 60 farms produced Mexican variety only, and 79 farms produced both the varieties.

Allocative Efficiency in Classical Profit Maximisation Framework with No Risk

We have fitted the unrestricted form of the Cobb-Douglas production function to the four sets of data mentioned above. The production function is specified as follows:

$$Y_i = A_i X_{1i}^{\beta_{1i}} X_{2i}^{\beta_{2i}} X_{3i}^{\beta_{3i}} X_{4i}^{\beta_{4i}} X_{5i}^{\beta_{5i}} \quad (1)$$

$i = 1$ (Mexican variety: 1967-68)
$i = 2$ (Local variety: 1967-68)
$i = 3$ (Mexican variety: 1968-69)
$i = 4$ (Local variety: 1968-69)

Where

Y = Crop output (rupees)
X_1 = Area under crop production (hectares)
X_2 = Human labour (adult man days)
X_3 = Bullock labour (bullock pair days)
X_4 = Interest on fixed capital and depreciation on farm machinery
X_5 = Value of seeds (owned and pur-

*** Significantly different from zero at 1 per cent level of probability.

chased), value of fertilisers and manures (owned and purchased), and irrigation charges (rupees)

While the variables X_1, X_2, and X_3 are the usual inputs in the agricultural production function, X_4 and X_5 are included to serve as a measure for the mechanical and biological inputs. The variable X_5 has been the most important expanding input during recent years. The empirical estimates are presented in Table 1 (equation I). It can be seen in Table 1 that in all the four sets of data variables X_3 and X_4 are not significantly different from zero even at 10 per cent level of probability. Therefore, we have fitted alternative models with the omission of insignificant variables: (1) equation II drops out X_4 but includes X_3, (2) equation III drops out X_3 but includes X_4, and (3) equation IV leaves out both X_3 and X_4 because in no case did these variables turn out to be significant. The sum of the elasticities in equation IV was tested against unity to verify scale returns. In all the cases, sum of the elasticities is not statistically different from 1.0, indicating constant returns to scale. Also, the per hectare output was found to be statistically invariant with the farm size (Appendix Table) in all the four data sets, signifying constant returns to scale relative to farm size.

There is an unusual feature to be noted that the partial elasticity of production for land input (X_1) in case of local wheat in 1968-69 is negative. This can be explained in the light of changes in other inputs in relation to land. An idea of such a change in the allocation of inputs can be had from the geometric mean levels of inputs presented in Table 2. It can be seen (Table 2) that, in general, there has been a decrease in the levels of all the three inputs in the production of local variety of wheat and that there has been an increase in input use in the production of Mexican variety of wheat in 1968-69 over the previous year (1967-68). The direction of change in the allocation pattern has been consistent with the increased profitability, but there has been an overreaction in many cases resulting in inefficiencies in resource allocation when evaluated under classical profit maximisation criterion. A comparative picture of the marginal value productivities and factor costs at geometric mean levels of inputs is presented in Table 3. The profit maximising criterion requires the use of factors up to the point where marginal value productivities are equal to the factor costs.[3] We have presented the ratio of marginal value productivity to factor cost for each input. A deviation of this ratio from unity points the direction of misallocation of a resource. It can be seen that it was profitable in 1967-68 to allocate more of land and seed and fertiliser inputs in case of Mexican wheat. However, the resources were efficiently allocated in local wheat except for the seed fertiliser and irrigation inputs. Similarly, profit could have been increased in 1968-69 by allocating less of land inputs and more of labour inputs in Mexican variety, and labour and seed, fertiliser inputs in case of local variety of wheat. Moreover, it can be seen that, while the farmers have allocated larger proportion of their non-land inputs to the production of Mexican variety, land inputs have not been reduced in the same proportion in case of local variety, resulting in negative marginal productivity of land input in 1968-69.

The allocative efficiency of farmers between two varieties of wheat can also be visualised in terms of unit-cost relationship evaluated at geometric mean level. We have fitted the following form of cost function for this purpose :

$$C_i = a + bY_i + cY_i^2 \quad (2)$$

Notes : * Evaluated at geometric mean level of output.
** Significantly different from zero at 1 per cent probability level.

i = 1 (Mexican wheat: 1967-68)
i = 2 (Local wheat: 1967-68)
i = 3 (Mexican wheat: 1968-69)
i = 4 (Local wheat: 1968-69)
where
C = Total cost of production (both actual and imputed)
Y = Crop output (rupees)

The quadratic form of cost function presented above was found to be an appropriate fit in all the four cases and the estimates are presented in Table 4. We have worked out the marginal cost of one rupee worth of output at geometric mean level of output in all the four data sets. It is found that the marginal cost was lower in the production of Desi variety as compared to Mexican variety in 1967-68, but it was much higher in 1968-69. Furthermore, the marginal cost of production of local variety of wheat in 1968-69 exceeds the break-even point and the average farmer is producing at a loss. In the profit maximisation framework, this indicates an inefficiency in the allocation of resources, and profit could have been maximised by a reallocation of resources.

ALLOCATIVE EFFICIENCY UNDER ALTERNATIVE CRITERION INCORPORATING RISK

When the risk factors are operative, it may be hypothesised that farmers maximise utility instead of profit. In such a case the allocative efficiency has to be evaluated in terms of individual farmers' utility function. But this approach is not feasible at this stage because (i) the choice of a particular form of utility function is itself debatable as the different types of utility functions used by economists (Bernoulli, Von Neumann, Tinbergen, Baumol, and Igiri) imply different degrees of risk and there is no empirical work available to form a basis of choice of farmers utility function, and (ii) the utility function for an average farm does not have any sensible meaning for individual farmers as the attitudes toward risk differ according to the wealth position of the producing unit [1]. Therefore, we do use profit maximisation framework, but a departure from the previous approach has been made by taking production elasticities not as point estimates but having probability distribution.

Following Dillon and Anderson [3], we have used the concept of expected opportunity loss to evaluate the allocative efficiency of average farm as our production co-efficients are only sample estimates with an associated probability distribution. Opportunity loss L suffered by non-optimal operation of the average farm can be written as follows:

$$L = \tilde{\pi} - \bar{\pi}, \qquad (3)$$

where
$\tilde{\pi}$ = Optimal profits
$\bar{\pi}$ = Profits at the geometric mean level of inputs

Optimal profits have been worked out in our case by constrained maximisation (under budget constraint). Thus the optimal level of inputs have been determined by setting the partial derivatives $(\partial\tilde{\pi}/\partial X_i)$ of the following equation equal to zero:

$$\tilde{\pi} = PY - \sum_{i=1}^{3} q_i X_i + \lambda \left(C - \sum_{i=1}^{3} q_i X_i \right) \qquad (4)$$

where
P = Output price
q_i = Price of input i
C = Average farmers budget allocation for the three inputs included in equation IV (Table 1)
λ = Lagrange multiplier

The budget constraint has been included because of two reasons: (i)

TABLE 5 : EXPECTED LOSS AND INDEX OF INEFFICIENCY OF OPERATION AT GEOMETRIC MEAN INPUT LEVELS

Notes : * Not significantly different from 1 even at 10 per cent probability level.
** Figures are in log to the base e.

it is known that all the groups of farms in India and other developing countries are forced to settle for a second-best solution due to a lack of financial resources [4,13,14], and (ii) it has been shown in the literature that given the constant returns to scale and linear input costs (with no budgetary limitations), optimal levels of inputs and output become indeterminate [8,13]. The size of budget C in our case has been put to be equal to the actual sum spent by the average farm on the three resources included in our production functions. The actual profits of the average farm are worked out by

$$\bar{\pi} = (PY - \sum_{i=1}^{3} q_i \bar{X}_i),$$

where $\bar{X}$'s the geometric mean levels of inputs allocated by the farm. Thus, the opportunity loss can be written as follows:

$$L = A \left(\prod_{i=1}^{3} \tilde{X}_i^{\beta_i} - \prod_{i=1}^{3} \bar{X}_i^{\beta_i} \right) \qquad (5)$$

where B_i's are the elasticities of production taken from equation IV of Table 1. The measure of allocative efficiency suggested by Dillon and Anderson [3] is the index calculated by taking the ratio of expected loss to expected profit. It is expressed as follows:

Index of Inefficiency

$$= EL/E\tilde{\pi} = EL/EL + E\bar{\pi} \qquad (6)$$

In the above expression E denotes the expectation. In this framework, our average farmer would be completely efficient if the index of allocative inefficiency is equal to zero. Any deviation of the above index from zero would denote allocative inefficiency. The percentage of potential profits foregone can be worked out by multiplying the value of index by 100.

Since the β_i's in our production function are probabilistic estimates, the loss L can be expressed as a function of random variables β_i.

i e, $L(\beta_1, \beta_2, \beta_3)$.

If the joint probability distribution of the β_i's is denoted by $f(\beta_1, \beta_2, \beta_3)$, the expected loss can be written as follows [3]:

$$EL = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} L(\beta_1 \beta_2 \beta_3) \times f(\beta_1, \beta_2, \beta_3)\ d\beta_1 d\beta_2 d\beta_3 \qquad (7)$$

We have evaluated the above integral by Monte Carlo procedure using pseudo-random sampling from the appropriate multivariate distribution of the β_i's. In order to ensure that the sampled β_i's are strictly positive, we have truncated the distribution symmetrically and confined to the area in the positive quadrant. We have taken an average value from 1,000 replications of Monte Carlo procedure[4] to estimate EL and also $E\tilde{\pi}$. The estimates of EL and the index of allocative inefficiency $EL / E\tilde{\pi}$ is presented in Table 5. We have not worked out the expected loss and the index of inefficiency for Local (Desi) wheat production in the year 1968-69 because the elasticity of production for land is negative. The average farmer in this case is *prima facie* inefficient in the allocation of resources.

It will be seen in Table 5 that the absolute value of the index of inefficiency is greater than zero but much smaller in all the three cases than the value, |0.2|, considered by Dillon and Anderson [3] as an indicator of allocative inefficiency. However, the interpretation of size of index of inefficiency is a matter of subjective judgment and open to debate. But the fact is that the percentage of potentially achievable profit foregone is very small: 8 per cent, 4 per cent in Mexican during the years 1967-68 and 1968-69 and 2 per cent for Desi wheat production during 1967-68. Thus, under this criterion, the average farmer is by and large efficient in resource allocation.

CONCLUDING REMARKS

It was hypothesised in this paper that the average farmer may not be efficient in the allocation of resources when he is in the process of adopting newer techniques of production and modern inputs. When we evaluated efficiency of an average Punjab wheat farmer under classical profit maximising conditions, it was found that there are inefficiencies in resources allocation both in Mexican as well as Local (Desi) wheat production. In most cases, farmers have overreacted in allocating resources in the direction of profitable opportunities resulting in allocative inefficiencies. When the resource-use efficiency was evaluated in terms of index of allocative inefficiency (an alternative criterion), it was found that both Mexican and Local (Desi) wheat farmers are by and large efficient in resource allocation. This analysis indicates that the judgments on the allocative efficiency which are based on classical profit maximising conditions may be misleading — particularly when production co-efficients are probabilistic.

Notes

1 Allocative efficiency was defined in terms of classical profit maximising conditions.
2 There were 113 farms in the sample which produced Mexican variety. But the data was incomplete in case of three farmers so we had only 110 observations.
3 Factor costs were taken on average basis.
4 The average value derived from 1,000 replications of Monte Carlo procedure is considered to give a stable estimate of EL.

The Eighth Seminar on

MANAGEMENT BY OBJECTIVES

From September 4 - 9, 1972

OBJECTIVE: Management by Objectives is a top management planning and control approach to improve performance of both, the individual executive and the enterprise. The primary objective of this brief and intensive seminar is to provide deep understanding of this approach and to help the top executives develop commitment for Management by Objectives based on proper understanding.

CONTENTS: The Seminar will cover all the elements of Management by Objectives, including the setting of corporate and unit objectives, strategic planning, profit planning, improvement of managerial performance, management job description, performance review, management development, problems of implementation and role of management adviser.

ELIGIBILITY: This is a top management seminar designed for the executives of the private and public sector enterprises as well as the Government. Only chief executives and top executives directly reporting to the chief executives will participate in this seminar.

PROGRAMME DIRECTOR: Dr. B. L. Maheshwari.

FEE: Rs. 2000/- per participant. This will cover tuition, boarding and lodging, and educational material for the seminar

LAST DATE: Completed nomination forms along with fees should reach the College by July 31. 1972.

For brochure and nomination forms, please write to or contact:—

Observations on Agricultural Technology in a Developing Economy

G C Mandal

Facts reviewed in this article reveal that the introduction of machine (tractor) service in agricultural technology influences the nature of farm enterprise in a way that leads to increase in the labour-input per acre. That is, reduction of labour input per unit of output — or reduction of the percentage of the labour-input in the total input structure — is likely to be accompanied by more intensive employment of labour in multiple cropping made possible by the short-period-maturity HYV, and result in a more valuable composition of farm products.

Facilities for obtaining mechanical services on custom basis are likely to lower the charges of farming operations compared to those carried out by human and animal labour. This would further widen the scope for diversification of farm enterprises, and the saved labour could become a factor of growth.

If land-ceilings are rigidly enforced, so that holding sizes become small and standardised, the consequent increase in self-employment would reduce the wage-labour market. But inadequacy of timely labour in many urgent farming operations might still make itself felt. In such a situation, farmers could form co-operatives for supplying themselves with mechanical aid which would otherwise be beyond their reach.

[The pilot investigation in the district of Purnea, Bihar, mentioned in the paper, was conducted by Ramnandan Prasad.]

THE search for the most appropriate technology is a crucial task in the growth of agriculture in a developing economy which is generally characterised by low per capita income and predominance of agriculture as a means of livelihood.

A technology may be broadly defined in terms of the proportions in which land, labour and capital are combined in the production of a unit of output. In detail, all the various physical inputs could be specified, such as land, human labour, animal labour, seeds, fertilisers, services of machinery of different types, irrigation-services by different methods, and transportation by different methods. A technology represents a set of inputs entering into a unit of output resulting from the inputs. To each technology corresponds a particular level of net profit — i e, the value of a unit of output minus the aggregate value of inputs producing that output. The efficiency of a technology is measured by the surplus generated by it per unit of output. Therefore, the values of different products as well as the values of inputs have to be taken into account. The values of inputs would obviously reflect the relative scarcity of the inputs and would serve as a signal, in conjunction with the values of products, as to which technology should be adopted in a particular situation of resource-product-relationship.

Recent times have witnessed the rise of various technological ideologies — mostly favouring capital-intensive techniques in a developed economy, where capital is abundant in relation to labour and labour-intensive technology in an underdeveloped economy where labour is supposed to be abundant in supply in relation to capital.[1] It is, however, necessary to probe deeply the nature of the labour-surplus or labour abundance in an underdeveloped economy before a policy-prescription can be made on a suitable technology for its agriculture.

Physical Constraints and Institutional Setting

First of all, the land-man ratio may not be the same all over the country. It may differ from region to region, district to district, and zone to zone. Labour is more scarce relative to capital in areas where the land-man ratio is higher and less scarce in areas where the land-man ratio is lower. Again, in a region or district where the average size of farm is larger, the abundance of labour, might be less perceptible in relation to the demand of individual employers — even though physically real in terms of man-days — than in areas where the average farm size is small. Similarly, in a region or district where the average farm size is smaller, capital supply in farming appears to be more limited than in areas where the average farm-size is bigger.

Secondly, the relative availability or the demand-supply situation of factors such as labour and capital is not merely a physical question of resource-constraints, as also to a large extent a question of institutional setting. For example, in two regions the land-man ratio may be the same, but if there is concentration of land in the hands of a few big farms in one of the two regions than in the other, labour would appear to be more scarce in the former region than in the latter — in spite of the equality of land-man ratio. In other words, the distribution of land is an important factor in determining the nature of the demand-supply relationship of labour and capital in agriculture. Bigger farms present increased demand for labour for wage-employment as a substitute for self-labour, and by a competitive bid for labour they may make shortage of labour at certain points of time perceptible. Smaller farms, using mostly their own labour, do not present a competitive bid for labour; so that in areas dominated by smaller farms capital-

Net return (pesos)=1332.46 per hectare
One peso=$0.15 (US dollar)

shortage rather than labour shortage may be more real. Apart from this, peak-time shortage of labour in farming is widespread even in a labour-abundant economy.

Is it invariably the labour-intensive technology (interpreted to signify the absence of mechanisation) that is the most appropriate for the agriculture of a developing economy — in the sense that it secures fuller utilisation of labour? Recent findings show that a labour-intensive technology, defined as a technology associated with a high labour-capital or high labour-output ratio, may not be more productive of labour-employment per acre of land than a capital-intensive technology defined as a technique associated with low labour-capital or high capital-output ratio.

EMPIRICAL DATA

Reference may be made to the following illustration (see Table 1) cited from a survey of 76 farms of the Central Luzan Laguna area and 153 farms of Laguna area in the Philippines conducted by the International Rice Research Institute.[2]

It is evident from Table 1 that, as a consequence of the increase in the number of tractor-users from 14 per cent to 48 per cent during 1966-70, man-days per hectare increased in the Central Luzan area from 64 to 67. In Laguna area, however, though man-days per hectare slightly decreased when the percentage of tractor-users increased from 37 to 76, the hired man-days per hectare appreciably increased. Thus tractorisation made a positive contribution to employment. Instead of displacing labour, it saved labour for the expansion of enterprise and output.

Even in India, farm mechanisation is reported to have created new employment in the farm economy. In a study, C Hanumantha Rao has shown that, "cropped area per 100 agricultural population, percentage of area irrigated, and cropping intensity, increase with the increase in the rate of tractorisation (number of tractors per 10,000 agricultural workers), thus indicating that tractorisation was induced by greater requirements of draft power".[3]

The present writer, during his stay at the Central Luzan State University, conducted a survey of 27 farm-households in 1970-71 in a village located near the University campus.[4] The farmers under survey had a cultivated area of 2 to 3 hectares and were mostly share-tenants. These farmers were growing mostly HYV rice such as IR-8, IR-5 and IR-20. The findings of the survey relating to the input-structure for rice and the corresponding output are given in Table 2.

The input-level of the rice-farming, shown in Table 2, is not high. What is remarkable in the composition of inputs is that they include tractor charges even though the farms are quite small and the farmers are share-tenants. The farms under study were taking advantage of tractor-ploughing operations on custom basis. The benefit consisted in timely and speedy operations, which implied taking advantage of the most suitable time for transplantation and sowing and a preparatory tillage for the next crop.

A S Kahlon and D S Gill, in their paper 'Economics of Mechanizing Farm Operations in Punjab', showed that on a 25-acre farm in Patiala the intensity of cropping could be increased from

TABLE 3: PATTERN OF CROP-ENTERPRISE ON FARM A AND FARM B

Intensity of cropping (percentage)	186	135
Output per acre, net (Rs)	643.74	446.78

140 per cent to 200 per cent and the net income from Rs 9,044 to Rs 18,396 by the introduction of mechanical power involving employment of 35 man-work-units per acre of cropped area instead of 40 man-work units with bullock power.[5]

Apparently, while in respect of a single crop tractor-power might reduce or displace labour, in regard to the farm economy as a whole it leads to further utilisation of human labour. For a single crop, the tractor is a substitute for human labour, but for the farm economy as a whole it is complementary to human labour.

A pilot investigation was conducted by the Visva-Bharati Agro-Economic Research Centre into the operations of two farms of the block Krityanandnagar in the district of Purnea, Bihar. One of the farms (later denoted as Farm A) has cultivated a holding of 50 acres, operated by tractors owned by the farm

Note : *Wage rate is Rs 2 per man-day.

itself. It was also making use of a mechanical thresher and using a tractor for transportation purposes. The other farm (later denoted as Farm B) has a cultivated holding of 40 acres. Only the preparatory tillage was operated with hired tractor services. The pattern of crop enterprise on the two farms is indicated in Table 3.

It is evident that the intensity of cropping is greater on the more mechanised Farm A than on the less mechanised Farm B.

Table 4 indicates the pattern of input on the two farms. It may be seen from Table 4 that the total input per acre on the more mechanised Farm A is Rs 351.34, and on the less mechanised farm B is Rs 256.57. The higher level of enterprise on Farm A *vis-a-vis* Farm B is explained mainly by the excess of machine services, fertiliser use, and irrigation cost. Technology of Farm A is less labour-intensive (and more capital-intensive) than that of Farm B, as reflected in input-output ratios or percentage of labour to total inputs. It is, interesting, however, to note that per acre input of human labour is somewhat higher on Farm A than on Farm B. Input of human and bullock labour combined is, of course, higher on Farm B than on Farm A.

Turning to human labour and machine (tractor) service input in individual crops of the two farms, as given in Table 5, we find that the human labour input per acre of Farm A for IR-8 paddy is worth Rs 150 (75 man-days), for wheat (ordinary) Rs 56 (28 man-days), for paddy (ordinary) Rs 118 (59 man-days) and for jute Rs 122 (61 man-days), and for other minor crops it is much less. On Farm A, mechanisation is not confined to tillage but is extended to threshing and transportation as well. Threshing is done by a diesel operated thresher and transportation is done by a tractor fitted with a trailer. On Farm B, human labour input per acre for ordinary paddy is worth Rs 118.30 (59 man-days), for HYV wheat Rs 105 (52 man-days), for jute Rs 190 (95 man-days), and for other minor crops much less.

Farm A dispenses with animal power altogether, while Farm B incurs a cost of Rs 7 per acre for ordinary paddy, Rs 6.50 for HYV wheat, Rs 6.25 for jute and around Rs 6.40 for other minor crops on account of the use of animal power. Tractor replaces animal power completely on Farm A. It is remarkable that while human labour input per acre for each of the individual crops, excepting ordinary paddy, is substantially higher on Farm B than on Farm A, the overall human labour input per acre for all crops taken together is rather less on Farm B than on Farm A. Farm A is yielding a higher rate of surplus than Farm B.

Farm A and Farm B represent two technologies of different capital intensity — the former higher, the latter lower. However, both of these technologies seem to involve larger labour-input per acre than observed in the case of absolutely non-mechanised farms of the district of Monghyr (excepting North Monghyr) and Shahabad (see Table 6).[6]

TABLE 6: MAN-DAYS PER ACRE ON SELECTED NON-MECHANISED FARMS OF MONGHYR AND SHAHABAD, BIHAR

Area	Man-Days per Acre of Paddy	Overall Man-Days per Acre of Net Cultivated Area
North Monghyr	27	94
Central Monghyr	42	79
South Monghyr	37	20
Shahabad	21	60*

Note: *Estimated on the basis of individual crop-data.

If one compares the input-pattern of ordinary variety paddy and that of high yielding paddy, one will find that HYV paddy is more labour-intensive than ordinary variety on per acre basis. HYV, however, is less labour-intensive than the ordinary variety, as reflected in percentage of labour and input-output ratios. In fact, this is clearly shown by data obtained from the survey of HYV IR-8 paddy and local paddy in East Godavari, Andhra Pradesh conducted by the Agro-Economic Research Centre, Andhra University (see Table 7).[7]

Table 7 shows that the wage paid for human labour is Rs 158.48 per acre for HYV paddy, while for local paddy it is only Rs 128. Animal labour input is, however, less for HYV paddy (Rs 26.29 per acre) and more for local paddy (Rs 37.09). On the other hand, input-output ratios indicate that one unit of output absorbs 0.13 units of human labour in the case of HYV paddy, whereas a unit of local paddy absorbs 0.20 units of human labour. For HYV paddy, human labour constitutes only 27 per cent of the total inputs, while for local paddy it constitutes 32 per cent of the total inputs. HYV paddy is

TABLE 7 : PATTERN OF INPUTS AND INPUT–OUTPUT RATIOS ON SELECTED FARMS IN EAST GODAVARI FOR RABI IR-8 PADDY AND LOCAL PADDY, 1968-69

Items of Input	IR-8 Paddy Value (Rs) per Acre	Per Unit of Output	Per Cent of Total Inputs	Local Paddy Value (Rs) per Acre	Per Unit of Output	Per Cent of Total Inputs
Human labour	158.48	0.13	27	128.63	0.20	32

Total :	578.25	0.45		396.22	0.62	
Output per acre	1238.40			633.66		
Surplus per acre	660.15			237.44		

generating a much higher rate of surplus than local paddy.

Conclusions

Because of diverse local situations as well as variety of individual farm situations, it is possible to conceive of the existence of diverse technologies in the economy. Different individual farms can adopt technologies differing in the degree of capital intensity from one another. The character of inter-farm competition is not such as will expel from the economy those farms which do not conform to a specific standard of efficiency. A small farm has the advantage of home-labour for the adoption of labour-intensive technique. A big farm has the advantage of large capital resource for the adoption of capital-intensive technique, saving labour which it lacks; a medium farm, owning smaller capital resource would supplement labour with a labour saving technique of mederate capital-intensity. Each category of farm continues to live on its own peculiar island of technology, enjoying a surplus feasible within its peculiar resource-constraints. The rates of surplus appropriated by these different categories of farmers are different, depending upon the character of the technology; but these surpluses enable all the different farms to survive at different levels of efficiency.

Facts reviewed above reveal that the introduction of machine (tractor) service in the agricultural technology tends to influence the nature and pattern of farm-enterprise in a way that leads to increase in labour-input per acre. Reduction of labour-input per unit of output or reduction of the percentage of labour-input in the total input-structure is likely to be accompanied by more intensive employment of labour in multiple cropping and in the various farming operations and cultural practices.

What does it imply if HYV crops are labour-intensive? The implication is that, the possibility of devoting less physical resource — both land and labour — to the production of a given amount of output would open upon opportunity for multiple-cropping, with the result of a more valuable composition of farm-products. Facilities for obtaining mechanical services on custom basis are likely to lower the charges of farming operations compared to those carried out by human and bullock labour. This would further widen the scope of the diversification of farm enterprises. Thus saved labour becomes a factor of growth.

Specifically, tractors appear to be an important ingredient of a progressively dynamic farming technology, compensating for the inefficiency of ill-nourished physically poor man power and animal power. Improving efficiency of agricultural labour by better nourishment and better environmental conditions would take time. This is also true for animal power. The farm-economy needs an elemental mechanical base for adding speed and energy to multiple cropping, the possibility of which has been accentuated by the HYV programme of crops with short-period maturity.

If drastic land-ceilings are rigidly enforced toward an equitable distribution of land, then holding-size of all farms would be small and standardised. In that case, increase in self-employment would reduce the size of the wage-labour market and the competitive bid for labour. But inadequacy of timely labour in many urgent farming operations might still continue and be reflected in falling overall farm-enterprise and output. In such a situation the farmers could form co-operatives for supplying themselves with mechanical aid which would have otherwise been beyond their reach.

Modi Rubber

MODI Rubber, a new company promoted by Modi Industries, is setting up a Rs 18-crore project at Modipuram near Meerut in UP for annual production of 5 lakh tyres and tubes each for automobiles with technical collaboration from Continental Gumni Werke of West Germany. The plant is expected to go into production by the end of 1973 or early 1974. It is intended to utilise 77 per cent of the capacity for production of tyres and tubes for trucks and heavy vehicles, which are in short supply in the country. According to the Planning Commission's estimates, demand for tyres is expected to be 7.2 million numbers in 1974, against the anticipated production of 5.4 million numbers. The project is proposed to be financed with equity share capital (Rs 6 crores) and loans and debentures from financial institutions and commercial banks (Rs 12 crores). The promoters and their business associates have subscribed 40 per cent of the equity capital and the financial institutions will subscribe Rs 65 lakhs. The balance Rs 2.95 crores is being offered to the public through a prospectus. The subscription list will open on June 21 and close on June 29 or earlier, but not earlier than June 26. On each Rs 10 share, Rs 2.50 will be payable on application, another Rs 2.50 on allotment, and the balance Rs 5 in two equal calls with a minimum interval of 2 months between each. The entire issue has been underwritten by financial institutions and brokers. According to K N Modi, Vice Chairman, the company is expected to have sales of Rs 15.36 crores in 1974 and Rs 21.75 crores in 1976. Profits after taxes and full provision for depreciation and development rebate should be around Rs 1.51 crores in 1975 and Rs 2.47 crores in 1976. Modi holds out promise that shareholders can feel sure of getting 'good dividends' on their investment and also reap benefits of 'substantial appreciation in the value of shares.

Small Farmer and Long-Term Finance

R M Mohana Rao

P Jagannadha Acharlu

Small farmers form a sizeable proportion of rural households. Yet studies on the green revolution have shown that it has been limited to the few who have the resources or the access to institutional finance.

The problem of credit to small farmers is mostly a problem of short-term finance in irrigated-areas while it is more a problem of long-term finance in the dry-areas where the needed infrastructure has not been made available through public investments. Even in areas newly brought under irrigation through public investments, small farmers need long-term finance for levelling, bunding, terracing, soil conservation, etc.

Most Committees, with the exception of the Rural Credit Review Committee of 1969, however, concentrated their attention upon short-term and medium-term credit and neglected the issue of long-term finance especially in relation to the small farmer. Against this background, an attempt is made in this paper to evaluate the scanty published data on long-term finance in relation to the small farmers.

The analysis is mainly limited to the advances of land development banks for 1969-70. Available data are examined to seek answers to the following questions. (1) What is the percentage of small farmer-households that borrowed from land development banks vis-a-vis *others? (2) What is the proportion of small farmers to the total borrowers from land development banks? (3) Is there any relationship between the area owned by small farmers and the advances made to them? (4) What is the relative share of small farmers in the total advances?*

[The authors are grateful to B Prasada Rao for his valuable suggestions.]

SMALL Farmers account for a sizeable proportion of rural households. Agricultural transformation through the green revolution will be meaningful only when this significant section of small producers are also partners in this process. But studies on the green revolution show that it has been confined to limited areas[1] with irrigation facilities as well as to limited numbers who have the resources or the access to institutional finance. Most small farmers, who lack resources of their own or have no access to the institutional finance, are outside the mainstream of the green revolution. This observation is based on the interpretation of the green revolution in terms of the area under the High Yielding Varieties Programme. Even if one interprets the green revolution very broadly to encompass use of chemical fertilisers etc, its use is seen to be concentrated in a few areas.[2]

Though the divisibility of modern inputs facilitates their application by small farmers, the risks involved in dry areas are great enough to deter them from using the inputs. If the green revolution is to be really green, the social imperative is to bring the small farmers into its fold. This requires equipping the small farmer with the resources needed to develop the needed infrastructure, like irrigation facilities, to help him participate in the process of the green revolution.

In the context of long-term finance and for the purposes of this paper, the small farmer is defined in terms of factor-endowments. Any effort to improve his lot in agriculture necessitates widening his agricultural base. Geographical limitations stand in the way of a physical increase in the size of the farm since land reforms offer limited scope to achieve this. It can be possibly achieved through intensive use of land. This alone provides scope for optimum utilisation of the factor-endowments on small farms. But development of small farms for intensive use could be achieved only through capital investments of a long-term nature. Because of the small size of the small farmer's holdings, long-term finance becomes crucial for optimum utilisation of this factor endowment. It is also a pre-condition for obtaining maximum benefits from the new technology and for fruitful utilisation of the short-term resources made available.

The problem of credit to small farmers is mostly a problem of short-term finance in irrigated-areas whereas it is more a problem of long-term finance in the dry-areas where the needed infrastructure has not been made available through public investments.[3] Even in areas newly brought under irrigation through public investments, small farmers need long-term finance for levelling, bunding, terracing, soil conservation, etc.

Most of the Committees, with the exception of the Rural Credit Review Committee of 1969,[4] concentrated their attention upon short-term and medium-term credit and neglected the issue of long-term finance especially in relation to the small farmer. The earliest attempt at a comprehensive study of the problem in its various dimensions was attempted by the All India Rural Credit Survey Committee. The Committee emphasised.[5] the need for special attention to the credit needs of the small farmer, but it did not suggest any concrete steps to facilitate the flow of finance to them — particularly, long-term finance.

The credit policy of the Government, as envisaged in the First and Second Plans, was mainly directed at implementing the valuable recommendations of the Rural Credit Survey Committee and it laid special emphasis on short — and medium-term credit.

The first Committee which examined the problem in greater detail and made specific recommendations for better flow of farm finance to small farmers was the V L Mehta Committee on Co-operative Credit. The Committee observed that "With the extension of irrigation facilities, when farmers switch over from dry to irrigated farming, there is likely to be an appreciable demand for medium and long-term agricultural credit."[6] The Committee also observed that co-operative finance did not reach the small farmer proportionately, and suggested outright grants to the co-operative central banks and to the primary societies, as an incentive to finance the small cultivators. Un-

fortunately, it did not make such recommendations to meet the long-term credit requirements of small farmers. Even the Working Group, constituted by National Co-operative Development Council in 1964, did not take notice of the long-term credit requirements of small farmer. It was the Rural Credit Review Committee that suggested concrete steps in this direction.[7]

Against this background, an attempt is made to evaluate the published data on long-term finance in relation to the small farmers. Published data on this aspect is very scanty.[8]

Our analysis is mainly limited to the advances of land development banks for 1969-70.[9] For this purpose, holdings below 5 acres are considered 'small holdings'. Hence the details reported under the first two groups, *viz*, ownership holdings below 1 hectare and between 1-2 hectares, are combined. As the Reserve Bank's statements do not provide details on the number of rural households and the extent of the area owned by various groups, these details are obtained from the estimates of the National Sample Survey (1961).[10] Available data are examined to seek answers to the following questions.

(1) What is the percentage of small farmer-households that borrowed from land development banks *vis-a-vis* others?
(2) What is the proportion of small farmers to others among the total borrowers from land development banks?
(3) Is there any relationship between the area owned by small farmers and the advances made to them?
(4) What is the relative share of small farmers in the total advances?

Data relating to number of rural households and borrowers of land development banks are presented in Appendix I and II. At the all-India level, the coverage of long-term finance is very insignificant, i e, only 0.5 per cent of the total rural households borrowed from the land development banks. Of all the states, Gujarat and Andhra Pradesh are in the lead, covering 2 per cent and 1 per cent of the total rural households, respectively, while the coverage is very poor in Bihar, Assam, Kerala, Rajasthan, Madhya Pradesh, Tamil Nadu and Uttar Pradesh.

As for relative coverage of small farmer households as against others, the percentage of coverage is only 0.25 for small farmers, while it is 1.32 for others. Even in the states with higher coverage, like Gujarat and Andhra Pradesh, the relative coverage of small farmer households is very low compared to others. It is 0.5 per cent for small farmers and 4.2 per cent for others in Gujarat, while it is 0.6 per cent and 2.6 per cent respectively in Andhra Pradesh. The position is much worse in other states. This makes it clear that, relatively speaking, the coverage of small farmer households is very poor compared to others in all the states with slight variations from state to state.

Looking at the borrower-households, one gets the impression that small farmers are neglected. To put it more pointedly, while 75 per cent of the rural households are small farmer households, the account for only 36 per cent of the total borrowers of land development banks, while the remaining 25 per cent of the rural households account for 64 per cent of the total borrowers. There are, however, variations among different states. Kerala ranks first, where 94 per cent of the total borrowers are small farmers, followed by Tamil Nadu (65), Assam (61), Uttar Pradesh (43), Andhra Pradesh and Bihar (42). The position is bad in respect of Madhya Pradesh (7), Rajasthan (10) and Gujarat (14).

The problem is also examined by comparing the proportion of advances made to small farmers with the land owned by them. At the all-India level, the advances to small farmers are more than their share of land. They borrowed 25 per cent of the total advances while the area owned by them was only 22 per cent of the total area. Among various states, Kerala ranks first with 91 per cent of the advances going to small holders as against 54 per cent of the land held by them. The other states with high proportion of advances compared to the land held by the group are, Andhra Pradesh, Tamil Nadu, and Rajasthan. On the other side, are states like Bihar where the proportion of advances is less by 20 per cent compared to their share of the land.

If, the analysis is restricted to advances only, small farmers' share is lower in MP and accounts for only 4 per cent of the total advances, followed by Gujarat (8), Rajasthan (9), Bihar (17), Andhra Pradesh (27), and Uttar Pradesh (30), whereas, in other states, the proportion of advances to small farmers is very high, *viz*, Kerala with 91 per cent, followed by Tamil Nadu (49), and Assam (46).

The above analysis suggests that a relatively lower proportion of small farmer-households are covered by land development banks, while their relative share in the total number of borrowers and in the total advances is very encouraging. But as the latter inferences go against the general impressions based on the loaning policies of the land development banks, they need to be examined a little more carefully.

The procedure of land valuation and the purpose for which loans are allowed by the land development banks are not conducive for free flow of long-term finance to small farmers. The land valuation procedures, as adopted by most of the land development banks, are either on the basis of the average sale statistics of land for a fixed period or a multiple of the land revenue prevailing in the concerned state as the case may be. These thus have limitations. First, to lessen the value of stamp duty and for other reasons, land values tend to be under-quoted in the sale deeds. Secondly the land revenue is not revised in most states and remains at a low level. In states where small farmers were assessed at concessional rates for purposes of land revenue, their eligibility in terms of the security they can offer will be reduced. In addition to the above limitations, acceptance of only 50 to 60 per cent of the value of land as security without due regard to the appreciation in value through investments, greatly reduces the value of security the small farmer can offer. This affects his borrowings from the banks.

As for the purposes to which loans are made, the insistence on the principle since 1969-70 that 70 per cent of the loans should be for 'easily identifiable purposes' and that not less than 90 per cent of the loans should be issued for productive purposes, need examination. If the land valuation procedures were to remain as they are with the land development banks, hardly any small farmer with 5 acres or less of land will qualify for loans under the category 'easily identifiable purposes'. One can argue that small farmer can avail of a loan for an oil engine which costs around Rs 2,500 with his limited security. But he cannot use it except for hire without a well which is jointly or individually owned. It is hardly likely that a small farmer in a dry region would be eligible to a loan for a well and an oil engine. In some areas where the costs are high, it becomes difficult for him even to qualify for the amount needed to dig a well.

In areas under ayacut development, credit needs for levelling, bunding and soil conservation will be more. Excepting the successful banks eligible for special loans from the Agricultural Re-

Appendix I

RURAL HOUSEHOLDS AND BORROWERS OF LAND DEVELOPMENT BANKS

State	Total			Small Farmer			Others		
	Number of Rural Households (in '000s)	Number of Borrowers	Percentage Columns 2 to 3	Number of Rural Households (in '000s)	Number of Borrowers	Percentage Columns 5 to 6	Number of Rural Households (in '000s)	Number of Borrowers	Percentage Columns 8 to 9
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)

Uttar Pradesh	1,33,72	70,337	0.526	1,03,59	30,427	0.293	30,13	39,910	1.324
Total	5,13,81	70,337	0.514	3,86,69	95,890	0.248	1,27,12	1,68,656	1.326

finance Corporation, the others find it difficult to advance for such purposes. The relative scarcity of funds for these purposes affects the small farmers in preparing the land for irrigation. It thus becomes difficult for them to adopt modern technology.

The above discussion shows that, by and large, the policies and procedures observed are not conducive to better flow of long-term finance to the small farmer.[12] Further, an examination of the records of some primary land development banks in Andhra Pradesh show that the details furnished by them under 'the size of ownership holdings', are more details of hypothecated, rather than actual size of, holdings. Though the loan application form contains such columns, no attempt was made to check the accuracy of the particulars relating to ownership holding. Even these particulars are not compiled in a register to furnish the figures relating to ownership holdings. This indicates that the details of distribution of members and advances by ownership holdings furnished by the banks might be the details of land hypothecated rather than land owned. This might be the case with respect to the other primary land mortgage banks in Andhra Pradesh and possibly in the other states also. If this is true, small farmers' share will be much lower than the data indicates.

To conclude, there is need for a second look at the data published by the Reserve Bank of India on the relative share of advances to different individuals by size of ownership holding in respect of co-operative central land mortgage banks.

Notes

1 Parthasarathy observes: "the impact of the green revolution is as yet limited. It is limited by and large to irrigated areas". G Parthasarathy, "Green Revolution and the weaker sections", Thackers, Bombay, 1971, page 10.

2 Falcon observes: "For example, in India approximately 80 per cent of the total fertiliser consumed in 1968 was concentrated in 25 per cent of the districts, with most of the latter being those with irrigated systems". Walter B Falcon, "The Green Revolution-Generation of Problems", Paper presented at the summer meeting of American Agricultural Economics Association, Columbia, Missouri, August 1970, page 6.

3 Falcon laid special emphasis on this aspect. He observed "Perhaps most promising as an aid to the small operator is the provision of adequate supplies of irrigation water". *Ibid*, page 29.

4 The Rural Credit Review Committee observed that "One of the features of the working of the land development banks on which increasing attention is being focussed relates to the extent to which they finance small farmers". Reserve Bank of India, Report of the All India Rural Credit Review Committee, Bombay, 1969, page 780.

Appendix II

SMALL FARMERS' SHARE IN LONG-TERM FINANCE, 1969-70

State	Total Rural Households (in '000s)	Percentage of Rural Households with Less than 5 Acres	Total Area Operated (in '000s)	Percentage of Area Operated by Small Farmers	Total Borrowers	Borrowers with Less than 5 Acres	Total LT Advances (in '000s)	Percentage of Advances to Small Farmers
Andhra Pradesh	66,41	77	2,82,19	16	70,113	42	20,68,21	27
Assam	20,24	85	46,49	50	303	61	9,30	46

Effects of Consumption Availability Fluctuations on Foodgrains Prices

S K Ray

The purpose of this paper is to examine the extent of fluctuations in major foodgrains prices in the past caused by their corresponding consumption availabilities.

Some single-equation models are developed to explain the price behaviour of foodgrains and cereals group and of the individual crops rice and wheat, by identifying the real and trend factors in their corresponding price movements.

FROM 1955, prices of foodgrains as a whole, of cereals separately, and of the individual crops, *viz*, rice and wheat, recorded a steep upward trend with nominal declines on two or three occasions. Foodgrains production continuously lagged behind demand and the shortages of individual commodities made their impression on their prices. The individual commodity price fluctuations around their respective trends followed a pattern closely related to the corresponding fluctuations in their consumption availabilities. Voluminous PL-480 wheat, imported to increase total foodgrains supply, did not help arrest the upward trend.

The mechanism by which prices adjust to general supply and demand changes in India is not yet fully established. Many factors are held responsible to explain the past price behaviour of agricultural commodities in India: fall in production, hoarding by traders, imports under PL-480, deficit financing by government, increase in per capita income, rise in total population, increase in urban employment, wages, etc.. Statistical evidences, available in published literature, through which the effects of these various factors can be measured are inadequate.

Mellor and Dar [1] used three variables to explain the behaviour of the foodgrains price index from 1952-53 to 1963-64: (i) current year's supply-demand gap, (ii) previous year's supply-demand gap, and (iii) money supply. The economic implication of this result is that since cultivators' stocks serve as private buffers and since cultivators' storage policies are closely related to the year's crop size, the influence of it is carried forward one year. Divatia and Pani [2] used a Nerlovian type expectation model to explain the variations in cereals prices. The hypothesis on which the model developed was "that the imbalance between supply and demand is reflected in the stock position of traders and that prices or price variations are set by the traders depending on the expected level of stocks of commodities or the difference between stocks of commodities held and the stocks desired to be held by them during any period". The suggested equation by the authors, estimated from 1951-67 data, is not a statistically good fit, however, and therefore provides little confidence in their result.

On the other hand, several studies suggest that the relationship between current prices and availability is more direct. Herrman [3] concluded that current availability and money supply with the public are the main causes for variations in cereals and pulses prices from 1950 to 1963. Joshi [4] used the ratio of money supply to current availability to explain the variations in foodgrains and rice prices. Thamarajakshi [5, 6] also used current availability and per capita income to explain the variations in prices of rice and wheat between 1952-53 and 1967-68.

Thus while evidence is mixed, there is general agreement that as the past was a period of chronic shortages in foodgrains and there was hardly any stock with the government to influence prices, whatever quantities were made available to the public were straight consumed. Therefore, there was a one-way causation from consumption availabilities to prices. Also, while the upward price trends in major foodgrains were due to rises in real income and various fiscal and monetary measures taken by the government, price fluctuations as such were mostly due to changes in consumption availabilities.

Our interest here is primarily to identify and measure the effects of various factors responsible for past fluctuations in major foodgrains prices. One possible approach is to remove the trend from the time series of price data and then to correlate the residuals with the various factors which we consider responsible for price fluctuations around the trend. However, the conclusions emerging from this two-stage estimation technique will obviously be influenced by the nature and form of the function chosen to eliminate the trend in prices. Moreover, the trend in prices might be due to one or more factors that are identifiable. In that case, an appropriate approach would be to develop single-equation estimation models by including both the trend and the other factors in the estimating equation. This approach not only eliminates the scope of any distortion in the analysis but also helps to examine, simultaneously, the interplay of the trend and the other factors in the price movements. This technique has been adopted here for explaining the price behaviour of foodgrains as a whole, of the cereals group, and of the individual commodities, *viz*, rice and wheat.

Other things being equal, the prices of a commodity over a period of years will record an upward or a downward trend according as the rate of change in its demand is greater or less than its corresponding rate of change in supply. The fluctuations around this trend arise when demand or supply, or both, fluctuate around their respective trends.

The past situation in India was one of chronic food shortage. While demand increased rapidly, supply was erratic and continuously lagged behind demand. The consumption availabilities of various food crops recorded wide fluctuations in the past[1] and none recorded any noticeable upward trend. On the other hand, both real income and money supply registered steep upward trends, with their corresponding repercussions on individual item demand. Growth in demand can, therefore, be held responsible for the upward trend in prices.

The above argument, based on the forces of market demand and supply, was probably not the only cause for the upward trend in prices. The causes of the upward trend in price level are clouded by the controversial inflationary implications of foodgrains import under PL-480 agreement from the US. Some economists believe that the rise in prices is due to the effects of the PL-480 counterpart funds on the country's money supply. This suspicion has some credence because the upward trend in money supply almost coincided with the imports under PL-480 and the trends of these two are too striking not to suggest their probable association. The controversy is worst confounded by another important factor. This is the inflationary effect of large-scale deficit financing incurred by the government to meet Plan expenditures.

Since the growth in demand is also reflected by the trend in country's money supply, inclusion of the latter as an independent variable in the equation seems appropriate to explain the trend-like movement in prices.[2] In fact, a major part of the variations in foodgrains prices, from 1952 through 1968, could be explained by the rise in money supply alone. The upward trends in the prices of these commodities were explained mostly by the money supply.

If we assume that the upward trends in prices are largely due to the money supply then the residuals around these trend lines are likely to have some functional relationship with their cor-

TABLE 1: MONEY SUPPLY AND GROSS PER CAPITA AVAILABILITIES AND PRICES OF FOODGRAINS AS A WHOLE, CEREALS AS A GROUP, AND RICE

Year	Money Supply (Rs billion)	Gross Per Capita Availability (kg/year)			Price Index (Annual Average, 1952-53=100)		
		Foodgrains	Cereals	Rice	Foodgrains	Cereals	Rice
1951	—	143.8	121.7	58.0	—	—	—
1952	18.0	140.4	118.8	58.0	99.1	99.0	100.0
1953	18.3	150.3	127.4	60.5	99.6	100.0	102.0

KEEPING A NATION ON THE MOVE

As many as 16 airlines of international repute avail of INDIANOIL's expert refuelling service.
In the growth of India's transport and communications, INDIANOIL has been playing a distinct role. But that is not to belittle its contribution to the nation's agriculture and industry.
In a short span of a decade, INDIANOIL has emerged as the biggest oil refining and marketing organisation in India—meeting more than half of the nation's total requirements of petroleum products.
With a chain of refineries processing indigenous crude, a vast pipeline transportation system, and a countrywide storage and distribution network, INDIANOIL has ensured an uninterrupted flow of oil for India's defence and development.
As part of the nation's planned development INDIANOIL ceaselessly strives to take the country towards self-reliance and self-sufficiency in petroleum.

INDIANOIL

—a national trust for economic prosperity

INDIAN OIL CORPORATION LIMITED

Dattaram-10C-7

** Fiscal year (April to March) average.

responding consumption availabilities. Simple reasoning would lead one to believe that current prices are governed by current availabilities and that the relationship would therefore be direct. However, there has been an expressed desire on the part of the government to assure a minimum quantity of foodgrains to the public and to improve upon it over time. This desire to provide more food through domestic production and imports probably creates an expectation on the level of foodgrains supply for consumption and hence on prices. The actual change brought about in consumption availability is, however, a partial realisation of the expected change. This may happen because of a significant fall in domestic production or difficulty in getting grains from abroad or both.

If we assume that the prices deviation from the trend line as a function of expected availability and actual change in consumption availability brought about in any period over the previous year is proportional to the corresponding expected change, then an appropriate single equation model, to explain the price behaviour of the commodities under study, should have the following functional form:

$$P_t = f(M_t, A_t, A_{t-1})$$

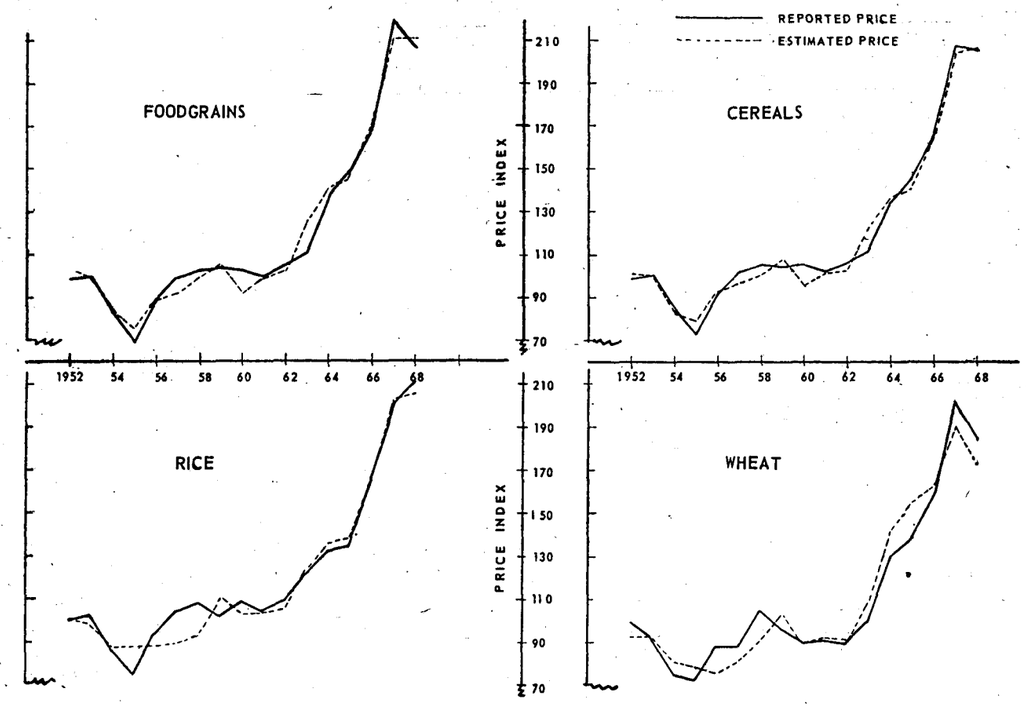
Where P_t = price index
M_t = money supply[3]
and A_t = gross per capita availability[4]

The above is broadly the frameline on which we have attempted to explain the past price behaviour of foodgrains as a whole, of the cereals group, and of the individual commodities rice and wheat. The linear relationship of the above functional form is used to derive single-equation models for the prices of these commodities.

For foodgrains as a whole, for cereals as a group, and for the rice separately, the estimated equations — obtained from data relating to 1952 through to 1968 (Table 1) — are as follows (standard error in parenthesis):

		R^2
Foodgrains :	$P_t = 299.80 + 3.23M_t - 0.75\ A_t - 1.04A_{t-1}$ (0.13) (0.16) (0.16)	0.98
Cereals :	$P_t = 277.32 + 3.40M_t - 0.73\ A_t - 1.24\ A_{t-1}$ (0.11) (0.17) (0.16)	0.98
Rice :	$P_t = 190.32 + 2.81\ M_t - 1.14\ A_t - 1.27\ A_{t-1}$ (0.13) (0.27) (0.26)	0.98

Where P_t = annual average (calendar year) price index (1952-53 = 100)
M_t = money supply in Rs billion
and A_t = gross per capita availability in kg/year



All the co-efficients in the above equations are highly significant and are of appropriate signs. Also, consistent with the observations made by Mellor and Dar, and Divatia and Pani, the weight of the lagged availability on prices in the above equations is higher than the corresponding weight of the current availability.[6]

A similar approach, attempted to explain the past price behaviour of wheat, ran into the serious problem of serial correlation and multicollinearity. The correlation between lagged and current gross per capita wheat availability was 0.90, while that between lagged or current gross per capita wheat availability and money supply was 0.91. The effect of these on estimated equation resulted in biased co-efficients with high standard errors.

Some explanation needs to be given for these high correlations between lagged and current gross per capita wheat availability and between gross per capita wheat availability and money supply. Past data on gross wheat availability includes a significant import content. This was not so much due to a great demand for wheat as due to shortages in aggregate foodgrains supply.[7] In the past, whenever production fell short of requirements, the government in its endeavour to provide adequate supplies to the consumers, imported grains from abroad. Since wheat was the only grain readily available in the world market and concessional imports from the US under PL-480 were attractive, the country imported massive quantities of wheat. Demands for other grains in short supply were met by supplying more of wheat, and there was thus forced substitution of wheat for other grains through various control measures.[8] The increasing shortfalls in domestic foodgrain production, were met mostly by imported wheat — which smoothed out most of the fluctuations in wheat availability based on domestic production. This is evident from the fact that, while the correlation between lagged and current gross per capita wheat availability is very high, that based on the corresponding domestic availability only is quite low.

Two explanations can be offered for the high correlation between gross per capita wheat availability and the money supply. First, PL-480 aid operations themselves might have resulted in a direct increase in money supply. On this viewpoint, there is a long-standing controversy in the country. One school, led by B R Shenoy [7], argues

FIGURE: COMPARISON OF REPORTED WITH ESTIMATED PRICES (1952 TO 1968)

that the PL-480 aid mechanism has been used to inject two streams of monetary flow into the economy for a single inflow of grain from abroad. Out of these two monetary inflows only one was matched by the sale proceeds actually mobilised from the public and the second stream represented an addition to money supply with the public. This observation is based on the argument that the sale proceeds are used as and when they accrue and finally when counterpart funds are to be disbursed from the earmarked uses, the Central government must be meeting that demand by borrowing from the Reserve Bank.[9] However, several recent studies have refuted this view [8, 9]. These studies unanimously agree that PL-480 imports have helped the government to mobilise additional monetary resources. Srivastava [10] estimated that, between 1956-57 and 1968-69, PL-480 support to the Central budget averaged at 5.72 per cent of the total. However, these studies also point out that government spending, together with US use of rupees, and Cooley loans, have more or less cancelled out such gains to the economy. Therefore, there has been a two-way impact of PL-480 operations on money supply in this country.

A second explanation could be that, in view of additional food (wage goods) availability, the government might have borrowed money from the Reserve Bank of India to increase its development expenditure. In this case, the net bank credit to the government sector would increase — resulting in an increase in money supply with the public. Srivastava [9] observed that the magnitude of investment sustained by PL-480 wheat was much larger than was indexed by the quantum of net support. This shows that, owing to availability of food aid, the government sustained its investment expenditure at a higher level than it could otherwise have done, without at the same time adversely affecting the cost of living. This opportunity was seized and the additional expenditure was financed by increasing the magnitude of net bank credit to the government sector. This explanation is supported by the increased deficit financing throughout the programme period — except during 1960-61.

Gross per capita wheat availability is not by itself always an appropriate variable to explain fluctuations in wheat prices in India. Indian consumers prefer domestic wheat to imported wheat. Imported wheat was generally sold through fair-price and ration shops at subsidised prices. Gross wheat availability — a significant part of which was made up by imported grain and sold at controlled prices — inflated the actual supply position in the markets which were more dependent on domestic supply. It therefore seems reasonable to include the domestic per capita wheat availability and not the gross availability in the price equation for wheat. In fact, 94 per cent of the variations in wheat prices, from 1952 through 1968, were explained when money and domestic per capita wheat availability were used as independent variables in the price equation. The estimated equation from the 1952-68 data (Table 2) is: (standard error in

parenthesis)

$$P_t^* = 164.52 + \underset{(0.25)}{3.40}\ M_t - \underset{(1.08)}{3.25}\ A_t^* - \underset{(1.28)}{5.08}\ A_t^* - 1 \quad (R^2 = 0.94)$$

where A_t^* is per capita availability of wheat from domestic production, and P_t^* is the average price based on the Indian fiscal year, April to March.

Use of the April-to-March price average seems appropriate, since the domestic produce starts arriving in the markets from the beginning of April.

To examine the effect of imported wheat on market prices of wheat, an additional variable I_t was introduced in the above equation where I_t = (Availability of imported wheat) /(Gross availability of wheat). The estimated co-efficient of I_t however, turned out to be insignificant; the value of R^2 remained at the same level.[10] The conclusion which follows suggests that management and distribution policy of imported wheat by the government was such that it was not allowed to disturb the normal market operations. This result provides added support to our assumption of the two markets for wheat.

CAUSES OF PRICE FLUCTUATIONS

The actual causes of price fluctuations are probably much more complicated than the simple relationships derived here. For example, the availabilities and prices of different types of grains, within the cereals group, are generally believed to affect rice and wheat prices. The estimated equations completely ignored the effects of substitution on rice and wheat prices.

Comparisons of the estimated and reported prices, however, provide sufficient confidence on the estimated equations derived here. The derived relationships predict prices very well, inasmuch as the estimated prices closely fit the historical record of prices. (See figure and Table 3.) The slight discrepancies found between the estimated and reported prices are not of any serious magnitude to question the basic assumptions underlying the price-quantity relationships derived here.

The implicit average price flexibility and price elasticity co-efficients, derived from the estimated equations, are obtained as follows:[11]

	Price Flexibility	Price Elasticity
Foodgrains	—2.38	—0.42
Cereals	—2.24	—0.45
Rice	—1.32	—0.76
Wheat	—2.08	—0.48

The estimated co-efficients for wheat refer to the domestic variety. For foodgrains and cereals, if we assume a Cobb-Douglas type demand model with per capita income and price as determining the entire variations, then the implicit income elasticity co-efficients for foodgrains and cereals are obtained as 0.58 and 0.55.[12] The income elasticity co-efficients, commonly used for foodgrains and cereals in India, all range between 0.5 and 0.6. The derived income elasticity co-efficients thus provide further confidence in the estimated equations.

The estimated equations provide us an opportunity to evaluate the government operations in foodgrains in the context of its price stabilisation objective. For this, per capita availabilities in the respective price equations are kept constant at their mean levels and the money supply variable is allowed to take recorded values. The estimated prices, thus obtained, mostly explained the upward trends in the prices of items considered here. Thus, even if the per capita availability was stabilised at a constant level by the government, past prices would have recorded a steady increase due to the inflationary effects of demand and other forces operating in the economy. However, the objective of stabilisation would have been achieved had the government followed a systems approach for controlling the demand and supply by holding an adequate level of foodgrains stock.

PRICE STABILISATION

When year-to-year fluctuations in production are wide and unpredictable, price stabilisation is possible only through successfully controlling demand and supply. To maintain stability at a desired level, any excess supply above the stability requirement must be procured and stored for lean years when supply falls short of stability requirement. Thus an effective way by which stabilisation can be achieved is by maintaining government stocks, building them up from years of relative abundance, and releasing from them in years of relative shortages. It is only the existence of these stocks that can provide the government a position of strength to influence prices.

Past government management in foodgrains did not follow this operational rule. The concern was more about equitable distribution of whatever was available on yearly basis; the need for stabilisation over years did not get adequate attention. This was evident from the past data on foodgrains stocks held by the government, the average size of which was hardly adequate to smooth out the normal production irregularities commonly experienced in the country. The ease with which foodgrains were imported and distributed, with apparent unawareness of utilising them as a provision against future production shortfalls, adversely affected the level of domestic production. Barnum [11], through a nine-equation stochastic simulation model for market prices in India, concluded that, during 1957-64, import of 28 million tonnes of PL-480 foodgrains depressed the path of domestic production and increased markedly the path of availability. A similar conclusion was also arrived at by Mann [13]; straight consumption, of whatever was available through imports in addition to domestic production on yearly basis, induced a decline in grain prices to domestic producers and, consequently, a decline in domestic grain production.

BASIC MALADY

The past, however, did provide opportunities to build up an adequate level of foodgrains stock. If the relatively comfortable situation in the 1950s and the concessional imports under PL-480 were utilised to build up reserve stocks, government could have reasonably buffered the sharp production shortfalls which occurred in the 1960s. The possibilities of such opportunities were very nicely illustrated through examples by Raj Krishna [12], Cummings [4] and Barnum [11]. Although none of these authors examined the costs and benefits of such a programme, the logic of the proposition was clearly demonstrated: to make provision for lean years, fat years must be trimmed above the tolerance limits and the excesses put into the store. Past government management in foodgrains failed to seize these opportunities; the hand-to-mouth operation technique did not provide it a strong cushion to tide over the crises years. This probably was the basic malady in past government operations in foodgrains.

Notes

1 The correlation between the current and previous year per capita gross availability of foodgrains, cereals, rice and wheat, calculated from 1952-68 data were obtained as follows:

	R^2
Foodgrains	0.26
Cereals	0.41
Rice	0.33
Wheat	0.90

The reason for high correlation obtained for wheat is discussed later.

2 Mellor and Dar wrote: "the monetary policy is usually decided upon by one authority and the reasons for such activity are well defined. Thus, if the increase in money supply are caused by rising investment and demand for money, the thinking and discussion by the monetary authorities at the time of a new liberal money policy should also show this need. On the other hand, if the decision to increase money supply are other than that of a rising demand for money, an excess money supply situation will be clearly indicated." Reviewing the basic facts and figures and the magnitude of deficit financing by the government, Mellor and Dar concluded that money supply certainly appears to be a separate and independent variable for the determination of foodgrain prices in India.

3 Money supply as published in the *Reserve Bank of India Bulletin* and defined as "composed of a currency component, *viz*, currency notes and coins with the public excluding the balances of the Central and state governments and cash on hand with scheduled and reporting non-scheduled banks and co-operative banks and a deposit component (demand deposits of banks and other deposits with the Reserve Bank). Money supply thus defined constitutes the monetary liability of the banking system. Since the liabilities and assets of the banking system always balance, any change in the monetary liability is to be reflected either in the financial assets or non-monetary liabilities of the banking system." ('Analysis of Money Supply in India', *Reserve Bank of India Bulletin*, Volume XV, Number 7, July 1961, p 1046.)

4 Unless otherwise stated, the computation of gross per capita availability is based on the total of net domestic production available for human consumption, imports, and change in government stock. Gross per capita availability here thus differs from the actual consumption availability, as the latter also includes changes in private stocks on which no data are available in India.

5 Zero-order correlation co-efficients between the independent variables in each of the above equations are found out to be insignificant.

6 In distributed lag type of model, the lagged variables generally have descreasing weights on the dependent variable. Mellor and Dar found two-year lagged demand-supply gap variable had insignificant effect on prices. See also Divatia and Pani [2] for an elaborate explanation.

7 The correlation matrix between per capita availability of rice, wheat and coarse grains obtained from 1952 to 1968 data was as follows:

	Rice	*Wheat*	*Coarse grains*
Rice	1.00		
Wheat	0.18	1.00	
Coarse grains	0.12	—0.43	1.00

From this it appears that gross per capita supply of wheat was more influenced by availability of coarse grains than of rice.

8 In statutorily controlled areas the quantum of foodgrains supply to ration card holders fixed by the government from time to time always had a wheat component.

9 Shenoy wrote: "The final disbursement by the US AID from the counterpart funds would demand the monetisation of Special Securities, e g, the creation of money by the Reserve Bank of India against the treasury bills, for redeeming the Special Securities as the cash balance being at the minimum the government will have no funds to redeem the Special Securities" [7].

10 The estimated equation was: (Standard error in parenthesis).

$$P_t^* = 169.38 + \underset{(0.37)}{3.50}\, M_t - \underset{(1.32)}{3.52}\, A_t^* - \underset{(1.33)}{5.04}\, A^*_{t-1} - \underset{(0.34)}{0.13}\, I_t \quad (R^2 = 0.94)$$

11 These are derived by using the following type of expectation model: (Mellor and Dar).

$P_t = b\, A_t^*$ and $(A_t - A_{t-1}) = r\,(A_t^* - A_{t-1})$

which in reduced form becomes

$$P_t = \frac{b}{r} A^t + \frac{b\,(r-1)}{r} A_{t-1}$$

Thus for foodgrains

$$\frac{b}{r} = -0.75; \quad \frac{b\,(r-1)}{r} = -1.04$$

and therefore, $r = 2.39$ and $b = -1.79$

With average value of P_t and A_t for foodgrains at $\bar{P}_t = 120.17$ and $\bar{A}_t = 159.85$

$(\bar{A}_t / \bar{P}_t)\ (d P_t / d A_t) = -2.38$ and

$(\bar{P}_t / \bar{A}_t)\ (d A_t / d P_t) = -0.42$

12 These are obtained as one minus price elasticity.

The Educational Situation

A R Kamat

It may well be said that in contrast to most other sectors of development the country has indeed done better in the educational sector and in fact has overfulfilled the targets of enrolment and turnout in certain sub-sectors like higher education, including engineering and technology. But the whole educational struture betrays serious weaknesses of a fundamental character which appear to be more or less inherent in our economic-political system.

A number of surveys clearly show that the spread of literacy and education is much more in evidence among the affluent and socially advanced sections of society. Elite formation during the post-Independence period is, therefore, very important for assessing the educational situation. In terms of social differentiation, the fall-out from our educational system can be briefly described as follows: (i) emergence and consolidation of a 'super' elite at the top — consisting of the old urban intelligentsia and a sprinkling of the more enterprising elements of rural stock — in technology, industry, business and in the higher echelons of the bureaucracy and the defence services; (ii) formation of a fairly large 'common' or 'regional' elite, consisting of the urban middle and lower salaried groups, skilled and semi-skilled technicians and professionals and of the newly emerging rural groups; and (iii) continuance of stark illiteracy in the rest of society at the base of the pyramid, with a slow and sluggish movement among small sections towards basic literacy and rudimentary education. It becomes obvious that this situation is full of strains, full of contradictions and confrontations.

THE educational development of a country is vitally connected to all other aspects of development and the educational situation in a given period is an inseparable part of the general socio-economic situation in that period. An overall view of the educational progress in India during the post-Independence period and an analysis of the present educational situation will, therefore, add to the knowledge of the socio-economic situation. Such an analysis also helps towards a better understanding of the present phase of social transformation in India.

There are, of course, many difficulties in such an attempt. The available data are not always classified in a manner which can be conveniently used for this purpose. Then, one is faced with wide discrepancies between the aggregative data from different publications such as the Annual Reports of the Ministry of Education and the Reports of the decennial Population Censuses. Moreover, since education is mostly a state subject there are differences in its organisation in different states, and consequently variations in classification. The figures are therefore not strictly comparable as between the states except for broad purposes. Even so, an attempt will be made here to piece together the available material — the figures from government sources, *the Report of the Education Commission* (1964-68), information culled from sample surveys, books and publications on the subject and a general feel of the situation — to arrive at some general formulations. They are believed to be broadly valid for the country as a whole. It should be stated at the outset, however, that this is an exercise in social analysis of the educational situation and it does not discuss the issues which have a bearing on educational technology.

I

Surveying educational progress since Independence it is clear that there has been a great deal of expansion of education at all stages: primary education, secondary education, higher education — both undergraduate and post-graduate, engineering and technology and other professional education, and also research in science and the humanities. Enrolment has increased considerably at all stages not only in absolute numbers but also relatively to the rapidly increasing population. (See Table at end of article.)

Educational progress during the post-Independence period is quite impressive by any standards. It may well be said that in contrast to most other sectors of development the country has indeed done better in the educational sector, and in fact has overfulfilled the targets of enrolment and turnout in certain of the sub-sectors like higher education including engineering and technology. During this period new agencies and institutions have come up to serve specialised fields, such as the University Grants Commission and the National Council of Educational Research and Training.

There has also taken place a great deal of deliberation and discussion on the educational development of the country as is evidenced in the number of committees and commissions that have worked during the last twenty-five years. Apart from the Sargent Committee with its "Report on Post-War Educational Development in India" prepared in 1944, there was the Radhakrishnan Commission on University Education (1948-49), followed by the Kher Committee (1951) concentrating mainly on the administrative aspects of primary education, and the Secondary Education Commission which reported in 1953. But the most comprehensive effort in this respect is that of the Education Commission (1964-66) under the chairmanship of D S Kothari. "The Report of the Education Commission" has considered in great detail almost every aspect of Indian education at all stages and has made a string of recommendations for the educational development of the country. That there is general awareness of the crucial importance of educational development for the country's socio-economic progress is clear from the deliberations of these committees, as well as from the documents

of the Planning Commission. For instance the chapter on education in "The Third Five Year Plan" opens with the following preamble:[1]

> "Education is the most important single factor in achieving rapid economic development and technological progress and in creating a social order founded on the values of freedom, social justice and equal opportunity. Programmes of education lie at the base of the effort to forge the bonds of common citizenship, to harness the energies of the people, and to develop the natural and human resources of every part of the country."

II

In spite of this recognition of the central role of education in national development and the substantial growth in education during the era of Independence the situation is far from being either satisfactory or hopeful. It is not merely that the oft-repeated aims and objectives have not been achieved and the targets set for such important sectors as literacy and elementary education have not been fulfilled. But the whole structure betrays serious weaknesses of a fundamental character which appear to be more or less inherent in the system.

Universal elementary education for everyone in the age-group 6-14 which the Constitution had stipulated for fulfilment before 1960 is far from being realised even in 1972. Even the primary education age-group 6-11 is not yet fully covered; the near-eighty per cent enrolment in primary schools is believed to be inflated by at least about twenty points.[2] No significant dent has been made in adult illiteracy as is clear from the fact that the overall literacy including those in schools was 17 per cent in 1950-51 and is believed to be 30 per cent in 1970. So on the one hand India has over 70 million learners at different levels of schooling, perhaps the largest in the world, excluding China. On the other hand we also have the distinction of having the largest number of illiterate people, almost 350 million of our present estimated population of 550 million; and this number is not decreasing but increasing with the years, thanks to a rapidly growing population.

Apart from the sluggish pace of the progress of literacy and primary education, whatever advance that has been made during the last twenty years is extremely uneven as between regions, sexes and different social strata. Against the general average of 75 to 80 per cent enrolment in the 6-11 age-group, even if we ignore the inflation in figures referred to before, the corresponding average is as low as 30 to 40 per cent for Madhya Pradesh, Bihar, eastern Uttar Pradesh, Rajasthan, Kashmir and also for Orissa. The degree of illiteracy in the different states more or less corresponds with the rate of enrolment in primary schools. And the regions where the two are lowest appear to be marked out by low economic growth and unsatisfactory land relations.

Then there are great disparities, as regards both literacy and primary-school enrolment, between urban and rural areas, and between different regions in the same state such as eastern UP and western UP and western Maharashtra and Marathwada. It is well known that literacy is very low amongst women as compared to men, particularly in the rural areas. The ratio of girls' enrolment to total enrolment in the 6-11 age group is considerably lower than 50 per cent in many states and this disparity between the sexes is even greater in the rural areas and in educationally backward states and regions. The fight against female illiteracy can hardly be said to have begun in these areas.

The socio-economic analysis of educational advance in the post-Independence period is available from a number of village surveys. From this it is clear that the spread of literacy and education is much more in evidence among the more affluent and socially advanced sections of society than among the poorer and more backward sections. In terms of caste, the traditionally advanced castes like the Brahmins are almost all literate and have progressed much further in higher education; the 'middle' castes have registered significant educational progress; but the Scheduled Castes and Tribes and other backward sections of the population are lagging considerably behind. Literacy is crawling at snail's pace and female education has not even touched these sections of society, particularly in the rural areas. Among the agricultural population it is the richer and middle sections of peasantry that are advancing in education while the poor peasants and landless labour are still largely illiterate and uneducated. Analysis in terms of income classifications tells the same story. Thus the backwardness in literacy and education is closely related to the economic and social backwardness and bears the same hallmarks of a society divided against itself.

It is not as though these disparities in development are not known to those who are in charge of planning education. Shukla sums up the position in this respect admirably.

> "All past experience shows that at the point of planning policy, greatest stress is laid on universal mass education, education of women, rural areas, scheduled castes and tribes. At the point of fixing quantitative targets, proportionate expansion of all sectors is provided for. At the point of actual execution, highest achievements are all in the field of urban education, secondary and college education, men's education, upper caste education and so on. The policy-wise 'priority' sectors, including adult literacy, fall much behind target".[3]

III

The other ills and shortcomings of the present educational situation will now be mentioned briefly; the omission of details does not mean, however, that they are unimportant. They are in fact the symptoms, displayed in the educational sphere, of the same stalemate which is being experienced in other spheres, and particularly, in the socio-economic situation in the country.

It is well known that there is considerable wastage and stagnation at all levels of education. It is especially high at the primary stage where, it is estimated, that more than fifty per cent of the children enrolled in class I drop out before reaching class IV. This has significance for the attainment of functional literacy which is the aim of primary education, since it is generally believed that children who fail to reach class IV invariably lapse into illiteracy in later life. By any standards this is an appalling waste of human effort and also of the resources devoted to primary education. It should also be mentioned in this connection that the incidence of wastage is the highest precisely in those regions of the country and in those sections of the population where the spread of education and literacy is the lowest.

In spite of repeated resolutions and recommendations by committees and commissions there is no fundamental change in the organisational structure, the curriculum content, the teaching methods or the examination system except for some valiant attempts at some peripheral points in the system. The languages to be taught and the medium of instruction at different stages of education constitute another important issue which is getting more and more vexed with years. While official thinking at the Centre still clings to the three-language formula, it was, in fact, never accepted in practice by the Hindi-speaking states in the north and has now been unceremoniously rejected by Tamil Nadu in the south. There is no firm policy or practice on the teaching of English in schools and its role in higher education. Consequently the medium of instruction in the universities is shifting to the regional language through sheer pressure of circumstances and therefore in a most unplanned, hap-hazard manner.

An expanding educational system is always confronted with the problem of maintaining and raising the quality of education. This demands conscious efforts for the improvement of the teaching material and teaching methods and measures to attract qualified personnel in adequate numbers to the teaching profession. While the educational standards at the microscopic top, that is, in elite institutions, are maintained and perhaps even improved, there is a universal feeling, both in the academic as well as the outside world, that the standards of the average product turned out by our educational institutions have been falling in the post-Independence era. The atmosphere in many of our institutions is marked by a lack of interest in teaching and learning, and by frustration and apathy on the part of teachers and students. To quote the "Report of the Education Commission" on the situation in higher education.[4]

> "The existing situation in higher education broadly alternates between slackness and strain — slackness durthe session, strain at the time of examinations. In many of the weaker colleges and universities, a majority of teachers teach mechanically and listlessly".

The lowering of standards is matched by the growing corruption in examination practices, and misbehaviour on the part of the candidates at the time of examination. For the mass of students who pass out from secondary schools and colleges, however, the trials and tribulations do not terminate with the acquisition of a certificate or a degree. They have to wait through an indefinite period of unemployment until they can land themselves suitable job.[5] It is estimated that fifteen per cent of the matriculates and ten per cent of the graduates are unemployed at any given point of time and the average waiting period is about one and a half years and half a year respectively.[5] The plight of the non-professional graduates — those in arts, science and commerce — is of course much worse than the professional ones. It should be noted, however, that in 1968 tens of thousands of fresh engineers discovered that they could not get employment. It is clear from the successive five-year plan documents and from the many speeches and writings on the problem that educated unemployment has been a continuing problem and with each passing year it is becoming more and more serious.

IV

If what is described above is a more or less faithful picture of the present educational situation one is naturally faced with the questions: What has led to the present situation in education? How is this paradox of expansion, development and progress on the one hand, and deterioration, failure and frustration on the other to be explained? What are the social forces that have caused the present educational crisis?

But before we probe further into the present it is necessary and pertinent to look into the past. Soon after conquering the Indian empire the British rulers decided to introduce the so-called English education, ie, education based on the advance of knowledge and science in England and taught in English at the secondary and higher levels. The main idea was to create an Indian elite who could serve in subordinate positions in administration and who would generally look up to the British and support them in ruling the vast Indian empire. This opportunity was eagerly grasped by sections of the former elite of Indian society for their own reasons: first, it enabled them to establish themselves in positions of power, pelf and prestige under the new dispensation; second, it was only through acquisition of Western knowledge that they could hope to revive and regenerate their prostrated society and to build up public opinion to make a bid for political rights and self-rule. That the British imperial rulers were not at all interested in the mass education of Indian is clear from the fact that they decided against Indian languages as vehicles of education beyond the elementary stage, and they did not concede for over a hundred years, even in principle, the idea of universal primary education. The number of secondary schools, colleges and universities started by the government was so small that the initial efforts in the educational sphere on the part of the newly formed English-educated Indian elite were for establishing their own educational institutions for the 'cheapening and spread' of English education. Through their own schools and newspaper they started an schools and newspapers they started an indigenous thought-process of self-regeneration against the alien thought-process of abject surrender propagated by the government and missionary institutions. They successfully used western thought and ideas for a linguistic, religious and cultural revival. In the process they discovered a new sense of national identity and thus laid the foundation for the Indian national movement.

Modern education in India which thus began its career in the earlier part of the nineteenth century went on at a slow pace for almost a hundred years. A substantial part of it developed outside government institutions, through private effort, financed mainly through fees and supplemented by government aid on a modest scale. The educational developments of this long period are an important part of our social history; but we shall not go into them here. For our purpose, however, it is useful to view the educational situation in India, as it was in 1921-22, shortly after the First World War, but before the advent of the Montford reforms by which much of the responsibility for education in the provinces was transferred to Indian ministers.

In 1921-22 there were 61 lakh pupils in primary schools, 11 lakh in secondary schools and 66 thousand in colleges in the whole of British India (excluding Burma), in a population of about 23 crores.[6] It is clear that there was no mass education. According to the Hartog Committee's report, during the period from 1892 to 1922 literacy in India increased from 13.0 to 14.4 per cent for males and from 0.7 to 2.0 per cent for females. Gokhale's insistence on universal primary education was a cry in the wilderness; even many of his Indian contemporaries did not approve of it. About 20 per cent of the students in colleges were training for the professions — law, medicine, engineering, etc — while most others were pursuing an arts degree. The whole of secondary education was mostly non-vocational. In any case vacational education had hardly any job-potential in the conditions of industrial backwardness forced on the country by its masters.

Viewed from another angle the spread of education until then was confined, to a large extent, to the advanced castes and social groups, and in the case of higher education, particularly in professional higher education, to the more affluent sections among them. They filled all available professional and white-collar positions. The civil service, high and low, became the most prestigious and important avenue of employment for them in the absence of any sizeable

economic development in the country. It is true that under British rule the doors of education were opened, at least formally, to all castes. This enabled a small number from the middle castes, and a still smaller number from the lowest castes, including the 'untouchables' (the Scheduled Castes), to rise and be absorbed in the literate occupations and particularly in government service. But they were a rather small proportion of the new elite. Since even a modestly comfortable or lucrative job required at least a secondary education, and preferably a degree and since, the British rulers had systematically avoided assuming responsibility beyond the absolute minimum, especially in the early period, the starting of new high schools and colleges with private management met an unfulfilled social demand. The 'cheapening and spread' of liberal education, the running of schools and colleges, initiated by the pioneers of political and social awakening in India, had, over the years, imperceptibly but inevitably become a professional interest of a section of the intelligentsia.

V

The period from 1921 onwards upto the eve of Independence is fundamentally different from the earlier period. First, the national movement took on a mass character bringing into its sweep wider sections of the population including the industrial workers in towns and the peasantry in the countryside. Secondly, the realisation of a socialist revolution in the USSR gave a new dimension to our thinking not only in the political field, but also in the social field and therefore in education. Finally, after the introduction of Dyarchy in 1921 and provincial autonomy in 1937, there came a new political awareness of what a widened franchise can imply for different social strata, in terms of effectively using even limited political power to forward general as well as sectional social interests. It was becoming evident by the beginning of the Second World War that political in India would soon change hands. This gave rise to an altogether new perspective, that of an independent India, in all spheres including education.

Under Dyarchy from 1921, education was tranferred in the provinces to Indian ministers belonging to the elected element in the legislatures, but their powers of raising resources were severely limited. The situation somewhat improved with the popular ministries assuming power in the provinces in 1937 for a short period and again in 1946 when they resumed working. The ideal of full literacy and universal primary education was hardly realisable under these conditions. Even so, education was spreading to wider sections of people and was assuming a mass character for the first time, raising the expectations of the people to still higher levels. Such was the enthusiasm generated by the developing national movement in this period that there were popular mass campaigns for adult literacy in cities like Bombay the like of which have yet to be seen in the post-Independence decades.

During this period rapid increase was taking place in enrolment at all stages, primary and secondary schools, and colleges and universities. An analysis of this expansion shows that the increase was proportionately much more in secondary and higher education than in primary education.[7] Unemployment among matriculates and graduates reached alarming proportions during the depression period of the mid-thirties, comparable or perhaps even worse than what it is today, as is attested by the reports of the Sapru and other inquiry committees. And it was relieved only with the availability of *ad hoc* war-time jobs during the early forties. An important consequence of the mass character of education and the demands of the growing national movement was the introduction of regional languages as media of instruction at the secondary stage in many provinces and the beginning of modernisation of text-books used at primary and secondary levels.

Education was spreading to new social strata who looked upon it as the sure, and perhaps the only, means of improving their condition and of acquiring economic status and social prestige. A small but significant nucleus of a new elite was now forming in the socially middle castes and to a lesser extent in the castes still lower in the social ladder including the Scheduled Castes. This elite was becoming conscious of the power which adult franchise would give them after the capture of power and which could be effectively used for building up social and political pressures to realise their objectives.

At the same time the question of radically changing the entire educational system and replacing it by a national system of education befitting an independent nation, was coming to the forefront. National education was not a new slogan but its content was different when it was first raised with the slogan of Swaraj in the first decade of the twentieth century and again in the days of the non-co-operation movement in the twenties. Now it meant education for all and its structure and contents should be so devised as to achieve a rapid social and economic transformation of the entire people. The lop-sidedness and 'bookish' character of the colonial educational system under British rule had long become targets of severe criticism. The insistence on diversification, the experiment in the Wardha Scheme of basic education, the demands for the qualitative improvement of secondary and higher education, and for the provision of adequate facilities for scientific research, all expressed the same common objective.

All this is clearly evident from the many writings on education of this period and is reflected in the many plans for national reconstruction. It was also the subject of the Report of the Sargent Committee on education appointed by the then British.[8].

VI

Thus the problems in education with which India was faced at the time of the transfer of power in 1947 were, as in every other sphere, the problems arising from the extremely retarded and lop-sided development under a long period colonial rule. On the other hand, mass political awakening had kindled high expectations in the minds of the people. The ideal was therefore nothing short of a complete overhaul which would usher in and rapidly develop a system of national education in tune with the modern age and independent national status. Naturally it meant, among other things, universal free elementary education, removal of adult illiteracy, adoption of Indian languages as media of instruction at all stages, a rational policy on languages to facilitate inter-state and international communication, restructuring secondary and higher education by introducing vocationalisation and diversification, raising standards at all levels, modernisation of the contents and methods of teaching and examination, development of research facilities and devoting special attention to the educational advance of women and the Scheduled Castes and Tribes. The popular urge for mass education was duly recognised in the constitution which directed the state in Article 45 to provide education by 1960 to all children upto the age of 14. The other demands of the national ideal in education find their echo in some of the developments of the initial post-Independence period, in the founding of a number of National Laboratories and other institutes of research, the starting of the Indian Institutes of Technology and other institutions of higher learning, the establishment of the University Grants Commission and National Council of Educational Research and Training, and the appointment of several committees and commissions to investigate and report on different stages of education including the most comprehensive effort of the Education Commission of 1964-66. The actual achievements of the last twenty odd years, described at the beginning of this paper, however, fall far short of popular expectations. The lop-sided character of the educational system inherited from the British rulers it has not been changed but accentuated. We have a situation where

> "primary education receives less resources than it should in a largely illiterate society; secondary education is non-vocational, pushing its products into higher education for improving employment prospects; and university education is indiscriminately subsidised and of low, decelerating standards".[9]

As a consequence the ills of the educational situation have grown and have assumed the proportions of an all-pervading crisis.

It will be useful at this stage to have a closer look at the educational developments of the post-Independence period. It is clear that even the limited spread of education has brought about fundamental changes in the social situation, particularly in the rural areas. In the old days, education, especially that beyond the mere acquisition of literacy, was mostly confined to the traditionally advanced castes like the Brahmins. It has now spread to the 'middle' castes, to the more affluent sections of the farming communities; they have now acquired literacy and are pressing forward to the higher stages of education. The rural elite now consists of the newly educated young men from these communities; the sons of rich peasants now dominate the political, social and cultural life in villages and small towns. These middle strata are occupipg positions of strength in political and social life at all levels, acquired through adult franchise. They reinforce these positions through educational progress and use them to advance their interests in education as in all other spheres. The acquisition of secondary and higher education helps them to improve their income and occupational status. The fee concessions for the 'Economically Backward Classes' (e g, in Maharashtra), more favourable grant-in-aid conditions for newly started secondary schools and colleges, and other similar legislative action, as also their actual operation, clearly illustrate this process. The other relatively affluent sections of village society, like the trading community, have allied themselves with the upper stratum of the peasantry in this respect. It is true the benefits flowing from this policy of 'democratisation' of education trickle down, to some extent, to the lower and also to the lowest strata of the rural population like the Scheduled Castes and Tribes. But as pointed out earlier the pace of progress of education amongst them is so slow that except perhaps in regions like Maharashtra and Kerala they have not been able to form a sizable elite of their own; nor are they able to join the main elite which has emerged in the village on socially equal terms. Consequently they do not count for much in terms of political, social or cultural prestige or influence. Being in a minority, adult franchise also does not help them in this respect except in a marginal manner.

VII

A relevant question is: what is happening to (the old elite) the advanced castes which had a much longer start in Western education and which was already entrenched in strategic positions in society, both urban and rural, during the pre-Independence period? In the first place, numerically, they were in a small minority in urban as well as rural society and, with the formation of the new rural elite with a much superior numerical strength, they have lost most of their political, social and cultural prestige and influence in the rural areas. This process was further accelerated by a considerable migration from amongst them to the cities and larger towns; a contributory factor for this movement was the enactment of tenancy reforms. Because of their tradition of learning and their social position they still manage to occupy most of the literate occupations including government and private white-collar jobs which are mostly urban or semi-urban. But their former monopoly of these occupations and services is being systematically eroded by the emerging new elite which has benefited from educational advances and changes in the pattern of political power. For the more ambitious amongst them there were, after Independence, and especially after the industrial advance during the second and third five year plans, new opportunities of highly-paid situations in the form of senior positions in technology, industry, business and trade, the professions, the defence services, and even in the civil service which has considerably expanded during this period. This has brought about a fundamental change in the educational outlook of the top layer of the old elite; it now sends its children to expensive English-medium schools, since this type of education helps entry to elite institutions of higher education and thus to the better-paid positions mentioned above. The advanced elements of the hitherto educationally backward 'middle' castes which have their base in the affluent peasantry have not been slow in realising these new job opportunities. They have become aware of the job-potential of expensive English-medium education. The recently started 'public schools' under government auspices and private auspices (like by the sugar factories in Maharashtra) illustrate this trend.

The large less-affluent sections of the old elite, however, has inevitably to be satisfied with the chapter education of indigenous variety, imparted through regional media in average and below average secondary schools and colleges. Their lot is to take the lower salaried jobs, from technical and skilled to clerical and semi-skilled. Large sections of this old elite at the lower levels feel frustrated and resentful as they find it difficult to adjust themselves to the fact that they have lost much of their former social prestige and social leadership, where they are no longer socially related to those in positions of political power and government authority and where they have to jostle for positions with the new elite which has emerged from the middle castes and is of rustic origin but which is well-connected with the new ruling class.

Elite formation during the post-Independence period is very important for assessing the educational situation and deserves further analysis. The pre-Independence elite, coming from a few, numerically small advanced social strata, was more or less homogeneous; although there was differentiation amongst it from low to high positions, except for its microscopic anglicised section at the top, it formed, so to say, a continuous spectrum. (This situation was slowly altering during the last two decades before Independence but this need not stop us from our general formulation.) Although belonging to the same society, there was social distance, unbridgable in many respects, between vertical sections within it and between it and the rest of society. But the traditional common social bonds and the anti-imperialist national sentiment — loud but mostly ineffective except at the

peak periods of the mass movements — bound this elite together and also acted like a connecting link between it and the mass of people.

The situation has qualitatively changed during the last twenty years;' the elite spectrum is no longer continuous. Now one can clearly identify two distinct developing sections in the elite with a growing gap between them. On the one hand there is the 'super' elite consisting of the top groups of bureaucrats, defence personnel, and entrepreneurs, technocrats and managerial personnel in industry and business. They are, in a sense, a continuation of the top layer of the older all-India elite and are now educated mostly in select and expensive English-medium schools and later on in the better-type institutions of higher learning, Institutes of Technology, Schools of Business Management, etc., in India and abroad. Although they do not have direct political power, placed in strategic positions, they exercise considerable influence in the actual exercise of that power and also on social and political thinking. On the other hand there is the other section of the elite, whom we may call the 'regional' or 'common' elite. This is drawn partly from the lower orders of the old elite and partly from the middle castes of rural peasant origin, the latter including among them those wielding most of the political power and derived social influence. The 'regional' elite is educated largely at the ordinary, cheaper, regional-language institutions.

In spite of the democratic, egalitarian protestations about education, the constitutional right to have schools of one's own choice for children is being utilised by the higher bureaucracy and the affluent to perpetuate select exclusive schools of the expensive variety and corresponding institutions of higher learning, not of course without liberal aid from the government. The educational system thus gets divided and provides for more or less two distinct channels, one producing and perpetuating the 'super' elite and the other augmenting the ranks of the 'common' or 'regional' elite. This division is aided, abetted and sharpened by the present policy (or the lack of it) about languages and about the medium of instruction. The political leadership, even the section of it belonging to the common elite, has to connive at this division because they have hitched their stars, if not in this generation at least in the next, to the wagon of the super elite. How else does one explain the stark contradiction that the same leaders who lose no occasion to plead vociferously the cause of regional languages are careful enough to send their children to exclusive English-medium schools?

In sum, the resulting educational situation, in terms of social differentiation, can be briefly described as follows: (i) emergence and consolidation of super elite at the top — consisting of the old urban intelligentsia and a sprinkling of the more enterprising elements from rural stock — in technology, industry, business and in the higher echelons of the bureaucracy and the defence services; (ii) formation of a fairly large common or regional elite, consisting of the urban middle and lower salaried groups, skilled and semi-skilled technicians and professionals and of the newly emerging rural groups; and (iii) continuance of stark illiteracy in the rest of the society at the base of the pyramid, with a slow and sluggish movement among small sections towards basic literacy and rudimentary education. It is obvious this situation is full of strains, full of contradictions and confrontations. For instance, the super elite of the present day is even more alienated from and indifferent to the lot of the common people than its counterpart of the pre-Independence period. Having no social commitment it is concentrating its attention on its own narrow interests and living a life of affluence in pseudo-westernised 'high society'. A large section o. the super elite, coming as it does from the now politically dispossessed but culturally dominant minority castes and groups, lives in resentful co-operation with the newly emerged political leadership of rural stock. There is also a feeling of contempt for the political leadership which lacks the knowledge and technical skills possessed by the super elite. Its contradictions and confrontation with the common elite are already mentioned above. Within the common elite there is the vast lower salaried class which finds it difficult to maintain, in the face of rising unemployment and rising prices, its exclusive lower middle-class mode of life and values, and lives a life of relative indigence and frustration. Then there is the internal contradiction within the common elite, between those belonging to the traditionally literate minority castes — now having no social links with those in political power — and the newly emerged belonging to the middle castes which have social connections with the politicians; cultural distance aggravates this contradiction. Finally, there is the contradiction arising from the conflicting interests of the entire elite super-cum-common and the mass of people deprived of all the good things of life including education.

VIII

No discussion of the present situation in education can be even tentatively adequate unless it discusses the problem of growing educated unemployment and the related questions of imbalance in the educational system and the surfeit of secondary and higher education. Apart from the Education Commission which made a pointed reference to these problems they have aroused considerable interest recently among economist-educationists.[10] As observed earlier, the problems are not new. Educated unemployment and the imbalance, the lop-sidedness and the low quality of higher education in general have been with us ever since the early part of this century. Educated unemployment was also very acute in India during the depression period of the thirties. The creation of war-time jobs, the expansion of governmental activity after Independence and industrialisation under the second and third plans had reduced its severity to a certain extent in the early post-Independence period. But now it has again reached a new high and given a rude jolt to everybody concerned.

The basic underlying cause of widespread unemployment in India is the incapacity of the national economy to provide the necessary number of jobs to employ all or at least most of those of working age, whether educated or uneducated. Superimposed on this is the imbalance built into the present educational system which allows and encourages secondary and higher education to expand at a rate much faster than the requirements of the economy and thus creates a surfeit of high school and college graduates in relation to the available jobs. Moreover, there is not much of diversification and vocationalisation of education at the secondary stage which will channelise high school-leavers to fruitful careers, with the result that many of them swell the stream of liberal arts education in colleges to improve their prospects of employment.

It will be remembered that an almost similar characterisation of the problem of the educated unemployed was made during the pre-Independence period. But then the blame could be squarely, and rightly, laid on the colonial rulers. The significance of the similarity between the two situations, is, however, quite clear. In spite of the many developments that have taken

place in the economy and education during the last twenty years no basic change has occurred with regard to the problem of the educated unemployed.

There is by now a growing realisation that the problem of full or near-full employment cannot be solved unless we adopt an altogether different strategy of economic development and the latter cannot be initiated in the framework of the existing socio-economic structure. Leaving aside these fundamental economic issues, we shall confine our attention mainly to the educational issues. Vocational diversification at the secondary stage is no doubt necessary to prevent a large mass of students from blindly taking to and hopefully continuing liberal education. But let us not delude ourselves into believing that this will substantially alter the situation unless jobs are available in the economy for the vocationally trained young men at the end of the high school stage. Otherwise the incidence of unemployment will be merely transferred from one type of educated youth to another. This should be clear from what has happened at the higher level of education to the engineers during the past few years. The success of vocationalisation and diversification ultimately depends on basic issues, *viz*, the rapid growth of the economy.

IX

A more fundamental proposal to meet the problem of educated unemployment, advocated by a number of eminent economists, is to limit drastically the runaway expansion of higher (and also secondary) education, reduce the number of admissions at those levels and divert substantial funds saved from this sector towards primary education. The rationale behind it is, briefly that the outturn of higher education already exceeds any reasonable estimates of manpower demand; that uncontrolled expansion has led to a considerable deterioration of standards; that higher (and secondary) education is heavily subsidised by the state and consequently claims an altogether disproportionate share of the total public funds available for education; that this liberal subsidy actually serves the interests of the relatively affluent middle class, the top decile of the population, whose children seek and benefit from higher education and who can afford to pay much more for it; that students who join colleges do so because higher education has high economic returns on the low private costs which they incur (and which are low because of the high subsidy); that because of it the educated or graduates can afford to wait in unemployment until they land a suitable job; and that this subsidisation is therefore neither socially equitable nor economically efficient; etc.

This is form of reasoning has some validity. But such control of, and relative reduction in, enrolment in higher (and secondary) education, if enforceable, will only transfer the incidence of unemployment to the lower level unless ways are found to create jobs at that level. Perhaps it is felt the educated unemployment, being more vocal, is much more dangerous and destabilising than the relatively mute uneducated unemployment. (This may well be true in the short-run. Curzon also thought the same way at the turn of the century.) A high subsidy to higher education is not a feature of India alone; it also prevails in other countries, e g, the UK, the USSR. But there the subsidy is coupled with limiting the number of places and this necessarily implies a selection procedure. If we start controlling the numbers (with or without subsidy), the selection procedure has to be fair, not only in the formal sense, but as between different sections of society. This implies a radical change in our present selection procedure. The removal of subsidy and limiting the numbers by making secondary and higher education more expensive must also be coupled with an equitable selection procedure and a graded scholarship scheme and/or a graded levy of fees in inverse proportion to parental income. In the absence of these measures all higher education will be entirely the monopoly of the super elite and the affluent; the less affluent sections cannot, in general, hope to enter the charmed circle. Such a policy will perpetuate the present elite in its present socially privileged positions.

The proposal for diverting substantial funds from higher (and even secondary) education to primary education, especially its variation of keeping the present expenditure on non-primary education constant and allowing that on primary education to increase, has much to commend it on grounds of equity, if it could be practicable. The programme of primary education is lagging far behind and its actual operation results in large wastage. Consequently there is a tendency on the part of the policy-makers to reconcile themselves to the existence of substantial illiteracy in society; a kind of vested interest in illiteracy seems to have developed. Educationists are also succumbing or adjusting themselves to it, devising an appropriate new slogan of 'consolidation rather than further expansion of primary education'. (Why not both!) A change in the present policy, a sustained interest in the spread of primary education and a vigorous drive against adult illiteracy merit consideration for their own sake; if this indirectly helps to control the numbers at the secondary and higher stages that is an additional consideration. Moreover, any expansion and improvement programme at the primary level will also provide additional employment to the secondary school-leavers.

There is, however, little likelihood of the proposed policy-change being accepted by the political leadership of the country, whether government or opposition. It is remarked by those who propose this policy-change that the present subsidisation and the consequent controlled spread of secondary and higher education is in response to the political pressures generated by the vocal top section of society.[11] A bland statement of this kind, however, does not tell us much, nor does it pose clearly the issues involved. It must be examined in detail. We have analysed above the process of cheapening and 'democratisation' of (secondary and higher) education in its historical context. Although the super elite may not vigorously resist the policy of making secondary and higher education expensive — since many in it are already buying expensive education (which, by the way is also extensively subsidised) and may welcome the 'cleansing' operation which the new policy will perform — the common elite, both the less affluent sections of the older elite and the newer regional section of rural stock, will oppose it tooth and nail. The reason is quite clear. It will deny them their continuance in the elite or bar them from entry to the elite class even at the common level and an opportunity to rise up to join the super elite, a dream which many of them entertain. The interests of the present political leadership are identical with those of the common elite and one can hardly expect them to divest themselves of their interests. As mentioned above, vocal or effective public pressure at the moment is overwhelmingly on the side of subsidising secondary and higher education. No state or Central government of the day can hope to survive very long if it drastically reverses the policy of 'democratising' (that is, subsidising and free access to) education. Moreover, it can quote history in justification and say that if the national stalwarts of yesterday actively worked for

the 'cheapening and spread' of Western education from the times of the early British period, it is today following and carrying forward the same tradition; while the former had to do it self-sacrificingly and in a spirit of service, the present-day descendants are doing so with the help of state power and thus taking it to people even further down the social ladder — and so what is wrong? And the vested interests who run the schools and collegiate institutions, including the teachers — formed during the pre-Independence era and grown much stronger after Independence — will range themselves against a policy reversal. A policy reversal would also be against the common interest of all the upper and middle classes; the political leadership, whether of the left or the right, all hails from this class. This is absolutely clear from the unqualified stand taken by the parliamentary committee representing all sections of parliament. Rejecting even the gradualist approach of the Education Commission advocating selective admission to control numbers, particularly in higher secondary schools and in arts and science colleges, it says:[12]

> "But we believe that every effort should be made to provide admissions to institutions of higher education to *all* eligible students who desire to study further" (emphasis ours).

The proposed restructuring of education on these lines may have to wait for the day when those who are really dispossessed in all the good things of life including education can make their voice and strength decisively felt in public affairs. Fine exercises in rates of economic return and appeals to the wisdom and foresight of the leadership are not going to induce a change of heart on this as well as many other vital issues.

X

We have dealt in this essay with what we consider to be the main social features of the present educational situation. It is not proposed to go into its other aspects and problems, mainly belonging to the field of educational technology. But from the foregoing analysis two facts clearly stand out. First, the national system of education visualised during the final stages of the national movement is still miles out of reach. But with the modification appropriate to the needs of the present times, it can be still looked upon as providing guidelines for the solution of our educational problems. Second, the crisis in education cannot be discussed or dealt with in isolation from the general crisis of the socio-economic-political situation. It is too much to hope for a satisfactory solution of our educational problems in the absence of thoroughgoing changes in the socio-economic situation. In the absence of a social revolution in India it is utopian to think of a really national system of education.

This does not mean, however, that partial solutions or solutions to specific problems should not be suggested and cannot be tried. In devising such solutions, however, educationists often lose the context of the Indian situation and tend to base them on Western models, models borrowed from particularly from British or American systems of education. It is not realised that these models can hardly serve us, situated as we are in totally different circumstances. If the general Indian perspective is clearly kept in view, and one is prepared for the non-fulfilment and even distortion of the proposed measures in practice, and also prepared to learn from such experience, such solutions are always helpful; they also help to clarify issues.[13]

Before ending this discussion, a question about the future may perhaps be in order: how will the educational situation develop in the next few years? Prediction is an interesting but risky game. But the logic of the situation is such that it can be safely predicted that education of development will continue along the same none too cheerful path which it has taken during the last twenty-odd years. Both the super elite and the common elite will continue to grow side by side with a large mass of illiteracy. Their internal contradictions will also continue and at times produce acute tensions but will not assume the form of a direct confrontation since the super elite has to bow down before the political power of the regional or common elite and the latter has to accept the technical competence and superior knowledge and skills of the former. (This is, in fact, a reflection in the educational sphere of the contradictory yet complementary relationship between the big bourgeoisie and the technocrat-bureaucrats on the one hand and the affluent peasantry and emergent middle castes on the other; both need each other to keep themselves in the saddle.) There will no doubt be attempts to tackle piecemeal one or the other of the more glaring inequities or inefficiencies in the educational system, but no radical transformation will be undertaken. The Education Commission's Report will be left on the shelf to gather dust like all the preceding reports.

In the meanwhile, with the growing crisis of economic development, the problem of educated unemployment will worsen. The continued expansion of secondary and higher education in rural areas will turn out growing numbers of educated rural youth who will further swell the ranks of the educated unemployed. This will create new tensions in the countryside in addition to the existing urban discontent. During the period of national movement in the twenties and thirties the educated unemployed often brought added strength and radicalisation to the freedom and socialist movements. This was in a sense natural and inevitable in the anti-imperialist phase of the struggle for freedom. In the present phase of the struggle for emancipation the super elite will mostly be on the side of the protagonists of the *status quo*, although a section may detach itself in sheer disgust with the acquisitive society and take radical positions (e g, the Naxalites and other radical youth formations of the present day). The unemployed from the common elite may necessarily join radical or progressive movements. While some sections may join people's movements for social and economic emancipation, others may join the forces of regional and communal chauvinism. This is already in evidence in many parts of India today. Even during the days of the freedom movement sizable sections of educated youth were attracted to communal and neo-fascist formations. So the path will not be straight or unbroken. While in the long run one hopes and strives — in the educational as in all other spheres — for a solution in favour of the people, in the short run one must be realistic enough to be prepared for setbacks. For the situation does sometimes become much worse before it begins to take a turn for the better.

2 This is the order of difference usually found between the number of pupils on roll and those who more or less regularly attend school. See Amartya Sen, "The Crisis in Indian Education", Shastri Memorial Lectures, 1970. This need not be, as Sen suggests, for getting grants, since primary schools are mostly run by the government or local bodies. It is well known that pupils once enrolled often remain on the rolls till the end of the year, even when they have actually stopped attending school.

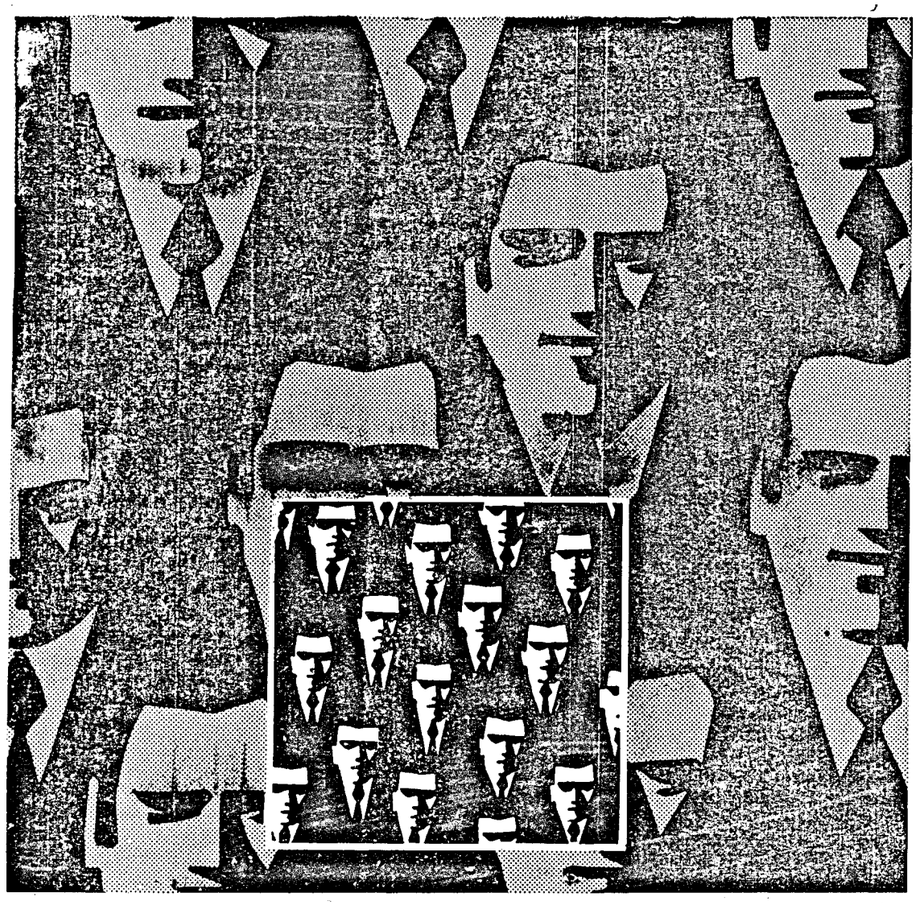
Taxation and Economic Development

V V Bhatt

Personal income-tax, corporate tax and indirect taxes collected from manufacturers constitute the three major taxes from the point of view of both their impact on development as well as their contribution to state revenue. As such, their structure and rates need to be devised in such a way as to be consistent with the major policy objectives of the government.

With the reforms in these three taxes suggested here, government revenue is likely to increase. More important, however, even if the tax revenue did not increase, there would be an increase in the real resources of the economy and reduction in consumption disparities.



I PROPOSE to deal in this paper with three major fields of taxation: (a) personal income-tax, (b) corporation tax, and (c) indirect taxes collected from the domestic manufacturers of products. This discussion would be in general terms in the light of the requirements for economic development in the developing countries. These three taxes for these countries are of major importance from the point of view of both their impact on economic development as well as their contribution to State revenues. As such, their structure and rates need to be devised in such a way as to be consistent with the major policy of objectives of the State.

I

Introductory

But before I go over to the discussion of each one of these taxes, I would like to make two observations; the first relates to the nature and stability of the tax structure and the second to the need for adequate open and effective discussion of tax proposals.

For major government policies including tax policy, what is essential is to frame them in the light of the basic requirement of rapid growth with social justice and at the same time to en-

Togetherness pays. Now, it pays more!

Fly to Europe, the USA, U.K., Japan and Australasia and save big money.

Now you save more under Air-India's Affinity Group Fare Scheme. To attend a conference or a convention or just for pleasure. Fly together and save big money. Your group must consist of at least 15 or 30 members belonging to the same school/college, institute, firm, club, society, corporation, association or organisation, of at least 6 months standing. Wife/husband and children are included as part of the group. A group of 15 gets a 30% discount to Europe, Japan, Malayasia, Australia; groups of 30 get a 45% discount for travel to Europe.

sure that they are simple and easily intelligible and are not likely to change in an *ad hoc* unprincipled manner. I feel that the tax system is an organic part of the economic system and hence it is essential that there be some certainty and stability about its basic features. A large number of *ad hoc* changes each year creates a climate of uncertainty, which hampers productive effort and diverts valuable scarce resources towards speculative and other undesirable channels as well as in circumventing and forestalling the government measures.

If some stability and certainty with regard to the impact of the tax system on the economy are to be ensured, it is essential, I believe, that tax proposals are formulated in the light of adequate research based on actual experience with regard to the working of the tax system in the country as well as abroad. In some countries, it is the Inland Revenue Board under the Ministry of Finance which is responsible for the implementation of tax laws as well as formulating tax proposals in consultation with some type of Economic Division (called by various names in different countries) in the Ministry of Finance. However, very few countries have a tax research unit in the Board with the result that tax proposals are not formulated rationally.

I think that it would be proper to set up a research cell in the Inland Revenue Board which could be assigned the function of formulating both short-run and long-run tax proposals for public discussion as well as discussion in Parliament. This Board has actual field experience with regard to the tax system and it would be wise to use this experience for formulating proposals for tax reform. There should be a creative dialogue between the research cell at the Board, and the Board's field staff and the actual proposals for reform of existing taxes or new tax proposals should emanate from the research cell as a result of such a dialogue, which is essential for sound viable and efficient evolution of the tax system. These proposals need to be published so as to stimulate wide constructive public discussion.

From among such proposals, the government should select such proposals as it thinks are worth implementing in a given year. But then, when such proposals are discussed in Parliament, it should be ensured that this discussion is both enlightened and constructive. Under the present system, this is hardly so. I, therefore, believe that in countries with a Parliamentary form of government, there is need for a Parliamentary Select Committee to study and report on the tax proposals to Parliament. In the United States, there is such a Congressional Committee. Even this may not serve much useful purpose unless this Select Committee has the right to invite people from the Ministry of Finance, particularly those who may have some share in devising the proposals and those who are likely to have some informed, enlightened views relating to them, as well as those from the public — economists, tax experts as well as laymen — who would be in a position to contribute constructively to the task of evaluation of tax proposals from the point of view of their impact on major socio-economic goals.

With these innovations, I feel that the Select Committee's Report to Parliament would be such as to induce effectice and fruitful discussion of the tax proposals in Parliament. The government then would be in a position to choose the final proposals in the light of informed and constructive debate in Parliament. Such wide-ranging effective discussion would ensure the sound functioning of the democratic process and at the same time the selection of tax reforms and proposals that would be appropriate to and consistent with the major development objectives.

Let me now pass on to the discussion of the three specific taxes that I mentioned earlier.

II

Personal Income-Tax

The personal income-tax, I feel, should serve two objectives: (a) to promote the incentive to work and save; and (b) to make the distribution of consumption more equal.

Progressive and steeply rising tax rates on personal incomes do hamper the incentives to work and save, and in their result are ineffective as they direct personal effort towards activities which can enable the individuals to evade the tax burden. Hence, I suggest that the tax base for personal income-tax should not be total income but total income (whether from work or investments) plus capital gains minus net change in financial assets; the assets to be included should be all financial assets excluding currency holdings and gold. These financial assets comprise bank deposits, small saving instruments, insurance policies, provident funds, and claims on the private sector and the government.

This would be in effect a tax on consumption. With such a tax, the tax rates can be sharply progressive and still the incentive to work and save would not be adversely affected. The demand for social justice would be met as the degree of inequality in consumption can be reduced by means of such a tax. Private fortunes, of course, could be built up but their effect can be offset by a properly co-ordinated pattern of other direct taxes like wealth tax, inheritance tax and gift tax. These taxes should be such that no private fortune, however large, can really support a household for more than three generations.

If a comprehensive return is asked for with regard to all these taxes from individuals, the possibility of tax evasion could be avoided.

This reform is administratively quite simple. Even at present, exemptions are given in various countries with regard to some financial assets like provident fund contribution, insurance premium and such other assets. Further, in some countries, interest and dividend incomes are also exempt from tax upto some extent. Instead of this multiplicity and complexity of diverse exemptions, what is suggested is that all savings in financial assets excluding currency and gold be exempted from personal income-tax. Obviously, with this reform, no interest or dividend incomes should be tax-free. All incomes to the extent to which they are not saved in the form of financial assets (excluding gold and currency) would be taxed.

This reform need not result in any revenue loss for the government. The present tax rates can be revised upwards once the tax base excludes financial saving, so as to result in the same revenue as is obtained at present. If, as a result of this tax reform, financial saving increases at a rate much sharper than it would otherwise have increased, it would more than offset any potential revenue loss. Such, indeed, would be the effect of this measure.

The proposed income-tax reform has several distinct advantages:

(a) It would raise the rate of overall saving as a result of the tax exemption for financial saving.

(b) It would raise the proportion of financial saving to total saving and thus bring, within the purview of policy-instruments for resources allocation, a larger part of total saving. It may be noted that policy-instruments are available to affect the allocation of only financial saving while physical saving (in the form of houses, other physical assets, etc) are by and large outside the purview of direct policy instruments.

(c) To the extent to which financial saving did not increase, there would be additional tax receipts.

(d) Tax receipts could also increase as the proposed tax exemption for financial saving might induce tax-evaders to show their correct incomes. Since financial saving would not be taxed, the motive for concealment of incomes could disappear. This itself would be an enormous advantage.

III

Corporation Tax

The tax base for corporation tax in all countries has been profits after providing for depreciation at specified rates. On the false analogy of the progressive income-tax on personal incomes, some degree of progression is introduced in some countries in the corporation tax structure. This progression in the corporation tax actually is a tax on efficiency and the tax system, thus, tends to encourage inefficiency in the use of capital resources. Hence, the tax rate on corporate profits should be made uniform and applicable to all companies.

At the same time, the tax base needs to be made uniform for all companies. At present in some countries, there are various types of allowances (other than depreciation provisions) which are tax-exempt. Further, there is a tax holiday for new companies on a certain rate of profit for five years. It is difficult to understand this multiplication of incentives. Apart from that, these incentives would have some meaning if they are selectively applied for the promotion of the industries which would not be otherwise started. These incentives, at present, are applied to a large number of industries without much discrimination.

I suggest that such incentives should not be indiscriminately allowed to a large number of companies; they should be very selectively applied to only a few industries which require to be promoted in the national interest and that too only for a stated period of time. Every five years, the industries to be given these incentives should be changed in the context of national priorities.

Further, I have two additional suggestions — one with respect to the tax base and the other with respect to tax incentive for promoting exports, import substitution and productive efficiency.

At present in a large number of countries, the tax base excludes interest payments on borrowed funds. I suggest that this be included in the tax base and the tax rates appropriately lowered so as not to put any additional tax burden on this sector.

Since interest payments are tax-exempt, there is a tendency on the part of the corporate sector to rely on borrowed funds to a much greater degree than they otherwise would do. Even parent companies are induced to give loans to subsidiaries rather than make additional subscriptions to the paid-up capital of the latter.

If interest payments on borrowed funds are included in the tax base, the tax system would really become neutral as between sources of funds and there would be to that extent an additional incentive to rely on paid-up capital by issuing additional shares and borrowed funds would be utilised much more efficiently than at present.

Further, I would like the corporation tax to be used as an instrument to (a) promote productive efficiency and (b) stimulate both exports and import substitution.

To promote efficiency, I suggest that each percentage point increase in the rate of profit above 20 per cent should mean one percentage point decline in the tax rate. The rate of profit should be calculated as a ratio (per cent) of profit (after depreciation) plus interest payments on all borrowings to total capital employed comprising paid-up capital plus all reserves plus all borrowings. A profit rate of 20 per cent is essential, on certain assumptions, if a growth rate of 8-10 per cent in industrial output is to be secured; that is the logic for inducing all firms to realise this rate of profit.

To promote exports and import substitution, I suggest that each percentage point increase in the net export ratio should mean one percentage point decline in the tax rate. Net export ratio should be defined as the ratio (per cent) of current value of exports minus current value of imports of materials, spare parts and components to value of imported plant and equipment. Such a link would promote both exports and import substitution and, at the same time, induce efficiency in the use of imported plant and equipment.

These two tax incentives would not only tend to promote productive efficiency of overall investment and investment to imported plant and equipment but would also indicate to the firms rational criteria of project selection. Any decline in tax receipts on these counts would be more than offset by their favourable impact on productive efficiency and on exports and import substitution. With these tax incentives, a large number of complicated measures of uncertain value should be abolished.

IV

Some Commodity Taxes

In developing countries, commodity taxation is of particular significance from the government revenue point of view. Commodity taxes quite often take the form of duties on certain specified commodities; these taxes are collected from the domestic firms producing these products at a specified rate per physical unit of output. This form of taxation would be appropriate in the case of commodities which are standardised and are consumed by large number of persons.

However, the other commodities which are subject to such taxes in various countries are more complex and further form only a part of the products which the concerned firms manufacture. In these cases, the administrative and collection machinery has become very complex. The collection costs are considerable; at each factory, there has to be an excise inspector at the gate to watch and supervise the exit of the specific commodities and to be vigilant enough to check whether the taxed commodity is not leaving the factory gate under the name of another non-taxed or low-taxed commodity. Even with these large collection costs, the possibility of evasion is not ruled out as a firm is producing not only the taxed commodity but several others as well. Further, with all these costs, the revenue is by no means substantial and probably, net of collection costs, would be negligible.

I suggest, therefore, that excepting the few standardised commodities and commodities of mass consumption, there should be no such taxes on the other commodities.

Instead, there should be a uniform *ad valorem* tax of the turnover type on all mining and manufacturing establishments on the value of their output. Even at present, some *ad valorem* duties exist in some countries and this principle needs to be generalised for all output other than of the few commodities mentioned. The collection costs would be much smaller as the tax would be on an assessment basis. Further and much more important would be the link established between tax receipts and industrial output and prices; the former would grow at the growth rate of the latter automatically without the need for tinkering with excise duties in each budget as is being done at present.

The next question is: What should the tax base and what should be the rate for this generalised tax? I suggest that the tax base be taken as value of output largely on the ground that it is administratively easier and quicker to collect these data from the existing published sources and no recourse to fresh collection is necessary. The suggested tax base would lead to the so-called "cascade effect". That is, since the material-producing firm will have paid a tax, the firm consuming these commodities would pay a tax on a base which is enlarged as a result of the tax already collected on raw materials. The tax-effect thus would discriminate against final goods manufacturing firms, whose raw material costs form a greater proportion of total costs than the rest.

From this point of view, a value added tax would be better than a turnover tax. However, a value-added tax is quite complicated and in countries where proper accounts are not kept by industry and trade, it may be difficult to enforce. On the other hand, an excise tax of the type I have suggested is administratively much simpler to enforce as it would be only at the stage of manufacturing and at this stage adequate output data are likely to be available.

However, the so-called "cascade effect" could be minimised by keeping a lower tax rate. Further, the additional "cascade effect" is unlikely to be large as even on the present basis some intermediate goods like cement, iron and steel products, aluminium, paper, tyres and tubes, copper and copper alloys and synthetic and organic dyestuffs are taxed and some at a fairly high rate. If these duties are abolished and replaced by the new generalised tax, it may turn out that the additional "cascade effect" would be negligible. Since prices have already been adjusted to the present duties, there need not result any additional adjustment in prices. It is glibly assumed that the generalised tax would be passed on to the consumers. If it is not passed on or passed on only partially, the "cascade effect" may be very small. Even if there is some "cascade effect" it would induce economy in the use of materials and capital and this would be worth encouraging.

For export promotion, it would be easier to give remission on tax paid on part of the output exported. A firm exporting, say, 25 per cent of its value of output would not pay tax on this 25 per cent. This tax-incentive would be easier and quicker to administer than the draw-back provisions existing in some countries at present. If the "cascade effect" is significant (it is unlikely to be so), it may affect adversely exports of products in whose costs raw materials consumption costs are significant. However, this would be offset by the tax-incentive with regard to corporation tax suggested earlier. For all these reasons, I propose value of output as the tax base for the proposed generalised excise tax.

What, then, should be the tax rate? For this purpose it would be necessary to work out the proportion of excise duties to the value of mining and manufacturing output (excluding the few commodities mentioned earlier). To keep the revenue at the present level, all that would be necessary is to have a generalised turnover tax equal to this proportion (per cent) on the value of mining and manufacturing output (excluding the few commodities indicated earlier). This rate may be raised marginally for additional revenue purposes.

For export promotion, this tax should be levied only on value of output minus the export value. This tax device would be much simpler than the complicated time-consuming drawback provisions existing at present. From the point of view of administrative convenience and cost as well as the prompt benefit to exporters, the suggested device would be simpler, prompter and more effective than the present provisions.

V

Concluding Observations

I believe that with the suggested tax reforms, the State revenue is likely to increase. What is important, however, to mention is that even if the tax revenue did not increase, there would be an increase in the real resources in the economy and reduction in consumption disparities.

For example, if the additional tax receipts under income-tax did not materialise, there would be an equivalent additional increase in financial saving and reduction in consumption disparities. From the point of view of the economy, additional resources would become available.

To the extent to which the additional tax receipts turned out to be lower than anticipated for corporation tax and generalised turnover tax, there would be a more than offsetting rise in exports, import substitution and productive efficiency. In fact, if the tax receipts proved lower than anticipated, it would mean a substantial increase in domestic and foreign exchange resources, and as a result a higher than anticipated growth rate in national income, investment, exports and import substitution.

Thus, the proposed changes in the tax system would induce either additional tax receipts or additional real resources; in either case, the economy would stand to gain.

Basis of the Japanese 'Miracle'

Lessons for India

Amulya Kumar N Reddy

The superstructure of Japanese attitudes, codes, character and culture and the homogeneity of the Japanese people are so unique that no other country can follow the Japanese path in all its detailed ramifications. Nevertheless, the Japanese story leads to the definition of several important national objectives, which must be pursued if a country like India wants to achieve a rapid rate of economic development.

An attempt is made here to outline some of these objectives.

"INDIANS like Japan most" — thus ran a headline in a Tokyo English newspaper of November 1970. The headline was based on a five-year survey carried out by the Indian Institute of Public Opinion. The Indian response to Japan was also demonstrated during EXPO '70 when Indians constituted the second largest group of visitors, after the Americans. The Indian attitude towards Japan may be attributed to a tremendous admiration for Japan's economic and technological success, and to a feeling of "if one Asian country can breakthrough to affluence, then

why not India?". Indeed, why not India? To answer this question we must understand the factors underlying the success of Japan. The aim here is to attempt such an understanding.

At the outset, some basic facts about Japan must be presented. Though Japan has only one-ninth the land area of India, its population is about one-fifth India's. Further, because of the mountainous terrain of Japan, only its coastal area is habitable; thus 102.65 million Japanese cluster in one-sixth of Japan's area. The Gross National Product of Japan (Rs 124,800 crores in 1969) was the third largest in the world after USA and USSR. The per capita GNP of Japan (Rs 9,667.50 per year in 1969) was only twentieth in the world, but by 1988 Japan expects to be first. Of greater importance is the fact that Japan's GNP has been growing at a rate which is both unprecedented and phenomenal, *viz,* 9 per cent per year (in real terms) in the fifties, more than 10 per cent per year in the sixties and 13-14 per cent in the past few years. The population of Japan, however, is rising at the much lower rate of 1-2 per cent per annum. Some idea of Japanese affluence can be got from the fact that about 85-90 per cent of Japan's 26.4 million households (each with an average of 3.89 members) possess a television set, a sewing machine, an electric clothes washer, a camera, refrigerator and an electric fan. The marked trend is towards luxury which the Japanese apparently define as the possession of the three C's, i e, a Car, a Colour television set and a Cooler (meaning air conditioner).

Meiji Restoration

The high population density of Japan and the tremendous pressure of its population on the extremely limited land have therefore not prevented Japan's advance to prosperity. It is submitted here that this advance has not "happened", but has been engineered through the unfettered development of the forces of production and the planned use of education, science and technology. We are all aware of Japan's technological triumphs *vis-a-vis* the West in the fields of cameras and optics, transistors and electronics, steel and metallurgy, ship-building and engineering. The real question, therefore, is: what are the factors which have facilitated the growth of Japanese technology and production?

The Japanese success story has usually been considered to commence from the year 1950. However, one must not ignore the preparative work done before 1950, and in particular since 1868, when after a virtual civil war the Emperor Meiji moved his throne to Tokyo and his supporters began the "Meiji Restoration" (1868-1912). It was in this period that several important steps were taken, among which were the following:

(1) sweeping agrarian reforms were implemented involving the abolition of Japanese-type zamindaris and a land-to-the-peasants movement;
(2) a unitary state was achieved with the ending of feudal de-centralisation;
(3) social hierarchies and stratification were eliminated;
(4) a massive investment was made on education with a powerful twin emphasis on western science and eastern ethics;
(5) the government initiated and sponsored basic industry (steel plants, for example).

The result of these steps was that, despite the havoc of the 1940-45 war in which one-fourth of Japan's plant and urban infrastructure was destroyed, Japan had in 1950 a foundation consisting of the following features:

(i) a homogeneous population undivided on the basis of religions, caste or linguistic differences and without barriers to inter-marriageability;
(ii) a modern educated population, with 100 per cent literacy and a science-dominated attitude;
(iii) a national character involving (a) this-world-based ethics rather than next-world-based religion, (b) nationally accepted codes to regulate the relations between man and man rather than between man and God, and (c) a powerful motivation to serve Japan;
(iv) a reservoir of technical and managerial talent arising from the Meiji Emperor's oath: "Knowledge shall be sought throughout the world so that the welfare of Japan shall be promoted"; and
(v) a basic industrial and agricultural infrastructure with a metallurgical, electrical, engineering and chemical industry and a well-developed agriculture.

Thus, the Meiji Restoration laid the foundation of a homogeneous, modern, scientifically-thinking, technically-trained and managerially-capable Japanese society equipped with the essential industry and agriculture. It was on this sure foundation that modern Japan has been built. Not to see this foundation is to miss the very basis of Japan's success, and to make misleading comparisons between India and Japan. The point is that India has yet to achieve the foundation which Japan had built by 1950.

Agricultural Self-Sufficiency

Turning now to modern post-1950 Japan, the crucial fact is that it is virtually self-sufficient in its agricultural requirements. The self-sufficiency was to the extent of 83 per cent in 1968, the chief imports being wheat, corn, raw sugar, oilseeds and tropical products (bananas and nuts). Since 1965-1966, Japan has had a surplus production of rice which in 1968 accounted for about 47 per cent of all agricultural produce. This surplus has been achieved even though: (1) only about 15 per cent (6 million hectares) of Japan's area represents agricultural land (the rest is mountainous); (2) the farm labour force constituted only 18 per cent of Japan's working population in 1968 (it used to be 50-60 per cent before World War II); (3) the average farm holding of arable land was 1.1 hectares in 1968 with holdings under 1 hectare representing 67 per cent of the total cultivated area.

The explanation of this agricultural achievement lies in two main directions. Firstly, there is the staple Food Control System by which the Japanese Government buys almost all the harvested rice at prices which are highly remunerative to the farmers. In 1970, for example, the Government bought unpolished rice at Rs 2.75 per kg. which was twice the international price and sold it to consumers at Rs 2.50 per kg. The firm and attractive price for agricultural products has led to a phenomenal rise in the income and living standards of farm households. The rise in income of farm households was 2.77 times between 1960 and 1968, and the annual income per farming household has surpassed the income level of urban households centred on wage-earners. The second factor underlying Japan's agricultural success is the uninhibited use of advanced mechanised methods and modern agricultural techniques involving land improvement, improved strains and the heavy use of chemical fertilisers and pesticides. To give an idea of the extent of mechanisation, we may mention the fact that 93 per cent of all farm households use power tillers and other machinery in paddy rice growing. The net result is that Japanese rice yields, for example, are the highest in the world. Thus, agricultural science and agricultural technology in Japan have played a key role in minimising its food imports and achieving virtual self-sufficiency.

The second crucial fact about modern

The second crucial fact about modern post-1950 Japan is that there is tremendous internal purchasing power within the country. This is because an average Japanese household, with a monthly income of about Rs 1,950 in 1969, spent only about 25 per cent of its income on food, and another 45 per cent on housing, electricity and fuel, clothes, entertainment, education, etc, leaving a clear 30 per cent for the purchase of non-essential luxury goods and for savings. An astonishingly high 94 per cent of the households possess savings. In short, a Japanese household not only has a need-based wage, but a wage that permits savings and the purchase of luxuries. Thus, Japan has a vast internal market, and this market has grown because prices have not risen as fast as wages, over a long period of time including the war years. The consumer prices increased in Japan at the rate of about 5.7 per cent per annum between 1960-69; whereas Japanese wages increased at the rate of more than 10 per cent per annum during the same period. At present, however, the Japanese Government is seriously concerned with preventing the acute labour shortage from making wages rise faster than productivity. It is this internal market of Japan which has stimulated the growth of production and competition between the various producers.

The growth of production and of competition in a country does not necessarily force its technology to catch up with and surpass international standards. By influencing the government's tariff and protection policies, Japanese industrialists could have (as most Indian industrialists have done) produced inferior goods at low technological standards and prevented the Japanese people from importing superior foreign goods produced with better technology. They have not done this, and cannot do this, for a reason which is vital to the understanding of Japan.

Japan, unlike India, has virtually no raw materials and is most of the time only 20 days away from raw material starvation. Japan is even getting sand for construction purposes from Korea. Thus Japan has to import almost all its raw materials, and these imports have to be paid for by exports. During the Meiji period, the chief export was silk, but with the domination of the fabric market by synthetic fibres such as nylon, Japan has had no choice but to export manufactured materials and finished goods. It may be noted that about 70 per cent of Japan's exports are in the form of machinery, metal products and chemicals, and only 14 per cent consist of textiles. These exports account for only 10 per cent of Japan's total production, but it is this 10 per cent which is necessary for Japan's survival through the import of raw materials.

Further, since Japanese manufactured materials and finished goods must sell in the face of competition from the most advanced countries in the world, they must be produced with technology which is equal to, if not better than, the best technology in the world. The absence of smuggled goods in Japan is a certain indication that Japanese goods are cheaper and in no way inferior to the imported ones; whereas the thriving smuggling "industry" in India is a realistic commentary on the price and quality of Indian manufactures.

Hence, the essential argument here is that, though Japan's exports are quantitatively insignificant in its economy, they are qualitatively crucial to the development of Japan's technology. The vital necessity to compete in the international market with finished goods and materials is the primary driving force for Japan's technological advancement.

To compete with foreign technology, Japan, like India, decided to import Western technology through foreign collaboration agreements. From 1959 to 1968, Japan operated over 11,500 agreements, in contrast to India's 2,600 agreements in the 20-odd years of our independence. Of these 11,500 agreements concluded by Japan, about half were intended for periods of less than a year and the remainder for more than a year. The bulk of the agreements were for the purpose of purchasing patents and not, as in the case of India, for obtaining manufacturing drawings, process knowhow, etc.

Japan, however, has always operated with the view that unless its industry receives quantitatively increasing and qualitatively improving inputs from its own science and technology, the import of technology through foreign collaboration agreements will lead Japan to greater technological servitude. Hence, to prevent the import of technology from leading to technological dependence, and thence to economic and political dependence, foreign collaboration agreements have been used as a means to technological self-reliance. To ensure this aim, Japanese industrialists, in total contrast to their Indian counterparts, have backed up the import of technology with massive investments into research and development. These investments, 65 per cent of which come from *private industry,* have assumed a simple pattern: for every dollar spent on patent fees, licence fees, etc, for the import of technology, at least four dollars are spent on indigenous research and development in the very areas in which technology is being imported. In this manner, the foreign collaboration agreements are being used in Japan as a take-off for research and development; whereas, in India, both the private and public sectors are guilty of having used foreign collaboration agreements as a substitute for indigenous research and development.

In the light of the above arguments, it is clear that a close and intimate interrelationship between Japanese industry, export-import trade and technology is vital to the survival and growth of modern Japan. No wonder that this interrelationship has been initiated, monitored and encouraged by a peculiarly Japanese institution, *viz,* the trading house. Of these, the Big Four, Mitsubishi, Mitsui, Sumitomo and Yasuda, are known the world over. These trading houses import raw materials from foreign countries into Japan and then supply them to Japanese industry; but they also handle the export and sale of Japanese manufactures to foreign markets. The 10 largest trading houses account for 50 per cent (about Rs 6,000 crores) of Japan's exports and 65 per cent (about Rs 6,750 crores) of Japan's imports. In this strategic and vantage position, the Japanese trading houses cannot limit their concern only to profits. They must have, and do have, a vested interest in the progress of Japanese industry and technology, and this patriotic interest is explicitly expressed in the the various industries which have been set up by the trading houses. The trading house of Mitsubishi, for example, has a special ralationship with the Mitsubishi group consisting of 45 of Japan's largest industrial corporations as well as with a large number of manufacturers outside the group. The Mitsubishi group manufactures over 7,000 commodities from turn-key plants and 300,000-ton tankers to small packages of raisins and noodles. Thus, the trading house of Mitsubishi, for example, has access to and is interested in virtually every line of industry in Japan, and therefore, in every area of technology. In contrast, Indian trading houses have concerned themselves with the profits of export-import business rather than with stimulating production and developing technology.

Continuous industrial growth and technological development necessarily

requires massive and enlightened financing. That such financing exists in Japan is evident from another peculiar feature of Japanese industry which astounds foreigners. Japanese industry runs with an average of 20 per cent of its own capital and 80 per cent loans from banks. In most countries, the figures are the other way round, with an industry meeting only 20-30 per cent of its capital requirements by raising loans.

A necessary consequence of this dependence on IOU's is that, in order to break even (after paying back interest on loans) and make profits, a Japanese industry must operate at over 80 per cent of capacity and must go in for economies of scale with lowered unit cost. The Kimitsu plant of Nippon Steel Corporation is an example of the trend towards large-scale operations in that its two blast furnaces, each with a capacity of 7,000 tons of pig iron per day, produce as much as all the steel plants of India put together even though its total work force including clerks and administrators is only 3,700.

Why are Japanese banks so interested in the risky business of financing growth and technological development? The answer is easily seen by noting that the major Japanese banks are owned by the very same trading houses which are interested in the progress of industry and technology. In India, the pressure for bank nationalisation arose precisely because the banks sought safe and profitable investments, such as multi-storeyed buildings in urban centres, instead of vitally needed support for national growth, agricultural development and indigenous technology. The critical technologically-oriented role of the Japanese banks is facilitated by the fact that over 90 per cent of the savings which 94 per cent of Japanese households possess are in the form of bank deposits. The stock market has only a minor role in the Japanese economy and the hoarding of gold is of course non-existent.

The intense competition between the various trading houses, industries and banks would have been fertile ground for fratricidal strife had the Japanese Government adopted the non-interfering *laissez-faire* attitude urged upon the Indian Government by Indian big business. In fact, the Japanese Government plays a commanding role in the country's economy through the Ministry of Finance (MOF), the Bank of Japan (BOJ), the Economic Planning Agency (EPA) and the Ministry of International Trade and Industry (MITI). The very names of these agencies suggest that the Japanese Government itself functions like a trading house which some writers have referred to as JAPAN INC. Through its control of these key agencies, the Government operates the crucial levers on the economy and ensures the co-ordinated functioning of the industries, trading houses, banks and technological laboratories.

For instance, every foreign collaboration agreement negotiated between a Japanese firm and a foreign one has to be approved by MITI. But this approval is not a mere formality. MITI subjects the agreement to close scrutiny and may require radical changes in terms to ensure reduction in down payments and/or royalties and to secure maximum in-flow of technological knowhow. Ashok Parthasarthi, in a talk to the National Academy of Sciences, has described the interesting case of a negotiation between Sony of Japan and Texas Instruments of USA for the manumfacture of one of the latest developments in electronics, *viz*, integrated circuits. MITI took over, after the draft agreement was written, and by bargaining and stalling for three years in the face of powerful American pressure, virtually forced Texas Instruments to permit Sony to pass on the imported knowhow to the other Japanese electronics giants: Hitachi, Toshiba, NEC and Fujitsu. The inclusion of this clause for the internal dissemination of knowhow may well have been to the disadvantage of Sony but it was certainly to the advantage of the Japanese electronics industry.

'United Front' Approach

It is worth noting that during MITI's negotiations with Texas Instruments, there was no hue and cry in Japan, as there would have been in India, about Government interference in the private sector's pursuit of its legitimate interests. The private sector in Japan appears to consider the Government as the protector of the best interests of Japan in its dealings with the foreign industrialist, trader and banker. It also seems to realise that conflict between the private sector and Government only helps the foreigner who profits by playing off one against the other. A MOF economist has said: "If business goes one way, and Government goes another way, it would bring harmful effects to the country". A Sumitomo spokesman put it very frankly: "In order to safeguard Japan's interests against powerful foreign companies, we must form a United Front".

The "united front" of industries, trading houses and banks has worked satisfactorily under the leadership of the Japanese Government (which does not issue directives but offers informal advice) because of the peculiarly Japanese method of arriving at decisions. This method does not involve the confrontation of views (and therefore of persons) and the triumph of the majority view (with a loss of face for those supporting the minority view). The Japanese method is based on an elaborate, behind-the-scenes search for a consensus. The actual 'unanimous' decision is only a formal acceptance of the already-attained consensus. The attainment of this consensus is facilitated by the fact that the higher echelons of government, industry, trading houses and banks are filled with graduates from only a few out of the 379 Japanese universities. It is these classmates and alumni of Tokyo, Waseda, Kyoto who matter in the decision-making and the easy communication which they have with each other facilitates the formulation of the consensus view.

The point that has emerged is that personal ties and friendships are woven inextricably into the fabric of Japanese business and executive life. This is only one example of how the humanistic aspects of feudal ethics have been preserved in Japanese life as a counter to the corrosive influence of commercialism. There are other examples. For instance, the paternalistic attitude of the employer to his employees is a carry-over of the feudal ties between a landlord and his peasants; but it is thanks to this attitude that a Japanese private sector concern assumes the responsibility of providing the social welfare for its employees who in return do not promote industrial strife. The amenities for labour include housing, medical services, recreation, opportunities for cultural development, and job training. All this is a far cry from the situation in cities like Bombay and Calcutta where, on the one hand, industrialists treat the employer-employee relationship as a pure cash transaction and foist the social welfare problem on to a government which is already smothered by countless problems, and on the other hand, labour brings the heartless industry to a standstill with strikes.

Another aspect of the feudalistic ties between an employer and his employees is the well-known fact that Japanese employees are permanent and serve a company until retirement. The Japanese have demonstrated that permanency of service and salary by experience (i e, age) does not necessarily preclude an organisation from being efficient. They have shown that human nature (at least, the Japanese version) does not require to be goaded into efficiency by the American carrot-and-stick method and hire-and-fire personnel policies. The short-term gains of the American policy must be offset against the resulting dehumanisation of a society in which the strong seek survival and success by ruthlessly pushing the weak to the wall.

Industrial Relations

The Japanese approach to personnel policy also helps to bridge one aspect of the generation gap which arises from a society undergoing rapid technological change. In such a society, experience gained from an obsolete and vanished past is invariably irrelevant to a new and living present. Further, since a technological explosion is based on a knowledge revolution, elders struggle to cope with the flood of new techniques and concepts so easily inherited and assimilated by the young. Thus, drive and specialised technical competence is most often associated with youth, and lethargy and outmoded views with the old. Such a situation leads in America to the old viewing the young as threats to their jobs and security, and the young viewing the old as road-blocks in the way of progress and efficiency. Not so in Japan. The permanency of service and salary-age link removes the insecurity of seniors. On the other hand, the consensus sought in Japan is not only horizontal, i e, between equals of different organisations, but also vertical, i e, between seniors and juniors of the same organisation. With this setup, juniors extend to their seniors the traditional Eastern respect for elders, and the seniors extend to their juniors the Western respect for good work and technical competence by involving their juniors very deeply in the planning and development of their organisation as well as in its decision-making and functioning. Thus, arises the two-way flow of respect and strong *oyabun-kobun* (senior-junior) relationship in Japan.

Notwithstanding all Japanese traditions, efforts and planning, there is an additional crucial factor which has promoted the stupendous growth of Japan. This is the matter of defence expenditure. In 1966, for instance, though the Japanese GNP was three times the Indian GNP, and Japan's per capita GNP fifteen times, India spent 4 per cent of its GNP (Rs 1,000 crores) on defence expenditure compared to Japan's 1 per cent (Rs 670 crores). Whatever the historical reasons for Japan not spending on defence what it could easily afford, and India spending what it cannot afford, the fact remains that the relative defence expenditures of Japan and India are very closely connected with their relative rates of growth.

The major conclusion that must be drawn from the above analysis is that the Japanese "miracle" is no miracle at all, for miracles by definition do not permit of rational explanation, and the phenomenal growth of Japan can be understood in its broad outlines if not in its intricate details.

Lessons for India

We turn now to the lessons which India can draw from Japanese experience. To draw these lessons requires an estimation of the extent to which the numerous factors listed above have contributed to the Japanese phenomenon, as also an evaluation of the relevance of these factors to the Indian scene. This is a task of no small magnitude, and should therefore not be done in a flippant and superficial vein. One point, however, is clear — the superstructure of Japanese attitudes, codes, character and culture and the homogeneity of the Japanese people are so unique that no other country can follow the Japanese path in all its detailed ramifications. Nevertheless, the Japanese story leads to the definition of several important national objectives which must be pursued if India wants to succeed. Some of these objectives are outlined below:

(1) the rate of growth of our population must be reduced drastically, and in the very near future the population must be stabilised at a tractable value;

(2) a radical land-reform programme and agricultural pricing system must be completed and this programme must be designed to give the actual tillers a stake in agricultural productivity and progress;

(3) Self-sufficiency in agriculture must be attained so that we are not compelled to import foodgrains;

(4) there must be a vastly increased investment on an educational system re-designed to produce citizens with a scientific-humanistic attitude and a commitment to the nation;

(5) the present dangerously wide income disparities must be eliminated;

(6) the economic factors which aggravate the caste, linguistic, religious and regional conflicts must be revealed and removed;

(7) the target of a need-based wage for all households must be set up and the highest priority must be given to the attainment of this target as soon as is feasible;

(8) the present wage-price spiral must be snapped with a ruthless war on prices outstripping wages;

(9) households must be induced to convert the excess of wages over living expenditure into savings;

(10) these savings must be channelised into banks rather than into luxury goods;

(11) banks must develop a growth-oriented and technology-oriented outlook;

(12) the technological criterion as distinct from the profit criterion must be introduced in the assessment of both public sector and private sector concerns, along with penalties for under-utilisation of capacity;

(13) our policy towards foreign collaboration agreements must be radically altered so that (a) they are backed with sufficient investments on research, design and development to advance towards technological self-reliance, and (b) they are not repetitive from the point of view of technology;

(14) industrialists must not be permitted to take shelter under tariff and protection measures unless they show evidence of advancing technology and meeting international standards in the quality of their goods;

(15) if import trade is not nationalised, then importers must be licensed in proportion to their production for export;

(16) employers must be compelled to assume the responsibility of social welfare (housing, medical aid, etc) towards their employees;

(17) all ways and means must be sought to cut down defence expenditure.

It is clear that attempts to implement the above measures will arouse the opposition of various vested interests. Whether this opposition will be overcome will depend upon whether the Government has the will to implement the measures and, in the last analysis, upon whether popular pressure can generate that will when it is absent or strengthen it when it wavers.

Coromandel Fertilisers Limited

Speech of the Chairman, Dr Bharat Ram

THE following is the Statement of the Chairman, Dr Bharat Ram, at the Tenth Annual General Meeting of the shareholders of Coromandel Fertilisers Limited held on June 21, 1972.

LADIES AND GENTLEMEN:

I have great pleasure in welcoming you to the Tenth Annual General Meeting of the Company.

We passed through an eventful year in 1971 which ended with a sense of fulfilment and renewal of faith in the traditions that this country has always upheld. The national effort inspired by astute leadership once again rose to great heights and exemplified the unity of our people in times of stress.

The burden imposed on our country's resources, firstly, by the influx of refugees and by the armed struggle later has tested our inner strength, but its full impact on our economy is still in the process of being felt. The nation's new mood of self-reliance is a very welcome trend, although this cannot be translated into action straightaway.

The recent Government move in regard to ceiling on land holdings is another far-reaching measure as, besides its social objectives, it has direct effect on the agricultural development of the country. While the success of the Green Revolution has not been questioned, many have asked whether the benefits have been widely shared. This, in turn, has set off much debate about the strategy for spreading the socio-economic benefits of the Green Revolution. Here, one has to be pragmatic and cautious, for, any absolute definition of 'holdings' without reference to their economic size may not be conducive to increased application of the package of practices, which alone can sustain greater agricultural productivity. Therefore, emotion alone should not guide us in this area. While structural changes seem to be necessary in the larger interests of the country, in our anxiety to achieve it, we should not lose sight of the necessary economic justification. Realities must be kept in perspective.

The past year has witnessed a further advance in application of agricultural technology towards increased production. Hybrid varieties in cereals have gained in popularity and it is hoped that equally important and great strides will be made in other crops. The increased attention being paid to cotton development in recent months is another happy feature. All this is an unmistakable sign of the greater application of science and technology in the service of agriculture and as a result, we are now poised for a Rice Revolution too. At the same time, it is heartening to note that greater awareness of the other implications of the Green Revolution has provoked informed discussion and study of the problem. While we need to display continued attention to the problem of environment, it is somewhat disturbing to find that many enthusiastic environmentalists are spreading panic without subtantiating their statements.

The Directors' Report and Accounts were circulated to you earlier. The marked improvement in the profitability reflects a steady and progressive growth of your Company during the last four operating years. Many of the inhibiting factors, affecting production have been considerably minimised. Capacity utilisation has been steadily improving and your Management is studying ways and means to achieve higher targets.

Your Company's products are being well accepted in all the major States in India. However, timely movement has not been possible due to the shortage of wagons and time and again this problem has assumed critical proportions. Consequently, your Management has had to move the product by road or by rail to the available point and then tranship by road. During 1971, of the entire quantity, only 55 per cent could be moved by covered wagons; the balance had to be moved by uncovered wagons or by road. These additional movements and handling have naturally pushed up the costs significantly apart from the incidence of increased freight and warehousing/siding charges. To partially mitigate the heavy freight and handling costs, efforts are being made to increase the sales in the home area without completely withdrawing from other States so that your Company's product image is maintained.

Your Company has strengthened and enlarged the areas of demonstration plots, soil testing and farmer services. A new N-P-K complex fertiliser with an analysis of 14-35-14 was added to the product line and launched in the market in April this year. The response has been encouraging. Special efforts are being made by the Government of Andhra Pradesh to bring at least 50 per cent of paddy cultivation under the High-Yielding Variety and it is reasonably expected that this will be achieved during 1972-73. From the fertiliser consumption angle, this is a very encouraging sign.

COSTS AND PROFITS

I would particularly like to comment on two significant and interrelated factors — profitability and price reduction. The shareholder is naturally interested in the profitability of his Company and compares its performance with similar companies in the industry. Members are no doubt aware that each Company faces its own problems, besides extraneous factors, which I will take up shortly. Your Company's performance has been steady and progressive but in the first two operating years, production was seriously hampered by unstable power and interrupted water supply. On the other side, sales were low due to excessive imports, natural calamities and the difficulties in getting a sophisticated but most excellent product accepted. Your Company primarily produces phosphatic fertilisers whereas the Indian market has been used to a nitrogenous mixture or straight nitrogen like Urea; hence it has taken some time for phosphatic fertilisers to be accepted.

The significant fact, however, is the abnormal rise in costs. The levy on naphtha from June 1971, now costs Rs 31 lakhs a year additionally. Whereas world Sulphur prices have reached rock-bottom rates, we continue to get this vital raw material at a price which is much higher. The agency concerned with the supply of Sulphur has recently increased its price to Rs 300 per M tonne, resulting in an additional cost of Rs 34 lakhs a year to your Company. Further, the Andhra Pradesh State Electricity Board increased the power tariff which has pushed up the power costs by another Rs 25 lakhs a year. Increases in rail freight, siding charges and warehouse rental, account for nearly Rs 40 lakhs a year. The Emergency Risks Insurance has cost us Rs 10 lakhs. These are strikingly significant; I am not cataloguing the hundreds of other items, the costs of which

are going up year after year.

Now, I come to the next point — reduction in the price of fertilisers. Reduction in price can be made possible by optimising production or reducing operating costs. In your Company's case, where production is near capacity and increases will be minimal due to technical reasons, capacity utilisation alone cannot contribute significantly to increased profits, if operating costs outside your Company's control rise steeply year after year. The recent increase in the excise duty on fertilisers, freight and raw material prices, cannot but go against the objective of reducing the price of fertilisers which will remain a distant goal. An industry is set up to produce goods and services at competitive rates, contribute to the economic activity and earn a profit for its investors. It would be a sorry state of affairs if industry is reduced to a position of sheer economic survival.

EXPANSION

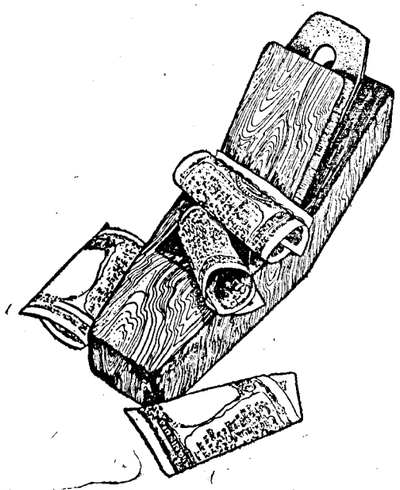
The preliminary negotiations on the technical and financial aspects of the Phase I expansion were deferred in the light of the Ammonia plant's performance last year, since your Directors felt that the expansion plan as originally envisaged required to be re-assessed and revised. Fresh technical studies on the Ammonia, Phosphoric and Sulphuric Acid plants are under way and based on the technical report, a revalidation of the expansion licence will be obtained and the project finalised. Preliminary engineering and design work will commence thereafter.

CONTRIBUTION TO NATIONAL DEFENCE FUND

Immediately on the declaration of Emergency, your Company made a token contribution of Rs 10,000 to the National Defence Fund. Early this year, another contribution of Rs 2,51,500 was made. Besides this, the entire staff of the Company contributed a sum of Rs 10,690.

DIRECTORS

Since the last meeting, Mr Harvey C Auman joined the Board in place of Mr C S Dennison. Mr J H Eckart returned to the USA to rejoin his parent organisation and Mr R B Lamer took over as Managing Director.



Your Company's performance has been improving each year and this has been, in no small measure, due to a co-operative effort on the part of the entire staff, workers and management. Permit me to express the Company's appreciation of their dedicated and loyal performance.

Thank you, Ladies and Gentlemen.

BHARAT RAM
Chairman

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

You need money to be your own employer.

Where is it going to come from ?
UCOBANK

If you are thinking of starting a business of your own, we can provide you with the means for doing so. That's our job. And, we like doing it.

At UCOBANK, we know your needs. And, we are prepared to help you. In any kind of business that you have in mind.

We can help you buy machinery or raw materials. Or give a loan for you to set up your shop. Assist you to utilise your skills in a profitable way.

At UCOBANK, we help you to help yourself.

Meeting the needs of the people.

Alembic Glass Industries Limited, Baroda

Speech of the Chairman, Shri Ramanbhai B Amin

THE following is the Speech of the Chairman, Shri Ramanbhai B Amin, at the Twentyseventh annual general meeting of Alembic Glass Industries Limited, Baroda, held on June 17, 1972.

LADIES AND GENTLEMEN,

I have pleasure in welcoming you all to the 27th Annual General Meeting of the Company. The Accounts for the year ended 31st December, 1971 and the Directors' Report have been circulated to you and with your permission I shall take them as read.

HIGHER PRODUCTION

During the past year your Company nas been able to achieve significant advances both in production as well as in sales. Our factories at Baroda as well as at Whitefield worked satisfactorily and reached higher output. Sales have gone up by as much as 22 per cent over last year. This performance is no doubt satisfactory, particularly when it was maintained in a situation where both manufacturing side as well as marketing side were encountering difficulties.

SHORTAGES AND DELAYS

The shortage of Soda Ash to which I referred in my last year's speech persisted during 1971 as well. The supplies of this raw material were uncertain and erratic and as a result we have had to run two of our furnaces using 50 per cent cullet with corresponding adverse effects on our overall efficiency of operations. I would also refer to another factor which has had an unsettling effect on our programme for regular maintenance and repair of furnaces. For adequate and timely repairs we require Electrocast Refractories of a satisfactory quality at regular intervals. Recently the import of these refractories has been canalised through the Minerals and Metals Trading Corporation. The direct result of this has been that there is a considerable delay in supplies due to procedural bottlenecks. Further, since refractories have to be tailor-made to the requirements of each individual furnace much time is again lost in correspondence and there is always the danger of getting something which is unsuitable. As a result the repair schedules of our furnaces are frequently held up. It is, therefore, necessary that the import of this specialised item should be allowed to be made by the units themselves so that they obtain the kind of refractories that they want without delays and interruptions.

TRANSPORT PROBLEMS

Our position is made more difficult this year by an unprecedented shortage of railway wagons in the Baroda region. It is not clear what has led to this crisis. But our despatches to up-country places are being considerably handicapped because of the overall low availability of wagons. This matter would become particularly difficult with the onset of the monsoon and we would expect that the railway authorities will handle this matter with utmost priority.

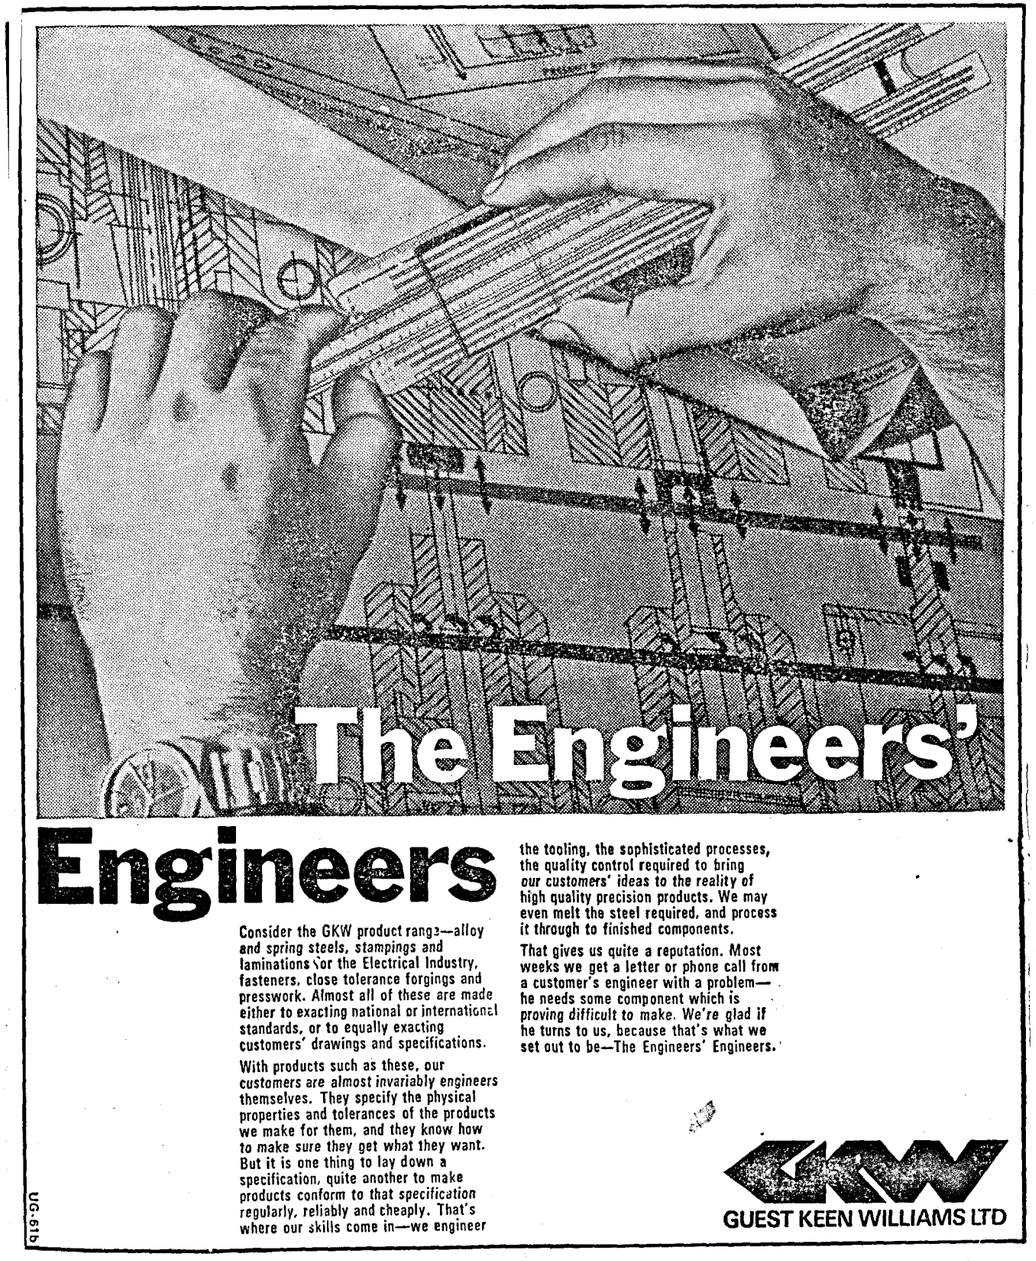
CHALLENGE OF COMPETITION

I have, in the past, spoken to you about the need to increase the overall production capacity for glass containers and other wares so that shortages are avoided and consumer needs are better satisfied. There has now been an overall increase in the installed capacity and production. The resultant increase in overall output means that we are facing greater competition in our marketing efforts. This is a good development both for the consumers as well as the manufacturers. Your Company is meeting the challenge of competition in the changed circumstances by bettering its overall skill and efficiency both in manufacturing and in marketing.

QUALITY AND VARIETY

We have always shown utmost concern for the quality of our products and in the new situation our Managers will further intensify their efforts in the direction of improving the quality, the variety and consumer appeal of our goods. We have given this objective a high priority and one can be confident that the result of this effort will continue to show itself in your Company continuing to maintain its premier position in the Glass Industry of the country.

DIVERSIFICATION AND INNOVATION



Apart from improving quality and sales appeal of our traditional products your Company has started considering various plans and proposals for diversifying its production. We feel that we should maintain our lead by introducing new products and thereby affording to the consumer greater choice and satisfying his demand for newer and better goods.

Before I finish, I would like to place on record our appreciation of the co-operation and hard work put in by the workers as well as members of the staff of the Company, both at Baroda and Whitefield. I also wish to thank my colleagues on the Board for their support and guidance.

I now commend the Annual Accounts and Directors' Report for your consideration.

Rural Indebtedness

ACCORDING to a survey done by Syndicate Bank in Cuddapah district of Andhra Pradesh, private financiers continue to dominate in the field of rural finance. In the village of Duvvur (largely wet cultivation) moneylenders provide 56 per cent of the total credit, whereas in Vontimitta (mostly dry cultivation) their share is 12.5 per cent. Co-operative credit accounts for 12 per cent of the total in Duvvur and 27 per cent in the other village. Most of the benefits of co-operative credit are reaped by big cultivators. Credit provided by state agencies through Taccavi loans is negligible — 3 per cent in Duvvur and 11 per cent in Vontimitta. Medium cultivators appear to have received a large slice of these loans. Big cultivators themselves are also a source of credit, supplying nearly 14 per cent of the total credit and invariably at exorbitant rates of interest. Commission agents and traders usually provide credit to the farmers just before the crop is harvested. In Duvvur they provide 12.4 per cent of all credit and 9.1 per cent in Vontimitta. Partly because there are no backing facilities in either village, the banks' share of credit in Duvvur is non-existent and is about 10 per cent in the other village.

Milk co-operatives
as an instrument for creating new jobs

Survey of two villages in Kaira* traces half their income to milk

Rearing milk cattle has become as important an occupation as agriculture in many villages in Kaira. In villages with milk co-ops, slightly over half the income is from milk, as against 20% in villages without milk co-ops.

Apart from raising village incomes, milk co-ops have created more jobs in villages, in collection centres, in cattle feed plants and in animal husbandry services.

With mechanisation of farming displacing people from agriculture, it is imperative that villages should offer alternative opportunities for employment. The traditional farmer is under-employed in any case. Dairying offers a part solution to both problems.

*This survey was conducted by the Department of Economics, Sardar Patel University, Vallabh Vidyanagar. The computed income included remittances from relatives in Africa.

Amul has shown the way.

State Bank opens new LOCAL HEAD OFFICES in PATNA and BHOPAL

Originally erected as a granary in 1786, the Golghar is a prominent feature of Patna even today.

Work on the Great Stupa at Sanchi, near Bhopal, was begun by Emperor Ashoka but completed by his successors in the 2nd Century B.C.

To serve the people better, State Bank has been progressively decentralising its administration. Two new Local Head Offices come into existence today, one in Patna and the other in Bhopal.

The formal inauguration by Shri Kedar Pandey, Chief Minister of Bihar, at Patna on 1st July, and by Shri P.C.Sethi, Chief Minister of Madhya Pradesh, at Bhopal on the 6th July, will mark the importance of the change for the respective States.

The new Local Head Offices will devote closer attention to the economic problems of these States and help to quicken their pace of progress.

Drifting Again

STERLING was clearly headed for trouble even before the Smithsonian Agreement, fixing the new currency parities, had been arrived at last December. The UK economy was inflating faster than those of its trading partners and Britain's balance of payments had begun to weaken. When the UK decided not to devalue in relation to gold and to let the US dollar depreciate fully in relation to the pound, this show of strength did not carry much conviction.

After the Agreement, hardly anything seemed to go well with the UK economy. The settlement with the miners, arrived at after a debilitating strike, was highly inflationary, and was to encourage the railwaymen and dockers into making similar demands. In the period since January 1971, British export prices are estimated to have risen by almost one-fifth, while those of its competitors rose hardly by 10 per cent. This competitive weakness had begun to show itself in the balance of trade: in every one of the first five months of 1972 the UK had a negative balance of trade, the total trade deficit amounting to £212 million (though, with its substantial surplus on the invisible account, this still did not result in an overall deficit on current account). Finally, with the date for joining the EEC fast approaching, sterling had to be in a position to stay strong in the enlarged Community.

The final push was given by the railmen's and dockers' strikes which widened the credibility gap about the strength of the pound, official protestations notwithstanding. June 22 saw a rise in UK Bank Rate to 6 per cent, but without any let-up in speculative pressure on the pound. In a single day, more than $2 billion was needed to support the pound — without any effect. So the next day the UK Government bowed to the inevitable and let the pound float to find its own level. When trading opened on this Tuesday, the pound had already depreciated by about 4.5 per cent — halfway between its pre-Smithsonian and post-Smithsonian parities.

The British decision to float the pound has exposed the inherent weakness of the December Agreement. The Italian lira has been weak, and it is only a promise of massive support by the EEC finance ministers which has saved it from having to float. On the other hand, the Japanese, despite the 16.9 per cent yen revaluation of December, have been able to maintain their trade surplus in 1972 at the same level as in 1971, and it is increasingly accepted that the yen is overdue for another revaluation — by as much as 10 per cent. The EEC countries, including the prospective members, have been able to patch up their differences at a Finance Ministers' meeting called to consider the UK decision. Britain has agreed to return to a fixed parity at an early date, having brought about a situation in which it could enter the Community with a stronger pound. However, the EEC countries' ability to remain within the self-imposed limit of 2.25 per cent of each other's parity must remain suspect.

The floating of the pound has yielded the best text-book response from the RBI. It suspended forward exchange transactions immediately and took six days to come forth with new spot rates for buying and selling sterling. These rates are fractionally different from those prevailing before the pound float, though it is difficult to fathom what profound calculations of national interest account for the trivial difference. When the dollar was floated last year, the rupee floated in company with the dollar. As a result the rupee was devalued in terms of other currencies, though the rate at which the rupee-sterling link was subsequently restored prevented the rupee from depreciating to the full extent of the dollar devaluation. Now the rupee is again afloat, this time with sterling. From the official reactions it is clear that the government is not unhappy to have got the opportunity to in effect devalue the rupee without openly appearing to be doing so.

Not that evidence is lacking of the over-valued state of the rupee. As everyone knows, the whole system of export subsidies is today in almost as chaotic a shape as it was in the middle sixties and import licences and imported goods fetch handsome premiums. Importers are stocking imported goods which may be partly responsible for the sharp rise in the non-food import bill without any corresponding increase in industrial production. The tendency to 'over-import' for the purpose of building up speculative stocks was conspicuous prior to the 1966 devaluation of the rupee. But since out-

right devaluation appears to be ruled out — it is, in any case, a double-edged instrument — the only feasible instrument left is a system of dual exchange rates. Apart from its other advantages, a system under which a part or whole of the foreign exchange receipts under different heads can be converted into domestic currency at a favourable exchange rate should be a great help in countering the kind of leakages that now sustain the export of capital and large-scale smuggling into the country. This, however, presumes readiness on the part of the government to view the question of the parity of the rupee in terms of this country's balance of payments problems instead of passively accepting such piecemeal depreciation as results from changes in the values of other currencies — which is what the government did last year and which is what it seems set to do once again.

The Pound Float—I

Exporter in the Lurch

A Correspondent writes:

IT is difficult to understand why the Reserve Bank has chosen to suspend foreign deals in sterling after the floating of the pound. If the past is any guide, the suspension is unlikely to last more than a month or so. As most export bills are of the type in which foreign exchange is realised with a time lag of two months or more, export activity gets thrown out of gear as and when the RBI suspends its forward transactions. If the government and the RBI really think that export activity falls in the priority category any decision that throws it into confusion can have little to commend itself.

The government incurs considerable amounts of expenditure on promoting exports. It spent an estimated Rs 54 crores for such purposes as cash assistance to export, interest subsidy on export credit and grants to various export promotion councils, etc, in 1970-71. It also gave to exporters a sum of Rs 33 crores as duty drawbacks during the same year. If all these disbursements are regarded as desirable for promoting exports, it should be considered equally desirable that the RBI take in its stride the likely losses that it may incur by not suspending forward cover to exporters.

By suspending forward cover the RBI might save a few crores of rupees but the loss to the economy as whole in terms of disrupted export activity is likely to be very substantial indeed. Moreover, in providing forward cover the RBI is running the risk of making losses only in terms of rupees whereas as a result of suspension of forward cover the economy stands to lose foreign exchange. The RBI, whose book profits run into over Rs 100 crores annually, cannot afford to let the fear of making minor losses stand in the way of providing stable conditions for the country's exports.

The Pound Float—II

Shifting Anchor

A Correspondent writes:

THE pound float does bring into question India's own exchange policy. After linking itself to the dollar last August when the US delinked the dollar from gold, Indian policy-makers, by a contrived sleight-of hand, went back, after the Smithsonian agreement, to a link with the pound, in the process devaluing the rupee surreptitiously by 4.5 per cent. The pound float has shown how weak the judgment of the devaluation lobby in the Finance Ministry and at the Reserve Bank on international currency trends is. The Reserve Bank has had to stop forward cover in pound, and the Indian trader has been left to the buffeting in a free international market, while his own hands are securely tied by exchange control regulations.

Despite the last six months' experience, the pound would have to stabilise to a fixed parity system soon — in any case, before the year-end. Given the need to enter the EEC in a strong position (that is, with the lowest feasible parity), it is likely that the pound will revert to its old parity — $ 2.40 to the pound. What should India do then? Clearly the pound is a shifting anchor which provides no safety to the rupee. India should sever its link with the pound, and should seek to appreciate in relation to the pound — at least to the extent of the pre-December parity. It is time India's exchange rate policy should be based on its own interests — and not be tied to international pressures as judged by bureaucrats in New Delhi.

P C Mahalanobis

Strategy plus Data

Savya Sachi writes:

THE death of P C Mahalanobis brings back memories of an exciting era of Indian planning. Mahalanobis was one of the principal architects of the Indian development strategy for about a decade from 1953-54, though his contribution to the improvement of national statistics was scarcely less significant.

Mahalanobis had an initial advantage: he was not an economist primarily. He was a physicist who later made major contributions to statistics, particularly to the theory of sampling. With this background of physics and statistics, he brought a fresh and original outlook on the problems of planning. The inhibitions and the weight of past theoretical work, which might have come in the way of an economist, did not constrain Mahalanobis. He went directly to the root of the problem while framing the Indian development strategy, which has stood the test of time. It has been criticised for its assumptions as well as analytical flaws. These were minor blemishes, however.

That for an economy of the size of India's, with its specific resource base, there had to be an initial concentration on the development of scientific and technological skills and on capital goods industries should have been obvious to a mind unprejudiced by economic theory. It should have been also obvious that simultaneously with the development of the capital goods industries, there should be an upgrading of traditional skills and occupations for meeting the demand for wage goods, which would inevitably rise in the process of development. This emphasis on capital goods and on basic wage goods was an integral part of Mahalanobis's strategy.

The criticism that at least some of his parameters were not right or that he ignored the choice problem arising from international trade may be valid but has far less operational significance in the Indian context. Of course, the very success of the strategy created different types of problems and the emphasis had to shift from giving the economy certain broad directions to the efficiency aspects of development. Anyway, the basic strategy did provide a significant insight into the process of planned development in India. Had the implementation of the strategy been more adequate, even the employment problem might not have become as acute as it has now become.

Mahalanobis generated the impulse for collecting and processing data required for planning. The National Sample Survey was his idea and could have been utilised more purposefully for the planning process had it been properly integrated with the planning machinery. Unfortunately, this did not come about and the Central Statistical Organisation too was not properly coordinated with the National Sample Survey. Still the NSS has thrown up significant data on many socio-economic aspects of development and are the only source for research on a variety of problems.

In the decade of the 1950s and the early sixties, Mahalanobis was a dynamic force in the fields of planning and statistics. The Indian Statistical Institute which he set up and the journal, *Sankhya*, which he started are monuments to his spirit of inquiry, sense of relevance and organising ability. Education was another field in which he held firm views. He was one of the few persons who realised that inequality of opportunity really arose from the educational system more than from inherited wealth.

In the shifting currents of time, one loses perspective on men and matters and all too often significance is attached to the transitory and the ephemeral rather than to the durable and the substantial. But in the correct historical perspective, Mahalanobis emerges as the man who understood the dynamics of socio-economic planning in India.

Belapur-LIC-Banks

The Heart Has its Reasons

AT the annual general meeting of Belapur Sugar and Allied Industries, now under the control of G D Morarka, held in Bombay on June 9, there was a furore of the first order. Apparently a section of the shareholders was not satisfied with the show of hands by which Morarka was re-elected chairman along with another director. A poll followed, the results of which were declared on June 19. The poll attracted total votes of the order of 82,000 of which Morarka and his running mate attracted over 71,000 each. Belapur's total equity runs to over 361,000 shares, of which the voting rights attached to about 22 per cent are held, in more or less equal proportions, by LIC and certain nationalised banks.

Two things are clear from the voting figures. First, Morarka does not have sufficient control over Belapur's equity to keep himself and his nominees in saddle. Second, by abstaining from voting the LIC and the banks — how did they participate in the voting by show of hands? — clearly chose not to disturb Morarka. It is not suggested that they should necessarily have dislodged Morarka, but what *quid pro quo* did they get from Morarka on behalf of the common shareholders who are clearly not satisfied with Belapur's affairs? Neither the LIC nor the banks have cared to explain their posture on Belapur so far. Informally banks say that they went along with the LIC, in keeping with the convention prescribed by the Finance Ministry. As for the LIC representative, he is known to have left the Belapur meeting before the poll!

To turn to the " affairs of Belapur which agitated the shareholders. The company's paid-up capital, comprising 3,61,406 shares of Rs 50 each, amounts to Rs 1.81 crores. Its reserves (general reserve Nos 1 and 2 and development reserve) amounted to Rs 1.20 crores. The sum of capital and reserves at the end of September 30, 1971, stood at Rs 3.01 crores. Against this, Belapur had lent out Rs 1.84 crores — or just over 60 per cent of its capital and reserves.

The break-up of the loans is as follows:

to Changdeo Sugar Mills (purchased by Morarka from Bhiwandiwala) Rs 20.93 lakhs, including Rs 5.93 lakhs interest due;

to Nasik Deolali Electric Supply (under Morarka control) Rs 13.75 lakhs, including Rs 3.75 lakhs interest due;

to Ganesh Flour Mills (in which Belapur holds shares worth Rs 5.15 lakhs) Rs 63.45 lakhs, including Rs 12.61 lakhs interest due;

to share brokers Rs 50.88 lakhs (out of which Rs 18 lakhs are given against pledge of shares — whose shares, pledged by whom? — of the market value of Rs 14.25 lakhs), including Rs 5.33 lakhs interest due;

to sharebrokers on badla transactions (interest free), Rs 23.27 lakhs (interest free), secured by pledge of shares.

to Armstrong Smith, a Belapur subsidiary, Rs 10.34 lakhs (interest due *nil*); and

to others (unspecified) Rs 0.95 lakh, including Rs 0.08 lakh interest due.

Of the outstanding loans of Rs 1.84 crores, Rs 34 lakhs were in the nature of interest-free loans (Rs 23.27 lakhs to sharebrokers on badla transactions against pledge of shares — are these loans or borrowings? — and Rs 10.34 lakhs to the subsidiary, Armstrong Smith, or at any rate the interest due from the subsidiary was waived. Against the residual loans amounting to Rs 1.50 crores, interest due works out to Rs 28-odd lakhs or just under a fifth of the total. The loans by Belapur to Changdeo, Nasik Deolali Electric and Armstrong Smith are in the nature of inter-company investments. Morarka's precise relationship with Ganesh Flour is not clear, but Belapur has an investment in Ganesh Flour and Armstrong Smith has business arrangements with Ganesh Flour, though the commission due from Ganesh to Armstrong "has not been ascertained".

Finally, what are the loans to sharebrokers and what are the badla transactions financed? How are these loans to sharebrokers related to Morarka's acquisition of various companies, including Belapur itself? Note must also be taken of the loans to Ganesh Flour which, according to Belapur's report for 1970-71, are secured to the extent of Rs 56 lakhs by deposit of their "second debentures" as collateral security, of which Rs 6 lakhs are in the name of Armstrong Smith. What is the precise nature of Ganesh Flour's debentures? It is known that under the Companies Act debenture loans are not considered inter-corporate loans. Clearly, this loophole is being taken advantage of. (Incidentally, the key to the loans to Ganesh Flour is the lands the borrowing company holds in Delhi. The lands are worth a fortune; but who has claims on them: sharebrokers, Morarka, Belapur or Armstrong?)

Furthermore, there is the question regarding the ceiling on inter-company investment prescribed under the Companies Act at 30 per cent of a company's paid-up share capital plus reserves. Clearly, this ceiling has been exceeded but the fact is being played down (or obfuscated?). Thus in the notes (to shareholders!) to the balance-sheet and profit and loss account of Belapur for 1970-71, the auditors state:

"The directors are of the opinion that the provisions of section 370 of the Companies Act 1956 have been complied with since *at the time when loans were given* the share capital and free reserves were adequate and as the total loans did not exceed the limit prescribed under section 370 *without taking into account the interest on the loans and the dividend subsequently* declared to be paid out of the general reserves" (emphasis added).

The auditors have, of course, no view of their own on the opinion given by Belapur directors. Nor the bankers to the company. Nor the LIC. The only opinion that matters apparently is that of Morarka, a sugar magnate of western Maharashtra. However inscrutable, the heart has its reasons!

'New Economics'

Facts That Do Not Fit

A Correspondent writes:

THE publication of the UN World Economic Survey for 1971 has come at an inconvenient time for those who have been trying to convince the less developed countries that they have been misguided in their "hot pursuit" of high rates of economic growth. The argument that these countries should now launch a direct attack on the worst forms of poverty, in the process accepting lower rates of growth of GNP if necessary, has rested heavily on the example of the People's Republic of China. In his celebrated "Let Us Stand Economic Theory on Its Head" article, Mahbub ul Haq says: "It appears that within a period of less than two decades, China has eradicated the worst forms of poverty; it has full employment, universal literacy and adequate health facilities; it suffers from no obvious malnutrition or squalor. What's more, it was my impression that China has achieved this at fairly modest rates of growth... In fact, China has proved that it is a fallacy that poverty can be removed and full employment achieved only at high rates of growth...".

It is not surprising that Mahbub ul Haq has been overnight hailed as a new messiah by the governments of countries like India which found in his formulation the perfect excuse for their past economic failures. They could now claim that they had been misled (by their own economists and, worse, by their foreign advisers from the developed countries) into pursuing the wrong objective, growth of GNP, when they should have sought other goals like full employment and a minimum level of living for their people. Now they had seen the light and so the future would be altogether different from the past.

Where does the picture of the Chinese economy, as it emerges from the UN World Economic Survey, fit into all this? According to the official data presented in the Survey, agricultural and industrial production in China rose by 10 per cent in 1971. By what standards is this rate of growth "fairly modest"? Certainly not by those of this country where the growth of national income is unlikely to have been more than 3.5 per cent last year. Similarly, the UN Survey discloses that steel production in China in 1971 was 21 mn ingot tonnes or more than three times ours. Indeed, on optimistic expectations we will crawl to that level of steel output only by the end of the decade, if even then!

So let us stop kidding ourselves. First, let us stop believing that China has achieved full employment, universal literacy and adequate health facilities with "modest" rates of growth — or that we can do so. Second, let us stop telling ourselves that if, as is only too true, our plans have had no impact on the worst forms of poverty it happened because we were engaged in the pursuit of high rates of growth of GNP. The fact is that China has achieved both a very much higher rate of growth and, at the same time, eradicated poverty. The explanation of what China has done, and we have not, is not to be sought in economic theory (whether stood on its feet or its head) but in the political systems of the two countries. China, like other socialist countries before it, has been able to achieve a high rate of saving and, therefore, a high rate of growth; at the same time, current consumption has been equitably distributed so that, even with a smaller proportion of national income devoted to consumption, it has been possible to eradicate poverty, provide adequate health facilities, etc, etc. By contrast, our own political system has stood in the way of the achievement of high rates of saving and investment and, therefore, high rates of growth; and yet, current consumption has been so unevenly distributed that even with a larger proportion of national income devoted to consumption it has not been possible, after 20 years of planning, to provide one-half of the population with the means of bare human existence.

Clearly, what is called for is a change of political systems, not new political slogans or new economic messiahs.

Japan

Commercial Foreign Policy

EISAKU Sato has announced his retirement from premiership at an honourable moment — soon after Okinawa's reversion to Japan after 27 years of American occupation. Sato's eight-year reign witnessed the crest of the economic 'miracle' (there are signs that this might now be tapering off) and relative internal political calm compared to the years of Ikeda and Kishi. In 1970 when the US-Japan Security Treaty was renewed for the second time, even the fiery leftist student groups — which had spearheaded the widespread demonstrations against the first renewal and revision of the Treaty in 1960 and had succeeded, if not in doing away with the Treaty, at least in having President Eisenhower's visit to Japan cancelled and in bringing about Kishi's subsequent resignation from the premiership — could do little to arouse the nation from its slumber over foreign affairs.

At one time it looked like Japan was getting away with the simplest of foreign policies — sheltering under the American security umbrella, keeping mute on almost every international political issue and making as many quick bucks as possible from every possible market, including China which Japan still does not officially recognise but whose major supplier it succeeded in becoming. But this essentially slumberous foreign policy has been rudely shaken by events elsewhere, most of the shocks coming from its 'close' ally, the United States. Last July Nixon announced that he would be visiting China, last August he proclaimed stringent economic measures including a ten per cent surcharge on a wide number of imports, also last August the Indo-Soviet Treaty came into being. Coming one after the other these moves temporarily stunned the Japanese Government. But it soon reconciled itself to making some economic concessions — the yen was revalued, export quotas renegotiated with the United States and promises made to ease import restrictions.

Japan has, however, not essentially changed its outlook on world affairs and still appears to think that it can continue to export indiscriminately to all sorts of markets without worrying too much about the consequences. For instance, it continues to adhere to its 'two Chinas' policy, woos both the Russians and the Chinese in the commercial field and is the main economic beneficiary of the US military vendetta in Vietnam. If this commercial foreign policy is not tempered, the long-term results could turn out to be serious, including a possible cold shouldering by other major powers which would consequently affect Japan's export oriented economy.

Sato's departure does not necessarily mean that there will be drastic changes in foreign policy. Of the four likely aspirants to premiership, two, Ohira and Miki, have been foreign ministers

in previous cabinets and one, Fukuda, is the present foreign minister. The fourth contender, Tanaka, is the present minister of international trade and industry. Since all four have had experience in the conservative mould of Japan's international dealings, the election of any of these four to leadership by the ruling Liberal-Democratic Party is not likely to alter drastically Japan's trade-cum-foreign policy which, after all, is geared to serving the interests of its powerful backers, the Japanese corporations. Yet, it is reputed that within limits, Tanaka would prove to be more flexible than Fukuda, the present ultra-conservative foreign minister, or the other two lesser contenders. (For details about the likely aspirants, see issue of March 4, Gene Gregory, "Factional Struggle for Succession", pp 541-2).

AITUC

In Mourning

Our Maharashtra Correspondent writes:

THE CPI-led AITUC's Maharashtra State Trade Union Committee held its Sixth Conference in Bombay recently after a gap of eleven years (the last conference was held in 1961). The conference was attended by over 400 delegates from all over the state and leading luminaries of the Communist party, including party chairman S A Dange who is also the General Secretary of AITUC and S S Mirajkar, AITUC President, graced the occasion by their presence. Of course, what was discussed at the conference is not known. A report in the CPI journal, *New Age*, referred to the conference, the attendance and the election of a new council of MSTUC along with a new president and a new general secretary. The report also made a mention of the need to take steps to strengthen the trade union movement in Bombay city and the rest of Maharashtra, but gave no details.

The conference appears to have been notable for the report of the General Secretary of the MSTUC on the state of the trade union movement, and the AITUC in particular, in the state. The report is the first official confirmation by the CPI of the decline of communist influence in trade union politics in Bombay city and in Maharashtra. The General Secretary of MSTUC is completely frank in his admission of the total loss of communist influence over the working class. Workers in Bombay and in the rest of Maharashtra, according to him, have lost all "respect and liking" for the left trade unions, particularly CPI-led unions. The CPI and its trade unions have failed to organise workers on organisational and ideological bases; as a result workers have lost all interest in political struggles and no longer believe that in their fight against employers for higher wages, shorter hours of work and other benefits, they are essentially waging a class struggle for the ultimate goal of ending exploitation. As they become less and less conscious of class interests and more and more 'income conscious', they invariably leave AITUC trade unions for other unions which make higher wage demands. Most important, workers have stopped acknowledging the historical fact that whatever they are receiving now — by way of higher wages and other many benefits — have come from the sacrifices made and the struggles fought by earlier generations of the working class.

In sum, what the General Secretary has sharply brought home to his partymen is the grim reality that the communist party and its trade union organisations have been neutralised in Bombay city, where their leadership of the textile workers provided for nearly four decades the inspiration for the working class all over the country. The report has attributed this loss of influence to, among other things, the anti-communist activities of the Shiv Sena and other independent trade union organisations. Here the report loses some of its objectivity and fails to mention what the CPI and its trade union organisations in Bombay have done in the last five years to fight anti-communist forces in the trade union field. It is content with blaming the state government for its failure to solve the problem of closed mills and other major industrial units in Bombay city. The report thus does not go beyond admitting the failure of the CPI leadership to organise the workers on a class basis. It does not state what specific errors of omission and commission contributed to this failure. Its prognostic value, from the view point of the communist trade union movement in Maharashtra, is therefore very limited.

Fertilisers

Better Times

FEW organisations can claim to rank first in their industry as GSFC has done. Its chairman, Jaikrishna Harivallabhdas, ascribes the "substantial improvement from year to year" in production, sales and profit to the "professional and progressive" management of the 10-year-old Corporation. Thus, in 1971-72, despite sharp increases in costs of raw materials (including of naphtha and gas), wagon shortages, blackouts due to war, and lowered retail price of urea, GSFC's gross profits were higher at Rs 14.97 crores (Rs 12 crores in 1970-71), net profit was Rs 3.18 crores (Rs 3 crores), and dividend was higher by 33 per cent. Working efficiency of the plant is high, and the better profitability compared to that of most other units is attributed to lower manufacturing and distributing costs. This operating efficiency is remarkable since in the industry as a whole capacity utilisation has tended to be low and operational hitches have been frequent, so that despite the expanding market and uncontrolled prices of fertiliser, profitability of individual units has been lower than it could be. On the other hand, as with other industries, the protected market and the overall shortage of fertiliser offer little pressure for improvement in efficiency. Meanwhile, consumption of fertiliser is again picking up all over the country and prospects for the industry are good, as is reflected in the 13 pending applications for licences. In fact, notwithstanding the reports circulated over the past three years that fertiliser manufacturers were having to build an extension and distributive network because demand was not rising as anticipated there is little visible evidence of that network. Earlier this year, the government was even threatening that it would re-invoke the 30 per cent compulsory procurement unless manufacturers strengthened their distributive network; and various states, particularly the southern ones, have complained of non-availability of fertiliser.

Indeed, apart from Haryana, Gujarat is the only other state that is 'surplus' in fertiliser — and it will be so as long as intensive cultivation of groundnut does not achieve a breakthrough. GSFC has thus had to undertake rather more marketing activities than most manufacturers. Its extension services network, includes 130 farmers' information centres, experimental trials in the company's and 7,000 farmers' fields, and water, seed and soil testing facilities offered to farmers as part of the promotional effort. Even so, some 42 per cent of the company's fertiliser had to be sold outside the state in 1971-72. Wagon shortages are a significant bottleneck in the circumstances.

How much the lack of regional demand has contributed to GSFC's

efforts at diversification is difficult to say, however, especially since two other major fertiliser units, *viz*, that of Indian Farmers Co-operatives (IFCO) and of Tatas, are nevertheless being planned to be set up in the area. Certainly, GSFC's entry into the petrochemicals field, by its undertaking to set up the caprolactum plant — the first in the country — should prove highly profitable. Caprolactum is used for nylon fibres and has till now been imported. The basic and front-end engineering for the project have been completed, and orders have been placed for both imported and indigenous equipment. Significantly, the detailed engineering is being done in India. But if external hurdles, such as delays in foreign exchange allocation are encountered, the project may be delayed and completed only in the latter part of 1973. This efficient 'joint sector' enterprise, as its chairman chooses to call GSFC, will thus be using its professional expertise to substitute the import of one more item needed by the nylon spinners and weavers in the country. How much of the nylon goes into products of consumption that do not fit into the priorities that should flow out of the *garibi hatao* objective of planning is a different question, however.

Education

Torpor at the Top

A Correspondent writes:

IT is not only the monsoon which has made a late start in many parts of the country. The new academic year which generally starts by now is yet to begin for university students in many places of learning. In Nagpur several examinations have been rescheduled because of the widespread malpractices at the regular session and these are now in progress. In Aligarh and some other places, examinations were earlier postponed on account of riots and for other reasons and are taking place only now.

Mass-copying and the use of other irregular means by students to get through examinations has been a common feature for many years now, and action such as that of the Nagpur university was long overdue. What is curious, however, is that the university has selected for this drastic measure only a few colleges which happen to cater primarily to students from backward communities.

There are other less obvious forms of academic truancy which generally go unnoticed. Some thousands of students will be losing at least one term of their study as a result of the dilatory ways of university authorities or other extraneous factors, though neither universities nor the government seem to be concerned at this. Even though many universities have started the new academic year, this is so only formally. The results of many examinations, held in April and May, are yet to be declared. In Bombay University, which has a reputation for being administered with better-than-average efficiency, results of more than half a dozen examinations were still to be declared when the university formally reopened on June 16. Consequently, the new classes cannot be formed nor instruction commenced. The student is thus effectively done cut of at least a few weeks of teaching. Evidently, to give students their money's worth is not part of our academic ethics.

Way beyond reach for the moment and hopelessly enmeshed with this couldn't-care-less attitude is the question of reform of the system of examinations in Indian universities. Not only is the system academically unsound, it cannot even be administered properly. Three months of the summer vacation are not enough to complete the full process of examinations as it is organised now. None of the universities has taken even the preliminary steps towards reforms of the examination system. Even at Nagpur, there has been no move towards a permanent solution to the problem. Nor are governments inclined to lead the way. Yet the Education Commission, and several other inquiry commissions before it, had underlined that reforms in the system of examinations are the single most important piece of reform most urgently needed on our campuses.

LETTERS TO EDITOR

Foreign Investment

YOUR correspondent who wrote the short note on foreign investment (June 17, p 1164) must be either very simple-minded himself or he was taking your readers for a ride.

In answer to his own question "what is a foreign business?", he suggests that a foreign company is here defined as one in which more than 50 per cent of the equity is held by foreigners because "the government is concerned with the outgo of foreign exchange on account of repatriation of dividends". If dividend repatriation were the government's only concern, why is preference capital omitted while calculating the proportion of foreign-held equity?

The reason why only equity capital is considered while determining the foreignness or otherwise of a company is that what is material is not the dividend remitted abroad so much as control over management. Only babes-in-arms will believe that all the return that a foreign company gets on its investment in India is what it gets in the form of dividends. What about royalties, technical payments, head office charges, licence fees, etc, etc, for use of the parent company's knowhow, patents, brand names, trade marks and what have you? Further, what about the pricing of equipment, intermediates and raw materials purchased from the parent company and of things sold to it? Over-pricing the former and under-pricing the latter contribute no less handsomely to the returns from investing in India than straight-forward dividends (though these themselves are not exactly chicken-feed). And what makes it possible to fiddle with these prices or to invent multiple excuses for making payments to the parent company is *management control* of the Indian company.

And for management control the foreign company certainly does not need to hold over 50 per cent of the equity capital of the Indian company. This is a lesson which capitalist Japan took to heart very early and which socialist India has not even begun to learn. As a reviewer pointed out in your own columns: "Japanese have permitted an influx of $ 4.4 billion of foreign capital investment, but of this three-fourths was in the form of local capital. Of the total equity, only one-third ($ 312 million out of $ 944 million) was with management participation (rigorously defined). Unlike in India where upto 49 per cent is not considered as controlling equity, in Japan anything above 7 per cent for a foreign company or 20 per cent of unrestricted indents and 15 per cent of restricted indents are defined as constituting management participation" (Baldev Singh, "Foreign Technology: Role and Control" November 20, 1971, p 2354). To simplify for the benefit of your correspondent: it is management control, not dividend payment, that matters. Once the foreign company has it, everything follows.

As for your correspondent's paens of praise for foreign business for introducing mass marketing in India, what is this mass market he is talking about? How many of the consumer goods the foreign companies sell in India can be bought except by the top 5, 10 or at the most 15 per cent of the country's population? And what proportion of the sales of any of the companies listed by your correspondent is actually made in the rural areas where the *mass* of the Indian people still lives? "Mass marketing" and "rural penetration" are fine words to throw about when all you are really after is the easy-to-get middle and upper middle class urban consumer who falls for a toothpaste because it has a coloured stripe running through it or for perfectly ordinary lozenges which can be — and in this case *are* — made by any Indian company with a saucepan or two because they are claimed to be 'mentholated'.

Your correspondent says, referring to Indian business, "we are too accustomed to being over-protected", thereby suggesting that foreign companies scorn protection and thrive on competition. Indeed! Aren't the foreign companies in India as much protected against imports as is Indian business? Isn't it the spectacle of a market virtually completely protected against competition from imports which lures most of them here in the first place?

Finally, your correspondent justifies the production of socially worthless products on the ground that if they were not produced here they would be smuggled into the country. Now, if prevention of smuggling were the only consideration, there is a straightforward way of achieving the objective — allowing import of the items concerned. If this is not done it is because we feel we have better use for the foreign exchange that will be spent on these imports. The same consideration is relevant to domestic production of socially worthless goods: we have better use for the resources that will need to be invested in their production. The argument applies with far greater force to foreign capital whose investment in any industry has to be doubly justified in terms of social priorities.

A READER

Bombay

Ripple and Wave but Not the Tidal Current

FARRUKH Dhondy's reports from London usually stand out in *Economic and Political Weekly* as being refreshingly readable. But his 'review' (December 25, 1971, pp 2549-50) of V S Naipaul with special reference to his latest novel, "In a Free State", was, I think, unnecessarily obtuse, often unjust and what is worse, self-congratulatory.

Granted it was not a literary review, but what in fact was it? An attempt to measure the novel against a Marxist slide-rule? No, not really. It appeared to ask of a writer the supreme moral/political vision of "that ultimate sympathy of sight from a novelist for the people he is talking about ... insights into the social crucibles of their being", in a form which suits the "essential creation" and "the changing myths of his time".

First of all, the reviewer flits from a consideration of Naipaul the writer (journalist, historian, novelist) to his latest novel. This in itself creates some confusion. Why should Naipaul as novelist, be compared to Frantz Fanon and Aime Cesaire? Both of whom as the reviewer admits, were rhetoricians with a cause. Were he to come right out and condemn Naipaul for writing novels at all, for not being a straightforward rhetorician—the point would be better made. As it is, the review is clotted with long metaphors about white-skinned Miss Jamaicas, ball-games and mistresses hanging about in the wings. Why does he fight shy of stating clearly what kind of writing Naipaul should be doing? I had the same exasperated reaction to the language of the review, as Farrukh Dhondy has to Naipaul. What kind of outmoded literary tradition was the critic waffling with?

Accepting the fact that Naipaul set out to write a novel and not a thesis, he must be commended for experimenting with the form: three stories of expatriate experience, within the statements of a personal diary which stops short of dialectics. (Actually a well known English writer objected to Naipaul being awarded the 1971 Booker Prize for fiction. In his view, "In a Free State" was not, strictly speaking, a novel.)

I don't agree that the inclusion of characters from a Chinese circus visiting Egypt, should be "tantamount to an admission that he (Naipaul) has no way of dealing with the creatures of this new creation", i e, of our times. These "creatures" are not just political demagogues. To my mind one of the points Naipaul is trying to make (and the lines quoted in the review echo it) is that the Chinese more than other groups, carry an enviable self-sufficiency. They hardly seem to suffer the pain of a cultural vacuum when transplanted.

It's true Naipaul lacks the temperament for blood and thunder and tidal waves in his language. But that's not to say he lacks insight in depth. Nor do his books all read like comedies of surface manner. Is he too subtle for the reviewer, doesn't he make his sympathies obvious enough? What about the epilogue in "The Loss of El Dorado"?

Exactly how much compassion and understanding Naipaul has for his characters is perhaps a personal, subjective assessment. I happen to think it's considerable. Farrukh Dhondy claims to have more. "If we understand his characters better than he does, as I feel I understand Santosh and the other benighted of 'An Area of Darkness' ..."

Surely the second story of "In a Free State" captures particularly well, the "essential antagonisms" that have shaped the soul of the West Indian immigrant in London. It is a deepening of the insights less of "Miguel Street" than of "The Middle Passage —the Caribbean Revisited". This book the reviewer has chosen to ignore.

The title of the story "Tell Me Who to Kill" is what Farrukh Dhondy also demands of Naipaul. Why? Because expatriates like him are Naipaul's essential audience and they have sometimes asked themselves this question. ("We, the expatriates he's talking about ...") Does "we" mean other expatriates who are well-anglicised and apparently self-exiled? Does the category mean only Indians or does it include English expatriates like Bobby and Linda of "In a Free State"? Or does it somehow include the under-educated exiles for whom economic necessity narrows the choice: Indian, West Indian, Irish, *et al?*

If anything, expatriates appear to be Naipaul's essential subject, not audience. And which of them is he supposed to rally round the flag? Frantz Fanon and Aime Cesaire spoke initially for the fellow blacks of Martinique. Fanon went on to become a spokesman for the colonial Third World, but Cesaire sold out to France. Martinique is still French. Besides it was their experience as blacks in a French colony that heightened their anguish. (Refer also to V Subramaniam, "Why are the French-Speaking African Elite Different?", January 22, 1972, pp 146-8.) Naipaul is the product of a relatively secure community in a British colony which graduated to independence. How can he be expected to rage *a la* Fanon? Or should he raise the banner of 'Brownitude' in present-day England?

As for who to kill, the reviewer even after reading Fanon and Cesaire, only comes away with the "feeling" that they know. They don't actually tell him, it seems. One gets the "feeling" that Naipaul being another 'Indian' expatriate, is somehow ripe for attack. He doesn't provide a certain explicit, ideological/emotional deluge which in itself often serves to salve the reader's conscience and purify it.

Almost as though to compensate, the review reads a bit like instant, do-it-yourself catharsis.

Bombay SUSHMA KUMAR

Kissinger in Peking

Dhananjoy

ALTHOUGH the declared objective of Kissinger's third visit to Peking was to discuss issues of bilateral relations between China and America, it is obvious that it was intended primarily to carry conviction to the Chinese leaders that whatever Washington might do with Moscow, it would not hurt the "legitimate interests" of China. In fact, the White House appears to be quite keen to periodically reaffirm that it now recognises China as the third Super Power which deserves as much of attention and respect as does the Soviet Union.

In some ways, Moscow still remains the more important capital for Washington. For one thing, the military equation between the United States and the Soviet Union is of an entirely different order. And the proper management of Soviet-American relations is still far more important than any other item on the agenda of American foreign policy.

Yet the old objective of Soviet-American co-operation to contain China and to preserve a duopolistic world order, which was vigorously pursued by the Johnson Administration, appears to have been given up as unworkable. What is more, in spite of its apparent weaknesses as a Super Power, China is being treated by the United States with just that additional bit of respect that makes all the difference between the status of the middle powers, on the one hand, and the Super Powers, on the other. In brief, the creation of a stable triangular arrangement among China, Russia and America seems to be the main objective of Washington today and, in this sense, Nixon can legitimately claim to have brought about a fundamental change in American foreign policy.

The change, however, is more the result of the inevitable tendency of any major power to try to adjust to new realities than of any great personal insight of the American President. The Chinese had very successfully prevented the crystallisation of the idea, that had been floating ever since the days of Khrushchev, of China being the great threat to world peace, so that only coordinated effort by the two Super Powers against its war-like tendencies could ensure peace in the world. Peking successfully conveyed the message to all Western capitals through various channels and diverse methods that whatever might be the foreign policy pronouncements of China, it was in fact far more cautious in handling issues of war and peace than most established powers in the world.

The two instances often cited as evidences of China's aggressive intentions, namely, the Himalayan war of 1962 and Peking's support to North Vietnam, were not conclusive enough proof of any Chinese misbehaviour. More than any others, Western analysts themselves seemed to accept without much reservation the Chinese version of what happened along the Sino-Indian border in 1962. The assumptions of the Johnson Administration that China was the real force behind what was happening in Vietnam proved to be equally unfounded.

Besides successfully living down the reputation of being an aggressive power, China also increased its value in Western eyes by repeatedly demonstrating its potentiality as a force to contain the Soviet Union, particularly in Asia. This was done at a time when the power, prestige and influence of the Soviet Union was expanding much more than what the United States had been mentally prepared to concede as part of its scheme for Soviet-American co-existence. Having occupied the White House after all these developments, it did not tax Nixon's genius much to discover that a basic change of strategy towards the two major Communist powers was called for.

Simplistic

By now, the shape and contours of the new model of American foreign policy are clear. It is still pertinent, however, to raise the question whether in many ways the current experiment is not as simplistic in perception as the one that Nixon's predecessors in the White House had tried out.

For one thing, the stability of a triangular balance will at least partly be a function of the state of Sino-Soviet relations. For the implementation of the American model, it is important that relations between the Soviet Union and China improve to a point where they agree to co-exist without in any way co-operating between themselves. Should Sino-Soviet relations improve to a point where these two powers can co-ordinate their foreign policies, the situation would be as disturbing for America as it would be if there was continued tension and possibility of conflicts between them.

It is not surprising that Nixon is reported to have raised the issue of Sino-American relations during his visit to Moscow. In some ways, the improvement of Sino-American relations would itself provide some impetus to the Soviet Union to improve its own relations with China, and Nixon's ploddings may have been uncalled for. But he will still have to face many uncertainties in regard to bilateral relations between the other two Super Powers. Sino-Soviet relations are not determined by exactly the same considerations as Soviet-American or Sino-American relations. The fact that both these powers profess to be Communists adds a dimension to Sino-Soviet relations which the American foreign policy-makers may be unable to grasp. Because of the importance of ideology in their respective foreign policies, China and the Soviet Union may find it necessary to evolve a relationship which is either more or less cordial than what suits the needs of American foreign policy.

The real weakness of the Nixon-Kissinger model, however, is precisely of the same kind that was inherent in the earlier Johnson-Rusk model. The world is far too complicated a place to be managed by two or three, or even five Great Powers. There is a requirement in the concept of a triangular balance, as much as it was in the concept of a bipolar system, that the Super Powers should assure each other that their legitimate interests would be best preserved through the maintenance of a minimum degree of accord among themselves.

A corollary of this is that in case there are any crucial contests between any of the Super Powers, on the one hand, and a lesser power, on the other, the other two should display an adequate concern for the protection of the legitimate interests of the concerned Super Power. This indeed is the principle that Nixon has been trying to invoke in his contest with Vietnam. In return, he has indicated his readiness to promote legitimate Chinese interests *vis-a-vis* India. His policy towards Bangladesh could only be interpreted in these terms.

But the results in Bangladesh and Vietnam have not been encouraging from the American point of view. And if any proof was needed of the virtual impossibility of creating any Super Power accord which will be so wide-ranging as to deny all political, military and diplomatic initiatives to the lesser powers, Bangladesh and Vietnam have already provided it. The fact is that the current model of American foreign policy is as simplistic as the earlier one and much as it may succeed for a while in making American foreign policy appear successful, its long-term consequences could be as destabilising as were the consequences of the concept of Soviet-American *entente*.

Indigenous, at Any Cost

Hansavivek

ESCORTS has represented to the government and to the Agro Industries Corporations, who have contracted to import tractors under World Bank aid, to permit Indian manufacturers to quote against tenders issued by them with a price preference and not to restrict their global tenders to foreign countries. The company's president, H P Nanda, observes that before the Tractor Distributory Control Order came into force towards the end of last year, the figures of actual demand for tractors received from various ministries, Planning Commission, etc, showed a varied and large demand on the basis of which government issued several industrial licences for multiple brands of tractors. This, Nanda feels, would lead to problems in maintenance and spare parts availability to Indian farmers. Nanda also says that the recent tenders under the World Bank Aid had revealed that the imposition of a levy on completely built-up imported tractors and the constant rise in costs of production in the western world have made tractors produced in India almost 20-30 per cent cheaper than the prices quoted by well known foreign manufacturers. In spite of 'indiscriminate' licensing of several manufacturing units, Escorts' joint venture with Ford is the first and the only unit in the private sector that is in actual production. Nanda advocates imposition of higher customs duty on import of completely built-up tractors and comparatively lower duties or no duty on the imported content for the indigenous tractors.

Government has permitted Escorts to import additionally from Poland engine components to enable it to manufacture upto 12,000 numbers of yet another new model of tractors during the fiscal year 1972-73. This would put the company on a firm footing to attain better quality production and higher profitability, with none or very little increase in tractor prices. The retail selling prices announced by government in February last would leave the company with a 'reasonable' margin and enable it to introduce an improved new model with water-cooled engine and many new features which could not be introduced earlier because of the 'unremunerative' retail prices. According to Nanda, the company was 'out of pocket' on every Escort 37 tractor sold, which led to a drop in its

profit in 1971. As a result of the heavy influx of imported tractors from East European countries and under UK credit, Escorts' own production of tractors dropped by over Rs 5 crores as compared to in 1970. With the fall in earnings, despite a small rise in total net sales, the company lowered equity distribution by 2 points to 11 per cent, which was covered 1.34 times against 1.79 times in the year before.

Among Escorts' other manufacturing lines, the piston and piston-pin plants improved their sales. Sale of bi-wheelers was also higher, though profitability was lower on account of increase in cost of raw materials and wages. There has been an overall increase in sales of automatic shock absorbers railways ancillaries and heating elements. The new range of industrial equipment, known as 'yellow line' introduced last year, holds good prospects. Sales of X-ray machines were marginally lower owing to curtailment of purchases by government hospitals and unloading of heavy stock by competitors. The activities of the electro-medical division are intended to be diversified by adding manufacture of industrial X-ray. The company expects government permission for production of pistons and piston-pins by one million pieces each, per annum. Negotiations are being carried on with the collaborators, Mahle Komm of West Germany, for supply of plant and machinery. The new plants, to be located in Bangalore, should be operative within the next two years. Export sales of Escorts International Division increased last year from Rs 40 lakhs to over Rs 80 lakhs. Major items exported were garments, textiles, radios, leather goods, blankets, castings, etc. It is proposed to set up a joint venture for production of some of the company's products in Malaysia.

BLUE STAR completed the second phase of expansion last year by increasing the manufacturing floor area by 39 per cent. This would permit further diversification in product range and enable the company to set up substantially its own production this year. With all the operating divisions maintaining satisfactory growth rates, Blue Star achieved good results during 1971, — with a 40 per cent jump in gross profit at Rs 42 lakhs, following less than 16 per cent rise in sales at Rs 940 lakhs. Equity dividend, maintained at 12 per cent, is covered 2.4 times. The performance of the machine tool department has been encouraging, and the principals have agreed to extend the company's franchise to cover the additional territory of Northern India. A new service centre was set up at Indore. Last year, the company executed a turnkey contract for air-conditioning Malaysia's largest integrated textile mill. Another contract of a similar nature has been secured for a textile mill in Sudan. An agreement has been concluded for export of manufacturing knowhow to Kuwait for production of water coolers.

ANTIFRICTION BEARINGS CORPORATION has been sanctioned a foreign currency loan equivalent to Rs 117 lakhs by ICICI to meet part of the cost of imported capital goods for the expansion project. The company also expects a foreign exchange loan of Rs 55 lakhs and a rupee loan of about Rs 45 lakhs from IFCI. To meet the balance rupee cost, additional equity shares of Rs 70 lakhs are being offered to shareholders as rights on a one-for-one basis. The technical and financial collaboration agreement for 10 years entered into by ABC with Steyr Daimler Puch AG, Austria expired in March last. The management is examining the manner in which technical collaboration arrangements can be extended for the future. Having achieved full productive capacity in the preceding year, the company maintained production levels during 1971. Net sales increased by Rs 7 lakhs to Rs 137 lakhs, but gross profit declined by Rs 3 lakhs to Rs 42 lakhs. The chairman, C C Desai, observes that the raw material position continues to cause anxiety with the sudden stoppage of US aid. Non-availability of adequate foreign exchange for the required currency area affects production. Various sizes of tubes are required for production of bearings and lack of any one item affects the final assembly of bearings. He also feels that the shortage of raw materials might continue despite the establishment of the proposed steel bank.

WARNER-HINDUSTAN recorded a significant increase in sale of all product lines during 1971. Net sales expanded from Rs 401 lakhs to Rs 536 lakhs, but gross profit edged up by a mere Rs 2 lakhs to Rs 120 lakhs. Contraction of margins is attributed to the cumulative effect of the Drug (Prices Control) Order, increased wages, rise in material prices, increased fares and transportation charges, and higher burden of taxes. Dividend was maintained at 9 per cent on the capital as enlarged by the issue of bonus shares on a two-for-five basis. The entire dividend is exempt from tax and is covered five times by earnings. K Mayadas, son-in-law of another director, C C Desai, has been re-appointed as whole-time director for 2 years from May last on a salary of Rs 4,250 per month plus various perquisites.

Indian Council of Social Science Research, New Delhi

The I.C.S.S.R. invites applications for doctoral fellowships in Social Sciences, tenable for two years, from persons preferably below the age of 30, who have a first or second class Masters Degree of a recognised university in any Social Science discipline. Preference will be given to students who have already done good deal of work and are likely to complete their thesis in a period of not more than two years.

The fellowship carries an emolument of Rs. 300/- per month besides an annual contingent grant of Rs. 1000/-. The college and university teachers will however be given their own pay and allowances upto a ceiling of Rs. 900/- p m.

Applications in the prescribed form which can be had from the Council's office should be sent to the Member-Secretary, Indian Council of Social Science Research, Indraprastha Estate, New Delhi, so as to reach him not later than 15th August, 1972.

J. P. NAIK

India-Pakistan Detente?

Romesh Thapar

WHATEVER the repercussions of the Simla Summit, it has served to underline the need for sustained and perspective thinking on the future of our subcontinent. Too long have we assumed the inevitability of collision, conflict and confusion. Too long have we refused to assess the grave damage such strains and tensions cause to our common interests. Slowly, a new consciousness is beginning to percolate into the thinking of policy-makers in Delhi, Dacca and Islamabad. It remains to be seen whether the summitry now engaged upon will make possible the breakthrough to understanding and friendship.

Interestingly, it is again Indira Gandhi who perceives the critical moment for the subcontinent's politics. So many of her open supporters and hidden detractors, inside the party and outside, continue to think within the old frames of reference. They pontificate about the dangers of 'weakness' and 'compromise'. They see a sinister potential in the 'brainwashing' of a number of our editors who have visited Pakistan since the rise of Bangladesh. They excite themselves about the dangers of a 'sell-out'. They do, in fact, underestimate the lady.

The trouble with so much of the commentary on Indo-Pak relations, within India and outside, is its failure to perceive the fundamental and qualitative change that has taken place in the balance of power on the subcontinent — and, for that matter, in South Asia. Only Indira Gandhi understands that it is no longer possible for foreign powers and out-of-context Islamic ideologues to manipulate Pakistan as a threat to India. At the most, they can delay the inevitable *detente* on the subcontinent. That is why, presumably, she overshadows all the political operators around her.

Changed Balance

Indira Gandhi speaks from a position of immense strength. The rise of Bangladesh has smashed the archaic concept of the so-called 'two-nation' theory. Pakistan, as a so-called Muslim state, is smaller than Indonesia and Bangladesh; indeed, India embraces more Muslims than does Pakistan. Then, again, the military strength of India today is adequate to take care of a Pakistan re-armed by the US, should such an eventuality arise. As for China, the knowledgeable know that her military machine in Tibet would rather not tangle with our mountain divisions in the Himalayas. Finally, India genuinely desires a viable and prosperous Pakistan on her North West as against a number of soft states; actually, it is in her national interest to work for such an objective.

While the Prime Minister possesses these balanced and perceptive understandings of the future, it is a pity that the education of the senior cadres of the Congress Party is so faulty and inadequate. So often, Congress 'leaders' sound like Jan Sanghis of the old variety — for even the Jan Sanghis are in the throes of reassessments. Something of the new understanding of India's interests in South Asia has to be projected urgently. The mass media are, as always, incapable of comprehending and projecting the qualitative change that has taken place in the situation.

All this is very unhealthy. In the course of the *detente* on the continent, complex situations are bound to arise. Apart from Pakistan's postures, our relations with Bangladesh are fast emerging from the euphoria which has so far enveloped them. Big power attitudes will also undergo sharp changes. Our public is essentially unprepared for all this. In other words, we have to move from the *cliches* of politics to more studied debates and dialogues. We must grow with the situation that is growing around us.

With some such thoughts, Indira Gandhi on her return from the Summit will take a good look at her Council of Ministers. The pointers suggest a far-reaching shake-up; indeed, one leading editor, with a nose for news, even reports an impending change at Rashtrapati Bhavan! There are reports, and there are prompt denials. Delhi keeps on speculating — and with the usual unabashed air of authority.

The fact remains that no one knows. The speculation underlines the hopes of the people. And, it's clear they are tired of incompetence, jobbery, corruption, perspective-less policies, stoogey ministers, fixers, and what have you; the list is long and tedious.

Will Indira Gandhi oblige?

June 26

FROM OUR CORRESPONDENTS

NEW DELHI

Reassuring the Private Sector

THE Planning Commission and the Industrial Development Ministry are currently engaged in parallel exercises on revising the Industrial Policy Resolution of 1956. The scope and objectives of the proposed revision are still far from clear. The idea is that by the time the Approach document on the Fifth Plan is ready in the middle of September, problems connected with a restatement of industrial policy should be sorted out so that it would be possible, if still considered necessary at that stage, to come out with a revision of the Industrial Policy Resolution.

The exercises on the revision of industrial policy consist broadly of two parts. The first part deals with issues connected with the Industrial Policy Resolution of 1956. The second part takes into account various operational policies like industrial licensing policy, the regulatory framework of the Monopolies and Restrictive Trade Practices Act, import policy and policy on foreign collaboration. The purpose is to outline the objectives of any change in the Industrial Policy Resolution and the the need to provide a more definite focus to some aspects of the resolution. As regards operational policies, the primary emphasis is on avoiding overlapping of functions between industrial licensing and MRTP regulations and on giving a clearer exposition of the role of the larger business houses in industries other than those falling in the core and heavy sector and in developing backward areas. The other operational problem to which attention is drawn is selectivity in industrial licensing and the different aspects of the joint sector concept.

The main interest of the Planning Commission in initiating these exercises stems from its proposals to organise a greatly expanded works programme to give employment to large numbers, particularly in the rural areas, and its basic minimum needs programme as spelt out in its document "Towards an Approach to the Fifth Plan". Implementation of these programmes on the scale envisaged will require certain modifications in the pattern of industrial investment and production. Greater emphasis will have to be laid on production of cloth, sugar, essential drugs and other similar mass consumption goods as well as on industrial inputs that would be needed to support the programme of rural employment such as rural electrification, roads and the like. It is suggested, in view of this, that the public sector will have to play a much larger role in expanding these industries as well as in bringing down manufacturing costs and prices of such goods and services.

At the same time, however, considerable concern prevails in the government and Planning Commission over the industrial stagnation in which we are caught. The development of basic industries particularly has come to a standstill. A way has to be found to make it possible for the government to ensure expansion of existing units in this sector. In some of these industries like steel and aluminium the quickest and the cheapest way of expanding capacity and production would be through the expansion of the existing units. It is argued that the fact that some of these units are controlled or owned by the larger industrial houses should not come in the way of the economy benefiting through their expansion. The problem thus is how and in what manner this expansion should be brought about without coming into conflict, or appearing to come into conflict, with the principle of preventing concentration of economic power. The Industrial Policy Resolution should take this problem into account and spell out the exact position of the government.

Not Worked Out

While discussing these matters, however, other problems have been posed. It is pointed out, for instance, that the physical programmes, the order of investments and other measures required to match the basic minimum needs programme proposed by the Planning Commission have yet to be worked out. Only after this task is completed would it be possible to visualise the directions which industrial policy might have to change. Also, the essential problem is not whether production to serve the requirements of the minimum needs programme should be organised in the public or the private sector. The real problem is that of tackling the accumulated problems of some of the established industries like textiles and sugar and their rehabilitation and modernisation. The primary objective of providing cloth and sugar at reasonable prices will obviously not be served unless there is a major programme of revitalising these industries. This would involve not only substantial investment but also provision of such inputs as technology and management. Rather than making substantial new public sector investments, strong public sector initiative may be needed for reorganising these industries.

As regards expansion of existing units, the question would have to be considered on a case-by-case basis. The present extreme dependence on the larger industrial houses to provide the momentum in various industries would have to be got over. One way would be for the government to join in partnership with competent managers who, on their own, may be unable to initiate new projects because of paucity of financial resources. An institutional arrangement to provide initial equity to successful managers could be devised. The idea mooted is that a new professional agency might be developed which will take the place of the old managing agency system to provide initial capital for the setting up of joint ventures in association with new entrepreneurs. As regards bringing down costs and prices, the existing variety in consumer goods may have to be reduced by introducing a measure of standardisation. This is particularly relevant in the case of textiles and drugs.

While discussions on industrial policy along these lines are going on, the Planning Commission has set up working groups to work out the pattern industrial production which will meet the requirements of the minimum needs programme. In this light, another paper is proposed to be prepared which will identify the basic issues of industrial policy for further consideration by the Economic Policy Committee of the Cabinet.

From the background note and the discussions on it within the Planning Commission and the Industrial Development Ministry, it is obvious that the exact scope and nature of revision of the Industrial Policy Resolution is not at all clear. What stands out is that there is only a general urge in favour of revision, largely to make an impact on the public mind rather than because of any compelling reason for making the changes. The orginal Industrial Policy Resolution of 1948 and its revised version of 1956 are so comprehensive that they can easily accommodate all the new ideas that are currently entertained or are being canvassed. The most noted of these ideas are the entry of the public sector in a big way into consumer goods production and the introduction of the joint sector in the heavy industry sector in association with the larger industrial houses. Both easily fall within the scope of the existing Industrial Policy Resolution. It is certainly not necessary to revise the Industrial Policy Resolution in order to reflect the right priorities and to make it obligatory for the public sector to enter certain lines of production instead of leaving this optional as at present. The same applies to the joint sector concept.

After all, these ideas had been incorporated in industrial policy as far back as the time of the formulation of the Second Plan, which provided the occasion for amending the 1948 Industrial Policy Resolution in 1956. While reserving the setting up of new units for the production of capital goods and heavy machinery in the public sector, scope was left in particular cases and in certain circumstances for undertakings owned and operated jointly by the government and private enterprise — that is the joint sector. While a vast field in industry was left free for private enterprise, it was also envisaged that the government would not hesitate to intervene whenever the progress of industry under private enterprise was unsatisfactory. This covers the entry of public sector into production of consumer goods on any scale that may be considered desirable or necessary. The Approach to the Second Plan had also recommended that where government assists private enterprise substantially by providing long-term finance, this should take the form of equity participation rather than loans on fixed interest. The present exercises at revising the Industrial Policy Resolution may thus end without achieving anything and may be ultimately dropped. The idea to revise the industrial policy resolution was canvassed at the time of formulation of the Fourth Plan and was later dropped.

The real issue in any move to revise industrial policy, as distinct from tackling the problems connected with its operation, is that the government's policy on the functioning of the mixed economy and the role of the private sector, particularly the larger houses, is not clear. In spite of much radical posturing and pledges of socialism, there is in fact no departure from the concept and practice of mixed economy as defined in the 1948 Industrial Policy Resolution. Any significant departure in a radical direction must bring in the question of nationalisation and elimination of private ownership, at least in the heavy and basic industries. The government and the Prime Minister herself have always been at great pains to rule out any extensive nationalisation. The idea of converting into equity loans advanced by financial institutions to private industry, which could be a way to change the ownership pattern of existing units, has been greatly toned down and is being applied with great circumspection. In this light where is the need for going in for any revision of the Industrial Policy Resolution unless it is desired to impress the people that changes in industrial policy are being made?

But while there are no indications of revisions of a radical nature in industrial policy, there appears to be another hidden motive behind these moves — to restate old policy, with some wordy, formal changes, with a view to reassuring the captains of private industry and business. The 1948 Resolution was brought up precisely with that purpose and in circumstances somewhat similar to the present ones. Prior to the introduction of that resolution there was great uneasiness in business circles over the populist stance of the ruling party. This had led to depression in industrial activity, reluctance to make use of official financial assistance and all other features of absence of confidence on the part of business and industry.

This crisis of confidence had become particularly marked after the resolution passed by the All-India Congress Committee towards the closing months of 1947 on "Objectives and Economic Programme". The resolution had called for a ceiling on incomes along with one on land ownership. It recommended that industries producing articles of food and clothing and other consumer goods should be in the small-scale sector and, to prevent competition from larger units it was suggested that, the competing large scale industry should be brought under strict government control. The state was to reserve to itself all new undertakings in defence and in key industries as well as public utilities and new undertakings which might be in the nature of monopolies. In addition, and this was most important, the resolution proposed that a process of transfer from private to public ownership of existing large undertakings should be started within five years.

An outcry against the resolution went up in industrial and business circles, and it was to reassure and restore their confidence that the 1948 Industrial Policy Resolution was presented and repeated assurances were given that the government was not contemplating take-over or nationalisation of existing undertakings — assurances which were given once again after the nationalisation of the 14 commercial banks. It could be that behind the move to re-state the Industrial Policy Resolution there is once again the anxiety to reassure the business community and industry in the hope that this would revive industrial activity. Now that political stability has been restored, the government may be thinking that it is in a position to offer such reassurance.

Syndicate Bank

THE year 1971 was one of all-round progress for Syndicate Bank. During the year the bank opened 46 branches of which 34 were in the bank's Lead Districts. Of Syndicate Bank's 507 branches at the end of 1971 nearly one-half were located in the Lead Districts. In as many as 210 centres in the country Syndicate Bank was the only bank operating. Only 76 of the bank's branches were located in metropolitan centres. For 1972 and the next t years Syndicate Bank, has a larger branch expansion programme.

Syndicate Bank's deposits increased by 30.3 per cent to Rs 219 crores from Rs 168 crores at the end of December 1970. Advances increased by nearly 24 per cent. On December 31, 1971 total credit disbursed was Rs 152 crores against Rs 123 crores at the end of December 1970. Advances to priority sectors increased from Rs 57.5 crores to Rs 64.6 crores. Advances to the agricultural sector increased from Rs 17.3 crores to Rs 19.8 crores. There were nearly 10,000 small-scale industry accounts who had availed of total advances of Rs 17.9 crores.

The Syndicate Bank completed Lead Bank Survey of 6 districts in 1971. The bank has not only opted for the relatively backward unbanked centres but has also encouraged other banks, both nationalised and non-nationalised, to come forward to open branches in these centres. It convened meetings of bankers and officials of the various government departments in each of the district to discuss the development programmes of the districts.

Strategy for Mineral Exports

D C Kale

IN the context of the generally worsening terms of trade of the developing countries, who are also primarily exporters of unfinished goods, ores and minerals, much thought has to be given to discovering ways in which better terms can be obtained for these exports.

The US, at one time almost entirely self-sufficient in, or even a net exporter of, minerals, became a net importer of them after World War II; in 1970 US imports exceeded exports by nearly $ 4,000 million. Similarly, Japan and West Germany have been importing ore or ore concentrates on an increasing scale. The trend is towards establishing long-term sources of supply, the period often stretching to 20 years or more and sometimes including the four or five years that it takes to bring a major new mine on stream.

Such contracts, however, are not restricted to purchases from the developing countries alone: Japan, for example, has entered into a 26-year contract with the US for supply of uranium oxide, and West Germany has long-term smelter concentrate contracts with Canadian suppliers. Economically advanced countries which earn large revenue through the export of ores and concentrates, are Sweden, Canada and Australia. The USSR may soon be counted among them. Even among this group of countries, a re-evaluation of the policy of mineral exports has been going on. The Australian minerals policy, for instance, has been the subject of hot debate there during the past two years. While major export orders for iron ore have been yielding valuable foreign exchange, the Australian Government has been in favour of processing the ore indigenously to the maximum possible extent. The developing countries too will face a similar choice as their industrial capabilities increase. Meanwhile, as exporters of minerals and ores, both the developed and the developing countries have an interest in ensuring markets and stable prices.

In a paper, "Monetary Disorder and World Trade", brought out in April, George Bolton, Chairman of the Commonwealth Development Finance Company, has gone into the related problems faced by developing nations. Bolton sees the problem as having three main aspects: the massive dollar surpluses (now inconvertible) of Europe and Japan, the weakness of commodity prices, and the plight of developing nations. He suggests, therefore, that a stockpile of primary commodities be built up by national or multi-national authorities; the purchases be mainly from the developing countries; and that these be financed exclusively out of the dollar surpluses from the Exchange Equalisation Account and not by taxation or borrowing. The stockpiles should not be used to meet current needs except in emergencies. And he suggests that monies be advanced against warehouse certificates, etc. All the base metals — manganese, pelletised iron ore, etc, — are listed among the possible commodities. The suggested outlay is $ 10,000 million to $ 15,000 million, held by advanced countries. The proposal is intended to assist in stabilising the markets and prices for such ores, and to encourage growth of mines in the producer countries.

While the idea is interesting, a crucial complication could arise from the pattern of financing adopted. It is generally not possible for a poor nation to finance major mineral projects from internal sources, nor are foreign loans readily available for such projects unless the markets are already established. Poor countries, in the circumstances tend to turn to private participation by international mining houses. These have, after all, the technical ability to assess a given project in great depth as well as to construct it, and they have the necessary marketing ability. Consequently, very often, the purchase contract — if not the purchaser himself — is the major source of finance for the new project. In return, of course, the financiers expect management control, at least for 10 to 15 years, out of which the first five may be spent in commissioning the project.

A developing country (such as India), which has a viable export-oriented project for which it needs foreign exchange for investment, thus has three options available to it: It can

(a) finance the project internally, using free foreign exchange loans where required, and sell the output at the best available price at any given time—and this generally has been the Indian pattern;

(b) obtain finance through a foreign house, and let them run the project for a fixed number of years with limits fixed on foreign exchange remittances;

(c) obtain finance against long-term sales contracts — technical advice being often given by the purchaser who does not want his own supplies to be delayed.

Option (a) is sound if managerial efficiency and steady foreign markets can be reasonably assured. The trend today is for the 'spot buyer' to become less and less and important, so that marketing will become a management problem. Option (b) becomes politically unacceptable, as in India today. Option (c) seems to be the best in the circumstances, and a vigorous drive needs to be launched to enter into such contracts for iron-ore, coal, manganese, mica, kyanite, etc.

However, there are certain conditions that still need to be ensured. The export contract must have terms of payment which will not go against our interests in the adjustments that take place in an international monetary crisis. Moreover, India itself may need many of the metals minerals, and export contracts should be restricted to the anticipated surplus. On the other side, we also need to conclude long-term purchase contracts for zinc and copper concentrates, crude oil, tin, nickel, etc, so as to have sources of their supply in the future.

As part of the effort to effect better terms, it might be useful to sponsor an official conference of iron-ore exporters which could help them protect their interests. At the same time, the suggestions made by Bolton are worth pursuing — possibly through the Commonwealth Secretariat — because steady mineral exports could do far more to improve the mines, mills, and infrastructure, than any series of high-powered delegations going abroad every year. *Ad hocism* in the metals and minerals trade proves expensive in the long run.

Government of India

4¾ per cent Loan 1979 to be issued at Rs 100.00 per cent and repayable at par on 15th July 1979

5 per cent Loan 1983 to be issued as Rs 99.50 per cent and repayable at par on 15th July 1983

5¾ per cent Loan 2002 to be issued at Rs 100.00 per cent and repayable at par on 15th July 2002

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs 350 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) securities of the Government of India 4½ per cent Loan 1972 and/or 4 per cent Loan 1972 which will be accepted for conversion at par. Government reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

If the total subscriptions received for the new loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the cash subscriptions received and the balance refunded in cash as soon as possible.

Interest on the securities of 4½ per cent Loan 1972 and 4 per cent Loan 1972 tendered for conversion into the new loans will be paid at the rate of 4½ per cent per annum and 4 per cent per annum respectively upto and inclusive of 14th July 1972 at the time of issue of the new securities.

Interest will be paid half yearly on the 15th January and 15th July. Interest on all the loans now issued together with interest on other previous Government securities and income from other approved investments will be exempt from income-tax subject to a limit of Rs 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of investments in the loans now issued together with the value of other previous investments in Government securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax upto Rs 1,50,000/-.

Subscription lists will open on the 15th July 1972 and close on 18th July 1972 or earlier without notice.

Applications for the new loans will be received at:-

(a) offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna;

(b) branches of the subsidiary banks of the State Bank of India conducting Government treasury work except at Hyderabad; and

(c) branches of the State Bank of India at other places in India.

For full particulars please apply to any of these offices or branches

NORTH

Congress Slump in Civic Elections

A CONFUSING pattern has emerged from the civic elections held in Punjab in mid-June after a long interval. Previous stage governments, uncertain about their survival and fearing reverses in many local bodies, had deferred the poll year after year. Though the Zail Singh ministry took the earliest opportunity of ordering elections all over the state, the results have fallen far short of its expectations. The inference that the Congress has partially lost its grip over the voters, so evident during the General Elections last March, is inescapable. Proof of the Jan Sangh contention that there is little evidence now of the wave that swept everything before it three months ago is to be seen in the Congress failure to secure a majority in any of the 79 municipal committees. The Congress could win only 182 seats out of the 393 it contested. Nor has the Jan Sangh fared well, only 68 of its 148 candidates having succeeded. Independents have, however, recorded all-round successes with a record bag of 746 seats. No wonder they are being frantically wooed by both the Congress and the Jan Sangh to gain control of as many committees as possible. The claims put out by both sides are exaggerated.

Evidently, local issues dominated the poll, state and national politics having been kept at arm's length. Political ideologies too were at a discount. Even the eve-of-poll Congress bait to traders (by granting all their main demands regarding sales tax payments) achieved little. But the government's proposal to nominate, through an ordinance, all MLAs, (besides representatives of women and backward classes) to the municipal committees in their constituencies, is preposterous. It will undeniably inject the divisive element of politics. The move, it is widely suspected, is designed to ensure Congress control over most of the civic bodies. The analogy which the government has drawn of legislators having already been assured close association with Block Samitis does not hold good. Besides, where is the emergency that alone justifies a resort to ordinances? The Jan Sangh and other opposition parties have rightly denounced such blatant misuse of power. The pretence of ensuring coordination at various administrative levels is too thin to stand scrutiny.

*

Among the factors that have partially tarnished the image of the Punjab Congress within a few weeks of its being catapulted into power are the internal feuds, personal rivalries and the creation of more highly-paid posts despite the already top-heavy administration. Early in June a new post of Planning Commissioner was created although there already were more officers of the Commissioner's rank than ever before. Worse, to the 13 Deputy Inspectors-General of Police yet another has been added. Two of them were without specific duties for several weeks. Cynics say the only "justification" for imposing this additional burden on the taxpayer is the superstition that the number 13 is "unlucky".

Such proliferation of senior posts in the small state of Punjab appears even more absurd in the context of the Chief Minister's disclosure, within a week of the new appointment, that even though Punjab has the highest per capita income in the country (Rs 945), about 42 per cent of its population was still living in abject poverty. Apparently, the famed Green Revolution has not helped to eradicate poverty in this region, owing to the concentration of the benefits on a limited section, mostly the landed gentry.

*

While Punjab's finances are on an even keel, the marked slump in Haryana revenues has slackened the progress of many projects. An official spokesman has, however, denied that the state is in the midst of a financial crisis. According to him, development has not come to a standstill. If, as is now contended, the cut amounts "barely to 10 per cent of the outlay", the position need not cause concern. But the fact is that even the prestigious Rs 50-crore Lift Irrigation Scheme, announced with much fanfare, is hanging fire owing to paucity of funds. The widespread belief is that the state's economy has been dislocated by the needlessly heavy expenditure on rural electrification, the net gains of which are much below the official claims. It has, however, yielded political dividends.

Meanwhile, the state's power tariff

has been stepped up by 20 per cent so as to enhance the annual revenue from this source by Rs 1 crore. Domestic consumers using less than 40 units and agriculturists have been exempted. (The Punjab Government has deferred the proposal for a tariff hike.) The mounting power thefts have assumed scandalous proportions in Haryana. All sorts of devices have been adopted by the pilferers, including obstructions in meter movements, "accidental" damage to meters, short-circuiting the supply and also the usual technique of "palm-greasing" of the Electricity Board staff.

•

By abolishing the toll tax with effect from July 1 the Himachal Pradesh government has eliminated a major cause of inter-state disputes. Last year the toll tax and the road barriers had led to a deadlock that caused much inconvenience to travellers and commercial interests. Haryana, which has a common border with Himachal at Kalka, was directly affected. The abolition will involve a loss of Rs 37 lakhs to the exchequer. The staff thus rendered surplus will be absorbed in the many vacant posts or deployed in multi-purpose barriers.

A High Court judge is to probe the fertiliser scandal in Himachal's Agriculture Department. Department officials are stated to have purchased fertilisers worth Rs 2 crores during the past four years though there were ample stocks in hand. Fertiliser scandals of a different kind in some central Punjab districts a couple of years ago led to dismal disclosures even without a top-level judicial inquiry.

BHUBANESWAR

Return of the Congress

MINISTRIES in Orissa have been literally a dime a dozen. In the 25 years since Independence, there have been as many as 11 ministries. And now the twelfth, led by former Union Minister of State, Nandini Sathpathy, has assumed office. This brings to an end the month-long political drama, the by-products of which have been three: liquidation of the state-based Utkal Congress, erosion in the strength of the Swatantra party (coupled with its ouster from power in the state where the party had been in power since 1967 when the Swatantra-led ministry headed by R N Singh Deo had assumed office) and, third, the return of Congress to power after more than five years. The fall of the united front ministry, after 14 months in office, was partly achieved by causing defections in Swatantra ranks but was mostly the result of inner contradictions within the United Front, climaxed by Biju Patnaik's unsuccessful bid to replace Chief Minister Biswanath Das.

By some quirk of fate Orissa, which had earned the distinction of being the first state (then province) where Congress had come to power way back in 1937, had refused the party an absolute majority in the state legislature until the mid-term poll in 1961. After the merger of the 24 former princely states. Orissa was divided into two sectors — the Eastern coastal belt, politically conscious and voting for the Congress and Left-oriented political parties, and the Western districts, once part of princely India, returning candidates of the Ring-wing Ganatantra Parishad, the precursor of the Orissa unit of the Swatantra party. The former Maharajas and their successors who led the erstwhile Ganatantra Parishad, which 'merged' with Swatantra party on the eve of the 1962 Parliamentary poll, exploited the feudal loyalties of the predominantly Adivasi electorate of the Western districts. However, in 1961 Biju Patnaik appeared on Orissa's political horizon and led the Congress to victory in the mid-term poll, with 82 seats in a House of 140.

But the glory was short-lived. Three Congress Chief Ministers and their colleagues came under a cloud on alleged charges of corruption. There was an inquiry by the Central Bureau of Investigation. The Opposition parties exploited the situation and the voters in turn bundled out the Congress party in the 1967 General Election. The slump in the prestige of the Congress was reflected in the new Assembly in which it had only 31 seats as against the combined strength of 78 of the Swatantra party and the Jana Congress. Since then the Congress has been itching to get back into power. Its efforts finally bore fruit in the middle of last month following the birth of an enlarged Congress legislature party built from the ashes of the Utkal Congress and the Orissa units of the PSP and the Jharkhand party. With the inclusion of the Swatantra party 'rebels', who were the first to strike at the three-party United Front, the strength of the Congress has touched 99 in the Assembly of 140. The Congress has never had it so good in Orissa before.

The government now formed by Nandini Sathpathy consists of persons of experience and merit. There are other aspirants, too, and the Chief Minister has promised to expand her Ministry after she consults the Prime Minister. Nevertheless, the Chief Minister will still have some anxious days because of potential trouble-makers like Biju Patnaik and Harekrushna Mahtab, who are waiting in the political wings. Both of them have for the moment extended support to the Chief Minister, but nobody is taken in by this posture. Nandini Sathpathy, however, has some major advantages. For one thing, her majority in the Assembly is too large to be immediately threatened by dissidents within the ranks of her party. More important, it is known all round that she enjoys the support of the Prime Minister. This will discourage her detractors, including Biju Patnaik, from openly opposing her — until she herself makes some serious false move.

SOVIET UNION

Fall of a Hardliner

THE chain of command in the Ukraine, the second-ranking republic in the USSR, has been shaken by the decline in the status of P Y Shelest. Shelest, who was First Secretary of Central Committee of the Communist Party of Ukraine, has had to leave Kiev to take up the rather inferior post of Deputy Prime Minister of the Soviet Union. The transfer places Shelest below the two First Deputy Chairmen of the Council of Ministers of the USSR, Mazurov and Polyansky. There are nine other Soviet Deputy Prime Ministers and Shelest becomes the tenth.

The downgrading of Pyotor Yefimovich Shelest is the most drastic act of overhaul which Soviet Party Chief Leonid Brezhnev has been able to push through since he and Prime Minister Alexei Kosygin combined forces with others to oust the late Nikita Khrushchev in October 1964. It is true that the young and ambitious A N Shelepin was bruised badly through successive blows to his prestige and power between 1965 and 1967. But Shelepin is still a member of the Soviet Party Politburo and is retained as a busybody heading the trade unions.

Opposed to Brezhnev

Shelest, who was reputedly the most vicious hawk in the Soviet Politburo, led what was derisively described by commentators as the "Ukrainian Mafia". He was known to be a hardliner on Czechoslovakia in the critical days preceding the Soviet invasion of Czechoslovakia in 1968 to curb Alexander Dubcek and his wayward reformist team. Excluding Shelest, the 15 member Soviet Politburo now has five Ukrainians. They are: Nikolai Podgorny, the Soviet President, Brezhnev, V V Shcherbitsky, Kirilenko and Polyansky. Shcherbitsky moved up from candidate member to full member of the Politburo only at the 24th Congress of the Party last year. The May 19 meeting of the plenum of the Central Committee which clipped Shelest's wings, also elevated B N Ponomarev, a Russian, to the position of candidate member of the Politburo.

The Ukraine is a western republic of the Soviet Union and Shelest has been a hardliner partly because of the fear that any relaxation in relations with western Europe might increase unrest in the area. As it is, much anti-Russian feeling prevails in the Ukraine. Shelest's repression of intellectuals and the KGB's special drive in the Republic have not completely curbed the nationalist and liberal tendencies in the Ukraine.

The Brezhnev-Kosygin policy of coming to an understanding with the West Germans (the treaty with Bonn and the Berlin accord) are understood to have been firmly opposed by Shelest. The Shelest view is said to be partly shared by Podgorny, Shelepin and Voronov. Voronov was removed from the post of Premier of the Russian Socialist Republic in July last year.

Shelest's successor as First Secretary to the Ukrainian Party is 54-year-old Shcherbitsky, who is ten years younger than Shelest. From 1957 to 1961, Shcherbitsky was a secretary of the Ukrainian Central Committee. At the 22nd Party Congress in 1961 he was promoted by Khrushchev to be a candidate member of the Soviet Party Presidium (Politburo). In 1961, he was also made Prime Minister of the Ukraine. In 1963, he clashed with Khrushchev and Podgorny and was demoted. He lost his Ukrainian Prime Ministership as well as the candidate membership of the Politburo. A year after Khrushchev's ouster, Brezhnev brought Shcherbitsky back as candidate member in Moscow and appointed him once again as the Ukrainian Prime Minister. He was promoted to be full Politburo member last year. In this way, Brezhnev had groomed him as a counter to Shelest who has had repeated clashes with Brezhnev and Kosygin. The clashes probably reached their apogee during the May 19 plenum which discussed and approved Brezhnev's conciliatory approach on West Germany, the United States and Vietnam. It was following this plenum that Podgorny was sent to Hanoi to explain Soviet policies to the North Vietnamese.

Consequent on the decision on personnel by the Soviet Central Committee, a session of the Supreme Soviet of the Ukrainian SSR was held in Kiev on June 8 and 9. This meeting chose A P Lyashko to succeed Shcherbitsky as the Prime Minister of the Ukraine. Lyashko was the chairman of the Supreme Soviet of the Ukrainian SSR.

The Ukrainian Politburo, which was elected in March last year, consisted of ten members. A year later, N A Sabol was pensioned off from his posts as politburo member and First Deputy Prime Minister of the Ukraine. He was reputed to be a protege of Podgorny. Now Shelest is also out. While Shelest was primarily a party worker, Sobol rose through the Government apparatus. Sobol has been succeeded in the post of First Deputy Premier of the Ukraine by a talented industrial manager, G T Vashchenko.

While Brezhnev was preoccupied with the manoeuvring in the Ukrainian party set-up, a serious riot took place in Lithuania in the third week of May, The riot erupted after a Catholic youth, Roman Kalanta, burnt himself to death as a public protest. The funeral of the boy sparked off demonstrations demanding "freedom for Lithuania". In March this year, 17,000 Catholics had sent a petition to the United Nations seeking an end to religious persecution. Major riots in Russia in recent years have been the Georgian uprising of 1956 (which was in favour of Stalin) and the outbreak in 1962 in Novocherskassk, in the Russian Republic, to ventilate economic grievances. Army and militia units had refused to open fire in 1962 and the KGB forces dealt with the rioters. In Lithuania, the army was called out to quell the riots.

Comparatively Civilised

Between 1795 and 1915, Lithuania was under Russian rule. It had two decades of freedom after the World War I until June 15, 1940, when the Red Army marched into Lithuania and then into Latvia and Estonia. Lithuania has experienced the bitterest rigours of the Soviet persecution of minority nationalities. Between 1940 and 1959, more than a million Lithuanians disappeared from the area. The population was more than 3.2 million in 1940 and around 2.7 million in 1959. The normal population increase would have taken the figure of Lithuanians to 3.8 million. The missing million were killed or deported.

Since 1961, after Khrushchev abandoned Stalinist policies, the Soviet Government has been comparatively civilised in its treatment of the Lithuanians. But the Catholic Church has constantly been accused of arousing anti-Soviet sentiments. There have been arrests and trials and jailing of protesters. The May incidents are the first known occasion in the past twelve years in which the Soviet authorities have cracked down with brutal military force on the Lithuanians.

YUGOSLAVIA

Tito's Soviet Sabre

IT is on record (in the words of Dedijer, Kardelj and Djilas) that Stalin blew his top when he saw Tito in the resplendent uniform of a marshal of the Yugoslav armed forces. Tito had given himself the title even as he and his partisan followers were fighting the Germans in the early forties. In the circumstances, it must have been heartening to the Yugoslav President and his countrymen that the Soviet Communist Party Secretary, Leonid Brezhnev, presented him with a Soviet Marshal's sabre on June 9, a special gift of the Soviet Communist Party Central Committee. The presentation of the sabre and the award of the Order of Lenin took place during Marshal Tito's visit to Moscow between June 5 and 10. The presentation of the marshal's sabre was a special gesture and Tito is the first

foreigner to be so honoured by the Soviet leaders.

This was Tito's tenth visit to the Soviet Union since the late Khrushchev came down to Belgrade in 1955 and apologised for Stalin's mistakes. Tito was 80 years of age on May 25 and the Russians flattered the old man not so much for himself but with their post-Tito interests in mind. The latest friendly exchanges between Tito and the Soviet leaders mark another phase in the love-hate relations between the two countries and the two communist parties since the end of the war. The present was certainly a kiss-and-make-up session, literally so because Radio Belgrade featured in its report "the kisses that the Soviet and Yugoslav leaders exchanged". "Magnificent, magnificent", Tito remarked on his return to Belgrade, while recounting the welcome given by the Russians.

Tito's previous visit to the Soviet Union was in April 1968 when he was returning from Outer Mongolia. Czechoslovakia was on the boil then, and Tito advised the Russians not to use force to tackle Dubcek and his reformist colleagues. Tito got the impression that the Russians would not use the stick. So he felt let down when the Russians sent their troops to Czechoslovakia in August 1968. But within weeks of the Czechoslovak tragedy the Russians tried to soothe Yugoslav sentiments. The road back to amity was not as hard as one might have imagined the day after the Soviet invasion of Czechoslovakia when Yugoslavia burst into an anti-Soviet uproar.

Tito's latest visit was preceded by Brezhnev's 'unofficial trip' to Belgrade in September 1971. Brezhnev laid on the charm and even tried out some extrovert Khrushchevian tactics to win over the Yugoslavs. During the Moscow visit of Tito it was smiles, smiles all the way. Differences continue to exist between the Yugoslavs and the Soviet Union but they were passed over, to emphasise what was common in the policies of the two countries and parties.

The Russians did not make any definite promises this time. Anyway, the Yugoslav experience is that Russian promises to Yugoslavia are rarely kept. The Tito-Brezhnev communique refers to the three previous joint statements, the 1955 Belgrade Declaration, the 1956 Moscow Declaration and the 1971 statement by Tito and Brezhnev. As Radio Belgrade reported, "despite the existence of certain differences — which is a natural thing — a common language has been found". The Yugoslav commentators describe the recent Tito-Brezhnev communique not as a declaration but as a business document. There has not been any new declaration of ideological principles of special significance.

One Yugoslav commentary said that Yugoslav-Soviet relations are "inspired by the teachings of Marx, Engels and Lenin". This deserves notice, for whereas relations between the Soviet Union and East European communist countries are proclaimed to be based on Marxism-Leninism, the Yugoslavs have not considered Lenin to be one of the saints in the socialist pantheon. Marx and Engels, yes; Lenin, may be, has been the approach of the Yugoslav party theoreticians.

The treaties between the Soviet Union and the other Warsaw Pact members insist on co-ordination of foreign policy on the basis of proletarian internationalism. The Yugoslav-Soviet communique naturally talks only of "consultations, in the spirit of international traditions of friendship, mutual respect and equality". On the question of non-alignment, one of the basic precepts of Yugoslav foreign policy, the Russians went to the extent of underscoring the merits of non-alignment in relation to the anti-imperialist goals common to both countries.

There are a few in Yugoslavia who regret that basic Yugoslav-Soviet differences are not constantly publicised. A commentator wrote in the Belgrade weekly, *NIN*: "It is well known that these differences exist. However, in the study plans and programmes in Yugoslav schools and in the school text-books, there is not a word about them. It is a fact that the concealment of these differences and the practical political manifestations lead to the acceptance of the Brezhnev theory of limited sovereignty as something quite normal and understandable." In the present exercise, the Russian intention obviously has been to build up a better image in Yugoslavia. But the ideological programme sheets of the Soviet communist party still contain this dictum: "The fullest embodiment of the ideology of revisionism is to be found in the programme of the League of Communists of Yugoslavia."

SINGAPORE

Selling the Concorde

Harish Chandola

A PROTOTYPE of the Anglo-French supersonic aircraft, Concorde, has just completed its 40,000 mile display and sales flight through Asia and Australia, sponsored by the British partners of the Concorde project, the British 'Aircraft Corporation (BAC). This journey made history, because to provide the sales talk two Ministers of the British Government accompanied the prototype, besides Lord Cole, the Chairman of Rolls Royce (which is the partner of the French firm SNECMA in manufacturing the plane's Olympus engines), the Chairman of BAC, Sir George Edwards, and two planeloads of supporting staff.

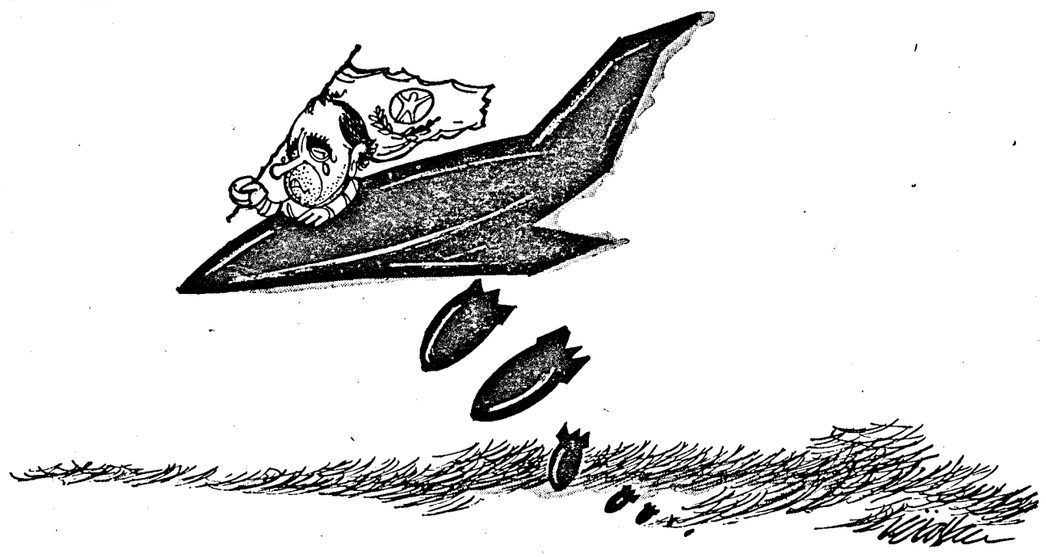
In spite of the weight of VIPs from Britain, two Japanese Ministers declined to go on the demonstration flight of the aircraft in Tokyo because of the very strong public opposition to the aircraft for its capacity to foul up the environment and for its excessive noise. The purpose of taking Concorde to Tokyo was to interest Japan Air Lines in buying the plane, but the reception it got would certainly have poured cold water over the desperate hopes of the BAC. Similar opposition to the aircraft was also voiced in Australia where it was felt that it would not possess the range to fly from Singapore to Sydney non-stop, which the present subsonic airliners like Boeing 707 and DC 8 do.

The high-pressure sales drive was attempted only because it has become extremely difficult to sell this controversial plane, on the development of which Britain and France have spent nearly $ 2.5 billion. Apart from the criticism of its excessive noise at airports, its damaging sonic boom will prevent it from flying faster than the present planes over most land areas. With its smoke adding to the pollution of airports and the upper atmosphere which shields the earth from cosmic rays, hardly any airline is convinced of its performance as an economical aircraft.

Doubts are being expressed that the plane will be able to carry 100 passengers from Paris to New York non-stop, a journey of little over three hours for it. The makers however promise that in 1974-end, when it is scheduled to enter airline service, it will have a payload of a little over 20,000 pounds (which is the weight of 100 note-too-fat passengers and their limited baggage). This is

ess than the payload of Boeing 707, nd nearly one-fourth the payload of the umbo jet, which carries up to 390 passengers, all their baggage plus cargo. hese days airlines are unable to make noney by carrying passengers only. hey must carry cargo on almost every light. The Concorde will be uneconomic not only because it will not be able o carry cargo, but also because its fuel consumption is three times that of the present-day jets.

In their sales talk, the attempt of the British Ministers (Michael Heseltine, Minister for Aerospace, and Lord Jellicoe, the Lord Privy Seal) was to present the aircraft as the future conveyance of government leaders and top executives and others who do not pay their fare themselves but travel on government or company accounts and of the very rich. What was not said at the numerous press conferences during this tour was that the airline that buys the plane will have to charge much higher fares than those obtaining at present (even higher than the present first class fares) to make its operation economical. This will mean that it will be the plane of very special people or of those who travel by it to experience supersonic flight over ocean routes (it will not be permitted to fly supersonic over land unless governments provide it with flight corridors over uninhabited deserts where its sonic boom will not cause damage) and are in a position to afford higher fares.



There are at present very few takers for the Concorde. Just before the British prototype undertook its sales odyssey in June, the British airlines, BOAC, announced that it will buy five Concordes. But no contracts for the sale have yet been signed between the manufacturers and the airline.

The French Government has an equal stake in the sale of this aircraft, because if it does not sell, France loses heavily. In spite of this, none of the French airlines have yet come forward to announce their intention to buy the plane. The reason might be that in spite of the manufacturers' claim that the production aircraft in 1975 will be able to fly Paris-New York non-stop, the airlines are not quite convinced.

The aircraft will cost about $ 60 million a piece, including spares and equipment. But this cost might go up (only a few months ago the cost was stated to be about half of this amount) because Concorde's present Olympus engines are still in the process of development to make them less noisy and free of the frightening amount of the acrid black smoke they belch at the moment, its wing area has still to be enlarged to give it a better balance in subsonic flight and its fuselage has still to be enlarged to seat the 100 passengers it promises to seat in comfort.

The French had taken their Concorde prototype to Africa and across the Equator to Latin America last year. This year Britain chose to display its prototype in countries where it is supposed to have influence. The British prototype first visited Teheran, where the Shah was given a joyride. As a result, the British claim that the Shah has promised to buy three Concordes for Iran's national airline and has also promised to provide a supersonic corridor over the uninhabited Iranian desert for Concorde flights. But the present routes of Iran's airline lie mostly over densely populated areas and therefore Concorde can hardly be of much use to it.

The other places Concorde visited were Singapore, Sydney, Darwin, Tokyo, New Delhi and Bombay. Though Air India has an option on the plane, the large sales team that came with the demonstration prototype and spent four days in Singapore did not really believe that India would buy the aircraft. Three demonstration flights were arranged in Singapore to impress local leaders, airline officials and journalists with the performance of the plane. Throughout the 40,000-mile journey, the British team kept spreading the word that China was going to buy the Concorde. It however added that the negotiations for the purchase were being done with France and not with Britain. China of course has said nothing on the subject yet.

"Of course I worry a lot about ecology. It makes me sad to think of those li'l butterflies and crickets down there."

Womanpower

Jai Nimbkar

The Educated Woman in Indian Society Today, a study carried out by the YWCA of India; Tata McGraw-Hill, Bombay; pp 287.

THIS is a book that grew out of the special number on Women of the organ of the YWCA of India called *Today*. Including the general editor, Muriel Wasi, the book contains articles by fifteen contributors, men and women, who have special knowledge of some aspect of the problem. It claims to have been brought out not as an academic exercise, but "to provide some direction on how most effectively to utilise educated womanpower in the immediate future". The book is divided into two parts, part I containing factual information, and part II indicating trends and suggesting a plan for the future.

The first part is a fairly thorough documentation, which presents an accurate picture of the place of the educated woman in the work-force of the country. Starting from a definition of the educated woman — as a woman who holds a first degree at a university — it goes on to give a numerical breakdown of educated women actually working in various professions. Out of the approximately 270 million women in India, about one million are educated. The book states that this figure is too low, and one wishes here that it had given comparative figures for other countries.

There follows a review of women in four important professions, teaching, social work, medicine and nursing. Women have made substantial strides in these four professions. In medicine especially, where ten per cent of the work force is made up by women, their achievement is second only to that in the USSR.

Attitude to Work

The book points out, however, that the growth of professionalism is still very slow among Indian women. Most of them do not have a professional attitude towards work. Also, the conflict between total personal happiness and total professional fulfilment still exists, and women have not yet realised that these need not be mutually exclusive, and that in the modern world it should be possible to reconcile them.

Substantial numbers of educated women, nearly fifty per cent between the ages of 15 and 59, are unemployed, and there is reason to believe that this unemployment is voluntary in the case of many of them. Also, though nothing but their own predilections and prejudices need keep women from any career of their choice, women have not explored many fields open to them. Part of the reason for this is the non-availability of information regarding career opportunities, and lack of systematic methods of recruitment. Vocational guidance is also very important, in order to allow women to receive better directed and purposeful training. There is no vocational guidance available to the majority of women today. (It is well to note here that much of what this book says is applicable to men and women equally.)

In connection with unemployment of married educated women, a few valuable suggestions are made. The book stresses the importance of the idea of life-long education especially for women, as they spend a number of years away from work and often away from the world of ideas, to devote themselves to family responsibilities. Continuing education, through universities, voluntary organisations, etc, can keep such women in touch with their own field, so that they will remain mentally and educationally equipped to re-enter the work force. Many women would like to go back to work after their children are grown up, but find themselves out-of-date, or unable to fit into the prescribed age limits. It is recommended that such unrealistic age limits should be relaxed at least for certain kinds of jobs. As a solution to the conflict of roles which forces many women to give up work, the book suggests part-time jobs in various fields. It has been found from experience that this is very useful in preventing non-use of training. Women who have received special training want to use it, and it is up to the society to create conditions in which they can use it.

In the concluding article, "Planning for Tomorrow", we are warned against complacency. Though a few women have gone far, the majority are still illiterate and untrained, and in that sense, not free. The educational structure in India "is like a pillar and elitism is entrenched in it". The structure needs to be made pyramidal with a broad base. To achieve social and economic change, it is important to achieve much more widespread 'education' (to be differentiated from mere schooling) among women. The aim of education should be not only academic excellence but also the absorption of and adaptation to technological changes which cause rapid social changes.

The book very unequivocally concludes on a note of warning to the educated women of India. Since the country has invested in them, they owe a debt to the country. It is not enough, even for those who have paid for their own education, to be content with raising a family. It is their obligation to use their education and training for their country.

Uneven Writing

As might be expected, in view of the large number of contributors, the writing is uneven, ranging from precise, effective and practical writing to an imprecise use of words and purple passages which ill fit the theme of the book. The article on voluntary organisations, for instance, talks about the latent power in the "hearts, minds and wills of women", as though these three were separate entities. Similarly, the following passage belongs on a political platform rather than in a book of this sort: "For the road is frighteningly rugged and long, is punctuated with dangerous corners, and promises no early haven of security. The challenge remains: we, who train for leadership, must travel courageously and, like the first men of Everest, keep 'going strong for the top'." The bits of inspiring prose and poetry quoted throughout the book also seem out of place. However, the writing generally is very competent and readable.

The contents present certain flaws in thinking. Traditional ideas are sometimes presented without examining them for logical fallacies. For example, the repeated statement that women are 'born' teachers, as against men who apparently are not, is not borne out by experience. If there is such a thing as an inborn capacity for rearing children, it must be confined to catering to the physical needs of very small children, and cannot possibly be carried over to teaching. There is no basis in fact for saying that women are better teachers than men, at any level of education.

The article on the teaching profession also talks nostalgically of the great teachers of old and laments their disappearance from our social system. Quite possibly, there are as many great and dedicated teachers today, in proportion to the total population, but their work tends to become obscured because of the tremendous expansion of education, and the shifting goals of education. Such nostalgia introduces a sentimental note in an otherwise practical and realistic book.

The section on medicine deplores the competitive spirit which spurs women to become doctors in urban areas when there is a shortage of doctors in rural areas and a shortage of nurses all over the country. The author claims that this competition by women for the top places in the medical profession is an "aggressive and misdirected use of a rightful privilege". Such a contention is obviously ridiculous. If there is an unequal relationship between requirement and supply, both men and women are equally responsible for it. *Per se,* there is no reason why we should expect men to be aggressively competitive for status and money, and women to steer clear of competition.

The whole tone of the book errs in the direction of regarding women as raw material, as something that must be 'used' to achieve certain goals. Theoretically, it is all right to say that the human potential of a country should be used in a certain way for best results. But in a democracy, on a practical level, beyond using persuasion and a system of incentives, the ultimate choices must be left to the individual. Saying that educated women must not be allowed to withdraw from the work force of the country, or that they must be conscripted into certain fields is taking a step towards a regimented society. We must not use the shield of democracy to justify inactivity, but at the same time we must not let our enthusiasm for planning carry us into narrowing individual freedom.

Helpful Suggestions

In spite of these defects, however, this is a very important publication. In this age of women's lib, it gives us a much needed picture of the status of women's education and employment in India. The suggestions for future planning should be very helpful to the makers of educational policy, and thought-provoking for anyone interested in the problem and for the general reader. Although it is not a stated purpose of the book, it will have accomplished something significant even if it is only able to awaken the social and intellectual conscience of its educated women readers.

No Cook-Book Recipes

Nita Sanghvi

Explanation and Management of Change by S C Dube; Tata McGraw-Hill, Bombay, 1971; pp 99+vii; (price not mentioned).

SOCIOLOGICAL theories from the time of Aristotle have accepted change as inevitable and concerned themselves with its analysis and explanation. In the developing countries, committed to change as they are, the theme has acquired added significance for the social scientist as well as the planner. For any conscious formulation and implementations of "desired" or "desirable" goals has to take social realities into account. Some of the social scientists and researchers in the so-called "policy" and "management" sciences have claimed that they have the conceptional maturity and methodological sophistication necessary for laying down strategies for "induction, direction and management of change". Dube rightly doubts this claim (p 55). He feels that their claims to impressive feats of social engineering cannot be substantiated. Although intensification of research in the social sciences has thrown up "many provocative hypotheses and some brilliant analytical insights" (p 95), social scientists do not have all the answers to the questions that baffle the planner. According to Dube, the main role of sociology and the social sciences, even in their new context, is explanatory and diagnostic. But even this is a significant contribution. By providing an understanding of how social and cultural factors operate in certain given situations, insights which assist development planning are provided. Why, then is social science research not used as widely as it should be in planning?

The communication gap between the planner and the social scientist is obvious and several factors have contributed to its continuance. Dube says that the only way to facilitate a bridging of this gap is by ending the senseless debate on fundamental *vs* applied research (p 87) and seeing the two as complementary. The limitations and interdependence of their roles have to be perceived. "The policy-maker will still have to make his choice, for the social scientist will not tell him what to do or how to do it. But he will have something definitely more reliable than mere hunches as the basis for his choice" (p 88).

In the chapter entitled "Strategies for Influencing Change" Dube attempts an extremely tentative formulation for stimulating change. The six basic investments required are: (i) investment in building the social and economic infrastructures of development, (ii) investment in image building and image maintenance; (iii) investment in attitude building and attitude maintenance; (iv) investment in developing resources and skills; (v) investment in institution building and (vi) investment in research and education.

Dube warns, however, that differences in the political economic, cultural and ideological context do not warrant a uniform strategy of change for all countries. Nor are mere economic inputs enough. He says that it is essential to invest in social overheads such as education, communications and public health. But aren't these a part of the economic infrastructure? He does not clarify what he includes under each of these six heads. Nor is the meaning very clear. Building and maintenance of whose image? What institutions? He does not explain. Crucial to any strategy for planned change is the "balancing and harmonising" of the different types of investments. There can be no cook-book recipes for achieving this. But it becomes even more difficult in a democratic framework where the administratively rational is not always the politically feasible.

In a series of lectures (the book is a collection of the UGC sponsored National Lectures, 1970) it was possible to touch upon the various explanations of change only briefly. Therein lies the value of the book for the graduate student and the lay reader. It acquaints him with the literature in sociology and anthropology on the theme of change. Theories of change, modernisation and its attributes, problems of innovation and their acceptance, motivations for modernisation and other related topics have been given a quick look.

Family and Child Welfare Projects

Organisation and Administration

S N Dubey

M J Apte

In the development of the organisational set-up for the family and child welfare projects, the following aspects were considered:

(1) Co-operation and participation of the institutions and agencies engaged in providing developmental services. Consequently, it was considered important to involve panchayati raj institutions, community development blocks, schools, and primary health centres;

(2) Participation of voluntary agencies, both within and outside the block; and

(3) An active involvement of the local communities and leadership in the field of co-operation, panchayat, and voluntary associations.

In view of the above considerations, the following organisational issues relating to these projects seem important:

(1) What is the rationale behind the assignment of the implementation responsibility of the projects to the Central Social Welfare Board, and the State Welfare Advisory Board? In other words, why was the Central Social Welfare Board considered uniquely suitable to implement these projects?

(2) What made the planners believe that the existing organisational set-up is best suited to achieving co-operation and co-ordination at the state and the block levels? Are the conditions necessary for interorganisational co-ordination present in the existing organisational arrangements?

(3) Is the Mukhya Sevika, responsible for bringing about co-ordination in the services at the block level, trained in the necessary skills and other attributes to perform the co-ordinator's role effectively? Where does she acquire these skills and attributes?

THE Family and Child Welfare Projects were initiated on November 14, 1967, to reorganise, improve, and expand the welfare services for women and children which had been provided by the Co-ordinated Welfare Extension Projects and the Demonstration Projects for Integrated Child Welfare Services. The Demonstration Projects for Integrated Child Welfare Services, initiated in the Third Five-Year Plan, provided services to children up to 16 years of age; and covered such services as health, nutrition, education, and training. One pilot project was organised in each state. The services of one chief child welfare organiser, four other child welfare organisers, a lady doctor, a midwife, and an average of 25 'Balsevikas' were employed for a project. A Project Implementing Committee was given the responsibility to implement the programme at the block level. The projects were funded totally by the Central Government. Each project carried an annual budget of nearly Rs one lakh. Since it was not possible to multiply the Demonstration Projects extensively, a decision was made after the pilot stage was over to discontinue the projects and to convert them into Family and Child Welfare Projects under the Fourth Five-Year Plan. Thus the 17 demonstration projects for child welfare were to become Family and Child Welfare Projects.

Co-ordinated Extension Projects, created by merging the earlier Welfare Extension Projects run by the Central Social Welfare Board and the Children and Women Welfare Programmes run by the Community Development Administration, were also converted into Family and Child Welfare Projects. The Co-ordinated Welfare Extension Projects were organised to avoid overlapping of services provided by the Central Social Welfare Board and the Community Development Administration, and to ensure the resources for both these organisations needed to promote women and children welfare programmes in the rural areas. Thus, at the end of 1966-67, there were 264 Co-ordinated Projects working in the country. Most of the projects among these were working in the second phase. By the end of the Third Five-Year Plan, the continuation of these projects was uncertain. It was, therefore, decided to convert all the 264 Co-ordinated Welfare Extension Projects into Family and Child Welfare Projects under the Fourth Five-Year Plan.

The formation of Family and Child Welfare Projects was recommended by the Evaluation Committee appointed by the Central Social Welfare Board to examine the working of the Co-ordinated Welfare Extension Projects in 1964 under the chairmanship of the Maharani of Patiala. The committee made the following recommendations: (1) The 'Balwadi' programme in the scheme of Welfare Extension Projects should be strengthened and converted into the Balavikas Kendra, which should provide services, on the integrated basis, for the total development of the child. (2) The Family of the child should also be utilised for continuance of the work started in the Balvikas Kendra. Thus, young mothers should be trained in child care, nutrition, home improvement and management, family planning, etc. (3) Various services available in CD Block, such as maternity services, applied nutrition, family planning, social education, craft activities, services of the primary health centres and sub-centres, should be effectively utilised to ensure the all-round development of the pre-school child. (4) Such an integrated programme of family and child welfare should be organised in as many community development blocks as possible within the available resources.

Thus, a new scheme of family and child welfare was prepared by the Central Social Welfare Board in 1964, which was reviewed by a study group appointed by the Planning Commission. The scheme was further discussed with the representatives of the Departments of Social Security (now, the 'Department of Social Welfare') and Community Development, the Finance Ministry, chairmen of the State Social Welfare Advisory Boards and several state governments. It was finally approved by the Department of Social Welfare of the Government of India, in 1967. The scheme was given for actual implementation to the Central Social Welfare Board to ensure the maximum participation of voluntary organisations and workers.

Thus the Welfare Extension Projects, which provided services to women in the field of maternity, and in child welfare, craft training, and social education, did not envisage any programme of education of young girls. The Family and Child Welfare Projects filled this gap by providing for training of young girls and mothers on subjects like home management and improvement, child care, nutrition, etc. Further, the Balwadi has been also linked with the family.

Since the Family and Child Welfare Projects have been organised on a pilot basis, they have been included in the Central Sector in the Fourth Five-Year Plan with an outlay of Rs 6 crores. In addition, Rs 6 crores have been allocated for nutrition, feeding children in Balwadis; Rs 6 crores for grant-in-aid to voluntary organisations; Rs 2.23 crores for the welfare of the physically handicapped.

The project normally caters to the age group 0=16 years. However, greater attention is given to children who are upto 6 years of age. The next priority is given to the needs of the children between 6 and 11 years. While services dealing with health, nutrition, education, recreation, and welfare are implemented in a co-ordinated manner, the combination of services and the emphasis differ for different age groups depending upon their physical need. For example, for children upto two and a half years of age, the programme includes post-natal care, immunisation, nutrition, and physical care; for the children between 2 and a half to 6 years, the services comprise informal education through play activity, supplementary nutrition, etc, for the children between 6 and 11 years, the services include mid-day meals, social health services, group games based on local game, promotion of hobbies, etc. The family welfare programme comprises home craft and home management, mother craft and child development, family nutrition, clothing, and other requirements.

Organisational Pattern

At the centre, the Family and Child Welfare Projects are a part of the Department of Social Welfare, Ministry of Education, Government of India. The scheme forms part of the centrally operated programme and is financed totally by the Department of Social Welfare. The Department of Social Welfare has constituted an Inter-Ministerial Co-ordination Committee for securing co-operation of the other ministries and the UN organisations. (Department of Social Welfare, 1970: 14-16). The Central Social Welfare Board has been entrusted with the responsibility of implementing the projects to ensure the maximum participation of voluntary organisations and workers. The Central Social Welfare Board is responsible for developing guidelines for the day-to-day implementation of the programme, organising orientation training of workers, undertaking an assessment and evaluation of the work done in the field, and arranging funds. (Mittal, 1969: 2.) The Board has constituted a small Standing Co-ordination Committee, with representatives from the Departments of Social Welfare, Planning Commission, and UNICEF, to advise it on the day-to-day problems which may emerge in the implementation of the projects. The Board has also established an administrative cell in its office to look after the programme and train workers under the programme. Thus, the Central Social Welfare Board sets the pace of the programme by finalising the selection of the projects, preparing detailed programme for each project, and releasing funds to State Social Welfare Advisory Boards.

The State Social Welfare Advisory Boards have a very important role in the implementation of the programme: It attempts to ensure co-operation and co-ordination of the state level governmental departments, voluntary organisations and other concerned agencies. Thus the State Board has to constitute a State Level Co-ordination Committee of the representatives from the Departments of Social Welfare, Health, Education, Community Development, etc.

At the Block level, a functional committee is constituted to run the project, which comprises an equal number of representatives from the Panchayat Samiti and State Social Welfare Advisory Board. The Block Development Officer and the Extension Officers in his team, the Medical Officer of the Primary Health Centre, and the Headmaster of the village school, are *ex-officio* members of the functional committee. The functional committee for the FCP was suggested to be a Standing Committee for the panchayat samiti for promoting social welfare services in villages. However, due to variations in the panchayati raj acts of the states, this has not been possible. Consequently, functional committees have been established by a government order of the State Department of Social Welfare. Thus, in nine states, the functional committees have been established by the government order; and in six states they have been established by the State Social Welfare Advisory Board on an *ad hoc* basis. (Department of Social Welfare, 1970: 15.)

The Family and Child Welfare Project consists of one main centre at the Block headquarters, and five sub-centres in key villages. In addition, the Central Social Welfare Board provides a modest financial aid and project staff to villages where local Mahila Samitis and panchayats are keen to initiate on their own a limited welfare programme. The main centre and sub-centres have a provision for a Balvikas Kendra and a Griha 'Kalyan Kendra,' the former working mainly in the mornings for children, and the latter working mainly for parents — especially for mothers in the afternoons.

The services in Balvikas Kendra include a creche or day-care centre for about 10 infants whose mothers are busy on the farm or in the home. A trained Kendra Sahayika looks after the day care centre under the supervision of Balsevika. There is also a provision for a Balwadi or a pre-school for 40 children, which is run by the Balsevika with the help of the active members of the local mahila samiti. Outside the hours of Balwadi, the Balsevika also makes home visits and maintains liaison with village school, maternity, and infant health centres, etc, to ensure full utilisation of all necessary services for the children in the block.

The Griha Kalyan Kendra serves as a demonstration-cum-training unit for about 15 young mothers and village women. The main activities in the Kendra include education in personal hygiene, health and sanitation, home craft and home management, mother craft and child development, family nutrition and feeding, family relationship, domestic budgeting, preparation of family clothing, family planning and citizen education, etc. The Griha Sevika, with the assistance of Kendra Sahayika and the members of the local

Mahila Samiti, organises these activities in the afternoon. The trainees are drawn from the main village and from the villages which have sub-centres. The Griha Sevika seeks the co-operation of staff in the Primary Health Centre, Block, Family Planning Centres, Social Education Centres, Craft Centres, etc. in organising talks and demonstrations.

While the main centre serves as a model of family and child welfare activities in the block, five sub-centres are also started. Each sub-centre is run by a trained Balsevika assisted by a Kendra Sahayika. The main programme at the sub-centre is similar to the programme at the main centre. In addition, the staff at the sub-centre, with the guidance of Mukhya Sevika, also organises a Mahila Samiti to recruit women from the villages under the sub-centres for training at the main centre, and to organise meetings of the women to discuss matters around social education, family planning, applied nutrition, etc. The organisational pattern discussed above is presented diagrammatically in Chart 1.

Organisational Issues in Family and Child Welfare Projects

In the development of the organisational set-up for the family and child welfare projects, the following things were considered: (1) Co-operation and participation of the institutions and agencies engaged in providing developmental services. Consequently, it was considered important to involve panchayati raj institutions, community development blocks, schools, and primary health centres; (2) Participation of voluntary agencies, both within and outside the block; and (3) An active involvement of the local communities and leadership in the field of co-operation, panchayat, and voluntary associations.

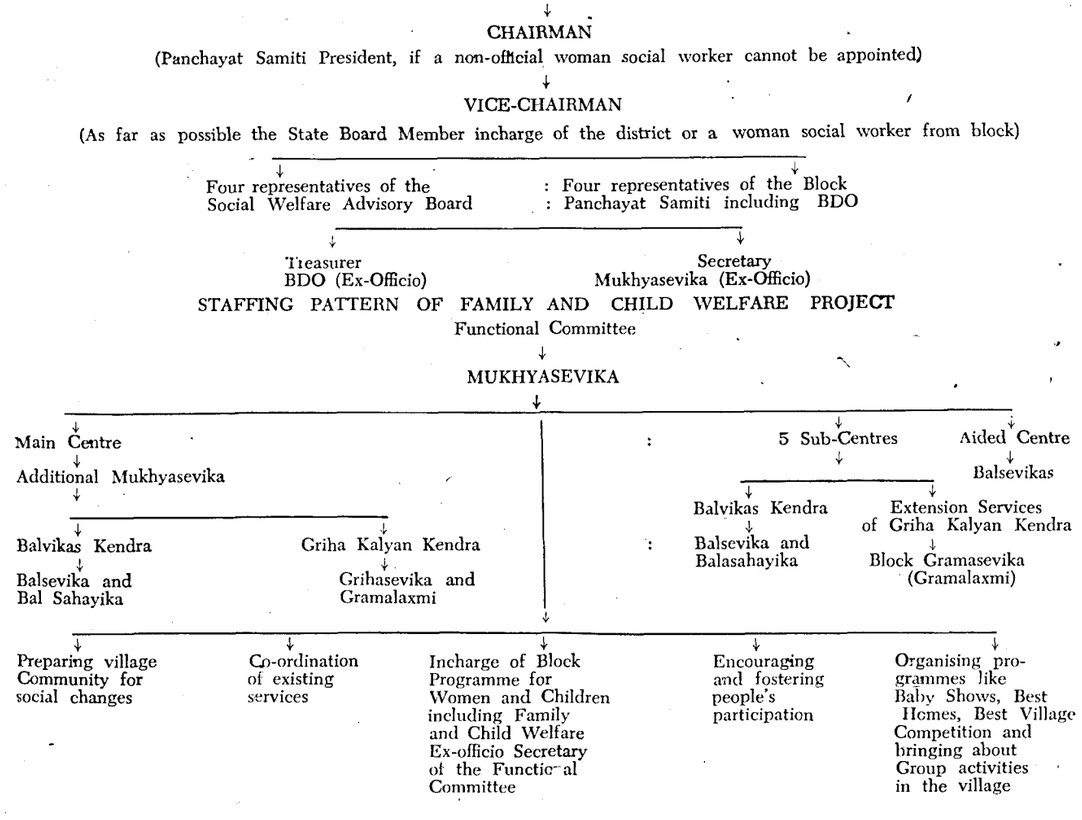
In view of the above considerations, the following organisational issues relating to these projects seem important: (1) What is the rationale behind the assignment of the implementation responsibility of the projects to the Central Social Welfare Board, and the State Welfare Advisory Boards? In other words, why was the Central Social Welfare Board considered uniquely suitable to implement these projects? (2) What made the planners believe that the existing organisational set-up is best suited to achieve co-operation and co-ordination at the state and the block levels. Are the conditions, necessary for inter-organisational co-ordination, present in the existing organisational arrangements? (3) Is the Mukhya Sevika, responsible for bringing about co-ordination in the services at the block level, trained in necessary skills and other attributes to perform the co-ordinators' role effectively? Where does she acquire these skills and attributes?

The first issue can be meaningfully examined it one compares the organisational machinery and linkages at the block level of the Central Social Welfare Board with the organisational machinery and linkages of the other two departments, *i e*, State Department of Social Welfare, and the Department of Community Development, which might suitably be considered for this responsibility. The main rationale for assigning the projects to the Central Social Welfare Board and the State Social Welfare Advisory Board was that they would be more effective in promoting and strengthening the voluntary sector in the rural areas where the projects would be launched. A recent evaluation of the Department of Social Welfare, Government of India, indicates that "very limited development of voluntary organisations for social welfare had taken place in rural areas where family and child welfare projects have been started". Though the report does not indicate the factors responsible for such a lack of growth in voluntary organisation, it is not hard to locate them. A most important factor seems to be the ineffective organisational machinery and disjointed linkages of the State Social Welfare Advisory Board with the panchayati raj institution and the community development machinery at the block and village levels. Prior to the conversion of the Co-ordinated Welfare Extension projects into the present set of Family and Child Welfare Projects, the Project Implementing Committee at the block level, and Mahila Mandel at the village level, were the two most important organisations through which the State Boards worked. The effectiveness of these organisations was found to be highly uneven and unsatisfactory, particularly in the development of voluntary organisations. Consequently, these organisations seem to have a limited viability for making contributions toward expansion and development of the voluntary sector in social welfare.

At the district level, the Family and Child Welfare Project has virtually no organisational relationship with the panchayati raj institutions and the community development administration. At the block level, the day-to-day management of the Project has been entrusted to the functional committee which includes an equal number of members from the panchayat samiti and the State Social Welfare Advisory Board. The committee is headed by the Chairman of the panchayati samiti and has a functioning vice-chairman, a non-official woman social worker proposed by the State Board in consultation with the panchayat samiti. It has been found, however, that the relationship between the chairman of the functional committee who is also chairman of the panchayat samiti, and the vice-chairman is not smooth. Complications tend to arise between them in the exercise of authority over the project staff, funds and material, particularly over the jeep. Further, the Block Development Officer who is an executive officer of the panchayat samiti acts as an *ex-officio* treasurer of the functional committee. He does not have any authority over the staff of the project and consequently does not take any interest in the project, which seriously affects the co-operation between the project staff and the block staff. Thus, this arrangement has been found very unviable in the effective implementation of the project.

On the other hand, let us examine if the panchayati raj institutions and the community development administration might be more suitable organisational set-up to implement the projects. The panchayati raj and the C D administration have institutional structures at the district, block, and village levels. These units have been provided with powers and functions — though the amount of power to these units vary from one state to another — to plan and execute the community development and social welfare programmes. The panchayati raj institutions and the community development agencies, therefore, form the backbone of the 'voluntary co-operation' in the rural areas. Besides, after the experimental stage is over, the state governments will have to accept the responsibility in these projects and finance them from their own funds. The state governments, therefore, will have to entrust the responsibility to the panchayati raj institutions which are the only development agencies in rural areas — including for general social welfare and backward classes welfare programmes. It seems, therefore, that the panchayati raj and community development agencies are more suitable for the implementation of the project than SSWAB/CSWB.

The responsibility for implementation of the projects cannot be entrusted to the State Department of Social Welfare, because in most states the majority of welfare programmes, except correctional services, have been transferred for implementation to panchayati raj institutions. (Dubey, 1971a, 1971b.) Consequently, the assignment of the implementation responsibility for these projects to the State Department of Social Welfare may again mean transfer of the projects to the panchayati raj institutions. Besides, in some states (e g Maharashtra) the Department of Social Welfare does not have its own functionary at the block level. Consequently, the Social Welfare Department will not be in a better position than the Central Social Welfare Board to implement the projects independent of panchayati raj institutions and community development agencies.



In summary, from the point of view of organisational machinery and linkages, the panchayati raj institutions and the community development departments seem the more appropriate agencies for running the projects. However, mechanism should be developed to involve meaningfully the State Social Welfare Advisory Boards in the implementation of the projects. One of the ways this can be done is to co-opt in the Subject Matter Committee for Social Welfare at the block and zilla parishad levels, the district member of the State Board and the former chairman of the Project Implementing Committees. Secondly, leading social workers in the block (not more than two) may also be appointed to the Subject Matter Committee for Social Welfare of the panchayat samiti. The names of such persons may be recommended by the State Social Welfare Advisory Board.

Co-ordination in Family and Child Welfare Projects

As regards necessary conditions for co-ordination among agencies, a particularly useful framework has been developed by Levine and White which treats co-operative arrangements among organisations as a system of exchanges. Organisations must possess or control certain resources — personnel, service, fund, etc — in order to achieve their objectives. Since most organisations do not possess all the resources needed to achieve their goals, they frequently turn to one another to supplement them. In more general terms, Levine and White define organisational exchange as any activity between two organisations which has consequences, actual or anticipated, for the realisation of their respective goals

Chart I

ORGANISATIONAL PATTERN OF FAMILY AND CHILD WELFARE PROJECTS

or objectives. (1961: 588-600.) As Reid (1964 : 418-428) points out, the major advantage in using exchange framework to study co-ordination is that, it draws attention to the *actual* goals of the agency rather than the *stated* goals. Further, it emphasises that any co-ordinating activity involves resources. Most agencies need funds, facilities, personnel, services, information, and clients to achieve their goals. When agencies lack these resources, they seek exchanges. (Reid, 1964: 418-428: Dubey, *et al* 1971: 177-208.) This makes it possible to describe co-ordination in terms of kinds of resources involved in transactions.

Reid points out that, taking the extensiveness of the exchange in terms of the equality and the value of resources, one can distinguish various types and levels of co-ordination. The first or the lowest level may be called *ad hoc* 'case co-ordination' in which co-ordinated activity is generated by individual practitioners to meet the needs of their particular clients. A second level may be called 'systematic case co-ordination', or service integration, in which the goal is to mesh services from different organisations, though the co-ordinated activity is still on the case level. Here, specific rules and procedures are developed to guide the exchange process among the interacting agencies. A third level may be described as programme co-ordination, which is centred on agency programme rather than on individual cases. This level of co-ordination may include a development of joint-agency programme, mutual assistance in development or extension of programme or mutual modification of programmes, to bring about more rational alignment of organisation's functions.

These types and levels of co-ordination can be graded hierarchically by the extent and the value of organisational resources exchanged. *Ad hoc* case co-ordination draws minimally upon these resources, whereas programme co-ordination demands a much larger portion of the organisation's resources. The greater the need for investment of resources by the organisations the lesser is its desire to seek co-ordination with other organisations. Thus, there is generally a low degree of co-ordination observed at the second and third levels. (1964: 418-428.)

Litwak and Hylton (1962: 401) observe that there are three conditions necessary for bringing about co-ordination among formal organisations. These are: (1) organisational interdependency, (2) level of organisational awareness about the interdependence, and (3) standardisation of organisational activities. Thus, co-ordination tends to develop and remains in existence when formal organisations are partly interdependent; they are aware of their interdependence; and when co-ordination is defined in the standardised unit of action.

Another variable which seems important in interorganisational behaviour, particularly in co-ordination, is the status of the organisation involved in an exchange situation. The nature of organisational exchanges also tend to be governed by the status they enjoy based on their size, characteristics of their employees, the number and type of clients they serve, and the prestige in the community. The organisation which concerns itself with most desired values tends to enjoy a higher status than the one which deals with a replaceable and relatively easily accessible commodity. A large sized organisation, which has a greater resource autonomy and influence, is also rated higher. The relative availability of employees, the length of their training, and their social and economic attributes, also contribute to the status ranking of the organisation. Thus, a department in the public bureaucracy which employs an IAS officer certainly enjoys a higher status to one which is managed by a non-IAS officer. When the system of organisational stratification is well developed and the basis of ranking the organisation enjoys general consensus, organisations which are evaluated high in rank are generally more reluctant or more evasive on exchanges. (Stinchcombe, 1965: 172-180.)

The above framework seems very useful in analysing co-ordination in the Family and Child Welfare Projects. In other words, are the organisations, that are expected to enter into exchange around Family and Child Welfare Projects, interdependent?; do they have unequal status?; and is there efficient mechanism for controlling whatever exchanges are involved?

It had been stated earlier that co-ordination in family and child welfare projects is sought at the state and block levels. The State Social Welfare Advisory Board seeks to co-ordinate, at the state level, with the Department of Social Welfare, Community Development, Health, and Education. The chairman of the Board is the main co-ordinator at this level. The nature of the co-ordination required at this level may be best termed 'service integration'. The nature of interdependency among these organisations is unilateral. The State Social Welfare Advisory Board uses time, personnel, equipment, etc, of Health, Education, and Community Development Departments, and is not in a position to offer any such resources to them in return. The Community Development Department is required to instruct its block staff to co-ordinate their programmes with the functional committee of Family and Child Welfare Projects. Similarly, the Health Department is required to instruct its staff at the Primary Health Centre to lend assistance to the project. The Education Department is required to instruct its teachers to co-operate with the Mukhya Sevika and the other project staff. The State Social Welfare Advisory Board hardly contributes any resource in return towards these Departments. Consequently, they are very reluctant to co-operate with the Board at the the state and the block levels. In consequence, in most states, there is no co-ordinating mechanism functioning at the state level in respect of these projects. They rarely meet as a committee. Generally, the executive secretary of the State Board, on behalf of the chairman, contacts these departments whenever he faces a problem. The representatives of these departments consider the time they spend on these projects as a waste.

At the block level, the Family and Child Welfare Projects, as it has been stated earlier, consists of one main centre, and five sub-centres. The main centre and sub-centres have a provision for a Balvikas Kendra and a Griha Kalyan Kendra. The size of the staff of a fully developed project consists of five wokers and an annual budget of Rs 50,000. The project also has a jeep. Consequently, the project depends for nutrition, health, and educational service on the community development block, primary health centre, schools, and panchayat samiti. The projects depend heavily upon these agencies for services, material, personnel, etc. The only thing these agencies can obtain from the project is the jeep. Therefore, they make continuous demand for its use — sometimes for purposes other than those of the project. Consequently, the vice-chairman of the project, who is responsible for controlling the jeep, finds it difficult to permit its use for unauthorised purposes. This leads to considerable dissatisfaction and bickering among the project staff, panchayat samiti officials, block staff, and primary health centre staff, which make the co-ordination among the agencies difficult even otherwise.

The uneven statuses of the interacting departments also tend to contribute to a lack of co-ordination at the state level. The government departments enjoy higher status as public bureaucracy than does the State Social Welfare Advisory Board which is a voluntary agency. Most of these departments are headed by senior civil servants who belong to Indian Administrative Service, the most prestigious administrative service in the country in terms of established traditions, power, security, calibre, socio-economic characteristics of personnel etc. On the other hand, the SSWAB is a voluntary agency, headed by a voluntary social worker of some repute and staffed by an executive secretary who is not even equivalent to a Class II gazetted officer in the state government. He is a trained accountant, sometimes without a graduate qualification. The Heads of the Departments, therefore, feel it below their prestige to attend the meetings of the Inter-Departmental Co-ordinating Committee which is headed by the Chairman of the SSWAB. They resist going down to the officer of the chairman—which is generally in a building with meagre facilities — to attend the meetings. Thus, the inequality of status between the government department and the SSWAB also tends to contribute considerably to the problems of co-ordination in the Family and Child Welfare Projects. However, when the chairman is a member of the Legislature in the state or the wife of one of the ministers, the status of the Board is viewed differently by these officers, and they tend to be more willing to co-operate with the Board. For example, in one of the states wherein we had an opportunity to examine this issue in greater detail we found that the heads of the concerned government departments were most willing to co-operate to the Board's staff and activities when its chairman was also a member of the Legislature or was the wife of a minister. The attitude of the officers of these departments was distinctly different when a lady — however genuine a social worker she may be — without much political influence was appointed Chairman of the Board.

A similar situation is observed at the level of some of the functional committees. The Block Development Officer and the Assistant Surgeon of the Primary Health Centre represent the Community Development and Health Departments. They are usually class II gazetted officers in the state government. Thus, they have higher status than the Mukhya Sevika who is responsible for co-ordination of the programmes at the block level along with the Vice-chairman of the functional committee for the Family and Child Welfare Project. Consequently, the BDO and the assistant surgeon are not willing to work with the Mukhya Sevika because they perceive her to be much below their status. The chairman of the functional committee, who is a well-known politician in the area, is generally disinterested in the working of the project because he does not see much scope in it for expanding his political influence in the area since the resources of the project which are very meagre. Secondly, he tends to dominate the vice-chairman of the functional committee because he thinks that he has sole authority to decide on matters of the project since he is elected whereas the vice-chairman is nominated. This has created considerable strain in the working of some of these projects.

A third issue, as referred earlier, in the implementation of the Family and Child Welfare Projects is the role of the Mukhya Sevika. There are two Mukhya Sevikas on the project staff. One is appointed by the CD Block, while the other is appointed by the State Social Welfare Advisory Board. While framing the scheme of Family and Child Welfare Project, the Board gave the job outlines of the Mukhya Sevika which make her role very critical to the successful implementation of the project. She is required to perform the co-ordinator's role as the secretary of the Functional Committee; she is responsible for bringing together the services of the various agencies (panchayat samitis and panchayats, primary health centres, schools, extension centres, applied nutrition working in the block). She is responsible for the planning, and evaluation of programme activities. As an educator, she has to undertake a staff development programme for Balsevikas, Griha Sahayikas, and other auxiliary personnel. She is also responsible for organising women's education and education for voluntary leaders and workers. For effective implementation of the programme and for enabling the workers to play their role effectively, the Mukhya Sevika is also expected to (1) supervise the working of all the centres in the project effectively; (2) to help the subordinate staff with necessary guidance and help; and (3) to check periodically all the records, registers, and the stock maintained by the subordinate staff and the accountant.

Thus, the Mukhya Sevika is expected to play the various roles of organiser, educator, supervisor and co-ordinator. The Board has prescribed the following qualifications for the post of Mukhya Sevikas: (a) graduation from a recognised university, preferably, in Social Work or in Home Science; (b) an aptitude for work in rural areas; and (c) one year's experience of work.

It will be worthwhile to see how many Mukhya Sevikas employed in the projects fulfil these requirements. The report of the Evaluation Committee on the Family and Child Welfare Projects (1970) points out that 34 per cent of the Mukhya Sevikas have a graduate degree, 16 per cent have a post-graduate degree, and 50 per cent are non-graduates. Thus, one-half of the Mukhya Sevikas do not have even the minimum educational qualification prescribed for the post. It is perhaps for this reason that the Board has given considerable importance to the training of the Mukhya Sevika. The training has been entrusted to special training centres, expenditure on which is incurred by the UNICEF. The broad areas of Mukhya Sevika's training, prescribed by the Central Social Welfare Board, are as follows:

Theory: —

(1) Concept of planning and the salient features of the First Second and Third Plans,
(2) Indian Constitution and its salient features,
(3) Concept, objectives and purpose of the Family and Child Welfare Programme,
(4) Understanding of social and economic conditions of the rural community and possible effects of the programme of Family and Child Welfare Projects,
(5) (a) Institutional and non-institutional referral services; (b) Study of legislations affecting family and children,
(6) Study of the methods of working with villagers,
(7) Dynamics of human behaviour,
(8) Methods of promoting different organisations for furthering the programmes and co-ordination the different activities.
(9) Health services and family Planning: (a) for the family; (b) for the child; (c) family planning,
(10) Nutrition,
(11) Agriculture and animal husbandry,
(12) Home management,
(13) Mother craft,
(14) Pre-school education — organisation of Balwadis and creches.
(15) Youth programmes,
(16) Recreation,
(17) Services for children in need of

special care,
(18) Family relations,
(19) Utilisation of services of other departments,
(20) Developing teaching aids for Griha Kalyan Kendra,
(21) Supervision and guidance,
(22) Administration and co-ordination,
(23) Public relations,
(24) Maintaining of records and accounts.

The contents of field work curriculum consist of (a) two and a half hours per day of practical work in Balwadi, Griha Kalyan Kendra, etc; (b) field trips to the local ANP, panchayat, and other local training institutions; and (c) a study tour of seven days to visit the working projects. An analysis of the training contents indicates that adequate emphasis has not been put on preparing the Mukhya Sevika as an administrator and co-ordinator. Out of 24 items, listed three (Items, 8, 19, and 21) deal with co-ordination. The present training programme tends to suffer from several limitations: (1) in view of the contents to be covered, the period of nine months is very short, (2) adequate stress has not been put on preparing her for the role of co-ordinator and office manager. Field work content of the Mukhya Sevikas training is also very superficial and does not expose her to the real problems experienced in co-ordination at the block level.

What is needed to be taught to the Mukhya Sevika to prepare for her co-ordinative and managerial roles in social welfare? It seems that an executive in social welfare administration should be exposed to the following substantive areas:

(1) Purpose, nature and working of social welfare organisations,
(2) Nature, characteristics and working of formal organisations:
  (a) Theory, principles, and characteristics of bureaucratic organisations
  (b) Formal and informal aspects of bureaucratic organisations
  (c) Influence of social and economic factors on the nature and working of the formal organisation
  (d) Control, power, and influence in formal organisations
  (e) Integration of the individual in the formal organisation, problems and methods to handle them
  (f) Analysis of human relation model of administration, and its usefulness for social welfare administration
  (g) Theories of inter-organisational behaviour, with particular emphasis on co-ordination, and conflicts among organisations
(3) (a) Building organisations in disadvantaged areas
  (b) Approaches to organisational change
  (c) Organisational research
(4) Social welfare policy and the organisation and administration of Social welfare programmes
  (a) Organisation and administration of CD programmes
  (b) Organisation and administration of health services
  (c) Working of panchayati raj
  (d) Administration of educational services
  (e) Organisation and administration of social welfare and Backward Classes' programmes

The contents will provide the Mukhya Sevika with knowledge of the nature, principles, and the functional and dysfunctional aspects of the bureaucratic organisation; provide her skills to analyse and handle the problems arising out of conflicts of interests among the organisations and the attitudes, aspirations, and values of the personnel; provide her information on the working of various departments, participating in a co-ordinative relationship; and develop skills required to build and change organisations. It is, therefore, important that the contents of the Mukhya Sevika's training is reorganised to include these areas.

It seems that the time currently allocated for training for the Mukhya Sevikas is too short to permit enlargement of the contents. However, in view of the critical nature of her role in the project, no short-cut will be desirable. Consequently, it may be wise to make the training period of 15 months' duration. Further, the Mukhya Sevikas, who have worked for several years may be sent for advance training in social work — preferably to acquire specialisation in social welfare administration or family and child welfare, with a focus on administration of social welfare programmes.

USA 1990

THE National Industrial Conference Board, a business research organisation in New York, projects a 4.2 per cent rate of growth from 1969 to 1990 compared with 3.9 per cent from 1948 to 1969. The Board also predicts a decline in the growth rate of expenditures on research and development, a reduction of efficiency from the price rises which have occurred since the mid-1960s, an increase in the proportion of young and inexperienced workers in the labour force. Consumption expenditures by 1990 will account for about 60 per cent of total GNP, approximately the same proportion as in the last two decades. These expenditures should exceed $ 1.5 trillion in terms of 1971 price levels — a rise of 135 per cent in consumer purchases of goods and services. Government expenditures as a percentage of total output are expected to remain stable — approximately 24 per cent of GNP. Investment expenditures are expected to decline slightly from the 15 per cent of GNP held through the 1960s.

On Differential Rates of Interest

A K Dasgupta

A differential in rates of interest is justified on economic grounds. Since the banking system today enjoys a virtual monopoly of its service, and since a way can be found to prevent transfer of funds, discrimination between weaker customers and stronger customers is feasible within limits and is consistent with the principle of maximum profits.

It is also in conformity with the social objective of favouring the poor as against the rich, insofar as the elasticity of demand or credit is higher in the case of the former than in the case of the latter.

Since, further, the principle of maximum profit here relates to a monopoly, surrender of a part of such profits may also be permissible in respect of discrimination in favour of specially weak customers, so long as the rate charged does not fall below the marginal prime cost.

I

THE nationalisation of the major banks in 1969 immediately raised the question as to how far it would be possible for these banks to follow a policy of interest rate discrimination. Indeed, as I wrote elsewhere (*Frontier*, Special Issue, 1969), "the *raison d'etre* of bank nationalisation is that it opens up possibilities of allocation of finance more in conformity to the objectives of planning than would be expected from a private banking system". I pleaded for discrimination in favour of smaller industries and smaller farmers and against big business, arguing that such discrimination was not inconsistent with the maintenance of normal profit and "could be justified on economic grounds". It is the purpose of this paper to spell out the analytical considerations in support of the proposition.

This seems to be called for. On matters like this the tendency often is to pay rather excessive attention to social aspects. "Rich and Poor" dichotomy comes in as the guiding consideration, and "equity" tends to be the overriding objective of policy. The purely economic consideration is often played down. While I have general sympathy for this attitude, and while I agree that the justification of an economic policy must always be tested in terms of its implication for the poor who form the large majority of the population, I would not lose sight of the profit criterion, especially when the matter in question relates to the operation of a commercial undertaking. Redistribution of income on an equitable basis is the direct responsibility of the State. The legitimate instruments of such redistribution are taxes and subsidies. It is unwise to relegate the function to public undertakings whose efficiency has to be tested by other criteria, such as volume of output and the rate of profit on capital invested. Harm has often been done to our economy by the government mixing up non-economic objectives with the function of enterprises whose sole purpose should be to serve economic ends. The Electricity Boards are a case in point. If farmers are to be subsidised, the subsidy should come direct from the State and not in the form of free or near-free finance, even as it should not come in the form of free or near-free supply of electricity. Government policy must not be permitted to be made an excuse for the failure of a public enterprise to show adequate profit. On the other hand, if its normal profit motivation leads up to the attainment of other socially desirable objectives, then a public corporation must be encouraged to make the fullest use of the latter. If the question of differential interest rates came up for consideration after the nationalisation of the major banks, it is because conditions were created under which it was thought it would be a feasible proposition for our banks to embark on a policy of discrimination in favour of small farmers and small industries while lending, and in favour of small depositors while borrowing, consistently with the realisation of maximum profit.

II

Interest is a price for borrowing and lending. A bank borrows low and lends high and makes profit out of the difference between the two rates. Banks can discriminate as between different groups of borrowers and lenders, first if they form a monopoly in respect of the services rendered, and secondly if the services rendered are not capable of being transferred from one group to another. The first condition is easily fulfilled — our banking system is virtually in a state of monopoly. A question does arise in respect of the second condition.

A transfer of funds from one group of customers to another is profitable so long as the rate of return that the former expects from investment is at all lower than the rate of interest offered by the latter. Suppose *A* is a favoured customer who is entitled, according to our scheme of differential rates, to loans at, say, 4 per cent per annum, while *B* happens to be one who is discriminated against and has to pay, say, 16 per cent per annum. *B* will then be prepared to take a loan direct from *A* at anything less than 16 per cent per annum. On the other hand, if the rate of return that *A* expects from his investment is, say, 8 per cent per annum, then he will be prepared to transfer the fund that he secures from the bank at anything more than 8 per cent per annum. These two rates therefore set limits within which there may be direct loan transaction between *A* and *B*. *A* borrows money from the bank at 4 per cent per annum, finds that if he invests it he gets a return of, say, 8 per cent per annum, whereas by transferring the amount to *B* he gets a return of, say, 12 per cent per annum. Both the parties make a gain; in this particular case each makes a gain of 4 per cent per annum. It is only if *A's* expected rate of return from investment is as high as 16 per cent per annum that this possibility is eliminated. But if this happens, would *A* be considered a "weak" customer after all? Surely, the case for favouring a borrower arises specially when, considering the yield from investment, the prevailing rate of interest is too high for him.

Now we have so far ignored the cost of transfer. It is clear that if transfer is costless, arbitrage operations prevent a successful implementation of the policy of differential rates of interest. However, the transfer of funds from the favoured group of customers to the non-favoured group is not altogether free from obstacles. The fact that, even as it is, differentials do exist in the banks' loan rates (the

small-scale industries enjoy a concession of around 1 per cent relatively to the normal rate and certain priority sectors, such as exports, of around 3 per cent) is evidence that transfer is not free. First, there is a certain obstacle arising from inertia on the part of the stronger customers; unless the differential is large, these customers would not find it worthwhile resorting to a clandestine deal. Secondly, the small customers are usually scattered and they lack organisation for such deals. Thirdly — and most importantly — there is the fear of detection.

It is this last that the government has to lean on if the policy of differential interest rates is to be made a success. The object is to reduce the scope of gain from transfer. In the foregoing example, the range of profitable transfer from the point of view of the favoured customer, as we have seen, is between 8 per cent and 16 per cent per annum. Any rate between these limits will yield a gain, its distribution between the two parties depending upon whether it lies towards 16 per cent or towards 8 per cent. But if such clandestine transfers are punishable by law, and if the risk involved is assessed by the parties concerned at 8 per cent per annum or more, then the gain vanishes.

While, therefore, a small differential of 2-3 per cent per annum can safely be maintained by banks in view of natural obstacles, such as inertia or organisational limitations, the widening of the differential to an appropriate range would require putting up a legal obstacle, aided by supervision by banks.

III

What is this appropriate range? A Committee of the Reserve Bank of India went into the question a year ago. The recommendation of the Committee is not unanimous. The majority are on the conservative side. While conceding the need for concessional rates for weaker borrowers, they recommend retention of the present rate for the general body of borrowers, with a concession of around 2 per cent per annum for the weaker borrowers. A loan rate of 12-13 per cent per annum is considered to be difficult. On the other hand, it is contended that a very low minimum rate could not be sustained, unless it were covered by a high maximum. The majority thus contemplate a range between 8½ per cent and 10½ per cent per annum. Ashok Mitra in his dissenting note goes to the other extreme and recommends a range as wide as 1 per cent to 20 per cent per annum. The distribution of finance, he argues, is to be arranged in such a way that the average rate remains more or less the same as obtains currently — the losses at the lower end being just recouped by the gains secured at the upper end of the scale. Apparently, the note rules out the possibility of inter-group transfer of funds.

It was naturally difficult for the government to take a decision on the basis of these conflicting points of view. It was, however, proposed that, while the question of the maximum would be left open for the present, the public sector banks would be asked to start with a concessional rate of 4 per cent per annum (i e, 2 per cent below the Bank Rate) for a selected group of borrowers. It is to be a "modest beginning", and is to cover, as a minimum, ½ per cent of the previous year's aggregate lending of these banks. It is urged, however, that it is the intention of the government in due course "to make the differential interest rate policy one of the important instruments for reducing disparities in income and wealth" (statement of the Finance Minister to Parliament).

It is indeed difficult precisely to indicate the appropriate range of interest rate differential from the point of view of feasibility — the banker's intuition based on experience is a better guide in the matter than the economists' hunch. Nor is it a worthwhile exercise asking what rates would serve most the cause of "social justice". The criterion of profit, however, does provide rules for the guidance of the bankers in respect of the fixation of differential rates, insofar as they are found feasible. I would suggest the following rules, confining myself to loan rates only.

(1) Even at the lowest end of the scale, the loan rate must not be lower than the prime cost of lending, i e, to say, the deposit rate plus incidental expenses, such as stationery, etc.

(2) If the deposit rate rises with increasing pressure on savings, or if there is discrimination here, too, so that it is different for different classes of borrowers, the highest deposit rate is to be the base setting the lowest limit for loan rate.

(3) The customers being classified into well-defined sectors, the rates should be fixed for the various sectors according to their respective elasticities of demand for credit. A relatively low rate is to be fixed for sectors having a relatively higher elasticity of demand, and *vice versa*.

(4) The availability of credit should be controlled so as not to violate Rule (1). Which means that the supply of credit in each sector should be limited to an amount for which the marginal cost of lending is equal to the marginal receipts from lending.

These are rules derived from the theory of monopoly price discrimination. There is, however, one deviation. While at the upper end the rates are fixed at the level of demand price, at the lower end the rates are permitted to be fixed at the level of marginal prime cost (or marginal receipts) and hence *below* the demand price. It is this latter that calls for Rule (4). The deviation proposed permits a widening of the range of differentials in interest rates beyond what would be the case if the banks had gone in for maximum profits; in the present scheme a part of their "monopoly" profits is surrendered in favour of the weaker customers, while no loss is incurred in any individual transaction.

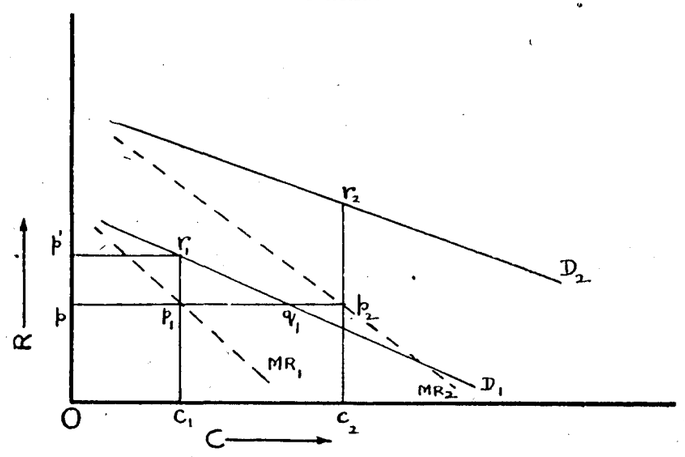
IV

It is presumed here that elasticity of demand for credit is high to the poor customers and low to the rich customers. For it is then that the sort of discrimination that is justified on economic grounds is also the sort that conforms to our social objective. What is the warrant for this presumption? Why should we take it that the small farmers in the rural sector, for example, have a more elastic demand for credit than, say, the big industrialists in the urban sector? There is no doubt that this is a matter that has to be empirically verified. Yet the presumption is not without some basis in the facts of our situation. Historically, the rural sector has suffered from exorbitantly high rates of interest at the hands of the village money lenders, while the urban sector has been fed by a well-organised banking system which has kept the rate down to an artificially low level. Until recently, the loan rate of our scheduled banks used to be of the order of 6 per cent per annum — the Imperial Bank of India had a special class of clients in the top echelon to whom it used to charge only 4 per cent per annum. On the other hand, in the rural sector, the

money lender's rate even today will be anywhere between 30 and 40 per cent. The result has been a relative over-capitalisation in the industrial sector, while the agricultural sector has gone on in its primitive way. The imbalance in the technologies employed in the two sectors can be explained, partly at any rate, in terms of the peculiar interest rate structure that prevails in our economy. While, therefore, the marginal productivity of investment has less tendency to decline in the agricultural sector, its general level is such that most farmers would find the normal loan rate charged by the banking system to be too high. At any interest rate which is realistic from the point of view of these farmers, the elasticity of demand for credit can thus be taken to be higher in the agricultural sector than in the organised industrial sector.

Now, there is a certain paradox here which needs being resolved. Do not these farmers, one may ask, borrow from money lenders at a rate of interest at least three times as high as the rate that prevails in the organised market? How, then, are they the weaker customers that we are taking them to be? The answer is that, although they borrow at higher rates, these rates have very little to do with the paying capacity of our farmers, as judged by the productivity of investment. It is indeed a vicious circle in which borrowing and lending proceed in our rural economy. The money lender charges an excessively high rate on loans on the ground that it has to cover the default risk. On the other hand, default is inevitable because the rate charged is too high for our borrower to be able to meet out of the surplus from investment even by reducing his subsistence to the minimum. The rates charged by the money lenders are thus spurious rates, well above the maximum rate of return that could be squeezed out of investment on land. Enforcement of these rates leads only to a transfer of assets and the total impoverishment of the borrower; the purpose of borrowing and lending is frustrated. If the incidence of default has to be minimised, the rate of interest has to be brought down to a realistic level. And this must have relevance to the yield from investment on land.

To sum up: A differential in rates of interest is justified on economic grounds. Since the banking system today enjoys a virtual monopoly of its service, and since a way can be found to prevent transfer of funds, discrimination between weaker customers and stronger customers is feasible within limits and is consistent with the principle of maximum profits. It is also in conformity with the social objective of favouring the poor as against the rich, insofar as the elasticity of demand for credit is higher in the case of the former than in the case of the latter. Since, further, the principle of maximum profit here relates to a monopoly, surrender of a part of such profits may also be permissible in respect of discrimination in favour of specially weak customers, so long as the rate charged does not fall below the marginal prime cost.



V

So far so good. We have a guiding principle for determining the limits of differential interest rates. Can we go a step further and indicate the order of the minimum and maximum rates, considering the conditions of the market? As regards the upper limit, the guideline, it appears reasonable to suggest, would be the rate at which companies accept deposits from outside the banking system which often goes up to 12 per cent per annum *plus* brokerage. Considering the fact that such deposits are restricted to limits prescribed by the Reserve Bank of India, one could perhaps put the upper limit a little above it, say, at 15 per cent per annum; there does seem to be traffic, at the upper layer, which can bear this rate. At this level of approximation, it is not difficult to define the lower limit either. It is true that deposits are not homogeneous and that the average cost of borrowing differs from bank to bank, depending upon the proportion that current deposits bear to time deposits; there is thus no smooth line showing the variation in the marginal cost of borrowing with increases in the supply of deposits. Nevertheless some kind of a guideline is provided by the Reserve Bank Rate for borrowing by commercial banks and also by the banks' own time deposit rate at the upper margin. Now, these two coincide at 7 per cent per annum if borrowings from the Reserve Bank exceed a certain limit. Having regard, therefore, to the fact that an offer of credit at concessional rates will eventually create a substantial expansion in the demand for credit, one would be inclined to put down the lower limit for loan rate at 7 per cent *plus*, to allow for other elements of prime cost.

Now, a range of differential in interest rates between, say, 7½ per cent per annum and, say, 15 per cent per annum is a wide enough range — the widest perhaps that canons of economic behaviour would justify. Whether, however, a differential of this dimension is operationally feasible or not, considering the possibility of transfer, only practice will show. A lower limit of 1 per cent, as suggested by Mitra, or even 4 per cent as announced by the Finance Minister in Parliament, may have an emotional appeal; it has little basis in economic theory. "Buy high, sell low" is bad economics anyway; it is a particularly offensive maxim when, as in the present case, the bottleneck lies in limited availability of credit and not in insufficiency in the demand for it.

Distribution of credit is a delicate

DIAGRAM

operation. Its success depends upon the degree in which it caters to allocative efficiency in the economy. Distributional considerations are important; but let them supplement the rule of efficiency, not supplant it. Let not banking be yet another prey to the decommercialisation of a commercial service.

A Diagrammatic Note

The analysis in the text can be conveniently exhibited on the usual textbook Diagram as shown.

The volume of credit (C) is measured along the horizontal axis, and the demand price of credit (R) is measured along the vertical axis. Two sectors *A* and *B*, represent the two ends of the market in respect of the capacity to pay — the rural sector and the urban industrial sector respectively. D_1 is the demand curve and MR_1 the corresponding marginal receipts curve relating to *A*. D_2 is the demand curve and MR_2 the corresponding marginal receipts curve relating to *B*. The marginal prime cost of lending in relation to the aggregate of credit is Op (=7½ per cent, say). The "no loss, no profit" margin is at p_1 for *A* and at p_2 for *B*. The corresponding demand prices are c_1r_1 and c_2r_2 — prices at which profit is maximised. If, however, *A* is given a special concession and the price charged is c_1p_1 (=Op), and not c_1r_1, there is excess demand for credit amounting to p_1q_1. The elasticity at r_1 is greater than at r_2, or, in other words r_1p_1 is less than r_2p_2. The rate, c_2r_2 (= 15 per cent, say) is thus higher than c_1r_1, and c_1r_1 higher than c_1p_1 The scope for profitable inter-sector transfer, if cost of transfer is ignored, lies between c_1r_1 and c_2r_2, and not between c_1p_1 and c_2r_2. Profit surrendered to give special benefit to *A* is pp_1r_1p'. Interestingly, if Mitra's dictum — "What the traffic can bear, the traffic must be made to bear" — were adopted *in toto*, there would be no surrender of profit, and *A* would be charged c_1r_1!

[The construction of the Diagram is due to S Natarajan, Senior Research Officer, Central Pay Commission.]

Is There an Alternative to Radical Land Ceiling?

G Parthasarathy
K S Raju

M L DANTWALA raises two pertinent questions relating to ceilings on land holdings ("Socialism at the Grass-roots", May 20, pp 1017-18): (1) is this necessarily the most radical and the prior-most programme in the prevailing situation? and (2) what is its relevance in relation to elimination of the rural poverty, since no land legislation, however drastic, will provide even an acre of land to a small proportion of the landless labour population?

The suggested alternatives to a radical programme of redistribution of landed wealth are several, and many of them have been in fact tried and found wanting in the existing pattern of agrarian structure. Tenancy legislation resulted in large-scale eviction of tenants and black market rents. Minimum wage legislation is a dead letter. It is simple economic logic that given high concentration of the land factor rewards cannot be influenced in favour of the labour class by legislation. The benefits of Public investments in agriculture go more to the landed than to the landless. Public credit institutions have a built-in bias towards the richer strata in rural society. The operation of the government machinery is not free from the influence of the rural rich. Crash programmes intended for the benefit of the rural poor prove to be ineffective within the given agrarian structure. Private investments in wells, shifts to more labour using crops, reclamation of land, etc, of course, help the rural poor by increasing their employment. But large-scale private enterprise in agriculture finds labour management difficult and shifts to labour saving machinery, even if wages are low, nullifying any favourable effects of investment on employment. The rural rich use their political power to stall any progressive tax measure, the proceeds of which could be used for the benefit of the rural poor.

Therefore, a radical programme of redistribution of landed wealth in favour of rural poor becomes compelling in densely populated agrarian economies. The rationale for this programme is obviously (1) eliminating remnants of feudal farming and preventing the growth of capitalist farming in agriculture, and (2) containing the millions of landless within the rural sector until they could gradually be absorbed in other avenues of employment. The concept of 'family holding' is a familiar one in the literature on land reform and the proposed levels are quite meaningful in terms of this concept. To argue for parity between the rural and the urban rich in fixing the level of ceiling is to question the need for structural changes in the economy, both rural and urban.

Not Enough By Itself

Dantwala is on much firmer ground when he affirms that the programme of land ceiling *per se* cannot give relief to the vast number of landless labour households. Taking the case of Andhra Pradesh, out of 7 million rural households more than 30 per cent are landless labour households. Even to provide an acre for a landless labour household, around 10 per cent of the total net area sown would be necessary. Statistics collected in the mid-sixties in the deltaic district of West Godavari show that 50 per cent of the land was possessed by 14 per cent of the farmers the average size of whose holdings was 23 acres.* These statistics suggest that if ceilings are effectively implemented, it is feasible to acquire 10 per cent of the net sown area as surplus through a programme of land ceilings: But assuming that 10 per cent of the gross income is transferred to the landless, around 2.5 per cent of the income which is appropriated as surplus by the former land-owners will now be transferred to the rural poor. Assuming that labour gets one-third of the total agricultural income, the transfer of surplus land will result in an overall rise of 7.5 per cent in the income of the rural poor. But not all surplus will accrue to them since compensation is being paid, and this will have to be collected possibly from them. If compensation works out to half the surplus the rural poor will have an overall rise in income of only 3.75 per cent. But if the surplus in Andhra Pradesh is only one million acres, a bare 3 per cent of the net sown area as the Communist Party of India estimates, the incomes of the rural poor will show a once for all rise of only 1.12 per cent. With much less surplus the impact will almost be negligible. These exercises are only illustrative and are intended to show that the surplus acquired through ceilings *per se* helps little to achieve the objective of uplifting the poor.

The most positive benefit from ceilings in the present context is not the redistribution aspect but the possibilities opened by even a limited nucleus land base for the rural poor to (1) implement the programmes directed to benefit the weaker sections more effectively, and (2) to launch programmes of labour mobilisation for development of rural resources and for promoting a better life for the rural poor. Redistribution of an acre of land or less to the landless poor, however politically attractive, is least desirable. Past experience of assignment of government land to the landless has shown in many places that such land is either leased-out or, much worse, sold for a song to others. This should not be repeated.

It is desirable to organise the land acquired through surplus into collectives of landless labour. The immediate step for this is a Consolidation Act by which the surplus land is consolidated into a single contiguous farm. The first responsibility of the extension agency at the village level is the development of the collective farm. The resources now available with several departments for the benefit of weaker sections could be routed through the agency of the collective farm. Most important, the collective farm of the rural poor should be the main agency through which labour for all public works, now undertaken by contractors, should be drawn and ultimately settled in non-agricultural occupations. Thus this will bring about radical changes in the organisation of labour for public works. Whenever irrigation projects are undertaken at public cost in the dry areas land should be acquired from private individuals in return for supply of water and on such land the labour drawn from collective farms should be settled. All this will mean socialist planning at the grass-roots level, and without commitment of the elite to the needs of the rural poor it will be a difficult task. The nucleus land base, available from the surplus acquired through ceilings, will generate the forces from among the rural poor themselves to ensure such a commitment.

FROM THE CHAIR

The Sandur Manganese and Iron Ores Limited

Speech of the Chairman and Managing Director, Mr Y R Ghorpade

THE following is the speech of the Chairman and Managing Director, Mr Y R Ghorpade, at the Eighteenth Annual General Meeting of The Sandur Manganese and Iron Ores Limited, held on June 30, 1972.

GENTLEMEN,

The production of manganese ore in the year 1971 increased to 2.61 lakh tonnes from 2.34 lakh tonnes in 1970 and 2.05 lakh tonnes in 1969. In 1972, the production of manganese ore is expected to be still higher and exceed 3 lakh tonnes during 1973. It may be recalled that in my speech last year, I had stated that every effort will be made to stabilise our manganese ore production and exports at a level of about 3 lakh tonnes per annum which is about six times the Company's annual manganese ore production before 1960 and about three times the annual production during 1960-65. Bulk of this ore is exported to Japan and some to Europe. It is being examined whether it would be possible to ultimately aim at a production of about 4 lakh tonnes of all grades of manganese ores in response to the Japanese market. Sandur manganese ore is now as well established in Japan as in Europe.

Manganese ore shipped during 1971 is 2.40 lakh tonnes as against a production of 2.61 lakh tonnes. Some shipments had to be postponed to 1972 at the request of our Japanese buyers and as a result of the Indo-Pakistan war. In the year 1972 also our level of production is likely to be somewhat higher than the shipments. This will enable the Company to build up adequate stocks for better co-ordination between production, railing and shipment and quality control. Every effort is being made to ensure that quality does not suffer as a result of increased production. It is gratifying that the out-turn analysis results of the shipments of manganese ore during the first quarter of 1972 have been well above the guaranteed minimum. The problem of increasing overburden is also being tackled. The two traxcavators commissioned in February 1972 will help in the removal of overburden at a faster rate resulting in higher production. The scope to further strengthen the mining equipment and transport facilities at the mines is being actively considered.

In the next year or two both our level of production and shipment of manganese ore will have to be stabilised at a level of about 3 to 3.5 lakh tonnes. Every effort will be made to reach an average of 3 shipments per month. This means not only adequate railings but adequate facilities at the port of Mormugao from which this ore is being shipped. With the development of the Mormugao outer harbour, the present mechanical ore handling plant could be made available for loading manganese ore. This would considerably quicken the pace of manganese ore shipments at Mormugao. Generally speaking, with the growing international competition, better ore handling facilities at ports becomes inevitable to safeguard the competitive position of all Indian ores. The Government of India should give adequate attention to port development during the Fifth Plan period to enable sufficiently large ships to be loaded at a faster rate, thereby reducing the sea freight for Indian ores to the same level as for ores from other parts of the world.

Smiore is conscious of the fact that manganese and iron ore production is and ought to be labour intensive and employment oriented. We are, therefore, determined to do as much manganese and iron ore production as is

economically feasible, keeping in mind rail, shipping and other available facilities. Apart from maximising manganese ore production, the Company is examining the possibility of undertaking large-scale mining of iron ore. For this purpose, Smiore has already entrusted the Indian Bureau of Mines to prepare a feasibility report for the production and export of about one to two million tonnes of iron ore per annum from the Company's mining areas. Our friends in Japan are likely to be interested both in our manganese and iron ore development in a big way. This is fully in line with the country's effort to increase exports and earn more foreign exchange. Side by side and as a part of an integrated programme, the Company has planned to expand its electrometallurgical industry.

Further Expansion

The 15,000 KVA electric pig iron furnace of the Sandur Metal and Ferro Alloys Plant near Hospet had to be shut down for about 8 to 9 months during 1971 for the purpose of relining. The furnace had functioned satisfactorily during 1969 and 1970. The requisite refractory material for relining was not readily available. There was great difficulty in this regard. The refractory material required to completely reline the furnace had to be specially manufactured within the country. However, advantage was taken of this extended shut down period to modify the furnace, incorporating certain latest developments in furnace technology, as a result of which the furnace is now giving a 10 per cent higher production compared to the years 1969-70. Production of pig iron in 1972 is expected to be 36,000 tonnes as against 33,991 tonnes in 1970 and 31,604 tonnes in 1969. This amounts to 100 per cent utilisation of licensed capacity. But there has been a steep increase in prices of raw materials, particularly coke and electrode paste and this is seriously engaging the attention of the Company. Smiore has developed considerable technical expertise and experience which is now one of its main advantages in launching on further expansion.

During 1971, the Company incurred a net loss of Rs 40.3 lakhs before depreciation and taxation as against a profit of Rs 40.4 lakhs in 1970. After depreciation and amortisation the loss for the year is Rs 67.2 lakhs. This was mainly because of the long shut down of the pig iron furnace for about 8 to 9 months upto September 1971. In spite of this, the Company repaid loans and deferred payment liabilities to the extent of Rs 12.74 lakhs in 1971. The Bank of India and the Industrial Credit and Investment Corporation of India Ltd, have kindly agreed to reschedule loan repayments in view of the plant shut down in 1971. However, the furnace is functioning very satisfactorily from September 1971 and the Company expects to make up by 1974 the loss incurred in 1971.

The Company is also going ahead with its programme of further diversification and industrial expansion. It has a Letter of Intent for the production of 24,000 tonnes of ferrosilicon per annum. The ferrosilicon project report, prepared by the Company, for the installation of two 20,000 KVA furnaces for an annual production of 24,000 tonnes of ferrosilicon, has already been submitted to the financial institutions, *viz*, Industrial Finance Corporation of India, Industrial Credit and Investment Corporation of India, Industrial Development Bank of India, Life Insurance Corporation of India and the Unit Trust of India. The estimated capital cost of the project is Rs 4 crores and is expected to be financed by the issue of fresh capital of Rs 1.5 crores and loan finance of Rs 2.5 crores. Foreign exchange component of the project is Rs 1.07 crores. The Company has already made applications to the Controller of Capital Issues and the Controller of Imports and Exports in this regard. The Mysore Government have agreed to supply a minimum of four lakh bags of charcoal per annum. The balance of reductants may have to come from other alternative sources. In view of the Company's substantial manganese ore export performance and programme, it may be possible to consider the import of some quantities of metallurgical coke of the best quality, with the approval of the Government of India, in order to maximise technical efficiency and production. The Mysore State Electricity Board has agreed to supply the necessary power on a long-term basis at the present HT-1A tariff. This increased power rate will be economically feasible in view of the higher profitability of ferrosilicon compared to pig iron. Completion of the ferrosilicon project will further diversify the Company's production and make the Metal and Ferro Alloys Plant more broad-based and viable. As per the time schedule drawn up for the implementation of this project, the two ferrosilicon furnaces, each of 20,000 KVA capacity, are expected to go into production by middle of 1974. After the commissioning of this project, Smiore will have three electric furnaces in all, including the existing pig iron furnace, and will no longer suffer from the disadvantage, which it acutely experienced in 1971, of functioning with only one furnace.

With regard to labour welfare amenities, the Company has tried to do its utmost. The Life Insurance Corporation of India have sanctioned a loan of Rs 25 lakhs to the Company towards construction of a modern colony for employees of the Metal and Ferro Alloys Plant. The Company has also applied to the Mysore Housing Board for financial assistance for constructing houses for its mining labour. The Company has a mining force of nearly 3,000. Efforts are also being made to augment the drinking water supply at the mines which gets depleted during summer months. The Company has revised the pay-scales of its employees both at Mines and at the Metal and Ferro Alloys Plant from January 1972 as a result of which the annual wage bill increased by Rs 6 lakhs.

Significant Landmark

The inauguration of the work on the Vijayanagar Steel Plant by the Prime Minister on 14th October 1971 marks a significant landmark in the economic development of Sandur, Bellary District and the State as a whole. The Government of India have now indicated that this two million tonne steel plant will cost as much as Rs 750 crores. I am sure the State Government will take all steps to ensure that this steel plant is completed as expeditiously as possible. Now that the Mysore Government has sanctioned the Taranagar multipurpose irrigation project, we could reasonably expect the National Mineral Development Corporation to commence work on its proposed two million tonne pelletisation plant costing Rs 25 to 30 crores in the valley of Sandur. The Mysore Government has agreed to meet the water requirements of this public sector pelletisation plant from the Taranagar project. All this will naturally result in a lot of ancillary development and employment in Sandur and the adjoining areas. This is a matter of great satisfaction to all those who have worked for the modernisation and development of Sandur which is destined to play a significant role in the progress and prosperity of our State and the country.

Shri M Y Ghorpade has resigned as the Joint Managing Director of the Company on his appointment as Finance Minister of Mysore State. The Board of Directors wish to place on record their appreciation of the valuable and signal services rendered by Shri M Y Ghorpade to the Company since its inception in 1954 and wish him every success in the discharge of the high responsibilities that he has been called upon to shoulder at this crucial juncture in the service of the State.

Y R Ghorpade

Yeshwantnagar
30th June, 1972

Mahindra Ugine Steel Company Limited

Statement of the Chairman, Mr Harish Mahindra

THE following is the Statement of the Chairman, Mr Harish Mahindra, to the Members on the occasion of the Ninth Annual General Meeting of the Company held in Bombay on June 26, 1972:

Political and Economic Outlook

The year 1971 was a difficult and eventful one for our country. It was the most tumultous year in certain respects after we attained independence. Under the inspiring leadership of our Prime Minister Smt Indira Gandhi, in our hostilities with Pakistan, we were able to register a victory for truth, liberty and democracy, the ideals which we cherish so dearly. It was a Dharmayuddha in the real sense of the term and it was a unique kind of a war, which resulted in the creation of an entirely new nation.

It is more than two months ago that we have had the fifth general elections to the State Assemblies. In almost all the States stable Governments have been formed by one and the same party, which is in power at the Centre. This should herald a period of political stability in the country and also a certain measure of uniformity, coherence and consistency in various economic policies. This is also the right occasion to concentrate on the foremost problems before the country and for implementation of various programmes for solving the over-riding issues of poverty and unemployment.

The ruling party is engaged in discussing certain far-reaching radical reforms. Many of us here at the moment have little doubt as to which way we are heading in the realisation of our desire for a socially and economically more egalitarian society. Most of our economic policies which decisively set the pace and pattern of economic development still suffer from ambiguity, nebulousness and anomalies.

Certain basic lessons in economic development which we learnt from the past are being ignored in the rush and tumble of events. While it is true that growth in GNP does not necessarily mean an improvement in the living standards of the masses, we cannot afford to go to the other extreme and decry rapid growth which we must have at all costs. While it is essential that we introduce equalisation measures, as one of the solutions to the contentious problems of poverty and unemployment, such a solution, however, does not necessitate the slackening of our development efforts for one reason or the other. On the contrary, an accelerated rate of development will in fact reduce the intensity of the problem.

While, I for one, welcome the radical measures initiated or contemplated by the powers that be, I feel that this should not become an obsession with the planners to the detriment of the growth of the economy as a whole. Although it is a truism and platitude, I would like to reiterate that only through implementation of massive labour intensive schemes such as construction of national highways, bridges, interlinking of inland waterways etc, the seemingly intractable problem of unemployment can be overcome.

Budget 1972-73

The Budget for 1972-73 has been rather disappointing for the corporate sector which had looked forward to certain development-oriented taxation measures. Contrary to the expectations of the corporate sector, the Government has withdrawn the allowance of a special deduction of an amount equal to 5 per cent of profits of domestic companies engaged in the priority industries. Conversely, the surcharge on corporate tax has been enhanced from 2½ per cent during 1971-72 to 5 per cent in the current year's Budget.

It is not these imposts that are causing concern. It is on the other hand what the Budget has failed to offer to enliven the investment climate has been a source of anxiety. I refer here to my previous statement to you wherein I had taken the position that the abolition of Development Rebate after 31st May 1974 would positively hinder capital formation. The same view has been continued to be echoed and stressed by various other persons and organisations. The Finance Minister has reiterated on several occasions that there is no possibility of revival of Development Rebate in its original form. However, it now appears that the Government is searching for a suitable substitute so that the withdrawal of the Development Rebate does not have a negative impact on investment policy and an inhibiting effect on the growth of industrial activity in India. I would plead for the reconsideration of the question of withdrawal of Development Rebate because I do not share the view that the Development Rebate contributed in any way to over-capitalisation as argued by its detractors. No management worth its name, while planning the capital structure of a Company, would deliberately over-capitalise only for the sake of availing itself of the benefits of Development Rebate. If Government feels that Development Rebate cannot be reinstated, I would suggest that either accelerated development rates should be allowed or grant of initial investment allowance as prevailing in other countries should be given as a corrective factor to counteract the rise in replacement costs of plant and equipment. If the Government is serious in directing industrial investments into so-called backward areas, it would be well advised to retain the incentive of Development Rebate at least for projects located in such areas. In the context of all these tax reforms and measures, the most important factor to be kept in mind is that what is at stake is not the growth, expansion, prosperity or adversity of a few organisations, but the very industrial development of the country itself.

Working Results

Coming to the affairs of our own organisation, I am sure you would have observed the very satisfactory and marked increase in the sales of your Company and the consequent surplus position obtaining therefrom from the Directors' Report and Accounts for the year ended 31st December 1971. We

were able to achieve an increase or more than 26 per cent in the income from sale of products and other income which is gratifying by any standard. The increase was of the order of about Rs 2.188 crores from Rs 8.265 crores. In terms of quantity, the output of saleable finished products increased to 31,836 tonnes — an increase of approximately 22 per cent over the previous year's output.

The turnover during the first five months of the current year has worked out to Rs 427 lakhs as against Rs 429 lakhs in the corresponding period of 1971. The order load at the moment is quite satisfactory and we expect that the inflow of fresh orders would be at the same levels as in the past.

Expansion

You are aware that we had received some time back an expansion licence permitting us to produce tool, alloy and special steels of all types, grades and categories (with the exception of sheets and plates) upto 36,000 tonnes per annum of finished steel. After a detailed study, your Company had come to the conclusion that additional capital outlay for implementing the expansion of the existing capacity of 24,000 tonnes to 36,000 tonnes per annum would be disproportionate to the incremental return on the extra output of 12,000 tonnes, particularly as the prices for arc furnaces, blooming mill, etc, had registered a phenomenal increase since 1968. After considerable deliberations and advice received from our collaborators proposals for expansion of the productive capacity of the plant from 24,000 tonnes to 60,000 tonnes per annum in terms of finished steel were initially submitted to the Government on 9th June 1970. Our expansion scheme as submitted to the Government is more in the nature of quantitative expansion inasmuch as product diversification is covered by the licence already held by us.

So far as the overall position of Alloy and Special Steel is concerned, the recent projections of NCAER and market surveys of different Agencies have proved beyond doubt that by 1980-81 there would be a substantial gap between the estimated demand and availability and especially in respect of Alloy and Constructional Steel, the gap would be quite appreciable. To ensure a balance between the demand and availability by 1980-81, additional capacities would have to be necessarily planned and action initiated as expeditiously as possible having due regard to long gestation period.

Basically, there is an acceptance by the Government that priority should be accorded to the expansion of the existing Steel Plants over the establishment of new Plants for three principal reasons *viz*, (1) The cost of expansion would be appreciably lower than construction of a new Plant, (2) Expansion would be comparatively less time-consuming and (3) Economies stemming from larger scale of production would render some of the existing Units more viable. For instance, it has been reported that the Steel Ministry now admits that the investment costs per tonne of steel ingots for the proposed Vijayanagar and Vizag Steel Plants in the South would be almost double that of the cost involved for expansion of Bokaro or Bhilai. Whereas investment per ingot tonne for plants located on green-field site is expected to vary between Rs 3,750 and Rs 4,000, the corresponding capital cost on identical basis for expansion of the capacity of Bhilai (from 2.6 million to 4.0 million tonnes) has been estimated at Rs 2,500 and, in the case of Bokaro, about Rs 2,160 (for expansion from 1.7 million to 4.0 million tonnes). The capital outlay on our project based on an annual capacity of 60,000 tonnes would work out considerably less than the corresponding capital outlay on new projects recently sanctioned by Government.

If we had received the approval of the Government to our Expansion Scheme within a reasonable period we could have taken advantage of the prices of plant and equipment prevailing in 1971 thereby saving a considerable amount of foreign exchange expenditure. Increase in the price of the plant and equipment in the Continent has been anywhere from 10 per cent to 15 per cent per year and the delay in going ahead with the Expansion Scheme will result in avoidable increase in the capital outlay, particularly in terms of foreign exchange.

Another factor which is in favour of expansion of a plant like ours is the shorter gestation period resulting in quicker displacement of imports and consequential savings in foreign exchange as well as larger earnings of foreign exchange through exports of alloy-steel-based engineering products.

Moreover, in respect of royalties, MUSCO's expansion would yield a distinct and recurring advantage from the point of view of National Exchequer in terms of smaller outflow of foreign exchange. Our Collaborators have agreed graciously not to charge additional royalty on any quantity beyond 36,000 tonnes. This advantage alone should weigh heavily in the minds of the Authorities in favour of our proposal for expansion of plant capacity upto 60,000 tonnes.

Summing up I feel that our Expansion Scheme is basically in consonance with the Government's thinking on the expansion of Mild Steel Plants. The social cost benefit of our scheme from a macro perspective is also too obvious to be emphasised. In spite of these advantages, the fact that our expansion scheme has been virtually kept in cold storage by the Government for nearly two years is rather inexplicable in the face of the avowed policy of the Government that units in the Private Sector are expected to augment the production of Alloy and Special Steels in the country. In these days when self-reliance, import displacement and rapid growth of economy are the cornerstones of our economic planning, we cannot afford to let industrial applications, based on sound techno-economic reasons, shrivel up in delays like this. I therefore fervently hope that the Government will accord its approval to our Expansion proposals without any further loss of time.

Scrap

Over the year under review, the capacity utilisation of Alloy Steel Industry has not been upto the mark. We have, as in the past, met with snags in the supplies of several of our most essential raw materials. In the case of scrap, the severity of shortage is fully manifest in the relentless surge in prices. It is desirable that scrap dealers voluntarily agree to exercise some restraint in the matter of scrap price increases. A recent study indicates that the requirements of scrap in 1976-77 would be double that of 1972-73, being of the order of 1.37 million tonnes. The supplies, however, are not growing at the same rate. From a nominal surplus position in 1970-71, we have today reached a stage when we have to start importing heavy melting scrap.

Even after measures are taken to improve scrap collection and scrap processing, there would still be a wide gap between scrap requirements and availability. It is, therefore, necessary to plan ahead, foresee gaps in supplies and attempt to bridge them by setting up sponge iron plants/metallised iron pellet plants.

Power

In respect of power, there are mainly two points which are of immediate relevance to the operations of your Company. The first relates to the apprehended serious shortage of power which is an essential input for melting operations, in the coming years. As you know, the present power situation in Maharashtra is not that comfortable and this situation is likely to continue unless immediate steps are taken to augment power generation. If I may say so, the Electric Furnace Industry, which is a power intensive one, has a share in the total generation capacity of only about 0.2 million KWs or about 1.5 per cent of the generation capacity or 2 per cent of the peak demand. We would, therefore, urge the authorities concerned to ensure adequate supplies of this essential input round-the-clock and all through-the-year. I would also suggest the creation of regional grids, which will help any Power Authority to take advantage of the ups and downs in the daily and seasonal peak demands, so that temporary shortages in one State may be made good by the temporary surplus in another State. Attention has also to be paid to the question of reducing energy losses in transmission and distribution. Hand in hand with these measures, there should be no slackening in the creation of fresh capacity for power generation.

A second and more urgent issue relates to the power tariff. At the moment the power cost for electric steel production in Maharashtra is almost prohibitive. I had referred in my previous statement that a Committee headed by the Industries Commissioner had been appointed by the Government of Maharashtra to enquire into this question. We learn that this Committee has recommended granting of exemption from Electricity duty to power intensive industries and bringing the tariff for power intensive units on par with those prevailing in States such as Mysore, Tamil Nadu, Gujarat and Madhya Pradesh.

Of late the Union Government is said to be advocating a concessional tariff of about 4.5 paise per KWH for purposes of encouraging Mini Steel plants in order to stimulate the growth of indigenous technology for sponge iron. Needless to say this is a move in the right direction and I only hope that the Maharashtra Government will act quickly in the matter of restructuring the MSEB tariff for electro-metallurgical industries.

Exports

Although the indigenous output of Alloy and Special Steels is not sufficient to meet the requirements of the country, which position is likely to continue for a few years to come, there is, in my opinion, scope for direct export of certain types of Alloy and Special Steels. Of course, indirect exports of certain types of Alloy and Special Steels are taking place at the moment in the form of sophisticated engineering products. My submission to the Government is that those Alloy Steel Plants which have been able to establish reputation for consistency in quality should be offered adequate incentives for export of Alloy and Special Steels. Although initially the quantity which could be spared for export market would not be substantial, the efforts to find markets for such sophisticated products will pay dividends from a long-term perspective when the country's output of Alloy Steel will be sufficient to meet the entire domestic demand, leaving some exportable surplus.

Imports of Canalised Items

As I had mentioned in my previous statement, the imports of Graphite Electrodes, Refractories, Ferro Alloys, Heavy Melting Scrap, Sponge Iron and Nickel were canalised through Government Trading organisations. On this matter we have had an open mind despite our misgivings. Nevertheless, I am now constrained to say that our experience so far in the matter of our obtaining these imported materials has not been happy. Nor are we satisfied with the manner in which imports are arranged, the lead time for physical receipt of the material and finally the actual cost we have to incur for their supplies. The commission of the order of 5 to 7½ per cent of the CIF value charged by the Canalising Agencies is definitely on the higher side and by any measure, out of proportion to the actual costs involved in the import of such materials. A better way to calculate commission would be to work out the actual cost of imports and to charge about 1 per cent extra over and above such actual costs.

There is not much of a business-like-approach in arranging imports. The time taken for finalising firm orders is nearly 6 to 7 months, whereas it never ought to take more than 2 to 3 months. Secondly, to curtail such delays, regular live-wire contacts with the consumers for purpose of consulting them regarding the most desirable source of supply, prices, quality, specifications and so forth are lacking. I suggest that the Canalising Agencies permit the consumers to scrutinise the offers received by them so that they could identify the best offer without any undue loss of time. Such a procedure will also ensure that specification-wise the material ordered by the Canalising Agencies is strictly in accordance with their requirements. The time lag involved between the date of the application for release order and the physical receipt of the canalised material is such that the expressed intention of the Government that the consumers could get their half-yearly requirements on a replenishment basis is defeated. Timely receipt of the materials is a *sine qua non* for keeping the wheels of production running. Clubbing all release orders for small values entails a certain amount of delay in placing the final orders with the foreign suppliers, completely upsetting the delivery requirements of the consumers. There is, therefore, a *prima facie* case for Canalising Agencies issuing letters of authority in favour of consumers to import on their own wherever the value of each individual release order is less than Rs 50,000.

Collaborators

The Shareholders will be glad to know that there has been a merger effective from 1st January 1972 between our Collaborators — Ugine Kuhlmann and Pechiney Group in France. This merger has resulted in the creation of a super conglomerate with an annual turnover of 2.7 billion dollars—according to various rankings, this new undertaking shall be number one in France and will be one of the top ten companies outside the United States. As a result of the merger, the assets and industrial activities of various companies belonging to Pechiney and Ugine Kuhlmann Group have been regrouped within the seven divisions, *viz*, Aluminium, Copper, Special Steel, Ferro Alloys, Chemicals, Special Products and Nuclear Products.

Our association with Pechiney Ugine Kuhlmann opens up new vistas for close co-operation and collaboration in several fields whereby we can make fuller use of our financial and manpower resources and the expertise we have been able to build up within our own organisation. With a view to selecting some of the products within the gamut of activities of Pechiney Ugine Kuhlmann for eventual manufacture in the country, it is proposed to establish a Merchandising Division to acquire the necessary skill and experience in marketing PUK's products and sale of their techniques to third parties in India wherever considered necessary.

Before I conclude, I would like to express my sincere appreciation of the unstinted efforts put in by your officers, staff and workers in setting new records. I am also grateful to my colleagues on the Board for their sound advice and counsel. We are also indebted to Ugine Aciers for providing technical assistance in solving some of the production problems and in establishing new grades of steel.

Note: This does not purport to be the record of the proceedings of the Ninth Annual General Meeting of the Company.

The Indo-Burma Petroleum Company Limited

Statement of the Chairman, Shri Kamaljit Singh

THE following is the text of the statement of Shri Kamaljit Singh, Chairman, The Indo-Burmah Petroleum Co Ltd, delivered at the 64th Annual General Meeting held at Calcutta on June 29, 1972.

LADIES AND GENTLEMEN,

It gives me great pleasure to welcome you to this meeting today. The Directors' Report, Balance Sheet and Profit and Loss Account for the year ended 31st December 1971 have been in your hands for some time, and with your permission, I take them as read.

As I mentioned to you last year, the association of your company with the Indian Oil Corporation commencing from January 1970 has helped to improve the working results of your company. The Table below shows the position for the last three years.

It has been possible to recommend a total dividend of 18 per cent for 1971, as against 17 per cent for 1970. I am glad to say that your company continued to make all round progress in 1971. As compared to 1970, sales of automotive fuels went up by 39 per cent, and sales of all products by 32.8 per cent thus achieving record sales of 37,1,244 tonnes and a turnover of Rs 31.5 crores. During the first five months of 1972, the sales are estimated to be about 30 per cent more than in the corresponding months of 1971. Besides consolidation and progress in the oil trade, your company has also made plans for development in other fields. I am glad to inform you that your company entered into a technical collaboration agreement with a Belgian firm in March 1972, for the manufacture of sophisticated bottle filling equipment used in aerated water, soft drinks and beer industries. As a consequence, it is hoped that the profitability of your company's engineering division will improve in future years.

Company's investments in Balmer Lawrie and ICICI fetched the same rate of dividend as in previous years. However, your company purchased an additional 3332 shares in ICICI, as a result of "rights issue", made by the ICICI.

Your company's investments in the Shama Pistons and Rings Ltd, Shama Forge Company Ltd, and Assam Sillimanite Ltd, did not yield any dividends. However, I would like to inform you that with the efforts of the financial institutions, the Shama Pistons and Rings Ltd, was reorganised in May 1972, and as a part of the overall arrangements, your company has sold its equity holding in Shama Pistons and Rings Ltd, worth Rs 8 lakhs at par value. I am glad to say that as a consequence the Industrial Finance Corporation of India have agreed to release the guarantee executed by your company in their favour in respect of loans granted by Industrial Finance Corporation of India to Shama Pistons and Rings Ltd. This will reduce your company's contingent liability to the extent of Rs 52.55 lakhs plus interest.

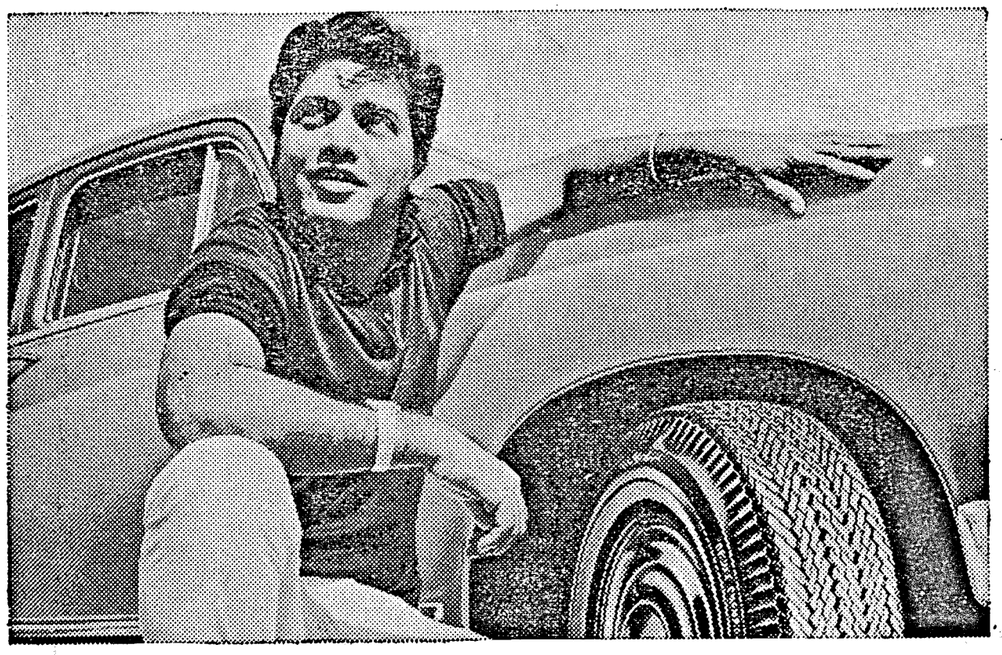
Your company was holding about 30 per cent of the equity shares of M/s Balmer Lawrie, Calcutta, for more than a decade. Earlier this month your Company has entered into an agreement to purchase additionally two large blocks of shares in this company held by Duncan Brothers and Alex Lawrie and Co (India) Ltd. Subject to your approval, these additional shares will be acquired next month and your company will hold about 80 per cent of the equity shares of M/s Balmer Lawrie and thus have control over that company and its subsidiaries, with their varied industrial activities, including barrel making, grease manufacture, engineering and electrical industries. Meanwhile your company has taken over the management of the Balmer Lawrie Group from 6th June, 1972.

Your company's retail outlets have been renovated in 1971 using the new colour scheme and new logo. We hope these outlets now project the new image of your company, *viz*, the image of an organisation dedicated to service and efficiency. Your company has also initiated a scheme for the rehabilitation of the ex-servicemen and their families by appointing them as dealers at company developed retail outlets and for selling kerosene.

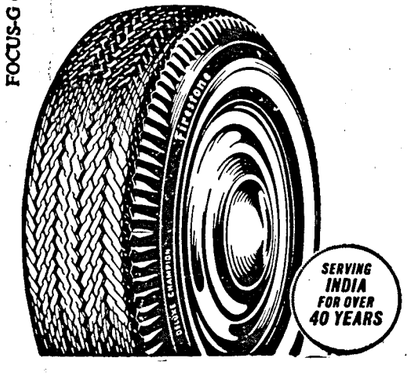
The success achieved during 1971 has been the result of the hard work and devotion of your employees and dealers. I am glad to convey deep felt appreciation to one and all, both on your behalf and on behalf of the Board of Directors.

Note: This does not purport to be a record of the proceedings of the annual general meeting.

TABLE



Year	Sales (Lakhs metric tonnes)	Profit before Tax (Lakhs Rs)	Percentage of Profit after Tax to Capital Employed
1969	2.04	32.50	6.20
1970	2.79	53.77	10.28
1971	3.71	74.66	16.83



Indian Diesel Engines

THE total production of Indian diesel engines which numbered around 10,000 in 1955, rose to 42,182 in 1960 and to approximately 360,000 in 1969. Since then the industry has been passing through a recession and production is currently about 160,000 per year. In 1969, there were more than 750 'factories' producing diesel engines. Of these only 30 belonged to the organised sector and the rest to the small scale sector, of which many are 'merely 'assemblers' and do not have any facilities for manufacture and testing of the engines. Nearly 90 per cent of the diesel engines manufactured in the country are of 10 hp and below and are mainly used for driving irrigation pumps.

Missing Perspective

BHUTTO's remark that the outcome of the Simla summit was a victory for both sides may be said to be tactful but not factual. India's 'victory' had already come with the dissolution of Pakistan last December. Handing back the territory taken by the Indian army in the west (excluding Kashmir) during the war was the only sensible thing to do with the occupied areas in the context of the Government of India's policy which is to have as untroublesome a neighbour as possible, while at the same time stabilising the border including the ceasefire line in Kashmir. And if these aims were to be furthered, a gesture which would help Bhutto to temper Pakistani feelings towards India and at the same time consolidate his rule had to be made, as the alternative would be to start thinking in terms of the dismemberment of what is left of Pakistan. Also, the Government of India has no reason to prefer an army *junta* once again in power in Islamabad to a Bhutto, even if he were to become bellicose again, a probability which must be taken into account.

At Simla, Bhutto was really the reasonable man. He was talking to the people who had played a major role in breaking his country into two. It is not altogether easy to recognise 'realities'. It has not been possible for us, for example, to recognise that a much smaller defeat and humiliation hardened our attitudes towards China almost beyond repair. Against this background Bhutto's initiative and realism have far exceeded our expectations of him. The summit has made it clear that the attitudes of the Pakistani leadership may not be the only insurmountable obstacle in any normalisation of relations between the two countries. It is doubtful whether the Pakistani leaders alone have been the recalcitrant ones in preventing an Indo-Pakistani dialogue. But even if that were so, Bhutto now appears to be behaving differently.

In this situation it would have been the height of arrogance to maintain that the Kashmir problem did not exist or that Pakistan did not have any legitimate interest in the problem. The agreement at Simla reflects the realisation that ultimately the *status quo* in Kashmir can be maintained (and Indira Gandhi, to be sure, does not want any change) only with the concurrence of the leadership in Pakistan. This does not mean, as Balraj Madhok may fear, any change in the Kashmir situation. It means basically that Pakistan has taken a first quiet step towards its acceptance. Sheikh Abdullah is happy that the Simla summit has acknowledged the existence of the Kashmir problem. If the present mood of the Pakistani leadership and their present problems continue, he may be in for a surprise. If the Simla summit has started a chain of consultations and meetings, he may find that Bhutto and Indira Gandhi might slowly arrive at a tacit agreement over Kashmir.

The Soviet Union would in all likelihood help this process. That the Third Party may enter the picture, if necessary, is already implicit in the Simla agreement which states that "the two countries are resolved to settle their differences by peaceful means through bilateral negotiations or *by any other peaceful means* mutually agreed upon between them" (emphasis added).

The summit has succeeded in terms of identifying and frankly recognising the existing problems between the two states. More specifically it has talked of the "repatriation of prisoners-of-war and civilian internees, a final settlement of Jammu and Kashmir and the resumption of diplomatic relations". The first issue cannot be settled without the concurrence of Bangladesh. But that need not present too many problems unless either India or Bangladesh wants singly or jointly to use this issue to pressurise Pakistan further. If that were to happen, such pressure would certainly be counter-productive. Related to this issue is Mujib's declared intention of going ahead with the trials of war criminals. India has predictably taken a we-know-not-anything-about-it attitude. This may not be entirely on the legalistic ground of non-interference in the affairs of our eastern neighbour. It is possible to argue that a certain level of tension between Bangladesh and Pakistan would work to India's advantage. Probably Mujib does not see this today, but he well might tomorrow. If he does, the issue of the Nuremberg-style trials would acquire a very different political connotation in his view. Bhutto is probably hoping that Mujib may begin to see the problem in this light. Besides there are the 400,000 Bengalis in Pakistan and their future. Bhutto may have had all this in mind when he appealed to Mujib at his press conference in Simla not to proceed with the trials and so reach a point of no return.

Strange though it may seem, more than Kashmir it may turn out that the Pakistan-Bangladesh relationship could become the crux of the Indo-Pakistani relationship. It is, therefore, surprising that the summit hesitated to see Indo-Pak relations in regional perspective. Both countries do not seem

to have yet fully realised that their relationship is more than just a bilateral problem. Both will have to think in terms of the region as a unit or else they will continue to be part of the schemes of those who have already thought in such terms. The central question is whether we want to make the South Asian region and, thereby, the Indo-Pak relationship subservient to the big powers? If not, we must identify the powers capable of making an Indo-Pakistani accord a part of their world system; the two governments should have no problem in identifying these powers. If this question is not faced squarely, we would be building only a sub-system of states presided over by one or more of the super powers. If that happens, agreements at high places like Simla and Murree would appear to be the small achievements of small people. Surely our subcontinent deserves better than that.

Sri Lanka

Keeping Heads Empty

THE Mexicans, it is said, believe that between God and the United States, the United States is more dangerous because it is closer. It should not be surprising if the people of Sri Lanka take a similar view of India. India has always been the principal concern of Sri Lanka's foreign policy. This concern has evidently acquired a sharper edge since India's intervention in Bangladesh. Sri Lanka must have regarded the Indian intervention as very ominous. There is no way of knowing whether the Sri Lanka politicians, like the Chinese, saw parallels between Bangladesh and Manchukuo. But they must have, like the Chinese, seen some seeds of a possible Indian design on their territory. Sri Lanka does not have an exactly enviable record of Tamil-Sinhalese relations. Sirimavo Bandaranaike must be acutely aware that she too has a skeleton in her cupboard. Judging by the case of Bangladesh, she must have had every reason to believe that the government of India, which was so sympathetic and helpful in her fight against the Janata Vimukti Peramuna rebellion last year, may not be as friendly if her problems with the Tamils were to continue to grow.

The chances are that they might. The Tamils, Sirimavo is aware, have not got a fair deal under the new constitution. Tamil discontent is on the rise. This raises the real question for Sri Lanka's foreign policy. What is the guarantee that India would not repeat a Bangladesh style intervention in Sri Lanka? Sirimavo has got to work on the assumption that no such guarantee can in fact be given. It is necessary to cultivate countervailing forces to India.

There has been a lot of talk in this country about the expansion of the Indian Navy. We have a very large and modernised army. Equally our air force is also highly modernised and large. It is said to have flown 500 sorties a day during the war. Our navy has been a comparatively modest one. Sirimavo Bandaranaike must have seen in the latterday talk of naval expansion some threat to Sri Lanka. Her government, therefore, moved promptly in the United Nations that the Indian Ocean should be an area of peace. It is quite clear that Sri Lanka views the rise in India's military power with concern. One does not know if the recent war has made us the dominant power of the subcontinent, but we seem to be the most feared and distrusted power of the subcontinent. Sri Lanka, in any case, treats us as such.

This would explain why Sirimavo Bandaranaike took an eleven-day trip to China. The Sri Lanka premier evidently thinks of China as a countervailing power to India. Although her talks with Chou En-lai are supposed to have centred largely on developing "closer bilateral relations", relations with India must have been an important item on the agenda of the two leaders.

A new aid agreement was signed in Peking on Sirimavo Bandaranaike's arrival. It covered technical co-operation, construction of a cotton mill and large dollops of aid. The Sri Lanka premier was received by Chairman Mao which by Chinese norms would impart a special status to the visit.

But it would be a mistake if Sirimavo Bandaranaike's visit to Peking is seen only as a response to what would appear to her as India's military might. There are equally strong domestic reasons why she must have thought it worthwhile to visit the forbidden city. Ever since the JVP uprising in April-May 1971, Sri Lanka has not known political or economic stability. Unemployment stands at 12 per cent. Over 15,000 young people, allegedly connected with the uprising last year, are behind bars. There is a state of emergency, complete press censorship, no right to strike or demonstrate or publish without permission, and so on. All these are continuing signs of the government's inability to deal with rising discontent. The April-May 1971 uprising was a glimpse of this discontent.

Sirimavo Bandaranaike seems to have decided to react to the situation in a familiar way. The strategy is not new. If the rebels claim to be leftists, the government in authority should try to cultivate the socialist States and through them try to neutralise the rebels. Even as Sirimavo Bandaranaike is touring China, Czechoslovakia has announced a £3 million credit to Sri Lanka. However, the thrust of this policy is not intended just to acquire more aid. The aid is sought and will come. What probably is more important is that many developing countries (Sri Lanka, to be fair, is not the only one) seem to be mortally afraid of the supply of ideas to their insurgents. They want to turn off the tap!

It was perhaps Kwang-Tee, the ancient Chinese thinker, who once advised a king that if he wanted his subjects to be peaceful, he should "keep their stomachs full and heads empty". Sirimavo Bandaranaike, like many of her counterparts in Asia, is just unable to do the first. As regards the second, she evidently hopes that if she can persuade the Chou En-lais and the Brezhnevs to disown the rebels and their ideas, it might at least help her in "emptying their heads"!

West Bengal

Post-Election Patterns

IN the post-election configuration of West Bengal politics, all parties — victor and vanquished alike — have reached a sort of quandary. The predicament of CPI(M) and its allies, worsted at the polls, has been obvious from the start of the new phase, while that of the ruling Congress and its fellow-travelling CPI is surfacing gradually.

The large number of its cadres and supporters who have been killed, the continued assaults on its trade union and mass bases in the post-election period, and the trauma of finding its strength in the Assembly reduced from 111 to 14 have created a frame of mind among CPI(M) which precludes the possibility of the party MLAs taking their seats and playing a subdued oppositional role in the Assembly. On the other hand, the battered morale and organisation of the party rule out any possibility of confronting the new regime with mass upheavals in the immediate future — i e, unless wider developments

in the national arena radically change the present correlation of forces. The accumulated burdens of its omissions and commissions during the period of the party's ascendancy in West Bengal politics, and the leadership's incapacity to appreciate the complexities of the geo-political situation in the wake of developments in Bangladesh, had been gradually driving CPI(M) into a corner. Now the unthinking and impulsive boycott of the State Assembly, as a reflex to the conduct and outcome of the last polls, condemns the party to a state of near passivity, even though the leadership has pulled off the remarkable feat of preserving the unity and loyalty of its extensive mass bases in the midst of the all-round debacles in recent months. However, the mid-June session of the State Council of the CPI(M)-led Centre of Indian Trade Unions (CITU) represents the first tentative steps towards a regrouping of its forces.

The position of CPI(M)'s major allies is even more difficult. These smaller parties are much more vulnerable than is their dominant ally to the buffeting of external developments. They are, furthermore, torn internally by the love-hate relationship to CPI(M). RSP appears set to demarcate itself from CPI(M) on the Assembly boycott — although its three unsophisticated MLAs can hope to have little impact in the House and any weakening of its links with its Left allies outside the legislature will only sharpen its sense of futility. The Forward Bloc, which suffered a split on the eve of the polls, is further divided by an ideological controversy between the advocates of 'Marxism' and of 'Subhasism'. In sum, the Left Front parties are in for a period of stewing in their own juice, notwithstanding their 35 per cent share in the votes polled in the far from free and fair elections.

The ruling Progressive Democratic Alliance, of Congress and CPI, fares hardly any better than the parties of the Left Alliance. Pompous declarations made by Congress ministers on their assumption of office serve today, 100 days after their triumphant re-entry into Writer's Building, only to heighten the indifferent quality of the government's performance. It is perhaps symbolic of the overall situation that, while the Chief Minister boasts of having extended electrification to some clusters of villages, civic life and industrial operations in the sprawling metropolitan complex of Calcutta have settled down to long periods of dislocation due to systematic load-shedding by the power supply agencies. The only act that has registered in the public mind is the clearing of Calcutta streets of the thousands of hawkers and vendors who used to struggle desperately to make a living, clogging vehicular and pedestrian traffic in the process.

The Chief Minister's monthly broadcasts about the past month's performance of the government are also accorded sceptical reception by the public. For instance, a recent report in a loyalist newspaper said:

> "In fact, the term 'monthly programme' is a misnomer since according to the normal procedure most of the government work is done through the contractors and the contract clearly specifies that the work must be completed within three months at the minimum ... how [can] a scheme normally scheduled to be completed by three months at the minimum be said to be programmed for completion or implemented within a month... No doubt the Chief Minister has good intentions, but wishes are not horses." (*Hindustan Standard*, Calcutta, July 3, 1972).

The government and the ruling party still lack a cohesive policy-frame and are subject to diverse pulls. The resulting passivity of the government is reflected in its failure to end the long-drawn deadlock at the Calcutta University, created by its student wing and led by a Minister of State. Moreover, internal group rivalries are increasingly surfacing and posing new problems of law and order. Referring to many recent instances of gheraos of police stations, following arrests even on specific charges like murder, the *Statesman*, Calcutta, reported some days ago:

> "Group rivalry among youth Congress workers which was so long latent is said to be coming into the open. In April, there was a clash between two groups in Nadia district as a result of which two died. There had been such incidents in Dum Dum, Baraset, and a few other places in the 24 Parganas district. In Hooghly, the factional fights among the youths is (*sic*) said to be getting sustenance from two top leaders of the district.
>
> "The police are to intervene when the intra-rivalry over-steps its limits and degenerates into violence, although it might not directly affect the law and order situation in its broad sense.
>
> "Local pressure, it is stated, is brought upon the thana officers to act according to the dictate of this or that group and when they cannot oblige them, complaint is made to higher quarters that they have unnecessarily been harassing the Congress workers in co-operation with the CPI(M)." (*Statesman*, Calcutta, June 18, 1972.)

Dissatisfaction with the performance of the government seems to have spread into the Congress Legislature Party. Youthful MLAs from the rural areas, who constitute a sizeable segment of the House, have been striking sharply critical notes in the Assembly debate on the state budget. Again, the repeated failures to work up a quorum in a House with such an overwhelming majority for the ruling party are at least in part an expression of disenchantment and loss of morale in the ranks.

CPI, meanwhile, in search of a credible role. It is in the ruling alliance, but not in the government. It has forged a number of formal links with Congress at the Assembly and party levels, yet it is unable to synchronise its policies with those of its partner. The CPI leader in the House is also the deputy leader of the ruling alliance, yet it is constrained to play a quasi-oppositional role in the House. Publicly voicing anger against the aggressive attention paid to its kisan and trade union bases by sections of Congress(R), it has nevertheless been unable to work out any effective remedies against what it calls "Congress's aping of CPI(M)" within its present policy framework.

Alloy Steel

No Case for Subsidy

WITH an installed capacity of 24,000 tonnes, Mahindra Ugine Steel's output of saleable finished products in 1971 was almost 32,000 tonnes. This is specially gratifying in an industry where underutilisation of capacity has become the norm, though it may also hide some interesting questions about the very concept of capacity.

Along with mild steel, alloy and special steels have been in short supply. Imports of alloy steel were valued at Rs 26 crores in 1970-71 and at Rs 18 crores in the first six months of 1971-72. As for the future, the NCAER demand estimates point to a widening of the gap between production and demand. The chairman of Mahindra Ugine, Harish Mahindra, is therefore on firm ground when, in his latest annual statement to shareholders, he presses his company's case for expansion to 60,000 tonnes capacity, for

which an application for licence has apparently been pending with the government since June 1970. The increase in price of plant and equipment, which Mahindra estimates at 10 to 15 per cent per year, and the long gestation lag underscore the need for quick action for expansion of capacity in the industry.

The major problem, however, is availability of scrap, to a discussion of which Harish Mahindra might have devoted rather more attention in his speech. It is certainly "desirable that scrap dealers voluntarily agree to exercise some restraint" in the matter of prices, but the problem of shortage of scrap still remains and is likely to get worse, after everything has been done to improve scrap collection and processing.

Mahindra does not say how the scrap requirements of his company's proposed expanded capacity of 60,000 tonnes would be met. Of course, given a choice between importing steel and importing scrap, the case for doing the latter is clear and the government has apparently decided to allow some import of heavy scrap. Unfortunately, little progress has been made in respect of manufacture of sponge iron. Should not the government try to persuade some of the larger users of scrap to take a more lively interest in the matter?

Harish Mahindra also raises the question of power tariff which he regards as a "more urgent issue" than even the shortage of power to which too he refers. It is true that the power tariff varies considerably from state to state and there may be something to Mahindra's complaint that the cost of power for electric steel production is "almost prohibitive" in Maharashtra. But, surely, in assessing the relative costs of production in different regions, a single item, even if it be a major one like power, cannot be considered in isolation.

That apart, the fact that a particular input is a major component of the cost of production of an industry is absolutely no reason why that input should be supplied to it at a subsidised price. According to Mahindra, the Union Government has proposed a concessional tariff of about 4.5 paise per KWH so as to encourage the so-called mini-steel plants. Mahindra commends to the Maharashtra State Electricity Board a restructuring of its tariff for electro-metallurgical industries on these lines. Very likely, 4.5 paise per KWH is substantially lower than the average generation and transmission costs of perhaps every electricity authority in the country. There can be no justification for a *general* subsidy of this kind to the electro-metallurgical industries and/or the consumers of their products. At best there may be a case for subsidising some sections of consumers of aluminium or steel, but for that very different policy instruments have to be used.

TDA

Better Resource Allocation

IN the two years of its existence the Trade Development Authority (TDA) has made its presence felt. The TDA is among the few major institutional innovations for export promotion to emerge after presentation by the Ministry of Foreign Trade of its Export Policy Resolution to Parliament in 1970. It is more than an export promotion body; it provides package assistance to individual exporters carrying them from the stage of intention to export, through collection and collation of information, product development and market research to securing and implementing of export orders and export finance and assistance.

The most important task assigned to the TDA is that of inducing and organising small- and medium-scale entrepreneurs especially to develop their export capabilities. Of the total of 297 export-worthy units enrolled, about 85 per cent are medium- and small-scale units. In its first two years the TDA secured export contracts totalling to Rs 6.14 crores, of which the share of small and medium units was Rs 4.94 crores, or 80 per cent. TDA's role in developing exports of the small-scale sector needs to be appreciated, though it is to be hoped that these efforts are not at the cost of export services to large-scale units most of which lack basic export consciousness either due to lack of initiative or ignorance of opportunities abroad. From this point of view, the TDA should seriously consider expanding its merchandising division. In the final analysis, the success or otherwise of the TDA will be judged by the expansion of export turnover. One of the ambitious programmes initiated by the merchandising division in April 1972 aims at boosting exports of 18 selected items from $10 million in 1970-71 to $30 million in 1972-73 and $70 million in 1974-75. Another important programme is the Airport Electronics project at Santa Cruz, Bombay, with an export target of $100 million in the next four years or so. Looking at these and other important projects which the Division is expected to handle, the allocation of a staff of only 10 to it as against one of 23 for the information division and 26 for the administrative division appears odd.

The TDA's efforts to push exports of woven men's and women's wear and other readymade garments, by identifying two promising manufacturing units and putting them in touch with department stores in the US, have resulted in creating a promising new line of exports. On the other hand, its attempt to support the efforts of one of its clients to export stainless steel cutlery to the US market has come up against quota barriers. These two examples typify the vicissitudes to which export efforts are subject. They also emphasise the importance of preliminary market studies for locating products and markets. The TDA could think in terms of ranking products and markets according to the ease with which they could be cultivated and then proceeding either to identify existing units or to help establish new units.

The information division of the TDA is functioning on more useful lines than its counterparts in the various export promotion councils or even the state trading organisations. Manual document control in terms of commodity, country, functions and industry has been attempted. Well over a thousand product-country cards containing information in respect of value of imports together with major sources of supply, import tariffs, ocean freight rates, overseas trade contacts, etc, are being prepared. Over 600 manufacturers cards providing ready-made profiles of individual manufacturers covering their capacity, production, technical competence, collaboration arrangements and export potential have been prepared.

The TDA may be thus said to be proceeding on broadly correct lines in respect of its merchandising and information divisions, but it is difficult to appreciate what useful role its research and analysis division is playing, saddled as it is with a number of general and semi-theoretical research problems. Take, for instance, the project on short-term forecasting which aims at evolving a suitable methodology and techniques for making advance estimates of exports on a quarterly basis. What useful purpose can such general studies play in the TDA's activities which aim at down-to-earth export promotion in specific lines. Studies on the likely impact of GSP, India's role in the emerging economic situation in Bangladesh, impact of currency parity realignments on India's trade, implications of Sino-US trade relations, etc, could be better fitted into the activities of the Indian Institute of Foreign Trade or the Economic Adviser's Division in the Ministry of Foreign Trade. The research analysis division appears to be not only an avoidable financial burden on the TDA, it might even result in deflecting attention to general research problems of dubious value to the TDA. The resources employed in research and analysis could be usefully diverted to its merchandising division.

Soviet Union

Foreign Trade

Vinod Mehta writes :

SOVIET exports in 1971, the first year of the Ninth Five Year Plan, exceeded imports by about 1,200 million roubles. The Soviet Union's exports amounted to 12,400 million roubles against imports worth 11,200 million roubles. But the rate of increase of imports was higher. While exports increased by 6.4 per cent, imports increased by 7.6 per cent.

The largest share of Soviet trade was, as is to be expected, with the socialist countries — particularly those which are members of the Council for Mutual Economic Aid (CMEA), — followed by the industrially developed countries and the under-developed countries. This can be seen from the following Table:

(in billion roubles)

Socialist Countries (including CMEA members states)	15.4
CMEA member states	13.3
Developing Countries	3.1
Industrially Developed Capitalist Countries	5.1

The founding members of CMEA were Albania, Bulgaria, Czechoslovakia, Hungary, Polond, Rumania and USSR Albania CMEA in 1961. The GDR was admitted in 1950 and Mongolia in 1962.

Before the ideological rift between the USSR and China, which affected their trade relations, China and GDR were the USSR's principal trading partners. They were followed by Czechoslovakia, Poland and Rumania. As the ideological gap widened, trade with China became negligible, while GDR and Poland became its principal trading partners. However, the total value of trade turnover with China which was 42 million roubles in 1970 rose sharply to 139 million roubles in 1971.

Among the industrially developed capitalist countries, Italy ranked first in terms of trade turnover followed by France and West Germany. Total value of trade with the US was 184 million roubles. Among the underdeveloped countries, Egypt and India are major trading partners. The trade turnover between India and the Soviet Uinon was about 370 million roubles.

Changes in the structures of exports are also visible. Since the Second World War, the proportion of machines, and transport equipment in Soviet exports has been steadily increasing. In 1971, about 21.8 per cent of total Soviet exports were machine tools, power and electrical equipment for ferrous metallurgy plants, aircrafts, helicopters, railway rolling stock, and equipment for light and chemical industries. These exports, often including complete industrial plants, are mostly to socialist countries and underdeveloped countries.

Export of fuel and electricity increased substantially. It rose from 15.6 per cent in 1970 to 18 per cent in 1971. Export of raw materials and foodstuffs registered an increase of 1.2 per cent. The major consumers of Soviet fuel, raw materials and foodstuffs were the CMEA countries and other socialist states.

On the import side, purchase of machines and equipment remained high. The Soviet Union imported mainly rolling mill machinery, construction machinery, ships and allied equipment chiefly from the GDR, Czechoslovakia, Hungary and Poland. Imports of foodstuffs, fuel, agricultural and industrial raw materials, semi-finished goods and manufactured consumer goods were also high. Among foodstuffs, coffee, cocoa beans, tea, meat and meat products, eggs, fresh vegetables, oranges and grape wine predominated.

However, the pattern of Soviet imports is not always dictated by the needs of the Soviet economy but also by political and other considerations. The USSR exports quite a large quantity of raw cotton to socialist countries, but it also imports a substantial quantity of raw cotton from Egypt — presumably to make Egypt pay for the sale of military hardware. Similarly, the USSR came to the rescue of Cuba's economy when Cuba lost its biggest customer for sugar in the United States. Again, though USSR exports natural gas to socialist countries it imports substantial quantities of combustible gas from Iran and Afghanistan. Trade thus flows not merely from commercial calculations but also from political ones. Thus it is likely that along with its bid for a leadership role in the third world, the Soviet Union's trade with these countries may also expand rapidly.

Industrial Finance

Not Unconventional Enough

AMONG the State Financial Corporations set up to extend term credit primarily to small and medium units, the one in Maharashtra is known to be among the most successful. During the three-year period, 1968-69 to 1970-71, the Maharashtra State Financial Corporation's operations had expanded impressively: loans sanctioned rose by nearly Rs 9 crores from Rs 3.41 crores in 1967-68 to Rs 12.11 crores in 1970-71 and disbursements by Rs 5 crores from Rs 3.30 crores to Rs 8.21 crores. The Gujarat State Financial Corporation had the next most impressive performance, its sanction and disbursements rising during the same period by about Rs 5 crores and Rs 4 crores, respectively.

In 1971-72, however, the operations of MSFC received a setback. Loans sanctioned dropped to Rs 10.63 crores and disbursements to Rs 6.51 crores. Against this, available data indicate an increase of about 10 per cent in sanctions and disbursements of other SFCs taken as a whole. A part of the decline is attributed to difficulties experienced in the recovery of loans given to small transport operators and the consequent deliberate slowdown effected "in the rate of consideration of loan applications for transport industry". For the rest, the Corporation has attributed the setback to a variety of reasons among them, "the influx of Bangladesh refugees ... culminating in Indo-Pak war" and the strengthening of "inflationary forces ... followed by uncertainty and cost escalation, resulting generally in slackness in industrial growth".

What is, however, missing in the MSFC chairman's speech and in the Corporation's annual report is a critical examination of the Corporation's organisational preparedness to face a situation where the demand for credit from traditional borrowers has slackened in the face of the general slackness of industrial activity. After all, the MSFC's operations touch only a fringe of the credit needs of the small and medium industries in the state, so that a general slackness of industrial activity need not dampen the expansion of the Corporation's operations.

The lack of organisational dynamism is seen particularly in the regionwise and size-wise distribution of the Corporation's operations. There is much talk these days of the need for wider dispersal of industries and in this task the state agencies are supposed to play a pivotal role. Unfortunately, the SFCs' impact in this regard has been generally marginal and no perceptible changes have taken place in the relative position of different regions in most states. The MSFC is no exception. Thus, of its total sanctions of Rs 10.36 crores in 1971-72, Rs 7.72 crores (or 73 per cent) went to the three developed regions of Bombay, Poona and Kolhapur, which between them account for 13 of the state's 27 districts. Under the technicians' assistance scheme, of the 19 applications sanctioned during the year, 15 were in the Bombay region, 3 in Poona and one in Nagpur. The disparity in the size distribution of applications sanctioned is even more glaring. Of the 1,133 applications sanctioned in 1971-72, 157 were for loan amounts exceeding Rs 1 lakh and accounted for 63 per cent of the total amount sanctioned (i e, Rs 6.74 crores out of Rs 10.62 crores). The share of such large borrowers has risen, it having been only 55 per cent in 1969-70.

Aluminium

Costs: Whose Responsibility?

IT is no insignificant comment on our two decades of planned industrialisation that industry now considers costs to be a matter of government responsibility. The 'cost-plus' formula in price fixation has led managements to cease considering cost control as an area of their own professional operation. At the same time, the effective protection from imports and the drive for import-substitution have encouraged the view that indigenous goods must automatically get preference.

The aluminium industry has found itself subject to the same temptations. Fostered as a priority, import-substituting industry it has been the recipient of much material support — not the least of which has been heavily subsidised power supply. For over two decades, till January this year, the industry was protected.

Hindustan Aluminium and Indian Aluminium between them account for 87 per cent of total production and Madras Aluminium and Aluminium Corporation of India account for 9 per cent and 4 per cent, respectively. If there was any hope that the efficiency of the two larger plants would be considered in fixing prices, the Wanchoo Panel scotched it last year when it recommended an excise rebate for the smaller Madras Aluminium and Aluminium Corporation.

This sacrifice by the public exchequer is now evidently expected to become a permanent feature. Thus Madras Aluminium's chairman, R Venkataswamy Naidu, suggests in his annual statement that the rebate should become available till the company's capacity reaches at least 30,000 tonnes — whereas with the current expansion plans under implementation it will reach only 25,000 tonnes. Even after last year's price notification and notwithstanding the partial excise rebate, he argues, Madras Aluminium's net realisation was reduced by Rs 400 per tonne; also its turnover and gross profit for 1971 declined because of cost increases.

But while net profit declined to almost half (Rs 1.03 crores to Rs 85 lakhs), Madras Aluminium could maintain dividend payment, thanks to the sizeable development rebate provision of nearly Rs 85 lakhs. Aluminium companies have been in fact among the major beneficiaries of the development rebate as is reflected in the fact that in 1969-70 out of a profit before tax of Rs 12.73 crores only Rs 0.59 crores were paid out in taxation and in 1970-71 only Rs 1 lakh out of pre-tax profits of Rs 15.98 crores. Retained profits by the aluminium companies in these two years were Rs 8.45 crores and Rs 12 crores, respectively. Understandably, therefore, the Madras Aluminium chairman is concerned about the withdrawal of the development rebate after 1974.

Madras Aluminium rightly takes pride in the fact that it is the most 'technically advanced' aluminium unit in the country since it operates its electrolytic pot room at higher amperage and in that it is using 95 per cent of indigenously produced equipment for its expansion. But it is still seriously handicapped by its low installed capacity of less than 14,000 tonnes per year which after the present expansion will still be no more than 25,000 tonnes — only halfway to the economic size 'in international parlance' of 50,000 tonnes. But with demand rising faster than supplies and with the public sector aluminium projects in such bad shape, Madras Aluminium ought to be thinking of further expansion beyond 25,000 tonnes — the prospect of loss of excise rebate notwithstanding.

EXPORTS

Growth of Residual Exports

Angus Hone

V K Saxena

PERFORMANCE has confirmed the view that the Fourth Plan export target was overoptimistic and that new policies and programmes are urgently required if the minimum compound growth rate of 7 per cent is to be achieved.* The 1970-71 growth of 8.6 per cent was largely the result of a sharp change in statistical systems and some doublecounting.** The final Reserve Bank export figure for 1970-71, at Rs 1,403 crores, was actually lower than the 1969-70 figure of Rs 1,404 crores. The real growth in 1971-72 exports may turn out to be substantial, but long-term prospects remain bleak.

In the general search for policies and programmes to increase the rate of growth of exports, attention must also be focused on a group of exports which has shown surprising growth between 1968-69 and 1970-71 — accounting for Rs 23 crores of the growth between 1968-69 and 1970-71 — but which has never before been analysed in detail. These exports fall under Item 52 in the Ministry of Foreign Trade's export data and are called 'Miscellaneous Items including Re-Exports'. Growth here has been substantial and this small segment represents more than six per cent of India's total exports of Rs 1,400 crores (see Table below).

TABLE: OVERALL GROWTH

(Rs crores)

	1968-69	1969-70	1970-71
Total, Miscellaneous items including re-exports	74.21	83.30	97.87
Of which miscellaneous exports	70.53	78.73	87.10

Source: Statistics published by the Office of the Economic Adviser, Export Planning Section, Ministry of Foreign Trade, New Delhi, 1971.

The 1970-71 total of this group is 32 per cent higher than its 1968-69 level. A growth rate of this magnitude, if sustained for even five years more, would mean that miscellaneous exports in 1975-76 would be Rs 200 crores. The real prospects, unfortunately, are very different.

First, the high figure for 're-exports' in 1970-71 can be explained almost wholly in terms of the re-export of two ships (value Rs 6.77 crores) and one commercial aircraft (value Rs 73 lakhs). None of the other re-exports has shown any growth tendencies, and a re-export figure of between Rs 3-5 crores can be expected for the future.

The rest of the analysis will, therefore, be concerned with a sector-by-sector look into each sub-group of miscellaneous exports.

(1) Food Items (code 001-099).

The significant product exports in 1970-71 were:

	(Rs lakhs)
Meal and flour	88
Starch of fruits or vegetables	67
Molasses	39
Chocolate and cocoa	41
Bran pollard	268
Food waste/animal food	77
Other food preparations	190
Tea extract	77
Total	847

The above items account for over 80 per cent of the sub-group 'food items' (total Rs 10 crores), but the only items among them to grow rapidly have been 'other food preparations' (from Rs 82 lakhs in 1968-69 to Rs 190 lakhs in 1970-71), and 'tea extract' (from Rs 30 lakhs to Rs 77 lakhs). The overall prospects will depend on 'wheat exports' (code 041) and not on these minor items. Wheat exports in their turn will depend on the 1972 Kharif crop, and overall food policy.

The next major group is raw materials (the 10-199 code sector) and this group has only three significant items.

(2) Raw materials (code 20 - 2929901).

The significant export products in 1970-71 were:

	(Rs lakhs)
Vegetable fibre other than cotton and jute	47
Textile waste	35
Crushed bones	430
Human hair	115
Bristles	50
Henna leaves	24
Myrobalan	20
Plants and seeds used in perfumery and pharmacy	555
Opium	862
Guar flour	541
Palm fibre	224
Bidi wrapper leaf	92
Total	2995

This major group shows rapid growth only in three items — 'plants and seeds' used in perfumery items (rising from Rs 4.35 crores to Rs 5.55 crores), 'opium' (from Rs 4.33 crores to Rs 8.62 crores) and 'guar flour' (Rs 1.02 crores to Rs 5.41 crores). Without these items the overall growth of the sector would be small, and it is extremely unlikely that they will be able to sustain their 1968-69 to 1970-71 growth rate during the next five years.

There are no significant export products in code groups 4 and 5. Group 6 consisting of building materials and minerals is weak.

(3) Building materials and minerals (code 60-689).

The significant exports in 1970-71 were:

	(Rs lakhs)
Building materials	51
Asbestos cement sheets	11
Other asbestos cement articles	36
Cut mica condenser films	57
Mica sheet strips cut n e s	31
Aluminium ingots	87
Newrought aluminium	11
Total	184

This segment is extremely unlikely to grow rapidly, given the international competition in synthetic mica substitutes and the acute shortage of aluminium within India. A possible source of export earnings, which vanished in 1970-71, is 'legal exports' of silver and gold bullion bars. These were Rs 3.31 crores in 1968-69 and Rs 5.16 crores in 1969-70, and fell to nil in 1970-71 as world silver prices fell. The present gold price as on June 10, 1972, of $ 60 per ounce, and a possible sharp rise in silver prices might lead to a resumption of 'legal' Indian exports.

(4) Miscellaneous Manufactures (code 862-8999701).

The significant exports in 1970-71 were:

	(Rs lakhs)
Developed cine films	585
Advertising material	16
Printed books	74
Journals and periodicals	19
Fountain pens	27
Sports goods	87
Collections of zoological interest	41
Carvings	14
Embroidery	30
Ivory manufactures	18
Leathergoods as artware	49
Silk scarves	207
Other artwork	66
Imitation jewellery	275
Manufactured articles n e s	299
Total	2137

The growth areas here are clearly 'cine film' which has grown from Rs 2.94 crores 1968-69 to Rs 5.58 crores in 1970-71 and has further rapid growth prospects arising from a large potential for Bengali films in Bangladesh; 'sports goods' which while they rose from Rs 51 lakhs in 1968-69 to Rs 87 lakhs in 1970-71 and offer a virtually limitless market potential, suffer from capacity constraints and financing difficulties, although the Trade Development Authority's recent initiative with UNIDO consultancy mission should help expand this industry. However, 'silk scarves' which fell from Rs 4 crores in 1969-70 to slightly above Rs 2 crores in 1970-71 and 'other manufactured articles' down from Rs 2.80 crores in 1969-70 to Rs 2.29 crores in 1970-71, are unlikely to expand rapidly. Though growth areas definitely exist in code group 8, therefore, overall the code group is unlikely to grow beyond Rs 25 crores in the next two or three years.

The final group of products, code group 9, is also unlikely to increase substantially.

(5) Residual Direct Exports (code 911-961).

The significant exports in 1970-71 were:

	(Rs lakhs)
Postal packings	174
Special transactions	109
Birds	57
Monkeys	26
Firearms	54
Coins and gold coins	25
Total	445

The group 9 has been falling steadily from 1968-69 to 1970-71, mainly as a result of the fall from Rs 3.36 crores to Rs 1.74 crores in 'postal packings', while 'birds', 'firearms', and 'coin and gold coin' exports have risen only marginally. There is no reason to expect rapid growth from this group.

Thus overall, within the entire group, there are items with good prospects of future growth: wheat, opium, guar flour, cine films, imitation jewellery, and sports goods. But it cannot be expected that these items can compensate for overall poor market prospects and likely drop in re-exports from Rs 10 crores back to Rs 3-5 crores. Whatever policies and programmes are now adopted for export growth, we can expect 'Residual Exports and Re-exports' to reach a maximum total of Rs 105-110 crores in 1973-74.

* See 'Exports in the Fourth Plan', Special Number, July 1970, p 1279, and 'Export Growth: Performance and Prospects', Volume VII, Number 10, p 559.

** The reality of India's export predicament was discussed in 'Exports: Growth That Was Not' Volume VII, Number 9, p 486.

Shuffles and Reshuffles

Romesh Thapar

WHATEVER the obsessions, relevant or irrelevant, which possess the politicians of this subcontinent in the course of the next few years, the Simla Summit will have wide and profound repercussions. But, for the moment, the scene is shifting rapidly to the less dramatic business of getting the old country moving from Delhi. The expectation is that the new orientation in the implementation of Congress policies will begin, in fact, with the reshuffle which is to take place almost immediately.

Shuffles and reshuffles of the Council of Ministers in these days of the so-called Indira Era do not really amount to much — that is, if we take note of the present-day concentration of power in the PM's Secretariat. Indeed, it would be more appropriate to assess the manner in which it is exercised and utilised. Nevertheless, the shuffling and reshuffling is a pointer to the state of the ruling party and the balance of contrary elements within it.

Broadly, the Prime Minister has to organise her Council of Ministers, keeping in view the perspectives of development that are to be placed before Parliament and the people. In other words, the euphoria of *garibi hatao* has now to be translated into hard-headed programmes. Very little progress has been made in this direction, apart from the fact that Indira Gandhi has registered her general lack of interest in the *cliches* of radicalised economics which over 25 years have not solved any of the country's problems. It is natural to expect that the new Council of Ministers will be structured to make possible the elaboration and implementation of the new programmes.

To begin with, attention has been focussed very precisely on the Planning Commission headed by C Subramaniam. Opinion is unanimous that the Commission is devalued, unable to pull its weight within the Union Government or with the states, and that it has yet to realise that a totally new approach will have to be forged if we are to make a visible assault on the poverty of our people. A drastic shake-up at this point should not cause surprise.

The economic ministries, by their incredible capacity to wallow in man-made muddles, cry out for a leadership which will have the courage to transform the present paralytic system. Finance, demanding archaic procedures and accountabilities, is the major culprit and remains unreformed despite all the promises of the PM. Industrial Development, Company Law, Foreign Trade, Petrochemicals and Steel have the power to change the face of this subcontinent, but, without exception, their state is worse today than when this Council of Ministers was constituted. As for Railways, upon which these ministries are so dependent, never have they known so dismal a period.

It is in this area of her government that Indira Gandhi has to concentrate. All else is peripheral. We cannot remain at the mercy of ministers who are forever lobbying vital jobs for friends and servitors when they should be passing power to the recognised specialists in each sector. The PM's Secretariat is too lax in its vigilance; because it has for several years relied on hunches in personnel policy, it tends to be carried away by dishonest briefings from the economic ministries. Public patience with nepotism is running out.

The economic ministries must begin to feel the impact of a new technical leadership. This obviously cannot be introduced through manipulations in the Lok Sabha and the Rajya Sabha. The Prime Minister will have to innovate. Why is it impossible to have men of outstanding technical ability with cabinet ranking attached to each of the economic ministries, somewhat in the style of D P Dhar? Someone, somewhere, is trying to prevent this innovation. Who is the culprit? This step is bound to become urgent when a whole bunch of senior bureaucrats — about 30 of the ICS cadre — retire towards the end of the year. Why not act now? Must we be pushed?

The trouble, of course, is that the Prime Minister herself has no clear conviction about the need to introduce massive technical competence into the outdated system. The stenographers, head-clerks and under-secretaries continue very much in the saddle around her ministerial colleagues. Hamstrung, frustrated, embittered, the economic ministerial team becomes a cynical club, for nepotism, for dispensing favours and for collecting party funds. It's an economically disastrous experience, but has Indira Gandhi drawn the appropriate lessons?

The fear persists that, returning from the Simla Summit, Indira Gandhi may indulge in another whimsical exercise in Cabinet-making and ministry-forming. After all, power is very much congealed in her Secretariat. So why all this hurry...? We have time...

July 3

THE FOURTH ESTATE

Sorry, No Deal

Nireekshak

A RECENT UNESCO survey of the world press has revealed that in the industrialised countries the number of newspapers is fast declining and concentration of ownership steadily rising. The considerations underlying the concentration of press ownership, according to the UNESCO study, are mainly financial: (i) increased production costs which are slowly putting the small and medium newspapers out of business; (ii) large capital investment needed to modernise equipment; (iii) high cost of competition with other media like radio and TV; and (iv) inadequate advertising revenue.

With concentration of ownership comes lowering of professional standards and abridgement of intellectual freedom. This is an implied conclusion of the UNESCO study. A leading mass communication expert, Jacques Leaute of the Strasbourg International Centre for Higher Studies in Journalism, has explained it in these words:

> "For all those in the newspaper business, journalists and technicians alike, problems created by concentration are the same as in other enterprises. But press concentration creates a special difficulty: as well as being an economic enterprise, a newspaper is also an enterprise of the mind. The journalist's status is ambiguous because, on the one hand, he works for a business concern, is a member of a trade union and is bound by professional agreements, and, on the other, he is a trustee of the literary tradition, dedicated to intellectual freedom and to informing his readers."

The findings of the UNESCO survey and the observations of Jacques Leaute are very relevant to this country where the problem of press concentration has figured prominently in public debate and a confrontation is gradually developing between big and small newspapers. Organisations of journalists and small newspapers in this country have been pressing the government to check the growth of big newspapers and to take steps to diffuse their ownership. The government is committed to bringing forward a bill proposing changes in the company law relating to newspaper establishments, though there is evidently no agreement yet even within the government on the contents of the bill. This has made the usually cautious big newspapers very vocal in stating their case.

C R Irani of *Statesman* recently made a bitter attack on the government for making life difficult for the big newspapers. The occasion was the 33rd annual general meeting of the Indian and Eastern Newspapers Society. Said Irani: "It would be true to say that never in the history of the press in India and, perhaps, of the press in any other liberal democratic society have so many difficulties been deliberately created to make life impossible, especially for the larger and more prestigious newspapers. It is fashionable these days to talk of equality, but all experience shows that in every field of human endeavour, there are a few who lead and inevitably there are many who must follow. To hold up the pioneers, the leaders and those with vision and enterprise to ridicule and worse in the name of equality may be politically expedient today, but it is extremely short-sighted."

Reported *National Herald* in an editorial: "Mr Irani has talked of 'difficulties deliberately created' in India as compared to 'any other liberal democratic society'; he who places himself in the ranks of 'pioneers' and 'leaders' should have also answered the question in which other 'liberal democratic society' the jute, cement, textile and rayon magnates own and control the press and employ contact men as editors and special correspondents to project and further their private business interests."

If Simla was chosen as the venue for the Indo-Pak summit mainly to keep journalistic noses out, in retrospect one feels New Delhi would have served the purpose better. Some 300 journalists — 200 Indian and 100 foreign, including 26 Pakistani — descended on Simla braving the unpredictable weather, the high altitude and the PIB restrictions. Little did they know the curbs Simla's topography would impose on their movements. The places connected with the summit — 'The Retreat', the Himachal Secretariat, the Himachal Bhavan, the Wild Flower Hall (where Pakistani journalists stayed), Grand Hotel, Cecil Hotel and Clarks Hotel — were miles apart and their altitudes ranged between 7,000 and 6,000 feet. Water shortage and frequent electricity failures were added hurdles. The Press Centre was a poor show. Still more disappointing were the Indian arrangements for the daily briefings, which reportedly drew this comment from an Indian journalist: "In Simla we know the Pakistan side better."

The hub of the newspapermen's activity was the Press Centre where apparently the Pakistani journalists were in great demand. Many Pakistani journalists had in the past worked in India and were no strangers to newsmen in this country. A common scene at the Press Centre was of Indian journalists gathered around their Pakistani counterparts trying to understand the political situation in that country.

Reporting from Simla followed a set pattern. There were not many bright sparks, though some of the bigger newspapers had sent high-powered reporting teams. The best organised team-reporting was done by *Hindustan Standard* correspondents, Sunil Basu and Khagen De Sarkar. Their photographer Aloke Mitra too did a superb job. G K Reddy of *Hindu* and A N Dar of *Indian Express* were the best interpreters of the summit, their reports more or less accurately reflecting the trends in Simla as they changed from day to day. Dilip Mukherjee of *Times of India* got lost in details and often his reports gave the impression that he belonged to the inner circle of the establishment. *Statesman*'s Visvam and *Hindustan Times*'s Prithvis Chakravarty were both too cautious. V R Mohinder of *Motherland* did little reporting and more editorial writing.

The Simla accord was generally welcomed in the Indian press. The two exceptions, interestingly enough, were *Patriot* and *Motherland*. The former had many "ifs" in its editorial: "The present agreement, if sincerely accepted and honourably implemented, can certainly open a new chapter in the history of India and Pakistan" and "To reach an agreement is easy, specially for an 'instant statesman' like Mr Bhutto who can change his mind as easily and as often as he changes his many-splendoured suits". *Motherland* was hawkish, as expected. In a front page editorial it said: "Indeed while Pakistan has got half of what it wanted we have got nothing but empty platitudes... It has verily been a sell-out of India's vital national interests. What the jawans won on the battlefield has, for the second time, been lost by politicians at the negotiating table."

Denial and Apology

A by-lined story written by *Statesman*'s Delhi editor, Kuldip Nayar, last month caused a sensation, though only for a day as it was promptly contradicted. The story had claimed that a "deal" has been struck between President Giri and Indira Gandhi that the former would retire from his high office "on health grounds and make room for Mr Jagjivan Ram" while the Prime Minister would oblige the outgoing President by appointing his son as a Union Cabinet Minister. The day the story was published (June 22) Rashtrapati Bhavan issued a denial calling it "ridiculous". Two days later the Prime Minister described it as "totally fantastic nonsense". *Statesman* published both the denials promptly as also a letter from the President's Press Secretary contradicting the story. So far so good.

Eleven days after the publication of the story of the alleged President-PM "deal", on July 2, *Statesman* published an abject apology. It read: "There is a well-established and healthy journalistic convention in this country whereby the President of India is beyond the reach of criticism, and particularly such as would tend to derogate from the dignity of his office. This is a principle with which no responsible newspaper can disagree; and it is consequently with the deepest regret that *The Statesman* acknowledges having inadvertently violated it in the article entitled 'Between the Lines' published in the issue of June 22-23. We are assured that the item in question is totally incorrect and we have no hesitation in accepting this as the final word."

It is significant that the apology did not come from the person who had reported the "deal" over his signature. Also, the reasons given for the apology were far from convincing. For example, there is no 'convention' that the President is treated as beyond criticism. Not very long ago *Statesman* itself had

indicted the President for saying "shut up" to some Members of Parliament who were trying to disrupt his speech to a joint session of Parliament. In any case, newspapers have criticised the present President on other counts. The Mercedes-600 purchase was criticised by several newspapers last year. So have been the President's frequent trips abroad. At a time when the hereditary monarchy in England is coming in for public criticism, it can hardly be maintained that the democratically elected President of India should be immune from it.

A version of the "deal" going round in Delhi newspaper circles is that Kuldip Nayar had got the story from one of the PM's close aides who leaked it to him deliberately to scotch the move to instal Jagjivan Ram in Rashtrapati Bhavan. Kuldip Nayar should have known only too well that a denial of the story from the President's Secretariat was inevitable. What perhaps he did not anticipate was the reaction of his own paper. An upshot of the episode has been that what was intended to be a regular political column by Kuldip Nayar has been apparently nipped in the bud.

COMPANIES

In an Orderly Fashion

Hansavivek

BRITANNIA BISCUIT is in search of new projects and opportunities to develop its activities, but it would prefer to enter new areas in an orderly fashion as it did when it gradually built up the bread bakery division. Meanwhile, initial response to ProBisk, a high protein food introduced last year, has been encouraging. The management envisages good growth potential for products in this category in view of the co-operation of the central administration and local authorities in recognising the need to improve the daily diet of undernourished members of the community. Last year, in spite of adverse conditions — including electric power and gas shortages, — production of biscuit and bread increased over the previous year. It is intended to launch several new products this year. 'Intense' competition and high price of ingredients and packaging materials notwithstanding, BBC stepped up its total exports including seafoods by more than 275 per cent. In the field of seafoods, however, the company is not yet fully organised and operative. A processing and freezing plant is being established near Bombay. The growth potential for this trade in overseas markets is rated high. During its 44th year, ended March 1972, BBC's operations expanded in volume but margins slipped owing to the rising cost of ingredients and "other problems with which the industry was confronted". Additional costs were absorbed by the company and no increase was made in the price of products to consumers. The situation is "under constant review" and strategies are being devised to overcome impediments and to protect and improve earnings.

TRAVANCORE RAYONS has been permitted to expand its rayon production by 1,800 tonnes per annum and also expects permission to step up cellulose capacity by another 10 tonnes per day. A part of the finance required for the expansion will come from the proposed merger of the Indian Overseas Bank Ltd with the company. This will bring in about Rs 225 lakhs. During 1971, cellulose film production increased by about 20 per cent over the preceding year. The volume of rayon production could not be improved for want of essential imported spares, but value of sales showed a small increase on account of better market prices. Although turnover was higher, profit decreased because of mounting costs of raw materials, labour and government levies, and loss due to exports. The budgets of May and November 1971 and March 1972 imposed an additional burden of Rs 31 lakhs on the company. This was neutralised substantially on account of economies in production and better product-mix, etc. Under the voluntary agreement between rayon filament yarn spinners and weavers, renewed for two years from January last, the company has to supply 40.3 per cent of production, (against 35 per cent previously) at concessional price, besides the 10 per cent for exports at a further concessional rate as hitherto. A long-term agreement, valid for three years from July 17, 1971, was entered into with the labour unions involving an additional annual commitment of about Rs 18 lakhs. The directors hope that this will help improve productivity at all levels and enable the company to cope with rising costs and competition in the future.

WIDIA INDIA is negotiating for conversion of its 'letter of intent' in respect of expansion of production capacity into an industrial licence. Last year, the company's actual production was 29.9 tonnes against installed and licensed capacities of 30 tonnes and 24 tonnes, respectively. Not only was manufacture of more sophisticated items taken up, but the ore-processing plant, commissioned in 1970, functioned satisfactorily and contributed to increased profitability. Net sales (excluding export benefits) increased by 28 per cent to Rs 149 lakhs, and gross profit expanded by 63 per cent to Rs 44 lakhs. Net profit rose from Rs 18 lakhs to Rs 34 lakhs, but no further dividend is recommended apart from the 10 per cent interim payment which absorbed only Rs 4 lakhs. This is because the company's bankers refused to give approval to further distribution. While granting the additional term loan to the company, the bankers had imposed the condition that dividend may not exceed 10 per cent without their approval.

ALEMBIC CHEMICAL could raise its sales by 12 per cent to Rs 15.23 crores during the 65th year ended December last in spite of "many unfavourable and unsettling factors" which affected manufacturing and marketing operations. The company, however, had to fight a losing battle against margins and gross profit was a shade lower at Rs 1.79 crores (1.80 crores). This was the result of all-round rise in costs. Besides, the Drug Prices Control Order was operative on all the products of the company. Net profit slipped from Rs 61 lakhs to Rs 53 lakhs, but still covered the unchanged equity dividend, of 12 per cent on the enlarged capital, 1.3 times. The hard gelatine-capsules manufacturing plant, installed in April last, has been commissioned. R B Amin, chairman, assures shareholders that efforts would be continued to ensure "appropriate returns" to them and to plough back reasonable amounts for the continued growth of the company in the coming years.

GRAPHITE INDIA has undertaken an expansion project at Bangalore for manufacture of graphite electrodes, anodes, and other graphite products. In order to meet the needs of additional finance, estimated at around Rs 4 crores, the company proposes to raise Rs 25.84 lakhs by the issue of equity shares at par, which would be first offered to the existing equity shareholders. A sum of Rs 1.20 crores is proposed to be raised by issue of 8.5 per cent convertible debentures, which are intended to be offered to LIC, UTI, or any other financial institution or other similar statutory body. The terms of issue of debentures will include an option to convert 20 per cent of the nominal value of each debenture into equity shares during 1975 and 1976. Besides, a loan of US dollars 869,800 will be obtained from ICICI to meet the cost of equipment to be imported for the project. Meanwhile, the borrowing powers of the Board have been increased from Rs 5 crores to Rs 7 crores, so as to cover all possible borrowings presently anticipated for the financial requirements of the project. Midnapore Commercial has been appointed sole selling agent for the company's products in the whole of India for 5 years from the beginning of the current year at a commission of 2 per cent on the net sale proceeds. G C Bangur and N D Bangur, Graphite India's directors are members of Midnapore Commercial. It is stated that their shareholdings in the latter company taken together are less than 20 per cent of its share capital.

HERDILLIA CHEMICALS, which earned a higher profit last year despite 'excessive' imports of phthalic anhydride and dioctyl phthalate, was looking forward to considerable improvement in trading conditions this year, but has had a setback in the 'illegal' strike by workers. According to H V R Iengar, chairman, workers demanded a 42-hour week "in direct contravention of the three-year settlement signed before the Labour Commissioner", and called the strike when negotiations were going on. The strike, he adds, was accompanied by "acts of sabotage against the company's property". The company intends to expand, this year, its phenol capacity from 10,000 to 12,000 tonnes per annum. Its proposals for expansion of phthalic anhydride, from 6,000 to 12,000 tonnes, and for dioctyl phthalate, from 3,000 to 5,000 tonnes, are still under consideration by government. Iengar feels that the current import policy is adequate to control the import of phthalic anhydride and dioctyl phthalate, but fears that it could lead to 'excessive' imports of phenol which would "prejudice our marketing position". This matter is, therefore, being represented to government so that the company may not have to experience a recurrence of the situation that emerged in 1971.

MAHINDRA UGINE STEEL COMPANY's chairman, Harish Mahindra, foresees a widening gap between requirements and supplies of scrap; he suggests the setting up of sponge iron/metallised iron pellet plants. He says that, from a "nominal surplus" position in 1970-71, a stage has been reached when the country has to start importing heavy melting scrap. He cites a recent

study that has indicated that the requirements of scrap in 1976-77 would be double those of 1972-73. Mahindra also apprehends a serious shortage of power in the coming years and advocates the creation of fresh capacity for power generation and regional grids with a view to making good temporary shortages in one state by the temporary surpulses, in another. He complains that the power cost for electric steel production in Maharashtra is 'almost prohibitive' and urges grant of exemption to power-intensive industries from electricity duty and the bringing of the tariff for such units on par with those prevailing in Mysore, Tamil Nadu, Gujarat and MP, as recommended by a committee appointed by the state government. MUSCO's chairman is not happy over the imports of graphite electrodes, refractories, ferro alloys, heavy melting scrap, spone iron and nickel through government trading organisations. Apart from delays in getting the imported materials, the commission of 5 to 7.5 per cent of the CIF value charged by the canalising agencies is 'out of proportion' to the actual costs involved in the import of such materials. He suggests that a commission of about one per cent may be charged over the actual costs.

UNIT TRUST OF INDIA has declared a dividend of 8.25 per cent for the year ended June 30, 1972 as against 8 per cent for the previous year. This year's dividend of 8.25 per cent is the highest so far declared by the Trust. The dividend income from units enjoys tax exemption (along with income from other specified categories of investment) upto Rs 3,000. There is also no deduction of tax at source for resident individuals and even in respect of non-resident unit-holders no deduction is made at source as long as the income from units does not exceed Rs 3,000.

The Unit Trust's aggregate income during the year 1971-72 was higher at Rs 9.62 crores as compared with Rs 8.41 crores in the preceding year. After the allocation of this income between the initial capital contributors and the unit-holders and allowing for expenses chargeable to unit capital in accordance, the net income allocated to unit-holders amounted to Rs 8.72 crores as against Rs 7.58 crores in the preceding year.

Aggregate sales of units by the Trust during 1971-72 amounted to Rs 15.00 crores under 58,558 applications as against Rs 18.00 crores under 61,500 applications in the preceding year. There were 9,990 applications for the repurchase of units during the year for the aggregate value of Rs 2.59 crores as against Rs 3.19 crores under 12,700 applications last year. As on June 30, 1972, units sold and outstanding with the public amounted to Rs 104.65 crores, the number of unit-holders registered with the Trust being over 4,25,000. Under the Reinvestment Plan of the Trust, a sum of Rs 69.30 lakhs was reinvested by 18,000 unit-holders as against Rs 50.44 lakhs by 15,700 unit-holders in 1970-71. Sales of units under the Children's Gift Plan were Rs 46.28 lakhs as against Rs 56.32 lakhs last year.

The Unit Trust has decided to reduce the margin between its sale and repurchase prices. The margin used to be 5 per cent in the initial years and was reduced to 4 per cent in 1969. Now it has been further reduced to 3 per cent.

BINNY, after two disappointing years, is on the road to recovery and is no longer in the red. Improvement in working started in the last quarter of 1971 and has been maintained so far. N S Bhat, chairman, expects the cotton prices to remain at 'reasonable levels' this year, and feels that if all units work uninterruptedly and there are no heavy additional levies, the results for 1972 should be satisfactory. The company had to skip payment of dividend on preference capital last year, since the accumulated losses exceeded the amount available in the general reserve. The question of paying dividend on equity capital would be considered only after the losses have been wiped out and the company's obligations under the debenture trust deeds have been met. The company's mills are equipped to manufacture mainly coarse categories of cloth, using Indian cotton. A substantial part of the machinery needs rehabilitation. Notwithstanding the strain on liquid resources, improvement have been made in the carding and spinning departments in the Madras Mills, partly by overhauling ond partly by re-equipment. Conversion of ring frames to the top arm drafting system, overhauling of blowroom machinery, and reclothing of cards are in progress. The Bangalore Mills had to contend with a strike last year which was followed by a lock-out for two months, as well as with shortages and high prices of wool. Shortage of steel continues to be a problem with the Madras works of the engineering division. Last year, this unit executed at short notice orders for additional Bailey bridges for use in Bangladesh. The subsidiary, Giovanola-Binny, experienced a setback last year in the production of penstocks and pressure vessels owing to delays in the receipt of imported steel plates and interrupted supply of industrial X-ray films. Non-availability of seamless steel tubes and steel of shipbuilding quality affected production of pressure vessels and barges. Most of the steel required is now in stock, and supply position of X-ray films has also improved. The company has secured, for the first time, two pen-stock contracts in North India. It has also got two pen-stock export orders, one of which is to be completed during this year.

JOTINDRA STEEL AND TUBES, which has an industrial licence for manufacture of 16,000 tonnes per annum of black iron and galvanised pipes and tubes, has set up a factory near Faridabad and already achieved an annual production of nearly 5,000 tonnes. The second phase, of installing another mill for producing pipes of small diameter, is under way. Besides, a machine workshop for producing spares for maintenance and servicing of the plants, testing facilities, and a modern galvanising plant are proposed to be added. The project, estimated to cost Rs 100 lakhs, is proposed to be financed with share capital (Rs 45 lakhs) and term loan from IFCI (Rs 55 lakhs). The present paid-up capital is Rs 14 lakhs. A public issue is being made to raise another Rs 31 lakhs — Rs 23 lakhs in equity and Rs 8 lakhs in 9.5 per cent redeemable cumulative preference shares. The subscription list will open on July 17 and close on July 31 or earlier, but not before July 20. The management expects that the company will be in a position to pay a maiden dividend of about 10 per cent for the year ending March 1973.

H L MALHOTRA AND SONS, maker of safety razor blades, will undertake manufacture of stainless steel blades at its Calcutta factory with the technical expertise from Wilkinson Sword, the 200-year-old UK firm which originally started as a maker of swords and diversified into the manufacture of consumer appliances, of which the safety razor blades have pride of place. HLM will manufacture 500 million pieces per annum, of which initially 25 per cent will be exported under the Indian brand name 'Bharat' to South America, Africa, and the Far East countries. The British firm is to be paid royalty at 4 per cent on total production out of the foreign exchange earnings from the exports of the product. R K Malhotra, managing director of HLM, indicated that collaboration in razor blades manufacture might soon be extended to include other shaving products in the near future.

CPI(M)'s Defensive Posture

M R

AT its ninth congress at Madurai, the Communist Party of India (Marxist) tried to appear in the role of the unifier of the international communist movement and an independent political force with renewed faith in parliamentary democracy at home. On the whole the party has sought to project for itself an image of anti-revisionism *sans* Maoism on ideological issues and of a force combining parliamentary functioning with mass action leaving the onus for peaceful transition on the class enemy.

The CPI(M) no longer seeks legitimacy in the eyes of one camp or the other in the international communist movement. It attempted to achieve such legitimacy in the past. After supporting the Soviet action in Czechoslovakia it expected to participate in the 1969 world communist conference in Moscow as an observer, though the CPI was the only genuine Indian communist party in the Soviet view. The Soviet leadership appeared keen on reuniting the two parties on the CPI's ideological terms. Now the CPI(M) is content to maintain its bridges with the international communist movement through four ruling parties which claim ideological independence of both Moscow and Peking: of Rumania, North Korea, North Vietnam and Cuba. The CPI(M) believes that together with them it constitutes the third bloc in the international communist movement and can play the role of a unifier of the two blocs. Its claim at the Madurai congress to uphold the banner of Marxism-Leninism steering clear of Soviet revisionism and Chinese "sectarianism" reflects this position.

Balancing Act

The most forthright attack perhaps by any communist party on Peking and Moscow over Nixon's visits there has come from the CPI(M). The CPI(M) has appealed to communists all over the world to mount pressure on the Soviet and Chinese parties to bring about a united front to intervene effectively in Vietnam to end United States aggression. One does not know if the CPI(M) is articulating the views of the other parties of the third bloc here because none of these four parties have given public expression to such a demand.

But the CPI(M)'s balancing act is indeed a bizarre performance. It is all praise for Soviet backing for the Bangladesh struggle but is bitter about Soviet failure to recognise the semi-fascist nature of the Indira Gandhi government's terror campaign against the party and repression against democratic forces in general. It has denounced Yahya Khan's "butcher" regime on Bangladesh issue but is silent about the fact that the Chinese have consistently denounced the Indian government as reactionary while the Soviet were singing praises for its progressive character.

If the CPI(M) regarded the Soviet party's ideological positions revisionist, logical extension of such analysis should have led to the conclusion that Soviet Union is also social-imperialist because a revisionist deviation should logically culminate in social imperialism. The CPI(M) is however content to emphasise the achievements of both the communist giants. It certainly cannot expect the world to look to it for a third general line for the international communist movement as an alternative to the Soviet and Chinese general lines.

The party's lack of clarity on the general line (or rather its equivocation on it) is reflected in its approach to Indian realities. In the Chinese view, peaceful transition is an exception and not the rule. In the Soviet view it is the rule. The origins of the international communist schism can be traced back to the Soviet attempt to revise the Leninist formulation on peaceful transition at its 20th congress in 1956. The pre-split CPI had no difficulty in accepting peaceful transition to socialism but the CPI(M) made no attempt to repudiate it. On the contrary it tried to rationalise it by placing the onus for it on the class enemy.

Limited Stakes

In application, it turned out to be parliamentary cretinism. After the 1967 general elections, the party was the dominant partner in two coalitions, in Kerala and West Bengal. Theoretically, the party looked at the two governments dominated by it as a form (one of the many forms it was committed to using) and instrument of struggle. In practice, the party's obsessive preoccupation was with the legality of these governments even if it meant a moratorium on class struggle. The stakes were limited to these two states and often it found itself in the unenviable company of the CPI ensuring the survival of Indira Gandhi's minority government at the Centre. The party's political debacle in both its strongholds has now prompted it to talk of combining parliamentary functioning with mass action. But it would be well to recall that the post-1967 election document, "The New Situation and the Party's Tasks" said much the same thing. The difference however is this: in 1967 the party was looking at things in a moment of triumph; now it is doing so in its moment of defeat.

The leadership's failure to initiate mass actions and build them up and its obsession with electoral power resulted in what it contemptuously calls the ultra-left deviation. Now the leadership claims that the party has been able to thwart the challenge of left adventurism during the last three years. Indeed, the party regards left adventurism a greater danger than the semi-fascist trends in the country. If the claim is correct, it could thwart left adventurism only with the help of the State machinery and the victory was not on the ideological plane. The CPI(M) documents even insinuate that the Chinese party by backing the extremist group to disrupt party unity, objectively colluded with the CIA. If it derives satisfaction from the suppression of the extreme Left by the government, it has little justification in charging Indira Gandhi with using semi-fascist methods to suppress the CPI(M).

Disillusioned Cadres

In the wake of the West Bengal debacle, the disillusionment among the party's militant ranks was complete. They had lost faith in the leadership's ability to galvanise the party into action outside the parliamentary system. Even the leadership was divided but the danger of a split in the party united the entire Politbureau and significantly B T Ranadive who at one stage in the past wanted the party to walk out of the West Bengal United Front to man the barricades, and not General Secretary P Sundarayya, initiated the discussion on the political resolution at the party congress. The party now prefers to bide its time, waiting to exploit the lapses of the ruling party in the coming years, and fondly hopes that it can make it once again in West Bengal and Kerala. It would boycott the West Bengal Assembly but has no objection to contesting Lok Sabha by-elections from the state or continuing to parti-

cipate in the other state legislatures and in Parliament. It bases its entire tactical line on two fortuitous circumstances: the lapses of the ruling party in the future and the absence of a credible Maoist rallying point which could attract its militant ranks. The "hawks" in the leadership (particularly Harekrishna Konar) have been snubbed and the moderates have carried the day.

Invented Theory

The re-election of P Sundarayya as General Secretary is significant to the extent it ends the Bengal-centred politics of the party. The theory of West Bengal being the Centre's colony was invented exclusively for the consumption of the West Bengal electorate (parallel to E M S Namboodiripad's imaginary confrontations with the Centre over rice supplies to Kerala five years ago!). The party has now disowned this theory and would like its following to believe that the entire country is a colony of the big bourgeoisie. Instead it has attempted rather belatedly to formulate demands for autonomy based on a new awareness of the problem of nationalities in India.

The low-profile posture of the CPI(M) suggests defensive action, to prepare organisationally for the "semi-fascist" onslaughts to come. Its new-found faith in united fronts stems from this low-profile posture. The promise of militant mass action to reinforce parliamentary activity is at best a sop for the restive cadre which finds the leadership united on the question of participating in the parliamentary system. After the West Bengal elections, both the CPI and the CPI(ML) had directed appeals to the CPI(M) rank and file, underlining once again CPI(M)'s dilemma. The leadership has sought to resolve it; but the following would take time to accept this, for the promise of militant action cannot be indefinitely a substitute for such action.

NEW DELHI

Ills of ONGC

IT is typical of the prevailing lack of initiative and inability to take decisions that the Petroleum Ministry should be sitting tight on the report of the Malaviya Committee on the Oil and Natural Gas Commission, submitted several weeks ago. The Committee itself took much longer than the stipulated three months to complete its report. The reason for setting a time-limit for submission of the report was that, in view of the urgent need to arrange vital crude oil supplies, early and decisive action should be taken to set matters right with the ONGC. The Committee at least had some justification for taking more time since it can claim that it has recommended fundamental structural reforms in oil exploration and production. But there is no justification for the Ministry's failure to even release the report to the public.

The Ministry is in fact trying its very best to hold back the report. To this end it even invoked the excuse that since the working of the ONGC had at the same time been examined by the Public Undertakings Committee of Parliament, a report on the same subject by any other committee would attract censure from Parliament. But the PUC's report on the ONGC had been submitted much before the report of the Malaviya Committee and there was no bar at all to the release of the Malaviya report. Anyway, even this lame excuse has lost all force since the Chairman of the PUC has now specifically informed the Ministry that there would be no objection to the Malaviya Committee's report being made public.

Ministry's Reluctance

The Ministry's reluctance to releasing the report really stems from the fact that the Committee has not spared the Ministry for the present mess in the ONGC. Sharp criticism has been levelled against the Ministry for its tendency to treat the ONGC as a subordinate department, for constant interference in day-to-day working and for blocking all initiative in the ONGC. Some of the members of the Committee, who acted more as the nominees of the Ministry or the government, did not obviously relish the idea of the government as a whole or the Ministry being subjected to criticism. There was also an additional vested interest involved. If the Committee's report led to a shake-up of the ONGC, so much the better; it would open up opportunities for their own and for their favourites' personal advancement. Indeed, one of the features of the report which detracts from its overall merit and weakens its impact arises from this tendency. Otherwise recommendations such as the one for the proposed corporation for exploration and production of oil to have as many as three Managing Directors (one each for Exploration, Production and Offshore work, with the last stepping on the toes of the other two could hardly have found a place in the report. The attempt to foreclose all consultancy work in oil production and transportation and related facilities in favour of a particular organisation in which one of the members of the Committee has a direct interest is also to be attributed to the same motives.

Barring these aberrations, the Committee has done a good job of laying bare the weaknesses of the ONGC. According to the Committee, there had been a fall in the status of the Commission and progressive deterioration in its performance since 1963. The Committee attributes this to "conservative finance procedures, ill-informed audit objections, bureaucratic methods in the administrative machinery and inappropriate selection of men for the top posts". In a large measure, "the present ineffectiveness and loss of purpose is inherent in the Act [constituting the ONGC] which placed the statutory body in a position subordinate to the government secretariat". As a result, the ONGC had been placed in a position where "it has neither the status of the Commission nor the flexibility of a Corporation. In fact, it has the disadvantage of both".

In the light of this basic finding, the severe criticism of the present ONGC leadership by the Committee may appear to be somewhat misplaced. The Committee has found many faults with the top men of the ONGC and emphasised the frustration which prevails at the middle and lower levels of the organisation. But considering the role that the Finance and Petroleum Ministries have played and the fact that the ONGC has been without a Chairman for over a year, the Committee might have been more considerate and circumspect in passing judgment on the ONGC set-up.

Organisational Changes

While the Committee's review of the working of the ONGC is very useful, its perspective on oil exploration and the new organisational set-up for exploration it has proposed are obviously more important. In the view of the Committee there is no need to be pessimistic about the possibilities of

discovering oil, on shore and offshore, and it argues for exploration work to be expanded and intensified throughout the country without financial constraints. To this end it wants the present financing pattern to be changed completely. In its view, the oil exploration plan should not be put on par with other investment plans, but should be treated as a pre-investment R and D plan on which no direct return should be expected. It has proposed an allocation of Rs 400 crores in the next 10 years to be made available in the form of an outright grant, instead of as equity or loans as at present. To ensure that the grant in question would be made it has proposed the creation of a special fund to be called the "National Oil Exploration Fund".

In the view of the Committee, if funds for the exploration programme were to be made available out of normal government revenues, then oil exploration may not get the special consideration which it requires. When there are competing demands from different priorities, the necessary allocation of funds out of plan resources may not be forthcoming and, as a result, the exploration programme may have to be pruned every time. It is recommended that the proposed special fund for exploration be built up from the surpluses obtained from the production of crude oil, by grants from the government and from other feasible sources. The Committee has suggested that a specific amount be earmarked every year from the general revenues of the government for this purpose. If this was not considered possible a cess might be levied on petroleum products to create the proposed fund.

Recommended Structure

The organisational structure recommended for exploration and production is radically different from the one existing at present. It is proposed that the ONGC be converted into a high-powered Commission with policy-making functions. It will cease to be an operating body. The new set-up will be headed by a person of the rank of a Cabinet Minister, though it would be under any government department. In fact, the government department in charge of oil exploration and production would function under its direction. It is proposed that the Prime Minister should hold charge of the oil exploration portfolio for the next 10 years and that a Member of the ONGC should at the same time be Secretary to the department of oil exploration. Under the leadership of the ONGC and the proposed department of oil exploration, a corporation is proposed to be set up to execute the policies laid down. The proposed corporation would have a chairman and a separate managing director for exploration: the exploration budget would also be separately drawn up. Here the Committee appears to have drawn on the experience of the Atomic Energy Commission.

Confused Approach

The approach and thinking of the Committee, however, appear to be confused on a number of points. If the ONGC is to be headed by a person of the rank of a Cabinet Minister and if it is to be a policy-making and directing body, where is the need for a separate department or ministry of oil exploration in the government set-up? Will it not be better if the ONGC itself carried out the functions of the ministry or the department with the minister in the government holding this portfolio responsible for handling its affairs in Parliament? This will eliminate the bureaucratic set-up in the field of oil exploration which has proved to be a major inhibiting factor so far. We already have in the Railway Board and the Planning Commission parallels to draw upon.

An important feature of the report on the ONGC is the stress that has been laid on exposure of our oil technologists to foreign technology and experience. However, the Committee has failed to take account of a major aspect of the ONGC's working and development — its tie-up with a single source of foreign technology, namely, the Soviet Union. This has been and remains an inhibiting factor. One of the recommendations of the Committee is to undertake a fresh review of the country's onshore sedimentary basins to assess the fundamental shortcomings in the exploration effort so far. This is proposed to be done with the help of experts from abroad, but the fact that only recently a team of Soviet experts was invited to make such a review is ignored. A review by a Soviet team will not help very much since the entire work on exploration and study of basins has been done under the close direction of the Soviet experts attached to the ONGC. Soviet experts headed the various executive directorates of the ONGC till recently and the many shortcomings noticed in exploration and production developed under their initiative and direction. The total dependence on Soviet technology has been and remains a high level policy matter rather than a problem which can be tackled at the level of ONGC experts and managers.

The report lays much stress on oil exploration abroad with the objective of achieving national self-sufficiency in oil. After calling for a bold exploration plan within the country, the Committee has itself cautioned against placing all reliance on indigenous crude. According to the Committee, for a long time to come indigenous crude production will continue to lag behind the growing requirements of oil products in spite of measures that may be adopted to restrict demand. Hence it urges that attention be paid to exploration abroad and asks for the government's political support for this effort. The Committee has gone so far as to commend the possibility of joint ventures with foreign interests — both in the foreign ventures and within the country as a *quid pro quo*. This will amount to a major policy revision in this field. Here it appears that the Committee has not shown adequate appreciation of the latest trends in the international oil business marked by the decline of the international oil companies and the coming into their own of national oil enterprises in oil-rich countries. It is just about a decade too late to base our perspective in finding foreign oil sources on the experience of ENI of Italy, as the Committee appears to have done. It will be far better and also practical to rely on straight trade deals with national oil enterprises to get our requirements of crude oil than to look for captive sources abroad. Of course, foreign exploration ventures with national enterprises need not be altogether ruled out, but too much reliance should not be placed on these ventures.

Synthetic Oil

One of the five pillars of the strategy for self-sufficiency in oil outlined by the Committee is the emphasis on production of synthetic oil. Some work has been done on this by the Fuel Research Institute and there might be good commercial possibilities for this in the far future. But it is odd that the Committee should want to saddle the ONGC with the responsibility for this. The principal responsibility of the ONGC should be exploration for crude oil and development of oil finds; it should not be distracted by such projects as that for production of synthetic oil.

The first reaction of the Petroleum

Ministry to the recommendations of the Committee has been that the Committee has gone beyond its terms of reference. In any case, the Ministry claims, its recommendations are such that decisions on them cannot be taken by the Ministry. Now that it is being pressed to release the Committee's report to the public, it will be called upon to make its own comments on it which it appears reluctant to do. Meanwhile, the Prime Minister's Secretariat is carrying on its own examination of the report. As matters stand, any action on the report will emanate from the Prime Minister and her Secretariat rather than from the Petroleum Ministry.

NAVY

Wrong Priorities?

(From a Special Correspondent)

NEGOTIATIONS for the construction of Leander class frigates were conducted between the government of India, Vickers and the Ministry of Defence (Navy), UK, in the years 1962-64. What we witnessed on June 3, when the first Leander class frigate, the Nilgiri, built in India at the Mazagon Docks was launched, was the fruition of this collaboration. The event was hailed as signifying the revival of warship construction in the country.

In 1968 the government of India announced an order for three Leanders to be built at the Mazagon Docks. A further commitment for another three ships followed the next year. This decision was meant to induce would-be manufacturers of indigenous marine equipment to take up contracts for machinery for the Leanders and to ensure that orders for equipment of each type would add up to respectable size. The small size of orders had been a long standing excuse of equipment manufacturers for not undertaking orders for the navy.

Leander class frigates were designed for the British Navy when the British government had already reconciled itself to getting out of the race for naval dominance and had instead opted to fulfil a limited role — of its navy becoming the anti-submarine arm of NATO and augmenting that component of NATO maritime forces. The Leander was the operational answer to the Royal Navy's new role. It would operate with integrated anti-submarine task forces usually built around aircraft-carriers. Technically, the Leander design really involved updating of the Type 12 Whitby class frigate, two of which the Indian Navy has — the Trishul and the Talwar.

The Nilgiri carries an improved sonar set, an additional variable depth sonar (VDS) and an anti-submarine torpedo carrying helicopter. The Nilgiri's anti-ship and anti-aircraft capability remains entirely defensive and details of its weaponry reveal some widely acknowledged shortcomings. The variable depth sonar has not proved to be operationally as smooth as it was hoped. The helicopter is a daytime use, fine weather machine whose availability on task is necessarily limited by it being the only craft on board. The Seacat missile is a short range, anti-aircraft missile with some basic limitations. The anti-submarine mortars and the main 4.5 inch guns fitted to the ship came into service as early as 1955. Of course, it may be pointed out that other warship designs and associated weaponry have their own limitations as well. It is also well known that the Leander has been ordered or built by three other countries, *viz*, New Zealand, Australia and Holland, and that it is capable of taking on better fire-control equipment and that, in fact, such modifications are already planned for India's second and subsequent Leanders.

These are indeed technical points best decided on by professionals. The issue for public discussion can only be whether this ship, the Leander, is relevant to our defence requirements and whether it is cost-effective in our context.

Successful Ship

It is readily conceded that the Leander has been a successful ship in the Royal Navy. Yet this very fact raises the basic question whether what fulfils the requirements of the Royal Navy can be taken as good for our navy too. The first Leander, Nilgiri, has cost us Rs 20 crores in 1972, including a foreign exchange component of Rs 14 crores. Allowing for a cost escalation factor of 15 per cent per year the likely cost of the sixth Leander, when it is commissioned in 1980, will be around Rs 40 crores, though the foreign exchange component will perhaps come down to 20 per cent or the equivalent of Rs 8 crores per ship by then. The total cost of the entire project would thus be around Rs 180 crores, including foreign exchange expenditure of the equivalent of Rs 80-90 crores. Considering the likely delays, the sixth Leander is likely to be with the navy only around 1980.

The Leander, said to have a first rate anti-submarine capability, would hardly be able to meet the challenge of even the conventional submarine of the seventies much less face the small, cheap and fast missile boats/ships. If in a war it becomes practical or advantageous for the navy to institute a limited convoy system for merchant ships, the Leander may find itself a role. As an escort for capital ships, it may no longer be needed since it is hardly likely that the Vikrant or the Mysore will survive the 1970s. It is, therefore, difficult to visualise what role this ship is likely to play, especially considering its own vulnerability.

It is instructive to compare the cost of the Leander with that of some other ships of the Indian Navy. The submarines cost around Rs 5 crores, the missile boats Rs 4 crores and the versatile Petya class patrol vessels Rs 6 crores. The first question that arises is whether these latter types of ships are not of greater operational value to our navy and, therefore, should have a higher priority. If it is true that the cost to punch ratio or the cost to firepower ratio of these ships — the submarines, missile boats or the Petyas — is higher than that of the Leanders then there is weight in the plea that their indigenous construction should receive the highest priority. It would appear, *prima facie*, that the country could build production lines for all three — Petyas, submarines and missile boats — within the costs projected/budgeted for the Leander programme. Apart from financial resources, technical manpower — which has to be found, trained and put on the job — is a major limiting factor. Quite clearly therefore, priorities have to be laid down and for this it is necessary to review the entire naval construction plan for the seventies. It may appear heretical to view the Leander project in a critical light when so much has been said and written in adulation. A hard look is, nevertheless, called for so that the all-round development of the navy is not hampered merely because certain commitments were made three or four years ago when the political, economic and operational compulsions were clearly different.

Dithering in Aluminium

D C Kale

THERE are disquieting rumours that Bharat Aluminium Company, the public sector undertaking, may be reconsidering the location and time-schedule of its Koyna/Ratnagiri project. This project is of key importance in Indian plans to maintain self-sufficiency in aluminium at least into the late 70's, and any prevarication at this stage would be little short of a disaster. The company had very slow schedules to start with; the Tariff Commission, for example, could find hardly anything new happening in this company between its two studies in 1968 and 1971. The Koyna project is for manufacturing 50,000 tonnes metal, of which half would be of EC grade. It was decided that the smelter at Ratnagiri would be commissioned earlier so as to treat surplus alumina from Korba, while the alumina plant which would utilise ores from Dhangarwadi and Udgir would be commissioned shortly thereafter. This is a sound scheme provided it is implemented in time. However, the hesitation, the pessimism and the warnings in advance that the project might be uneconomic are most disquieting. The public sector has learnt to adopt this last tactic for projects which are yet to be commissioned. Bokaro and the proposed new steel plants at Visakhapatnam and Vijayanagar, as also several other projects, are announcing in advance that they will be uneconomic unless prices are raised substantially. Coal is another case in point where price increases denied to private producers as such are given to them through the intervention of the public sector. What is interesting is that the doubts are not expressed *before* a project is sanctioned and top staff appointed!

Private Sector Benefits

The Tariff Commission's report of September 1971 on the aluminium industry has had a similar effect. The Commission boldly, and correctly, announced that the Indian aluminium industry had come of age and that it did not need protection any longer. However, because Bharat Aluminium as a new producer would suffer if protection was removed, the Commission recommended its continuation for three years. The Government of India (through the Ministry of Foreign Trade, strangely enough) went one step further and extended protection for five years, i e, upto 1976. Private aluminium companies will benefit greatly out of this, while it is doubtful if BALCO will derive any benefit at all by 1976. By humming and hawing over plant sites at this stage, and after several crores of rupees have been spent on project reports, camp sites, changes of consultants/collaborators and their terms of reference and trips abroad, mainly to Eastern Europe, this is hardly the time for the government to change its mind. The Koyna plant is perfectly viable. It can be run at a profit — witness Indian Aluminium's new plant at nearby Belgaum — and it should be built with the least possible delay.

On the international scene, aluminium producers have at long last formed an association. The International Primary Aluminium Institute was formed in May this year in London. Copper, lead, zinc and tin producers had formed such bodies many years ago. The new Institute has over 60 aluminium smelters as members, and those on the Board of Directors are Pechiney (Chairman), Alcoa, Alcan, Alusuisse, Ardel, British Aluminium, CBA (Brazil), Comalco, Kaiser, Nippon Light Metal, Reynolds and VAW (West Germany). The Institute will sponsor new uses, promote the metal in general, and sponsor research in science, technology, statistics and ecology. The international aluminium picture of over-supply is apparently changing for the better at last, and Alcoa's Chairman John Harper, estimates that capacity utilisation will move up from the present 85 per cent to 90 per cent in early 1973. On the other hand, the western world's installed capacity increased by nearly one-fifth (9.6 mn tonnes to 11.3 mn tonnes) last year and is further increasing this year. Primary producers in the United States are, moreover, committed to purchasing nearly 400,000 short tons from the US stockpile by the end of 1973. Thus in the next four or five years at least, the supply position is likely to remain easy. Hence major producers who have subsidiaries or associated companies in India are not likely to be in a hurry to instal new capacity.

The position in India is, however, likely to remain tight if imports are banned. Demand for aluminium in 1973-74 and in 1978-79 is estimated at 260,000 tonnes and 500,000 tonnes respectively, and estimated installed capacity 223,350 and 493,350 tonnes, respectively, *including* 150,000 from Bharat Aluminium. Thus it is obvious that the Koyna project must not lag behind. A closely related matter is that of supply of alumina. INDALCO, in its data presented to the Tariff Commission, states that because of alumina shortage from its own sources it had to buy alumina within the country at Rs 1,068 per ton or import it at Rs 1,147 per tonne. Madras Aluminium also pays heavily for its alumina, because it has to blend high-grade bauxite to up-grade its own ore. (The Alupuram and Hirakud smelters get relatively cheap alumina.) The State Electricity Boards have unfortunately not played fair with aluminium producers in recent years. To take only two examples, Madras Aluminium's contract power rate jumped suddenly from Rs 155 to Rs 550 in 1970 and when ALCOP was transferred as a consumer from Durgapur projects to DVC in July 1970, the latter fixed higher power rates and imposed another 15 per cent surcharge in February 1971. A sense of balance needs to be kept about producers of industrial raw materials, such as base metals. India is a midget in the world league in aluminium, as in most other metals, and can exert no influence either as a producer or as a consumer. (The Indian production capacity is about 200,000 tonnes in a total world capacity of 11.3 mn tonnes, excluding the socialist countries; as for per capita consumption in India, it does not bear talking about.)

Unacceptable Apologies

Bauxite deposits in India are not unlimited, and we cannot hope to match Jamaica, for example, which tiny country leads the world with an annual bauxite output of 13 mn tonnes. But India has reasonably large potential in bauxite and hydro-electricity. It must, therefore, make concerted attempts to meet its modest demands internally, and do nothing to disturb production which is already established.

Aluminium is practically the only metal in which we are reasonably well off at present. This position can be maintained by pushing through Bharat Aluminium's projects with guts and brains. Neither Government nor the consumer should accept BALCO's apologies in advance about probable high costs or about unavoidable delays, for it is certain that existing producers will pounce on this opportunity to ask for increased prices, to the detriment of the growing number of aluminium users. Must the Ministry of Steel, Mines and Metals, after failing to make a success of steel, coal and copper, be now allowed to stage a fiasco in aluminium?

SOUTH

New Configurations in Andhra

Mohit Sen

THE announcement that Brahmananda Reddy has been appointed Chairman of the Finance Commission was also the formal declaration that his faction had wound itself up in Andhra. What had seemed so powerful and pervasive proved to be utterly hollow, illustrating the superficiality of the view that there are omnipotent state bosses in the Congress. Indeed, there had been any amount of speculation that by unseating Brahmananda Reddy the Prime Minister was taking the top off a volcano. It was not, however, a dormant volcano that she was tackling but an ant heap that crumbled at a kick, the ants scurrying off elsewhere, too terrified even to bite.

The elections to the Legislative Council from the Assembly constituency further illustrated the point when all the nine official Congress candidates got through in reasonable comfort. It is true, of course, that considerable pressure was brought to bear upon those who had revealed potentialities for cross voting. It was not for nothing that the Election Commission had to rush an official from Delhi to supervise the ballot since the Chief Minister had declared that he was in a position to know exactly who had voted for whom. But no amount of pressure would have worked were it not for the fact that the Congress MLAs knew that cross-voting would not, at the moment, unsettle the group in power and that Brahmananda Reddy had thrown in the towel. It was power that had brought his group together — neither ideology nor caste nor region counted to any appreciable extent — and the lack of it brought the facade down.

Peace and Stability?

Does this mean that P V Narasimha Rao can now look forward to a long reign of peace and stability? Considering the huge majority that his party has in the Assembly this might appear to be the case. But the reality is not all that simple and unilinear. He cannot be as easily disposed of as some had thought previously. He may not be as competent an administrator nor as adroit a manipulator as his former leader. But he is certainly improving and he has the great advantage of being regarded as the Prime Minister's representative in the state. If the situation in 1972 had been anything like what it was some eight years ago the present Chief Minister might have looked forward to a reasonably relaxed period ahead. But the situation is quite different today. The times are troubled and not even the biggest of majorities leaves much scope for peace.

The paradox of the Indian situation is that the popular thrust for change has manifested itself in the form of a massive vote for the ruling party. Confused radicalism expressed itself in a preference for the Prime Minister! But the thrust remains and the entire crisis of the capitalist path of development remains. And this is the unsettling factor.

The changed mood reflected itself in the debate on a resolution moved by a Congress member for the State takeover of the sugarcane factories. The unanimity in the House was quite remarkable. It may be argued that the takeover would benefit one section of the capitalist class at the expense of another. Quite true. But the section that would be hit by this measure is the large landholding stratum of the capitalist class, i e, the scarcely transformed feudal and semi-feudal landlords. It is this stratum, above all, that would also be hurt if radical ceiling laws are promulgated and implemented. Further, the fact that there is such unanimity on a measure that would extinguish the right of private ownership in howsoever a restricted area is itself indicative of the changed mood in the State. Finally, it is not only a section of the capitalist class that would benefit. Cultivating peasants would benefit, a stimulus would be imparted to productive efforts and a greater degree of socialisation of the production process would be accomplished.

Land Ceilings

It would, of course, be the height of folly to be smug and contented as a result of this mood. It would be criminal to simply sit back and allow this mood to manifest itself in further radical measures. Mass moods are only the raw materials of historical change. They have to be transferred into mass consciousness and organised for mass action. This is all the more necessary when one realises what the imposition of radical land ceilings is going to mean.

The battle for land ceilings is going to be a bitter one, perhaps the most bitter since Independence. It is an important stage in the struggle for the democratisation of Indian society — democratisation of the Indian village. And it is democratisation that would have to be accomplished by a drastic change in property relations, by the working of the concentration of ownership of a most basic means of production and the transfer of property in the form of diffusion of ownership. It involves thousands at one end and lakhs at the other.

Prospect of Mass Action

Particularly at the time of implementation there is bound to be acute social tension based on the accentuation of class struggle. Up till that time the present land monopolists would be hoping against hope that the plague of dispossession could be avoided. And they would use all their ties and connections with the local administration to secure the subversion of whatever progressive acts the legislature might have passed But given the mass mood, the adherence to democratic forms of rule and the growth in influence of the petty bourgeois sections in the Congress, it is possible to secure a measure of neutrality and even benevolent neutrality on the part of the State power as the peasant masses move into action for the implementation of radical agrarian relations acts. One should not, of course, bank too much on this possibility of the neutralisation of State power. Indeed one should ready oneself as well as the peasant masses for the contingency of facing up to the full fury of unleashed State violence. Far more important than neutralisation is the very real prospect of involving in such actions the sympathy and, to an extent, even participation of the vast masses who had voted Congress in the recent elections. The forging of this bond for mass action and through mass action is the key to the situation. And it is here that ultra "Left" gestures and the clinging to outmoded anti-Congressism in the shape of a call for all-in unity against one-party dictatorship hamper the forging of militant mass unity on the broadest possible scale. In Andhra the possibility of such unity is very real indeed as is the prospect of mass action.

It is against this new background that the chances of Narasimha Rao surviving and strengthening himself have to be measured. To date he has shown little

signs of understanding the changed temper of the people. He has given absolutely no indications that he intends to be more radical than his predecessor. His attachment to Sanskrit and rituals breed a conservatism that borders closely on sympathy for revivalism. His callousness towards the murder of the Left student leader George Reddy in the very sight of the police by thugs with RSS and Jan Sangh sympathies has made him more suspect than his predecessor in the eyes of many progressives in the state.

He would, indeed, be giving himself false comfort were he to see in the defeat of the Srikakulam Naxalite misadventure the decline of Leftism among the students and youth. Naxalite moods are very prevalent still among the students despite the manner in which Nagi Reddy accepted the humiliating bail conditions imposed by the government. The revolutionary poets and other writers are immensely popular with the youth and their whole style and idiom is that of the extreme Left. They obviously evoke the mood of frustration close to that of rage which is still dominant among large sections of the young. Another and more stable as well as fruitful manifestation of the same underlying trend is the response of the students and youth to the Communist summer camps of 10 days' duration organised by the CPI. A qualitative leap in attendance and seriousness were very much in evidence after a whole period of patient effort.

All these factors taken together lead one to believe that Andhra is no longer going to be the Left state that had gone quiet, even though the configurations of the advance of the Left are likely to be novel.

BANGALORE

The Centre Smiles

RECENT trends in the state support the view that it pays to be on friendly terms with the Centre. The overdraft problem has vanished into thin air and the government's financial viability appears to have been restored, if the budget presented by the Finance Minister, M Y Ghorpade, is any indication. There need be no quibbling over the distinction between "overdraft" and "ways and means advances". On April 29 the state's overdraft stood at Rs 71 crores. The 1972-73 budget makes mention of ways and means advance of Rs 62 crores from the government of India. And so, New Delhi has bailed Bangalore out of a difficult situation. It is now for the Brahmananda Reddi Commission to sort out the implications of these ways and means advances on Centre-State financial relations. The budget reveals that the State's indebtedness to the Centre is of the order of Rs 385 crores which drains away a sizeable chunk of the tax payer's money in the shape of interest.

The Centre has also come to the state's assistance in another way. The Rs 164-crore Kalinadi Hydro-Electric Project, which would have cost the state Rs 13 crores in the curent year, has been quietly transferred to the Centre. Kalinadi, which is the most economical of all the power projects in the state, will add 640 megawatts to Mysore's power system by 1981. The present generating capacity of the State is 960 megawatts. Incidentally, the Finance Minister scotched opposition fears that under the guise of financing the project, the Centre may take over the distribution function and averred that no strings were attached to Central assistance to this project. The Centre's interest in the Kalinadi Project is understandable in view of the power needs of Goa and Maharashtra which are residual claimants for Mysore's surplus power. The Union Minister, K L Rao, has always held the view, which is shared by many, that the big power and irrigation projects in the country should be constructed and run by the Centre. This will reduce the number of inter-state disputes. Cynics may respond by suggesting: why not begin with Nagarjunasagar?

Changed Situation

The softening of the Centre's stand on the "unauthorised" irrigation projects in the Cauvery basin fits in with the new pattern of Bangalore-New Delhi relations. It may be recalled that in the last months of the Congress(O) Ministry — and in the halcyon days of DMK's honeymoon with New Congress — Mysore was under pressure to halt work on the Hemavathi and other projects objected to by the Tamil Nadu Government. Now the situation has radically changed and Chief Minister Urs is hopeful of evolving a *modus vivendi* for securing Centre's assistance for the completion of the three projects, namely, Hemavathi, Harangi and Kabini on which the state has so far spent over Rs 26 crores. Thanks to the good offices of the Centre, Tamil Nadu has decided to withdraw its case on this issue (use of Cauvery waters) now pending before the Supreme Court. Instead of a tribunal, there is to be a fact-finding expert committee to collect the necessary data about the Cauvery waters, the use of which is governed by the 1924 agreement which will lapse by 1974. Chief Minister Karunanidhi himself denied recently that his government had ever objected to the construction of dams across the Cauvery and its tributaries by Mysore. Needless to say, this softening of attitude is welcomed here.

Perhaps it would be wrong to think that all inter-state disputes can be settled "out of court", although it sounds quite sensible. For instance, neither Mysore nor Maharashtra, both of which have a common stake in the Krishna-Godavari dispute, is in a mood to withdraw the dispute from the Bachawat Tribunal. Not that the outcome of a negotiated settlement will necessarily be less favourable to Mysore, but the Urs Ministry has reason to think that this approach carries with it the risk of being accused of a "sell out" — real or imaginary. After all, it could well be a case of bolting the stable door after the animal has sped. Nagarjunasagar is a reality and the Srisailam project will be completed soon. What, then, will be there to fight over?

And lastly, a word about the Mysore-Maharashtra border dispute which remains frozen for many years now. The Congress Ministry still swears by the Mahajan award but Chief Minister Urs may be feeling his way towards a negotiated settlement. The Union Minister, K C Pant, was here sometime ago to sound Mysore's spokesmen about their views, but no one is eager to spill the beans. The Centre is reluctant to bring the two Chief Ministers to a conference table unless a mutually acceptable formula is worked out in behind-the-scene manoeuvres. The reported statement of a junior Minister (now denied) that a "Vishal Gomantak State" could be formed by merging the disputed areas with Goa has caused a flutter in opposition dovecots. That may not be such a ghastly — and unwelcome — idea provided there is any chance of Goa merging with "Vishal Karnatak". And Maharashtra should welcome the proposal if it thinks that the political wind is blowing in its favour. In politics nothing is impossible.

WEST GERMANY

The New and the Old Left

Aswini K Ray

THE arrests of the hard-core Baader-Meinhoff group ended the latest phase of the so-called New Left movement in this country. A series of 'political' violence — political, because, according to the authors, they were directed against private property and not against persons as such — preceded their arrests. During the later phase, the end appeared inevitable; it was only a matter of time. But the failure of the Rote Army Fraction (RAF), the name under which the Baader-Meinhoff group operated, has raised questions that may be relevant for the socialist movement of the world.

On the face of it, there was no direct connection between the New Left movement and the RAF. When the chips were down, the entire West German 'Left' — old and new — were vying with one another to denigrate Baader and Meinhoff from the Left pantheon; in fact, the more the Left protestations, the more the compulsion for unsolicited censure of the RAF. It was a 'Leftist informer' who enabled the arrest of Ulrike Meinhoff, the intellectual leader of the group. Since then, the lionised informer has offered to donate his prize-money to enable a fair trial of the RAF. How, he alone knows; his share of the few millions set for Meinhoff's head could only be decided by the courts, and that only after her conviction.

However, the relation between the New Left movement and the RAF lay exclusively in their identical philosophical base: like the New Left, the RAF believed that the inner contradictions of developed capitalist state, and imperialism, made them 'paper tigers'; that, the proletariat was 'assimilated' in the productive processes of the consumer societies; that, a 'revolutionary elite', conscious of its alienation from the capitalistic system of production, could through political actions sharpen the contradictions and the consequent polarisation of classes to the point of clash; the bliss of socialism was to follow inevitably. But a vital difference that distinguished the Baader-Meinhoff group from the New Left movement, and made all the difference to the fate of the two, was that the former practised what it preached; starting from the same premises, the New Left continued merely to 'interpret' the society while the RAF sought to change it. In the process, disowned by the Left, hunted by the 'paper tiger', the Baader-Meinhoff group raced to its inevitable end.

The philosophical radicals of the New Left movement, barring some notable exceptions, have ended up more profitably for themselves. To be exact, the New Left movement in West Germany began on June 2, 1967, with a demonstration against the Shah of Persia in Berlin; the police-firing and the death of a student-onlooker gave birth to the New Left movement, for which, the intellectual base had been prepared by the Frankfurt School of sociologists led by Horkhymer, Adorno, Habermas and, of course, Mercuse. The 'anti-authoritarian' basis of this school of 'Critical Theorists' struck a familiar chord among the youth of post-Nazi-Germany. The subsequent sound and fury signified a catharsis of the pent-up emotions of the past and an urge for a total break with it. The reaction of the Establishment to the New Left was sympathetic, almost paternalistic. But the New Left was asking for too much if it expected the West German bourgeoisie in the late-sixties to sacrifice anything for the sins of its predecessors. The assassination attempt on Rudy Deutschke showed up the teeth of the 'paper tiger'; the shot which for a long time incapacitated Rudy virtually killed the movement, but for the Baader-Meinhoff group. The former began where the latter ended. But, from that point, there was hardly any resemblance between the two. While the Baader-Meinhoff group continued to escalate its 'political violence' to the point of no return, by 1970 the leaders of the Sozialistischer Deutsche Studentenbund (SDS) — the organisational mouthpiece of the West German New Left — were busy dividing the spoils of the movement, which, had helped to highlight the incongruity of the authoritarian and hierarchical university structures of the country for the needs of a streamlined capitalist economy. 'Reforms' in this feudal inheritance of the university administration has been one of the very few lasting contributions of the New Left to the stabilisation of Bourgeois-Democracy in this country. In the process, the movement has been the first casualty and the participants, with notable exceptions, the prime beneficiaries of the reforms. The 'reforms' were enough to blunt the 'revolutionary' edge of this self-conscious elite. The bulk of the erstwhile instant-revolutionaries, and those who are not busy writing their own treatises on the 'revolution', are now jockeying for positions in the various universities of the 'capitalist state'. The new justification: "Be in the system to be able to change it" — another familiar Left rationalisation.

The contrast between the two is recalled here not to eulogise one or the other. On the contrary, based upon the same philosophical foundation, and drawing almost exclusively upon the 'revolutionary' potentials of a self-conscious elite steeped deep in its own class mores, both were doomed from the very beginning. Both, anyhow, were part of the pitfalls of Left-adventurism the world over.

However, there is another aspect to the story which is sought to be highlighted here. While the Baader-Meinhoff group was being hounded out of its hide-outs, there was no dearth of solidarity among the West German Left for revolutionary causes and the 'wretched of the earth' — except the one at home. Vietcongs, IRA, Naxalites, Black Panthers, Tupamaros — all, at this time, obtained demonstrative solidarity from the West German Left, though the Baader-Meinhoff group did not get it at a time when they needed it most. 'Tactical silence'! Perhaps so; or perhaps an instance of 'Left-Internationalism' of convenience!

Ultimately, those who came to the aid of the RAF, under great personal risks, were not those who had been preaching what the Baader-Meinhoff group had practised; they were 'bourgeois-liberals' — a term that has come to have pejorative connotation in the lexicon of the revolutionary Left. These few professors, doctors, lawyers, journalists, priests, even a business executive — not all of them sharing the political views of the RAF — are now being prosecuted for having supported 'criminal gangs'; even as the 'Left-informer' is faced with the problem of how best to invest his prize-money.

The Baader-Meinhoff group has also exposed its own confused assessment of the reality of the infrastructure; in fact, it has neglected it, and paid dearly for it. But, although its ability to "create insecurity in the bourgeois society" is debatable, it was able to expose — for however short a period — the ridiculous impotence of the State — power against the desperate courage of a group of dedicated anarchists; never before, in post-War Germany, has the entire potential of the State machinery been so fully stretched to apprehend what the establishment called this 'tiny band of criminals'. In the long run, of course, the end was inevitable. It certainly, but only partially, vindicated the view of the RAF, that the invincibility of the 'bourgeois state' has been exaggerated by the prophets of doom to justify their inaction. Nevertheless, the RAF also proved by its follies that the 'theory of capitalistic contradictions', as an independent variable in the breakdown of the 'bourgeois state' is equally romantic; in the context of the material and technological resources of a developed capitalist State — as the RAF found to its cost — there could really be no substitute for the long, hard, struggle through mass organisations for socialism. It is not really a question of violence or non-violence; more aptly, it is a question of broadening the base of the catalytic agent, committed to change, so as to make the distinction between 'subversion' and 'revolution' self-evident.

LONDON

The Apprentices Revolt

Farrukh Dhondy

IN Britain the revolt of the young is fast becoming the revolt of the younger. The press contemptuously call the action of school students 'the lollipop revolution'. The police, obviously taking a more serious view, weren't prepared to combat them with liquorice sticks. The march of May 17 this year brought out about eight thousand demonstrators, aged between eleven and seventeen, demanding the abolition of school uniforms, demanding an end to corporal punishment, making a stand generally for more control of their schools.

On an earlier demonstration a week before, the police managed to turn back four hundred school revolutionaries and took some of those in the front rank in and charged them with being leaders of a disorder. Stephen Finch, arrested on that day, played up by the press as the 'leader' was tried and fined and warned that more serious consequences would follow if he didn't stay out of student politics. The purpose of the May 17 rally was partly to show solidarity with those arrested earlier and to demand their release, partly to launch a national campaign which would co-ordinate the spontaneous growth of resistance to schooling that is being offered by students.

There have been panic reactions from politicians. Reginald Maudling, Home Secretary, speaking to the police federation, blamed lax parental control for the upsurge in youthful 'criminality'. *The Daily Telegraph* with it's constant Marie Antoinettian formula of 'let them eat cake', called for a diet of severity. Leaders writers were convinced that a left wing conspiracy of Maoists had stirred up the chick's nest. The youth themselves came out very clearly with what they wanted. One group, interviewed by a revolutionary newspaper, said "Teachers treat us like a piece of machinery, and when you rebel they think there's something wrong with you, and the Head sends you to a psychiatrist ... We learn nothing in school that gives us any interest in what workers are doing. I supported the miners, but there has been nothing in school to assist my understanding. If you raise the subject in class they tell you to shut up and get on with your work. Very rarely do we discuss anything. Religious instruction is the only subject with any room for discussion and if you disagree with the teacher it's back to written work. Most of the time outside of school I read books on political struggle which I think should be used in school. I think politics should be discussed from the first year... The pupils in schools think that if workers are coming out on strike and getting what they want, why can't we come out and get what we want..."

The strikes have hit British schools in a year in which Ted Heath's government is once again resorting to the educational system to take the unemployment load off the economy, Representing it as a liberal measure to increase the nation's mental wealth, the government has raised the statutory school leaving age to sixteen. The youth of Britain will, by staying on at school for one more year by compulsion, decrease the pressure from below on the pool of a million or so registered unemployed in the country. In a country in which part of the volume of surplus wealth has been traditionally channelled into pacificatory welfare, the cost to the economy is in absolute and relative terms, small. It would cost the social services more, for instance, to pay dole money to the fifteen year old unemployed than it would to keep them unpaid at school and compel their parents to support them for an extra year.

The politics of school students are in no way in the tradition of student politics. All over the world, for centuries, the populations of the universities and centres of learning have had an ambivalent and special place in the structure of society. On the one hand they have had the potential of conceit which has enabled them to read about and historically analyse the issues that confront a population. They have had the media of the day at their disposal and they have, in France and America especially, been somewhat foolishly looked upon as the future arbiters of a country's destiny. There is no doubt that they have contributed, in the US, in Bangladesh, in France, in a hundred other countries and situations, to the historical change overtaking their nations. The gunmen of Yahya Khan, Mayor Daley, Ronald Reagan, and other mythical warlords of our recent history, followed the echoes of righteous rhetoric onto the campuses to do their murder. In England, where the 'voluntary' systems of university education produce the same noises about politics, about Vietnam, about nuclear disarmament, about women's lib, about South Africa and racism, such measures have not been necessary. The closest thing to left wing action at universities in Britain in recent years has been the sacking of a hotel in Cambridge where sympathisers of the Greek *junta* were holding a party.

But the school movement is something else. It is in essence the organised dissatisfaction of the near future's working class. Today's third formers are tomorrow's apprentices, and their involvement in the politics of their class on their own front and within state-run institutions, is obviously a far greater danger to the capitalist state of Britain than the protests against American action in Vietnam in Grosvenor Square. It is also a much more difficult thing for the police to handle. Whereas the population of the country is largely apathetic to the denial of civil liberties to protesters from universities, they will not stand by and see their thirteen year olds battered by a supposedly liberal police force. In terms of mass opinion the lollipop has more power than the cap and gown.

The movement of school students and the demands it has generated serve to point out the contradictions inherent in a welfare state. State education for school students is completely free, books are provided, even meals and uniforms are subsidised for families who are willing to declare themselves low income earners. By and large only the education of the work-

ing class is undertaken by the state school system, the other strata of Britain's finely divided society having set up for itself a 'public' school system. The state schools have become manufactories for disciplined and literate workers and the situation has bred its antithesis. Organisations which represent the school students, such as the School's Action Union which called the London demonstrations, are moving fast towards demanding that the state pay its future workers while they are still at school, as it has become increasingly evident to the students themselves that far from receiving an education they are serving an apprenticeship of processing for the general and lower orders of the economy.

WEST ASIA

The American Factor

Shah Abdul Qayyum

DURING the past few months, Arab-Israeli tension has reached a point, perhaps, almost as ominous as just before the June 1967 war. If international efforts for a peaceful and mutually agreeable solution are not diligently pursued, the Arabs and President Sadat of Egypt, in particular, might be compelled to give way to local pressures for making a fresh bid at a military solution.

Last year it was thought that the efforts of Gunnar Jarring, Special Representative of the UN, might prove useful in bringing about a limited Arab-Israeli *detente*, if not an era of peace. These hopes have been belied, at least for the moment. At one point, last year, the UAR went to the extent of announcing its readiness to allow Israeli ships to pass through the Suez Canal in return for a partial Israeli withdrawal away from the Canal bank and into Sinai. The Israeli Prime Minister, Golda Meir, then indirectly complimented Sadat for his boldness and realism. But since that juncture the two sides have again become frozen in their rigid positions. The Israelis insist that all attempts at a *detente* should be only through direct talks between themselves and the Arabs and that the latter must provide firm guarantees of peace as a precondition for any changes in Israeli policy. The Arabs on the other hand are again asking for a complete and unconditional surrender of all Arab territories captured by Israel in the June 1967 fighting. They argue that without a total withdrawal Israel would be talking from the position of an occupying power.

In fact, any peace initiative in West Asia without the participation of the crucial third party is unlikely to bear fruit. The United States and the Soviet Union are this vital third party. Unless these two powers agree between themselves on concerted action, the dangerous stalemate in West Asia could reach flashpoint. More than in any other part of the world, peace in West Asia depends largely on the policies and attitudes of the two super powers who appear to be committed to safeguarding the stability and territorial integrity of their respective clients in the region. By virtue of this patronage, they alone are in a position to exercise pressure and bring about a lasting peace in this area.

And of the two super powers, the United States has much greater potential for bringing about peace in West Asia. Without US moral and material support, Israel would find it extremely difficult to maintain its economy, its defence forces and, therefore, its rigid position *vis-a-vis* the Arabs. The Arabs argue that if the US were to exercise sufficient pressure on Israel, it would be compelled to see 'reason'. This argument has much substance as the US and Israel do have much closer bonds than the Soviet Union and the Arabs. While the Arab countries that are close to the Russians — the UAR, Iraq and Syria — are dependent on and grateful for Moscow's political and military help, they are at the same time quite wary of Russian influence. For instance, Sadat in Egypt has often shown his independence of the Russians, as in the arraignment and imprisonment of Aly Sabri and other reputedly pro-Russian elements. The Soviet Union also does not subsidise any of the Arab states to the extent that American private and public funds do in the case of Israel. Therefore, while the Russians could persuade some Arab countries to follow certain policies in West Asian affairs, they do not have the sort of leverage that the Americans have with Israel. The Russians have no organic relationship with the Arabs; the organised, influential and affluent American Jewish community-cum-vote-bank makes the American relationship with Israel a very close one. It is inconceivable that the United States could ever leave the Israelis to fend for themselves in a situation of extreme danger. The preservation of Israel's integrity is a neo-permanent national interest of the United States. On the other hand, the Russians have no such organic commitment to any of the Arab states.

The United States is, therefore, in a markedly better position to pressurise Israel to make concessions for a peace settlement. At the same time, while all the Arab states may not be particularly friendly towards the United States, there is no basic antagonism towards the Americans. Further, the United States still exercises a good deal of influence in countries like Jordan and Saudi Arabia. In contrast, Moscow has little or no leverage with Israel. This means that Moscow is just now suited to bringing about a peaceful settlement in West Asia by itself.

But the United States, together with the Soviet Union, could exercise a definite influence on the prospects for peace. Thus far the two super powers have found it convenient not to adopt a concerted stand to bring about peace in West Asia. While avoiding a direct confrontation, each has used the Arab-Israeli conflict to strengthen its own position in the region and weaken that of the other side. Complicated manoeuvres have been conducted by these two powers to extract the maximum benefit from the simmering conflict.

However, there are now some signs that Moscow and Washington are moving towards a period of general accommodation of each other's interests. Nixon's visit to Moscow could pay dividends in the shape of a joint approach towards the West Asian problem. Despite America's renewed military vendetta in Vietnam, the overall international political climate remains 'quiet' and conducive to an imposed peace settlement in West Asia. Nixon once described the Arab-Israeli confrontation as "the most dangerous" for the United States and indeed the rest of the world because of its "potential for drawing Soviet policy and our own into a direct collision". Perhaps, for this very reason, the United States, along with the Soviet Union, could end the logjam in West Asian affairs by persuading the Arabs and the Israelis to work seriously towards a peace settlement. In this task the United States fits the bill for playing the more active role.

Indian Council of Historical Research

Sudhir Chandra

THE state of historical research in India has not been terribly satisfactory all these years. The quality of both writing and teaching has left a great deal to be desired. Little co-ordination of effort and purpose has been visible. Barring a couple of exceptions, historical journals in the country appear intermittently with a fare unlikely to cheer many. The annual *tamasha* at the Indian History Congress has to be seen to be believed for its banal academic proceedings and inverted perspective in which petty profiteering acquires the pride of people's attention. The Indian Historical Records Commission can scarcely boast of a more edifying performance. Sporadic seminars attract more or less the same set of bigwigs most of whom, too busy to read, desperately try to say pompously the same trivial things over and over again. The freak work of quality has been the result of individual enterprise scarcely motivated and aided by organisations.

In a chaotic situation like this, it is difficult to argue with conviction and cogency for a continuation of the existing ill-organisation or *laissez-faire*. More often than not, it has worked to the advantage of the manipulative rather than the intellectual genius. The mechanism of academic elevation simply beggars description if one looks at the unworthies placed at the mountain-tops of history departments in the country's universities.

The case for the Indian Council of Historical Research can, therefore, be disputed in principle by only the incorrigible utopian or the blind. In fact, for quite some time the need was being felt, and at one stage some interested lobbies from abroad had even broached the possibility of doing the job for us in order to be able to influence subtly the writing of our history.

Stupendous Task

The task before the ICHR is stupendous. It has to co-ordinate research so as to avoid unnecessary duplication of effort; indicate neglected areas of study and promote work on them; locate, classify and preserve historical material lying in the custody of individuals or institutions unable to look after it; sponsor research programmes and provide technical assistance for the formulation of research projects by individuals and institutions; organise seminars, workshops and conferences; and promote publication of historical research in order to disseminate ideas and information on historical research in the country and abroad; undertake the compilation and publication of necessary source material; and encourage the production of popular literature which would foster an objective understanding of India's cultural heritage. The Council also aims at facilitating intercourse among workers in the field of Indian history and at developing a body of talented young historians. Obviously, it claims within its jurisdiction everything connected with the writing of Indian history, be it the most abstruse historical treatise or elementary books for schools or adult literates. It also attempts, and rightly so, a broad definition of history so as to include in it history of Art, Literature and Philosophy, and allied subjects like archaeology, numismatics, epigraphy and the historical study of manuscripts.

This is a grand promise. One will wish the Council all success.

Pitfalls

But there are pitfalls. The conception of the objectives of the Council betrays lack of clarity in the face of irreconcilable demands. This may be deliberate, or the result of uncertainty about the relative importance of social engineering and the values of an intellectual discipline. Whatever be the reason, the choice of priority between the two has to be clearly made and stated before the Council can hope to be unequivocally supported by the academic community. It cannot get away with the present equivocation that in its aim of giving 'a proper direction to historical research' it will have two objectives to guide it: encouragement of objective and scientific writing of history; and inculcation of 'a healthy respect for our cultural heritage without encouraging a blind acceptance of superstition, obscurantism and revivalism', and promotion of national integration.

Is the 'proper direction' to be given in accordance with the first or the second objective? The two may not always be contradictory. They can often be irreconcilable. Which of the two will prevail in that case? If we are expected to owe primary allegiance to our cultural heritage, history writing cannot be objective and scientific. History writing is either so or it is not so. It cannot be partially or intermittently so. That is to say, on the conscious plane. As such it cannot be geared to serve a primarily utilitarian purpose howsoever noble it may be in its own right. National integration and respect for cultural heritage are extraneous to the cultivation of historical research. If these get promoted incidentally, no one shall be unhappy. That is about all. Historical inquiry, in order to be objective and scientific, has to be pursued for its own sake. There are already in existence many unconscious or subconscious constraints on this ideal exercise in objectivity. Addition of conscious constraints will make the finished product ludicrous or propagandist, if not wholly futile.

Confusion over Objective

It would be alarming if the 'proper direction' were to be given in terms of national integration and cultural heritage. The fear is not imaginary if one bears in mind the possibility of excessive and misplaced enthusiasm for 'a forward looking and scientific approach' getting the better of the essential historical perspective. These may be beautifully resonant expressions. But they hide within them interpretations which by highlighting the one may smother the other. Confining ourselves to the study of history, it may be argued that a *scientific* approach may not always be forward looking. An instance of the baneful effect such an approach can have on the writing of history is offered by the comments of the Minister of Education and Social Welfare on the occasion of the inauguration of the ICHR. Observing that in the ultimate resort history deals with people, he criticised the 'elitist view' for 'minimising, ignoring or distorting the role of people'. This apparently innocuous and valid statement reflects the risks of lack of clarity about the basic objective of historical research and of enthusiasm for using history as a tool of social change. History, in the ultimate resort, deals with facts. If people are shown by facts to have been led or misled or exploited by the elites, the historian has no option but to say so. Dealing with people cannot mean attributing to them, irrespective of historical veracity, all the manipulation and motivation of historical change. If a researcher finds that at a certain stage the Indian

national movement — for this is the example the Minister gave — was the handiwork of some elite groups who formed different constellations among themselves independent of or in the name of the people, he is supposed to say so and no more.

This gives rise to a suspicion which may turn out to be real. The Council may, in course of time, be used to cast all historical research into a specified mould. Expressions like a 'national policy of historical research' and a 'national direction to an objective and rational presentation and interpretation of history' lend credibility to this suspicion. The Council is badly needed to help and co-ordinate research. But if it means straitjacketing historical research in the country, the existing jungle law of might is right is more likely to result in some worthwhile historical works. And what does 'national direction' to objective and rational understanding of history mean? One would have thought that objectivity and rationalism existed *per se* without needing a particular ideological or regional flavour. Maybe the idea now is, following the pattern of *Indian* socialism, that historical presentation and interpretation will be objective and rational on the lines prescribed by our national oracles.

Government Influence

History is an effective instrument to regiment the minds of men. It is indeed difficult for any organised authority to resist the temptation of utilising this potential weapon to promote its interests. The fact that the ICHR is by its very construction totally dependent on the government suggests a strong possibility that it may never develop beyond being a governmental department. Given the existing rules, it will require tremendous will power, vigilance and courage of assertion on the part of its non-official members to turn into reality what has been given to the Council by way of autonomy. Some of the rules may be cited in this connection. Rule 16 (a) provides: 'The Government of India may give directives to the Council in respect of its broad policies and programmes.' The preceding rule lays down:

> 'The Government of India may appoint one or more persons to review the work and progress of the Council and to hold enquiries into the affairs thereof and to report thereon, in such manner as the Government of India may stipulate, and upon receipt of any such report, the Government of India may take such action and issue such directions as it may consider necessary in respect of any of the matters dealt with in the report and the Council shall be bound to comply with such directions.'

These stringent requirements have been provided for, it may be noted, in spite of the fact that even the 18 non-official members of the Council along with its chairman will be nominated by the government of India.

Even the founders of the Council will concede that the fear articulated here flows from a careful assessment of the rules, objectives and composition of the ICHR. The assessment, of course, owes also to an evaluation of the trends within the Indian historical community. It is for the members of the Council to establish by way of performance its credentials as a national body concerned primarily with the quality and promotion of historical research *per se*. If they have the will they can succeed. For in a democratic set-up an autonomous organisation instituted by the government is as autonomous as its members manage to make it. The government is normally constrained to work within certain limits. In spite of the rules vesting so much power in the government, the members of the Council can evolve norms necessary for the cultivation of their discipline. The cynic may argue that when organisation after organisation has failed the cause of history writing in this country, the ICHR should not be expected to succeed. But the more sober will watch with hope and concern the progress and performance of the Council. Meanwhile the lone individual researcher will go ahead with his commitment to work, making sure that even if the fear of historical research running on centrally laid down national rails comes true, dissentient voices will not be dead.

Income TAX

DEDUCTIONS ON PAYMENTS TO contractors.

While making payments
to contractors, for carrying out
any work, tax at 2%
will be deducted
from the payment made
after May 31, 1972.
This applies to contracts with—

- Government Departments and Corporations;
- Local authorities.
- Companies

Contractors will, in turn, deduct 1% tax on all payments to sub-contractors for such contracts.

Exemptions :-

- No deduction will be required to be made if the consideration for the contract does not exceed Rs. 5,000/-
- Contracts for sale of goods and for rendering professional services by engineers and architects, etc, will not be subject to deduction of tax.

For further clarification :-
PLEASE CONTACT INCOME TAX OFFICER,
CENTRAL BOARD OF DIRECT TAXES.

REVIEW

The Active Residue

Ratna Dutta

Class Structure and Economic Growth: India and Pakistan since the Moghuls by Angus Maddison; George, Allen and Unwin London, 1971; Rs 35.

THERE exists today an increasing awareness of the rigidities associated with social structure which intrude upon the growth process and, despite expanding GNP, frustrate the social justice objective. In this context, Angus Maddison's book "Class Structure and Economic Growth" deals with a highly topical subject. Indeed, Maddison also gives the now familiar argument — about to pass into economic rhetoric since Mahbub ul Haq has been respectably quoted — that "capital poured into luxury housing, large dams ... and tractors can hardly be transformed at some later date. The production pattern affects the pattern of skills which will not be equally useful if the pattern of demand is changed at some later date. The pattern of growth chosen will also generate a particular set of vested interests in its continuance." (p 137).

Of course, such a general exposition does no more than scratch the surface of the complex relationship between class structure and economic growth. Maddison is quite explicit that it is not his intention to present a rigorous analysis of the relationship between class structure and economic growth; his purpose is to give a historical account of that relationship as it existed in the subcontinent during the Moghul and British periods and since Independence. In fact, the 166-page book, sweeping through this large span of time, does not present any data with which we are unfamiliar. What is interesting, however, is the juxtaposition of class pyramids with economic data — particularly in Tables II-1 and III — which highlight the particular types of disincentives and depressants that have evidently kept economic performance below the economic *potential* in each period. One is led to ask: what is that potential?

An indication is available when one considers that the 'surplus' during the Moghul period went to support the lavish styles of the ruling elite, who froze some of it in the form of tombs and palaces. What should have been the surplus during the British period, similarly supported the lavish style of living of the ruling elite and a great deal of it was siphoned off abroad to pay for imports which the rulers thought necessary. The colonial rulers did make their contribution to posterity through the railways and the irrigation systems. Yet, the fact is that, the per capita income in the subcontinent did not increase in the two centuries during which "there was a tenfold increase in per capita income in the UK" (p 67). But Maddison's normative conclusion that it was the class structure that kept the economy geared below its potential during the Moghul and British periods, is something of a spurious issue. For the potential of any economy, including the feudal, can be appraised only in terms of its own historical role.

What is perhaps of greater importance is the residue of structural processes which have been left behind by colonial rule and today pose significant barriers to economic growth. Celso Furtado has analysed some of these processes in his classic "Development and Underdevelopment" (Berkeley, University of California Press, 1964). He has shown how exogeneously generated industrialisation, as in most colonial countries, results in a particular type of social-economy. One could deduce from his analysis that it also spawns a particular type of class structure. It is a class structure in which the dynamic sectors are geared *outward* to the affluent societies (in terms of investment in particular types of technologies and styles of consumption) rather than *inward* towards the suctioning of its own subsistence sectors. This is a logical outcome of the co-existence of developed societies and non-totalitarian underdeveloped societies. The result is a cumulative polarisation of the class structure in the poor countries. It is not surprising, therefore, that even in India with its 25 years of planning towards a socialist society Maddison should find that economic disparities have increased.

Maddison's description of the developments in India and Pakistan since Independence leads him to gloomy conclusions. Whether armed with the ideology of functional inequality, as in Pakistan, or with socialist rhetoric, as in India, the planners and policy-makers in this subcontinent are now becoming painfully aware that the existing class structure poses a formidable challenge to growth with social justice. It is becoming increasingly clear that the alleged conflict between economic growth and social justice is merely a superficial expression of the more fundamental contradictions in the underlying structural arrangements of social relations. Maddison, thus, has raised an important question, if only through a historical and descriptive account.

Wanchoo Report: A Critique

I S Gulati

If the report of the Wanchoo Committee were to be judged only on the basis of its tax policy observations and recommendations, the Committee might as well not have been appointed. But, then, its tax policy observations and recommendations, which have attracted so much attention, were not germane to the Committee's principal tasks.

The bulk of the Wanchoo Report concerns itself, quite appropriately, with legal and administrative measures designed to combat evasion and avoidance. And it is on the basis of its recommendations designed to improve the legal framework and administrative machinery that the Committee's work ought to be judged.

Unfortunately, even on its homeground the Committee's observations and recommendations fail to inspire confidence.

THE Wanchoo Committee was appointed "to examine and suggest legal and administrative measures for countering evasion and avoidance of direct taxes". According to its detailed terms of reference, the Committee of Experts was asked to.

(a) recommend concrete and effective measures (i) to unearth black money and prevent its proliferation through further evasion; (ii) to check avoidance of tax through various legal devices, including the formation of trusts; and (iii) to reduce tax arrears

(b) examine various exemptions allowed by the tax laws with a view to their modification, curtailment or withdrawal; and

(c) indicate the manner in which tax assessment and administration may be improved for giving effect to all its recommendations.

If a reader of the report of this Committee were to have started reading it from the very first chapter, without having read the press reports and observations on its recommendations, he would expect to read largely an account of the legal framework within which the existing administrative machinery entrusted with the task of assessing and collecting direct taxes operates and recommendations for the improvement of both the legal framework and the administrative machinery with a view to countering evasion and avoidance and reducing tax arrears. However, having had the good or bad fortune of having seen not just reports of the Committee's recommendations but also comments thereon, a reader like myself reads the report with quite a different expectation. Here is a Committee which, though ostensibly appointed to advise the government mainly on legal and administrative measures to combat evasion and avoidance of direct taxes, has made important recommendations with respect to major aspects of tax policy. This comment is offered not by way of criticism. Probably, the Committee felt, and perhaps quite rightly, that it would be failing in its duty if it interpreted its task so narrowly as to overlook those aspects of tax policy which had an important bearing on the effective administration of taxes. The fact remains, however, that the Committee's principal task was *not* to examine changes in tax policy but to suggest changes in the legal and administrative framework for direct taxes. Since the Committee did go into questions of tax policy and made some major recommendations in that area, it was only to be expected that they should attract public notice. In fact, Justice Wanchoo and his colleagues on the Committee might will complain that their tax policy recommendations have received (and are receiving) so much attention that the Committee's observations and recommendations on the substantive part of its task have not received the attention they deserve.

But what else did they really expect to happen? If in their examination of the existing situation with respect to tax evasion and avoidance, Justice Wanchoo and his colleagues were content with the observation that the present high marginal rates of direct taxes had a large role to play in motivating people to evade and avoid these taxes and that therefore the government should examine seriously the desirability of scaling down these rates, it was one thing, but when they made a definitive recommendation as to the income-tax rate structure and the maximum marginal rate, surely such a recommendation was bound to hit the headlines.

Or is it that this was precisely an objective aimed at by the Committee, knowing that on matters of legal and administrative details, however far-reaching their recommendations may be, they would not attract much public notice? Perhaps this would be considered a somewhat harsh judgment.

Possibly, the Committee felt strongly that no amount of legal and administrative reform would by itself be effective in combating evasion and avoidance of direct taxes until and unless it was accompanied by a scaling down in the rates of personal income-tax. But if the Committee did feel so, its report does not say so. No doubt, a number of arguments are adduced for not keeping the marginal rates of taxation at 'nearly expropriatory' levels, namely, (i) high tax rates make evasion very profitable and attractive; (ii) public conscience against tax evasion will be difficult to arouse so long as the marginal rates of taxation are confiscatory; (iii) high rates sap the incentive to work, save and invest; and (iv) the present high rates leave no scope for raising revenues in an emergency. But there is nothing new in what the Committee has said on the subject of high rates of taxation. The government should have known all this before and still the Committee was not specifically asked to advise on the subject of appropriate rate structure, keeping in mind the prevailing scale of evasion and avoidance.

Could it be that the government felt, rightly or wrongly, that all these arguments for reducing the present high rates were not convincing enough? Does it mean that the Government has then to put up with the present (and possibly rising) scale of evasion and avoidance, notwithstanding all the legal and administrative reforms proposed by the Committee?

I, for one, have always pleaded strongly against maintaining a facade of

high tax rates which are not effectively enforced. Very high tax rates ought to be avoided not only because they make "tax evasion so profitable and attractive" but also because, if they cannot be enforced effectively, their existence creates a public distrust in the government and its professed objectives of social policy. However, it is one thing to say that very high rates of taxation are undesirable on not only economic but also other, including administrative, grounds, and another to say that effective tax administration is impossible, or virtually impossible, at high level of rates. Maybe the latter turns out to be true, but one must take some pains to establish propositions like this.

The Wanchoo Committee has estimated that income evading tax went up from Rs 700 crores in 1961-62 to Rs 1,000 crores in 1965-66 and to Rs 1,400 crores in 1968-69. According to its manner of calculation, tax-evaded income increased at the same rate as national income. Thus evasion was regarded more a function of the change in national income than of the changes in marginal rates. However large the figure of Rs 1,400 crores may appear to be, it bears the same relation to national income in 1968-69 as the earlier *figure* of Rs 700 crores bore to the corresponding national income in 1961-62. The relationship between national income and tax-evaded income has on the basis of these calculations, not undergone a major change during this period of eight years when the marginal rate of tax (including surcharges) applying to individuals (and HUFs) was actually lowered from 87 per cent to 82.5 per cent between 1961-62 and 1968-69.

Highest Rate of Tax and Amount of Income Evading Tax

	Estimated Income Evading Income-Tax(a) (Rs crores)	Highest Rate of Income-tax including Surcharge (per cent) (b)
1961-62	700	87
1965-66	1000	81.25
1968-69	1400	82.5

(a) Wanchoo Committee Estimates, see Report, p 8.

(b) Information based on RBI Currency and Finance Reports.

Between 1961-62 and 1965-66 the highest rate was reduced from 87 per cent to 81.25 per cent and even though it was raised for unearned incomes to 89.4 per cent in 1966-67, this was brought down to 82.5 per cent in 1968-69 and the same highest rate applied to both earned and unearned incomes.

Surely, if in spite of the lowering of the highest rate of tax applying to income which yielded a gain in net income (after tax) of almost 35 per cent [(100-82.5) ÷ (100-87)] there is little impact on the extent of evasion, how, it might well be asked, could the Committee be certain that lowering of the maximum rate of income-tax to 75 per cent would make a major impact on the extent of evasion? The answer to this question might well be in the manner of the Wanchoo Committee's calculation of the amount of tax evasion. The fact remains, however, that the Committee has failed to show that tax evasion is linked positively with the rates of taxation.

A Committee which ranked the prevalence of high tax rates "as the first and foremost" cause of evasion could have done better homework on the subject before making a definitive recommendation for the reduction of the present income-tax rates applying to the higher ranges of income. In vain does one look for an answer to the doubts raised in the meeting of the select group of economists called to New Delhi, namely, what guarantee is there that the evasion of income will go down if the present tax rates are lowered to the proposed levels. Nor does the Report provide one with any reasonable basis to accept the Committee's assurance that the estimated loss to revenue of Rs 45 crores a year on account of the scaling down of income-tax rate will be more than offset "in not too distant a future" by improved collections following upon "better compliance with the laws".

I must add, however, that just because the Wanchoo Report does such a poor job of presenting the case for lower but effective rates of income-tax, the case cannot be taken to not exist any longer. The simplistic calculations set forth in the Report of the scale of evasion prove nothing.

Another important policy recommendation of the Wanchoo Committee concerns the Central taxation of agricultural income. Again, the question of taxing agricultural income is raised, quite appropriately, in the context of tax evasion. As the Committee points out, "in recent years agricultural farms, vineyards and orchards have been acquired by many film artistes, industrialists and others, not for love of agriculture but to convert their black money into white." Having said that, the Committee does not even pause to give an idea of the scale of evasion that is possibly taking place through this source. Couldn't the Department be asked to indicate the amount of income which was shown, or passed off, as agricultural income by at least the top 2,000 income-tax payers in the country? On the other hand, the Wanchoo Committee gives one the impression of being in a desperate hurry to brush aside the possible objections to the Central taxation of agricultural income. I do not wish to examine the Committee's answers to the various objections it identifies against the Central taxation of agricultural income. The fact that the government thought it proper to appoint another committee to go into the matter is proof enough that the case for the Central taxation of agricultural income is far from clearly established.

To the Wanchoo Committee the case for the Central taxation of agricultural income was so patently established that it even omitted to take note of the experience of even the foremost developed countries in the matter of taxing agricultural incomes. While in India the problem is that tax payers tend to show substantial agricultural incomes, in more developed countries where agricultural income is taxed as part of total income, the problem is that taxpayers get away by showing sizeable losses in agriculture. What would happen if, assuming that the necessary constitutional modifications are possible to make and the Centre takes over the taxation of agricultural income, taxpayers succeed in understating incomes from this source or in showing considerable losses — a possibility that cannot be ruled out in the light of the experience elsewhere in the world or even in the states in India which impose an agricultural income-tax. After all why should the state governments be able to collect such abysmally low amounts by way of agricultural income taxation? Presumptive assessments of agricultural income are resorted to in several countries (incidentally even in India the concept is being applied with respect to agricultural income as, e g, in Tamil Nadu where a farmer is allowed to 'compound' his income for purposes of agricultural income taxation) not so much because farmers do not or cannot maintain proper accounts but because the accounts are easily 'cooked up'. But you cannot tell a man whose accounts for non-agricultural income are acceptable that his agricultural income will be calculated on a presumptive basis — and that is where the rub lies. If, in the past, he succeeded in presenting accounts where non-agricultural income could be paraded as agricultural income, would Indian ingenuity be found

wanting in 'preparing' accounts of agricultural operations which show losses? It is somewhat intriguing how we in India complain on the one hand of large scale evasion of income-tax and at the same time talk of replacing the present base of agricultural taxation from land to income; the surprise is greater when a so-called expert committee does that.

In fact, it appears to me that if the Wanchoo Committee were genuinely interested in tackling only the problem of tax evasion arising as a result of the exclusion of the agricultural income from the ambit of Central income taxation, it could have arrived at some constructive recommendations which would effectively prevent such evasion and at the same time not call for such far-reaching constitutional amendments as the Committee envisages. Evasion of non-agricultural income-tax could as well be tackled by requiring the integration of agricultural income with income from other sources for the limited purpose of determining the rate to be charged on non-agricultural income. Even if this limited integration is not possible within the existing provisions of the Constitution, the modification that would be called for to achieve this limited integration would not be as far-reaching as the one suggested in the Wanchoo Report.

Although the question of including agricultural income within the scope of Central income taxation is important from the point of view of tax evasion, it is principally a question of tax base reform. Likewise, while the question of treatment of the Hindu Undivided Family is important from the point of view of tax avoidance, it is a question which again is basically connected with the determination of the tax base. Should the income accruing to the undivided family *qua* family be treated as separate income for purposes of taxation or should it be treated as the income of the members comprising the family?

It must be said to the credit of the Wanchoo Committee that it has been forthright in conceding "that the Hindu Undivided Family as a unit of assessment is retained in most cases only when it enables the persons concerned to reduce their tax liability, and that in other cases it is promptly partitioned without considerations of sentiment coming in the way." (Bhoothalingam's identification of the HUF as a source of tax avoidance was really too feable to merit any mention.) The Wanchoo Committee even arranged studies to be made of a few "big families" in certain commissioners' charges to have some idea of the extent of tax avoidance resulting through the use of the HUF device. These studies, says the Report, revealed not only quite substantial tax avoidance but also that "the number of income-tax files in respect of each family was ... more than the total number of members in the family."

Having found "convincing" evidence that the existence of the HUF as a unit of assessment had little to do with sentiment and also that not only did the present system of treating the HUF lead to quite substantial avoidance of tax but that it imposed a considerable burden on the administration, it is impossible to believe that the Wanchoo Committee could get persuaded to reject the only logical (as well as equitable) solution, namely, the forthwith derecognition of the HUF as a distinct unit of assessment. The Committee clearly knew what the right course to adopt was, namely, that the family should be treated as a registered firm and its income should be apportioned among those of its members who would be entitled to claim partition, but it shied away from this solution on the feablest of grounds such as increased administrative burden and possible delays in assessment. Instead, the Committee opted for a facade of a higher rate-structure for HUFs when any member has independent income. It ought to have paused to consider in making its choice how a higher rate-structure would prevent persons from resorting more even to all those devices listed by the Committee (paragraph 3.23). In fact, if one were to extend the same logic which the Committee employs against high rates of income-tax, the higher rate-structure for HUFs should drive people to use the HUF device even more diligently for purposes of tax avoidance. It is a safe guess that if the Committee's recommendation is accepted, there will be still further creation HUFs, and still further 'partial partitions' and, as a result, avoidance on this particular account would increase rather than diminish.

Logic can, of course, take the strangest of twists. It has to be read to be believed that the Wanchoo Committee which clearly recognises that the Hindu Undivided Family is being used today as a tax avoidance device should turn round and say that since the HUF will continue to be recognised as a separate taxable entity, to treat a family consisting of husband, wife and minor children as another unit of assessment "might lead to confusion". While the continuation of the former is indefensible any longer, the Committee ought to have clearly seen that not to treat the family as a unit of assessment leaves one more door open to tax avoidance.

It would be quite in place to go back to the Committee's suggestion about the taxation of agricultural income as part of total income. With the HUF continuing to be treated as a separate taxable unit, as at present, the incentive to partition agricultural land into several parcels will be immense indeed.

Although, as was pointed out at the very outset, it was quite in the nature of things that the tax policy recommendations of the Wanchoo Committee should attract attention quite out of proportion to their significance in the context of the Committee's terms of reference, it must not be overlooked that apart from several matters of legal and administrative detail the Committee's Report has touched upon some very important questions. One such question that was specifically mentioned in the terms of reference of the Committee pertained to the treatment of trusts.

The Wanchoo Committee observes that as in the more developed parts of the world, in India too, "the misuse of trust funds by charitable and religious trusts has been confirmed by studies made from time to time." It quotes a recent study by the Department of Company Affairs of 75 trusts, of which 62 were supposedly charitable. This study clearly showed "that the business houses creating the trusts had mostly appropriated the trust funds for their own businesses." The Report also quotes from the Public Accounts Committee's 121st Report which voiced deep concern over the misuse of trusts with a view to avoiding tax.

What, however, is most intriguing is that in spite of the clear indications of the widespread use of the device of trusts for purposes of tax avoidance, no attempt was made, now or earlier, to have an idea of the number of public and charitable trusts in the country and their wealth and income. How would one otherwise have some measure of the magnitudes involved?

Just as in the case of the Hindu Undivided Family, select cases were studied in a few 'charges' to get an idea of the extent of the use of the HUF as a tax avoidance device, could not a few select public charitable and religious trusts be studied in each 'charge'? Why must committee after committee take up this matter of trusts, deal with it in general and vague terms, and make a few suggestions here and there to tighten the law without ever knowing all that lies behind the existing income-tax provisions granting complete tax exemption

to these institutions?

Whether the changes introduced through the Finance Act of 1970 or the additional changes proposed by the Wanchoo Report go far enough or whether they are just trying an overkill and therefore merely dissipating the energies of an over-worked Department is impossible to say in the absence of information.

Where I would fully endorse the Wanchoo Report is in its recommendation for an all-India legislation for the purposes of controlling and regulating all public charitable and religious trusts. Such a legislation must insist upon the registration of each and every public and religious trust regardless of the size of its income or wealth at any given point of time. Also, all such trusts should, I feel, be statutorily obliged to submit returns of income and wealth every year *regardless of size*. Any failure to submit returns of income and wealth should make a trust liable to tax in the same manner as a private discretionary trust. (Surely the Wanchoo Report could not be taken seriously when it suggests that a ridiculously low penalty of one per cent of the trust income for each year of default would secure compliance by the defaulting institutions.)

Since the legal obligation to submit an income return was imposed in 1970, the Department should already have collected enough information to obtain some idea of the wealth of the public trusts, and their annual income. The Finance Minister would then know how much tax is being foregone by government in the form of tax exemption to these trusts and answer for himself the various questions which arise with respect to the operation of these trusts.

Having said all this, the fact remains that the bulk of the Wanchoo Report concerns itself, quite appropriately, with measures, legal and administrative, which are designed to combat evasion and avoidance. I think that, in all fairness, the Report ought really to be appraised not on the basis of its tax policy recommendations but on the basis of its recommendations designed to improve the legal framework and administrative machinery.

But my layman's suspicion is that even on its home ground the Committee's observations and recommendations fail to inspire confidence. Take its recommendation for the Department to make vigorous use of its powers of search and seizure and also of prosecuting tax dodgers. The tax laws of this country already contain numerous provisions conferring considerable power on the income-tax authorities for search and seizure in cases of suspected evasion and also for prosecuting tax offenders. Significantly, these provisions (which have been considerably strengthened in recent years) have been invoked in very few cases.

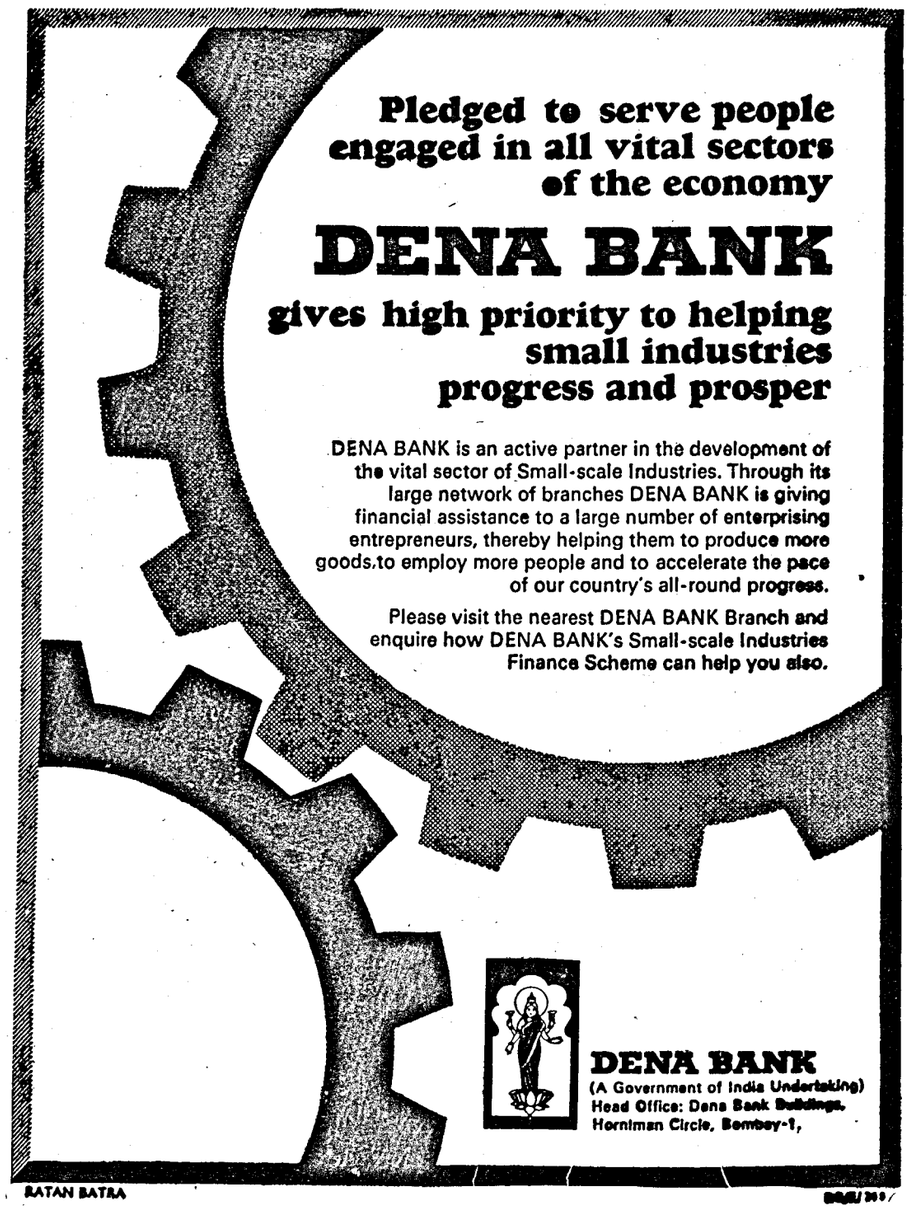
As the information furnished to the Committee on the subject of searches and seizures shows, the number of seizures and searches was the largest in 1964-65 and declined to only 81 in 1968-69. The number increased in the following two years and searches and seizures in 1970-71 numbered 195 and the amounts seized rose from Rs 59 lakhs in 1968-69 to Rs 120 lakhs in 1970-71. The Wanchoo Committee has in suggesting an increasing use by the Department of its powers of search and seizure made a number of recommendations which amount to increasing these powers in several ways. The question one could ask here is: is there any justification at all for increasing the Department's powers of search and seizure when the Department seems to have been increasingly diffident in the exercise of the powers that it already possesses?

There arises another question also. When one places the information with respect to searches and seizures alongside prosecutions launched (as in the table below) one cannot help asking whether what are classified by the Department as successful searches were genuinely successful. If these searches were genuinely successful, how is it that they led to so few prosecutions?

SUCCESSFUL SEARCHES AND PROSECUTIONS

	1965-66	1966-67	1967-68	1968-69	1969-70
No of successful searches	293	186	106	79	169
No of prosecutions launched	1	4	8	31	27
No of convictions		1	3	7	6

Source: Wanchoo Committee Report, pp 16 and 29.



One would expect that a tax case where the authorities are driven to the point of invoking search and/or seizure would be one where if the search is successful it would mostly result in a criminal prosecution of the persons involved. At least, the data furnished to the Wanchoo Committee do not bear out this assumption. It would have been instructive to know whether or not such a relationship exists in other countries, such as the UK, USA and Japan, where a far more vigorous policy of prosecution is pursued by the tax authorities.

While I would very much like to see the legal and administrative observations and recommendations of the Wanchoo Report subjected to careful scrutiny by specialists in that area, I cannot resist the temptation to observe that if there is one area in which the government can be blamed strongly for false economy it is in this field of direct taxation. As the Wanchoo Report brings out, the Department has been virtually kept "on a starvation diet" in the matter of staff. If evasion has increased over the years, avoidance has multiplied and if arrears have piled up at an almost geometric pace, could it not be largely the government's own doing?

There is also a lurking suspicion that because of internicine rivalry between the 'Brahmins' and the 'Sudras', the Department's expansion has been deliberately held back. The Wanchoo Report cleverly skirts this and related issues.

If I were to assess the Wanchoo Report on only its tax policy observations and recommendations, I would rather that the Committee had never been appointed. But surely, these observations and recommendations were not germane to its principal tasks. This, however, should not be construed as a plea for one more committee to go into the tax policy questions. On the contrary, I would strongly urge a moratorium on committees and instead plead for a strong tax research and statistics bureau which collects, collates and analyses the whole wealth of figures that the Department has to deal with. The present state of the so-called Directorate of Research and Statistics is, to say the least, most deplorable even when one compares, its performance with that of similar agencies in some of the less developed countries. The latest annual report, the shoddiest report one could ever see, brought out by the Directorate, pertains to 1966-67.

A strong tax research and statistics bureau should do away with the need to have the issues examined so frequently by committees and outside experts. Not only that, when such outside assistance is invoked, the usefulness of outside advice is always a function of the information and data that are placed at the disposal of the outside advisers. The Wanchoo Committee's limitations do certainly reflect, to a large measure, the information constraints within which they had to operate. Maybe that is also why the Committee has, in most cases, been so very diffident in its observations as well as recommendations.

Approach to the Fifth Plan

Issues and Pseudo-Issues

Phiroze B Medhora

For the first time since the Mahalanobis plan-frame, the formulation of the Fifth Plan has been preceded by a great debate on the objectives and rationale of planning.

No longer is the debate concerned with the trivia of continuing the existing distribution of plan funds, of required rates of growth, of the size of the plan and of problems of raising the required financial resources.

The issues discussed are major ones: What is planning for? Does present planning assure welfare to the masses? Given the objectives, what is to be the strategy of planning? It is these issues which need clearer definition if the experience of the past is not to be repeated.

This article deals with some of the issues—and pseudo-issues—which have arisen during the pre-Fifth Plan debate.

I

Production and Distribution

THE issue that has caused the greatest interest is the perennial one which economists have debated since the beginning: production versus distribution. It is argued that planning has so far been concerned (or over-concerned) with production, and that the distributional aspects of planning have taken a backseat. It is argued that the growth strategy has left, for example, 40 per cent of the population in India below the poverty-line. The study by Dandekar and Rath[1] shows that in the sixties (1961-62 to 1968-69) the number of people below the poverty-line increased in India. Studies by Ojha and Bhatt[2] as also by K R Ranadive[3] confirm this finding.

Mahbub ul Haq now suggests that since the objective of planning is economic welfare (or better economic distribution or provision of minimum economic requirements to *all* people), distribution considerations should govern production (more buses rather than cars) as also other aspects of economic policy.

Has There Been Enough Growth?

The superficial logic of this enunciation should not hide the inner contradictions contained in the policy prescriptions flowing from it. One is not even sure if the basic facts in the formulation are correct. The so-called growth strategy as adopted in the countries generally cited has aimed at rates of growth which, however high in the historical perspective, are irrelevant in welfare terms.

Pakistan achieved during the sixties an annual growth rate of 5.7 per cent and India (which incidentally has never given growth a primary position in its plan strategy) has had, during the same period, a growth rate of 3.8 to 4 per cent per year. Allowing for a population growth rate of 2.5 per cent for Pakistan and 2.1 per cent for India, this leaves a bare margin of 3 per cent for Pakistan and 1.7 per cent for India for annual growth of per capita income. When this is related to the low base of per capita income (about $ 70 per year) in these countries, the growth works out to about $ 1 to $ 1.50 per year per head — approximately 10 kilos of wheat per year. Surely this is not what growth is about.

When one talks of growth, one has to consider much higher growth rates — for example, growth rates of 8 to 10 per cent which have been achieved in Japan and South Korea. Yet in these admittedly inegalitarian societies, the simple crumbs of welfare (television sets, telephones, not to mention clothing and food) are distributed far more broadly than in supposedly egalitarian societies. In fact, a rapid growth rate sets up its own compulsions for creating a domestic market for the output produced and also in terms of demand for labour, so that welfare has to be generalised in order that growth can be sustained.

The question to ask is: what would have been the position if India and Pakistan had achieved similar growth rates? If a 5 per cent growth rate in per capita income had been achieved in India in the sixties, would the income distribution have been such as to still leave 40 per cent of the people below the poverty-line? Even if the distribution of the higher growth between those below the poverty-line and those above it had been the same as it in fact was, the number of those below the poverty-line would have been much smaller.

During the last six years, despite the good performance in agriculture, the pace of growth has visibly slowed down, particularly in the industrial sector. Data on distribution trends in India after 1967-68 are not available, but various indications show that inegalitarian tendencies might actually have been accentuated during this period. Firstly, the rate of investment in the economy has slowed down, so that the growth of employment has slowed down in the industrial sector. Secondly, with increasing mechanisation, the benefits of the green revolution have accrued mostly to large land-owners and owners of land with access to perennial irrigation sources; thus greater inequality and possibly more poverty for the poor have come about in the agricultural sector. Finally, the wheat price support programme, besides benefiting more the large wheat-growers who have a marketable surplus, has failed to diffuse the benefits of increased output to consumers; in fact, import substitution in this respect, as in most others, has been at the cost of consumers.

The failure of the developing economies lies not only in the field of distribution, but also in that of production and growth. Countries like India and Pakistan have not had high rates of growth and it is futile to talk of production and distribution as mutually exclusive, alternative paths of development. The experience of the last six years shows that this country has had neither economic growth nor distributive justice.

Primacy of Distribution Objective

In this situation, what are the options open to planners in India? Unfortunately, the choice, as framed, is made out to be between a rapidly growing economy and a more equitable distribution system. And as the experience of the last six years shows, one can manage the economy without either

growth or social justice — a low-level, low-growth equilibrium of the kind that has prevailed for long also in Burma and Ceylon. Growth, no less than distribution, is not a self-propelling system, but requires the intervention of an *exogenous impulse*.

What the dichotomy between growth and distribution does imply is that the production system cannot be independent of distributive considerations; in other words, assuming a society sets before itself distributive goals, it must orient its supply system through production (or, in an open economy, through exchange) to achieve these goals.

The other side of the coin is that the availability of goods by itself does not ensure that they would be equitably distributed. Distribution can only be ensured either by providing required incomes to individuals or by centralising production resources with the State which then distributes the output on some assumed distribution considerations. In other words, it is not the production function which determines the distribution system, but the distribution system which determines the production content of an economy. It is, therefore, the distribution system which should be the primary concern of the State; the production system would then be adjusted to the demand pattern as set by income distribution.

Problems of Redistributing Consumption

Against this it has been argued that existing production is relatively specific and resources cannot be easily shifted from production of luxury goods to that of basic consumption goods; secondly, that the main issue in development economics is not that of providing minimum consumption in the present but between providing consumption in the present and (through investment) providing consumption in the future.

It has to be recognised that specificity of factors limits to some extent the flexibility of the production system and, therefore, (in the absence of trade) limits the benefits arising out of a rearrangement of incomes. However, given the immediate problem as one of providing basic consumption needs, even where such basic goods are produced in an adequate quantity (as in India), an unequal distribution system may leave a large part of the population without its minimum requirement (again as in India, as Dandekar and Rath have shown). India produces today sufficient foodgrains and cloth to meet the minimum consumption needs of the whole population; yet 40 per cent of the population lives below this standard. In such a case, it is not specificity of factors, but the inequitable distribution system, which prevents the provision of the minimum needs to the whole of the population.

So also, the choice between present consumption and future consumption (or investment) in such a situation is a pseudo-choice. At a given level of production, a redistribution of consumption standards does not reduce the level of investment (in fact, as will be shown below, it can be used to help to raise the level of investment). If in an economy there is adequate production of consumption goods, it should be possible, by rearranging distribution, to provide for equitable consumption standards for all, and at the same time, to maintain the given level of investment.

There are two ways in which such redistribution (of existing consumption) can be brought about. Firstly, as suggested by Dandekar and Rath, there might be massive taxation of those above the poverty-line, the resources so obtained being used to provide employment (and income) to those below the poverty-line.

Dandekar and Rath estimate that a transfer of Rs 800 crores (net)[4] is required to provide a minimum level of living (defined as Rs 324 per capita per year) to those below that standard in India. This estimate is in 1968-69 prices. Such a transfer could be made from the highest decile having a consumption of Rs 875 or more per head per year.[5] Given India's per capita income, the upper 10 per cent consists not of millionaires but ordinary people — clerks, typists, factory workers — who, let alone being willing to let such a shift occur, are themselves engaged in improving their relative status (and are, moreover, able to do so under the existing institutional structure). Such an attempt to transfer income is likely to set up economic and psychological resistance. It would also involve a massive strain on the fiscal system.

In the alternative, the same result can be sought to be achieved by a direct increase in the incomes of those below the poverty-line through creation of the required jobs — resorting to the fiscal weapon of direct transfer only to a limited extent. Such a policy, however, has two implications for the economic system. Firstly, where a redistribution of real consumption is done not by redistribution of present money incomes but by increasing incomes of the poor sections, resistance to such transfer is likely to arise through price movements (though, if the better-off sections cannot increase their income, they can hardly avoid some reduction in their consumption of basic goods). In other words, the consumption standards of the poorer sections are bound to increase, though not necessarily to the extent envisaged by the increase in their money incomes. Thus such a policy might require a larger money transfer to bring about a given real increase in consumption than if incomes were to be transferred from the well-off to the poorer sections of the society.

Secondly, if consumption is sought to be redistributed without a redistribution of money incomes, the relative price-level is likely to move in favour of consumption goods, and their production would become more profitable. A redistribution policy need not reduce the level of investment, but it might shift investment towards immediate production of consumption goods — more cloth rather than steel.

The argument that increase in consumption is not possible because the production system is specific or that such consumption can only be at the cost of future consumption, therefore, does not have economic logic. The problem of providing minimum consumption needs to all, in the context of the Indian economy, is not one of economics but one of organisation: it involves a change in existing income-distribution and accepting the organisational implications of such a change.

Growth Implications of Distributive Justice

The time horizons of the two processes, production and distribution, however, differ. While the production process is not bound by a time dimension and must go on (as it does even in advanced countries), equitable distribution, *whatever the level of production*, needs to be achieved within a defined time-frame. The time constraint, as the existence of gross inequalities in many societies shows, is not an economic requirement but a political compulsion, but, for being political, is not unimportant.

It is necessary, therefore, that the State concerns itself with both production and distribution goals. As examples of many economies (China, for instance) show, it is possible to have distributive justice even at fairly low levels of per capita income: if luxury houses cannot be converted into utility huts, the lawns can be handed over to the landless for cultivation. Dandekar and Rath have shown how, even at present income levels, a more equal distribution of consumption can be brought about. In such a case, once the transitional problems of income-transfer are solved, it should be possible to provide minimum consumption standards to all. A growth rate of about 2½ per cent would be needed in future to ensure minimum consumption to the additional population.

Yet however intellectually satisfying it might be to bring about equalitarian distribution of income, experience shows that a minimum income level is not the maximum goal of human endeavour. Distribution of income cannot end with providing minimum incomes to all — however wonderful such a prospect might look today to the near-starving; the process of rising expectations cannot end at this point.

This presentation also brings out clearly the institutional options open to the system. The Chinese system is a jig-saw, and one part of it (income distribution) cannot be taken out and fitted in another system; such grafting has little economic relevance. It is certainly possible to have a Chinese solution for India, provided we are willing to accept all its implications. The alternative is to have the cake grow, using the increase to buy potential economic discontent. Income growth then becomes an alternative to institutional change: what is incompatible is inequitable income distribution and economic stagnation.

II

Fifth Plan: Growth Requirements

A process of rising production is, therefore, needed to improve living standards beyond the minimum. Such a process serves two purposes: firstly, it enables the redistributive process to work at the margin, creating lesser resistance from the existing established interests; and, secondly, it helps to provide not only a minimum, but a rising, standard of living to the mass of the people.

A transfer of Rs 800 crores amounts to almost 3 per cent of national income. Given the fact that India's population rises at 2/2.5 per cent per year, it can be said that the growth rate in national income (5 to 5.5 per cent) which is accepted by planners, but which in the past has *not* been achieved, about meets the cost of providing a minimum standard of living to all people without disturbing the existing distribution of income (but also without improving the standard of living of any section of the people, except of those below the poverty-line). Thus the minimum income level, set by Dandekar and Rath, can be provided from the existing growth rate, by pre-empting the whole growth to the objective of providing minimum consumption levels to all.

This analysis brings out that the existing increase in income is being preempted mostly by those who already have a standard of living above the minimum. Apparently, the present system requires a larger growth in national income (than the existing 5 to 5.5 per cent) to begin to improve the lot of those below the poverty-line.

The planners, therefore, need to target for a fairly high growth rate if they are to achieve, within the existing institutional structure, a minimum level of living for the whole population. Given the fact that, while maintaining the present distribution system, it would require about 5 per cent increase in national income (to be devoted wholly to bringing up the level of living of those below the poverty-line) to achieve the objective of providing minimum consumption levels to all, a higher growth rate is needed to achieve the objective without disturbing the existing system. With the present income distribution, this would mean a minimum growth rate of 7 to 7.5 per cent of national income. It is this growth rate which the planners must aim at.

Production System for Minimum Consumption

Yet it is recognised that growth by itself is not sufficient to ensure equitable distribution. It will remain necessary to adopt positive policy measures to ensure a minimum level of living to all people. Dandekar and Rath have set this at a per capita income of Rs 324 per year in 1968-69 prices. Such an amount takes care of the personal living needs of the people, and would need to be supplemented by social transfers, for example, in the form of health and education facilities. Both these aspects have profound implications not only for fiscal policy but also for planning priorities and plan allocations. It is these aspects which deserve to be looked into more carefully.

Firstly, given the average propensity to consume various goods in the low-income categories, an attempt to provide a minimum level of income to all would require a change either at the margin of, or within, the existing production system. A transfer (or addition) of a net income of Rs 800 crores (in 1968-69 prices) to those below the poverty-line would imply a specific demand pattern for goods. On a very approximate calculation, it is estimated that the expenditure would create a demand for 5 mn tonnes of foodgrains, 500 mn metres of textiles and 200,000 tonnes of edible oils.

Talk of green revolution notwithstanding, our agricultural system does not at present generate adequate surpluses to ensure these supplies. After allowing for the existing distribution requirements (based, incidentally, not on the criteria of ensuring minimum consumption but meeting foodgrain requirements on present income distribution and allocation norms), the present system of foodgrain procurement leaves a surplus of about 3 mn tonnes. A minimum rise of 5 mn tonnes in foodgrain production is needed to provide minimum consumption levels to the whole people (while maintaining the higher consumption standards of those who already enjoy them); thereafter, a minimum annual rise of 2½ per cent in foodgrain production is necessary for the increasing population. Requirements arising out of increasing incomes and of a buffer stock would be in addition to these prior demands on foodgrain supplies. Thus even if the marketable surplus out of increased foodgrain output is as high as 75 per cent at the margin, an increase of 7 mn tonnes foodgrain output is required (or 12 mn tonnes including buffer stock requirements) if the foodgrains consumption of those below the poverty-line is to be brought up to the minimum consumption standards. The same considerations apply to other agricultural commodities like vegetable oilseeds, raw cotton and so on.

What is more important, it would be incumbent upon the State to obtain these additional supplies for fair distribution lest the increasing demand is defeated by price rises. It is only to the extent that an efficient production system is ensured that distributive justice can be attained.

Secondly, if a net income of Rs 800 crores is to be generated among the poorest sections of the population, a suitable programme will have to be worked out to create the required job opportunities. It is possible to create job opportunities of the 'digging holes and filling them up' type and still achieve the social purpose of providing a minimum consumption level to all. However, given India's need for economic and social infrastructure, it should be possible to create job opportunities which would help build such infrastructure.

It is here that planning has a relevant role to play: that of transforming idle labour into economic and social capital. Rather than create projects of the 'make work' variety, it is desirable that a bank of infrastructure projects, spread all over the country, is built up to use unemployed and partially employed labour. Such projects can be in

road-building, land-levelling, minor irrigation works, building of schools and other public works. In its Approach paper, the Planning Commission estimates the cost of employment-intensive programmes at Rs 7,200/7,800 crores over a five-year period; in addition, the outlay on providing social consumption needs (education, public health and so on) is estimated at Rs 3,000/3,500 crores during the Fifth Plan. The two programmes work out to an outlay of Rs 2,000/2,200 crores a year (at current prices). Assuming a labour-content of 70 per cent (which is a high figure) in such expenditure, the amount of income transfers involved in such a programme works out to Rs 1,400 crores per year in current prices.

It has to be recognised that a nation cannot live only by building roads and schools. Beyond a point of time, such works can only be of a replacement type. It is, therefore, necessary to lay down clearly the limits of such a programme, determining both the volume of such work available and the period over which it is to be completed. Such work must be looked upon as an interim means of employing surplus labour; the interim period should be used to create job opportunities which would absorb the labour released from infrastructure projects. In other words, the Government is only buying time with infrastructure projects, and it should create viable job-opportunities in the meantime to absorb the surplus labour.

The organisation of interim employment opportunities is not easy, as the experience of the last three years shows. The creation of viable jobs, despite large plan expenditure, is an even more difficult process, as the experience of the last 20 years shows. What is needed is the inclusion in the Fifth Plan of a public works programme to create ultimately 20 to 25 mn jobs *and* a growth philosophy by which the other sectors would begin to absorb increasing quantities of labour.

Role of Social Consumption

Such creation of job opportunities, and a production pattern which would supply the goods needed by the newly employed, would only meet the basic consumption needs of the people. It would still remain to provide their other requirements — health, education and so on. Given the level of living made available through the programme, such needs should be met essentially through the State. In other words, given the propensities to consume, it is desirable to insulate the supply of some services from the income-levels of the population. Thus a part of the supplies of services should be through social consumption, rather than through direct income-transfer to individuals. These then become free goods consumed according to need rather than according to ability to pay.

Table 1: Plan Outlay on Social Services

(Rs crores)

	First (1951-56)	Second (1956-61)	Third (1961-66)	Annual (1966-69)	Fourth (1969-74)
A Plan Provision					
(1) Social Services	477	1044	1300	1195	2772
(2) Total Plan Outlay	2069	4800	7500	6665	15902
(3) (1) as per cent of (2)	23.1	21.8	17.3	17.9	17.4
B Actual Outlay					
(4) Social Services	472	855	1493	993	—
(5) Total Plan Outlay	1960	4672	8573	6757	—
(6) (4) as per cent of (5)	24.1	18.3	17.4	14.7	—

Significantly, despite the welfare protestations of the planners, in actual fact the relative allocation to social welfare tended to remain stable over the first three plans — and actually went down in the Fourth Plan. As Table 1 shows, the plan provision on social services increased from Rs 477 crores in the First Plan to Rs 2,772 crores in the Fourth Plan. As a proportion of plan outlay, the outlay on social services was 23.1 per cent in the First Plan and 17.4 per cent in the Fourth Plan. Per capita, the expenditure was Rs 2 per head per year in the First Plan, and is set at Rs 10 (in 1968-69 prices) per head per year in the Fourth Plan.

It is obvious that this trend needs to be reversed. The outlay on social services needs to be increased not only absolutely but relatively, if a significant dent is to be made in the all-pervasive poverty in the country. The Approach paper sets the estimate of expenditure on social consumption (which forms only a part of the total social welfare outlay) at Rs 3,000/3,500 crores for the Fifth Plan. This amounts to Rs 12 per head per year, and would form about 10 per cent of the total outlay envisaged in the Fifth Plan.

Outlay on social services has many economic advantages. The outlay on education can impart skills which improve production during the working life; so also the outlay on health has a direct bearing on productivity. Finally, outlay on family planning has both immediate and long-term implications on individual and social welfare.

Summing up, the main implication of providing a minimum consumption level to the whole population lie in the field of allocation of plan outlays (particularly on infrastructure and social services) and on the production pattern to be established. A programme for providing a minimum standard of living cannot be an appendage to a plan programme. Besides introducing *ad hoc*-ism in the use of resources, this would subvert plan priorities by creating consumption pressures and it would only postpone, not solve, the main task of creating viable job opportunities. It is only by integrating the programme into the plan that it can be put to social benefit, and its adverse repercussions (for example, on prices or on creating new job opportunities when existing projects are completed) avoided.

Implications for Sectoral Growth

If a growth rate of 7/7.5 per cent is to be aimed at, it does need to be determined in what sectors the growth is to be. Arguments about the relative growth of agriculture and industry have been perennial. Vakil and Brahmananda, following classical economists, have argued for growth led by wage-goods (mainly agricultural) production. On the other hand, the Mahalanobis strategy, following the Russian model, opted for the development of the heavy and capital goods industries as the lead sector in the strategy of development.

The experience of the past 20 years shows that, of the various sectors, the tertiary sector has been the fastest growing in the economy. Dividing the economy into four sectors — primary,[6] secondary, tertiary (trade and transport)[7] and tertiary (others)[8] — it is shown that in India the fastest growing sector has been tertiary (others). During the last 20 years, the average growth has been 1.8 to 2 per cent per year in the primary sector, 4.4/4.5 per cent in the secondary sector, 4.5/4.7 per cent in the tertiary (transport and trade) sector and 5.5 per cent in tertiary (others), mainly administration and defence.

Table 2 : Consolidated Budgetary Position of the Centre and States

(Rs crores)

Development of primary production is needed both to supply wage-goods to workers and to supply raw materials to agro-industries like cotton and jute textiles and vegetable oils. There are obvious limitations on the consumption of agricultural goods and, therefore, their market. The tertiary (trade and transport) sector is essentially a service sector whose expansion depends upon the volume of output in the primary and secondary sectors. It is apparent, therefore, that in the long run growth must be sought in industry. International comparisons also suggest that India's lag in agricultural output (on a per capita basis) is much smaller than that in industry. Apparently if India is to bridge the development distance with advanced economies, it will have to do so through a faster rate of growth of industry.

In the last five years, the average rate of growth of agricultural production has been about 5 per cent. In the recent past the rate of growth in agricultural output has been large — even allowing for the investment made in agriculture (not only irrigation, but also industrial inputs like fertilisers, pesticides and tractors). The law of diminishing returns operates most clearly in agriculture: as land supply remains constant and as the more productive (due to irrigation and other factors) land gets exhausted, the return on fresh inputs (more fertilisers, better seeds) is likely to diminish, Therefore, assuming adequate demand, the rate of investment needed in agriculture to obtain a given rate of increase in output will increase over time. However, it would be justifiable to assume that possibilities of constant returns on the basis of known technology will not be exhausted till the end of the Fifth Plan (and perhaps some years beyond) and that supply estimates can be based on this assumption for the Fifth Plan.

In India the tertiary sector is well developed and contributes a relatively large proportion of national income. There are two aspects of this phenomenon which need to be considered. Firstly, India has now a fairly developed governmental apparatus (including the Planning Commission); in a *dirigiste* economy, with expanded functions, this apparatus has become an important part of the total economy. Secondly, the tertiary (trade and transport) sector is at present less capital-intensive than in the advanced countries. The margins (in the form of surplus capacity) in the transport sector, for example, are much smaller than in the advanced economies. As regards the trade sector, it necessarily acts as a channel for disguised unemployment. There is thus a vast proliferation of retail outlets, trying to share the same volume of total trade. There are many trades (*panwallas*, for example) where little capital is required (or credit against goods supplied is available); given no reserve price for labour, such vocations are taken up on failur to find employment.

For some time to come, these conditions must continue in the tertiary sector. In other words, till employment opportunities in other sectors expand, to some extent the tertiary sector must continue to harbour disguised unemployment. As the volume of real output (marketable surplus in agriculture, industrial production) increases, the number of trade outlets will continue to increase — as also (along with increasing employment opportunities) the capital intensity in the trade sector. In the transport sector also, employment is likely to grow faster as services ancillary to transport (for example, garages and petrol stations in the case of road transport) are provided on an adequate scale.

It is in the secondary sector that the largest scope for growth exists. This is partly because the country's lag in this sector is the largest and partly because income elasticity of demand for manufactured goods is high and the saturation point comes much later than, for example, in agriculture.

To provide minimum consumption standards to all it has been shown that an additional production of 7 mn tonnes foodgrains is required, given the existing distribution of income. A 2.5 per cent growth in agriculture is required for increase in population, and another 2.5 per cent to cater to the demand arising out of increasing incomes. On this basis the required rate of growth in the agricultural sector works out to 7 per cent year in the Fifth Plan period. The growth in the mining sector, given the emphasis on coal in the future energy policy, can be much higher at about 10 to 12 per cent.

In the past the tertiary (trade and transport) sector has grown faster than national income and, given the emphasis on production of physical goods in future, this trend is likely to continue during the Fifth Plan period, particularly as a large increase in employment-creating activities like construction is planned. It is reasonable to assume a growth rate of 8 per cent for this sector. On the other hand, given the developed status of our administrative structure, 'growth' in the sector might be kept at 6 per cent — which still remains slightly above the rate 'achieved' during the last 20 years. On this basis the required growth in the industry and mining sector works out to 10 per cent to achieve an annual growth rate of 7.5 per cent in national income. On the the other hand, if the growth rate in agriculture does not exceed 6 per cent, a growth rate of 12/12.5 per cent would be required in industry to achieve the same increase in national income.

Given the laxness in the industrial sector, it is not necessary that investment in the manufacturing sector will be required to the extent corresponding to the production growth envisaged. In fact, at least one year's growth equivalent can be obtained by utilising existing capacity more fully (that is, from past investment which is not being utilised fully at present). The level of investment required would, therefore, be equal to that needed to achieve four years' growth (40-48 per cent) in output. Assuming that surplus savings are available, they can be easily invested in the manufacturing sector to increase output further.

III

Consumption, Capital Formation and Foreign Trade

Once the production structure and distribution requirements are laid down, it should be possible to examine the implications of these requirements on policy issues. These requirements

would determine both the size of the Plan and the allocation of funds among *various sectors*. These are essentially matters of calculation. But given the size of the Plan and allocation of funds among sectors, it is necessary to consider issues of how the required resources, both domestic and foreign exchange, are to be raised.

Perhaps the greatest illusion which our system of planning has sought to perpetuate is the dependence on a financial counterpart for the process of real investment. Almost every plan is preceded by a great debate on the size of the plan and of the availability of resources to finance it; it is these considerations which limit the development effort included in the Plan. Unless our planners break through the money barrier, the rate of capital formation (and of foreign exchange earning) is likely to be inhibited.

In a country where perhaps one-third of the agricultural sector is not monetised and a fourth of the labour supply is unemployed in various degrees, the dependence on money as an intervenor in the development process should be limited — and to that extent the options available to the planners are increased.

(A) Money Supply and Investment Process

The function of money is to redistribute resources in the desired directions which, in India's case, consist in providing minimum consumption to those below the poverty line and to increase employment to this purpose (if possible, by creating social capital). An increase of money incomes in such a situation in a particular sector is likely to divert a part of consumption goods towards this sector (for example, towards those below the poverty line). The point is that the State is able, through money creation, to bring about the required redistribution of consumption goods.

In an earlier section, the likely additional consumption of basic goods as a result of a policy decision to provide the minimum requirements to the disadvantaged sections has been estimated. The breakthrough in agriculture has made the agricultural production system dynamic, and has created conditions (with a total adequacy of production, which is unequally consumed as a result of the existing income distribution) where a policy of work-creation for the disadvantaged sections need not lead to severe economic strains.

At the same time, of the investment taking place in the economy, only a part is financed by the intervention of money — as in the case of investment in industry and in other productive assets. Capital formation, by the direct labour of the farmer in land improvement, for example, does not involve intervention of money; in this case, the process of investment is internalised to the farmer who provides for himself the consumption goods needed during the process of investment.

During the Fifth Plan period, the State will be creating considerable amount of investment through the provision of employment to those below the poverty-line. This will require mediation of money at two points: in obtaining consumption goods (as in procurement of foodgrains) and in making payments to those given new employment. The net increase in money supply, however, will be only at one point, as the sales of consumption goods (for example, foodgrains) would lead to a corresponding reduction in money supply. Alternatively, to the extent the State remains both a buyer and seller of foodgrains (and itself does not hold foodgrain stocks), the only increase that will take place in money supply will be due to the employment-creation programme.

Role of Investment

Not only for growth, but for social justice, it is necessary that the rate of investment in the economy is stepped up considerably. Such investment can be of two forms: employment-creating investment (which involves a transformation of idle labour into social capital) and goods-generating investment (which creates not only capital goods needed for investment but consumption goods required as a result of employment created in the economy). Expenditure on employment-creation by itself does not create the required consumption goods, but (as in the case of land levelling or irrigation) improves production capability. Consequently, it is the system outside the employment-creation programme, which has to produce the required consumption goods.

There is apparently a direct correlation between the two in a free market economy: the more there is of either, the more is needed in the other sector. In a controlled economy where the State undertakes to distribute basic consumption goods, the proportion between the two can be varied at the State's discretion (the minimum being set by the minimum consumption standards accepted by the State.) The system of direct correlation can be carried to the level where there is full employment in the economy.

In an earlier section, the likely increase in investment as a result of the employment generating programme has been estimated at Rs 1,400 crores per year. This is about 3 to 4 per cent of the national income. In effect while in the past investment has been taking place at a rate of 10-11 per cent of national income, the acceptance of a minimum consumption standard implies a direct increase in investment rate to 14 per cent of national income. Such a rise in the rate of investment will not by itself increase the supply of consumption goods. Additional investment, particularly in the agricultural sector, will be required to bring this about.

Such a system requires management of the economy by the State, particularly in insulating the rate of investment from financial and local production constraints. On the financial side, it is necessary that the State provides the required income for creating the given level of investment. To ensure that such a transfer to the disadvantaged sections is not defeated by price changes, it might have either to arrange for adequate production of basic consumption goods (given the income distribution, rate of market surplus and propensity to consume) or to set up a procurement and distribution system for such goods to ensure minimum supplies to those for whom new employment is generated (indirectly thus setting up a real wage-employment system). The production of basic consumption goods required under the second alternative is smaller than under the first, but the administrative apparatus and efficiency required is much more. In other words, organisation and production, to an extent, become substitutes for each other: the larger the increase in production, the lesser the strain on organisation.

Raising Resources

The State needs to create or raise money resources to generate the required employment. In fact, in raising the resources required, the State has to strike a balance between direct transfer from the better-off sections (by taxation and loans) and indirect transfer (through deficit financing). It is an option of which the consequences must be recognised and accepted.

The problem of resources affects basically the Fifth Plan decisions on taxation and deficit financing. Table 2 gives the total budgetary position of the Centre and States, including overall deficits. During the last six years the surplus on current account has been at a lower rate than during the Third Plan; moreover, the overall deficit has been maintained at around Rs 300 crores (in money terms, but less in real terms).

In recent years, the State's tax effort has remained at about 13 per cent of national income. As non-developmental

expenditure has increased rapidly and developmental expenditure has failed to keep pace with it, the State's contribution to national saving has declined from 2.8 per cent of national income in 1965-66 to about 1.1 per cent in 1970-71. With the large increase in State expenditure planned under the Fifth Plan, the extent of government saving will have to rise nearer to 4 to 5 per cent of national income.

In the past the volume of resources raised by the State has amounted to about 15 per cent of national income. To the extent the employment-generating programme (school-building, road construction and so on) is in the State sector, the State will need to raise additional resources to finance such programmes.

The Approach document suggests that fresh taxation required to finance the Fifth Plan would be Rs 6,000 to Rs 7,500 crores. Distributing this progressively over a five-year period and allowing for the rise in national income, the proportion of resources raised through taxation remains about the same as at present, namely, 13 per cent. The Planning Commission's estimate of additional taxation still seems to be made within a continuing frame of past trends — rather than intended to meet a major shift in policy towards labour-intensive works in the State sector.

It is almost certain that a transfer of income, equal to about 3 per cent of national income, is needed through the State if the minimum consumption needs of the people are to be met. Assuming that half of this is met through taxation, the State will have to continue to raise 13 per cent of the increased national income to take care of its increased obligations under the minimum consumption programme.

In addition, the State will have to raise resources for the (other) investment programme under the Fifth Plan. This programme is at present estimated at Rs 20,000/21,000 crores over the five-year period (in fact, as shown later in Section IV, as a result of price changes, the total size of the Fifth Plan, and the amount of resources to be raised through taxation and deficit financing, will be much larger). It is evident that resources raised through taxation will have to exceed 13 per cent of national income for the whole of the Fifth Plan programme. Given the need to reduce demand for consumption goods from those above the poverty line, such taxation will have to cover, as implied by Dandekar and Rath, these classes, including the factory working class and the middle classes. The Planning Commission will have to identify clearly tax measures which cover these sections.

The amount available for plan expenditure is a residual between additional taxation and non-plan expenditure of the government — unless the government raises additional resources to cover the increase in its non-plan expenditure. Since in the past (including in the Fourth Plan) a part of the additional tax effort has always gone to finance non-plan expenditure, a realistic estimate of increase in non-plan expenditure must be made, and should be provided for, in any estimate of additional tax effort.

Deficit Financing

Every plan provides for a certain amount of resources to be raised through deficit financing. The actual amount of deficit financing undertaken is shown below:

	(Rs crores)
First Plan	333
Second Plan	954
Third Plan	1133
Annual Plans (3 years)	682
Fourth Plan (2 years)	479

During the last six years, the annual level of deficit financing, both as proportion of national income and in real terms, was lower than the level reached during the Second

Given the additional tax effort and assuming that the government's borrowing rises at the normal rate, the government will have to resort to considerably increased deficit financing during the Fifth Plan period. A minimum estimate of deficit financing required would be about Rs 600 crores per year (equal to about half the transfer in current prices to the disadvantaged sections) or Rs 3,000 crores over the Fifth Plan period. To the extent the production system is responsive to increased demand, a given level of deficit financing will be neutralised by increased output.

In effect, the government will have to raise about 40 per cent of the total plan resources through taxation and deficit financing. Even as the nature of the plan effort undergoes a change, the scale of the government effort required in raising resources will increase. Government policies will have to be oriented to meet the implications of such a change in scale.

(B) Open or Closed Economy?

One of the major constraints on development (and even social policies of government) is the existence of a semi-open economy in India. So long as international trade is allowed, a country's domestic economic policies are subject to the constraint of maintaining a balance on international account. It cannot have the rate of growth (and price inflation going with it) without running into a foreign exchange crisis or making adjustments in its policies to correct it.

In a sense, few countries operate a

wholly open economy for fear of importing economic repercussions. Many advanced countries like Japan and the USA adopt various discriminatory policies in relation to imports. Developing countries have also adopted various mechanisms to insulate their economies from international trade repercussions: many Latin American economies reduce their foreign exchange parities, through regular devaluations, to maintain international balance; South Korea has a constantly variable (depreciating) currency; many countries have introduced multiple exchange rate systems, with favoured rates for priority imports and exports.

Most countries also try to intervene directly in import and export trade. India, for example, operates such a system. As regards imports, there is a ban on import of luxury and non-essential goods, irrespective of their local availability; imports of essential commodities are allowed subject to considerations of local availability, and even then their allocation is on a rationed basis. Various subsidies are given to promote exports. In addition, a large part of foreign trade, both imports and exports, is channelised through State trading.

India's foreign trade has continued to grow during the plan periods, despite the attempts at import substitution in the plan strategy. Apparently the impact of the growth factor on the economy has been much larger than that of the import-substitution strategy. Table 3 shows the total volume of imports and exports during the last 20 years. The Table clearly bring cut the inability of the economy, given the present policies, to generate the exchange earnings needed. The relative ease on international trade account which the economy is enjoying today is due to the green revolution (which has reduced foodgrain imports) and the slackness of the economy (which has reduced demand on current and investment account in industry and allied infrastructure sectors).

The composition of imports under the plans has undergone a radical change — from non-essentials to essentials and from finished goods to raw materials and components. The overall availability of imports, however, has been much smaller than the requirements of the economy. Table 4 shows the changing composition of India's foreign trade during the planning era.

Despite these measures, over the last 20 years of planning, there has been a continuous shortage of needed imports. The cost of imports, required but not

* At post-devaluation rate.

made, is not the saving brought about in foreign exchange but the much larger volume of output possible by using such imports but forgone (for example, plant and labour which are left idle) for lack of them; some estimates place this at 10 times the value of imports. This is a high price to pay for imports not made, and on this basis it would certainly be found economically more advantageous to make the exports needed to pay for the required imports (rather than forgo imports).

Is Self-Sufficiency Enough?

In recent times the government has sought to encourage self-sufficiency. This policy implies an attempt to make locally goods which are imported. As Table 3 shows, imports have been reduced in relation to total domestic output. This view of self-sufficiency often results in domestic production of goods where the local resource advantage or the size of market does not justify their manufacture; in this sense, self-sufficiency is bought at a high cost in domestic resources.

Emphasis on a self-sufficient economy also implies that the level of investment in the economy is determined by the level of production of capital goods in the economy. In such an economy the level of investment can increase only by the devotion of increasing resources to manufacture of capital goods (including the technology for their manufacture).

According to the Annual Survey of Industries, the ex-factory value of total output was Rs 7,213 crores (and value added by manufacture Rs 1,810 crores) in 1966. Of this the ex-factory value of output in the capital goods and related sectors (iron and steel, cement, machinery and metal products, transport equipment) was about Rs 1,950 crores and the value added Rs 575 crores. In the past, based on domestic production and import of capital goods (*vide* Table 4), it can be estimated that about one-half to two-thirds of investment in the industrial and infrastructure (power, transport, communications) sectors has been based on imported capital goods. Clearly the rate of growth of the economy should not be left to be determined by only the capacity for local manufacture of capital goods.

Towards an Autonomous Economy

Consequently, it is desirable that India gives up the option of the semi-open economy it is operating today, and tries to operate an autonomous economic system. An autonomous system does not mean a self-sufficient economy — in fact, such self-sufficiency is obtained at a heavy cost in the use of local resources, and is, therefore, inefficient and wasteful.

The objective of having an autonomous system is not to have self-sufficiency but to make exports needed to meet the imports required for operating and developing the economy at the maximum rate feasible. One advantage of operating an economy of the kind suggested above is that it insulates the level of investment in the economy from the level (and technology) of production of capital goods. In a developing economy where the rate of investment has to be high (and rising), such a system enables the transformation of consumption goods locally produced into capital goods internationally produced. The rate and level of such inter-change depends upon the level of local technology and the state of international demand. One of the major advantages of trade with the USSR and the East European economies is that both these aspects have to some extent been controlled.

Table 5 gives India's foreign trade position, overall and with the USSR and East European countries, according to Plan periods. The main point to note is that while the overall trade has tended to remain adverse, the trade with the USSR and East European countries has not only increased, but has generally

TABLE 6 : STC OPERATIONS

(Rs crores)

	1967-68	1968-69	1969-70	1970-71	1971-72
Imports	115.8	114.1	150.2	141.9	220.7
Exports	23.6	48.5	55.1	70.6	96.8

done so in a balanced way. Almost the entire strain on the country's foreign exchange resources has come out of its trade with the free economies. On India's side, India has been able to export consumption goods (bananas, shoes) in exchange for capital goods (machinery and equipment, basic goods like copper). Moreover, to a large extent the trade has taken place without significant changes in terms of trade.

Unfortunately, in recent years changes in composition of foreign trade have taken place so as to reduce this advantage, particularly as India has tried to export capital goods (railway wagons, steel). The capital goods content of India's trade has thus declined not only by reduction in their imports (from Rs 500 crores per year in the 1960s to about half that level in the first two years of the Fourth Plan) but by attempts to increase their exports — reflecting the low level of capital investment taking place in the economy. It is necessary that India moves away from this low investment-low capital goods import syndrome.

Trade Policy for Fifth Plan

Such an approach has various implications for planning policy during the Fifth Plan period. The main objective of foreign trade policy should be to insulate the international trade account from price and demand considerations. In other words, India would determine its foreign exchange requirements on the basis of its needs, rather than its export capacity. This then would constitute the foreign exchange budget on the import side. It would then make exports needed to earn the required exchange. Secondly, given the need to increase the level of investment in the economy, an attempt should be made to maximise the balance between import and export of capital goods.

To put such a policy on a viable basis, it is necessary that domestic production policy is adjusted to take into account its foreign exchange cost. Thus a greater reliance might need to be placed on domestic production capacity in laying down the pattern of investment. To the extent foreign exchange needs are determined, the country should seek to develop surplus capacity in goods which are likely to have a strong international demand and in which it has a local advantage. This is *not* to subject the economy to vagaries of international trade since in fact one of the aims of planning is the optimum development of local resources. Such a policy involves a lesser constraint on domestic policy than the convolutions generated by the mirage of a self-sufficiency policy. Rather than subject economic growth to fluctuations in foreign exchange earnings, an attempt would be made to have the pre-determined growth, irrespective of international trade movements.

In India's case, this would imply development of iron and steel and aluminium industries (for both of which India has large ore resources) as also of electronics and similar systems which have a higher labour content. There has been a world shortage of iron and steel and aluminium in the sixties, but India was a net importer of these goods. The quantity of iron and steel imported during the sixties was 8.5 mn tonnes and of aluminium about 2.5 lakh tonnes. It is obvious that by a proper investment programme the country could have not only produced these commodities, but in the process, avoided a strain on foreign exchange resources. At the same time India has been exporting to Japan iron and manganese ores to be converted into steel, which Japan then exports to the USA. Is it any wonder that India has both unemployment and a large trade deficit with the USA?

India has already available, in the State Trading Corporation, an apparatus for operating an autonomous foreign trade policy. So far, as Table 6 shows, the Corporation has concentrated on the easy job of making imports (that too often on an agency basis). Being a State organisation and enjoying a monopoly position in some elements of foreign trade, it should be given the task to earn export earnings needed by the economy. This would imply that the State Trading Corporation would use its market power to develop exports and export markets which would give it the required export earnings.

An adjustment of the pattern of production to take maximum advantage of international trade opportunities does not take away from the local autonomy of developing a country's resources to the maximum advantage. Misguided attempts at self-sufficiency cost the economy far more. What is also wrong is to determine exports on the basis of the financial profit it earns the exporter, rather than the total cost-benefit to the economy. What is necessary is to keep the option of international exchange open to maximise the rate of growth.

IV

General Trends

A development process is set within general or secular trends. Some of these trends are independent of the planning process — as in the case of urbanisation or modernisation; some other trends are inherent in the planning process, for example, inflation which is a counterpart of a forced pace of investment. There are also a large number of issues which, the earlier experience of planning shows, the planners have not given due thought to. It is lack of attention to such issues that has made for ambivalence in planning and for its generally unsatisfactory performance. These are dealt with in this section.

Inflation and Planning

Two trends are likely to emerge in the coming years. Firstly, given the vastly increased outlay envisaged in the "employment-minimum consumption" programme, the rate of price inflation is likely to be faster in the Fifth Plan period than in the past. Secondly, if the programme succeeds, it is likely to slow down the process of urbanisation. The implications of these on Fifth Plan formulation need to be examined.

Except for the First Plan (when, with a high price level in the base year as a result of the post-Korean war boom, the price level actually declined), prices have continued to rise during each plan period — even between 1966-67 and 1967-68 when there was a transition from foodgrain scarcity to high foodgrain crops, and since then also, though foodgrain production has continued to rise and there has been a flattening out of investment in the economy. Using 1955-56 as base, the price-level increased by about 35 per cent during the Second Plan period; with 1960-61 as base, the price level rose by 32 per cent during the Third Plan period; using 1965-66 as base, the price-level rose by 25 per cent during the three annual plan years; and with 1968-69 as base, the price level has risen by about 15 per cent during the first three years of the Fourth Plan period. Table 7 shows the price-level changes during the last 20 years.

Significantly, planning, as practised in India, has been oblivious of the pressures exerted by this general trend. Almost every plan is expressed in constant prices (and the raising of financial resources planned accordingly), while it is implemented at price levels which rise from year to year; the planners have never given the extent of fulfilment of a plan in constant prices. Such changes in prices have various implications on plan trends: directly they affect the total volume of resources needed to be raised to fulfil the plans; in a less direct way, price changes tend to bring about sectoral pressures which have an influence on detailed plan fulfilment and general welfare.

The actual context of price rise during the Fifth Plan period will depend upon many factors, most important of them being increase in foodgrain production and money supply. The rate of investment in the economy is likely to rise sharply as a result of the employment-generating programmes; at the same time, the State is not likely to be able to raise resources through taxation to cover the higher level of investment fully, and, as stated in Section III, it would be necessary to raise resources through much larger deficit financing.

Given the past experience, it can be expected that the price rise will be much sharper — say, between 8 and 10 per cent per year — during the Fifth Plan period. Even with a fairly stringent fiscal and monetary policy, a rise of 8 per cent per year in price level needs to be anticipated and provided for. On this basis a reasonably phased out Rs 30,000 crore plan at constant prices will become a Rs 35,000/36,000 crores plan at current prices.

It is necessary not only to determine monetary policy to take this fact into account, but also to adjust fiscal policy to raise the required resources. While revenue from some taxes (sales tax, corporation tax, personal income-tax when not evaded) varies with price (and income) changes, the revenue from excise duties (which are levied mostly at specific rates) is inelastic. It is, therefore, necessary that attempts be made to make the fiscal system more elastic with respect to price changes; one measure would be to raise the rates of excise duties, where specific, by 8 to 10 per cent every year almost automatically.

There are two sets of measures needed to keep these tendencies under reasonable check. Firstly, the government should seek to divert to its coffers as large a part of the additional liquidity in the economy as possible. Consequently, a tax and borrowing policy will have to be evolved which ensures that the elasticity of government revenues and receipts, in relation to income and prices, is larger than one. Secondly, the government should adopt a monetary policy which will curb inflationary pressures. With expectations of price rise sharpened by the Fifth Plan outline, the tendency to hoard goods and speculate on price-rise will be accentuated. Apart from physical controls on credit supply, it would be necessary to adjust credit cost to deter excessive commodity holding.

TABLE 7 : ANNUAL SECTORAL CHANGE IN PRICE LEVEL

	First Plan	Second Plan	Third Plan	Annual Plans	Fourth Plan (3 years)
Food articles	—6.3	6.8	9.6	10.9	2.2
Industrial raw materials	—9.3	8.0	7.4	5.8	6.7
Manufactures	—4.6	4.4	4.2	4.0	7.6
All commodities	—6.3	6.2	7.1	7.9	4.4

Another major point is to make annual revisions in plan scheme costs and to arrange for the required financial resources. The final money cost of any "constant price" plan is bound to be much higher than originally fixed, and resources need to be raised accordingly. Given the fact that a substantial rise in incomes is likely to take place in the low-income categories whose consumption levels have to be protected, the resource raising effort will have to be concentrated on the remaining sections of the population and the remaining commodity-transactions sectors.

URBANISATION

A similar problem arises in respect of urbanisation. In 1951, of a total population of 361 mn, 62 mn was urban; the figures are 439 mn total population and 79 mn urban population in 1961, and 547 mn total population and 109 mn urban population in 1971. Past trends indicate that the growth in urban population is faster (about 3.5 per cent per year) than that of total population. By 1981, the total population is expected to rise to 650/660 mn and the urban population to 150 mn.

The planners have never taken into account the implications of the urbanisation process, though planning decisions have tended to accelerate it. Increasing urbanisation has consequences in the form of providing urban infrastructure — housing, transport, services like power and water, which are not sought or are not available in rural areas — whose impact on planning is hardly taken into account.

It is clear that even if the urbanisation process is slowed down as a result of the Fifth Plan programmes, there is likely to be a major problem of providing facilities to those newly joining the urban process. They create new demand for urban amenities which has to be financed and provided.

Many urban areas provide inadequate urban amenities. It is necessary that the financial cost of urbanisation is imposed on those who create pressures for such urbanisation. Consequently, every employer in urban areas should be required to buy urban bonds according to the volume of employment — permanent or temporary — created in such areas. Such a levy should be made on both government and non-government employers. A requirement of fixed bond purchase would enable such urban systems to come up to minimum standards — of water and power supply, sewage facilities and garbage disposal system.

A large part of the activity carried on in urban areas need not be carried on there. A tax on urban employment, or a fixed urban bond purchase system, will discourage unjustified setting up of establishments in urban areas and help to decentralise employment.

SHORT- AND LONG-TERM OBJECTIVES

It is also necessary that the relationship between short-term and long-term objectives be clearly recognised. An absence of this recognition has led to an almost total divorce between budgetary/monetary policies and five-year plans (as also the Planning Commission's total unconcern with the current industrial stagnation which set in more than five years ago).

If a five-year plan is to be fulfilled, the operation of the economy every year at full capacity and the generation of resources from it to finance the plan requirements are absolutely essential. These matters must be of concern to the planners. It involves keeping a continuous watch on non-plan expenditure, examining their implications for plan resources, and laying down policy guidelines for fulfilling annual plan targets, particularly as inflationary pressures have an impact on the amount of plan resources to be raised and on distribution of incomes.

There is also need for a certain consistency in policy measures, directed to various policy objectives. The primary fact in India is an excess of labour supply over labour demand, and the primary objective is to promote labour-use in the economy.

It is futile to create new employment schemes when existing policies encourage substitution of labour by capital. Almost all fiscal incentives are related to capital use and are thus geared to encouraging capital use. So also almost all factory legislation which, while improving the condition of those already employed, also reduces opportunities for more labour-use by making labour relatively more expensive. (At the same time, the State is unable to provide any protection to the more disadvantaged employees, like hotel or laundry workers.) A tight labour market, arising out of the employment-generating programme, is a better safeguard for labour than unimplemented laws.

Such a dichotomy in policy sets up contrary pulls on the economy — resulting in fossilising existing positions. It is desirable that economic relationships are so established and incentives so given as to pull in one direction only. Deviations from this position should be rare, and should be justified by economic or social considerations.

ROLE OF STATE

Finally, it is necessary to define clearly the role of the State in the economy. At present State intervention in the economy is *ad hoc* — a response to pressures from groups — and is in many cases totally unrelated to economic or social policy objectives. There are various areas in which the level of State intervention, and the limits to it, need clearly to be defined.

An example of an irrelevant (or even positively mis-directed) use of State power is the taking out of a large number of licences for the manufacture of beer by various State industrial development corporations (Haryana, Punjab, Kerala, Rajasthan, Orissa are reported to have taken out such licences). This decision is evidently directed to the objective of cashing in on the beer boom (in the wake of removal of prohibition in many States) and the bureaucrats' zeal to prove that, if not steel, they can produce at a profit at least beer — a commodity which has little relevance to economic or social policy objectives (and whose production is in fact contrary to the Directive Principles of Policy embodied in the Constitution). Such policies are hardly geared to maximising welfare of the larger masses of the population. In any case, State policy should not be determined to salve the managerial conscience of incompetent bureaucrats.

It is necessary that the State limits intervention where it affects the mass of the population or to important policy objectives where it has economic and social relevance. Massive State entry (often incompetently effected) in various fields without economic and social logic has little meaning.

Should not state intervention be restricted to benefiting limited disadvantaged classes? For example, rather than control steel prices (and thereby incidentally affect adversely the working of public sector units), it is desirable to distribute a limited quantity of steel at low (international) prices — for example, for exports as at present or for low-cost housing — and let the remaining sector free. Similarly, nylon yarn and other artificial fibres (as also credit) can be given to poorer classes of weavers (to weaving co-operatives and individual weavers, but not to privately-owned power-operated looms) at fixed prices instead of the present system of having price control on the total output of these industries.

At present foodgrains and milk are supplied in urban centres at low prices irrespective of the economic condition of buyers; it is desirable that such subsidised consumption should be restricted to the poorer sections of the urban population. Rent control again is imposed on all housing, benefiting the richer classes and commercial users — and in the process depriving the municipal authorities of revenue. It is time rent control is removed on all residential accommodation above a specified rent and on all commercial establishments. So also, co-operative and bank finance is being pre-empted by rich farmers, including the sugar barons. Such State help should be given only to improve the condition of those at the lowest level. Finally, one still fails to understand the rationale of price control on cars. Tax concessions should similarly be related to social objectives: should there be a tax allowance for car-users?

It is in these directions that the State power and the State's new awareness of social responsibility should move. The present attempt to meddle in all spheres leads to misguided intervention in the economic process and inefficient control (as is evident in the extensive prevalence of black markets and of tax evasion).

Too long has planning been concerned with general growth and welfare objectives, often without a time dimension, rather than with specific objectives limited by a time constraint. The main achievement of the Mahbub ul Haq thesis is to question the rut in which the process of development seems to have got stuck. The Fifth Plan, for once, brings out clearly the issues facing our planners. The framers should show a new path for the development process.

7 This sector includes, in national income categories, transport and communications, trade, storage, banking and insurance, real estate, construction, electricity, and other services.
8 This is a residual category, comprising public administration and defence.

Artificial Fibre Industry

THERE are now about eight units in this country manufacturing 36,000 tons of rayon filament yarn per annum; three rayon tyre cord plants with an approximate total capacity of 19,800 tons per annum, two rayon staple fibre plants producing 64,000 tons, one acetate filament and staple producing plant with a capacity of 2,000 tons, five nylon-producing units with a capacity of 5,700 tons and one polyester fibre producing unit with an approximate capacity of 4,700 tons per annum. Nylon tyre cord and acrylic fibre is also being produced in India.

The pattern of world consumption of textile fibres is fast changing and man-made fibres account for nearly 38 per cent of the total fibre consumption. In India, the share of man-made fibre consumption is approximately 11 per cent.

Indian Sugar Mills Association

Problems and Prospects of Sugar Industry

Presidential Address of Lala Bansi Dhar

THE following are extracts from the Presidential Address of Lala Bansi Dhar delivered at the Thirty-ninth Annual General Meeting of Indian Sugar Mills Association held at New Delhi on July 3, 1972:

During the last two years the sugar output has come down precipitously from a record output of 42.6 lakh tonnes in 1969-70 to 37.4 lakh tonnes in 1970-71. During the current season, 1971-72, it has dropped further to a bare 31 lakh tonnes. Such a sharp drop in output was paradoxical, specially when the installed capacity in the industry has been going up annually to the tune of about 1.5 to 2 lakh tonnes. The fall was basically due to sharp decline in cane acreage, which during the last two years has come down by eight per cent in factory areas. Besides, excessive rains and floods in some areas and drought in others also affected the cane yields.

Despite a very sharp drop in the sugar output in the last season, Government continued to maintain the monthly releases at the current level of 3.25 lakh tonnes which was possible only due to large carry-forward stock of 14 lakh tonnes from the preceding season. But at the end of this sugar year, the carry-forward stock is not expected to be more than 5 lakh tonnes which is not sufficient even to maintain the present monthly supplies for the next two months when normally now production is not available. To maintain the present level of consumption, Government will have to draw from the season's production during the months of October and November. But, in the next season, i e, 1973-74, we would be starting from scratch with no stocks to fall back upon.

On Government's own reckoning the country would need about 52 lakh tonnes sugar, i e, by the end of the Fourth Plan Period (1973-74) and 60 lakh tonnes by the end of the Fifth Plan Period (1978-79) taking into account the requirements for export and buffer stock. These estimates seem to be quite realistic. But their achievement is, by no means, easy.

No doubt, higher cane prices paid by the factories in the last season has induced larger cane plantings. According to the initial survey made by the Indian Sugar Mills Association, there is an overall increase of 5.6 per cent in the cane acreage in factory areas. The unfavourable weather conditions, more particularly the recent heat wave, have adversely affected the cane crop. The monsoon will, of course, play a dominant role in the conditioning of the crop.

The new levy prices announced by the Government effective from July, 1972 which been fixed without due regard for the actual costs obtaining in the industry are highly unrealistic. Besides, there are certain apparent lacunae in the Tariff Commission cost schedules based on which the levy prices have been fixed. The Commission, as a package deal, had recommended a lower rate of depreciation but a uniform allowance of rehabilitation. While the Government did not accept the recommendation to provide rehabilitation in the price, they did not enhance the depreciation allowance so as to conform it to the provisions of the Income Tax Rules. The industry has thus suffered on both the counts.

Surplus to Shortage

Sugar was decontrolled in May, 1971 by Government as an alternative to increase the levy prices. The decision came as a surprise to the industry as sugar policy for any season is normally announced at the start of the season and is expected to hold good for that season at least. By that time the declining trend in cane acreage and production had become quite clear. It was also apparent that internal consumption was picking up at a fast rate and to maintain supplies we shall have to draw substantially from the carry-forward stocks. Despite this apparent tight statistical position following decontrol, Government continued to release sugar far in excess of quantities actually needed by the markets. Moreover Government did not create buffer stocks in 1969-70, when stocks were plentiful. Thus, due to excessive releases and the absence of buffer stocks a tight supply position has now emerged.

Essentials of a Long-Term Policy

For planning a steady increase in sugar output, it is apparent that a long-term policy needs to be devised, which should comprehensively deal with all the relevant aspects of the working of the industry. If any significant aspect is left out of consideration, the policy will soon run into rough weather, needing a change. The policy has to be a production oriented policy and the first and foremost consideration which should go into its making is the determination of a remunerative cane price which would ensure the desired level of sugarcane output. The existing statutory minimum cane price of Rs 7.37 per quintal is not remunerative to the cultivators.

Also extension of cane acreage would be inevitable. Happily, with the advent of 'Green Revolution', food yields have shown substantial rise and it is imperative to divert some of the cultivated land to sugarcane. As it is, sugarcane accounts for a very small portion of the cultivated land, being only about 1.8 per cent. Even if it is doubled, sugarcane will not account for more than 3.5 per cent of the gross cultivated areas.

It must be pointed out here that a uniform increase in the statutory minimum cane price for all the regions may not be practical. Government may have to fix regional cane prices depending on the actual conditions obtaining in different regions in the matter of yields and parity realisation from other crops as also competition from gur and khandsari. The cane growers should, by and large, be assured of similar per acre returns in different regions. The cost disparities arising from different regional cane prices will have to be equalised through appropriate adjustments in the sugar excise. For this, if it is necessary to amend the Excise Act and Rules, this should be done in the larger interest of cane growers in different regions.

Need for an Integrated Approach

The sugar policy should also ensure a uniform treatment to all the three sweetening agents. The Government's approach should be integrated one. In the absence of this, sugar output has invariably suffered far more severe variations than gur and khandsari. In the last 10 years, while in the case of gur and khandsari the variations around 6.3 per cent have been modest, in the case of sugar they were as high as 22.1 per cent. In the recent past, the cane production in 1971-72 came down by 11 per cent as compared to the previous year. Against this, the sugar output has dropped by 27 per cent to 31 lakh tonnes in 1971-72. Thus, the shortfall in cane production has not affected uniformly all the three sweetening agents, and the brunt has been felt mainly by sugar.

With the rate of extraction of available sugar in gur and khandsari being only about 50 to 60 per cent against well over 90 per cent in a vacuum pan sugar factory, it stands to reason that even if the sugar factories do not get any preference they should not be at a disadvantage in the matter of cane supplies. Here lies the clue to a long-term stable sugar policy. It has to be an integrated policy embracing equally the three sweetening agents. For every stick of sugarcane which is diverted from factory areas to power crushers and khandsars, the country loses valuable sugar which it can ill-afford. Besides, Government also loses in excise, cess and other taxes.

Buffer Stocks

Sugar, being an agro-based industry, its output has been subject to a four-year cyclic variation which can not be entirely eliminated. Hence, there is a need for creation of buffer stocks to minimise the hardship to consumers, cane growers and the industry. It has to be an integral part of the long-term sugar policy.

Government should draw upon such stocks only in periods of shortages. It should not happen, as in the past, that efforts are made to liquidate surplus stocks through excessive releases regardless of future prospects of cane area, crop and market conditions. Such excessive releases, which amounted to as much as 5/6 lakh tonnes during certain months, have undermined stability and the industry's financial position which has affected production. The stocks earmarked as buffer stocks should be released only when required in the interest of the consumer.

Monthly Releases

During the last two years, the Government's policy of monthly releases had been somewhat unsteady. Very often excessive releases have been made without proper consideration of the market conditions. The industry has to sell sugar at a loss and consequently has to face financial difficulties. Such variations could be avoided through a policy of planned and judicious releases.

Early and Late Crushing

Depending on the size of the crop and the requirements of sugar, factories may have to start early and also continue crushing late in hot summer months. Late crushing becomes necessary when the prices of gur and khandsari come down and farmers divert their cane to sugar factories. This excess supply of cane has to be crushed in the interest of cane growers. Early and late crushing is highly uneconomical and factories need to be compensated through adequate rebate in sugar excise duty. This has a special significance for the ensuing season when factories should start early to secure maximum output during the months of October and November.

Bank Finance

Equally significant for the stability of the industry is the provision for adequate bank finance. The non-availability of bank finance commensurate with the stocks in the past has been primarily responsible for the accumulation of cane price arrears. When adequate finance is not available from banks, the factories are helpless, although, unfortunately, it is they who face the public criticism. It is necessary that the policy decision should also govern the bank advances to this industry. When factories don't receive adequate bank finance, they have two clear alternatives. They should either suspend working and leave the cane un-crushed to dry up in the fields or to crush it by deferring the cane payments. It would be disastrous for growers to pursue the first alternative. The cane, which is highly perishable, must be crushed in the larger interest of cane growers. If the factories, responding to the needs of the situation, opt for the second alternative, should they be blamed for delayed cane payments?

In order to find a solution to the problem of cane price arrears on the Association's suggestion, with the Food Ministry's approval and blessings, the Reserve Bank of India has directed all the nationalised commercial banks to segregate the bank accounts of the mills into two separate accounts — the cane account and general account. All the drawings from the bank are first credited to the cane account to provide for the cane dues and it is only the balance that is credited to the general account of the mills.

Increase in Sugar Production from Gur Sensitive Areas

Due consideration must be given to the peculiar problems of gur sensitive areas especially in the context of the need for an immediate increase in sugar output. For, it is in these areas that production can be stepped up within the shortest period without any further capital investment. Factories in these areas, through appropriate measures, should be enabled to prevent diversion of cane from their areas to gur and khandsari by paying competitive cane prices. In the present situation, it is essential that the capacity of such factories is fully utilised and this would depend mainly on the policy decision of the Government with regard to these areas.

Licensing of Capacity

For achieving higher sugar output, Government have already licensed adequate capacity. The licensed capacity currently stands at 53.04 lakh tonnes, against the planned production target of 52 lakh tonnes. The installed capacity achieved during the season 1971-72 is only 39.5 lakh tonnes and it is expected to go up to 41 lakh tonnes during the ensuing season 1972-73. But according to the present trend, it is not likely to exceed 43 lakh tonnes by the end of the season 1973-74, the last season of the Fourth Plan Period. We would thus be left with a gap of 9 lakh tonnes between the capacity actually achieved and the planned target of production of the Fourth Plan.

Cane Development

The essentials of an ambitious cane development programme are quite well-known and have received a wide measure of support from all concerned. The need has been recognised for provision of assured and adequate irrigation, drainage facilities, supply of manures and fertilisers good cane varieties and above all for sufficient availability of disease free seed material. Hitherto, however, availability of adequate finance has been one of the limiting factors resulting in a slow rate of progress in this behalf. While there is need for all the State Governments to utilise the entire proceeds of canecess/purchase tax on cane for cane development work, effective participation of the Central Government in the matter

through allocation of adequate funds is also very necessary.

Here, it may be mentioned that much better and more tangible results can be achieved provided a direct link between the cane growers and the sugar factories can be established. The Pasricha Committee which has recently submitted its Report to Government has also recognised the need for direct link between the sugar factories and the cane growers. This Committee has also made other valuable recommendation for accelerating cane development work. These should be implemented expeditiously.

Sugar Exports

A well defined export policy, particularly with regard to meeting of export loss, should also form an integral part of a long-term sugar policy.

Through sugar exports the country earns valuable foreign exchange. If we export our full quota of 3.5 lakh tonnes we could earn foreign exchange worth over Rs 30 crores annually. Sugar is one item of export where hundred per cent of the foreign exchange earned is retained by the Government. Keeping this in view, earnest efforts should be made to increase our export quota to at least 5 lakh tonnes when the present International Sugar Agreement comes up for revision in the International Sugar Conference to be held in early 1973.

The Madras Aluminium Company Limited

'Jayalakshmi'

Race Course, Coimbatore 18

Address of the Managing Director, Shri R Venkataswamy Naidu

THE following is the address to the Members of the Company delivered by Shri R Venkataswamy Naidu, Managing Director, at the 12th Annual General Meeting of The Madras Aluminium Company Limited held at the Registered Office at 'Jayalakshmi', Race Course, Coimbatore-18 on Wednesday the 28th June 1972.

I have great pleasure in welcoming you all to the 12th Annual General Meeting of the Company.

Eventful Period

Before discussing the affairs of the Company, I would like to dwell on the eventful period through which the country has passed recently. Nearly 10 million refugees poured into the country from the former East Pakistan. India had to bear the heavy burden of caring for the refugees. This caused a very heavy strain on the economy of the country. International Organisations had only lip sympathy for India's predicament and they were either unwilling or were unable to create conditions for the return of refugees. India had no alternative but to take necessary steps to solve this issue. The people stood united under the dynamic leadership of the Prime Minister. India's successful military operation in the former East Pakistan took only 14 days and the refugees were able to return to their homelands. This successful operation has enhanced the image of the country internationally as a military power of consequence.

Your Board of Directors' Annual Report, Balance Sheet as on 31st December 71 with the Profit and Loss Account and Auditors' Report have been with you for sometime. You would have noted that our turnover and gross profit have come down when compared to the previous year. You will recall that this was anticipated in the last Annual Meeting itself. The Government of India notified the prices of Aluminium and its products from 25th May 71. Though the Government offered a rebate in Excise Duty to small Producers like us, our net realisation has come down by nearly Rs 400 per tonne. This has affected our working results. Secondly, the cost of production has gone up considerably due to increases in the costs of all raw materials and services mainly due to governmental imposts. The increased cost of production has eroded into our gross profit considerably. In addition, we did not have the benefit of the Tax Credit (Excise Duty on Excess Clearance) Scheme for the year 1971, as the scheme lapsed on 31st March 1970. You will recall that under this Scheme about Rs 22 lakhs accrued to the Company in the previous accounting year. It is most unfortunate that the benefit of this scheme was available to the Aluminium Industry for only three years.

As we have a large quantum of unabsorbed development rebate, your Board of Directors have decided to transfer Rs 84 lakhs (practically the entire net profit) to development rebate reserve and to pay the Dividend on Preference as well as Equity shares out of General Reserve.

It has been the policy of this Company to plough back its profits after paying reasonable dividends to the shareholders. The profits have not been frittered away in any manner. The ploughed back profits have been utilised to bring the industry to international standards and to increase its productive capacity, resulting in the manufacture of industrial raw materials required by the nation and in creating remunerative employment potential.

Decision on Pricing

We have made strong representations to the Government of India that they should reconsider their decision on the pricing and allow us more remunerative prices. Though the Government order stipulated that any increase in the prices of Synthetic Cryolite and Aluminium Fluoride would be neutralised by sanctioning increase in the price of Aluminium and its products, so far, the Government of India have not deemed fit to sanction the increase in spite of the prices of these chemicals having gone up. In addition, the prices of all raw materials like Calcined Petroleum Coke, Pitch, Caustic Soda, etc, have gone up considerably. Moreover, the cost of raising steam is higher for us when compared to the other Aluminium Producers, as we use a costly fuel like furnace oil unlike other producers, who use coal for steam raising. We are also operating under a handicap of having a small plant producing less than 13,500 tonnes per year without the advantage of fabrication facilities. As I have indicated on an earlier occasion, in international parlance, even units of 50,000 tonnes capacity are not considered economic or viable. Even with our expansion, we will be producing only, probably, a little over 25,000 tonnes per year which, by no means, can be considered a very economic unit specially when compared to the huge production capacities executed and planned for the two private sector and the public sector projects. I request you to join me to appeal to the Government of India to extend the benefit of excise rebate upto a production of 30,000 tonnes per year.

From the working results, you will notice that we have increased the sale of our intermediary products like Alumina Hydrate, Calcined Alumina and Carbon Electrode Paste from Rs 49 lakhs to Rs 61 lakhs. This is a matter of gratification to us and I am hopeful that we would maintain the sales during this year also.

Expansion Programme

Based on the working results, I am quite sure that you will agree with me that only technical innovation and increased production with the diversification alone can improve the working of your Company in the years to come. Conscious of this objective, your Board of Directors have been pushing ahead with the expansion programme and in spite of various difficulties, we are trying to complete the expansion programme as per schedule. Due to the delay in the financial institutions' making available the term loans, the Company has been put to severe financial strain in its efforts to complete the expansion project. The physical progress is quite satisfactory and I am confident that additional production in the first phase will start in the course of the next month or two and that the entire expansion of metal production will be completed by early 1973.

In this connection, I wish to place on record the help rendered by our Collaborators M/s Montecatini Edison, who have been assisting us with the relevant data, drawings and engineering services, even without receiving in advance the fees that have been sanctioned to them.

As indicated earlier, the electrolytic pots of our expansion will operate at more than 100,000 Amps. Moreover, the Alumina Plant of the expanded capacity will be so designed that it will be able to process even Bauxite with low alumina content — literally the rejects from the Bauxite Mines. This will enable us to maximise the utilisation of our Bauxite, thereby, providing for the longevity of our Mines.

I may be pardoned, if I once again take pride in the fact, that as on date, we are the most technically advanced Aluminium unit in the country, as we operate our present electrolytic pot room at higher amperage. Moreover, we produce the largest proportion of EC grade metal in the country.

Training of Technical Personnel

As a matter of policy, at the initial stage, we decided not to employ engineers from other Companies. We decided to recruit young engineers and develop them to take positions of responsibility. Our Collaborators have assisted us in training several of our technical personnel. This policy has paid rich dividends in that our young engineers under the leadership of the technically qualified management have been able to reduce the imports for expansion to barely 5 per cent as against the local fabrication and utilisation of local machinery upto 95 per cent. The reverse was the case when the original plant was erected and commissioned. I believe that India cannot afford to go on importing machinery for developing her industries. But she must develop her indigenous talent for designing and fabricating machinery. Only by such a policy, the country can progress without the burden of foreign exchange loans. We, in this Company, being alive fully to our responsibility in this direction, have utilised the services of our young engineers in designing and fabricating of our indigenous equipments for our expansion. We are also willing to share our knowledge and experience with the Public Sector units also in the manufacture of specialised equipments to avoid imports.

As mentioned earlier, only technical innovation, increased production and diversification can help your Company to maintain its working against stagnating prices at uneconomic levels and against rising cost of production. With this objective, we have continuously given our attention for developmental work, apart from striving to complete the expansion project expeditiously. I am glad to inform you that from July onwards, we expect to market aluminium circles, which will come into production out of equipments designed, fabricated and commissioned by us. We are also in the process of producing Aluminium Alloy Rods for eventual manufacture of alloy conductors for use in specialised fields.

We have also undertaken necessary steps for manufacturing sheets and extrusions. I expect that we will be marketing sheets of larger dimensions in 1973 and possibly extrusions by end of 1973 or early 1974.

I am glad to inform you that labour relations during 1971 were smooth and cordial, though there has been labour unrest for the last two months due to inter-union rivalry unconnected with relations between management and labour. I wish to take this opportunity to assure our workers and staff that their welfare is of paramount importance to us. We are conscious of our social responsibility to our workers. I hope that our workers will identify themselves with the interests of the Company and share in its progress.

I am confident that your Company has a great future in view of its expansion and diversification programme. Moreover, the demand for Aluminium in the country is continuously growing. The production is not keeping pace with the growing demand. Your Company, being conscious of its responsibility to the Nation, is willing to extend its co-operation to the public sector units in sharing its experience in fabricating equipments indigenously. However, I wish to utter a word of caution that the Government should be very careful in allowing imports of Aluminium in order to avoid a situation like 1967/68 being repeated in the country, when due to depressed demand, Aluminium was exported from the country at low prices, while importing Aluminium at higher prices — the country losing foreign exchange both ways.

I also wish to appeal to the Government of India to reconsider the decision to abolish tax relief to the priority industries, the increase in the surcharge on the company profits and the withdrawal of development rebate concession after 1974.

I wish to thank Government of Tamil Nadu, M/s Mediobanca of Italy, Industrial Finance Corporation of India, Industrial Development Bank of India, Industrial Credit and Investment Corporation of India Limited, Unit Trust of India, Life Insurance Corporation of India, Punjab National Bank and Indian Bank and my colleagues on the Board and all our Senior Executives for their help and co-operation.

In conclusion, I request you to join me in paying tribute to our employees at all levels for their unstinted co-operation and loyal service.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Shree Digvijay Cement Company Limited

Speech of the Chairman, Shri G C Bangur

THE following are extracts from the Speech of Shri G C Bangur, Chairman, Shree Digvijay Cement Company Limited, delivered on June 29, 1972:

GENTLEMEN:

I have pleasure in welcoming you all to this 27th Annual General Meeting of the Company. The audited statements of account for the year ended 31st December, 1971 and the Directors' report thereon have been in your hands, for some time and with your permission, I take them as read.

In the past year, the world witnessed a chain of epoch-making events. Fast historical developments have taken place in the national and international scenes. Summit meetings were held at Peking and Moscow between Great Powers in search of world peace and it is hoped that these summits would pave way for greater understanding among them.

The Summit meeting now taking place between India and Pakistan, it is hoped, will open a new era in the subcontinent by paving a way for durable peace and lasting friendship between the two neighbours so that both the countries can divert their limited resources to achieve economic prosperity and higher standard of living of their people.

Our economy has withstood the serious strains and stresses of the war with a great degree of resilience. But there are distinct signs of slackening in industrial growth. The need to achieve self-reliance has assumed greater urgency in the context of curtailment in foreign aid. The economy has to be highly geared up by better utilisation of the existing capacities and the massive drive to build-up our exports, which will be possible only by increased production and productivity in the industrial sector. This can be achieved only by hard work and strict discipline enforced with the dynamic and imaginative economic policy directions from the Central Government.

Growth of Cement Industry has also sagged and touched a virtual stagnation over the past few years due to lack of self-generated resources. Unremunerative price policy followed by the Government over the years has denied to this industry adequate resources to be ploughed back for expansion, renovation and diversification which is necessary for any healthy industrial development. The Government has recently referred the case of Cement Industry to the Tariff Commission for a comprehensive review including revision of the price policy. If past experience is any guide, tariff inquiries will not take less than two years and, therefore, it is earnestly submitted that the Tariff Commission should give interim recommendation for increase in retention price. The industry's capacity to absorb constantly rising costs has reached saturation point, the margin having been seriously eroded. The industry needs to be given fair treatment, particularly when the cost increases are mainly due to various measures taken by the Government which is beyond the control of the industry.

Cement Industry is highly capital intensive and cost of new units and expansions has substantially gone up resulting in high incidence of depreciation and interest. At the current price, industry would not be in a position to provide adequately for payment of interest and the principal amount of loan. In view of this, price revision must come at the earliest to give the much desired relief to the industry.

Recently, the industry has been served with a charter of demands by the Federation of Cement Employees' Unions for substantial increase in wages and other amenities. But as stated earlier, in view of unremunerative retention price of cement, the industry at present has no capacity to bear any additional burden until the price is revised upward. Moreover, it is most essential that any increase of wages must be directly linked with the productivity, as is normally seen in other developed countries. We must strive to get out of the vicious circle of rising prices chasing wages with mounting costs.

As stated in the Directors' report, the working result of the Company for 1971 has shown fairly good improvement as compared with the previous year. Towards the end of the year, due to bombing by Pakistani planes in Jamnagar area, the plant's working was also affected. During the current year, the Company experienced some difficulty in production owing to power shortage for a short period. It is hoped that production deficiencies would be made up in the coming months.

The labour-management relations have been cordial at all the units of the Company in 1971. I would like to express my appreciation for the earnest and sincere devotion to duty of the workers and the staff at all levels of our organisation.

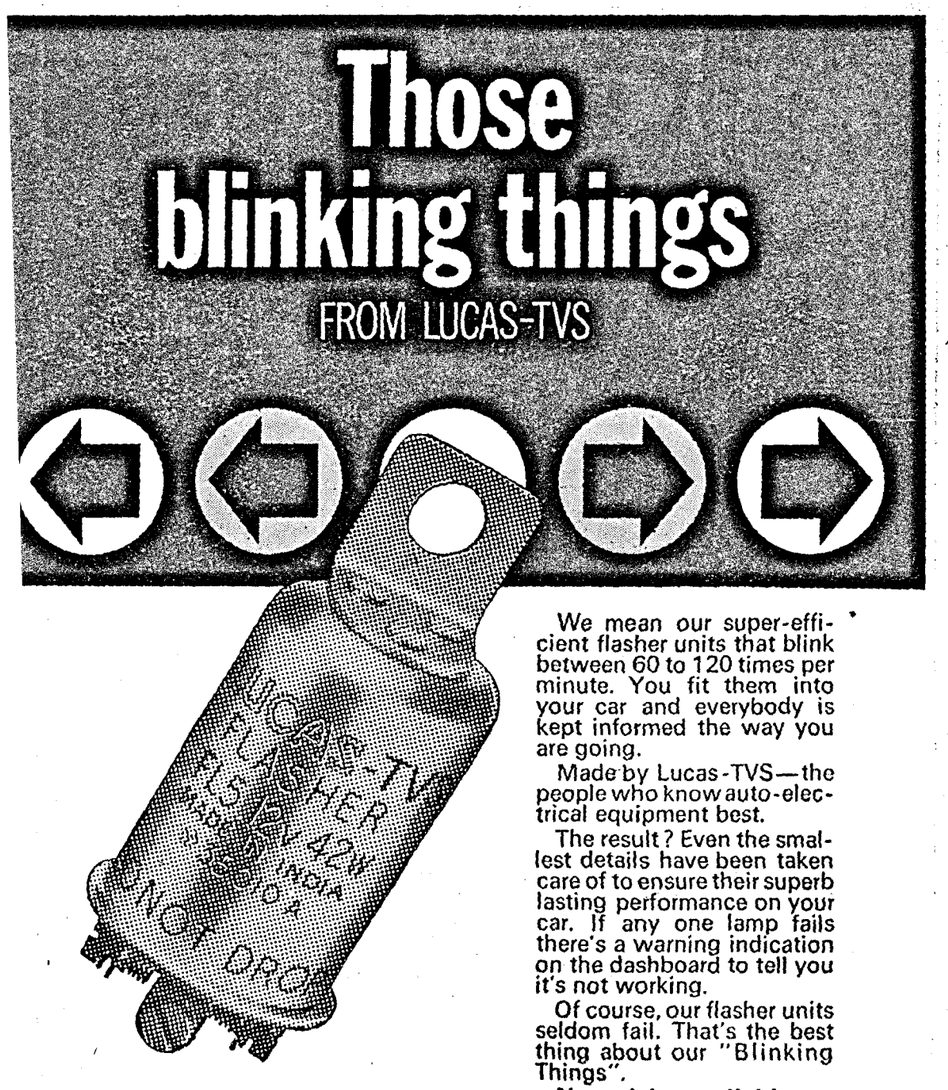
Note: This abstract does not purport to be a record of the proceedings of the Annual General Meeting.

'Cost-Benefit' of Family Planning

WITH national family-planning programmes now under way in many Asian countries and with investment in them increasing, a rigorous evaluation is needed to ensure maximum effectiveness. So far very little has been done to assess the efficiency with which these programmes have been implemented or the social and individual benefits of reducing fertility. ECAFE, therefore, called some 20 specialists together at Bangkok to investigate the costs, effectiveness and returns of family planning activities.

Carl M Frisen, Chief of ECAFE's Population Division, reported that the US dollar cost of each new acceptor of some form of family planning varied widely—from $5 in some areas to $40 in others. As many as 400 million couples in the ECAFE region may be eligible for help in planning their families, in terms of age-group, and currently available figures indicate that the governments of the region were spending more than $100 million yearly. However, how many people are actually reached remains a mystery and data on this need to be improved.

The session at Bangkok was thus asked to find answers to questions such as: Is the increasing allotment of public funds to national family planning programmes by countries in the ECAFE region justified, and to what levels is further investment in these programmes warranted? Are the programmes being operated efficiently and what can be done to improve them? What are the best procedures of costing and assessing in economic terms, the effectiveness of family planning programmes? What are the gains to the economy of a country as a whole and to an individual family of averting unwanted births? How is the distribution of income affected by family planning?



With Best Compliments

Printed by Krishna Raj at States' People Press, Jamnabhoomi Bhavan, Ghoga Street, Fort, Bombay-1, and published by him for Sameeksha Trust from Skylark, 284 Frere Road, Bombay-1.

We mean our super-efficient flasher units that blink between 60 to 120 times per minute. You fit them into your car and everybody is kept informed the way you are going.

Made by Lucas-TVS—the people who know auto-electrical equipment best.

The result? Even the smallest details have been taken care of to ensure their superb lasting performance on your car. If any one lamp fails there's a warning indication on the dashboard to tell you it's not working.

Of course, our flasher units seldom fail. That's the best thing about our "Blinking Things".

Now it's available at reduced prices.

Sold and serviced by: **Lucas Indian Service Limited,** Madras-Bombay-Calcutta-Delhi-Bangalore and **TVS & Sons (Private) Limited,** Madurai and all its branches.

Ends and Means

THE descent from the finely-honed exercise in diplomacy in Simla to the work-a-day life of New Delhi cannot have been easy. So the Prime Minister's momentary loss of style at her press conference on Wednesday, when she flourished testimonials from the Aid Consortium and the International Monetary Fund to support her claim that there was nothing very much the matter with the economy, was perhaps understandable. However, it was not only style that was awry. On this occasion the Prime Minister was distinctly ill served by her economic advisers. How else does one explain her answers to questions about the recent sharp rise in prices? The rise was seasonal; it was also part of a world-wide phenomenon of rising prices; finally, some rise in prices was inevitable in the development process. These explanations certainly had the merit of novelty compared to the actual causes of the rise in prices which have all been well known for some time now — the bloating of money supply as a result of the Central and state governments' free spending sprees, the price support policies for agricultural products, the shortage of critical industrial items following from the prolonged investment holiday, the cost-plus method of price-fixing for manufactures, and so on. Not that an accurate listing of these factors by the Prime Minister would have been assurance of corrective action, but by taking resort to more esoteric explanations she succeeded in conveying an impression of cynicism and indifference, even callousness, which was not intended perhaps — or so one hopes.

However, there was nothing unintended about the particular brand of cynicism practised recently by some of the leading economic functionaries of the Central government in relation to the agriculturists' stir in Tamil Nadu. This is no doubt phase one of the bid to topple the only remaining non-Congress government worth the name in the country. But much more than the fate of the DMK government is at stake. The agitation in Coimbatore started with a demand for reduction in the rates charged on power supply to farmers. Once some concessions were made in response to this demand the Coimbatore District Agriculturists' Association came up with more demands; among these is one which, if conceded, would nullify an important experiment in progressive taxation of agriculture attempted by the government of Tamil Nadu. From 1955 the state government has offered to assessees under the agricultural income-tax the option of being taxed on the basis of the size of their holdings expressed in terms of 'standard acres'. The Madras Agricultural Income-Tax Act of that year defined a 'standard acre' as "one acre of wet land assessed to land revenue at the rate of Rs 8 and above per acre" or "one-third of an acre of land used for growing arecanut", or "three-fifths of an acre of land used for growing tea", and so on. Accordingly, the tax leviable was also stated in terms of two schedules, one in terms of income slabs and the other in terms of standard acres. Those who opted for being assessed in terms of standard acres had the advantage of not having to maintain detailed accounts of income and expenditure. To reduce the administrative costs of individual assessment of income the government also offered an incentive to assessees to opt for the compounding method; the rates of tax leviable on standard acres are lower than might have been applicable if they had been based on the actual income derivable from the holdings.

The Tamil Nadu government has recently attempted to widen the coverage of the tax and make it more progressive. It has enlarged the list of crops separately identifiable for the estimation of standard acres, modified the equivalence between different crops to conform more closely to the returns now obtainable from them, and stepped up the rates of tax. One acre of wet land assessed to land revenue at the rate of Rs 8 and above continues to be regarded as equivalent to a standard acre; the equivalence in terms of the area under arecanuts has however been changed, and one-sixth (instead of one-third) of an acre of land under this crop is now to be treated as a standard acre. Grapes, banana, rubber, groundnut, cotton, coconut, tobacco, etc, have all been brought in so as to bring within the purview of the tax the higher incomes now obtainable from growing these crops.

It is this more comprehensive system of compounded levy that is under fire from the Coimbatore District Agriculturists' Association. It is aided and abetted not only by all the parties that call themselves 'progressive' but by key Ministers in the Central government entrusted with responsibilites of planning and development. The merits of the Tamil Nadu system of taxation of agricultural incomes can perhaps be questioned, but what is extraordinary is that the system is being dismissed merely on the ground that it is too complicated and that this objection should have the support of persons who are urging

state governments to raise more resources by taxation of agriculture.

Such questions of principle and consistency do not apparently worry politicians who are interested above all in securing footholds where they have none. It is interesting that, while the toppling operation is being pressed forward in every possible way, a letter has been sent out by the Finance Minister, reportedly under inspiration from the Planning Commission, to all state governments suggesting alternative ways of raising resources from agriculture. One of these is simply a withdrawal of all concessions given hitherto in respect of land revenue (such as for holdings below 5 acres in size). The other is even more disarmingly simplistic. A surcharge is to be levied on the basic land revenue at graduated rates related to size — 75 per cent for holdings of 5 acres or more but not exceeding 15 acres, 100 per cent for holdings of 15 acres or more but not exceeding 25 s, and 125 per cent for holdings of 25 acres or more. Whether the basis of levy of the basic land revenue justifies such a system of progression being built on it has apparently not occurred to those who have thought up this proposal. But it certainly has the merit of being very simple, and perhaps this is all that is now wanted for achieving the political objectives immediately in view.

If the Planning Commission or the Ministry of Finance had such a simple formula to offer for introducing progression in agricultural taxation and for raising more resources, why did the government have to appoint a committee specifically for the purpose of studying the problem in depth and ask it to submit its report by the end of this September?

Banks

On Sound Haunches

IT has become difficult to make anything of the weekly changes in the scheduled commercial banks' assets and liabilities as shown in the returns issued by the Reserve Bank every Friday. Thus, during the week ended July 7, the data show a phenomenal rise in banks' liquid assets and credit. Deposits increased by Rs 74 crores. This rise supported a credit expansion of Rs 61 crores, a surge in cash and balances of Rs 47 crores and an investment spurt of Rs 58 crores, besides enabling banks to slash their borrowings from the Reserve Bank by Rs 38 crores to almost nothing. The weekly data are provisional. That and the delayed impact of window-dressing by banks for their half-yearly accounts as on June 30 perhaps account for the all-round expansion. It is also likely that the data were skewed by adjustments made for delayed cheque clearing, resulting from the Reserve Bank employees' strike in Bombay in the second half of June. The adjustments on this count must have been sizeable since one-third of the country's cheque transactions pass through the clearing house in Bombay.

But the weekly returns are all one has to go by to get a feel of the banking situation. On the assumption that over a period of time the cumulative data are fairly reliable, it is instructive to examine the changes in the assets and liabilities of scheduled commercial banks between April 28, when the busy season technically ended, and July 7. The data show that during the current slack season so far bank deposits have jumped by Rs 390 crores to Rs 7,597 crores against an expansion of Rs 274 crores to Rs 6,240 crores in the corresponding period of the 1971 slack season. How did banks funnel in the extra Rs 143 crores?

One wishes one could attribute the extra deposits to the 2,000-odd branches opened by the banking system in the smaller towns and the countryside since July 1969. This would be the official line of reasoning. Yet doubts arise. Surely, if the deposits came from outside the areas of business concentration, time deposits would have shown a more rapid growth? In fact, demand deposits increased Rs 217 crores to Rs 3,345 crores against Rs 103 crores to Rs 2,734 crores in the corresponding period of the 1971 slack season while time deposits increased by Rs 174 crores to Rs 4,252 crores against Rs 144 crores to Rs 3,506 crores. Of the extra Rs 143 crores, as much as Rs 114 crores came from demand deposits!

This is not the only reason for believing that the 2,000-odd branches opened in the post-nationalisation period remain largely outside the mainstream of banking activity. Take the changes in bank credit. Total bank credit expanded by Rs 249 crores to Rs 5,438 crores between April 28 and July 7 against Rs 206 crores to Rs 4,880 crores in the corresponding period of the 1971 slack season. Food procurement advances increased by Rs 242 crores to Rs 530 crores between April 28 and June 30 against an increase of Rs 176 crores to Rs 379 crores in the corresponding period on the 1971 slack season. It is likely that food procurement advances have declined since June 30. Assuming that these advances declined by Rs 38 crores — the amount by which banks' borrowings from the Reserve Bank declined during the week ended July 7 — the increase in these advances since the end of the busy season would be Rs 200 odd crores. The slack season credit expansion excluding food procurement advances is thus likely to have been of the order of Rs 40 crores, or roughly the same as that in the corresponding period a year ago.

Clearly, banks have failed to use the impressively large number of branches opened since nationalisation outside the major industrial and commercial centres to extend the coverage of their lending operations. Though banks today do not lack the resources for financing them, small industry and trade in the smaller towns remain the preserve of the usurious moneylender. At the same time, the momentum of bank financing of agriculture witnessed in the immediate post-nationalisation period appears to have been completely lost. Given the banks' lack of initiative and failure to build up the necessary organisational resources, the expansion of bank branches in the last three years serves mainly to adorn official statistics.

What is interesting is that this failure of the banks is sought to be made into a virtue. The growing investment by banks in the securities of the Central and state governments and semi-government bodies, inevitable given the banks' inability to use their rapidly growing deposits in advances, will, it is claimed, put the banks in a 'sound' position — that is, in a position from which they would be able to expand credit (in the coming busy season) without relying heavily and for prolonged periods on Reserve Bank accommodation. Blessed are we that we are able to pursue such 'sound' central banking policies in an economy where the greater proportion of borrowers have to rely on the usurious moneylender!

In the meantime, ways might be found to revive the organised sector's demand for bank credit. Along with the other relaxations that appear to be on the anvil, hints could go out to the banks that credit appraisals could be more liberal and that double financing of inventories was not the sin that they were once told it was. In that event, credit policy would be not only 'sound' but would also become 'production-oriented'.

Tamil Nadu

A Different Ball Game

A Correspondent writes:

THE goings-on in Tamil Nadu could, in other circumstances, be dubbed as pure Gilbert-and-Sullivan. But deaths and violence rob it of the quality of innocent divertissement. And one can certainly question how innocent the proceedings are. Consider the grotesqueness of Congress(R), Congress(O)

and the CPI pooling their resources together. Consider the further incongruity of the Deputy Chairman of the Planning Commission, ever worrying about the niggardly resource-raising efforts of the states, gleefully blessing a movement to force the Government of Tamil Nadu to rescind its decision to enhance power rates, which were hitherto inordinately low and, in many instances, even below cost. Also consider the fact of that great party of the toiling masses, the CPI, mobilising its cadres from all corners to defend the economic interests of the up-and-coming kulaks. Finally, consider the wonderlandish phenomenon of Congress(O), CPI and Swatantra party stalwarts leading joint processions and issuing joint statements condemning police violence and all that.

Karunanidhi, with his defences to the wall, must be currently in the mood to invoke Shakespeare dilating on the ingratitude of human beings, in this particular case, of one belonging to the female of the species. For what appears as a macabre farce is, after all, the dance of the marionette: the strings are being arranged and pulled from New Delhi. However compliant the DMK might try to be, there is, it is now obvious, no place for it in the Prime Minister's vision of things. They also indeed serve who stand and wait, but only for a time. Thus Jyoti Basu served in West Bengal, as much as Annadurai and Karunanidhi did in Tamil Nadu. For Basu, the tenure was over in early 1970; maybe for the DMK the bell will toll finally even as the autumnal harvests are being brought in around October of this year.

Karunanidhi might protest that, in his time, he has rendered some service to the Prime Minister. Clutching the primitive notions concerning parliamentary democracy, he might argue that he has a solid majority in the state legislature, and that it would be manifestly unfair to ask him to pack up before 1977. But such naivety deserves its own punishment. Through feats of mechanical engineering, a sizeable group of DMK legislators could be made to experience a revolution of conscience. The thirst for instant socialism, after all, must be quenched at all costs; and how could a sectarian, divisive, revanchist party like the DMK be an appropriate vehicle for socialism when a glamorous substitute is available?

And if that stratagem fails to click, the model of the Kerala Vimochana Samithi, vintage 1957, should come in handy: legend has it that Indira Gandhi herself was the President of the Congress party when that model had its trial run. A special team deputed by the present Congress president is now visiting Tamil Nadu: on its return to New Delhi, it is quite on the cards that it would recommend that only a liberation struggle, no less, can extricate the long-suffering people of Tamil Nadu from the tyranny of the Karunanidhi regime. The scenario from then on will run according to pattern. It is, as the Americans say and as Karunanidhi ought to know by now, a different kind of ball game altogether.

Innocenti Deal

Loss of Innocence?

A NEW giant scooter unit is to be established at Lucknow with an annual capacity of 100,000 scooters. The unit will be in the joint sector, with the Union Government holding 51 per cent of the equity, Automobile Products of India (API) 29 per cent and Innocenti, the foreign collaborator, 20 per cent. According to the agreement among the three parties, the entire scooter manufacturing plant of Innocenti located at Milan, together with drawings, designs and technical data for producing the latest models of Lambretta scooters, is to be bought by the joint sector unit from Innocenti. The unit is expected to start turning out scooters in about two years.

This is perhaps the first joint sector unit in the consumer durables industry with an appreciable element of foreign technical as well as financial participation. Details about royalty rates and technical fees have not been released so far, but since the unit at Lucknow has been granted exclusive rights in respect of Innocenti's business in Lambrettas, including export rights and also rights to licence manufacture of these scooters in other countries, a substantial sum must have been paid to Innocenti. It may be accepted that the new unit would have a number of advantages to start with, especially that of being the sole custodian of scooter manufacturing technology as developed by Innocenti, an internationally known firm. This would be significant if the unit proposes to enter export business in a big way or to offer scooter manufacturing technology to other countries.

When the Innocenti proposal was first mooted, the general impression was created that Innocenti's plant was being shifted to India so as to take advantage of the relatively lower wage costs here and to improve the competitive position of Lambretta scooters in the world markets. Under this arrangement, the scooters made by the plant relocated in India would have been mostly exported. This would also have been in conformity with the government's policy of permitting foreign collaboration in export-oriented industrial units. Now, however, the whole emphasis appears to have changed. The *raison d'etre* of the project is seen in terms of meeting the domestic demand for scooters.

If the primary purpose of shifting the Innocenti plant from Italy to India was to supply the domestic market, there was no justification for entering into a foreign collaboration arrangement with 20 per cent foreign equity holding. Scooter manufacturing technology is now available in the country and the API itself has been producing scooters in collaboration with Innocenti. The present foreign shareholding in API is negligible — about 2.5 per cent — compared to the 20 per cent allowed in the proposed new unit. It should not have been difficult for the government to bring one or both the existing scooter units — API and Bajaj Auto — into the joint sector, had it wanted to do so. If the API, which had applied for expansion of capacity, were to step up production from the present 24,000 scooters to, say, 125,000 scooters, it might have had to increase its equity over threefold, which would have given enough scope for the government to acquire a large share in its equity.

Special Number 1972

The Special Number 1972 of the *Economic and Political Weekly* will be published early next month. It will be a 180-page issue bound in art cover and will be priced Rs 10 per copy.

The Special Number will be supplied free to subscribers. Agents are requested to place their orders in advance.

In view of the Special Number there will be no weekly issues on July 29 and August 5 and 12.

The point is that the Innocenti deal on the present terms — complete import of plant and equipment, substantial foreign equity participation, payments for purchase of technology, licensing rights, etc — makes sense only if the proposed new unit is going to concentrate on exports of scooters as well as scooter-making technology. If its production is intended mainly for the local market, as now appears to be the case, the deal has no justification and, in fact, involves breach of accepted government policy on such matters as foreign equity participation and repetitive import of technology. What, for instance, is the value of the purchase of exclusive rights to Innocenti's scooter manufacturing technology if export of technology is not going to be a major concern of the new unit?

If the Innocenti deal is to have any justification, the government needs to stipulate explicitly that the output of the proposed unit at Lucknow would be primarily, if not exclusively, for export. For meeting domestic demand, the existing manufacturers should be allowed to expand — on condition, if this is considered an essential element of government policy, that they allow equity participation by the government.

Man-Made Fibre

Social Cost-Benefit

THE chairman of the Tariff Commission some time back identified the 'crux of the problem' with regard to the man-made fibre industry as that of achieving "a rational system of distribution and supplies of yarn coupled with the maintenance of steady prices". In fact, the spinning industry has never needed such overt support. The handful of units in it have always operated like a cartel and confronted both the very numerous and widely scattered weavers as well as government with virtual *fait accompli* on prices. The Tariff Commission's recommendations in 1969 were shelved and earlier this year government acted as 'umpire' in the unequal negotiations between unwilling weavers (who wanted statutory prices) and spinners (who wanted a cost-incorporating raise in prices) — till the weavers more or less acquiesced.

While the Tariff Commission saw the problem in such limited terms — not surprisingly, considering the Commission's narrow interpretation of its own role —, the Association of Man-Made Fibre Industry has thought it necessary to spell out the relevance of the industry in the 'new approach' envisaged for the Fifth Plan. The chairman of the Association, V K Shah, is at pains to establish that man-made fibres can substitute cotton, in the process releasing the acreage under cotton for other crops and saving the foreign exchange currently spent on Egyptian cotton imports. Despite the uneconomically small size of the indigenous units, if prices of man-made fibres in India are high compared to those in other countries, this is because of the heavy exchange imposts which the industry has to bear. Granting that excise duties on the industry are heavy and that minus such duties prices of comparable qualities produced here and abroad would be on par, there is a further point that needs answering since the Association is seeking to establish its case for getting various special considerations from government — such as foreign exchange for raw material imports, assistance for expansion of capacity, freedom from price regulation, protection against imports, etc.

Rayon material for tyres accounts for just one-fifth of the industry's market, the rest being used for textiles manufacture. The claim of the industry would thus have to be justified in terms of the textile policy appropriate to the government's so-called new 'basic minimum needs' approach. If the Fifth Plan is to create significant additional employment and be oriented to meeting the basic needs of a large segment of the people, apart from foodgrains, the output of cheap cloth would have to be stepped up substantially. Given the resource constraints and the far greater profitability of the fine and superfine varieties, how is this shift towards cheaper varieties of cloth to be brought about? Past experience has shown that, notwithstanding the small penalty for not producing controlled cloth, mills found it worth their while to continue to produce the finer varieties. Here it is no argument to say that there has not been enough demand for even such quantities of the controlled varieties as have been produced. Surely, this cannot be taken to mean that such cloth is not needed by a large section of the population; only that given the income levels of this section, the prices fixed for this cloth are too high.

This is the context in which the case for the man-made fibres industry has to be viewed. The relevant question is not whether it enlarges the area of choice available to those who use fine and superfine varieties of cloth, but whether it can provide the answer to the problem of supplying cheap textiles to those who now use little or no cloth. Then there is the employment aspect to be considered. The increased incidence of 'sickness' among textile units in the last few years is linked to the expansion of the production of synthetic and mixed textiles. But since the labour employed in these mills cannot be allowed to be thrown out of employment, the government has been forced to take over these mills and keep them going more or less as an unemployment relief operation at the cost of very substantial subsidies paid out of government revenues. In a real sense, these subsidies ought to be reckoned as part of the social cost of expansion of production of the costlier fabric varieties, including synthetic and mixed fabric. Indeed, it is problematic whether the excise burden on the synthetic fibre industry, that V K Shah refers to, adequately covers this cost.

Nor must it be forgotten that even as rayon yarn claims to be able to substitute cotton yarn, it is competing for its raw materials with such other important industries as newsprint and paper. The pulp plant expansions granted and being considered have to be seen in this light.

The industry's record indicates that a lowering of prices is not going to be easy. Nor are exports of man-made fibres and textiles really feasible given our price levels without either a subsidy or a recovery of the losses through higher margins on expanding internal sales to the relatively affluent sections of the population.

Fourth Plan

Quiet Burial

A Correspondent writes:

WHETHER the 'Approach' document on the Fifth Plan results in a new approach to the next Plan or not, it seems to have served one unfortunate purpose. There is no longer any serious talk about the Fourth Plan, though the Plan has still two years to go. These two years are to be spent apparently in anxious waiting for the unborn Fifth Plan. Yojana Bhavan has prepared a detailed time-table extending over one and a half years from October 1972 to March 1974 for completing the necessary exercises on the Fifth Plan. This time-table serves as an appendix to the Planning Commission's now-famous paper "Towards an Approach to the Fifth Five-Year Plan".

A strange situation, indeed. It was only in December 1971 that a Mid-Term Appraisal of the Fourth Plan was presented to Parliament. The Planning Commission was honest enough to admit that the progress of the plan had been disappointing. The position had been summed up as follows:

> "Taking the economy as a whole, the required average annual rate of growth of net domestic product during 1971-72 to 1973-74 to realise the adjusted national income target is 6.2 per cent. Against this the actual rate has been 5.2 per cent in 1969-70 and 4.8 per cent in 1970-71. In 1971-72 a further decline in the rate of growth may occur due to the sharp decline in the rate of industrial growth during the first half of the year. The economy is expected to pick up during the second half of 1971-72 and gain a further momentum during the next two years. However, the average for the three-year period 1971-72 to 1973-74 is unlikely to reach the required rate of growth of 6.2 per cent a year. The savings estimates assumed an average rate of growth of 5.5 per cent in real income for the next two years. Even this would require a substantial improvement in the performance of the economy during the second half of the Plan period compared to the first half. In order to achieve that, among other things, it would be necessary to take vigorous corrective action to deal with the intersectoral and intrasectoral imbalances that have emerged during the first half of the Plan period, on account of wide and varied divergences in the case of several sectors and sub-sectors between the planned and the realised rates of growth."

The picture in regard to the progress of the different sectors of the economy was not very different. The situation in agriculture was not disappointing, though rice, the most important cereal, had registered only a small increase over base-year production. In jute and cotton, the output was actually below the base level. The overall performance of the industrial sector was unsatisfactory. There was a shortfall in power generation. The progress in education was uneven. Achievements in the health sector fell short of targets.

But instead of initiating remedial action in its remaining years, the Fourth Plan appears to have been given up as a bad job. The final blow was struck by the Approach paper which came out with the finding that all the earlier Plans had been fundamentally misconceived. Thus: "In elaborating our strategy of development in the earlier Plan documents, we seem to have assumed that a fast rate of growth of national income will by itself create more and fuller employment and produce higher living standards for the poor. We also seem to have assumed that, for reduction of disparities in income and wealth, the scope of redistributive policies is severely limited".

Has the Fourth Plan been finally given up, then? The Plan, it will be recalled, had been preceded by three years of planless planning, the unadmitted 'plan holiday'. We seem to be now in for two years of a forgotten Fourth Plan. Indeed, the Fourth Plan must have been born under a 'bad star', as they say.

Industrial Statistics

CSO Skeletons

A Correspondent writes:

THE Central Statistical Organisation's industrial statistics are again in the news. It has been reported that on the basis of its Annual Survey of Industries for 1966 the CSO has estimated that in that year industrial output of the small-scale sector had risen by 16 per cent. This has revived the controversy regarding the differential rates of growth of the organised industrial sector and the small-scale sector.

In 1970-71 the growth of industrial output on a wide front was known to have slackened and this was reflected in the CSO's regular index industrial production (Base: 1960 = 100). However, the Ministry of Industrial Development took refuge in the explanation that, after all, the CSO's index omitted the output of small-scale units and that these units were in fact showing rates of growth of 8 to 10 per cent when the official index, representing only large-scale units, had registered a growth of hardly 4 to 5 per cent. The Industry Ministry's Annual Report for 1970-71 had stated that "the annual growth rate has been about 11 per cent in the registered [small-scale] factories sector and about 8 per cent in the case of units which are smaller than registered factories" (p 92). This claim was duly incorporated in the Government's "Economic Survey, 1970-71" (p 15).

On a closer scrutiny, however, it was found that the claim had no basis. In fact, CSO's national income statistics concerning manufacturing, registered and unregistered sectors, appeared to point in the contrary direction. The output of the small-scale sector at constant prices rarely grew at a faster rate than that of large industries. This would hold good even after allowing for conceptual differences in the definition of 'small-scale industry'. The government has apparently accepted this and the "Economic Survey, 1971-72" makes this categorial assertion: "Nor can it be averred that the small-scale industrial units have performed so much better during the year than the organised ones..." (p 26). The confusion had arisen, it was thought, because the growth rates for the small-scale units were at current prices.

Now, the CSO should know the difference between output at current prices and at constant prices — and yet it has disclosed the fantastic growth rate of 16 per cent for the small-scale sector in 1966. According to CSO's White Paper on national income, income originating in the manufacturing registered sector, comprising both large and small industries, had shown an increase of 2 per cent each in 1965-66 and 1966-67 (at 1960-61 prices). For the same years the growth rates of the large manufacturing sector as shown in the index of industrial production were 7.0 per cent and 0.1 per cent, respectively. Given the relative weights of the large and small-sector in the computation of income originating in the manufacturing sector, the above rates of growth simply leave no room for a 16 per cent growth in the small-scale sector in 1966.

This brings us to the reliability and comparability of the entire gamut of official statistics. For instance, till recently the CSO had been publishing the finished steel capacity in the country as 3.64 million tonnes for all the years from 1961 to 1968 (see *Monthly Statistics of Selected Industries*, November-December 1968, p 61). By 1968 the finished steel capacity had actually reached 6.9 million tonnes. In the subsequent issues of the *Monthly Statistics*, finished steel capacity is not published. Similarly, the capacity for railway wagons is not indicated. An instance of the CSO's lack of statistical sense is the way it dealt with the transfer of some large-scale units (as defined originally) to the small-scale sector. Their production returns were simply excluded from the current index of industrial production, "but no corresponding adjustments have yet been made for the early years" ("Economic Survey, 1970-71," p 15). Since this publication from the CSO itself comes out with a time lag of nearly three years (the latest one is for March-August 1969), one is forced to look for other reliable sources. The Industry Ministry's Annual Report gives data on production and capacity for many industries but rarely does a figure given there tally with the figures which the CSO publishes.

BHEL

Slow Persuasion

THE Chairman of Bharat Heavy Electricals (BHEL) has reason to feel happy about the performance of the largest electrical plant in the country and the ninth biggest public sector project. In 1971-72 BHEL's production increased by 23 per cent to Rs 59.33 crores and, against a modest profit of Rs 65 lakhs in 1970-71, profit improved to Rs 319 lakhs in 1971-72. Both the Tiruchi heavy boiler plant and the Hyderabad heavy power equipment plant recorded profits, while the heavy electrical equipment plant a Hardwar — BHEL's sick baby — is reported to be well on its way to breaking even. BHEL has substantial orders on hand (Rs 190 crores) and is aiming to achieve a turnover of Rs 82 crores in 1972-73.

O S Murthy, who has since retired as chairman of the company, explains in his chairman's statement that lack of orders for the Hardwar unit had resulted in a gap in planning for manpower and materials. This not only affected production in 1971-72 but also resulted in creating a false impression that indigenous manufacturers, such as BHEL, were responsible for the present crisis in power supply in the country. The real causes of the crisis are to be found, according to Murthy, in the planning, organisation and execution of power projects. He points out that of the expected shortfall of 2.1 mn kw in generation capacity, nearly 33 per cent (or 0.69 mn kw) is on account of delay in the commissioning of schemes for which equipment was to be imported. Projects with a generating capacity of of about 0.54 mn kw, for which BHEL is expected to supply the equipment, had not been included in the Fourth Plan originally and orders for equipment for them were received by BHEL only in July-September 1970. (Of the total orders of turbosets for power stations in hand at Rs 190 crores, orders for about Rs 119 crores were placed only in late 1970.) Having delayed placing orders for equipment (which has a long manufacturing cycle), it is unreasonable to blame indigenous manufacturers for late delivery. Murthy, therefore, stresses the need to initiate advance action right now for power schemes in the Fifth Plan.

BHEL seems to have succeeded in its attempt to convince the government of the wisdom of placing 'imprest orders' as standing arrangements to fill up the gaps in its order books and to ensure a minimum level of production at the plants. In view of the long lead involved in procurement of sophisticated materials and in the manufacturing process, BHEL admittedly has a case in asking for adequate orders. While a close liaison with the Ministry of Irrigation and Power should help in this regard, this also brings to light the peculiar difficulties that BHEL faces. Most of its orders emanate from the State Electricity Boards and, the financial position of the Boards being what it is, BHEL has to balance the risk of idle capacity against the possibility of being left with high inventories of finished goods in case its goes ahead with anticipated orders which fail to materialise. The remedy may perhaps lie in initiating advance action against anticipated orders but backed up by a revolving fund set up by the Central government while simultaneously taking action to set right the weaknesses in the financial structure of the Electricity Boards.

BHEL's share capital increased by Rs 15 crores to Rs 80 crores in 1971-72 as a result of conversion of an equivalent amount of government loans. BHEL now has an equity to debt ratio of 1:1. By reducing its interest burden by over Rs 1 crore, the conversion is also to a large extent responsible for boosting its net profits to Rs 3.93 crores.

BHEL's chairman claims that a rational and realistic pricing policy, fair both to itself and to its customers, has been introduced. In the case of boilers and switchgears, the prices realised seem to be fair as they are quoted largely on the basis of open tenders while in the case of turbosets prices are negotiated with the Electricity Boards. This leaves out quite a few other important item of electrical control equipment, to the pricing of which there is no reference.

COMPANIES

Overpowered by the Unforeseen

Hansavivek

HINDUSTHAN-PILKINGTON GLASS showed a trading deficit of Rs 14 lakhs during 1971, against a surplus of Rs 30 lakhs earned in the preceding year, despite a 40 per cent rise in sales at Rs 384 lakhs. The sharp diminution of margins was due to mounting prices of raw materials and fuel — coupled with certain "extraordinary and unforeseeable" factors, most significant among which was the "acute wagon scarcity".

The wagon scarcity hit the company very badly since the company gets its requirements of practically all the important raw materials in bulk supplies from long distances — such as sand from Allahabad, dolomite from Jubbalpur, and soda ash from Saurashtra. Even transport of furnace oil from Budge Budge was seriously affected for want of tank wagons, and large quantities had to be carried by road at "exorbitant" rates. As manufacture of flat glass involves continuous process, the company had to resort to expensive road transport or transport by coastal vessels.

Morever, the reconstructed and modernised furnace of the sheet plant (the major unit of the factory), though commissioned for commercial production at the beginning of the year, could not be brought to the stage of optimum operational efficiency on account of repeated trouble with the compressor supplied by a "well-known Indian manufacturer". Similarly, on account of the difficulties in the procurement and transport of raw materials, the rolled plate unit of the factory (representing about half its total capital investment) had to be kept out of production throughout the year.

The report points out that there was also large increase in the labour cost, although the ratio of wages/sales showed a decline compared to the previous year. However, the current year is said to hold out promise of improved results. The rolled plate unit, which resumed production in February last, is expected to have a fairly long run. Meanwhile, with the modernisation of sheet furnace, the quality of sheet glass has reached a "new high". Steps are to be taken shortly on the recommendation of technical consultants to enlarge production for better economic results on an enduring basis. The directors expect that the company's working this year will be established on a "profitable basis".

GODFREY PHILLIPS INDIA has not yet received government sanction for the proposed merger with it of D Macropolo and Company, which was long ago approved by the Bombay High Court. D S Barron, chairman, says that although the merger itself will result in a "substantial" increase in the participation of the Indian public in the company, the authorities have suggested that such participation be further increased by issuing a large number of additional shares to the Indian public, but have not granted the company approval for the necessary expansion for employing these funds gainfully in the "interests of all shareholders". He adds that the Board has indicated its readiness, in principle, to increase Indian participation in the company's ownership and is now awaiting word that the merger is approved and that manufacturing capacity may be increased. Of GPI's total paid-up equity capital of Rs 60 lakhs, over Rs 55 lakhs are held by Godfrey Phillips (Overseas Investments) of the UK and its nominees. As per the terms of merger, the company will issue to members of D Macropolo 83,490 equity shares of Rs 10 each at par in proportion of 5 equity shares for every one of the 16,698 fully-paid equity shares in Macropolo of the face value of Rs 100. The scheme would be put into effect on the approval of RBI for issue of shares to non-resident shareholders of Macropolo. During the year ended December 1972, GPI increased its net sales by 20 per cent to Rs 13.28 crores and gross profit by 25 per cent to Rs 1.66 crores.

KOHINOOR MILLS gave disappointing results for the 77th year ended December 1971, with a trading profit of only Rs 27,139 compared to Rs 69 lakhs in the preceding year, following only a moderate decline in sales from Rs 1,329 lakhs to Rs 1,188 lakhs. After depreciation, there was a net loss of Rs 25 lakhs. The loss apart, no provision has been made in respect of doubtful debts and advances of about Rs 8 lakhs. Also, arrears of contribution to ESI amounted to Rs 9 lakhs and those of income-tax in respect of the assessment year 1971-72 to over Rs 3 lakhs. The directors explained the loss as due to rise in cotton prices, credit squeeze, and increased cost of labour, stores, etc. Production of synthetic cloth was also curtailed. Three directors, Shantanu N Desai, Chunilal L Kapadia and Jagdish J Kapadia, resigned membership of the board last year, but the report does not give any reason for their resignations. At the annual meeting, the chairman, Kantilal Nahalchand, disclosed at the instance of LIC that that institution, which holds about 15 per cent of the equity shares in the company, had suggested that two members of the Kapadia family out of the 5 on the 8-member board of the company should retire and that independent directors should be co-opted in their place in consultation with it. He also stated that LIC had rejected the board's counter-proposal to increase the strength of the board by co-opting two additional directors.

On Differential Rates of Interest

A Correction

There is a small error in my paper "On Differential Rates of Interest" (July 1, pp 1279-82). In my assessment of the marginal prime cost of lending I refer to the Reserve Bank rate and suggest that beyond a limit it coincides with the commercial banks' "own time deposit rate at the upper margin". This is not correct. The commercial banks' deposit rate at the upper margin is a long term rate and should not have been compared with the Reserve Bank rate. This does not, however, materially affect my assessment of the marginal cost of lending, which is based on the Reserve Bank rate of 6 per cent per annum, with a margin of 1½ per cent per annum to allow for contingencies.

Lobbies to the Fore

Romesh Thapar

THERE's something very unreal about Delhi these days. The Prime Minister, after a prolonged stay in Simla, which covered the Indo-Pak Summit and the underplayed visit of Connally, Nixon's emissary; was expected to begin talks and consultations on the formation of a new ministry to coincide with the return of the President from his visit to Yugoslavia and Afghanistan. Not a move is evident. Maybe, these ministry-making calculations are intended to tremble on the edge of an auspicious moment. But imagine the wretched state of the present occupiers of ministerial chairs.

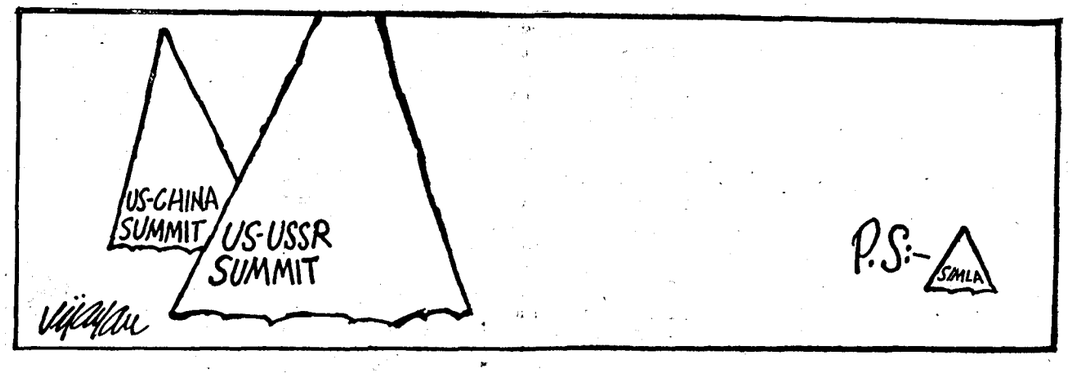
No Independent Base

The inherent lack of health in the present most unequal balance of forces in favour of the Prime Minister is underlined by the fact that every one of her colleagues does not possess a real base of political power in the country — or, for that matter, within the party and its organisations. Anyone can be ushered in, and anyone can be kicked out. Obviously, this opens the way to intense lobbying around the Prime Minister.

Speculation about the reshuffle, reports of correspondents and their prompt rebuttal, together with the familiar smear-campaigns and character assassinations, are very much part and parcel of that lobbying. Whenever reports are tracked back to their sources by independent observers or by Central Intelligence, the findings usually confirm the involvement of some of the colleagues of the Prime Minister. Clearly, we are witnessing the growth of a very special facet of the apparent anarchy that passes as Indian democracy!

Indeed, of late, this public and private lobbying has become a feature of the bureaucratic jungle in the Capital. If power is getting concentrated, the ability to make it accountable is diminishing visibly. Naturally, in this kind of situation, critical positions within the government apparatus become all most vital to the lobbyists and the hordes of minor manipulators who now crowd the corridors of power in Delhi. We have been witnessing extraordinary manoeuvres to get this or that person into some position of power and patronage — an activity which now obsesses rather important officials in the Capital.

The battle for the spoils of office is entering a critical phase. It is expected that some 30 ICS luminaries will retire by the end of the year. That's quite a slice of the machine. There are, apparently, hundreds of vacancies yet to be filled in areas which cannot be left leaderless. And, to top it off, the defence services are wondering what the hell's going on about senior appointments in the army, air force and navy. The battle is joined because the old system of promotion has broken down, while an alternative has not been worked out. We carry on, as in so many things, from one dreary day to another, without thrashing out relevant procedures and systems.



It is argued by some very cynical observers that the lobbing by various conflicting groups is so intense that the decision-making at the political level is paralysed. For one thing, politicians are essentially an isolated bunch, out of touch with the skills and talents they need. At another level, they are terrified of being taken for a ride. They tend to leave the final manipulation to their secretariats, hoping thereby to free themselves of responsibility. But the way in which key appointments are being made these days, someone is going to come a cropper.

Towards a Zero Rate of Growth

As for the nation's economy, the prospect is dim despite all the favourable factors. Hindustan Steel, Heavy Engineering, state trading, the banks, power, railways, airlines, and mining, are wallowing in crises. All the tall talk of ministers cannot hide the fact that these key sectors of the State are leading the dynamic drive to a zero rate of growth. The ever-mounting price index is a pointer to what we should expect. The present is, as I have said, an unreal kind of situation. For instance, the implications of the current sterling crisis have yet to enter the thinking of our political leadership. It has no time for these mundane things. The impending reshuffle of powerless men absorbs all our attention.

And so it goes on, this merry-go-round. I hope we'll have something to chew on next week....

July 10

Tangled Web of Centre-State Finances

Charvaka

THE Union government has strenuously sought to maintain that the constitutional provisions relating to Centre-state financial relations have stood the test of time and that there is no case for any substantial change in them. Yet, these relations have grown so complex over the years that time is ripe for a fresh look at them, even if it is to be within the existing constitutional provisions. The terms of reference of the recently appointed Sixth Finance Commission, however, fail to reflect any awareness of this need.

The founding fathers of the Constitution had visualised the Finance Commissions as *the* machinery to deal with matters relating to the devolution of taxes and grants from the Union to the states. But as things have turned out, a preponderant part of the transfer of resources from the Centre to the states falls outside the purview of the Finance Commissions. This is evident from Table 1. The Finance Commissions are charged with making recommendations regarding the distribution of income-tax, Union excise duties, additional excise duties and estate duty (other than that on farm land) between the Union and the states and *inter se* among the states as also grants to states in lieu of the tax on railway passenger fares. The Commissions have also to recommend the principles which should govern 'grants-in-aid of the revenues' to states in need of assistance. But the states get, besides these, loans and discretionary grants, for both Plan and non-Plan purposes, which are outside the purview of the Finance Commissions and which form nearly 70 per cent of the total resources transferred annually to the states. Further, out of the transferable resources falling within the ambit of the Finance Commissions, shared taxes form about 80 per cent and successive Finance Commissions have suggested only minor adjustments in their coverage and in the principles governing their distribution. In other words, there is in practice little scope for the supposedly high-powered Finance Commissions to effect any major changes in the quantum or distribution of resources transferred from the Centre to the states.

The fanfare that surrounds the appointment of the Commissions and, later, their deliberations which extend over one-and-a-half years and include a series of visits to state capitals, hardly seem justified considering that the Commissions' verdict makes a substantive difference only to the relatively meagre quantum of statutory grants given to states which have a deficit on revenue account after taking into account their share of the divisible taxes. Even in regard to these grants, as D T Lakdawala has pointed out, "not much progress seems to have been made" ("Union-State Financial Relations", p 71). It is well known how state governments are anxious to show large revenue deficits so as to stake a claim to large sums as grants. In the absence of basic data and because of their inability to determine a system of weights for the various relevant factors — budgetary needs, tax potential, economy in expenditure, the need to avoid wide disparities in the provision of basic social services and special national considerations — the recommendations of the Finance Commissions have been influenced by impressionistic arguments and their result has been to make the system of statutory grants inequitous (D T Lakdawala, pp 72-74 and minute of dissent by Swaminathan to the Fifth Finance Commission's Report, pp 99-103).

The importance of the Finance Commission is considerably eroded by the exclusion from its scope of a substantial part of loans and discretionary grants from the Centre to the states and by its own inability to conduct comprehensive studies and compile the type of data required for fulfilling even the limited task assigned to it. Considering the latter deficiency, there is much substance in the suggestion for a permanent Finance Commission which would keep constant watch over the finance of states, the tax and other revenues mobilised in relation to their respective potentials, the working of state government commercial enterprises and the progress of developmental activities and social services. A continuous study of this type by an independent body alone can help to determine objectively the quantum of Central grants (and loans) to states. This would also go much farther than the present system in achieving one of the major objectives of federal finance which is to reduce interregional disparities. Even on a more mundane level, the administrative cost of a permanent Finance Commission would not be very much more than what the present five-member Commissions, which normally function for about two out of every five years, cost. Such a permanent body would be better suited to laying down even the principles governing allocation of Plan loans and grants, which task is today performed by the Planning Commission, as well as the various discretionary grants extended by the Centre to the states.

In all these respects, the terms of reference of the sixth Finance Commission reflect no advance over those of its predecessors. The Central government continues to hold that all loans and discretionary grants, Plan and non-Plan, ought to remain the prerogative of the Planning Commission and other Central government departments. The argument that if the powers of the Finance Commission were extended to cover all financial transfers from the Union to the states it would interfere with the work of the Planning Commission is untenable. The Planning Commission can continue to perform planning functions such as laying down targets, estimating aggregate investible resources, determining their sectoral distribution and so on, whereas the Finance Commission would fix principles governing distribution of financial assistance — Plan and non-Plan, revenue and capital, normal and discretionary — to the federal units. Today the Planning Commission has usurped the function of the Finance Commission and, even after the *ad hoc* principles enunciated in the Fourth Plan (pp 54-55) regarding the allocation of Plan assistance, the allocation remains arbitrary.

Further, even if the principles enunciated for allocation of Plan assistance were considered acceptable, there remains a significant proportion of loans (over 50 per cent) and grants (about one-fourth) which are extended for non-Plan purposes. No rational norms appear to govern their dispensation. A functional classification of all grants (including statutory grants) given by the Centre to the states shows that about 30 per cent of the total amount is given for non-developmental purposes (*Reserve Bank of India Bulletin*, May 1972, p 800). The distribution of this largesse among the states is often decided by blatantly political considerations. The very substantial grants for 'famine relief' to Tamil Nadu and Rajasthan of recent memory are outstanding examples

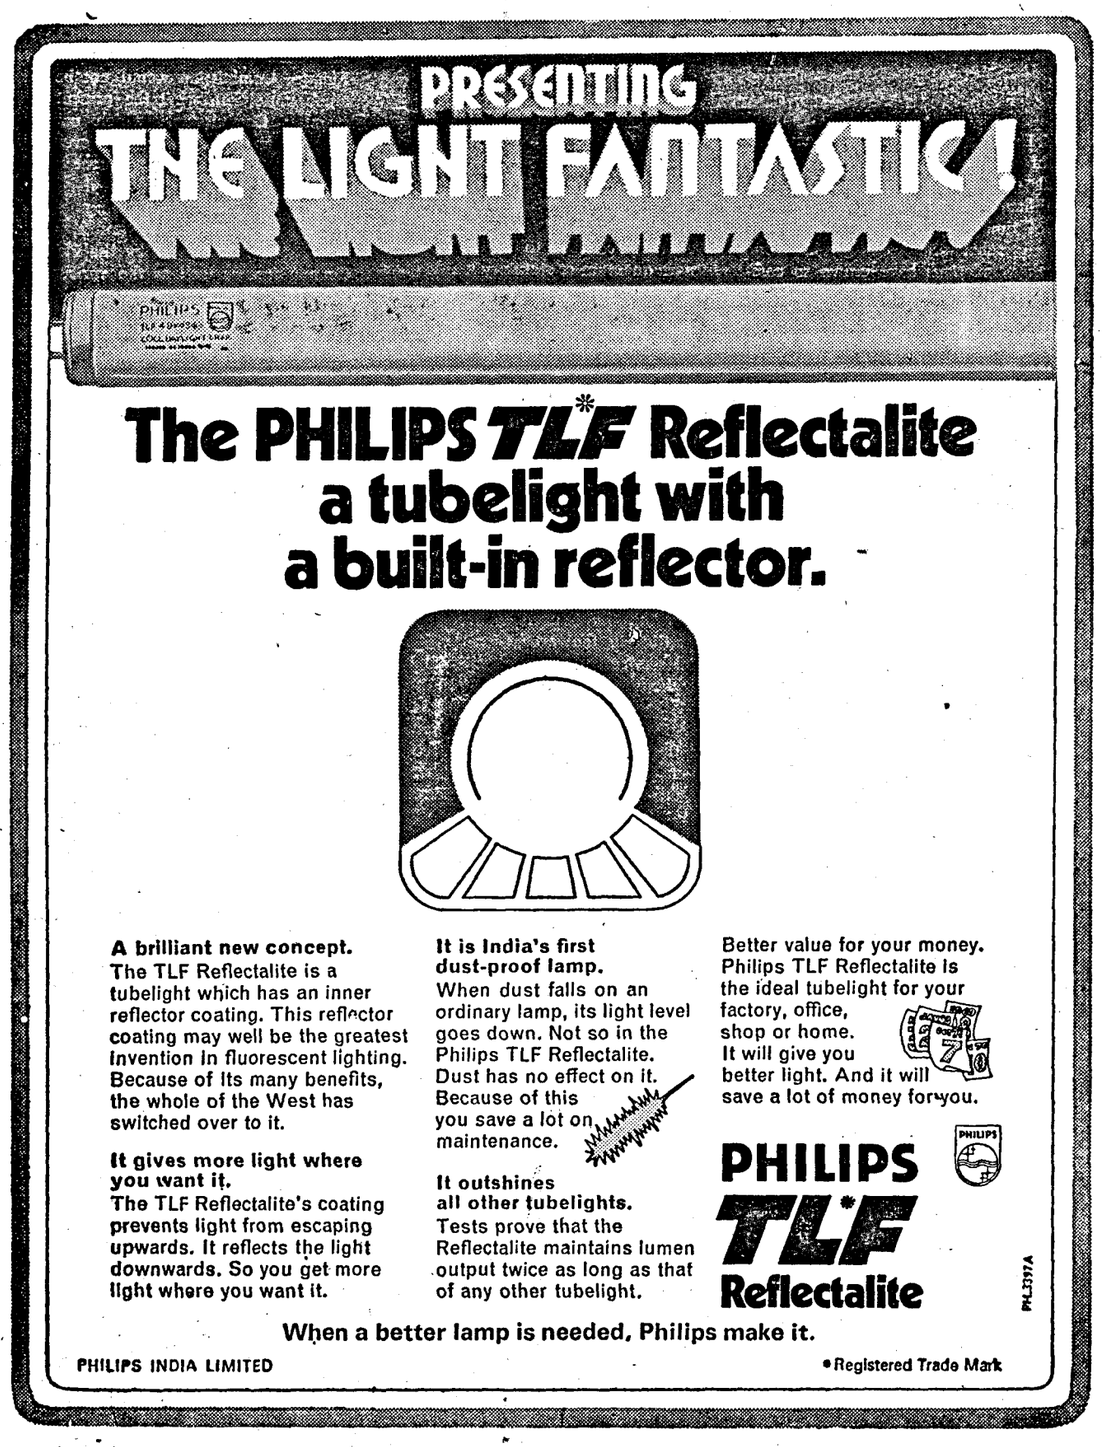


TABLE 1: RESOURCES TRANSFERRED BY THE CENTRE TO STATES AND UNION TERRITORIES

(Rs crores)

	1970-71 RE	1972-73 RE	1971-72 RE
1 Total Resources transferred (A+B+C)	2435	3128	3046
A Shared taxes	755	945	1055
B Grants (i + ii)	636	965*	889
(i) Non-Plan grants	311	580	292
Of which, those dispensed by the Finance Commission under substantive provision of Article 275(1)	142	141	147
(ii) Plan grants	325	385	597
C Loans (i + ii)	1044	1218	1102
(i) Non-Plan loans	551	681	566
(ii) Plan loans	493	537	536

of this.

In this specific context of famine relief, the sixth Finance Commission has been asked to examine if a national relief fund could be established to finance relief expenditure of states facing natural calamities. In the past successive Finance Commissions have suggested the creation at the state level of a separate Famine Relief Fund by transferring the excess of budgetary provision each year for famine relief over the actual expenditure. But, as the Fifth Finance Commission lamented, no progress has been made towards this objective. This is hardly surprising. If the experience of the last few years is any indication, the amount actually spent by the state governments every year on famine relief is substantially more than what is originally budgeted so that the question of unspent balances does not arise at all (see Table 2). Incidentally, it is interesting to note that expenditure on famine relief incurred by the states during the past four years, which have been marked by fairly good weather conditions and rains, has been far higher than that incurred during the poor agricultural years from 1965 to 1967. During 1969-70, when famine relief expenditure was the highest, one-half was spent by only two states, Rajasthan (Rs 63.07 crores) and Tamil Nadu (Rs 13.24 crores). Further, and equally relevant, even if the Famine Relief Fund were established, the allocation of famine relief grants to the states would require an independent and permanent body to objectively study the extent of damage and the genuine requirements of the different states.

TABLE 2: REVENUE EXPENDITURE ON FAMINE RELIEF

(Rs crores)

Year	Budget	Actual
1965-66	13.8	17.2
1966-67	19.5	77.7
1967-68	55.8	86.3
1968-69	22.0	89.5
1969-70	56.6	159.4
1970-71 (RE)	48.8	109.6
1971-72	38.3	NA

Some other issues arising out of the terms of reference of the sixth Finance Commission deserve comment. The Commission has been asked to undertake a general review of the states' debt position with particular reference to the Central loans advanced to them and suggest changes in the existing terms of repayment. This is to be done having regard to the overall non-Plan capital gap of the states, the purposes for which the loans have been utilised and the requirements of the Centre. This task has been introduced into the Commission's terms of reference in the context of the steep decline — from Rs 638.5 crores in 1966-67 to Rs 282.6 crores (BE) in 1971-72 — in the quantum of loans net of repayment given by the Centre to the states.

Two dangers have to be guarded against in this context. First, any substantive debt repayment relief might encourage the states to relax their resource mobilisation efforts. Secondly, some of the state governments may become even more lax in recovering loans given to state government undertakings as well as to third parties so as to be able to show a relatively large non-Plan capital gap and extract the maximum debt relief. It also needs to be borne in mind that so far relatively high proportion of the resources transferred by the Centre has gone to the richer states. Now, at a time when the Centre is showing signs of responding to pressures to weight its financial assistance in favour of the poorer states, any debt relief going to the richer states would be at the cost of the poorer ones.

A rather inexplicable aspect of the terms of reference of the sixth Finance Commission is the specific stipulation that the emoluments of state government employees, teachers and employees of local bodies, as obtaining on a particular date determined by the Commission, would be taken into account in computing the claims of the states to grants-in-aid of revenue. These emoluments have always been taken into account in determining the quantum of grants-in-aid by successive Finance Commissions since they form an important component of the states' Revenue expenditure (see, for instance, Fifth Commission's Report, p 51). Whatever the intention behind this explicit stipulation, its effect might be to encourage state governments to resort to upward revision of their employees' wages since the additional expenditure would be covered by larger grants-in-aid — at a time when many of their productive schemes are starved of funds. Surely, this cannot be dressed up as another *garibi hatao* measure?

LUCKNOW

Not Worth the Paper . . .

THE UP Government has simultaneously introduced two bills, one stipulating ceilings on landholdings and the other on urban property. The Uttar Pradesh Ceiling on Landholdings (Amendment) Bill, 1972, is aimed at lowering the land ceilings fixed under the 1960 Act at between 40 and 128 acres, depending upon the quality of land. When passed, the Bill will come into retrospective effect from February 24, 1970. The earlier Act allowed ceiling exemptions for orchards, manure pits, land belonging to co-operatives, specialised, poultry and dairy farms. The 1972 Bill does away with some exemptions and modifies some af the remaining ones. For example, a ceiling of 12 hectares (about 26 acres) has been fixed on land belonging to intermediate colleges teaching agriculture and 20 hectares on land belonging to degree colleges. But no ceilings have been put on land belonging to post-graduate colleges or universities. The provisions regarding *waqfs* and endowments have also been modified, but the exemptions in respect of land used for industrial and residential purposes, tea, coffee and rubber plantations and a few other special categories (e g, mechanised herb farms and graveyards) have been retained.

The 1960 Act defined the family of the landholder so as to include husband

and wife, dependent father and mother, sons and grandsons and their wives or widows, and unmarried daughters and granddaughters. The 1972 Bill defines 'the family' as husband and wife, unless legally separated, and minor sons and unmarried daughters. This new definition of family is expected to provide surplus land for redistribution, but the authors of the Bill have failed to take into account the various other ploys used by landholders to defeat the purpose of lowering the ceilings, such as entering fictitious names under the category 'minor sons and unmarried daughters' or resorting to *benami* transactions. The 1960 Act had fixed the ceiling at '40 acres of good quality land' and if a family consisted of more than five members, eight acres were allowed for each additional member, subject to a maximum of 24 acres. The present Bill fixes the ceiling at 7.30 hectares (about 15 acres) of irrigated land, two extra hectares being allowed for each major son who does not own land in his own name, subject to a maximum of six hectares. The definition of irrigated land is land which yields two crops in an agricultural year with both the two crops being irrigated from any source — canal or tubewell. For unirrigated and orchard land, the Bill provides a conversion formula: 1.5 hectares of unirrigated land and two hectares of orchard land being equal to one hectare of irrigated land.

With all these legal devices it is expected that two lakh acres will become available for redistribution. But as official evaluations of land redistribution have shown, such land reform measures take place only on paper without adversely affecting large landholdings. There is no reason to assume that this pattern is about to change.

One suggestion which has often been made but continues to be ignored by government, is to settle landless labourers, not on an individual but on a co-operative basis, on the surplus land available near a village or group of villages. These tillers should then be given the right to inherit property and also to sell it, but only to government. This co-operative approach would ensure the supply of agricultural inputs, due to the lack of which a large number of landless labourers resettled under the Bhoodan movement, for instance, had to abandon their holdings after a year or so of occupation.

To forestall any outcry about discrimination against the rural sector, the UP Government has simultaneously introduced the Urban Property Ceiling Bill, 1972. This Bill defines urban property as such land or buildings as are located in towns with a population of 10,000 or more. Urban property, however, does not include any 'machinery or affixations' used for purposes of trade, commerce or industry. The ceiling is fixed at urban property valued at Rs three lakhs held by a person and his/her wife/husband, minor sons and daughters. Additional property upto Rs one lakh is allowed per major son, subject to a maximum of Rs two lakhs. The Bill does not recognise any *benami* or *mala fide* transfers of property made after April 1, 1969. It also prohibits acquisition or construction of new property exceeding the limit of Rs three lakhs (inclusive of property already held). The Bill exempts property owned by the Central, state and local governments as well as universities, public corporations, banks, public limited companies and clubs. Property which is used for public purposes, like temples, churches, industrial undertakings, cinemas and theatres, is also exempt from the ceiling.

As is immediately obvious, the urban Property Bill is most indistinct and reflects a great deal of confusion in the government mind. Most ominously, the UP Government has no idea as to how the surplus property accruing from the Bill will be redistributed or used.

NORTH

With Mop and Soap

FAITH in water diviners still prevails at high levels, even among scientists of repute. Proof of this comes through the communication received by the Punjab Government from M S Randhawa, Vice-Chancellor of the Punjab Agricultural University, suggesting "a register of genuine water diviners so as to eliminate quacks in the field". Now that the state government has set up a department to assess and manage surface and ground water resources, it does need dependable advice in this field. Whether water diviners would prove more useful than scientific experts, however, remains to be seen.

The new department has been necessitated by the proliferation of tubewells and pumping sets whose number is now estimated at 2 lakhs with an investment of Rs 140 crores. Most of them have been installed without firm data about the quantity of underground water. The fear that with the fall in the water-table because of heavy withdrawals, many wells might go almost dry is haunting tubewell owners. The entire farm economy would then be endangered. Since the area irrigated by tubewells is substantial (about 989,000 hectares against 1,293,000 hectares fed by canals) the 'green revolution' would languish with a sharp decline in the output of tubewells. To forestall such an eventuality, proposals for a closer study of the water-bearing strata and of sophisticated boring techniques are being considered.

Plugging Loopholes

To check corruption in the higher echelons of the administration the Punjab government has decided to require all officials to submit lists of property and other assets they and their family have acquired since joining service and also indicate how their acquisition was financed. Moreover, Deputy Commissioners will be required to send details of vacant lands in urban areas and state whether there have been any encroachments on government lands. The order follows the allegation that some officials and other influential people had put up buildings on government land. Zail Singh is evidently keen on creating a clean image of his ministers. The loopholes exploited by ministers during the Akali regime to feather their nests and make the best of their powers of patronage are being gradually closed. (The allegations of graft against former ministers are now being looked into by the Dave Commission.)

Efforts are also being made to give the ministry a socialistic image. On July 5, Finance Minister H R Sharma pleaded before the Central Pay Commission in Delhi that wide differences in salaries should be eliminated. He urged a 1:10 ratio (after deduction of all taxes) between the minimum and the maximum salary. In a more practical vein, he added that the Centre should bear half the additional burden of the emoluments sanctioned for state employees following the periodic revisions of grades and DA of Central government employees.

Punjab has also sought another power plant to help overcome the chronic shortage of electricity. A pooled price for industrial raw materials is being sought to offset geographical disadvantages. Two other decisions are also designed to serve the same purpose. The categories of industries entitled to 50 per cent government subsidy for employing jobless engineers (hitherto available to small-scale units with capital outlay upto Rs 7.5 lakhs) are to be extended to cover medium-scale units as well with capital upto Rs 25 lakhs.

Happily, the Union Finance Minister has promised all possible aid for Punjab's development schemes, including those for reducing unemployment. Incidentally, the glut of used woollen garments in the markets has posed a new challenge to some Ludhiana factories. An "Anti-Rags Committee" has been formed and it has threatened to close down the factories if the government fails to check the flow of ready-made woollens in the garb of "rags".

Following Punjab's example, the Himachal Pradesh authorities are also planning measures to end the misuse of quotas of essential commodities. At present the state earns about Rs 3 crores annually by way of various taxes, the number of quota holders being 300. Serious allegations have been made by legislators and others against quota holders. Many of them have no equipment for manufacturing goods and are guilty of under-the-counter deals.

The state government has also revised its industrial policy to offer further incentives to entrepreneurs. The high priority industries now include cement, newsprint, paper and paper pulp, fruit preservation and breweries and distilleries. But the Rs 30-crore newsprint project in the private sector facing uncertain weather again. For a decade there has been talk of a newsprint mill in Himachal Pradesh which has large forest reserves, but for one reason or the other the project has not gone beyond the blueprint stage. The major hurdle now is the price. A leading industrialist who signed the agreement for a plant one-and-a-half years ago has demanded a sharp increase in the newsprint price — from Rs 1,360 per tonne to Rs 1,800. This alone, according to him, would make the project economically viable.

NEW DELHI

'Social Control' of Urban Land

THE Housing Ministry has initiated a proposal for what has been pompously described as "socialising" urban land. Leaving aside the rhetoric so characteristic of the present government's policy proclamations, the Housing Ministry's proposal is of considerable relevance to urban development and planning. The idea is that all urban and "urbanisable" land should be converted into lease land and no part of it should remain freehold land. This conversion is proposed to be achieved within a short time, according to a time-schedule. This requires putting an immediate end to all sales of land as freehold.

In its note to the state governments on the subject, the Housing Ministry says: "Of particular importance from the point of view of raising resources for housing and urban development is the recommendation that all urbanisable land should be socialised at least in the large and growing cities. The state governments have to give serious attention to this recommendation and take suitable action with least possible delay. It is understood that some state governments and their Housing Boards continue to sell developed plots of land to beneficiaries on freehold basis. This is out of tune in the present day context." The note has outlined what is called a national policy on housing and urban development. It is suggested that land should be viewed as a primary natural resource; it should be brought under social control and speculative pressures on it should be ended.

Besides bringing urban land under "social control", the Centre is showing considerable concern over the tardy progress in providing free house-sites to the rural landless. In the midst of the controversy over ceilings on farm land ownership and on urban property, the Congress Working Committee recently passed a special resolution urging that provision of house-sites to the landless in rural areas should be completed by August 15 next year. The cost of the programme is placed at about Rs 300 crores and organisationally it will require a massive effort. Much of the expected expenditure will be on development of house-sites and provision of minimum amenities around them. There may also be some expenditure on land acquisition. However, a major portion of the land for house-sites for the landless will come from land available with the state governments in various forms. This is a Central scheme and is based on 100 per cent grant from the Centre to the states.

The question of providing house-sites for the rural landless was raised by the Centre with the state governments early in May. The state governments were asked to forward their programmes by the end of June. Actually, the scheme for the provision of house-sites to the landless is supposed to be in operation since October 1971 and in May the Centre had merely pressed the state governments to ensure that this scheme was completed by August 15 next year as desired by the Congress Working Committee. But the response of the state governments remains tardy. Except for Kerala, no other state has done anything very much about it. The Kerala government launched its scheme for providing house-sites to the landless in May and in the first phase of operation of the scheme it hopes to be able to provide sites to at least 86,000 families, or one-third of the total landless labour in the state. But even in Kerala it is doubtful if the target date of August 15 will be kept for providing house-sites to the entire landless labour population.

As for the other states, Andhra and UP have formulated statewide plans in this connection and forwarded them to the Centre, obviously with an eye to securing special financial accommodation under this head. Five other states have sent in schemes in the form of projects covering a few blocks in each state. Others have not paid much attention to formulating any schemes.

The state governments readily accept in principle the need to provide house-sites to the landless and bring urban land under social control. But the snag lies in implementation. They have indicated their reservations about fixing target dates for carrying out these programmes. Both these schemes are of particular significance in the light of the much-debated ceiling on both farm land and urban property and the speed and will with which they are implemented would indicate how serious the ruling party is about fulfilling its election promises.

★

The US Presidential envoy, Connally, is reported to have taken the stand in his talks with the Prime Minister that the many-sided assistance the US had provided in the past had saved the Indian subcontinent from communism. But for the American presence — here and in the South Asian region generally — both India and Pakistan might have been engulfed by the advancing tide of communism. He wanted that the role of the US and its policies in this part of the world should be appreciated in this light. He regretted that Indian leaders did not show this appreciation. He is also reported to have suggested to the Prime Minister that Indian leaders did not give due regard to American susceptibilities and sentiments, presumably with reference to Vietnam. He said that while the US was keen to improve relations with India, it sought a measure of reciprocity.

This presentation of the US position is unlikely to have helped matters. The Prime Minister is known to have taken the position that the issue of resumption of US economic aid should not be raised with Connally by any one from the Indian side. Explicit instructions to this effect are understood to have been given to all concerned.

JOINT SECTOR

Adapted to Private Ends

THE term 'joint sector' has become very popular recently. As with many popular words, its popularity is due to its vagueness and its suitability for being defined differently on different occasions. It has been used (and abused) by the spokesmen of the Government as well as by the leaders of industries. But what stands out is that everybody seems to welcome it and many consider it a solution to most of the current ills of industry.

The credit for introducing this phrase into the Indian industrial dictionary goes to the Industrial Licensing Policy Enquiry Committee, commonly known as the Dutt Committee. The Committee reviewed the licensing policy and, on the basis of its finding that a thorough change in policies was necessary, put forward a concept which they termed 'the joint sector'. To quote the Committee:

> "Where a very large proportion of the cost of a new project is going to be met by public financial institutions either directly or through their support, normally these projects should be set up in the public sector. This does not mean that ordinary shareholders and even some private concerns may not be associated with such projects. The Companies Act already has provisions relating to government companies under which equity in such companies can be shared by Central and state governments and private parties. There would be two main advantages of this policy. On the one side private interests — and in the case of large projects these are likely to belong to the Large Industrial Sector — would thus not be permitted to build up huge industrial empires and obtain the benefits accruing from them while essentially using in large part public funds and support for such development. On the other hand, the objection raised to permitting large projects to be developed, even though such a size might be necessary on techno-economic grounds, because of the fear that this would help build up a private industrial empire would become irrelevant. On both these grounds, therefore, it is necessary that such projects should be treated as belonging to the public sector."

The Committee, however, did not go into details. In fact, they made it explicit that they did not propose to go into the details about proportionate project costs to be met from the State sector or the details of organisational devices required to make the idea work. They desired that the Government should lay down policies in the matter, including on personnel and organisation, the private partners (Indian or foreign) that have to be associated with particular projects and their experience and background, and the extent of the private partners' participation. In the Committee's opinion, joint sector would include units which have both public and private investments, and *where the State takes an active part in direction and control.* The Committee considered it important that when the public sector provides financial assistance on a significant scale to the private sector, not only should an appropriate share in the benefits, accruing after the completion of the project, be available to the State but the project should necessarily be treated as belonging to the joint sector, with proper representation being given to the State in its management. The Committee hoped that the development of the joint sector will prove an important instrument for curbing the increasing concentration of economic power and that this policy would be more effective than licensing had been.

Watered Down, Not Crystallised

Until now, though three years have passed since the Dutt Committee made its report, those ideas have not crystallised nor the scope of the joint sector been properly examined or explained. Very recently, it has been reported that Government has 'assured' the industry that the terms of the 'joint sector' actually envisage a more liberal approach towards units coming under the purview of state governments and that even foreign majority companies and large industrial houses would be allowed to participate.

Evidently, there has been no clear thinking on this subject and there is an inadequate appreciation of the correct scope of the concept. It is essential to recognise the basic fact that 'joint sector' refers to a *form* of organisation of industrial enterprises and that it has therefore necessarily to be in accordance with the industrial *policy* of the Government. In other words, the joint sector cannot be used as a tool to modify the basic directions of industrial policy that have been laid down in the Industrial Policy Resolution. The Industrial Policy Resolution, though it was drawn up 16 years ago, still holds the field. Broadly, it defines certain areas as those in which the future development would be only and exclusively in the public sector and under public ownership. At the same time, it describes the field in which the private sector will be allowed to operate, though, for obvious reasons, under general regulation by State. In between, is an area in which there was a possibility for a certain measure of discretion. Whatever be its merits or demerits, the Industrial Policy Resolution has stood the test of time and, until it is revised and reformulated, it is obligatory on the part of the Government to conform and adhere to it.

The impression that the joint sector would enable private participation in *any* field of industrial activity is, therefore, misconceived. Clearly, the joint sector formula is applicable only to that limited area where the private sector is free to operate in accordance with the Industrial Policy Resolution. There is, for instance, no question of a new iron and steel unit being put up in the joint sector nor is the joint sector a substitute for either the public sector or the private sector.

What then is the true scope and merit of the idea of the joint sector? It is necessary to go back to the historical context in which Dutt Committee formulated its scope. Though it was not explicit, the approach of the Committee was clear. The Committee was concerned with the fact that even in respect of the so-called private sector, a large part of the funds were drawn from the public financial institutions or from Government. These were public funds used by the private sector for private profits. The Committee rightly considered that to treat such units as pure and simple private sector units while allowing them free use of public funds was inconsistent with the need to secure proper utilisation of public funds. Hence they recommended that these projects should be treated as belonging to the public sector in a wider sense of the term. This would ensure that management is conducted according to overall policies laid down by Government; that public interest and not mere private profit would guide the operations of these undertakings; and that this would also serve as an important means of curbing the concentration of economic power. This was in sharp contrast to the indifference of Government to the utilisation of public funds. It was in fact the Mahalanobis Committee, the Hazari Report, and the Dutt Committee that focused attention on the large-scale unregulated use of public funds by the private sector.

Examples of this nature are many. In TISCO, which is normally taken to be a private sector unit belonging to the House of Tatas, public financial institutions hold about 38 per cent of equity capital and constitute the single largest shareholder. In the Associated Cement Company (ACC), public financial institutions hold as much as 40 per cent of the equity capital. In VOLTAS, the financial institutions' holdings amount to about 30 per cent. And in ESCORTS, as much as 40 per cent. More striking is the case in Indian Iron and Steel Company where the holdings of public financial institutions constitute about 51 per cent of the total virtually making it a *de facto* Government company. All these have benefited largely from the use of public funds; but there has been little or no public direction of them in line with socio-economic policy of the Government. Indeed, many of them have drawn, apart from equity capital, substantial loans from the Government or financial institutions on which they pay a rate of interest very much lower than the rate of dividend they declare to the equity shareholders.

Herein lies the importance of the concept of joint sector—*viz*, that whenever public funds are invested in large measure, it is public interest that should prevail and not private interest. But thanks to the indecisive attitude of policy-makers, the concept has been twisted out of shape to be made into an instrument for the enrichment of the private sector. An impression has been created that there is a complete lack of managerial talent in the public sector, which has not lacked credibility because of lack of commitment on the part of the top public sector managers. It has been made out that it is, therefore, necessary to evolve a form of organisation in which even though the major share of funds would come from public financial institutions and Government, management will be left to the private sector.

But what this actually amounts to is that public funds would serve the purpose of private business interests and would be managed in accordance with the private sector's interests. There is already the example of Bolani Ores, where Government hold as much as 50.5 per cent equity though management is left entirely to the private sector. No wonder then that even the Federation of Indian Chamber of Commerce and Industries welcomes the emergence of the joint sector!

LONDON

Britain's Gulf War

Farrukh Dhondy

EARLY this year *The Guardian* reported, "It has emerged that two men of the Special Air Service Regiment have been killed and four wounded in military operations in the Dhofar region against the Chinese-supported rebel nationalist movement." The report went on to quote the British Foreign Office which was obviously embarrassed by the revelation. "A number of British seconded and contract officers are serving in the Sultan's armed forces. And other British personnel, the Special Air Service, have been giving training assistance as well." The incidents and casualties brought to light a secret war which no amount of public relations could explain away. The contract officers referred to are mercenaries bought by the state of Oman at £5,000 a piece a year. They have led the Omani forces in this eight-year long war in the Persian Gulf.

With Ulster on its hands, it is difficult to bring home to the British public that the soldiers in Dhofar were the first two since 1967 to be killed on active service outside the UK. Most people sincerely believe that Britain has finished with all that and the boys are safely at home. It is only in the Gulf that Britain has recently been engaged in a full-scale people's war. The lessons of Vietnam have, however, been learnt. The war has proceeded from the first with the equivalent of Vietnamisation. Britain has not intervened openly, but has lent its officers to the Sultan, given him arms, ammunition, an air force and even a tiny British commanded navy.

Last month eighteen more soldiers of the Muscat Regiment lost their lives and the British press (while not saying how many of them were British) has ventured to dip a toe into troubled waters, working on the principle that it ought to create as much confusion about the situation and about British involvement as possible, before the propaganda of the people of Dhofar begins to filter into Britain through the left press. The government knows the importance, after Vietnam again, of losing a propaganda war at home. With feeling about the use of troops in Ireland mounting, the government can ill afford an East of Suez scandal.

That it is a British war is not in doubt. About 70 per cent of Western Europe's (including Britain's) oil needs are met by the states around the Gulf. The Popular Front for the Liberation of the Occupied Arab Gulf (PFLOAG) is winning the war, having succeeded in setting up a people's government in the Dhofar province of Muscat and Oman. PFLOAG successes will lead to a further escalation of the war and that will mean, in one way or another, a more substantial military commitment from Britain. At present the British unequivocally support Qabus bin Said, Sultan of Oman. Before him they supported his father, Said bin Taimur, whom they succeeded in throwing out by engineering a *coup* in July 1970, in order to stem the tide of discontent against his mediaeval regime. In Qabus they have a better boy, trained at Sandhurst and willing to take some welfare measures in an attempt to off-set discontent.

There is, of course, more at stake than Dhofar. A revolutionary state adjoining the Gulf would mean a threat to the sultans and assorted royalty of several states. Already, Hussein of Jordan has sent guns and advisers, the Shah of Iran has sent an ambassador and Faisal of Saudi Arabia is negotiating to assist Oman's Sultan with money.

It is most unlikely that this money will, or could now, be used for the welfare of Dhofar's population, most of whom live in the mountains, mainly off agriculture of a primitive sort. Dhofar's geography and social conditions are ideal for guerilla warfare. The revolutionaries live among the people of Dhofar's main mountain, range which stretches for 200 miles, about 20 miles deep, along the coast. The Dhofar Liberation Front was set up in 1965. Two years later, as the struggle progressed, the PFLOAG was born out of a split in the Front. One section committed itself to Marxist principles, recruited an army of political militants and launched an offensive. They used a base in the Republic of South Yemen as their starting point, after the British were forced out of Aden. Through five years of constant war and the building up of mass support in the province, the revolutionaries have succeeded in largely chasing out the Sultan's British-led troops from Dhofar. They have consolidated their work by setting up lite-

racy and education programmes throughout the liberated areas. They have also built model farms, organised medical centres and constructed roads.

In the kind of war that is being waged, popular support is bound to be crucial leading to the total withdrawal of the Sultan's forces from Dhofar. The Dhofaris have effectively grown beyond the state of nationalism in which they had demanded independence from Oman and are now seeking to spread popular struggles beyond their province.

This is why the Sultan spends a third of Oman's £ 55 million annual oil revenues on defence. Other interests, such as American and European oil companies, are also trying to help the Sultan out. But if there is one lesson from contemporary history, it is that this sort of aid in a revolutionary situation is always too little and always too late.

CANADA

The Anti-Model

Stephen Clarkson

FOR two decades after World War II, Canadians prided themselves on being an immaculately conceived nation, an internationalist country that was leading the way beyond narrow nationalism towards super-national co-operation. It is taking the Canadian public as long to discard this myth as it is to perceive the reality of Canada's demise as a nation. For if Canada is leading in any field, it is in becoming ensnared by a complex of economic, cultural, military and technological dependencies that other countries should consider — and avoid. Canada may well serve as the anti-model of industrialised, modernised, Americanised dependency that other countries wanting to build a self-reliant policy would do well to heed. It is as if Canada has defied all the laws of political development which abound in social science textbooks, disproving one after the other the axioms of modernisation.

A glance at Canada's history will show that, far from following a steadily rising curve from colonial dependency to independent autonomy, the chart of the country's independence rose as it emerged from Confederation in 1867 through to Dominion status by the Statute of Westminster of 1932 only to fall into a new colonialism. 'National policies', aimed at accelerating economic development by tariff protection, resulted in the integration of the Canadian resource and manufacturing industries with the American economy through direct US capital investment. What is even more anomalous in this historical regression into dependency is the lack of a 'national liberation movement' which students of de-colonisation would normally expect as a response to such foreign exploitation. Only in the last five years has there been a tardy nationalist awakening among certain communities of the country. But in the main, the growing extent of foreign control has instilled a psyche of dependency rather than a spirit of resistance. Even though this is an unashamedly capitalist, consumer society, there is barely a hint of a bourgeois nationalist movement towards an independent capitalist economy. On the contrary, what capitalist class exists is known more for its predilection to *harakiri* by selling out Canadian firms to expanding foreign conglomerates than for its drive to innovate a national sector.

Translated into political terms, this means that the conventional view that political sovereignty constitutes the first step towards consolidating genuine economic independence is the antithesis of the Canadian experience: De-colonisation from the British empire only paved the way for a re-colonisation by the American imperium. Twenty-five years ago, at the end of the Second World War, Canada was a proudly independent State, the fourth strongest military and economic power in the world. Now, Canada is without rival as an 'advanced' nation so completely dependent on decisions made by government and business forces outside its borders, so fully integrated in a system of military alliances whose world view it no longer accepts, or so completely tied into a self-castrating reliance on imported technology. This does not mean that Canada has no indigenous political system. It has active political worlds operating energetically at the federal, provincial, and municipal levels. It has its own national flag and what passes as a national anthem. The problem is that these visible power symbols which express the mystique of independence are taken as reality, whereas the real institutions of power in Canada — the American controlled multi-national corporations, the American domination of the Canadian trade union movement, and the American government itself — are not visible to the naked eye and are even generally dismissed as only peripheral problems.

The discrepancy between Canada's international myth and its continental reality can best be seen in the paradox of its foreign policy. In the western community, Canada was an active midwife of the North Atlantic Treaty in 1948, proudly claiming considerable credit for dragging a would-be isolationist post-war US government into a peace-time collective security agreement to stabilise what was seen as a dangerously expanding stalinist threat in Europe. Now, Canada is a lower middle power that in its major foreign policy stances —such as its lack of pressure on the Vietnam war, its tardy recognition of communist China, and its passive role in North American defence — is little more than a diplomatic satellite of Washington. This does not mean that Ottawa has no differences with Washington. Canada recognised Bangladesh and exchanged diplomatic missions with China before the US did. Ottawa refused to co-operate during the Cuban missile crisis by not putting its military forces on alert. Nor does it mean that Canada is prevented from carrying out its own aid programme with the third world. But almost everything that Canada does internationally is done on tolerance. Canadian civil servants and politicians have a finely tuned sensitivity to what is acceptable and what would not be tolerated in Washington. Thus, when Canada extended very considerable aid to socialist Tanzania throughout the 1960s, this was not done behind the back of the American eagle; it was with the Americans' approval. Ford Foundation money, in fact, went to Canadian universities to extend technical aid to Tanzanian institutions, since Canadians were more acceptable to Tanzanians than were Americans. On the other hand, there is no thought given to exporting Canada's vast reserves of crude oil to India despite the mutual interests of the two countries — *viz*, Canada to sell oil and India to expand its public sector — because the oil industry in Canada is completely controlled by the international oil companies who would not allow their cartel's position in India to be undermined this way.

While Canada devotes considerable energy and resources to supporting nation-building in the third world, this does not mean that its own process of national consolidation has been completed. Quite the contrary; the theory that the modernisation process goes hand in hand with national integration is exploded in the Canadian case. By generally accepted notions of modernisation, there is no doubt that Canada is very high on the world pecking order. Its social welfare services are among the best; its educational system is generally admired; literacy is virtually total; the media technology is highly sophisticated; and so on. For all this 'progress', Canada remains an uneasy and unequal partnership of French-Canadians (six million), Canadians of British extraction (eight million), and the so-called ethnic groups — mainly immigrants from continental Europe plus the indigenous Eskimos and Indians (eight million). Far from acting as a unifying pressure, the so-called 'modernising' change of urbanisation has been a disintegrating force — radicalising the French-speaking Canadians to a fresh awareness of their collective identity and a demand for separate statehood. Even in English-speaking Canada, one can easily find examples of how modernisation undermines national integration. Canadian universities, for instance, can hold their heads high among universities of excellence in the world. Canadian campuses are, in fact, graduating more doctorate students per 100,000 of population than the Americans. Nevertheless, there are so few jobs available for the highly trained natural or social scientists that these graduates must either emigrate to the US or find some trivial job that does not use their qualifications.

Index of Dependence

Even in the economic dimension, the general assumption of social science literature, that economic development will lead to self-reliance, is manifestly untrue in the Canadian case. There is no doubt that economic development has taken place. Canada and Sweden compete for second place in the highest standard of living awards. There is an extremely active resource industry and a large manufacturing sector. Canada has the latest technology and computers. Yet almost every indicator of development is also an index of dependence: the Canadian automobile industry is almost entirely controlled by the three American giants: Ford, General Motors and Chrysler. For Canadians, the computer industry reads 'IBM'. For resource industry reads 'exploitation of raw materials to fuel and feed the American economy'. Behind two out of three brand names there is an American firm.

The growing Canadian dependency on the United States does not prevent two further paradoxes. While being part of the American imperium, Canada itself has a colonial periphery in the Caribbean. While claiming to be a country with no territorial ambitions, Canada's multi-national corporations nevertheless dominate the economy of the many ex-British Caribbean islands. Nor does the country's domination by Washington prevent the internal domination of French Canada by English Canada. These further contradictions in the Canadian dilemma complicate, but do not limit, the apparently unalterable decline of the country. While such pessimistic statements may seem overdramatic to the outside observer, it is nevertheless true that the only scenarios that are the subject for serious debate are forecasts of takeover of the country by the US. Whether it be the editors of *The Guardian* who predict 20 years or, television producers and film directors who prefer the year 1984, those who accept the general points made above have little else to do but play a guessing game of how long will the countdown take.

PERSPECTIVES

Bread or Circuses?

FOR the last several months, it has been an unending circus for the Press and issues concerning bread have naturally been crowded out. Priorities, after all, are priorities. In this stratified society of ours, and given particularly the ownership pattern of the newspapers, to discuss the non-availability or otherwise of bread will not be frightfully *a la mode*. There has thus been but scant reference in the papers to the fact that, in the week ending June 17, the wholesale price index for foodgrains was a neat 15 per cent higher than what it was a year ago. At the retail level — never mind the lack of official data, you just have to talk to an assortment of non-chic housewives to find out — the rise is much steeper. There can be little doubt of a further increase having taken place during the subsequent weeks. It would not perhaps be polite to point out that the over-the-year price rise is still larger in the case of sugar, salt, vegetables, milk and milk products.

Veil over Inferior Distractions

But so what? Nobody who matters seems to be worried. It is as if this phenomenon of galloping prices has not even a slender relationship with the quality of being in this country. Since circuses are aplenty, why bother about such trifling non-issues? Draw the veil over inferior distractions or turn your gaze to New Delhi, the Capital, and soak the carnival-like atmosphere. Summitry, any one? Toppling, any one? Eradication-of-poverty-mongering, any one? Be your age. What has spiralling prices to do with the problem of socialism? Has not the Prime Minister given her word that, once you strengthen her hands, the rest of the minor issues will be sorted out in no time?

It is thus all of a piece that alongside the small item conveying the information about the Economic Adviser's foodgrain price index showing a jump of 15 per cent over the year, the non-thinking newspapers print a parallel item. The Union Minister of State for Food and Agriculture was waxing eloquent in Calcutta: never in the history of this nation did we possess such a large stock of foodgrains, namely, over nine million tonnes, as we do now. We read the statement in hushed admiration. Do we dare to ask about the purpose behind such impressive stockpiling of grains? Since it is not being used to pump-prime and slash the ruling market prices of foodgrains, has the buffer been built purely for the sake of form, for quenching the inner thirst for poetry in some hearts?

Bizarre Edifice

These are perhaps jejune questions. And yet, rummage through official data: in the current year, the quantity of foodgrains issued through the public distribution system, month by month, is even less than what it was in the past year. It is a bizarre edifice that we have created for ourselves. With each year since 1968, the production of foodgrains has allegedly increased in the country. In each successive year, however, the price level of foodgrains has climbed still higher. Simultaneously, with each successive year, there has been a progressive dismantling of the public distribution system and a reduction in the total quantum of food releas-

ed through the ration and fair price shops.

This is then proving the edict of the Gita wth a vengeance. Procure and pile more and more stocks of grains, thereby fulfilling your obligation to the rich farmers; beyond that, you must not be overly concerned about the fruits of your efforts. Do not inquire what is the operational significance of such accumulation of food stocks for the level of living of the semi-starving, struggling, indigent majority of the population. Incentive to the top peasantry *uber alles;* it is therefore the government's bounden duty to pay the farmers a stiff enough procurement price. It is again in the implied line of duty to satisfy the mundane demands of the intermediaries, to rent more storage space, to pre-empt railway capacity for the movement of grains and, in general, to ensure that the surplus farmers are protected in all respects from the machinations of nature and other men. In this republic of ours, so reminiscent of the one Plato had idealised, the government's obligation to the remainder of the nation ceases once these chores have been looked into.

Wheat: a Precious Grain

If National Sample Survey data are to be believed, the landless labourers meet almost their entire need of foodgrains through market purchases; even the small farmers, that is, those owning less than 5 acres of land, buy from the market roughly three-quarters of their aggregate consumption of cereals. Unfortunately, almost none among the landless workers and the small farmers, who constitute more than half of the country's total population and who are affected much more than anybody else by the spurt in prices, can really afford to purchase the grains, which the government believes in stocking up, at the prices which the government has set for them. Of the current stockpile of over 9 million tonnes, roughly 7 million consists of wheat, precious wheat; the rest is an assortment of rice and the coarser grains. The issue price of wheat takes the grain beyond the pale of the poor and the needy; for precisely the same reason, the half a million tonnes of coarse grains or thereabouts lying in the godowns cannot be disposed of either.

Symmetry is not a strong point of official policy. It may be all right for the government to shell out a hundred crores of rupees annually to propitiate further the over-pampered wheat farmers in the north-western part of the country. It would, however, be a sacrilege to suggest that it should similarly invest a few extra crores to reduce the issue prices of coarse grains and the inferior varieties of wheat so that, in this season of distress, the poorer sections — in both the countryside and the urban areas — could get some relief. A still greater sacrilege would be to mention that, merely by withdrawing the support which high procurement prices imply, market prices can be brought down at one stroke by 15 to 20 per cent. Clever-clever economists will not be lacking in government to argue that, despite the spiralling prices, the very fact that grains are still being cleared in the market means that there is no dearth of purchasing power; it would be bad economics to lower the price and spoil the consumers.

After such enlightenment, where is the need for any further benediction? Lesser people may continue to feel puzzled that foodgrains prices have kept rising even as production has gone up over the year by 4 to 5 million tonnes. According to the official 'Economic Survey', in 1970-71 the output of foodgrains was of the order of 107.8 million tonnes, while this year it is going to touch nearly 112 million tonnes. Then again, if you listen to the half-whispered gossip along the catwalks of New Delhi, the figure of 112 million tonnes was inserted in the Survey only to ensure that the rate of growth of national income in 1971-72 attains a respectable magnitude. Since the rate of industrial growth was less than 3 per cent, unless agricultural output could be jacked up, there was a danger of the overall rate of growth appearing in an unfavourable light. This was not permissible. In international forums — for example, the Aid India Consortium — they have a habit of wanting to know about such things as the global rate of growth of the economy. Besides, have not the outsiders been told that the Green Revolution has, once and for all, licked the problem of production and the regime is now fast moving forward to tackle the residual problem of distribution?

The Aid India Consortium has met and dispensed with the expected favours. Connally too has come and done the pilgrimage to Simla. (It was a stroke of genius when, at the very last moment, the Prime Minister decided not to descend from the summit and the poor big Texan was made to crawl all the way to Simla *via* Chandigarh, Kalka and Solan. Style, some English poet had once written, is the man. Style, let us repeat, is what makes a regime.) The defences can now be let down. The latest that is being said is that food output in 1971-72 is unlikely to exceed 106 million tonnes, that is, a couple of million tonnes less than in 1970-71. Not only is the production of rice and the coarse grains somewhat down; in respect of wheat too, Uttar Pradesh has belied earlier expectations. But one must not lose one's sense of proportion. What is a couple of million tonnes when socialism is practically round the corner? Through resolutions and counter-resolutions, in the Central Land Reforms Committee and the Congress Working Committee, the problem of land ceilings is being tackled once and for all — and, after such hard labour, it would be churlish on the part of the poor to complain, three or five years hence, that the availability of land for them has not gone up one bit. What is more, Subramaniam's Fifth Plan will do all that one had failed to do for the down-trodden in the course of the past 25 years. A minor slip-up on the foodgrain front should not therefore bother anybody.

Having a Field Day

It is not bothering anybody. The Ministry of Finance has abdicted all its responsibilities. The budgetary gap continues to widen. The Reserve Bank has given up all pretence of credit control: what can it, innocent thing, do, with the liquidity position of most banks bulging and the advances-deposit ratio dipping below 70 per cent? Traders and speculators are having a field day. They are no less worthy than the kulaks, and haven't they contributed almost as much to the ruling party's coffers? Let peace reign on earth, all controversies be stilled.

What, after all, is the alternative left for the poor? The opposition parties are decimated. Economists, being economists, know which side their bread is buttered. Newspapers have learned to their cost the perils of playing with fire. In the circumstances, the poor should be left to their own devices. The issue of bread, let us all agree, is postponable. Meanwhile, let there be more of circus. As the most recent deliberations at the Congress Working Committee show, it will be double the fun if, occasionally, the circus is about bread. If you do not have bread, you will at least have the privilege of watching a circus on how to provide you bread in the millennium that is acoming.

Lord Robbins

A K Dasgupta

Autobiography of an Economist by Lord Robbins; Macmillan, London, 1971; pp 301.

WHY does one write an autobiography? There may be several reasons. One may find at one stage of one's life that the vicissitudes that it had gone through represent a series of experiments, with varying degrees of success or failure; one feels an urge to leave a record of these experiments behind for posterity to profit by. Gandhi's autobiography falls under this category. It may be also that one's life is a long struggle against misery and squalor leading in the end to success of a spectacular order. And one feels an urge to put on record how, given the will, man's genius can rise above wordly obstacles and compel society to the recognition that is its due. Chaplin's is such a success story, a romance as exhilarating as it is reassuring. Or again one may be the author of discoveries in science or philosophy so pervasive as to change man's mode of appreciation of the universe, and one may be impelled to unfold the inner processes of thought and the provocations that they experienced, for the world to have a more intimate knowledge of the spirit of adventure that led to these discoveries. One may refer to James Watson's "The Double Helix" as one such endeavour in recent years. It may also happen that big changes take place in the life of a nation, and one finds oneself, as did Nehru, at the centre of the scene, shaping events in a substantial way. One's life story then becomes a document for later historians to build on.

Lord Robbins' "Autobiography of an Economist" does not fall under any of these heads. Robbins has had a fairly easy life. The torments of a sort that he had in his youth are the usual torments of an inquisitive mind. They have none of the characteristics of what may be called "experiments with truth". Nor did he have a poor start in life to be placed in contrast with the success that he has had later. If he did not attend a public school, it was not due to lack of resources — it was because his father wished him not to. And it was the father who, at a later stage, provided the "wayward and intractable son" with adequate finance for study at the London School of Economics, then, as now, one of the finest institutions of its kind anywhere in the world. Robbins lived through troubled times — the war and its aftermath, which saw vast changes in the level and structure of the British economy, and he had an important part to play in shaping the processes of its adaptation to these changes. But he was not at the centre of the stage in the manner, for example, in which Keynes was. As for contribution to knowledge, our author will be the first to disclaim any whose origins needed revealing. It is doubtful indeed if the field of his specialisation, Economics, at all admits of spectacular discoveries: "It does not shatter atoms or weigh stars", to repeat Pigou's telling words.

Then why did Lord Robbins write his autobiography? If I were asked to answer the question, I would be inclined to say: "he did it to amuse himself". And I am almost certain that Robbins would agree that this comes nearer to the point than any other alternative answer. He was distressed by certain unseemly happenings in the London School of Economics in the late sixties when he was Chairman of its Court of Governors. And he sought relaxation in an attempt to re-live his past years at the School. Perhaps this is enough justification for the autobiography. For the story of the LSE since the twenties is also the story of the greater part of Robbins' life and activity.

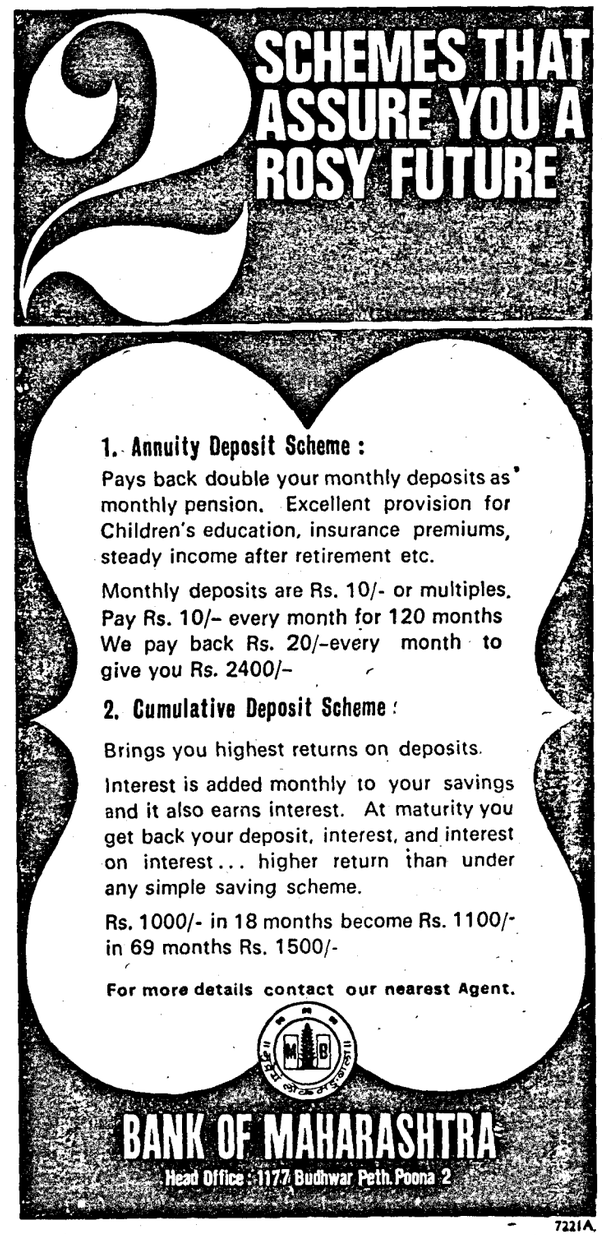
II

Robbins spent his boyhood in a quiet way under the benign care of an understanding, though strong-willed, father and an indulgent step-mother. After Matriculation he went straight to the University College, London, for a degree course in literature. But his study was interrupted by the war. He joined the army, and at some stage of the war, was sent to the French border, received a bullet wound on his left arm and was despatched back home for treatment. Within a short time the war ended, and he found himself in the position of a demobilisation officer. His direct experience of fighting was thus meagre. But the horrors of war that he saw left an indelible impression upon his sensitive mind. He emerged out of the war, a disgruntled young man, intent on preparing himself for a "social revolution".

Thus came a period of "confused" wanderings during which he chose Guild Socialism as the panacea for the ills of the society. He joined the movement and, through the good offices of some friends, got an assignment under Arthur Greenwood, one of the leaders of the movement. Soon, however, he got disenchanted; the various discourses that he had with the leaders convinced him of "the irrelevance and sterility" of the Guild idea. He moved away from active participation in any revolutionary movement and found himself drawn to the idea of reverting to an academic course — this time not in literature but in social sciences. It is at this stage that he had an encounter, as sweet as it was decisive, with his father with whom he had previously quarrelled just on this issue, and who, knowing about the changed state of his mind, spontaneously offered him the finance that he needed for "a full university course". He opted for B Sc (Econ). And thus began his almost unbroken association with the London School of Economics.

What an extraordinarily fruitful association! He took in the best that was in the tradition of the LSE and gave of his best to the institution, creating new traditions himself. Those who, like myself, had an occasion to see Robbins at work at the LSE in the thirties, lecturing on principles of economic analysis in the big halls to a tense undergraduate audience, or conducting weekly seminars on economic theory in the Graham Wallas room, surrounded by responsive colleagues and senior students, or taking supervision of Ph D candidates at odd hours of the day — all these in the midst of multifarious administrative obligations — will appreciate what it is that he must have been pining for when he found himself in the midst of the revolt of the late sixties. The focal chapter in the "Autobiography", I should like to imagine, is "LSE in the Thirties".

III



As an undergraduate student at the LSE, he came under the influence of teachers like Edwin Cannan, Graham Wallas and Hugh Dalton, all of whom

he adores. He does not have much sympathy for the politics of Dalton, and he puts his term as Chancellor of the Exchequer down as a failure. But he has all praise for him as a teacher. His reference to Harold Laski, who became his supervisor in his second year at the School, is lukewarm, to say the least; he got little "positive intellectual stimulus" out of Laski. This and other remarks that follow will surely puzzle admirers of Laski, of whom I confess I count myself as one. Nor does Beveridge, then Director of the School, come out clean in the narrative. There is obvious sympathy for the man and some appreciation of occasional fits of "idealism and generosity", but there is scant respect for his knowledge of economics or for his "skill in handling men".

Robbins' appointment as Professor must have been a surprise to many who knew the convention of British Universities in those days. Doubtless he had a brilliant academic record, and he had also made a reputation as tutor during his three years' sojourn at Oxford. He must also have made a mark as Lecturer in the School. But he was young, around thirty at the time, a B Sc(Econ) of only five years' standing. And his publications consisted of just about a couple of papers in the *Economic Journal* and a small monograph on "Wages", which he does not perhaps care to own now. One now gets a glimpse of how it happened. To those of us to whom Robbins as Professor and Dalton as Reader at the same time in the same School would appear as an anomaly, it is a revelation that it was Dalton who, more than any other single person, was responsible for bringing Robbins back to the School from his happy retreat at Oxford.

In retrospect, one must say without reservation that the appointment was a success — the authorities surely knew what they were doing. Those who know must put it on record, even though Robbins in his modesty may conceal it, that he brought new life to the Department of Economics at the School and raised it to the stature that it acquired in the thirties, that it was under his leadership that an atmosphere was created which gave impetus to the formulation of the main ingredients of Hicks' classic "Value and Capital", which he so fondly mentions as sufficient "justification of the ethos of the Economics Department of the School".

What was the relation of LSE in those days with Cambridge — the other great centre of economic studies? Robbins makes a tangential reference to it, only to suggest that, contrary to common belief, there was nothing like "group conflict" between the two centres. There were "differences of atmosphere" and occasional "conflicts of outlook", but there was collaboration, too — for example, in the running of the London and Cambridge Economic Service. All this may be true. But to an "outsider" it would appear that there was a certain lack of communication between the two centres which was conspicuous. While we in London were wrestling in the mid-thirties, more or less unsuccessfully, with Hayek's formidable lectures on

the pure theory of capital, we knew little about the path-breaking propositions of the "General Theory" that were being hatched in the other centre and were about ready to be delivered to the world. As I recall, some at least of the frustration that some of us felt in the wake of the "General Theory" could have been avoided had there been a little more understanding between the two centres. I know of at least one member of our Seminar (now a distinguished economist and author of many publications) who was so overpowered by the immediate impact of the "General Theory" that he came to my cubicle one day, almost in tears, to say that the entire approach to capital theory that he had hitherto adopted was wrong and that he had to scrap most of the work that he had done over the past two years! Such things are unlikely to happen nowadays.

Once only did I have an occasion to listen to Keynes at the LSE. That was prior to the "General Theory". The talk was on cheap money policy on which he had already written in *The Times*. He came at the invitation of the research students of the School. The Senior Common Room where the meeting was held was full. But not one of the stalwarts of the School was present. I have indeed a feeling that Robbins' appreciation of the greatness of Keynes as an economist came much later when, as Head of the Economic Section of the War Cabinet, he came into closer contact with Keynes, having had in the meantime a crystallisation of the "General Theory" from Hicks, Meade and Lerner. In the early thirties, one suspects, Keynes would be placed by Robbins as well as by Hayek as a mere monetary theorist, still struggling with the Wicksellian propositions on saving and investment which they had already mastered. How else could one explain his quarrel with Keynes over the question of increased public expenditure as a solvent of the depression of the thirties? The "Treatise" with its emphasis on "excess savings factor" and "excess bearish factor" came shortly after and one could see, unless one was completely impervious to the new approach, as Robbins apparently was at the time, that Keynes was already making it clear that saving depressed and investment stimulated an economy, and that from saving to investment there was no smooth passage. However, now that he has realised his mistake, he makes the most generous amends. Not only does he acknowledge his error, he goes to the length of repudiating his book, "The Great Depression", which is based on a theory which had misled him. The capitulation is complete: he reserves for Keynes the highest tribute that he pays to any man in the "Autobiography": "I would certainly regard Maynard Keynes as the most remarkable man I have ever met".

The episode is "painful" to Robbins. Yet it shows up the man, his courage, his integrity and his sense of social obligation.

IV

Undoubtedly Robbins is a controversial figure. His language is to an extent responsible for it — he often uses superlatives in his critical observations. But, of course, there is more in it than this. His social philosophy is out of tune with current trends. There are today many more even among so-called orthodox economists who are on the other side of the centre than there are towards his side, the former including some of his own students. He believes in private property. He believes in free trade and free enterprise. He believes in markets and prices as the regulator of resource allocation. It is true that he now concedes that aggregate public expenditure needs to be controlled in the interest of adequate employment. Yet he is still worried about the possible inflationary effect of such action and he insists on utmost caution. His publications are in the main an exposition of these principles with special emphasis on this or that element according to their respective relevance at different points of time. Here in the "Autobiography" we have a succinct account of each of these publications, and of the author's present attitude on them.

Now, there will be many among us who will accept these propositions in principle. Differences will arise concerning reservations. The alternative to "totalitarianism" is not complete exposure of the economy to free trade, free enterprise and market forces. Indeed if unrestricted market economy were the rule, the economist's role would be a frightfully easy one, now that the analytical theorems supporting it are already in our possession. It is the inevitability of reservations that brings in complications. What is the permissible limit to the size of individual property ownership, considering the level of an economy? Are market prices at all a reflection of the "social utility" of goods or a measure of the scarcity of services? In the context of aggregate expenditure, could one pay exclusive attention to the level of prices, irrespective of its implication for the level of employment? And what is one to say about allocation of resources over time — could market prices be depended upon to ensure an optimum rate of growth? These are the questions that a socialist planner would ask, and they are questions to which Robbins does not seem to have an answer. It was all right for Adam Smith to have argued, nearly two hundred years ago, for freeing the economy from the then existing controls and restrictions. We have travelled far since then, not only in respect of our appreciation of social norms, but also — and this is more important — in respect of the operational possibilities of attaining these norms. Surely it is a counsel of despair if we are still asked to rely solely on the Invisible Hand.

All this does not detract from Robbins' eminence as a scholar and as a teacher. His "Robert Torrens", by which he rightly wants to be judged as a scholar, is a model of exposition of an individual economist's contribution seen in a larger setting. And his "Essay", considering the times, is a courageous defence of economic theory against illegitimate intrusions. The criticisms that came in the wake of its publication were distressing to the author, for they were wide of the mark and based on misunderstanding. I remember Robbins lamenting to me one day that if somebody had written a book like that arguing for the purity of physics, scientists would be grateful to its author, whereas here was Lindley Fraser angrily asking why economic science should be free of value judgment and all that. He was right. The irony is that the physical scientist did not need this defence; the economic scientist did, at any rate at the time the book was written. And of course the "Essay" had its impact, in spite of its critics.

It is as a teacher that I found Robbins at his best. His publications do not reflect at all the rigour of analysis that he used to adopt in his lectures — whether on principles of economic analysis or on the history of economic thought. With all intricacies retained intact his lectures on economic analysis were an example of superb expository skill. It is a great pity that he was prevented by other preoccupations from bringing out a comprehensive book on principles of economics which he had promised in the Preface to his "Essay", and at which he had been working as late as the early sixties when he was called upon to preside over the Committee on Higher Education. It was a hard choice, he tells us, between the Education Committee assignment and his projected book on

principles. One could understand his decision in favour of the former, and yet one still hopes that he will not have abandoned the book altogether.

A great quality in Robbins' relations with his students is that he left them completely free to think for themselves. What he says about Dalton applies equally to him: he, like Dalton, would never impose his socio-economic views on his pupils, strong as they were. It is indeed not an accident that right in the thirties when he was caught up by the Mises doctrine of the impossibility of economic calculation in a socialist economy, two of his own students — Durbin and Lerner — came out with their challenging formulations which, together with the famous Lange paper, still form the basis of the socialist theory of price formation. Rosenstein-Rodan once told me half-jokingly that many more socialists and planners have come out of Robbins' seminar than from Laski's. He was very right.

V

Robbins has been the recipient of many titles, culminating in a life peerage. He has taken important part in public affairs at a crucial period in the history of the democratic world. He has been the architect of much that is and will be happening in the field of higher education in England. There are world famous Art institutions — the National Gallery and Covent Garden, for example, with which he has been actively associated as trustee or Board Chairman, and for whose successful management and financial progress he is largely responsible. He has acquired almost a legendary reputation as a teacher. Altogether, it is certainly true, as he claims in the opening paragraph of the "Autobiography" that he has had "a successful academic career".

Yet, with all this, one detects a certain craving for solitude, a certain inwardness in his disposition. His love for the arts is as strong as his passion for human understanding. And if the latter keeps him busy, the former gives him repose.

"To watch Fonteyn or Seymour dance the love and despair of Juliet or to arrive at that magic moment in *Fidelio* when the canon quartet takes over and the impossible and indeed absurd plot becomes more intense than real life — or to sit alone in the National Gallery with the great masterpieces on a summer evening when the people have gone home, or to stroll among them with my son Richard who, in my later years, has so often given me what I used, in my younger days, to to get from his uncle Clive, namely contact with and understanding of the creative artistic process — I count such experiences among my greatest privileges. I have had other sources of happiness, love and friendship, speculative thought, writing and teaching, but, in the world of contemplation, I ask for no better heaven than these" ("Autobiography", p 267).

This is the other side of Robbins. Had it not been for the war and the social milieu that he faced in its aft math, one does not know which si would get the better of him.

The "Autobiography" is almost sile about Lady Robbins. Perhaps right For, the lovely lines with which t book is dedicated to her are a mc eloquent acknowledgement than vol mes in plain words would be of t sweetness and felicity that she has pr vided all these years to Robbins' li and activity.

Manpower Control in China

Harold Lubell

Employment and Economic Growth in Urban China, 1949-1957 b Christopher Howe; Cambridge University Press, 1971; pp xix + 17(£ 3.

CHRISTOPHER HOWE'S fascinating little book unfortunately tells only half a tale. He describes China's efforts to cope with manpower direction and urban unemployment from 1949 to 1957 but stops at the crucial point in time when the state on paper took over full control of the urban labour market. Given the difficulties encountered by the Government in its efforts to administer the economy up through 1957, the reader is left wondering how the internal contradictions inherent in the policies followed up to 1957, as described by Howe, were resolved thereafter.

The manpower control efforts of China during the 1950s had two objectives: direction of labour to the State activities given priority in the Five-Year Plans; and avoidance of socially intolerable massive unemployment. The essential contradiction arose from the Government's inability to control hiring at the peaks of economic activity and to provide jobs in slack periods in an economy subject to violent fluctuations.

Population Shifts

According to Howe's analysis, it took China's planners several years to realise that their situation was not that of the Soviet Union in the late 1920s, that China could not possibly achieve urban full employment and a net transfer of productive labour from the rural sector to the urban sector during its First Five-Year Plan. By the writing of the Second Five-Year Plan, it was clear that the growth of the urban labour force during the First Plan period was excessive and that what was called for was massive labour absorption in agriculture, some outmigration from the coastal cities (particularly Shanghai), and a feasible growth of urban employment.

One of the remarkable facts recorded in Howe's book is the size of the popu lation shifts that occurred in 1950 Shanghai's population increased by 4 per cent per year from 5 million in la 1949 to 7.2 million at the end of 195 two-thirds by natural increase and on third by net migration. Gross immigratio (about 1.8 million) was about two and half times net immigration (0.7 million The good harvest of 1955 and the prc mise of high incomes following the Hig Tide of Socialism facilitated an outflo of 500,000 peasants from Shanghai to th rural areas in mid-1955 (compared wit the planned 1.0 million person reductio of the city's population for that year) But 1956 and 1957 saw an uncontrollabl gross return flow into the city of ove 800,000 persons.

The interesting questions, for th reader who is not a China specialist, ar by what methods and with what succes China has dealt with its own version o the developing world's problem of urbar unemployment. Howe's book answer them in part. In the early 1950s, th Government introduced a series of mea sures that combined attempts to contro participation in the urban labour force through population registration, to maintain redundant employees in their jobs, tc control hiring and firing, and to carry on registration and placement of the unemployed. The existence of a sizeable small-scale private sector through 1957 made effective direct control of the labour force impossible since the residual private sector provided a significant part of total urban employment, particularly in Shanghai. In the mid-1950s, each time the Government stepped up its efforts to increase the degree of control, it frightened the small-scale private sector proprietors into laying off employees and thus intensified the social problem of unemployment. When unemployment reached too extensive proportions, even the Labour Bureaux, the administrative organs responsible for labour control, had to fall back on the policy of encouraging small enterprises to increase employment outside the public sector.

Howe implies that the more intensive controls established in 1957 combined with the elimination of the last vestiges of capitalism in 1958 have removed the basic contradiction obstructing effective implementation of the Government's employment strategy. However, the detailed study ends in 1957 for lack of available information and the final chapter presents a set of optimistic speculations on the course of events since 1958 that ignore Howe's earlier warnings to avoid the temptation of accepting policy statements and administrative measures as parts of a coherent plan. The question of what has happened to employment in China since 1958 is not answered in this book.

SPECIAL ARTICLES

Poll Participation Slump

R Chandidas

The drop of six per cent points in voter turnout between the 1967 and 1971 elections has made many scholars apprehensive. This concern calls for an examination of the election results with a view to understanding the slump in participation in the last parliamentary elections.

Many dimensions need to be studied for a full understanding of electoral participation. Here an attempt is made to analyse voter turnout through four major dimensions. First, what has been the pattern of voting in past elections; second, how far is the de-linking of assembly elections from parliamentary elections responsible for a drop in the rate of participation; third, whether participation in elections is related to the degree of intensity of inter-party competition; and fourth, do certain select socio-economic variables explain variations in turnout.

OF the many preconditions to the successful functioning and sustenance of a democratic regime, the extent of participation is one. In polities where elections are a means to select rulers, the number of citizens exercising their franchise and the extent of legitimacy enjoyed by the ruling elites, are complemental political realities.[1] Putting it differently, "If democracy is going to be rule 'of the people, by the people, and for the people', the people, by definition, must be interested and active" in all participatory activities, of which, elections are one.[2] With its undiminishing importance, any ebbing of the growing participation rate, is prone to challenge the very representative character of a government. Therefore, the drop of six per cent points in turnout between the 1967 and 1971 elections, a rather substantive voter alienation, has made many scholars express their apprehensions. Some, basing their fears on the 1971 outcome, have gone to the extent of recommending a high-powered commission, presided over by a retired Supreme Court judge, to investigate low voter turnout in some Indian states.[3] This overall academic concern, therefore, calls for an examination of the election results with a view to understanding the serious slump in voter participation during the last parliamentary elections.

Though many dimensions need to be studied for a fuller understanding of electoral participation, certain dimensions just cannot, perhaps, be tapped through aggregate analysis. However, at an aggregate level, we can concern ourselves with at least four major dimensions and attempt to understand: first, what has been the pattern of voting in various past elections; two, how far the de-linking of assembly elections is responsible for a drop in the rate of participation; three, whether participation in elections has any relevance to party competition; and four, do certain select ecological variables explain electoral participation. These parameters mark the scope of our inquiry.

Let us begin our discussion by closely examining participation trends in various states over the past five elections to the Lok Sabha. All the southern states (except Kerala) together with Assam, Himachal and Orissa, have not behaved like other components of the Indian Union. Everywhere else a rather marked increase in participation from 1952 through 1967 is discernible. In some states, namely, MP, Rajasthan, UP and West Bengal, where just over one-third of the electorate voted in the 1952 elections, as many as over half of the voters exercised their franchise in 1967. Bengal has, especially, made great strides in this direction. Starting very poorly with 39.43 per cent in 1952, the rate of citizen participation, during the fourth elections, shot up to 66.03 per cent (see Table 1).

At the other end, there were states with fluctuating voter participation. All such failures in increasing voter turnout, were a consequence of the second general elections in 1957 which registered an insignificant improvement of only 2 per cent points over 1952. This shift, though positive, was very meagre. It rather depressed participation in most states and effected improvement in a few. Therefore, nearly all statewise voting trends which generally moved upwards in other elections, got subdued in 1957. If one chooses to skip a statewise scrutiny of 1957, the electoral data from 1952 through 1967 read quite differently. One would clearly discern an uninterrupted upward trend in the percentage of electors who went to the polls in all but two states. Orissa experienced a serious drop of about twelve per cent points from its performance in 1952. Jammu and Kashmir, on the other hand, showed more fluctuations. With an ambitious start of 71.0 per cent in 1962, it recorded only 55.16 per cent in 1967. In 1957 elections, however, 61.6 per cent of the electors exercised their vote.[4]

In the union territories, the voting percentages have definitely been moving

TABLE 1 : RATE OF PARTICIPATION IN ELECTIONS TO LOK SABHA FROM 1952 TO 1971
(Statewise)

* Instead of exact names of states, these abbreviations have been used in this paper.
Note : The figures in bold relate to those elections to the Lok Sabha which were de-linked from state assembly elections.

upwards. However, most union territories, other than Delhi, Manipur, and Tripura, experienced elections for the first time in 1967. As such, much discussion on these political units is not relevant.

At the all-India level of aggregation, the picture is quite impressive. Starting in 1952, with 45.67 per cent of the electorate turning up at the polls, there has been a regular increment of active voters till fourth general elections. In 1967, as many as 61.33 per cent of electors voted.

Let us now turn to some of the events that brought about the 1971 mid-term elections. The first of these events was the defiance by many Congress legislators of the Congress party's whip to vote for Sanjiva Reddy in the 1969 presidential elections. As a consequence of this intraparty tension the historic split in the Indian National Congress took place. The ruling Congress (INC) ran the government on the support of left and parochial parties. This was followed by certain major socialistic measures by the INC government which were carried through parliament; but some like the abolition of privy purses failed for want of sufficient strength in parliament. A need for increasing the strength of the INC in parliament was felt. All these events taking place in a very short time of over one year, led to a highly competitive electoral situation where most of the national parties regrouped themselves into many poll alliances. As keen electoral competition is usually accompanied by a high rate of participation,[5] it was very natural for some to expect more than the 61.33 per cent turnout in the 1971 polls. However, a very important question missed the notice of all: Was this drop of six per cent points in voter participation between 1967 and 1971 a *real drop* in the true sense or were the entire electoral data misread by most of us?

The answer to the foregoing question lies in the fact that the fifth elections were exclusively for the Lok Sabha. All elections earlier to 1971 had been simultaneous elections both to the state and the national legislatures. This distinguished the 1971 elections from all previous elections and, therefore, rendered them non-comparable with the prior polls. Any attempt to directly compare the 1971 turnout with past turnouts is quite risky.

Voter identification with contestants for political office is an important stimulus to go and vote. We may hypothesise that the closer (to the voter) the level of political office, the greater the stimulus to vote. The same holds true of issue-salience in stimulating participation in elections. Of course, the best way to test this surmise is through surveys; but some degree of relationship can be ascertained through aggregate data.

Quite often in local body (especially, gram panchayat) elections, because the contenders for political office and the issues are very closely identifiable, nearly all registered voters take part. Identification becomes less close when it comes to participating in elections to state assemblies where the gap between the voter and the issues and contestants becomes wide. At national level identification with issues and the candidates becomes even more remote and probably weakens the voter's involvement in electoral politics.

Turnout at the last two assembly and parliamentary elections, when juxtaposed, reveals practically no differences in voting at the two levels.

TABLE 2: VOTER TURNOUT AT ASSEMBLY AND PARLIAMENTARY ELECTIONS IN 1967 AND 1971

	States	1967 Elections			1971 Elections		
		Assembly	Lok Sabha	Difference	Assembly	Lok Sabha	Difference
1	Andhra Pradesh	69.15	68.67	+0.48	—	59.13	—
2	Assam	61.83	59.28	+2.55	—	50.29	—
3	Bihar	51.51	51.53	—0.02	—	48.86	—
4	Gujarat	63.70	63.77	—0.07	—	55.50	—
5	Haryana	72.65	72.61	+0.04	—	64.35	—
6	Jammu and Kashmir	58.79	55.16	+3.63	—	64.01	—
7	Kerala	75.67	75.64	+0.03	—	64.53	—
8	Madhya Pradesh	53.49	53.46	+0.03	—	47.79	—
9	Maharashtra	64.84	64.75	+0.09	—	57.95	—
10	Mysore	63.10	62.95	+0.15	—	57.43	—
11	Orissa	44.05	43.70	+0.35	43.44	43.27	+0.17
12	Punjab	71.18	71.13	+0.05	—	59.90	—
13	Rajasthan	58.22	58.27	—0.05	—	54.00	—
14	Tamil Nadu	76.57	76.56	+0.01	71.39	71.82	—0.43
15	Uttar Pradesh	54.55	54.51	+0.04	—	46.00	—
16	West Bengal	66.10	66.03	+0.07	59.40	61.01	—1.61

Note : The percentage of voters in 1971 assembly elections in West Bengal is approximate as the elections in three constituencies were countermanded.

Differences between participation rates at these two levels are merely fractional (see Table 2). Keeping assembly performance as the base, in most states during 1967 the difference between turnout at assembly and parliamentary elections, is positive. In certain other cases, such differences are negative and, therefore, slightly puzzling. These negative differences are primarily due to procedural failures — sometimes by the election staff and, at others, by the voter himself.[6]

In Andhra, Assam and Jammu and Kashmir (JK), the gap between the two levels of participation is quite wide. This is mainly due to certain assembly or parliamentary constituencies returning their representatives without contest. As the maximum difference occurs in JK, so does the number of uncontested seats during 1967, i e, twenty-two out of seventy-five assembly, and two out of six parliamentary, constituencies are uncontested. Next to JK, the striking dissimilarity in proportions is noticed in Assam. Here again six assembly and one parliamentary seats are uncontested. A look at the 1971 elections in Orissa, Tamil Nadu and West Bengal reveals that as far as the first two states are concerned, the magnitude of difference in voting, at the two levels, is negligible. However, in West Bengal, it is not so. One of the reasons for this can be that as elections in three assembly constituencies were countermanded, the 1971 assembly voter turnout for West Bengal is approximate. Keeping these minor differences aside, one fact emerges from the analysis of Table 2: the participation at assembly level is comparatively high. Another interesting inference can also be made that so far in Indian elections, voting in assembly elections has been determining the turnout for parliamentary polls.

A very interesting way to bear this out would be a scrutiny of all the previous to 1971 mid-term elections. All such elections have been exclusively for state legislatures. Upto 1971, about thirteen such mid-term elections, covering ten states or parts thereof, have been held. The voter turnout nearly in all mid-term elections has been more than that in preceding general elections. All these mid-term assembly elections were de-linked from Lok Sabha elections. Yet despite the non-simultaneous elections, the turnout has usually gone up in each successive election (see Table 3). In this connection, the 126.69 per cent increase in the 1960 elections in Kerala, is as interesting a case for study as a decrease of 78.75 per cent in 1968, in Haryana.

Each successive assembly election has always mobilised a larger turnout. This has escaped nearly everyone's notice. The 1971 elections — which happen to be the first independent elections to the Lok Sabha — when compared to previous un-delinked elections, present a pronounced drop in participation in all states. This depression in turnout for national elections, however, just could not be ignored due to its uniqueness in the otherwise rising trend. Another observation can be made from Table 3: in mid-term as well as normal term general elections the voter turnout for assembly contests is moving upward.

The above has not been the case with delinked Lok Sabha elections. Scanning the electoral outcome from 1952 to 1971, we get four states where more than one election to the Lok Sabha was delinked (see Table 1). These four states provide us pure voting data on elections to the national parliament which can safely be compared with the 1971 delinked elections. Let us take up each state, one by one, and compare voter participation. In 1957, the Andhra region of Andhra Pradesh (AP) went to the polls only for parliament seats. As many as 43.85 per cent of the registered voters in the state cast their vote (see Table 4). Since, in the other half of the state, there were elections for the assembly too, the 43.85 per cent voter turnout figure is misleading. Figures in Table 4 reveal that in its delinked Lok Sabha election the Andhra region showed a striking drop of 20 per cent points in participation. On the other hand, the Telengana region, in a joint Lok Sabha — state assembly election situation, showed an increase of about 3 per cent points in voter turnout. However, in about fourteen years, i e, from 1957 through 1971, the voting percentage in AP has shot up to 59.13.

Himachal, where the assembly, as a result of states reorganisation, was abolished, experienced a voter turnout of 28.09 per cent for the Lok Sabha elections in 1957. This further improved to 38.37 per cent in 1962. In the fifth elections to the Lok Sabha, the rate of participation in Himachal shot up to 41.16 per cent.[7] It is clearly a case of an upward trend in turnout.

Kerala, with a declining participation in Lok Sabha elections, is an exceptional case. Beginning with 66.50 per cent in 1957, it improved to 70.55 in 1962, but in 1971 it seriously slumped to 64.53 per cent. This is puzzling at first sight. However, one must not overlook the fact that the Kerala electorate, in the last twenty years, has participated in eight elections. As against this, certain other states have experienced only four elections. It is quite probable, therefore, that areas having frequent elections, largely fail to maintain voter interest.[8] It is, therefore, likely that with the decline in interest in elections, the percentage of electors turning out to cast their vote should concomitantly drop. This, perhaps, has pulled down the voting percentage in Kerala.

Among the union territories of Delhi, Manipur and Tripura the trend is quite haphazard. Delhi has shown an increase in participation: in 1957, as many as 57.83 per cent voted. In 1971, turnout further improved to 65.19 per cent. In Tripura the East Bengal

TABLE 3 : PER CENT CHANGE IN PROPORTIONS OF VOTER TURNOUT AT MID-TERM AND PRECEDING GENERAL ELECTION

States as of 1971		Areas Participating in the Mid-Term Poll	Mid-Term Election Year and Voter Turnout		Preceding General Election Year and Voter Turnout		Per Cent Increase in Voter Turnout in Col (4) over Col (6)

* Since no general election took place between 1957 and 1962 the 1960 mid-term election has been treated as a general election in this analysis.

troubles may have been responsible for the dislocation of the electorate at the time of the 1971 elections. Manipur was very much in the midst of Naga turmoil. Both these areas were therefore, quite susceptible to sudden demographic shifts. This in turn, might have caused the electoral rolls to be quite inaccurate. A natural consequence of this might have been the proliferation of non-voters. There can be other similar reasons to render the electoral registers outdated.[9] However, our discussion of Table 3 and Table 1 provides us with ample evidence to prove that most of the earlier percentages of voters turning out for elections, in each state, conceals the 'true' participation in Lok Sabha elections.

Another approach to reinforce our foregoing inference, can be an examination of bye-election statistics. Between 1967 and 1971, thirty-two Lok Sabha and one hundred and twentyseven assembly bye-elections have taken place. Admittedly the rate of participation is usually low in all bye-elections, but it surely does not mean that such depressed voting percentages are uniform both at assembly and parliamentary elections. Each election level has its own importance to the voter and, as such, the degree of stimulus to vote varies with the level. In all the bye-elections held between the last two elections to the Lok Sabha, the drop in turnout for parliamentary election, in contrast to assembly, is accentuated (see Table 5).

One major conclusion emerges: whereas delinking did not have much impact on the voter turnout in assembly elections, it greatly lowered the turnout for parliamentary elections. Putting it differently, we may conclude that linking of parliamentary and assembly elections has always concealed the true participation rates in parliamentary elections. Therefore, any comparison of 1971 electoral turnout with previous elections is not free from risks. All previous rates for parliamentary elections, with the exception of some pointed out in Table 1, are relevant to assembly elections only. All trend analyses on turnout, therefore, should be made with due caution.

Besides other factors, party competitiveness is equally important in mobilising voter participation. It has been observed that, in general, "The more competitive the parties, the greater the likelihood of high rates of participation" in elections.[11] Of the many ways in which an election can be characterised as competitive, the following three are important: (i) the number of candidates running for a seat; (ii) the distribution of voter preferences; and (iii) the margin of victory, i e, the per cent points difference between the returned and runner-up candidates. Taking into account the first two items, Goyal and Hahn have built an elaborate classificatory scheme, and have quite successfully attempted an aggregate analysis of party competition.[12] A major part of our discussion here shall be based on this classificatory scheme. We shall, at constituency level, attempt to ascertain whether party competition has any bearing on voter turnout.

At an all-India aggregate level, it is quite obvious from Table 6 that, both in the 1967 and the 1971 elections, the parliamentary constituencies recording the highest voter tnruout fall in two categories, namely, (a) "Two Party Constituency dominated by one Party" and (b) "Competitive Two-Party Constituency". These voting percentages, in each election, are four to five per cent points more than the total national turnout. However, in the "non-competitive" category, the voting in 1971, is 59.44 per cent and it needs be explained.

On scrutiny of constituency-wise detail, it has been found that the entire "non-competitive" class accounted for thirteen constituencies[13] or, say, 2.5 per cent of the total seats in the Lok Sabha. Kerala and Himachal were not as conspicuous as others. In Andhra, all the four seats were won by Indian National Congress (Ruling) (INC). The contest in two constituencies was between INC and Indian National Congress (Opposition) (INO). As INO was routed in the entire state, voter alignment in these two seats was, not surprisingly, strikingly skewed, thereby enlarging the margin of win. In the other two seats, a sitting INC member of parliament and another new INC entrant were challenged by completely fresh Swatantra and Communist candidates. In Maharashtra, again, all the three seats were bagged by INC. In two out of three, Congress got re-elected in the face of a very weak opposition from purely local left parties. In the third constituency, the sitting Peasants and Workers Party candidate disaffiliated himself to contest as an independent. Likewise in Mysore, in two constituencies, the INC was directly challenged by independents. INC

TABLE 4: 1952 AND 1957 GENERAL ELECTIONS — ANDHRA PRADESH

Areas and Year of Election		Electorate	Votes Polled	Voter Turnout	Linked or Delinked Elections
Andhra Region	1957	14,680,293	5,837,682	39.77	Delinked
	1952	12,941,473	7,774,847	60.08	Linked
Telengana Region	1957	7,489,915	3,885,132	51.87	Linked
	1952	6,551,396	3,230,878	49.32	Linked
Andhra Pradesh	1957	22,170,208	9,772,814	43.85	Both
	1952	19,492,869	11,005,725	56.46	Linked

annexed both these seats by great margins. In the third seat, the Congress incumbent retained the seat with practically no opposition. These details make the abnormal results, in "non-competitive" situations, more or less understandable. Let us also add here that in two constituencies, one each in Andhra Pradesh and Maharashtra, two central ministers were contesting which, perhaps might have been another additional factor in inflating the margins of victory.

Between 1967 and 1971, the incidence of "One-Dominant Party" constituencies has tremendously increased. However, when compared with total turnout, the pattern of voting in the majority of these constituencies is, comparatively, unchanged. It has already been argued earlier that as party-competition becomes diffused, participation rates, in most cases, start slumping. This pattern, though maintained in 1967, does not remain consistent in 1971. However, in certain classes of constituencies where the competition is fragmentary, the turnout shows two patterns: it stays either slumped or almost parallel to total average. One of the reasons for such a haphazard distribution of rates of participation in diffused and multi-party constituencies, is the shifting nature of competition. With various political parties, forming electoral alliances, the 1967 patterns have failed to remain fairly constant in 1971. This new trend in India's electoral politics is, perhaps, responsible for making any classification of competitive constituencies slightly ineffective. For instance, in Tamil Nadu, a sizeable aggregation of constituencies under "Marginal Two Party" type is discernible in 1971. If the INC-DMK electoral alliance fails in the state, in the next elections, it may proliferate or, perhaps, polarise electoral competition. Therefore, the entry of both the 1971 partners of the alliance, as political opponents may, perhaps, upset the voting percentages in such a manner as to revert the 1967 turnout pattern. What we are, precisely, trying to suggest here is that any negation of the influence of electoral alliances may, allow the above classificatory scheme to work more independently. In spite of the special situation created by the political settings of 1971, the analysis of Table 6 broadly supports our earlier contention that highly competitive constituencies with two major contenders for a seat stimulate comparatively more voters to exercise their franchise.

As pointed out earlier, another approach to understand the impact of party competition on turnout, is through a bivalent analysis of the number of parliamentary constituencies distributed on the basis of per cent electors voting and the margin of victory over the immediate runner-up in an electoral contest. As "competitive parties tend to produce a close vote",[14] the margin of victory or the "closeness of the vote" is very closely related to electoral competition. In comparison to the 1971 elections, the 1967 elections were more keenly contested. Out of 499 contested seats in all the Indian states, 46.7 per cent were won by a margin of less than 11 per cent points; another one-fifth with a margin varying between 11 and 20 points; and these percentages kept on neatly tapering off as the margin points increased (see Table 7). In other words, in about half the constituencies, as a result of keen party-competition, the vote was very close. In regard to participation, as many as one-third of the constituencies experienced a turnout of more than 65 per cent. In yet another one-third, the turnout was between 56 and 65 per cent. The distribution of the remaining seats was: 23.45 per cent of total seats recorded a turnout of 46 to 55 per cent and the other 9.22 per cent recorded 25 to 45 per cent voter participation. The fact that two-thirds of the total seats during 1967 were won by margins ranging upto 20 per cent points and recording voter turnout beyond 55 per cent essentially suggests a high degree of keen party-competition plus its relevance to voter turnout.

Contrastingly, the 1971 dispersion of constituencies over margins of victory and turnout intervals was not similar to 1967. The nature of party-competition had changed and so had the turnout pattern. Out of 499 contested constituencies, less than one-fifth recorded turnouts of more than 65 per cent as against one-third in 1967. However, the areas where turnout ranged from 46 to 65 per cent were slightly more than in 1967. Also, over the last two elections, the proportion

TABLE 5 : EXTENT OF SHIFT IN RATE OF PARTICIPATION IN ALL THE BYE-ELECTIONS HELD BETWEEN 1967 AND 1971

N	233 46.70	133 26.65	78 15.63	28 7.81	16 3.21	499 100.00	499 100.00	133 26.66	107 21.44	96 19.24	56 11.22	107 21.44

of constituencies recording less than 46 per cent voting has doubled. As a consequence, more than 22 per cent of constituencies are low turnout areas.

The margins of victory in 1971 do not taper off as sharply as in 1967. However, the single largest concentration of constituencies in margins above 40 per cent points clearly indicates the proliferation of one-party dominated constituencies. Nearly half the constituencies in 1967 were won with not more than a 10 points margin, but during 1971 we observed only one-fourth in this margin area. This means that between the two elections a serious reduction of constituencies in the highly close-vote area has greatly impaired the growth of party-competition. In the last election this indirectly pulled the voting percentage down. Whereas in 1967 we had as much as over one-third of the constituencies (37.07 per cent) in above 65 per cent turnout areas, we have as little as about one-fifth (19.25 per cent) of the seats in high turnout categories during 1971.

In seeing how constituencies falling under each turnout category get distributed among different margin categories, we discern that in the majority of constituencies turnout and margin of victory are quite closely related. However, some of the constituencies lying in either extremely low or high turnout regions demonstrate somewhat erratic behaviour. For instance, there are 10 constituencies in the 25-35 percentage turnout category in 1967. In 1971, there are three in the below 25 and eight in the above 75 categories. These cases, to some extent, distort our analysis of Table 7. With a view to making the last two elections comparable and also in order to analyse our data more meaningfully, let us skip all constituencies in the below 35 and above 75 per cent turnout categories. In other words, our analysis here will disregard over 13 per cent of the constituencies in 1967 and about 9 per cent in 1971.

Over four-fifths of the constituencies recording 36-45 per cent voting in 1967 are evenly distributed over margin ranging from 0 to 30 per cent points. And about 14 per cent of the seats are concentrated in the '31-40' points margin. However, the constituencies in this turnout group show the highest voting proportions in the '21-30' and '31-40' margin points categories. The '46-55' turnout class, though otherwise all right, shows an unexpected aggregation in the '0-10' margin points area. The distribution of constituencies in the '56-65' and '66-75' turnout categories suggests a reasonably close relationship between participation and margin of victory in 1967.

There is a slightly heavier clustering of 1971 constituencies in the 36-45 per cent turnout area in the '0-10' points margin class. The rest of the constituencies are distributed in such a manner that as the margin points increase the proportion of constituencies in a given turnout-class also improves. As a result, this turnout category records the highest percentages in the '31-40' and 'above 40' margin points areas, i e, 18.66 and 28.00, respectively. The concentration of 24.03 per cent of constituencies in the '21-30' margin points class being an exception, the distribution of constituencies in the '46-55' margin class is more or less all right. In the '0-10' to '31-40' margin categories, the cas s in the 56-65 per cent turnout class get distributed in a descending order. This tapering off of percentages is further accentuated in the 66-75 turnout area. Here we observe, as compared to all other turnout categories, the highest concentration of cases in the '0-10' and '11-20' margin points classes and the least clustering in the other three margin classes.

The foregoing analysis reveals the nature of and the degree of change in party-competition over the last two elections. What it really brings out quite clearly is the fact that party competition is essentially related to voter participation. It also reinforces the fact that the "closeness of the vote" is positively related to voter turnout.

We have observed that voter participation, in all previous elections, varied from one state to another. In other words, electors inhabiting certain parts of the country are comparatively more active in electoral participation than those dwelling in other regions. Naturally, each region is characterised by a differential aggregation of environmental, demographic and ecological variables which provide a community with a structural context. That the structural context largely influences voting behaviour is subscribed to by many.[15] In India, rapid industrial and other development is causing great positive shifts in many indicators of modernisation, such as, literacy rate, urbanisation, and population density and growth. Because of the INC appeal to women voters to support it in 1971, we have, with a view to seeing whether this relates to turnout, included sex-ratio in this analysis.

Various Indian states are at different levels of electoral participation, such as, 41.16 per cent of the electors voting during 1971 in Himachal and 71.82 per cent in Tamil Nadu. This wide range

places many states at unequal stages of electoral development. Similarly, we observe great differences in the socio-economic conditions of these states. For example, we have states recording literacy rates as low as 18.30 per cent or as high as 60.16 per cent. The same is the case with urbanisation and density of population (see Table 8). Even the growth rate of population and the sex-ratio vary from state to state.

It has been sufficiently established through research surveys that education has a definite bearing on political participation. So much so that some cross-national studies have found consistent international patterns. One of these studies concludes "That education has a greater impact on political behaviour than the other components of socio-economic status (income and occupation)".[16]

Though educational levels would make our analysis more sophisticated, pure literacy rates are useful. Our analysis supports the contention that literacy is highly positively related to turnout. We have, elsewhere, used the literacy rate for analysing voting behaviour and are fairly convinced of the predictive power of this variable.[17] Employing the same indicator and working out Spearman's rank order correlation (rho), we obtain co-efficients as high as +0.4387. However, this rho is significant at 0.1 per cent level which, perhaps, could have been further sharpened had we used educational levels instead of pure literacy rates. But this was not possible.[18]

The centres of political power, in general, are located in urban areas. Therefore, urban voters are closer to political activities than rural voters who always happen to be on the periphery. The abundance of opportunities for better interaction, communication, and nearness to centres of power makes an average urban elector highly politicised. Participation in electoral politics is, therefore, greater in urban areas. The 1971 turnout when related to the percentage of urban dwellers in the 1971 census, provides us with an rho as conspicuously high as +0.6691. This co-efficient of correlation is significant at 0.01 per cent level. In other words, urbanisation is a very relevant factor in predicting electoral participation.

Another interesting demographic variable, namely, density of population per square kilometre, though seemingly overlapping urbanisation, is equally important in explaining voter turnout. It may be largely true that urban areas are densely populated, but Kerala, for

TABLE 8 : RELATIONSHIP OF SOME SELECT ECOLOGICAL VARIABLES AGGREGATING AT STATE LEVEL WITH THE RATE OF PARTICIPATION IN 1971

Variables (Basis : 1971 Census)	Co-efficients of Correlation (rho)	Levels of Significance (Per Cent)	Variable Range	
			Maximum	Minimum
1 Literates as per cent of total population	+.4387	0.1	60.16	18.30
2 Urban population as per cent of total population	+.6691	0.01	31.20	7.06
3 Density of population per square kilometre	+.5196	0.05	548	62
4 Growth rate of population between 1961-1971	+.1887	Not Significant	34.37	19.82
5 Sex-ratio (Females per 1000 males)	—.1225	Not Significant	1019	873

Note: The Density of Population for Jammu and Kashmir has been worked out by excluding Rajauri, Punch and Ladakh districts, as parts of these districts are under the illegal occupation of Pakistan and China. It is, therefore, not possible to work out density of population for the entire state.

Source : Government of India, Registrar General and Census Commissioner, India, "Census of India 1971: Provisional Population Totals—Part I of 1971-Supplement, (Series-1)", The Manager of Publications, Delhi, 1971.

instance, has high population density but is not highly urbanised. Moreover, in India, classifying any area as urban is very much dependent on definitional considerations and, therefore, may differ from urbanisation indicators in other countries. However, density of population is a very straightforward indicator and its standardisation is universal. As such, its relationship to turnout may be more meaningful. Like urbanisation, though at a slightly lower scale, the density of population also enhances opportunity for interaction and communication. Therefore, density of population also stimulates voter participation. The 1971 electoral data when compared with the 1971 density, give us an rho positively high enough (+0.5196) to reinforce our foregoing argument.

The growth rate of population between the 1961 and 1971 censuses was included in this analysis with the implicit idea that the higher rates increase pressure on land as well as on other economic resources. This indirectly increases frustration with the present government and may result in two opposite attitudes: (1) it may alienate a large number of electors and reduce participation; (2) it may stimulate voters to bring about a change in the government through the electoral process. Another indicator, sex-ratio in the 1971 census, was also introduced in this analysis. It was primarily done because of the ruling Congress's appeal to women voters to turnout in large numbers and support the party. Since the ruling Congress contested over four-fifths of the total seats in the country we expected to find some kind of definite relationship with turnout. On actual examination of the electoral and demographic data, we find that both these components of the structural context are too poor to predict voter turnout.

Yet another variable added to this analysis was the number of villages with a population of less than 1,000. The reason for selecting this variable is the country's electoral system. Turnout in a way is the output of election arrangements. The election rules of the country require that, as far as practicable, not less than 600 or more than 1,000 voters should be attached to a polling station.[19] Moreover, in clubbing together villages or parts thereof, a voter shall not be made to travel a distance of more than two kilometres in reaching a polling station. These conditions may be technically satisfied, e g, a village attached to a polling station may be within the prescribed limit of two kilometres but the actual path to the polling station may be very arduous. In many states more than one village is attached to a single polling booth. Each Indian village is traditionally a compact unit. Therefore, in those states where more than one village is attached to a polling station, the government's electoral arrangements are inadequate and seriously impede people from voting. In southern India, especially in the extreme south, the villages are exceptionally large and the number of polling stations with more than one village attached to them is very small. As a result, in the southern states, we have substantially high rates of participation. The western states also show a similar

TABLE 9 : RELATIONSHIP BETWEEN SIZE OF VILLAGES AND VOTER TURNOUT

States	Number of Villages and Proportion of Villages with Less than 1,000 Persons		Voter Turnout		Rank in Descending Order of Proportions		
	Total	Villages with Less than 1,000 Inhabitants	1962	1971	Villages with Less than 1,000 Persons	1962 Voter Turnout	1971 Voter Turnout
Orissa	46,466	93.58	23.56	43.27	1	14

Uttar Pradesh	112,624	84.97	51.02	46.00	5	11	13
Bihar	67,665	83.07	46.97	48.86	6	12	11
West Bengal	38,530	80.10	55.75	61.00	7	8	3
Mysore	26,377	79.80	59.30	57.43	8	6	7
Maharashtra	35,851	76.27	60.44	57.95	9	5	6
Punjab	21,269	76.19	65.41	59.90	10	3	4
Gujarat	18,584	74.27	57.96	55.50	11	7	8
Andhra Pradesh	27,084	61.40	64.72	59.13	12	4	5
Tamil Nadu	14,124	37.31	68.77	71.82	13	2	1
Kerala	1,574	01.52	70.55	64.53	14	1	2

Note : (i) Co-efficients of Correlation (rho) between villages with less than 1,000 inhabitants in 1961 Census and voter turnout in 1962 = —.9209.
(ii) Co-efficients of Correlation (rho) between villages with less than 1,000 inhabitants in 1961 Census and voter turnout in 1971 = —.8462.

pattern. For instance, Kerala, which recorded the highest percentage of turnout from 1952 to 1967 and the second highest in 1971, happens to have only 1.52 per cent of its villages with less than 1,000 population. At the other extreme, Orissa, which has 93.58 per cent of its villages with less than 1,000 persons, has constantly recorded the lowest turnout among all the states (see Table 9).

On comparing the proportion of villages with less than 1,000 population with the proportion of voters participating in the 1962 and 1971 elections, we observe a very significant negative rho (— 0.9209) in the 1962 elections and again a quite significantly negative rho (—0.8462) in the 1971 elections. The difference between two co-efficients could, perhaps, have been completely wiped out, had the 1971 census figures been available to us. Since the 1971 rho is based on the 1961 census and also no care has been taken about the trifurcation of Punjab, the expectation is that with the latest census data the result would be definitely better.

Our analysis of Table 9 brings out that as long as there are many thousands of small villages in the country and efforts are not made to provide, say, one polling station per village, the voter turnout in this country is going to be very closely negatively related to this variable. In brief, this variable does explain, very precisely, much of the fluctuation in rates of participation from one state to another

To sum up, five major conclusions emerge from this discussion on the slump in electoral participation during the 1971 elections. One, whereas the de-linking of parliamentary and assembly elections had no impact on voter turnout for assembly elections, it had serious implications for participation in parliamentary elections. The participation rate was seen to be closely linked with the level of the elections, i e, higher voter turnout for state than for national elections. Probably, this is related to the "central-peripheral" dimension which surely is an acceptedly important factor in political participation.[20]

Two, though very closely overlapping the above but all the same needing separate mention, is the finding that any direct comparison of the 1967 and 1971 elections is sure to lead to spurious conclusions on voter turnout. The best way to understand the shift in the turnout for parliamentary elections is through a comparison with earlier de-linked elections as well as with bye-elections which usually take place in rather highly encapsulated conditions. Using these comparisons, we have sufficiently established that turnout in parliamentary elections has in fact increased and the apparent slump is not real.

Three, the unequal rates of participation among the various states are, to some extent, a result of the degree of party-competition. In highly competitive constituencies more electors participate, but as competition becomes fragmented or polarised, turnout suffers a setback. Further, the margin of victory or the "closeness of the vote" is positively related to participation. Along with the widening of margins of victory the rate of voter abstention also increases.

Four, the socio-economic configuration of an area definitely fashions people's attitudes towards electoral involvement. States with a high concentration of literates, greater urbanisation, and high density of population,

GOOD COMPANIONS
Baroda

show higher rates of participation in elections. Though these three variables are very important correlates of electoral participation, the growth rate of population and the sex-ratio have no significant relevance to participation.

Five, electoral arrangements are very crucial to participation. Wherever more than one village is attached to a polling station, the rate of participation definitely drops. This holds true both for assembly and national elections. We have observed that as the proportion of small villages declines, the rate of electoral participation improves. When mutually related, the rate of participation and proportion of small villages bring out a negative correlation (rho) as high as — 0.9209 for 1962 and — 0.8462 for 1971.

From these findings it can be safely said that the drop in turnout between 1967 and 1971 is purely a result of de-linking. A close examination of electoral statistics, from 1952 to 1971, reveals that turnout for parliamentary elections has improved. With regard to variations in the rates of participation among states, the disparity in electoral participation cannot be removed as long as there are disparities in the socio-economic make-up of each state. The most important obstruction which largely hampers participation in elections is the inadequate government input in the electoral process. Unless the electoral administration in the country stops religiously following arbitrary prescribed limits about the number of electors per polling station and the placing of polling booths within the stipulated distance from the voter but without considering obstacles to easy access, the rate of participation just cannot be improved in states with a large number of small villages.

6 The election procedure is that in all cases the polling officers shall issue first the assembly ballot and after the voter has cast his assembly vote, he shall be issued a parliamentary ballot. With little voter education and inadequately trained electoral staff (who are generally drafted from other non-electoral agencies of the state governments), the chances are that a voter might exercise his assembly vote and might leave the polling booth without demanding his parliamentary ballot. In such cases, the difference in participation at two levels is going to be positive, if assembly is kept as the base. In other circumstances, the inadequately trained staff might issue parliamentary ballot first. In such cases, the difference is likely to be negative. But these types of slips are so few that differences become insignificant — rather totally absent — if we do not care to look at percentages beyond the decimal points.

7 In Table 1, it is very interesting to note that when in 1967 the Legislative assembly was revived in Himachal and elections for the assembly were held along with Lok Sabha elections, the participation jumped from 38.37 per cent to 51.20 per cent. This is another instance of spurious rate of participation in Lok Sabha elections.

China's Crude Oil Production

COMMUNIST CHINA has moved, within the past three years, from 19th to 14th place in the world league of oil-producing countries. Output is believed to have at least doubled between 1968 and 1970 when, according to Chou En-lai, it reached a figure of around 20 mn tonnes. It has now been officially announced that there was last year a further increase of 27.2 per cent, raising the total to about 25.5 mn tons.

Much leeway had to be made up in 1969 and 1970, after the disturbances of the Cultural Revolution, but last year's advance seems to indicate a successful effort to add to the country's productive capacity. Established reserves of natural crude oil in China have recently been estimated at 5,669 mn barrels or about 780 mn tonnes, not including recently discovered reserves in west Tsaidam and elsewhere, but many of the fields are in remote and difficult areas and cannot be easily utilised.

The official statement on crude oil production in 1971 also asserts that output was in excess of what had been planned. Some of the oil is said to be from entirely new discoveries, apparently at convenient locations. Production in the celebrated Taching area went up by around 26 per cent, and new wells also went into operation in the Yumen, Chinghai, Sinkiang and Szechwan areas. There was, at the same time, a 25 per cent increase in the country's still relatively small production of natural gas, presumably as a result of the reported discoveries in Chekiang province. Refinery capacity was raised during the year by 16 per cent — significantly, less than crude oil production — and petroleum products were among a small group of commodities whose sale prices were cut during July-December.

Drug Price Control: An Evaluation

V L Mote

H N Pathak

This paper sets out to achieve the following three objectives :

(1) to develop a framework for examining the problem of price control in the context of the drug industry;

(2) to use this framework for considering whether there is a conflict between the short-term and the long-term benefits of the price control to the consumer; and

(3) to use this framework again to analyse the Tariff Commission Report and the Position Paper on Drug Prices submitted by the OPPI.

Lack of adequate empirical data made it difficult to achieve the second objective. In our analysis of the Tariff Commission's Report and the OPPI Position Paper, it became evident that there was considerable difference of opinion between the two on what should be the 'adequate rate of return' and on methodology for its measurement. These differences are discussed in detail.

One of the positive aspects of the Price Control Order is that it has once again brought into sharp focus the problem of maintaining profitability through higher sales at lower prices.

[The authors acknowledge the assistance given by R N Karanjia, H K Agarwal, S G Ratnam, P S Vishwanathan, and R Sampath, who collected, compiled, and analysed the data for this paper; the financial assistance given by the Indian Institute of Management, Ahmedabad in the preparation of this paper; and the OPPI who made available their 'Position Paper' on drug prices for the study.]

IN August 1966, the Government of India asked the Tariff Commission to examine the prices of 18 basic drugs and their 69 formulations. The Tariff Commission submitted its report in August 1968. Based on this report, in May 1970, the Government issued the Drugs (Price Control) Order. The Control Order fixed the prices of the 18 basic drugs and laid down a formula for determining the prices of the formulations from these and other drugs. It so happened that, for certain non-ethical drugs, the prices computed according to the formula were higher than the prices prevalent before the Order. Amendments to the Order were therefore issued subsequently to bring down the prices to the pre-May 16, 1970, level.

The price control has inevitably led to a controversy between the Government and the industry. The industry believes "... that under misguided enthusiasm and for some short-term advantages, Government, though its Price Control Order, sacrificed the long-term consumer interest".[1]

The pharmaceutical industry is important to society's well-being, so the impact of price control is an important issue meriting close examination. In this paper, we attempt first to develop a framework for examining the problem of price control, and secondly, to use this framework for answering the question whether there is in fact a conflict between the short-term and the long-term advantage to the consumer.

Unfortunately, major manufacturers in the industry have not been able to share with us data regarding product profitability or to discuss with us, in quantitative terms, their views on the impact of price control, on the product-mix and on investment decisions. Consequently we have not had much success in determining whether there is a conflict between short-term and long-term consumer interests. It has not been possible to decide on the basis of empirical data whether or not there will be any conflict between the short-term interests of the consumer and the long-term interest of the industry. Nevertheless, we believe that the framework developed in this paper for analysing price control problems is useful.

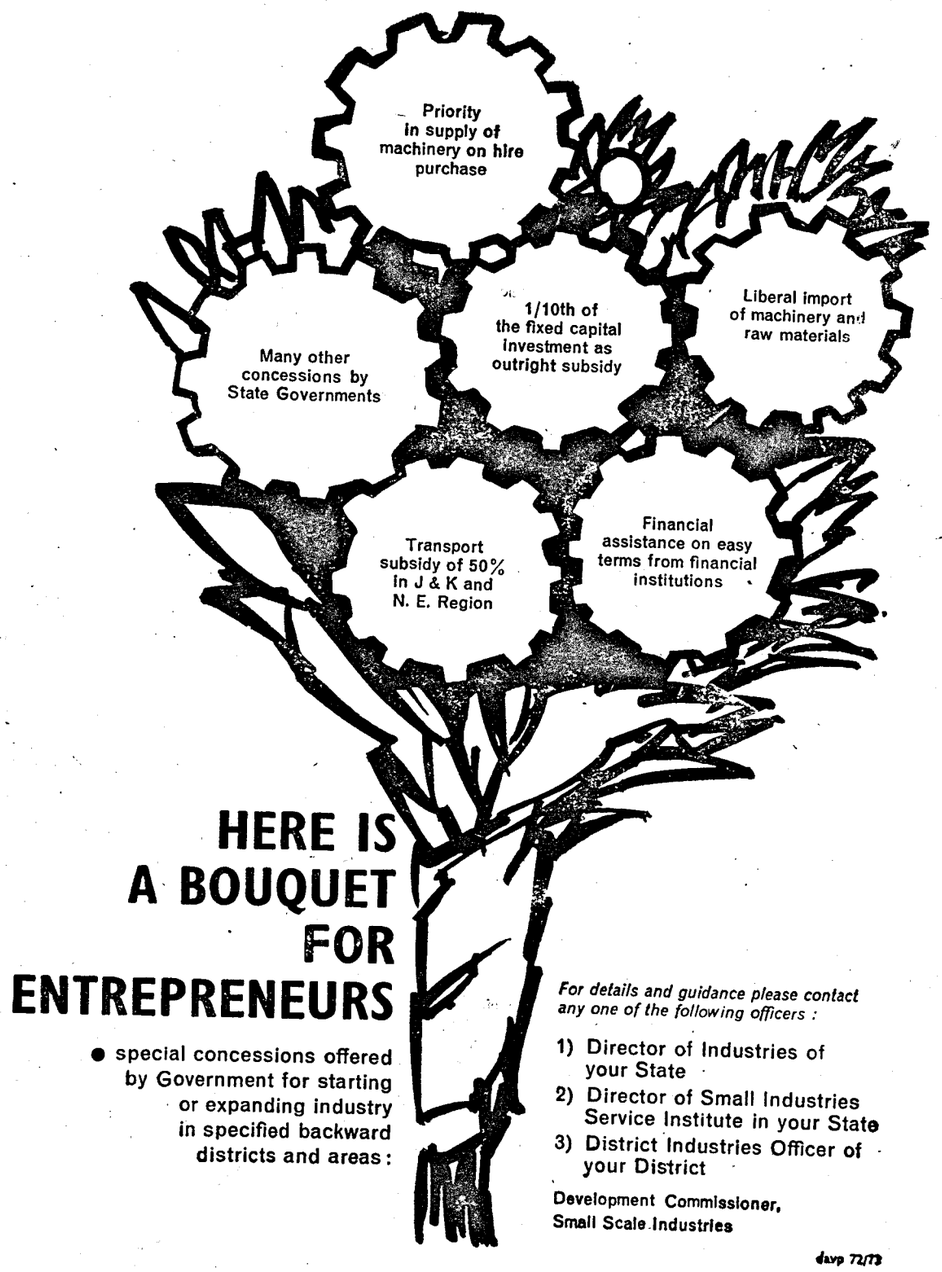
Before we develop our framework we examine the case for and against price control, as put forward by its respective advocates. While we have not found any explicit statement of the reasons for advocating price control, these seem to be as follows:

Case for Price Control:

(i) the industry is oligopolistic and hence competitive forces do not play a major role in determining prices;

(ii) the return on investment in the pharmaceutical industry is unduly high as compared to in other industries;

(iii) compared to pharmaceutical units in advanced countries, the industry in India spends very little on research and development; and



(iv) the industry has large unutilised capacities.

Each of these reasons merits consideration and is examined in some detail below.

Table 1 gives data on the sales of the various large pharmaceutical units in 1966. It can be seen that 50 per cent of the market is shared by the top 10 firms and that the first 25 firms account for 74 per cent of the total market.[2] Though the market shares have been calculated on the basis of the 1966 data (owing to non-availability of more recent data), it will not be unreasonable to assume that the situation has not changed radically. Table 2 presents data on the installed capacity for various basic drugs, of the different manufacturers as of 1969, and the actual production value in 1969. A study of this Table indicates that, in most cases, a particular drug is produced by only a few manufacturers (43 drugs out of 69 were produced at the most by two manufacturers). The fact that a small number of companies account for a major portion of the industry's sales and that only a very limited number produce the same basic drugs is indicative of the oligopolistic nature of the industry.

Another major characteristic of the industry is its dependence on foreign participation. An examination of the ranking of the firms shows that, out of the first 15 firms ranked by sales, only four firms are wholly Indian-owned.

Table 3 gives data on the research and development expenditures in the pharmaceutical industry in India and in other advanced countries. In 1968, the Indian pharmaceutical industry spent only 1.5 per cent of its sales on research

and development as compared to an expenditure of 8.5 per cent of sales on research and development in 1966 by the American drug industry.

Financial Analysis

The Reserve Bank of India Bulletin reports the balance sheets and income statements of public limited companies in drugs and pharmaceuticals, chemicals, and all other industries. Analysis of these data gives an insight into the profitability in the pharmaceutical industry as compared to the profitability in chemical and other industries.[3]

Table 4 shows the profitability of the companies in the three industries.

From this we can see that the profit after tax to net worth for the drug industry was consistently higher than that for the chemical industry — which itself was higher than the return on investment for all manufacturing units. An earlier study by Hazari and Lakhani[4] gives the magnitude of return on the investment made by some selected companies in the industry. Their main finding is that "...out of 87 companies studied, 38 wholly owned Indian companies made losses in 1964. For the remaining 49 companies, the profit after tax, but before depreciation, (cash earnings) was 31 per cent on net worth".[5]

The reasons for this high return on investment are twofold:

The pharmaceutical industry has a higher sales to fixed assets ratio. As its balance sheet (Table 5A) shows, it has a lower percentage of net fixed assets. Hence it has to carry a lower burden of depreciation, which increases its profitability. This is substantiated by the fact that profit before interest and tax to total capital employed for the pharmaceutical industry is about three times that for all industries (22.6 per cent for drugs *vs* 6.9 per cent for all industry in 1968). But when the ratio of the funds generated[6] to capital employed is compared, it is 9.9 per cent for the drug industry as against 6.0 per cent for all industries in 1968.

The second reason is that the contribution[7] in the pharmaceutical industry is about 53 per cent, whereas it is 41 per cent for the chemical industry and 38 per cent for all industries. It is true that the fixed costs are higher for the pharmaceutical industry but the difference in fixed costs among the industries does not fully account for the differences in contribution. (In 1968, the percentage of fixed costs to total sales was 36.8 per cent for drugs, 30.6 per cent for chemicals and 33.2 per cent for all). It is claimed that

Source: Adapted from Tariff Commission Report, Vol II, pp 541-543.

the high contribution is justified by a higher research and development expenditure, which at any rate is not true for the Indian pharmaceutical industry. This points to the fact that drugs were higher priced in India.

A study of data presented in Table 3 points to the presence of large unutilised capacities in the basic drug sector of the industry. For example, in 1969, in the antibiotics category, with the exception of one where the capacity utilisation was 81 per cent in the others utilisation of capacity ranged between 25 per cent and 61 per cent. Similarly, in the alkaloid and allied drugs category, with the exception of one where the capacity utilisation was 80 per cent, in others utilisation of capacity ranged between 6 per cent and 60 per cent.[8]

In addition, the technology and the knowhow in the pharmaceutical industry do not easily permit entry into the market, especially in the manufacture of certain basic drugs. Coupled with the oligopolistic character of the industry and the Patent Laws, this fact indicates how the field of enterprise is limited and further is restricted in the case of certain basic drugs.

Thus reasons for price control, as advocated by its proponents, rely on certain aspects of the drug industry and can be restated in the following terms:

(i) oligopolistic structure of the industry
(ii) domination by foreign companies in the industry,
(iii) lack of adequate indigenous research and development base in the industry,
(iv) high profitability of the industry,
(v) barriers to entry owing to technology constraints and existence of patent laws.

According to the advocates of price control, all the above aspects and the fact that large unutilised capacities exist in the industry, build a strong case for price control.

Case Against Price Control

The opponents of price control, largely represented by the industry, build their case as follows:

In the industry's view, the oligopolistic nature of the industry is found mainly in the manufacture of certain basic drugs but not in the formulations. Even in the basic drugs, though for individual drugs there are only one or two manufacturers because of possibilities of substitution of one basic drug by another, competitive forces do operate to a certain extent. Unfortunately, there are no published quantitative data of on this aspect. Promotional expenditure for drugs could be the other

indicator of the presence of competitive forces. Thirdly, the need for price control should be felt when the industry is operating at full capacity and not when there is underutilisation of capacity.

In the industry's opinion, price control at this stage will not be able to protect the long-term interest of consumers and the industry. A healthy and more beneficial development of the industry can be secured in their view by:

"(i) using forces of competition at all levels to check prices,

(ii) allowing the industry to grow and make profits which will ultimately encourage basic research, especially in the field of tropical diseases, and

(iii) looking upon the industry as a responsible partner and resolving issues in a persuasive manner rather than resorting to compulsion."[9]

Framework for Analysis

The reasons for and against price control as stated so far seem to indicate that on the one hand, the industry by taking advantage of its oligopolistic nature attempts to make higher profits at the cost of the consumer, whereas on the other hand, the government is seeking through the price control mechanism to guard the interests of the consumer at the cost of the industry.

As the industry has pointed out, price control is not the only way of checking prices. Encouraging competition is another, equally efficient, alternative. We agree that this alternative is worth exploring, particularly in the light of the fact that units in small-scale sector account for about 30 per cent of total production and of the fact that the market for drugs is very large in India. In the "Position Paper" prepared by the OPPI, unfortunately, no mention is made as to whether this alternative is feasible and, if it is not feasible, what concrete steps have to be taken in the future to make it viable. The Tariff Commission too has very little to say on this point.

This alternative, of keeping prices down through competition, is really part of a much larger question in the context of the economic and social environment, and an examination of this issue is beyond the scope of the paper. We limit ourselves to the present alternative chosen by the government — *viz* that of controlling prices for protecting the interests of consumers.

The case for and against price control suggests that the interests of the two — that of the consumer and that of the

industry — seem to conflict. In order to understand whether they do in fact conflict, and if they do from where does the conflict arise, it is necessary to make some explicit statements about the interests of these two segments.

The interests of the consumer are aptly stated by the OPPI:[10]

(1) He should be in a position to get the best possible drug for his condition known to science in the safest and most hygienic form.

(2) Such drugs of highest quality should be available to the consumer at reasonable prices.

The interest of the industry is that the funds generated from its operations must be adequate to yield, at least, the minimum return that investors expect for the capital they make available to the industry.

In addition to these two parties, there is a third party involved — *viz*, the retail trade — whose interests also matter. Implied in the interests of the consumer, that the drugs should be readily available, is the fact that there should exist channels of distribution which will make these drugs available to the consumer. It, therefore, follows that the agencies in the distribution channel must also get an adequate return on the capital they use for making drugs available to the consumer, and this consideration should therefore form part of any attempt to fix prices.

The framework of analysis for considering the pricing problem must take into account the interests of all these three groups. According to this framework, the reasonableness of prices to the consumer is not to be considered in isolation. It has to be related to a satisfactory return to the manufacturer on the one hand, and to the agencies in the distribution channel on the other. In particular, our framework judges the 'reasonableness' of the drug prices to the consumer in terms of:

(i) whether the consumer gets the latest drugs,

(ii) whether they are available as and when he requires them,

(iii) whether the return to the manufacturers based on these prices is substantially higher than the minimum return desired by the investors. Also, how does the minimum return desired by the investors investing in the drug industry compare with that in other comparable industries?

When viewed in this way, the apparent conflict between manufacturers and consumers would be resolved. We would now like to analyse the Tariff Commission report and the "Position Paper" on Drug Prices submitted by the OPPI within this framework.

Source: "Various Aspects of Pharmaceutical Profession" M K Rangnekar, *Eastern Pharmacist*, January 1971, pp 16-17.

When we examine the terms of reference of the Tariff Commission and the "Position Paper" on Drug Prices prepared by the OPPI, it is evident that both of them view the problem essentially in the same perspective. For example, one of the important terms of reference of the Commission was to examine the extent to which the prices of the 18 basic drugs can be lowered keeping in view the economics of their manufacture. This, in effect, is the same as the industry's objective to meet the consumers' drug requirements at a reasonable price which would give an adequate rate of return to the industry as well. Therefore, we would like to state that the difference of opinion seems to concern the adequacy of the rate of return and the basis of measuring this return.

We believe that, had the problem been formulated in such explicit terms, it would have been easier to understand the differences of opinion on these two crucial questions — *viz*, the adequacy of return and the basis for measuring this return. This understanding itself would have gone a long way to resolve the controversy.

Approach of the Tariff Commission

We now examine the approach of the Tariff Commission in the light of our framework to illustrate the above point.

The basic approach of the Tariff Commission has been to work out a price which would give the basic drug manufacturers a 15 per cent pre-tax return on the net fixed assets plus working capital, and a 15 per cent mark up on the sales turnover for the formulators. The implicit assumption here is that the 15 per cent mark up for formulators gives an adequate return on capital employed by them. We will say more about this later. Another implicit assumption is that there will be an increase in the sales volume because of reduction in prices. The Tariff Commission has computed the cost after adopting "... utilisation of capacity to the extent warranted by the actual installation which exists and the extent to which this can be worked with reference to future requirements."

The OPPI on the other hand argued against using an increase in sales volume for the determination of cost. They suggested that "... The basis for arriving at the manufacturer's cost will be the actual installed capacity presently being utilised, and not the maximum installed capacity as appears to have been assumed by the Tariff Commission".[12] More will be said about this later.

In computing the capital employed, the Tariff Commission:

(i) valued all assets at book value;

(ii) computed the after-tax profit required to pay a minimum dividend of 8.5 per cent on paid up capital and provide some cushion for retention. It further worked out for the 12 companies (out of the 34) on which the study was made, what should be profit be-

fore tax in order to obtain the desired profit after tax as computed above. Further, this profit was expressed as a ratio of the capital employed. The capital employed in these companies has been defined as net fixed assets plus working capital. It is their contention that the definition of capital employed does not really matter since, "employed capital has been adopted as a basis for reference".[13] Their observation has been that this ratio varied from 13.3 per cent to 20.7 per cent. It has been finally argued that, based on this observation, a 15 per cent pre-tax return on the capital employed is adequate. To put it in the commission's own words, "the quantum of profit needed has been determined on the basis of the amounts due to the industry for the purposes of meeting its liabilities and commitments".[14] It is not clear whether the Tariff Commission has included interest as an item in the other costs of manufacturing a product. However, we presume it has done so.

Earlier, we have said that the difference of opinion between the industry and the government was on the adequacy of return and the basis for measuring the return. We therefore, begin our analysis with this part.

Let us examine the implication of the Tariff Commission's fixation of 15 per cent pre-tax return on capital employed. Using 1965-66 data contained in the Commission's report, this would mean a 6 per cent profit after tax on the capital employed (assuming a tax rate of 60 per cent). The financial structure of the industry[15] in 1965-66 comprised a 42 per cent paid up capital, 37 per cent reserves, and 21 per cent long-term borrowings.[16] According to the above formula, a dividend of 8.5 per cent on paid up capital, i e, 3.6 per cent of capital employed, is paid out as dividends. Thus, only 2.4 per cent of capital employed is retained in the company for purposes of future growth.

Also, the return on net worth (profit after tax to net worth) based on this financial structure works out to only 7.6 per cent. The return to the investor is then not 8.5 per cent as envisaged by the Commission but in fact 7.6 per cent. More will be said on this aspect when we discuss the Commission's methodology for determining the return.

It is surprising that the Tariff Commission does not spell out its reasons for stipulating the adequacy of this retention policy. It is equally surprising that the industry has no comments to offer on the impact that this retention policy would have on its ability to attract capital for growth and expansion. Similarly, it is surprising that neither the Tariff Commission nor the OPPI has anything to say about this 7.6 per cent return on net worth. Noting, particularly, the fact that in 1970 the Unit Trust of India paid a dividend of 8 per cent and that a long-term deposit in banks fetched anywhere between 6 per cent and 8 per cent this return of 7.6 per cent is inadequate by any standards.[17]

TABLE 4: COMPARATIVE PROFITABILITY IN THREE GROUPS OF INDUSTRIES

	Drugs			Chemicals			All	
	66	67	68	66	67	68	67	68
Profit after tax to net worth (per cent)	18.2	17.2	18.3	11.7	12.4	10.6	8.9	7.0
Profit before interest and tax to total capital (per cent)	27.8	27.8	22.6	15.0	15.3	11.8	8.8	6.9
Profit before depreciation but after tax to total capital employed (per cent)	13.1	12.4	9.9	9.5	9.6	7.6	7.2	6.0
Dividend payout to profit after tax (per cent)	52	52	66	59	55	64	61	73
Sales to fixed assets	2.08	2.15	2.05	1.42	1.37	1.31	1.25	1.23

Source: *RBI Bulletin*, October 1970.

Of course, it would be possible to improve this return on net worth by resorting to larger borrowings. Unless, therefore, the Tariff Commission has made an assumption that, in future, the financial structure would remain unaltered, it is difficult to understand how the definition of capital employed is insignificant. Here, too, neither the industry nor the Tariff Commission has discussed the limits upto which borrowing is feasible in the pharmaceutical industry.

In our view, the absence of discussion on these vital matters by the "Position Paper" of OPPI and the Tariff Commission reflects the lack of a clear framework. The industry should have formulated, in quantitative terms, the minimum expectation of the investors and then pointed out, again in quantitative terms, the cutbacks in their investments if these expectations were not fulfilled.

A word or two might be appropriate on the methodology followed by the Tariff Commission. They have measured the return to the shareholder in terms of the dividend paid to him alone. In our view, the correct measure of the return to the shareholder is the profits to net worth ratio.[18] When the Tariff Commission worked out this 'adequate return' of 15 per cent, the combined capital structure of the 34 companies it studied consisted of 42 per cent paid up capital, 37 per cent reserves, and 21 per cent long-term borrowings. The total capital employed remaining the same, if the proportion of paid up capital and reserves were different, the Tariff Commission could have come up with a different recommendation. The final comment which we want to make concerns the Tariff Commission's approach to deciding what should be the adequate return to the share-holders. The adequacy of this return should be judged not by legal provisions alone but by the alternative opportunities for investment that investors have. Unless the expectation of a minimum return by the investor is carefully appreciated and steps are taken to ensure this, it would be difficult to attract the requisite capital.[19] Lastly, the question of return has also to be linked to the risk in the business. The Tariff Commission has certainly taken note of this fact. It has argued very forcefully that there may be elements of risk in the drug industry in the advanced countries but that this does not apply to the drug industry in India. The "Position Paper"

TABLE 4A: PROFITABILITY OF A CHEMIST WITH A TURNOVER OF RS 1 LAKH A YEAR

1 Investment:

Investment required to attain a sales target of Rs 1 lakh a year is as follows:

	Rs
Working capital	30,000
Fixtures and furniture	20,000

2 Fixed Expenses

	Rs per month
Rent for premises	150.00
Municipal taxes	150.00
Salary for one qualified person	50.00
Two other employees	200.00
Part time accountant	250.00
Miscellaneous expenses	75.00
	150.00
Total	875.00

Anuual expenses = Rs 10,500 (875×12)

3 Contribution from sales 1,00,000×.108* =Rs. 10,800

4 Profit per year =Rs 300

* The margin of 10.8 per cent on sales is arrived at on the following basis:

Type of drug	Margin permitted	Proportion of total sales
Ethical Drugs	12 per cent	40 per cent
Non-Ethical Drugs	10 per cent	60 per cent

Average Margin: 10.8 per cent

TABLE 4B: PROFITABILITY OF A CHEMIST WITH A TURNOVER OF ABOUT RS 3 LAKHS

1 Investment:

	Rs
Working Capital	80,000
Fixtures and furniture	20,000

2 Fixed Expenses

	Rs per month
Rent	200.00
Municipal taxes	65.00
Salaries to 2 qualified persons	400.00
Salaries to two other employees	250.00
One Accounts Clerk	150.00
Miscellaneous expenses	300.00
Total	1,365.00

Total annual expenses = Rs 16,380

3 Contribution from sales: 3,00,000×.108=Rs 32,400

4 Profit: 32,400—16,380=Rs 16,020

5 Return on Investment: From the above profitability it is seen that the return on investment is approximately 16 per cent. The common pattern of financing in this business is to borrow money from friends and relatives and put one's own money. Assuming a 50:50 mix the capital structure would look as follows:

	Rs
From friends and relatives	50,000
From one's own funds	50,000

The cost of funds borrowed from friends and relatives is approximately 12 per cent. Thus, the retailer gets 20 per cent before taxes on his own capital outlay.

by OPPI, what is more, gives little evidence to the contrary.

The other point that we would like to comment on concerns the Tariff Commission's approach of not permitting any return on the funds generated by depreciation and employed in business. Without an involved argument, it is quite easy to see that if these funds were not used they would have been required to be substituted by a combination of debt and equity. It would therefore be legitimate to claim return on such funds. In the Tariff Commission's opinion, depreciation was not included in the capital employed because, "since the element for depreciation has been added as an item of cost it cannot be accounted twice over as an item on which return is to be allowed, even if it has not been used. Where the amount allowed as depreciation has already been utilised for increasing the assets, the company in addition to the advantage of its being reckoned as an item of cost, also gets return on the amount or such amount as may have been added to the assets for the purpose of return."[20] It is not then clear why the same argument was not used against permitting any return on funds raised through debt and equity which are used in financing the fixed assets. The magnitude of depreciation funds used in the business was about Rs 280 lakhs in 1968.[21]

Measurement of Return

The preceding analysis pertains to the adequacy of the return and the decision regarding what elements of capital employed should be permitted to earn a return. We now turn our attention to the other aspect, *viz*, the basis of measuring the return.

The first important question in the measurement of return is, how quickly should the assets be written off. In other words, the measurement of return depends on the period in which the invested capital and the return are to be recovered. The Tariff Commission has taken the view that the time period as suggested by the depreciation rates specified by Income Tax authorities would be adequate. For instance, if a 15 per cent depreciation rate is permitted by income tax, then the period required for writing off the entire asset is 20 years. Clearly, the write-off period for an asset should not be related to its physical life but rather to its economic life. On this point also, the OPPI position paper gives no quantitative data to indicate the obsolescence of product and technology.

Some informed men in the industry have indicated to us that the product obsolescence in this business is very rapid. It is their claim that 80 per cent of the products used in 1950 are now completely outdated. We do not have any factual information to check this claim, and we do not have any quantitative estimates about the investment in these products.

We now come to the last aspect of measurement of return, *viz*, the question of valuation of assets. The point raised by the OPPI, that the assets should be valued at market value rather than at book value, merits consideration though we do not wish to go into this question here.

Coming to the aspect of pricing the formulations, it is surprising that, while the report goes to great lengths to establish each of its other recommendations, the suggestion to allow 15 per cent mark-up on sales turnover is not at all established. As this suggestion has become a bone of contention between the industry and the government, the lack of details here is indeed unfortunate.

Short-Term Product-Mix

So far, we have considered the impact of price control on total profitability and, therefore, its impact on the long-term investment decisions in the industry. We would not like to consider the impact of this method of fixing prices on the short-term product-mix decisions by individual units.

In a unit manufacturing many products which thus share a common faci-

* Net Sales=Sales net of rebate and discount—excise duty and cess—selling commission.
** Variable cost=Raw material cost—inventory adjustment + Stores and spares + power and fuel + other manufacturing expenses.
Source: "Finances of Public Limited Companies, 1967-68", *Reserve Bank of India Bulletin*, October 1970, pp 1657-1666.

lity, determining the cost of a product becomes difficult indeed. The variable cost of each of the products is easy to determine. The allocation of the other fixed costs to each of the products, to arrive at the total cost of the product, can be misleading. The reason is that the other costs do not change in proportion to the production of individual products. The profitability of products calculated on the basis of 'full costs' is, therefore, not correct. If the prices of the products are determined, on the basis of full costs, the question that arises is how will the contribution[22] of the individual product change and, so how will the product-mix change. Is it likely that some products drop out of the product-mix because of the adverse effect on contribution. It was here that the need for empirical data was the greatest. But, as pointed out earlier, such data are impossible to gather — perhaps for good reasons.

Case of Retailer

We now turn to the profitability aspects of the retailer. The Tariff Commission gives us no evidence as to why the margins it recommended would give adequate return to the retail channels. Some of the evidence that we have collected points to the contrary. The details of profitability of a retailer are shown in Tables 4A and 4B. These data indicate that a retailer with an annual sales turnover of Rs one lakh gets virtually no return. This is also based on the assumption that there would be no change in sales volume because of a reduction in drug prices. We, of course, do not make any claim about the data being realistic or otherwise. We would like to see the fallacies to be pointed out, perhaps by a more intensive study of the economics of retail distribution channels. In terms of our basic framework, this forms part of the study of drug price control.

How the product-mix decisions and future investments change will have to be watched. Whether this would mean dropping of certain essential drugs and formulations from the product-line of the manufacturers and inadequate maintenance of stock by retailers due to low profits, remains to be seen. As has been stated earlier, discussion of these issues, in quantitative terms, with the leading manufacturers is not possible in the near future.

The empirical evidence that has accumulated after the Drug (Price Control) Order indicates that the increase in sales volume has far exceeded even the most optimistic estimates of the industry. This is contrary to the industry's belief that the sales may not increase — which perhaps, was the basis for its suggestion that only the actual capacity presently being utilised be considered for arriving at the manufacturer's cost. Evidence on this needs closer examination. Nevertheless, once again, it has underlined the question of whether profitability can be maintained through higher sales at lower prices.

Notes

1 See page 21, paragraph 26, on Drug Prices, Organisation of Pharmaceutical Products of India, 1970, hereafter referred to as OPPI.

2 Some units in the small-scale sector claim that the contribution of the small-scale sector to the industry sales is of the order of 15 per cent. In terms of production, however, the contribution is about 30 per cent. Unfortunately, no data are available with us to verify this claim. Nevertheless, it does indicate the extent of the influence of the organised sector of the industry in fixing the prices.

3 The Tariff Commission has pointed out that the companies included in the Reserve Bank study account for only 25 per cent to 35 per cent of the total industry sales. The Tariff commission does a study of balance sheets of both private limited and public limited companies which account for 65 per cent of the total industry sales. Unfortunately the data given by the Tariff Commission is not amenable to the type of analysis which we wanted to do. We have, therefore, used the Reserve Bank of India study. The Tariff Commission's sample, however, would have been more appropriate had it reported the data in the same form as reported in the Reserve Bank of India study.

4 R K Hazari and H G Lakhani, 'Pharmaceutical Companies in Maharashtra — Financial Structure and Ownership', *Economic and Political Weekly*, Volume 2, 1967, pp 1169-1182.

5 If cash earnings are being considered, then these should not be compared to net worth but to capital employed. It might so happen that for those companies the proportion of borrowings may be small and hence the picture may not change. We could not recompute the ratio because the total capital employed is not reported in the Hazari study.

6 'Funds generated' means profit after tax plus depreciation.

7 'Contribution' is defined as net sales minus variable cost. Variable cost includes raw material costs, fuel costs, stores and spares costs, other manufacturing costs and adjustments for inventory.

8 M K Rangnekar, 'Various Aspects of Pharmaceutical Profession', *Eastern Pharmacist*, January 1971, pp 16-17.

9 For detailed statements see "Position Paper" on Drug Prices, OPPI, pp 21-23.

10 "Position Paper" on Drug Prices. Chapter on Social Responsibilities, p 1, OPPI.

11 Tariff Commission Report, Volume II, p 583.

12 "Position Paper" on Drug Prices, OPPI, para I, OPPI Proposals.

13 See Tariff Commission Report, Volume II, Page 708

14 *Ibid.*

15 This includes only the 34 companies studied by the Tariff Commission.

16 Long-term borrowings has been calculated on the difference between the capital employed and networth. See Tariff Commission Report, Volume II, p 546.

17 While the OPPI has suggested to the Tariff Commission that it consider, among other factors, the prevailing rates of return in the money market for arriving at a fair rate of return for the industry, no quantitative data are furnished in the report. See "Position Paper" on Drug Prices, OPPI, chapter on Tariff Commission Enquiry, Para B(v) 6, p 2.

18 Strictly, in financial circles, the return to the shareholder is measured in terms of the earnings per share to the average market price of the share. Admittedly, this approach would pose many practical problems and hence the next best alternative would be to measure profitability in terms of profits to net worth.

19 In this context the following remark by the Tariff Commission is worth noting. "……considering that the drug industry is oriented to humanitarian services it should not hanker after the high profits, and we have assumed a low rate of dividend and consider that the stability of companies as well as higher margins earned on their side activities would be conducive to the attraction of the requisite capital. Tariff Commission Report, Volume II, Para 31.8, p 709.

20 Tariff Commission Report, Volume II, Page 703.

21 This refers to the RBI study of 39 public limited companies. *RBI Bulletin*, October 1970.

22 Contribution again is defined as net revenue minus variable costs.

588,76,69,235			TOTAL	664,50,54,181	.56

Notes : 1. A writ petition has been filed in the High Court of Delhi by the Punjab National Bank Limited and three of its shareholders in November, 1970, claiming payment of ad-interim dividend of Rs. 24 lakhs sanctioned by their Board of Directors on 16-7-1969; the said claim has not been acknowledged as a debt and has not been included in the amount of Contingent Liabilities.

2. The affairs of Lahore and Karachi branches of the Banl have been in charge of the Custodian, Enemy Property, Pakistan. No returns having been received from these branches, it has not been possible to compute the Profit and Loss Account and the unaudited Balance Sheets as at 30-6-1965 have been incorporated in the accounts as on 31st December, 1971.

3. The inter-branch balances are in the process of being reconciled. Urgent steps are under way to reconcile these balances.

588,76,69,235			TOTAL	664,50,54,181	.56

4. In respect of two branches, the branch auditors have not expressed an opinion on advances aggregating Rs. 60 lakhs, as they have not been able to examine the documents and as these are under investigation. These advances have been incorporated in the accounts on the basis of the classification made by the bank.

5. In the case of some branches, the branch auditors have not been able to examine the documents in respect of some advances as they were not available for inspection at the branches at the time of branch audits. These advances have been incorporated in the accounts on the basis of the classification made by the bank.

6. At a few branches, the subsidiary records have not been reconciled with the control accounts. Steps are being taken to have these reconciled at an early date.

Notes: 1. Particulars of remuneration to Chief Executive of the bank:

(i) Salary Rs. 72,000.00 (Rs. 72,000.00) *(ii)* Contribution to Provident Fund Rs. 6,750.00 (Rs. 6,750.00) *(iii)* Contribution to Superannuation Fund Trust Rs. 10,800.00 (Rs. 10,800.00) *(iv)* Monetary value of the benefit of the use of a house (taken @ 12 1/2% of the salary as the Municipal valuation is in dispute) and use of car calculated according to the Income-tax Rules Rs. 12,000.00 (Rs. 12,000.00) *(v)* Medical Aid including Insurance under Hospitalisation Scheme Rs. 1,607.44 (Rs. 1,823.67)—Total Rs. 1,03,157.44 (Rs. 1,03,373.67)

2. The amount shown against item 9 Stationery, Printing, Advertisement includes expenditure of Rs. 14,36,961.69 (Rs. 11,51,394.13) on Public Relations and Publicity.

3. Previous year's figures have been regrouped wherever necessary.

Auditors' Report

The President of India:

We have audited the attached Balance Sheet of Punjab National Bank as at 31st December, 1971 and also the annexed Profit and Loss Account of the Bank for the year ended on 31st December, 1971, in which are the returns of 21 branches audited by us, 382 branches audited by other auditors, the unaudited returns as at 30-6-1965 of the Pakistan branches (see note 2) and the unaudited returns in respect of 417 branches not visited by us, for the exclusion of which branches from audit, concurrence of the Reserve Bank of India was obtained.

2. The Balance Sheet and Profit and Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph and subject to Notes 3, 4, 5 and 6 on the Balance Sheet we report that:—

(*a*) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank:

(*i*) The Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1971,

(*ii*) the Profit and Loss Account read with the notes thereon shows a true balance of Profit for the period covered by the Account.

(*b*) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

(*c*) The transactions of the Bank which have come to our notice have been within the powers of the Bank.

(*d*) The returns received from the branches of the Bank (except for Pakistan branches—see note 2) have been found adequate for the purposes of our audit

Tata Engineering and Locomotive Company Ltd

Statement of the Chairman, Mr J R D Tata

THE following is the Statement of Mr J R D Tata, Chairman, Tata Engineering and Locomotive Company Limited, for the year 1971-72:

The past year was one of the most eventful years in the country's history, in which a great human crisis was successfully overcome, thanks to the outstanding leadership of our Prime Minister and the efficiency of our armed forces.

Production

The Company continued to make good progress during the past year. Production, which had already exceeded rated capacity last year, was marginally higher at 25,075 vehicles, while the production and sale of spare parts rose by 30 per cent over the previous year. As a result of the latter, as well as of the introduction of the new direct injection engine, which, although higher priced, has been well received by operators because of its greater operating economy, the turnover at Rs 158.49 crores was Rs 22.25 crores or 16.3 per cent higher than in the previous year. However, the continuing inflation in costs from which we, along with all industry suffered, prevented the radio of profit to turnover from improving.

Production in excess of rated capacity and the highest turnover on record was achieved in spite of many difficulties, including irregular supplies, sporadic though minor labour troubles and repeated failures in power supply. The latter are, incidentally, becoming more and more frequent in Bihar, as elsewhere in the country, and are making the smooth operation of industries increasingly difficult.

Quite apart from such specific handicaps, the operation of large and complex industries involving the mass production of sophisticated products such as ours, containing about seven thousand separate parts, entails problems and strain on management personnel which are almost totally absent in other countries. In Germany and the USA for instance, the task of the truck manufacturer is made immeasurably simpler than our own by the easy, prompt and regular availability of raw materials, bought-out equipment, electric power, rail and road transport, foreign exchange, and by the freedom of decision enjoyed by management, all of which are a source of perpetual worry in our country, aggravated by the need for licences, permits or Government approval in some form or other in respect of every need of industry. In the circumstances, the fact that production at Jamshedpur was maintained in excess of rated capacity for the second year in succession, reflects great credit on our management and staff at Jamshedpur.

Inflation

Apart from operational difficulties, we have to function under unrelenting inflationary pressures which increase the cost to us of raw materials, bought-out items and wages. Thus, since 1965, the price of our principal steel raw materials has increased by an average of 16 per cent per year, materials and items bought from ancillary industries, including tyres, have risen by over 10 per cent per year, and so has the level of our wages. We have always attached special importance to the interests of the users of our vehicles and the fact that our price for them has increased over the same period by an average of less than 6 per cent per year, despite the constant introduction of improvements or new features incorporated in our trucks, often at considerable cost, indicates the extent to which we have been able to absorb cost increases beyond our control. This has been achieved mainly through an increase in production year after year. Now that our production has reached, and even exceeded, our rated capacity, little or no savings can be made from increased production, except in respect of spare parts.

It is true that the customer pays today a higher price for our vehicle than he did a few years back, but it still gives the transport operator the best value for his money, as evidenced by the overwhelming preference for it, and the improvements incorporated in it year after year compensate him for the increase in purchase price because of the longer life and the lower operating costs which they make possible .

Our sustained efforts to satisfy our customers and compensate them for higher costs do not end with the delivery to them of better vehicles. We realise that the large investment they have made and the crushing initial and recurring burden of tax they have to bear as road transport operators, require that their trucks or buses be kept operating and earning continuously if they are to be operated at a profit. We have therefore set up the finest service organisation in the country which we are constantly extending and improving. We go out of our way to train our dealers' representatives in the repair and maintenance of our vehicles and assist them in other ways. We have extended the warrantly period from 10,000 to 32,000 kilometers, and we are increasing as rapidly as we can the production of critical spare parts at our Works in order to reduce the downtime of our vehicles. Had Government not taken two years to sanction the urgent expansion of our spare parts capacity, our customers would have been saved the delays and loss to which they are still subjected.

Expansion Programme

As stated in the directors' Report, the Government of India have approved of the Company's project, mentioned in the *Directors' Report* and my statement to the shareholders last year, and issued to us on the 29th of June a Letter of Intent the main terms and conditions of which have been mentioned in the Report. If all goes well, the industrial licence for the project may be expected within, say, the next six or eight months, i e some two years after the application was made. In a free economy, or even under the conditions in which industry was allowed to operate in India only a few years ago, we would by now have been half way through completing the programme. While we are grateful to Government for having approved our project, in what may be considered under our licensing system, a reasonably short period of time, I cannot say that we are entirely happy with all the conditions that Government have chosen to impose on the issue of a licence, the most important of which is the requirement that 20 per cent of the added production should be exported over and above our present level of exports so that our total exports reach a minimum of Rs 20 crores per annum. While we appreciate Government's desire to specify a certain minimum volume of exports to be achieved many years hence, I wonder if they are fully aware of the uncertainties and difficulties involved in exporting sophisticated

engineering products in competition with the largest and most efficient producers in the world, who can, whenever it suits them, cut prices without seriously affecting their overall financial health, and who have substantial inherent advantages over us, arising from their much largest volume of production, and freedom from onerous conditions and handicaps under which industry has to operate in India.

Apart from international, political, economic and monetary factors over which neither we nor the Government of India can have any control but which can drastically affect exports from India, there are also, nearer home, major hindrances to exports. For instance, we do not have, as exporters from more advanced countries do, the assured and reliable port facilities which are essential to meeting tight export schedules and ensuring low costs. This requires not only well equipped ports, but also a high degree of efficiency and reliability in their operation, qualities notoriously lacking at Indian ports, and particularly at Calcutta. The delays occurring at India's major ports are often so serious and unpredictable as to make shipping a nightmare for Indian exporters. Furthermore, the delays and extra costs caused by the longer turn-round time of ships at our ports, and other factors, have resulted in freight rates from India to other countries being much higher than they are from foreign ports to the same destination. Shareholders may be interested to know, for instance, that shipping freight rates from India to Australia are higher than the rates from England to Australia!

We shall point out that the export target can only be achieved provided conditions prevailing in India and abroad at the time will be such that our efforts, however strong and sustained, are not frustrated by causes beyond our control.

Another important condition imposed by Government and mentioned in the Report is that the full production of 12,000 additional vehicles at Jamshedpur and Poona must be reached not later than the 31st March, 1978. Assuming that the necessary industrial licence will be issued to us by December this year, this will give us about five years in which to achieve the rated output. Assuming again that it will take a couple of years from the beginning of manufacturing operations to overcome initial difficulties and build up regular production, we shall have a tight schedule time of three years for the construction and installation of the plant and the recruitment and training of personnel. Based on our past experience, and on the highly competent and enthusiastic organisation we have built up over the years, we are confident of our ability to adhere to it barring unforeseen circumstances, and are, therefore, accepting this condition.

We shall, however, point out to Government that the completion, in time, of our own programme alone cannot by itself ensure production of the necessary number of trucks by the stipulated date. About 45 per cent of the vehicles will consist of items bought out from ancillary sources which, incidentally, we ourselves have been largely responsible in developing over the years. These ancillary manufacturers will, naturally, have to undertake a substantial expansion of their own capacities in order to meet our own expanded requirements. At the moment they are able to deliver the requisite products of the equality specified by us for our present levels of production. Whether they will be able to expand their capacities and production in time to ensure the specified output of additional vehicles by March, 1978 is a matter that will be largely outside our control. They have their own licensing difficulties and their own financial, labour, import and other problems which could prevent them from meeting our requirements in time and therefore affect our own ability to meet the dead line. We are drawing Government's attention to this important factor and urging them to minimise uncertainties and delays by expeditiously granting to ancillary manufacturers the licences they might require for their own expansion and also by encouraging the development of such new sources of supply.

The third important condition imposed by Government in their Letter of Intent is that the economies of scale achieved by this expansion programme should be passed on to the consumer. Actually, the main economies of scale which can arise from the programme will be in the modest increase of production at Jamshedpur of 3,000 vehicles of the type that are being currently made there. The manufacture of 9,000 vehicles of a heavier and altogether new type at Poona cannot be considered a large scale operation. Economies of scale in their production will only be achieved if and when the output is increased under some later expansion project.

In their interpretation of this clause, Government have specified that the pricing of the products made under the programme should be such that the rate of gross profit, after allowing interest but before depreciation, development rebate and taxation, should not exceed the base rate of 11.85 per cent of gross profit to net sales achieved in the years 1968-69 and 1970-71.

Subject to clarification on some points, the conditions as proposed by Government are acceptable to us, and we expect that an industrial licence will be issued to us in due course. On that assumption, we are taking all preliminary steps required to launch the project thereafter as quickly and efficiently as possible.

Jamshedpur and Poona

On the completion of this programme, the Company will have powerful centres of production at both Jamshedpur and Poona, in two factories equipped with the most modern plant and machinery available for the type of products made in them. While Jamshedpur will remain the larger producer of the two, Poona will also play a powerful role in the total production programme of the Company. It will not only make 9,000 new heavy vehicles but also will continue, as it has already begun, to make equipments for Jamshedpur including the production of special purpose machine and press tools and spare parts for our vehicles, the total number of which on the road today is over 250,000.

The fact that manufacturing, research and training facilities are spread over two such production centres has added great strength to the Company as a whole. It will not only diminish its vulnerability to any unforeseen events or incidents which might interrupt production at one centre, but will ensure that production at each place is on a scale and of the nature best suited to it.

There is a practical limit beyond which an increase in size of a plant in the Auto industry not only fails to provide real economies of scale but makes operations and management more difficult and burdensome. We believe that, with the present limited programme of expansion at Jamshedpur, we shall have reached such a situation there. Thereafter, Poona will provide the necessary scope for being built up ultimately to more or less the same size as Jamshedpur.

Conditions for creating and operating a modern industry in Maharashtra are particularly favourable because of that State Government's wisdom and understanding of industry's requirements and problems. I am glad that the Government of Bihar have realised that the industrial climate in their State has in recent years offered less inducement

to private enterprise to establish new industries or expand old ones, than that of other States into which, as a result, industries have flocked, and have shown willingness to extend special facilities and inducements to new industries established in Bihar. In contrast with this new spirit, however, the Bihar Land Reforms (Amendment) Bill, 1972, which has chosen to treat as if they were agricultural lands the area covered by the Works and Township of Tisco and Telco, and other Companies at Jamshedpur, is a most unfortunate and disturbing legislative enactment. As a result, we shall, once the Bill has received the President's assent, become tenants of the Government of Bihar instead of being tenants of the Tata Iron and Steel Company as at present, and control over the area of the works and township we have created there will be subject to such conditions as Government may choose to impose. We shall do our very best to co-operate in every way with the authorities and hope that they will themselves want to see that the beautiful city of Jamshedpur to the development and maintenance of which we have ourselves contributed much, will remain unspoilt and not be allowed to turn into the kind of slums which Government have allowed to develop all around the city.

Bihar is blessed with magnificent mineral and other resources and ample labour. It could, and should, become one of the great industrial centres of the world bringing widespread employment and prosperity to its people. This, however, will require, over the years, massive investments by both the public and private sectors.

With the great majority, in value, of Tata and associated enterprises centred in Bihar, I have a special feeling of loyalty towards the State, and am distressed at the fact that its 56 million under-privileged have been denied the benefits which much larger-scale industrial development could have brought them. I can only hope that the Government of Bihar will realise that their State is today a far less attractive part of the country in which to establish new industries or expand old ones than many other States which have seen the light and into which, as a result, industries have flocked in recent years.

So far as we are concerned, we certainly have no intention of forsaking Bihar and, over the next years, during which we shall implement our expansion programme, we shall spend at Jamshedpur some Rs 25 crores on expansion, improvements and replacements.

The Future

On the completion of our expansion programme the country will have at its service an engineering complex unparalleled in the country in its layout, equipment, organisation, skills and managerial talents.

During the many years of hard work and effort it took us to reach such a stage of development those in charge of the venture steadfastly adhered to the basic principles of Modern Industry so often ignored in our country. They knew that success in establishing a complex industrial enterprise is not achieved merely by providing money, land, building and machinery and recruiting labour, but rather by the human skills and expertise invested in it. This requires, amongst many other factors, a vigorous and continuous programme of training at all levels, the use of the most modern planning and management techniques, a relentless pursuit of excellence, the highest standards of supervision and maintenance, the nurturing of the design and other creative talents required for fruitful research and development, the maintenance of high morale and good human relations.

If your Company has achieved so much in its relatively short history, it is because your Vice-Chairman and Managing Director, who has been the chief architect and builder of this great enterprise during the past twenty years, has ensured from the start that these all-important human inputs were adequately and constantly provided and has devoted so much care and effort in building up a young, able and dedicated management team imbued with his own ideas and traditions. In them lies the greatest strength of the Company today and in the years to come.

In closing, may I on your behalf and mine, express to our Management, staff and workers at Jamshedpur, Poona and elsewhere, our thanks for the hard work they put in during the past year and the excellent results they have achieved. We are also grateful to our dealers, suppliers and customers whose support and loyalty is a source of continuing strength to the Company.

JRD Tata
Chairman

Bombay, 7th July, 1972

World Economic Survey

THE "UN World Economic Survey" for 1971 notes that the world economy made unspectacular progress in 1971 — a year overshadowed by the international monetary crisis. Output rose only about 4 per cent, slightly better than 1970, but below the 5.3 per cent average of the 1960s. The 'developing' countries averaged a [illegible] per cent increase, the centrally planned economies of Eastern Europe and the Soviet Union together recorded an average 6.4 per cent rise and the 'developed' market economies, a combined 3.4 per cent. China, which has been excluded in the "Survey" for the time, increased its aggregate industrial and agricultural production by 10 per cent in 1971.

The 'developing' countries were in general not seriously affected by the difficulties that confronted the 'developed' market economies. 1971 saw a trend towards greater self-reliance in the 'developing' world and a growth rate which, though it was slightly below the 6 per cent target of the Second United Nations Development Decade, followed two good years of growth and was better than the average for the 1960s. This fact, the "Survey" believes, "augurs well" for the long process of narrowing the gap between the rich and the poor nations.

A slackening in agricultural growth, despite, in some cases, progress in the green revolution, makes the 1971 performance all the more noteworthy. But group averages were affected by substantial improvements in a few countries. These included some of the largest, with a corresponding impact on the overall figures. 'Developing' countries in the Western Hemisphere stepped up total output by 6.5 per cent in 1971 (compared with 6.8 per cent the previous year), while in Africa the increase was 4.5 (4.5); West Asia, 7.7 (6.7); and Southern and South-Eastern Asia, 4.5 (5.3).

The volume of goods exported by the 'developing' countries increased by about 5 per cent in 1971. This was below the 8.2 per cent increase in 1970 and also short of the 1960s average of 6.5 per cent. The slackening was largely a reflection of reduced demand in the 'developed' market economies, with the slowdown most pronounced in Africa, where a 10 per cent expansion in 1970 was followed by a decline in 1971; and West Asia where annual growth decelerated from 12 per cent in 1970 to 3.3 per cent in 1971.
