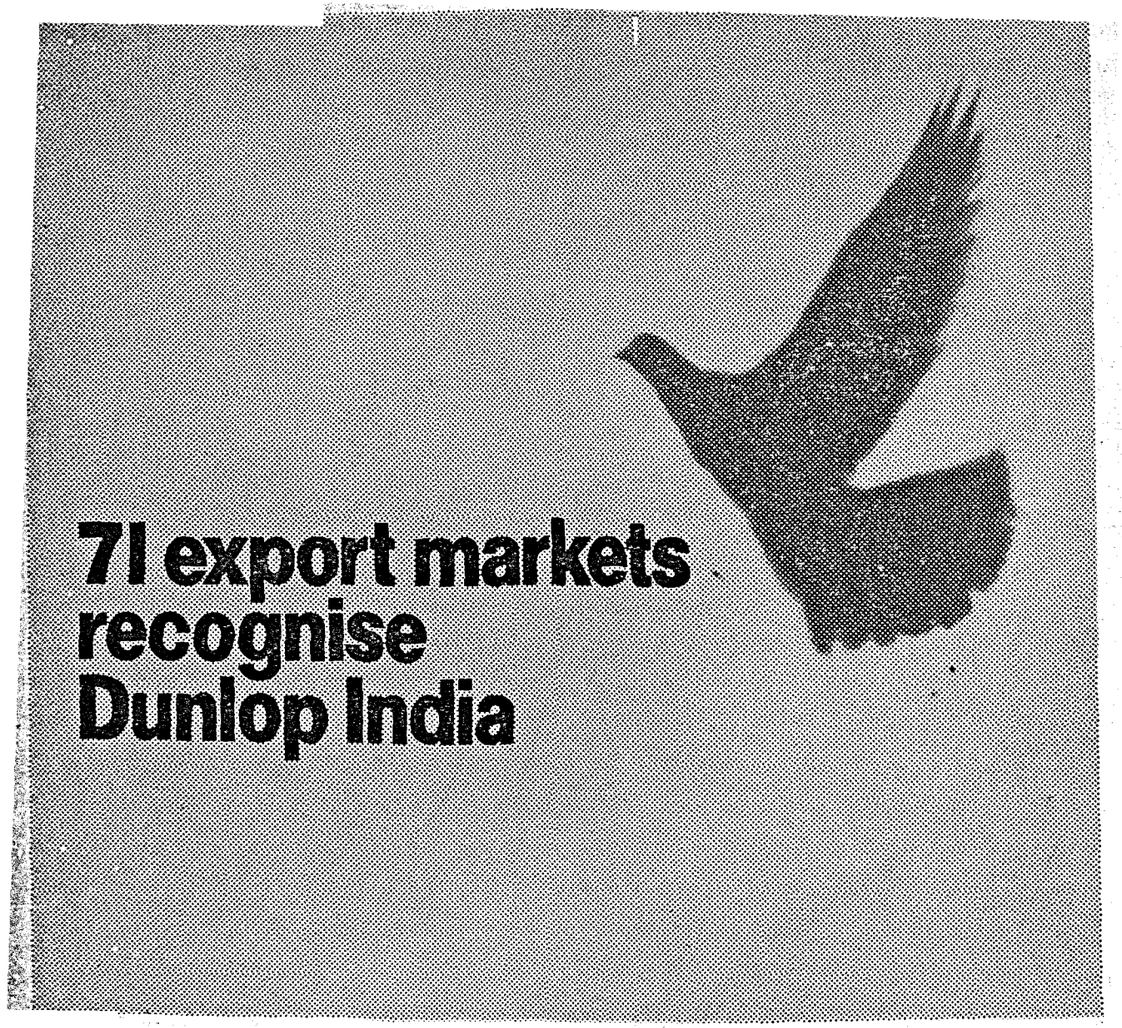
WHO WON IN WEST BENGAL?



JOINT SECTOR BECOMES RESPECTABLE

BANKING COMMISSION'S REPORT

RADICALISATION OF INDIAN ECONOMISTS

AGRARIAN TRANSITION IN WEST UP

LOWER TAXES PLUS EVASION

In 1971, Dunlop's export earnings crossed Rs. 3·34 crores— 9·7% more than 1970

Our products are now exported to 71 countries. In 1971, we achieved an all-time export record and earned Rs. 3.34 crores – 9.7% over 1970. And all this in the face of stiff international competition.

From automotive and aero tyres to cycle tyres and tubes; from fan and vee belts to transmission belting and braided hose, we exported to the U.S.A. and Yugoslavia, to Fiji, Zambia and Venezuela.

We also secured orders worth Rs. 1.56 crores from Czechoslovakia—the highest ever placed by that country with any tyre company in India.

As an Export House, we developed overseas markets for products made by indigenous small scale manufacturers.

With a well-planned export promotion drive, Dunlop India export executives visited as many as 36 countries to expand the existing markets and develop new ones.

DUNLOP INDIA
—keeping pace with India's Export Drive

All Fluff

THE developments in relation to cotton in recent weeks are a rather good example of how government policy is more often than not shaped by opposite pressures exerted by different vested interests. If at last the government has now taken some steps to stem the fall in prices and speed up the marketing of cotton, this has been the result of pressures from a few state governments, cotton growers, cotton trade and the textile industry. Earlier in the marketing season, when there were cries of distress from cotton growers in Punjab, the government acted to exempt cotton from certain districts of Punjab from the Reserve Bank's credit control regulations and also activated the Cotton Corporation of India to make purchases of cotton in that state. But it appeared to have no premonition at all then that a similar situation might soon develop in Gujarat, calling for more or less similar steps. It has taken some agitated discussion in Parliament, an air dash by the Gujarat Agriculture Minister to New Delhi and numerous statements and counter-statements by representative bodies of growers, trade and the textile industry to persuade the government to come forward with another round of credit liberalisation and to raise mills' cotton stock limits by one month and direct the Cotton Corporation to enter the market once again, mainly in Gujarat this time. Also it has been announced that cotton imports in the current season would be cut by 2.5 lakh bales — though it is not clear whether the cut is being made in deference to the larger crop or would have had to be made anyway on account of the non-availability of US PL 480 assistance.

What stands out in all this is, first, the lack of an integrated and consistent policy towards prices and marketing of different agricultural products and, second, the failure to estimate the size of the crop and anticipate its likely consequences. For a number of foodgrains, and for wheat particularly, the government has followed a policy of large-scale purchases by the Food Corporation of India at predetermined procurement prices. And in the case of wheat certainly procurement has come to mean price support, which the Agricultural Prices Commission in its latest report estimates will involve a subsidy of Rs 132 crores in the current financial year. In the case of sugarcane, acreage under which have been subject to wide fluctuations, the government has sought to ensure certain minimum prices for growers by working these prices into the prices of sugar. To take a somewhat different instance, the government has fixed floor prices for natural rubber at levels higher than the prevailing market rates and sustained these prices by requiring major consumers to stock up large quantities of rubber.

By contrast, the government has been content to let market forces determine the prices and marketing of cotton, supplemented by credit and other restrictions, such as those on mills' inventories, intended to exert a general downward pressure on prices. When the decision was taken to set up the Cotton Corporation it was entrusted with the task of regulating purchase and distribution of imported, not indigenous, cotton. This approach was conditioned by the persistent shortages of cotton year after year and so the estimated rise of almost 20 per cent in the cotton crop this year was something for which the government was clearly unprepared. In the first place, the government's ideas of the size of the crop have, as always, followed those of other interested parties. The cotton trade puts out its own estimates of the crop mainly with the objective of influencing prices in the direction in which it wants to. The officially-constituted Cotton Advisory Board, which is headed by the Textile Commissioner, met towards the end of October last and came to the conclusion that the crop would be slightly below 55 lakh bales. Since then the trade has changed its views and puts the crop at 63 lakh bales. The government now accepts this figure. The fact is that the actual size of the cotton crop becomes known only when the season is finally over.

As with output, so with prices. Having exerted little influence on prices in the years of rising prices, it has few ideas on what constitutes an acceptable price level now when a particularly sharp rise in output is pressing prices down. And so we find the Deputy Minister for Foreign Trade denying in Parliament on March 24 that there has been all that steep a decline in cotton prices since the present prices, while lower than those of last year, were still comparable to those prevailing in 1969-70, a normal cotton year, whereas only two days earlier the Minister of State for Agriculture was sharing the concern of many members of the Rajya Sabha over "the continued fall in cotton prices in recent months" and accepting the suggestion that the Cotton Corporation should enter the market in a big way to protect the interests of the cultivators.

If the decline in prices over the levels of last year is not such a serious

forward budgets, and no longer complains about shortage of finance. Unlike his bureaucrat predecessors, Tandon has used business techniques to 'make money work harder'. Complaints about incompetent business deals too — such as purchases of nylon yarn at peak prices, etc — have become few and far between. These are significant improvements.

Yet, an analysis of the trend in STC operations, shows up that these have remained unenterprisingly traditional, and improvements here have been achieved largely due to State patronage and State monopoly. Thus, while its exports increased from Rs 48.5 crores in 1968-69 to Rs 70.6 crores in 1970-71 (and are expected to increase to Rs 90 crores according to STC's performance budget for 1971-72), the Corporation essentially remains an importing agency, its imports being Rs 114.1 crores in 1968-69, Rs 141.9 crores in 1970-71, and Rs 175 crores (planned) in 1971-72. And the commodity composition of its trade is also primarily traditional — jute goods, cotton textiles, etc. Similarly, the direction of its trade has stayed mainly oriented to Europe.

It is in this context that Tandon's suggestion for separate trading organisations for import and export needs to be considered. The main advantage of a single organisation for import and export trade would be that 'market power' can be used to increase market share. In fact, the Japanese trading houses operate exactly in this way. STC's operations also bring out this situation. Its margins on overall trade are inversely related to its exports. The separation of export and import trade would automatically lead to stagnation of exports and large losses on them.

So, what is needed is not a separation of import and export trade, but adequate exercise of STC's trading leverage. The STC has neither penetrated new markets, such as in Africa and Asia, nor pushed non-traditional goods in old markets. This it could well do by exercising its trading leverage. In fact, now that STC has a performance budget, it should be given clear tasks: say, increasing India's trade with African countries to 40 per cent of total trade, or increasing India's exports of non-traditional goods to 60 per cent of total exports.

It is not that STC does not have the manpower; recently Tandon complained at a seminar on unemployment that he could do the same business with one-third the staff. If so, he should use the remaining staff to improve STC's operations in the country's interest. Issuing bonus shares or reducing bank borrowing is not the only criterion of economic efficiency. Nor is splitting of STC into separate import and export corporations a remedy for the country's international trade problems. STC needs to have wider perspectives for its operations.

Sugar

Free and Sweet Play ?

THREE decades of 'sugar control' have failed to carry the country much towards cheap and adequate supplies. Reports have it that much of the official sugar policy is formulated in private meetings and D O letters between the government and industry. The interests of cane-growers are also well-guarded by a parliamentary lobby and by the Chief Ministers of UP, Bihar, Maharashtra, etc. And, if there was any question of the consumers raising a hue and cry, the industry looks after that too by looking after the press at its 'news conferences' and ensuring that facts are depicted as they would like them seen.

Almost half the current season is over. Before it began, a scare had been raised of an impending 'sugar famine'. Since then, the industry has been periodically revising upwards its figures of the area under cane. The estimate issued early in December 1971 showed a 4 per cent fall; the second estimate issued on January 6, 1972, shows a 3 per cent fall only. Meanwhile, the *RBI Bulletin* for February 1972, received on March 22, unhelpfully prints at this late stage the final estimate of the 1970-71 season!

The first estimate of sugar production by government placed it at 3.6 mn tonnes; and the second one raised it to 3.8 mn tonnes. About 180 sugar factories were working at the beginning of the current month and, on a conservative estimate, production for the season would be at least 3.3 mn tonnes. Sugar prices have continually moved upward. During the 14-day war, the industry, fearing public and government wrath, voluntarily offered to operate the partial decontrol scheme. This has become effective from January 1972. Under the scheme, 60 per cent of the output is taken by government at an ex-mill rate of Rs 150 per quintal and distributed through fair price shops at Rs 2 per kg. Industry has been permitted to sell the remaining 40 per cent in the free market. But a large section of the industry refused towards the end of December to supply levy sugar to the states. Sugar prices increased sharply from Rs 220 to over Rs 290 per bag; government itself had contributed to this by increasing tariff value for free sugar by Rs 15, to Rs 150. Further, and less pardonably, government has helped the up-swing in prices by increasing the levy prices month by month, and by restricting the monthly releases to 325,000 tonnes over the last six months — in addition to gradually advancing the release date from the 19th to the 7th of the previous month.

In February, prices moved within a range of Rs 15, varying between Rs 270 and Rs 285 per bag. The tariff value for February was increased to Rs 165. In the current month, prices hit a new high because the tariff value was raised further to Rs 190 and because rumours had it that there would be an increase in excise duty, from 30 per cent to 40 per cent. The price for D-30 increased to Rs 305. But the budget left the excise duty unchanged, and the price is now hovering between Rs 295 and Rs 300.

In the midst of the 'storm' over prices, government is reported to be considering raising the share of levy sugar to 80 per cent of output. (In 1969-70 this was 70 per cent.) This may well work out; but after that, the free market price must be allowed to touch the level it can sustain.

Price of Modernisation, Diversification

Hansavivek

BOMBAY DYEING experienced a sharp contraction of margins during 1971, as reflected in a 4 per cent decline in gross profit (after taking away the non-recurring gain of Rs 45 lakhs against Rs 8 lakhs on sale of land) despite a 27 per cent advance in sales. The increase in sales value is attributed to increased cost of manufacture, particularly on account of the higher prices of cotton, as well as further diversification of the product-mix — particularly in the field of superfine saris, synthetic shirtings, and industrial fabrics. Exports amounted to Rs 5.48 crores, as against Rs 4.92 crores in 1970 and Rs 6.69 crores in 1969. Recovery in exports was mainly due to considerable improvement in exports of finished goods to Australia, New Zealand, and the UK, and also due to some improvement in exports to West Europe. The management considers the future outlook for exports 'uncertain' in view of the fluctuating cotton prices and the "Government's changing export policy". With the sharp increase in customs duty, from 2.5 to 30 per cent, by the Australian government on all unprinted and unraised wide sheetings below 3½ oz per square yard from August last, about 25 per cent of the company's exports to Australia and New Zealand would be affected. The British Government has imposed from January last an import duty of 15 per cent on cotton textiles imported from India. For the present, however, the UK has continued the import quota system which will ensure a market for Indian textiles in that country.

During 1971, Bombay Dyeing installed new machinery worth Rs 90 lakhs, of which Rs 40 lakhs will be payable in deferred instalments over 5 years under IDBI's scheme for financing the purchase of indigenous machinery. For the past several years, the company has been rationalising and modernising its machinery and equipment and this has stood the company in good stead. The management is now considering replacement of looms at the textile mills which have long passed their useful life. Neville N Wadia, chairman, assures shareholders that they will be able to reap the benefits of this major step in the years to come.

SIEMENS INDIA, which completed its 15th year in September last, came in public focus in March last year when it floated a public issue of six lakh equity shares of Rs 10 each at par. The issue was oversubscribed by about 19 times. This issue notwithstanding, the parent company, Siemens Asia Investments AG, Zurich, still owns 51 per cent of the share capital. Siemens' association with India dates back to 1867 when the collaborators, Siemens AG of West Germany, laid the first direct telegraph line between London and Calcutta. During its career, the Indian company too has associated itself with several important projects in the country. It is now diversifying with a view to further broadening the scope of its activities. It has secured a 'letter of intent' for railway signalling equipment and also expects to

receive one for power line carrier equipment. Its application for a 'letter of intent' for electronic control equipment, however, has been turned down by government, but fresh efforts are being made to secure it. Siemens proposes to invest Rs 6 lakhs in 'British Physical Laboratories India' and Rs one lakh in 'Electronic Research' — which make 'Siemens' design products — to ensure closer association with these companies. During 1970-71, the company expanded turnover by 33 per cent to exceed the Rs 32-crore mark and also stepped up profits — enabling the dividend to be raised from 8 per cent to 14 per cent, even though there was a much larger tax liability. The 14 per cent recommendation included a 2 per cent public participation bonus dividend. According to K M D Thackersey, chairman, turnover in the current year has been running some 25 per cent ahead of the performance in the same period last year, and orders booked were 30 per cent better. Thackersey has, however, pointed out that the fiscal imposts outlined in the recent Budget proposals would have a "definite bearing" on production costs. The company will also have to contend with a still higher tax burden this year in view of the proposed withdrawal of tax reliefs to priority industries. He has therefore declined to promise maintenance of dividend.

LAKSHMI MACHINE WORKS is considering the starting up of a second unit for additional production of ring frames and is also taking up new lines of textile machinery not produced at present in the country. The company has also been assured a 'letter of intent' for the manufacture of automatic pirn winders with Swiss collaboration. It has since delivered the first complete blowroom line. Production of combers and lap machines has been taken up, and the first set of machines are expected to be ready during the latter half of the current year. Efforts continue to be made to further improve the quality of existing products. Last year, the company exported machinery and spares worth Rs 28 lakhs and completed the second and third contracts with the UAR. A contract for further export of machinery and spares of the value of Rs 2.2 crores to UAR has been finalised, but the contract is kept pending since the financial terms between the governments of India and the Arab Republic of Egypt are yet to be finalised. In spite of loss of production of about a month, on account of a lock-out necessitated by a strike by workers on the question of bonus, LMW could increase its turnover during 1971. But margins shrank and gross profit turned out to be lower than in the last year. Dividend, however, is stepped up by two points, to 12 per cent. The directors say that, after the lock-out, relations with labour have been cordial. The order book position of the company is also said to be satisfactory.

Thinking of buying a TV Set?

Save for it under our CUMULATIVE DEPOSIT SCHEME

This Scheme brings you the highest returns, higher than even Fixed Deposits.

Save for that new TV Set under this Scheme. Buying it will not be a burden at all.

Study this chart. It shows how this Scheme can be real boon:

Deposit.	Months.	Amount. Repayable.
Rs. 1000/-	18	Rs. 1100/-
Rs. 1000/-	33	Rs. 1200/-
Rs. 1000/-	46	Rs. 1300/-
Rs. 1000/-	60	Rs. 1400/-
Rs. 1000/-	69	Rs. 1500/-

Deposits are accepted even in the mulitiples of Rs. 100/- under this Scheme.

Full details from any of our Branches.

Who Won in West Bengal?

Ashok Rudra

EVEN the most optimistic political forecaster could not have forecast, and none did forecast, the surrealistic electoral victory of Indira's Congress in West Bengal. Even the most confirmed CPM hater can hardly explain to himself how it has been possible for the giant party to be defeated so abjectly. And, of course, nobody is in a position to say how much of a loss of mass support for the CPM this defeat in elections indicates.

Whatever the CPM party leaders say, there is no doubt that there has been a genuine swing away of votes from CPM to the Congress; that Indira's military victory over Pakistan has overwhelmed the ideological predilections of the Bengali voters; that glory has prevailed against revolution. While that is true, it is also no less true that there has been widespread intimidation of voters coupled with false voting on a truly gigantic scale. It is true that in many areas CPM agents could not go near the booths; Congress 'volunteers' went from house to house warning people known to be CPM sympathisers not to go out on the election day. It is true that election officers had been carefully selected to collaborate with Congress goondas. It is true that armed ruffians entered booths and cast false votes before the very eyes of the guardians of law and order. However, such organised intimidation and false voting could have taken place at Baranagar; it could have taken place at one or two dozen constituencies; but, surely, not in all the 100 constituencies where CPM lost seats?

The reaction of liberal opinion in the country has been to laugh at the discomfiture of the CPM. This opinion is not much concerned with rejecting the CPM complaints regarding organised violence by Congress goondas and the forces of law and order. "What! What! CPM protesting about violence! CPM protesting about false voting!" One may indeed not waste any sympathy on the CPM — it has been paid back in its own coin, one may say. But liberal opinion, stopping at that, reveals its hollowness. If it were sincerely concerned about the parliamentary process being jeopardised by the CPM's tactics, if it were genuinely worried about the violence indulged in by CPM cadres and Naxals, then its composure and equanimity before the pervasive violence unleashed by the Congress betrays hypocrisy. Politics of violence decried only when indulged in by extreme Leftists and condoned when resorted to by the Congress in the name of others having done it before reveals not abhorrence of violence, but antipathy towards extreme Leftism.

Not only liberal opinion, something else stands thoroughly exposed. It has been the posture adopted by the CPI that it had to part company with the CPM because of the intolerance of the latter and its practice of strong-arm tactics. This holy non-violence however did not prevent the CPI from making a common electoral front with the Congress precisely when the Congress goondas, with the active help of the police, first flushed out the Naxals from all their strongholds and started the process of physical intimidation and liquidation of CPM cadres everywhere. Nor has this party got any qualms now over having got more Assembly seats than ever before with the help of genuine Congress voters' votes as well as false votes cast by the Congress goondas. The CPI has got what it wanted in West Bengal. It is a very modest party; all it wanted were a few more Assembly seats for itself and all its strategy and tactics in West Bengal were directed at reducing the strength of the CPM. It has got both — not by its own effort, but as gift from Indira Gandhi. It has got the seats and the CPM is indeed reduced to nothing, at least in the parliamentary arena, which is the only arena that concerns the CPI.

The CPI will probably face some embarrassment now. After all, what forces will it fight? By a curious process of dialectics the CPI had made the CPM its main enemy and the Congress its ally. As no other Right-wing parties exist in West Bengal and as the CPM is out of the parliamentary scene, it would be entertaining to watch what the CPI would do now. It cannot oppose the Congress, having won the elections with Congress votes. One supposes it would guide the Congress MLAs from the ranks of jotedars to enforce land reforms and distribute land above ceilings among landless labourers and exercise friendly persuasion on the Congress goondas to give up violence.

The defeat of the Left in West Bengal cannot however be ascribed to the CPI's apitulation to and collaboration with the bourgeoisie. The CPI is not a Left party in West Bengal and it cannot possibly do any harm to the Left movement. The setback of Leftism in West Bengal is due to some criminal errors committed by the two genuine Left forces in West Bengal, namely, the force represented by the CPM and the force constituted by the Naxals. The fatal error of the two parties consisted in failing to recognise that the roles assumed by them were complementary rather than contradictory. They not only mistook them to be contradictory but acted as if they were antagonistic, so that much of their energy was wasted in mutual annihilation. The CPM officially declared that the Naxals were agents of the ruling class, and killed them or helped the police to kill them or arrest them. Naxals retaliated by making killing CPM cadres the main programme in their annihilation campaign, mainly in the urban areas. It is futile to argue who started the suicidal process and who scored a higher number of kills. There cannot be any doubt that the net beneficiary of the process was the Congress. The police held its hands sufficiently long to allow the forces on either side to be depleted. Then it swooped first on the Naxalites, while the CPM kept watching. Having more or less eliminated the Naxals the police and the goonda forces under its protection turned upon the CPM. The result: the incredible and pathetic spectacle of the CPM complaining that its leaders and cadres cannot enter their erstwhile strongholds!

But it is not just that the forces of the Left got depleted by the suicidal killings of the CPM and the Naxals. There was an ideological failure in either party insofar as neither recognised the positive role played by the other, complementary to its own. The failure of the CPM is due to its having only talked of armed resistance but not having made the slightest preparation. It is ironical that it protests today that its leaders and cadres are helpless victims of Congress violence. That hardly is any failure of the police; the police in a bourgeois state is not supposed to give protection to a supposedly revolutionary party. The failure is that of the party organisation which is such as to provoke violent onslaughts on it and yet does not make the slightest preparations for its self-preservation. The CPI required — in addition to its trade union and peasant fronts — a guerilla front which it did not have. It

is in this sense that the Naxals were potentially complementary to the CPM organisation.

The undoing of the Naxals, on their part, has been that while they built up, in an incredibly short time, a fantastically efficient underground organisation and recruited into their ranks human material of such high quality as the communist movement in the country has rarely known before, they were completely isolated from all mass movements and mass organisations. Consisting almost exclusively of guerilla squads, they moved secretively and acted terroristically, as a result of which they were incapable of doing ideological or organisational work among the masses, especially among the industrial working class. The Naxals required a wing to participate in mass struggles and do educational and propaganda work among the masses, a wing they did not have, and it is in this sense that the CPM mass fronts were potentially complementary to the guerilla front of the Naxals.

It is late, but not too late. The chances of survival of the Left in West Bengal reside in the CPM and the Naxals not only coming to a no-war agreement, but actually forging a working alliance. The CPM cannot but realise now that marking time at the dead end of parliamentarism and constitutionalism was frustrating for its supporters and provocative for its opponents. It has either to advance towards armed insurrection or retreat towards the CPI line of class collaboration. The Naxals cannot but realise now that they cannot get the masses to take up arms under their leadership unless they work among them to give them political education and participate in all their struggles.

But is it the time to talk of such a fighting alliance? Is there any such possibility now when both the CPM and the Naxals seem to have been liquidated and routed? But this precisely is the time. If the election results show anything, it is the total absurdity of electioneering in West Bengal. Surely, no student of politics, whatever side he takes, can possibly pretend that the West Bengal Assembly as it stands now is a representative body of the people of West Bengal. No economist, whatever political views he holds, can pretend that the Congress government is going to solve any of the economic and social problems of West Bengal that had given rise to extreme Leftism in the state.

It is no interpretation of the election results to say that the Congress has won and the CPM has lost. What has lost is Left parliamentarism. The CPM had continued with its important parliamentarism way beyond the point at which it became redundant. It is difficult to imagine it continuing to have any hold over its supporters and cadres if it still restricts its activities to preparing for yet another election — the only activity it has indulged in since 1967. CPM's half-hearted parliamentarism has now to be treated as dead and buried. And what has won the elections? We have given one answer to the question at the very outset: glorification of the Indian nation state in a brilliant military victory over Pakistan and an impeccable political victory over Washington and Peking at one and the same time. But that is only one answer. The other thing that has won is Naxalism — the philosophy that no further progress can be made on the Left without opening a guerilla front at selected areas where conditions are ripe for such a front. Naxalism is dead at the moment — if by the term one means actual actions carried out by the Naxals. But if by Naxalism one means the path of armed insurrection, it has become all the more valid, all the more immediate after the elections have shown what the masses who have all these days supported the CPM have come to think of its strategy and tactics of sitting pretty on its Assembly seats.

FROM OUR CORRESPONDENTS

NEW DELHI

Joint Sector Becomes Respectable

THE striking feature of the annual session of the Federation of Indian Chambers of Commerce and Industry this year, as the Prime Minister herself noted in her inaugural speech, was a "more cheerful note of co-operation" between government and business. The leaders of business and industry were at pains to underline their acceptance and appreciation of political realities and the government leadership, on its part, was graciously willing to show understanding of businessmen's position and problems. There was no suggestion of an exchange of accusations, such as have taken place so often in the past, that private business was on strike so as to put pressure on government to change its policies or that business was not being allowed to function by all manner of unreasonable controls and restrictions. The mood of mutual understanding extended so far that no particular demands were put forth by business and industry, except indirectly and with considerable circumspection.

For the rest, the proceedings of the session yielded very little that was new or enlightening. Besides outlining the general approach and outlook of her government, the Prime Minister's speech once again underlined the government's anxiety to achieve some concrete results in the next three or four years — that is, before the next general elections become due. How far this sense of urgency that Indira Gandhi has been expressing repeatedly in the last few weeks will get translated into purposeful and well directed activity is, of course, another matter.

But a more noteworthy feature of the session — more important than the mood of cordiality and the sense of urgency, so far as the policy-frame for private business, particularly big business, is concerned — was the attention that was given to the concept of what has come to be known as the "joint sector". Both the government spokesmen at the session and the leaders of FICCI seemed to suggest that the joint sector was probably the best form of organisation for larger enterprises in the private sector to function safely and profitably in the present political and social situation. As it has been elaborated over time since its inception in the report of the Dutt Committee on industrial licensing, the concept of the joint sector, which is still far from being fully defined and made a practical proposition, appears to have lost much of its fearfulness for business people. Indeed, businessmen appear to be beginning to look upon it as a useful device to go forward and expand their role in the economy.

The idea of the joint sector was put forward in the context of the large financial support extended by public financial institutions to private business, specially the larger houses. In effect, the joint sector idea suggests that public financial institutions should also participate in the risk capital of these ventures, even converting existing loans into equity. A share in equity for these institutions would involve a share in management as well and to that extent it would imply extension of public or government control over private enterprises. When the proposition was first put forward, the managers of the public financial institutions were themselves somewhat sceptical about it since it would saddle them with additional responsibilities while the returns on finances committed by way of loans may not remain secure when they are converted into equity. Businessmen, for their part, denounced the idea as amounting to back-door nationalisation. Since then, while action in the direction of making the joint sector a reality has been studiously avoided and only enabling powers have been assumed by the financial institutions in respect of new financial assistance, the idea itself has been further refined and appears to have now found wide-ranging acceptance.

This refinement of the concept of joint sector has taken the form mainly of the assurance that there is no intention to take over the management of enterprises even when sizeable proportions of shares in them may be held by the public financial institutions. Management remains the responsibility of the private entrepreneur, who is assumed to possess greater management skills and expertise than public authorities can be depended upon to provide. This assumption is strengthened by constant reference to the poor performance of public sector undertakings. Thus the joint sector concept does not make much difference so far as the management and actual running of enterprises are concerned. It merely means closer liaison between the private sector management and the public financial institutions which extend financial support. In this form, the joint sector does not remain a frightening proposition, nor does it smack of back-door nationalisation or anything of the sort. The references to the joint sector at the FICCI session and the demonstrative display of understanding between the government and business have to be judged in this light.

The Prime Minister made it quite clear that there was no intention to threaten big businesses in any way. On the contrary, they had a useful role to play. This role was particularly significant in the core sector which, considering the importance and size of projects in this sector, might even involve their becoming bigger and more powerful. All that was intended, the Prime Minister said, was that when the big houses took loans from public financial institutions, these institutions should have a say in the management of these resources. To this the response of the FICCI President was a positive one. He described the joint sector idea as "a welcome innovation in the context of the need for economic growth and the social and political environment prevailing in the country". Only, he went on to argue that private business could already be regarded as being in the joint sector because government was in full control of all the levers of power and control in the economy. If this control was to extend further, he suggested, this should be done in such a way as not to impair efficiency.

Later, in the course of the discussions at the session, the Chairman of the Industrial Credit and Investment Corporation appeared to offer the assurance that the FICCI President seemed to have asked for. Through the concept of the joint sector, he said, was proposed to combine the vast financial resources of the State and the considerable managerial and other skills and resources of private industry. Where a unit, he said, was run efficiently and was well managed, there was no reason why the government or the financial institutions should interfere with its management. It would appear that just as, after the country had gained independence, foreign capital very quickly became keen on collaboration arrangements with Indian capital as the safest form of investment, Indian capital is now beginning to see the virtues of the joint sector.

*

The report of the Agricultural Prices Commission on price policy for the coming rabi crop has once again argued for reducing the procurement price of wheat. Made wise by its past experience, it has suggested a moderate decrease of only Rs 4 per quintal for the Mexican and indigenous (common white) varieties and a somewhat bigger cut of between Rs 5 and Rs 8 for the indigenous red variety. The Chief Ministers' conference to take action on the report will be held on April 8. The Commission, while making its recommendation in respect of procurement prices, has also suggested abandoning the practice of fixing procurement targets for wheat for the reason that procurement of wheat has now acquired the character of support purchases. Procurement has ceased to be a special effort to acquire stocks, by offering incentive prices, for feeding the public distribution system. On the contrary, the demand for wheat at current prices is lower than its supply and stocks of wheat with public agencies have reached a level when they are fast becoming a burden. In addition, the cushion of lower-priced imported wheat for subsidising the distribution of domestic wheat having disappeared, the entire system now imposes a heavy burden on the Exchequer by way of subsidy for distribution, handling and storage charges.

The problem that the APC has posed had been outlined in the Economic Survey as well as in the Finance Minister's budget speech. According to the Commission's calculation, the total subsidy involved in the present system of procurement and distribution would be Rs 132 crores next year, compared to Rs 120 crores mentioned by the Finance Minister in his budget speech and the provision of Rs 100 crores that has been actually made in the budget. This is on the assumption that releases through the public distribution system will be 5 million tonnes in 1972-73. As the trend this year shows, it may not be possible to distribute that quantity and to that extent the subsidy may turn out to be smaller, though the cost of storage and the locking up of funds on that account will be correspondingly greater.

According to the Commission, an imbalance has developed between the rates of growth of wheat output and demand for wheat and there is need for an adjustment in wheat prices to reduce this imbalance. An adjustment in wheat prices is also necessary to prevent further shift of acreage from other crops to wheat. Besides, the time had perhaps come when the benefit of the wheat revolution should begin to percolate to the consumer. The Commission has argued that fears of a drastic fall in the growth rate of wheat production, as a result of reduction in procurement prices, are exaggerated; the reduction that was being recommended would still leave the procurement price comfortably above the cost of production, even after taking account of the imposts proposed in the budget on fertilisers, etc.

The Commission has not favoured the suggestion, put forward by the Planning Commission, to de-link the support price of wheat from its procurement price. This is not necessary since no targets for procurement are being fixed and all procurement at present is in the nature of support purchase. The suggestion for a two-tier system of prices will, in the APC's view, raise the question "Who would be allowed and who denied the benefit of the higher support price, its nomenclature notwithstanding". The two-tier system can actually work in favour of the more powerful, influential and bigger producers.

How exactly the farm lobby and the Chief Ministers will take to the report will be known at the Chief Ministers' conference. But the strong criticism of the proposed levy on fertilisers and tractors suggests that there will be strong opposition to the report at the conference and that, unless the Union Food and Agriculture Minister takes a firm line, the APC's recommendations may once again be scuttled.

Lower Taxes plus Evasion

Charvaka

THE enthusiasm with which the business community has welcomed the Wanchoo Committee's recommendation to reduce the tax rates on personal income at all levels and in the process to bring down the maximum marginal rate of income-tax from the present 97.75 per cent to 75 per cent is difficult to understand. Surely, the intention of the Committee was not to provide tax concessions, but to check tax evasion. In the opinion of the Committee, "the prevalence of high rates is the first and foremost reason for tax evasion". If this is the logic of the proposed reduction in tax rates, then tax payers have little reason to be so jubilant about the suggestion, because when it is implemented they will be paying, if anything, more by way of taxes than they do now. Therefore, if the business community is jubilant today, it is because they are pretty certain that under the Wanchoo Committee's dispensation, they will have both reduced tax rates and tax evasion.

Past Experience

The Wanchoo Committee does not seem to have cared to look into past experience with lower marginal rates of tax. If it had done so, this suggestion at least would not have found a place in its Report. The maximum marginal rate of 75 per cent proposed by the Committee would not be altogether new to this country; nor is the idea of a sharp reduction in the rate at one stroke so that the measure has the maximum impact so novel. The Union budget for 1957-58 had proposed a revised tax schedule "which will mean that the total of the income-tax, super-tax, and surcharge for the highest slab will be brought down from the existing level of 91.8 per cent to 84 per cent for unearned incomes and 77 per cent for earned incomes". Earlier, the marginal tax rate, which had been at about 82 per cent from 1951-52 to 1954-55, was raised to 88.6 per cent in 1955-56 and further to 91.8 per cent in 1956-57 on the recommendations of the Taxation Enquiry Commission (1953-54), which had also made a detailed study of tax evasion but had found no justification for reducing the marginal tax rate. The reduction in the highest marginal tax rates in the 1957-58 budget was based on a superficial analysis of tax-payers' morality *vis-a-vis* high tax rates, the conclusion of which the then Finance Minister stated in his budget speech thus: "It is said that they [high tax rates] tend to diminish the incentive for work but I am aware that they encourage large-scale evasion." The reduced tax rates, with the maximum marginal rate at 77 per cent, prevailed continuously for five years upto 1961-62, by which time, according to the Wanchoo Committee's own verdict, the income which escaped tax had reached the phenomenal figure of Rs 811 crores. In fact, one of the members of the Committee placed the figure still higher at Rs 1,150 crores. The estimates of tax evaded income for subsequent years attempted by both the Committee and the dissenting member are based on the yardstick used for the year 1961-62.

The Direct Taxes Administration Enquiry Committee (1958-59) surveyed the conclusions of many attempts at in-depth study of the tax payers' morality, not only in India but also in countries like the US, the UK and France, where the marginal tax rates are considerably lower than in India. On this basis, the Committee concluded (p 149) that "even if the rates of tax are reduced evasion will continue, *because it exists at all levels of income*" (italics added). Even in the US, where the marginal tax rate was only around 50 per cent, "for the overwhelming majority, tax violation has been the first blemish on otherwise unstained careers" (quoted by the Direct Taxes Administration Enquiry Committee). Nicholas Kaldor, who had much faith in a single comprehensive consolidated return as an evasion-proof system, conceded that even under such a low marginal rate as 45 per cent, "it would be sanguine to believe that it would solve the problem of the evasion of business profits through false book entries, etc, by itself" ("Indian Tax Reforms", p 110), D T Lakdawala, who examined the Kaldor proposals, was categorical: "There is no case for reducing the maximum income-tax rates" ("Taxation and the Plan", p 204).

The Wanchoo Committee's other justification for reducing marginal tax rates runs in terms of affording the government greater "scope of manoeuvrability" for raising additional resources in times of emergency. This is too naive to be taken seriously. The country has passed through a national emergency only recently and during this period not only have very large additional resources been mobilised despite the prevalance of supposedly very high marginal tax rates, but this has been done without any adverse impact upon the economy. In times of emergency, mobilisation of resources does not depend on the scope for fiscal manoeuvrability but on the will of the people to make sacrifices. A high rate of economic growth facilitated by an equitable and progressive system of taxation only can make the general public more ready to make sacrifices.

Aggregation of Family Income

If the most important recommendation of the Committee is based on wrong premises, its other suggestions appear to have the objective of soft-pedalling certain much-needed reforms of the tax system. How else can one explain the rejection by the majority report of the idea of aggregating the incomes of a family consisting of husband, wife and minor children and treating them as one unit of assessment? It is now widely accepted that submission of more than one income-tax return in the names of different members of a family facilitates considerable tax avoidance as well as evasion. The Taxation Enquiry Commission had recommended that "it is both equitable and necessary for effective administration of the Income-tax Act to aggregate the incomes of husband and wife, and indeed of the whole family" (p 139). At best, such aggregation may be accompanied by some system of family allowances. Fortunately, in this regard, the government seems to have been convinced by the case for aggregation as propounded by the two dissenting members of the Committee.

Similarly, the Committee has chosen to lend support to the business community's complaints about certain expenses, such as those on entertainment and guest houses maintained for employees on duty, being disallowed as deductible expenses. These concessions were, in fact, available to the business community till recent years and if they have been abolished, it is only because these loopholes were widely used for tax evasion. In Bombay city, for instance, one comes across guest houses maintained in expensive localities like Malabar Hill in the names of employees of firms which the employees themselves have perhaps never even seen.

Again, while the Committee has rightly suggested a thorough overhauling and streamlining of the intelligence and investigation wing of the Income-Tax Department, it suggests at the same time that the existing penalties for concealment of income should be reduced. The suggestion is that the penalty should have reference to the tax sought to be evaded, instead of the income concealed. The justification cited for this is that "a penalty based on income instead of tax hits the smaller tax payers more harshly". Indeed, if the purpose is to be less harsh on the smaller tax payers, then the obvious course is to have a progressive structure of penalties so as to enhance the penalty on the bigger tax payers. In the ultimate analysis, a thorough streamlining of the tax machinery, effective plugging of loopholes in taxation laws and harsh punishment for tax dodgers are the only ways to minimise tax evasion.

Towards a Credible Maoism?

M R

TO see in the CPI(M)'s present predicament the nemesis of what it did five years ago to its extremists who wanted the party to opt out of the parliamentary system might be cynical. But the CPI(M) faces the same crisis it did at the time of Naxalbari. The difference is this: five years ago the crisis followed the party's electoral triumph and its emergence as the dominant partner in the coalition ministries in Kerala and West Bengal. Now it follows its defeat and near-isolation in Kerala first and more dramatically in West Bengal later. The party's proximity to parliamentary power in these two states had largely conditioned its attitude to the system, beginning with its famous document "New Situation and Party's Tasks" which conjured up visions of a maturing political crisis that would make non-Congress governments possible not only in all the states but held out prospects of a non-Congress democratic coalition government at the Centre. The party's participation in the Kerala and West Bengal coalitions was rationalised in terms of abstractions: "In clear class terms" it was "one specific form of struggle to win more and more people and more and more allies for the proletariat and its allies in the struggle for the cause of People's Democracy". But in practice it became almost the sole form of struggle. Running the ministries at all cost became the pre-occupation because the line had been laid down: "Hence it is imperative that our party realises that its immediate future in no small way depends on how it plays its worthy part in running the two state governments of Kerala and West Bengal."

Being in power in two states and in the opposition in others and at the Centre imposed peculiar constraints on the party's style of work. An agitation on a set of demands in a state where it was not in power might result in similar agitations by others where the CPI(M) was in power. To this extent, the party's participation in the two ministries compromised its role elsewhere. The premium was no longer on extra-parliamentary struggles based on mass action. A short-cut to power at the Centre, obviating the need for class struggle, was implied in the 1967 line. The two non-Congress ministries dominated by it in Kerala and West Bengal were to be the principal instruments in the hands of the people's democratic revolution to come.

This brought the CPI(M)'s tactical line into focus with that of the CPI. The only difference between the two related to strategy. The CPI was for a national democratic front and transition to socialism through the national democratic state and the CPI(M) was for an altogether narrower front. In more tangible terms, the difference related to the Congress party and the government run by it at the Centre. Consistent with its approach, the CPI believed in differentiations in the bourgeoisie and was prepared to accept the leadership of the patriotic national bourgeoisie in the national democratic front albeit as a transitory arrangement until the working class could establish its leadership.

This was the context in which the Maoist perspective in the Indian communist movement emerged. The CPI(M) faced a two pronged attack — from an extremist group in West Bengal which led the Naxalbari uprising from within, and from the Chinese Communist Party from without. The leaders of the Naxalbari revolt were convinced that the United Front Ministry could not solve any of the land problems and called for the setting up of liberated areas, forcing an awkward dilemma on the CPI(M)-dominated state government. Stern repressive measures would expose the government to the charge that it was no different from any bourgeois-landlord government and prove that the CPI(M), by participating in the Ministry, had compromised on class struggle. Failure to put down the miniscule revolt would have provided the Centre an alibi to dismiss the ministry for its failure to discharge the constitutional obligations relating to law and order. The CPI(M) was facing its moment of truth. Its entire tactic of forming united fronts with other parties and its participation in non-ideological coalitions and in the parliamentary system in general was being challenged.

The Chinese read great revolutionary significance in the Naxalbari uprising. Earlier, Peking had attacked the CPI(M)'s participation in the Kerala and West Bengal ministries, which it said were "also components of the State apparatus of Indian big landlords and big bourgeoisie. As long as they are under the direct control of the Central government there can be no essential reformation and the capitalist and feudal relations of production can in no way be fundamentally shaken". Peking observed that the Centre could topple these ministries any time, as it did in Kerala in 1959. The revolutionary line was laid down for India: "... without a people's revolution, without a seizure of political power by violence, without smashing the old State apparatus there can be no change whatsoever in the social system nor in the nature of real social reform."

In June 1967, when the Naxalbari campaign was gaining momentum, Peking renewed its call for an armed struggle to "overthrow" the Indian government and to "forcibly seize power", and hailed Naxalbari as "Spring Thunder over India", a "prelude to a violent revolution" by the Indian peasants. The Maoist model was commended for India. The climax was Peking's call for a new party of "genuine Marxism-Leninism" guided by Mao's thought.

The CPI(M) leadership could not ignore the challenge from within, which it branded Left adventurism and Left deviation. "It is an ideological disease of the frustrated individuals and it affects also young militants whose militancy is not tempered by the fire of class struggle and disciplined outlook." The CPI(M) also made a forthright statement differing with Peking's assessment of the Indian revolutionary situation.

The CPI(M)'s fight against "ultra-Left deviation" cost it dear. The party had postponed taking a stand on the ideological issues facing the world communist movement. In 1968 it produced a draft document which rejected almost all the Soviet positions in the dispute but did not examine the Chinese positions at all. The Andhra Pradesh plenum of the party rejected the draft outright and the Andhra leadership carried the fight right up to the all-India

plenum at Burdwan and lost. The CPI-(M)'s ideological position was roughly this: anti-revisionism *sans* Maoism. Judged from Chinese positions, the CPI(M)'s position might still look revisionist.

Much as the leadership wanted the discussion limited to ideological issues, the Andhra plenum had set the pace for a discussion covering even the programme and the documents like "New Situation and Party's Tasks". The frustration of the Andhra leadership stemmed largely from the restrictions the party line imposed on agrarian struggles developing in the state. Some of these struggles (in Srikakulam and Telengana districts) were growing into armed clashes, but the party had settled for parliamentarism. The perspective on extra-parliamentary struggle emerged clearly in the Andhra documents at the Burdwan plenum.

In 1968, the CPI(M) appeared to have survived the "ultra-left challenge" on the whole, though in Andhra Pradesh the majority of its membership quit the party and joined the Communist Party of India (Marxist-Leninist) that was to be formed shortly after or the Andhra Pradesh Revolutionary Communist Committee (known as the Nagi Reddy group). The "ultra-left" challenge failed to split the CPI(M) veritcally.

In the meantime, the West Bengal United Front broke up and in the March 1969 mid-term poll, the CPI(M) emerged stronger and another United Front Ministry was formed. The Congress was in a serious crisis and was heading towards a split when the Kerala united front ministry also disintegrated and was replaced by a Congress-backed coalition led by the CPI. The Congress split at the end of 1969 forced a crucial dilemma on the CPI(M). The CPI saw in the impending Congress split a vindication of its theory of differentiation in the bourgeoisie. But the CPI(M) was hard put to it to explaining the split. On the issue of V V Giri's election as President, the CPI(M) found itself supporting Indira Gandhi's candidate against Sanjiva Reddy because it thought Indira Gandhi was more progressive than the Syndicate. In fact, the party was seriously divided on this issue, one section insisting on a neutral position and the other urging support to Indira Gandhi. The fact is the CPI-(M) feared a "rightist" take-over if Indira Gandhi's government was toppled by the Syndicate-led alliance. The CPI(M)'s electoral opportunism stemmed from its high stakes in West Bengal and Kerala. Though it had been manoeuvred out of power by the CPI in Kerala (with the backing of Indira Gandhi's party), the CPI(M) thought it was ensuring the survival of its ministry in West Bengal if it backed Indira Gandhi in Parliament when her party had lost its majority in the House with the Congress split. In the snap elections in Kerala, the CPI(M) found itself routed by the CPI-Congress dominated front.

The Bangla Desh issue forced another dilemma on the party. The second West Bengal united front ministry had broken up and the CPI(M) was demanding fresh elections when the Bangla Desh crisis developed. The CPI, in line with the Soviet position, was going all out to support Indira Gandhi and, therefore, the Bangla Desh struggle. The CPI(M), which had abetted the Centre's massive man-hunt of the Naxalites, was denouncing the Congress government as tending towards fascism but could not help supporting the Government's stand on Bangla Desh. At one stage, the CPI(M) was opposed to Indian intervention but later it was pledging support to the Government in the event of a war, even while it was denouncing it as "fascist". Oddly, the CPI(M) ended up hailing the Soviet role in the Bangla Desh crisis and simultaneously deploring its support to Indira Gandhi's government.

When the Congress split and the new Congress set itself in late 1969 the twin objectives of fighting "right reaction" and "left adventurism" the CPI(M) did not seem to realise the significance of the slogan. The Congress was not only bracketing "right reaction" and "left adventurism", but by not specifying the Naxalites, the Congress was keeping the option open to fight the CPI(M) when the time came. The Congress decided to fight any force to the left of the CPI. The Chattra Parishad and the Central Reserve Police took up the fight, reducing the CPI(M) to its present predicament, underlined by the West Bengal election results.

The CPI(M) is disillusioned with the parliamentary system but its leadership is not ready yet to opt out of the system. Its programme has rejected peaceful transition to socialism but places the onus for it squarely on the class enemy. (The CPI, on the other hand, is wholly for peaceful transition.) The CPI(M) undoubtedly has the largest number of dedicated, militant cadre in the communist movement. And in the absence of a credible Maoist rallying point, the militant cadre would have to remain with the CPI(M) for some time, while the opportunist elements on the periphery would desert it to join the CPI or even the Congress. The leadership is now obliged to take the disillusionment of its following with the parliamentary system into account and can talk of priority for extra-parliamentary struggles, but a point may soon be reached where the tactic of combining a large measure of extra-parliamentary struggles with participation in the system would lose credibility for the militant cadre. Either the party would split vertically, a substantial number rejecting the parliamentary path outright and opting out of the system and accepting the Maoist revolutionary model or the party as a whole might be forced to opt out of the system. Either way it would be vindication of Naxalbari.

A Maoist perspective has already emerged in the Indian communist movement despite the setbacks the CPI(M-L) suffered as a result of its infantilism. A vertical split in the CPI-(M) might hasten the emergence of a credible Maoist party in the country.

The Radicalisation of Indian Economists

(From a Special Correspondent)

THE Bombay University's Department of Economics is now over fifty years old. During these years its tradition of relevance and radicalism has contributed much to Indian economics. To celebrate its Golden Jubilee, the Department organised a seminar on "The Indian Economy: Performance and Prospects" from March 25 to 28.

The participants in the seminar were drawn from academic life, from industry and from the government, representing a cross-section of India's economists. The representative character of the participants was much enhanced by the unexplained absence of some leading luminaries who were expected to attend. Forty papers were presented and a thousand man-hours were spent discussing them. What emerged from all this was an exposition of the views of ordinary work-a-day economists about various problems confronting the Indian economy.

The first session, chaired by Sukhamoy Chakravarthi, was devoted to the general approach to development in India. The principal feature of this session was the clash between the proponents of two different approaches to development. P R Brahmananda argued, very forcefully, that the objectives of output growth, employment and justice would have been better secured by promoting the production of wage-goods and that it was our inability to produce wage-goods and our concentration on "industrialisation in the narrow sense" that has led to a state where, in spite of large doses of investment, there is little evidence of growth or structural change and much evidence to show that we are heading towards diminishing returns, a falling rate of return and a stationary state. Gautam Mathur outlined what could be called the orthodox approach when he argued that if one wants to minimise the time taken to reach a particular target level of income and consumption one should choose a strategy where, as he chose to put it, heavy industries "look after the long-run and economic growth" and the other sectors "look after the short-run and social justice". This conflict between the Ricardian and the Mahalanobis models is an old one in Indian economic analysis. It started sometime in the mid-fifties and has continued since then. Now as then, both approaches remain inadequate because they pay little attention to a systematic comparison of alternative time-paths of income and consumption, because they lack a policy-frame to show how they can be implemented in a market economy and because they tend to ignore the possibilities of transformation through international trade. The discussions at the seminar were inconclusive and the conflict between the two approaches remained unresolved. Is it possible that this controverssy is no longer very relevant since the transformation possibilities inherent in our stock of capital are no longer what they were in the mid-fifties?

Dividing the Cake

It was unfortunate that the seminar got bogged down in an inconclusive discussion of an irrelevant controversy leaving little time for a discussion about the overall policy-frame for implementing plan strategies, covered by V V Bhatt in his paper. The seminar was so absorbed in talking about planning models that it found little time for discussing theories of development one of which was covered by V N Kothari of Baroda University in his paper. Kothari's paper challenged the relevance of Arthur Lewis's theories of growth in India. The core of his attack lay in his demonstration that the rate of surplus over and above wages is not very different in agriculture and industry. It is a pity that the wider implications of this were not discussed.

Though there was no agreement about the facts of economic growth there was almost universal agreement that the benefits of growth had not been equitably distributed and that drastic redistributive measures were necessary. This issue was discussed in a session on "Income Distribution" which began with a spirited paper by K R Ranadive of Bombay University. Though there was general agreement about trends in the distribution of income, there was some dispute about the sources of income-inequality. Ranadive and T N Krishnan argued that it was largely due to maldistribution of property. Some others suggested that it may be due to a maldistribution of power (Bhatia) or maldistribution of marketable surpluses (Shah). Both Bhatia and Shah argued that the distribution of these is not correlated perfectly with the distribution of property.

P D Ojha and some others suggested that we ought not to be obsessed about maldistribution of incomes measured by Gini co-efficients and the like but about poverty defined in terms of some objective criterion. This, rather than Gini co-efficients, ought to be the object of policy and the measure by which the success of policy ought to be judged. In this connection, A M Khushro suggested that by and large the absolute number of the poor had remained unchanged over the past 20 or so years.

Programmes, Not Piety

The seminar did not discuss fully the likely impact of income redistribution on savings in a market economy. Krishnan presented some evidence to suggest that the rate of return on assets was higher the lower the volume of assets owned by a household. This implies that if assets are redistributed from the rich to the poor the amount of property income may rise. This may increase savings if the propensity to save out of property incomes is roughly similar in different size-classes. This interesting suggestion was not discussed by the seminar since so many participants were too absorbed in their rhetoric to be interested in argument.

The problem of employment, which is related to the problem of poverty, was discussed in a separate session. P M Visaria presented a paper which suggested that the problem of disguised unemployment is less widespread than we think. Most people were sceptical about the effectiveness of rural works programmes in alleviating this problem.

The overall problem of poverty and unemployment has arisen because of our failure to increase the supply of wage-goods which determines the number of people we can sustain at any given level of welfare and because of our failure to operate on income-distribution and choice of techniques in a market economy. Several people pointed that both these failures have flowed from the sort of strategy of development — the promotion of heavy industries, high-technology industries, farm mechanisation, etc — that we have followed.

The participants were generally agreed that little could be done about poverty and unemployment in a market economy and that revolutionary changes in property and power relationships would be required. This dispassionate, almost clinical, prescription of socialist remedies is somewhat pointless. If socialism comes it will come, not because progressive income taxes are ineffective but because property relationships become untenable. Revolution

is not a remedy. It cannot be prescribed. If it is a prescription that one is interested in then one inevitably operates within the system, of which such seminars are a part. In that case what is needed is what M L Dantwala called "a relevant radicalism", a radicalism that concerns itself with programmes not piety.

Optimism about Agriculture

The participants in the seminar were generally optimistic about developments in agriculture. Most people felt that Indian agriculture has reached a stage where the production of staple foods is growing at an adequate rate. The problems it faces now are not of production but of diversification. There was general agreement that a substantial permanent transformation had taken place in agricultural technology. G S Bhalla, who presented the results of a survey of farmers in Haryana, and several others suggested that the new technology was size-neutral and would help to reduce disparities in levels of living in rural areas. However, most participants recognised that the extension of this technology to dry areas and to smaller farmers posed difficult problems. H B Shivamaggi and several others felt that the institutional structure that supports the use of the new technology is biased in favour of the larger farmers. Most participants were sceptical about the efficacy of existing programmes to assist small farmers. They felt that an extension type approach may not work given the sheer number of small farmers. Some of them also felt that the rural power structure would not allow programmes to succeed.

Te question of institutional changes in the pattern of land-holdings was discussed at length. Dantwala pointed out that the abolition of zamindari which led to a redistribution of 172 million acres of land was possibly the most massive act of land reform in history. He felt that the Tenancy Acts did lead to some redistribution in states like Gujarat and Maharashtra. In this connection, it was pointed out that a substantial proportion of leased land was leased in by large holders and owned in fact by small holders. Dantwala agreed that ceilings legislation had not led to much redistribution. In this context he again pleaded for "a relevant radicalism" which instead of concentrating on ceilings did something useful to prevent the eviction of tenants particularly in the green revolution areas, say, by controlling land transfers.

The discussion on industrial performance centred around an assessment of the extent to which the objectives of industrial policy had been achieved. Everyone agreed that there had been some industrial growth though there were some disputes about the extent to which there had been a substantial structural change in industrial production. These, like other disputes about 'structural change', lacked a sense of proportion.

There was general agreement that the government had failed to prevent concentration of industrial capital in a few hands. Many people felt that this was because of inherent contradictions in the objectives of industrial policy and because of an ambivalence in the government's attitudes, reflected in the prevalence of the development rebate and measures to promote corporate savings and the Monopolies Act. In this sense the abolition of the development rebate is a welcome thing. H K Paranjape raised the issue of separating ownership and control. He suggested that it may be possible to reap the benefits of economies of scale and of conglomeration by separating the regulation of industrial control and the regulation of the ownership of industrial capital.

Predilection for Autarchy

The international context in which the Indian economy functions came in for discussion in the session devoted to foreign trade and the balance of payments as well as in some other sessions. In general one felt that most Indian economists have predilections towards autarchy. This may explain the lack of discussion about the disturbing results presented in V R Panchmukhi's paper on trade policies. There was some discussion about the relative importance of import substitution and export promotion. Samuel Paul and Hannan Ezekiel, however, pointed out the real issue was not import substitution or export promotion but efficiency at international prices which, in a market economy, would secure both. The participants were generally in favour of eliminating dependence on foreign aid though they did not discuss fully the precise role of foreign aid in the Indian economy or how it could be eliminated.

The discussions on monetary policy centred around the possibility of effective monetary control. Dev Nathan argued that the monetary authorities could not regulate money supply because of the high proportion of money supply in the form of currency, because of the fact that the monetary authorities had no control over budgetary deficits and because of the need to facilitate government borrowing programmes by avoiding disturbances in the securities market. S B Gupta and several others pointed out that even if the monetary authorities could have controlled money supply they lacked a proper policy-frame for exercising this control. Most people agreed with Brahmananda's suggestion that money supply in India adjusted to prices and production rather than the other way round.

The seminar discussed centre-state relations mainly in the context of public finance. B V Krishnamurti pointed out that there was no correlation between the responsibilities assigned to the centre and the states in the Constitution and their respective fiscal powers. However, there was little discussion about the best way of assigning planning authority and regulating functions on the one hand and fiscal powers on the other. V V Borkar seemed to feel that the assignment made in the Constitution was optimal and should be fully implemented. The discussion on centre-state relations also suffered from the fact that they lacked a political context.

The seminar discussed many other issues. The overall impression that emerged is that there has been a drastic radicalisation of Indian economists over the past few years. Yet this new radicalism is not based on a transformation in ideology. The way in which economists conceptualise and view the problems confronting the Indian economy seem to be unchanged. Thus there is no evidence that economists have moved away from the categories of neo-classical orthodoxy to the categories of, say, Marxian economies. They still talk about rates of return not rates of surplus value. They still work in terms of capital-labour ratios not in terms of the organic composition of capital. There are no class considerations in their analysis of policy. It is this dissociation between methods of analyses and policy prescription which ensures that many discussions about economic policy end up in slogan-mongering. It would be better for all concerned if policy debates were conducted either within the framework of a full-fledged socialist economy or within the context of hard-headed pragmatic radicalism *a la* Dantwala, Dandekar or Lakdawala. One assumes of course that in a state where capitalists pass resolutions in favour of socialism, conservative neo-classical economics has no role to play.

WEST GERMANY

The Ostvertrage

Aswini K Ray

AMONG the non-issues sustaining international politics, international treaties easily take the cake. When the going between two nations is good — the precondition for any treaty — the treaty is superfluous, and, when it is bad, a treaty is useless. No nation in history is known to have sacrificed what it considers its best interests because of an international treaty. Hidden deep under the 'sanctity' of international obligations is the muck of national politics. Most often such treaties facilitate the shadow-boxing necessary to show up the contours of a national perspective to the outside world.

Such shadow-boxing is on the cards now in West Germany; and the world awaits the outcome of the ratification proceedings of the country's two treaties with Moscow and Warsaw. As if, as party chief Brezhnev claimed at the recent Trade Union Congress at Moscow, the balance between "peace and war in the world" depended upon the ratification of Bonn's treaties with Moscow and Warsaw! If either party had the necessary strength to change the *status quo* (even assuming they wanted to change it) the treaty would not have been talked about; and, when either of them does have the strength, the treaty would either be forgotten or explained away. 'The high contracting parties' of any international treaty always know it. The Soviets themselves know only too well that a treaty with Germany in the early forties was useless; what they refuse to accept now is the fact that a treaty with West Germany in the seventies is unnecessary. The times have changed; but not so, it seems, the illusion of security surrounding treaties.

Staking Their All

The Soviets seem to have staked their all in seeing the treaties ratified by the West German Bundestag; they are blowing hot and cold in the same breath. The West German Opposition is unwittingly forcing more concessions from the Kremlin than the optimistic Brandt Government earlier thought was possible. On the eve of the Bundestag debate came the announcement of special arrangements for West Germans and West Berliners to visit relatives in East Berlin and the GDR during the Easter and Whitsuntide festivals. Following it came further concessions in the negotiations for a permanent regulation of the Berlin traffic. Shortly afterward, *Pravda* came out with a warning: future Soviet-German relations depended upon the ratification. But when the Government came to be threatened by defections, and the Opposition talked of new elections and a possible "constructive vote of no-confidence", Ambassador Fallin, who was himself present in the diplomatic gallery during most of the Bundestag debate, handed over to Chancellor Brandt more Soviet concessions: the Soviet government finally acknowledged Foreign Minister Scheel's letter written in 1970 indicating that the treaty did not in any way prejudice the aim for a future German unification. (A similar claim in 1955 had been summarily rejected by the Russians who had then claimed that the post-War map of Europe was finally and irrevocably drawn at Potsdam.) The Russians now agreed to forward Scheel's letter to the Supreme Soviet and to include it as part of the document constituting the treaty. The Soviet government also indicated the possibility of a trade agreement with West Germany including West Berlin. The Soviets also accepted the existence of the Common Market. Ambassador Fallin's note indicated the adverse consequences of the non-ratification: apart from affecting bilateral Soviet-German relations, the final four-power Berlin agreement would depend on it.

Good advice to the Opposition, and help for the Government, also came from good old friends. Apart from leaders of the neighbouring Scandinavian countries and the United Nations Secretary General, Secretary Rogers announced that the treaties would help promote world peace. President Pompidou, who had been an ardent supporter and, along with de Gaulle, a precursor of Brandt's *Ostpolitik*, again lent a helping hand to the West German Chancellor: he again announced his wholehearted endorsement of Brandt's *Ostpolitik* even while the Bundestag was debating the *Ostverträge*. Poor Barzel! He followed the Chancellor to Moscow and Washington, without any success; now he is in Paris trying to persuade Pompidou of his *bona fides*. No one questions it; there is no lack of appreciation of the Opposition's internal compulsions to oppose the treaties.

The Opposition has now climbed down from its earlier criticism of the Government that the *Ostpolitik* was a 'total sell-out to the communist aggressors'; it now merely says the treaties give away more than they earn for West Germany. The Opposition demands further freedom of movement of persons and ideas between West and East Germany. It accuses the Government of weakening the western alliance on the one hand and on the other (since the debate coincided with Nixon's Peking odyssey) asks a Far-East politik as a supplement to the *Ostpolitik*.

The Social-Liberal coalition does not claim the treaties to be ideal, but only the best in the circumstances; it claims that they would go a long way to remove tensions in Europe, minimise the human hazards of the Berlin Wall, and indicate the "first constructive step towards replacing confrontation with co-operation" between the East and the West. The Government also proved its anti-communist *bona fides* through its projected new repressive measures against 'Left extremism' in general, as also its actions against a row of Marxist intellectuals in recent times under one pretext or another. The Government countered the opposition attempts to be more papal than the Pope by quoting facts to indicate the overwhelming Western support there is to the Chancellor's *Ostpolitik*. According to SPD Parliamentary Secretary, Herbert Wehner, the present German *Weltpolitik* enabled the country not only to "stand on one foot" as the past CDU regimes has forced it to, but to "move forward on both feet".

Logic One Thing, Power Another

In any case, logic is one thing and politics another. In the jockeying for power for the 1973 general elections, not the merits of the treaties, but the outcome of the present battle is important. The two defections from the SPD have meant the loss of only one vote — members from West Berlin have no voting rights — but it has meant some loss of face, though not of confidence, for the Government. Still with a majority of five, the Government has no fears of losing in the division. The unquestioned nervousness of the Government stems from another source: the results of the state elections in Baden-Württemberg, where till now the old CDU-SPD Grand Coalition continues to rule with CDU still the single largest party. Here the SPD could afford to continue as the second largest party, even lose a couple of per cent of its

Ulka-MPC-20

votes to the CDU implying some setback but less disastrous than if the FDP loses about the same percentage of votes. That would mean the 5 per cent barrier for the FDP, its end in the state, and possible repercussions on the attitude of the FDP members in the federal parliament. After all, the leader of the FDP is the Foreign Minister, and the state election is clearly on the issue of the *Ostpolitik*. All the party leaders have understandably been campaigning in Baden-Württemberg. But the Social Democrats in this state have the onerous task of winning from their coalition partners in the state and simultaneously of preventing their federal partners from losing. The *Ostverträge* would be in jeopardy if the SPD fails to achieve either of these twin imponderables in the state.

Mud around the Super-Minister

Meanwhile, Super-Minister Schiller — a much-married man — continues to make more enemies than is good for the ruling party, particularly in the present circumstances. For the third time a secretary has resigned from his department, again 'for personal reasons'. The capital's gossip columnists are agog with reports of all the kitchen intrigues brewing around him. A competent technocrat, like a lot of them Schiller has already become some sort of a political liability. Recently again, for the umpteenth time, the Chancellor had to come to the aid of his prodigal colleague and shield him from his party critics. But the Opposition has already splattered a lot of mud around the Super-Minister.

While the parliament's Foreign Affairs Committee scrutinises the treaties after the three-day Bundestag debate, the Opposition has announced its 'shadow cabinet'. The Foreign Affairs Committee Chairman, Schroeder, gets back the shadow Foreign Ministry; the present Super-Ministry has been divided, and Strauss gets back the Finance portfolio, with the economic affairs separated. Schroeder categorically announced the Opposition's continued opposition to the treaties, but with a catch: "it may be easier to ratify the treaty with Warsaw than the one with Moscow". Meanwhile the shadow cabinet, according to Rainer Barzel, is "ready to take over the responsibility of government at any time". No one doubts it; in fact, this statement could be the best summing-up of the internal compulsions of the West German Opposition in their attitude to the *Ostverträge*.

GHANA

Holding Whose Fort?

Africanist

"NEO-COLONIALISM", said Nkrumah, "is not a sign of imperialism's strength but rather of its last hideous gasp". Ignatius Acheampong and his National Redemption Council, ruling Ghana today, are but a stage in that gasp.

The coup against Nkrumah in February 1966 was not, as is popularly believed, the outcome of his ineptitude or bungling; rather, it was engineered precisely because Nkrumah was feared to have definite ideas about freeing Ghana from the stranglehold of international capital.

Inaugurating the Bank of Ghana in July 1959, Nkrumah had stated: "Our political independence will be meaningless unless we use it so as to obtain economic and financial self-government and independence". Then, Nkrumah proceeded to take steps with regard to the Ashanti Goldfields Corporation. In what he assumed would give Ghana a little more control over Ashanti, a heavy tax was imposed on it. It was not Nkrumah's immediate intention to nationalise the company which was still able to declare a total dividend of 37.5 per cent on the original capital of £ 250,000. Ashanti had built up its present £ 3.5 million capital base out of profits alone. Nkrumah also set up Ghana's own diamond market in Accra and all sellers, including Consolidated African Selection Trust (CAST), which was working a valuable 68 sq mile concession in Akim Abuakwa district, were to sell through the new market.

Other imperialist monopolies operating in Ghana were not nationalised. Instead, they were brought under a doubtful system of controls. Thus, the imperialists, during Nkrumah's time, maintained their economic and political positions within the country, and it was from the inside that the neo-colonialists, using elements in the State apparatus, the army, and even the official party, managed to put through the coup against Nkrumah.

Yet Nkrumah's achievements were sizeable. Under him, roads were modernised and extended; a network of telecommunications came into existence; a new broadcasting station was established in Accra with a countrywide network of sub-stations bringing the radio to even the remotest village; printing houses were established; a new modern harbour at Tema was constructed and the existing harbour at Takoradi was modernised; new schools (which more than trebled the number of seats), new universities, and technical training institutions were established. Education from the primary to the university level was also free. Hospitals and medical health centres were built, and such medical treatment as was available was free. Agricultural services were extended, modern farm machinery was acquired, and advanced agricultural studies were introduced into the university system. Deep-sea trawlers were purchased for the fishing industry; traditional fishermen were encouraged to form co-operatives; State and co-operative buying and marketing of fish was introduced. A giant refrigeration plant was built, so that large catches did not rot in the tropical heat.

Greatest Achievement

But Nkrumah's greatest achievement was the Volta River Project (VRP) a multi-purpose scheme with a dam across the Volta just above the Accra Plains.

Along with VRP went a plan to use Ghana's huge bauxite deposits in an indigenous aluminium industry. The railway system was extended to take the bauxite to the new township and industrial estate at Tema, where a giant smelting plant was built. Anticipating power from VRP, new manufacturing industries came into existence in Tema, and a programme was instituted to train workers technically. At the beginning of February 1966, Nkrumah inaugurated the flow of hydro-electric power from VRP; 24 days later (February 24), while he was in Peking seeking aid, the National Liberation Front under Harley and Afrifa seized power in Ghana.

The NLC immediately set about scrapping Nkrumah's development plans, and systematically went about crushing pro-Nkrumah elements so as to prevent a resurgence of Nkrumahism. This was not a difficult task. Nkrumah's ideas had not filtered down to the masses, who had not participated in any economic or social revolution clearly giving them a direct stake in the policies and ideas of the regime. In fact,

Nkrumah's failure lay in his reliance on some progressive elements within the Convention Peoples Party (CPP). Further, even as the CPP was taking an anti-imperialist position, its ideological foundation was shaky and was heavily biased toward Nkrumah's concept of 'Pan Africanism'. This weakness, together with Nkrumah's inability to create out of the CPP a broad-based mass party with its roots among the peasants and the workers, was his final undoing. The CPP was a party of the bourgeoisie, for the bourgeoisie. When Nkrumah was overthrown, the CPP disintegrated. There could be no call to the masses to revolt, because the CPP did not prepare the masses for a complete imperialist takeover. It was impossible for the CPP to play this role, because the ruling circles within the party were already agents of imperialism. In fact, the NLC's uncontested hold on power for three years cannot be explained except in terms of the support it got from this section of the CPP.

Three years later, the NLC installed Kofia Busia as premier, but power rested in a presidential commission made up of Afrifa, Harley and Ocran. The US was pleased, and William Rogers, US Secretary of State, went so far as to state that the US was impressed by Ghana's steps towards civilian rule and was therefore prepared to grant it New Cedis 15 million for importing raw materials, spare parts, and capital equipment, for its economic development. Busia's role, of lending civilian respectability to the regime, thus became clear.

However, a few days after his installation, the violence and civil war that followed the imposition of Busia's choice of the new paramount Chief of Yendi, made it clear that Busia would not be able to maintain civilian peace. Not long afterward, Ghana experienced its biggest food crisis in history. Practically all the essential foodstuffs had to be imported — mostly again from the US. Normal import restrictions were removed. Nevertheless, food prices rose phenomenally; and so did extreme malnutrition: hospitals in Tamale were inundated with such cases.

Ghana received massive aid of $ 250 million. But debts accumulated, and the World Bank consultative group had to be asked for a doubling of the repayment period for the dues between 1972-1982 totalling over $ 350 million.

There was unrest at home. In September 1969, 2,000 workers from the Ghana Rubber Estates, went on strike for more than a month. Their principal demands were for more pay and the expulsion of certain senior officers. In Accra, dismissed State Corporation workers, who were given no severance pay, locked up the management. Early in March 1969, police opened fire on striking demonstrators at Ashant and three workers were shot dead and many injured. Busia set up a commission to look into the matter. When the Commission submitted its report, Busia refused to publish it. At the Obuasi goldmines, 7,000 workers protested against the refusal and went on strike. Busia retaliated by intimidating the strikers and arresting large numbers. Thus Busia got into open conflict with the workers. Attempting to disorganise them, he dissolved the Federation of Labour, a body with a strong socialist bias, and distributed its assets among the 67 constituent units. It was a clear attempt to create independent trade union units schisms among the working class, and thus to render concerted trade union action difficult. But the 67 unions reconvened themselves and formed a new federation. It was this new, more conscious, federation that Busia had then to contend with. Meanwhile, even in his own administration, he was faced with a dissatisfied civil service. In July 1969, the Junior Civil Servants Association threatened a countrywide strike. Two days before the strike, the NLC proscribed the Association.

Unemployment the Trigger

But what really triggered off the working class struggle was the unemployment that resulted from Busia's closure of State farms and his scrapping of the various industrial and agricultural projects initiated under Nkrumah. According to official estimates, 6,000 were unemployed including a large number of teachers and students. Teachers too went on strike because they did not receive their pay. On student unemployment, the *Ghanian Times* asked: "How can the Ghanian taxpayer spend large sums on the universities only to find their products idling without work?" Besides, free education was abolished. Busia even laid off 300 workers from the Water and Sewerage Corporation because of the shortage of funds.

The administration was corrupt too. Ministerial salaries alone, aggregated East African shillings 5,227,300 (rather more than the 2 million EA shillings under Nkrumah). So rife was the corruption, nevertheless, that the Presidential Commission was forced to appoint a five-man Commission to study the problem. Its report on the State Furniture and Joinery Corporation is typical.

Like several other enterprises, the Commission stated, the Corporation was mismanaged, significantly, because of political interference. Thus, what characterised the Corporation was "a reign of confusion, maladministration, mismanagement, rancour, chicanery and undermining". Private firms manufacturing things for the corporation got their raw materials from the Corporation on credit — these firms acted in a fradulent and dishonest manner; the import licence of the Corporation was used by private firms; huge amounts due to the Corporation (e g by two MPs), were written off without proper authority; goods were sold to customers without proper accounting; salaries were raised without permission; a firm of auditors appointed by the Auditor-General for the Corporation's accounts was "guilty of gross dereliction of duty"; the Corporation was in large debts; and so on.

It is telling that, for all this financial and economic chaos, what finally played an important part in Busia's downfall was his move towards a dialogue with South Africa. After returning from his State visits to the West, Busia set about trying to establish some sort of working relationship with South Africa. First, he advocated renunciation of the Organisation of African Unity's policies against South Africa, stating: "the situation compels us to be independent". Also, about this time, Busia allowed the Ashanti Goldfields Corporation to sell their interest to Lonrho — a concern which has links with the South African, comprador, Anglo-American Corporation of Oppenheimer. Thus Busia's intention was to solicit financial and technical assistance from South Africa to bolster his sagging position. This incensed the people. There were demonstrations in Accra. His downfall followed.

Significantly, Acheampong's first statement opposed dialogue with South Africa. Acheampong, in power today, has to tread warily. He needs support from the people, and clearly the best way to get that was to disassociate himself from those aspects of Busia's policies which were the breeding ground for a real revolutionary situation in Ghana. Thus Acheampong has stemmed the tide — at least for the time being. But he and his National Redemption Council (NRC) are just a new group of choir boys in the same old church.

Source Book, Not Policy Guide

A C Shah

Report of the Banking Commission, Government of India, 1972; pp xvi + 760.

THE report of the Banking Commission is a formidable piece of work. It undoubtedly bears the stamp of hard labour spread over nearly three years. In view of its comprehensive coverage of issues, the report will constitute for many years to come the most important basis for policy formulation affecting the growth and diversification of Indian banking. This underscores the need for an informed public debate on the major recommendations of the Commission.

It may be said at the outset that the report does not come up to the high standard that is expected of a national commission. The Commission appears to have succumbed to the temptation to attempt to cover every conceivable aspect of banking. This may make its report useful as a record but imposes severe limitations when it comes to analysis and interpretation. This is mainly responsible for the absence of a sound theoretical base and a sharp perspective which reports like this ought to have.

Co-operative Banking

The fundamental contribution of the report lies in its recommendations on co-operative banking. Although the subject has been discussed threadbare time and again, fresh ground is broken and new and bold ideas are thrown up. The Chairman, R G Saraiya' insights as a co-operative banker of long standing come into full play in this field. Following the integrated scheme of rural credit adopted in 1956, co-operative banking has taken rapid strides. But behind the impressive quantitative growth have been concealed many qualitative deficiencies. The progress has been uneven, overdues have been heavy and have continued to mount, deposit growth has been meagre, dependence on the central banking authorities has been excessive, vertical and horizontal integration of business has been poor and scant attention has been paid to management.

The primary credit society has been the weakest link in the co-operative structure. Taking into consideration the recent experience, the Commission rightly comes to the conclusion that reorganisation of more than one lakh agricultural credit societies into viable units on the lines recommended by the All-India Rural Credit Review Committee would not be completed in the foreseeable future. It then takes a bold stand by asserting that the primary tier should be dispensed with altogether and replaced by a wide network of rural banks. Orthodox co-operators, who have not reconciled themselves to the gradual dilution of co-operative principles, are bound to be taken aback by this suggestion.

To start with, viable primary credit co-operatives should be converted into rural banks, preferably with the help of the apex and central co-operative banks. Each such bank can be organised for a group of, say, 10 villages, covering a population ranging from 5,000 to 20,000. In sparsely populated areas, it may be necessary to organise a rural bank for as big an area as a development block. The report outlines a detailed scheme for organising such banks and maintains that rural banks will be free from the weaknesses of primary credit societies and that they would be able to cater to all the credit needs of farmers and artisans. In areas where the co-operative credit structure is generally weak, commercial banks can set up their own rural subsidiary banks. Of the total capital of a rural subsidiary bank, the sponsoring bank will hold 51 per cent and the remainder will be available for subscription by the people in the area of operation of the rural subsidiary bank. In those cases where no local participation is forthcoming, the sponsoring bank would have to provide the whole of the capital for the rural bank. In course of time, the sponsoring bank should sell a part of its holding to the local people. The establishment of rural subsidiary banks will necessarily be somewhat slower than that of rural co-operative banks as it will take time to sort out the various practical problems of running such banks. The Commission has recommended that commercial banks should take up this work on an experimental basis for a period of five years and establish rural subsidiaries in some of their lead districts. The experience gained during this period will decide the future of the scheme.

The report has many pertinent observations to make about the surplus share capital contributed at different levels of the co-operative credit system, the strategy and methods by which deposits can be mobilised by co-operative banking, and the failure of the state governments to administer the co-operative movement. The Commission has recommended that co-operation should be removed from the State List and included in the Union or the Concurrent List. This suggestion is also likely to meet with strong opposition. The Commission's recommendation to merge the Agricultural Finance Corporation with the Agricultural Refinance Corporation will, however, be generally welcomed.

Definite Bias

The Commission demonstrates a definite bias in favour of co-operative banking. Despite the past adverse experience and the present unsatisfactory state of affairs, it firmly believes that the system can be revived if its comprehensive recommendations are implemented. In other words, it would like to give one more chance to the co-operative movement. The Commission has doubts about the ability of commercial banks to reach down upto the village level. It is also not in favour of commercial banks extending direct finance to agriculture on a large scale. A number of suggestions are made as to how commercial banking should help co-operative banking. Thus the report gives the impression that the Commission would like to reserve the field of rural banking for the co-operative credit system. Although it repeatedly emphasises the interdependence of the two sectors, the commercial banks are asked to give without receiving anything tangible in return. It will be difficult for commercial banks to accept this position. The relationship between the two sectors should be carefully examined before any commitments are made.

The performance of primary credit societies does not inspire the confidence that would be feasible organisationally to create a wide network of rural co-operative banks and subsidiary rural banks. A similar programme for fostering large-sized co-operatives was accepted in 1956 following the Gorwala Committee Report, but under the pressure of orthodox co-operators it was given up in stages. The government's co-operative policy has been very volatile and this has done a great deal of harm to the co-operative movment. There is one more important point. When

the Commission is prepared to give up the primary tier of the co-operative system, why should it hesitate to say goodbye also to the remaining two tiers at the central and the apex levels? Their survival can be justified only on two grounds — one, that they will help finance rural marketing and processing enterprises on a significant scale and, two, that they will help rural banks to come into existence. There is no reason why commercial banks cannot perform these functions. Perhaps, in view of their organisational and financial resources, they can perform these tasks better than co-operative banks.

Structural Reorganisation

In the field of commercial banking, which is the main preoccupation of the Commission, the most controversial set of recommendations relate to the restructuring of the banking system. The existence at present of 22 separate banks in the national sector is a historical accident. In the opinion of the Commission, not only is the number too large, but the distribution of banking facilities provided by these banks is uneven as between different states. However, the Commission has categorically rejected the merger of all the 22 banks into one bank on the lines of the LIC. This would raise enormous problems of integration. The Commission also believes, rightly, that a reasonable choice must always be available to the customer to choose his bank. After building up its case systematically the Commission reaches the major conclusion that there would be three all-India banks and five or six regional banks. The all-India banks should aim at having branches in all population centres at the level of district towns and above. The other banks, each one of which working over the areas of, say, 2 or 3 neighbouring states, would have branch networks below the level of district towns in the concerned states. In metropolitan cities, both the all-India and the regional banks should be allowed to open branches so that every bank gets a reasonable share of the business in these centres. Each of the national and regional banks will have between 1,500 and 2,000 branches to begin with and between them they would be responsible for opening between 1,800 and 2,000 branches a year, that is 200 to 250 branches per unit. At the end of 10 years from the inception of reorganisation along these lines, the Commission has recommended a comprehensive review of the working of these banks, the size they have attained and the further organisational changes that will be necessary keeping in view their future development.

The Commission considers three other suggestions as alternatives. First, the restructuring might be such as to form 8 or 9 all-India banks. Second, the restructuring might be achieved by forming a similar number of regional banks. Third, an altogether different method of restructuring would be to form banks on functional lines. All the functional banks would have to operate on an all-India basis. The first two alternatives are rejected by the Commission on the ground of high cost. As regards the third one, the Commission feels that in the conditions obtaining in our country this method does not offer any advantages. Moreover, it would involve a very drastic change in the institutional structure which can cause serious disruption of economic activity until the reorganisation is completed and the banks begin to function in an efficient manner.

The case for a smaller number of banks is examined at length from the angle of economies of scale, management control and effective implementation of monetary and banking policies. The Study Group on Banking Costs, appointed by the Commission, comes to the definite conclusion that there are positive economies of scale and that the size of a bank has a definite relationship with the profit margin. Larger banks have an advantage both in regard to average interest rates as well as the average servicing cost of their advances. Another study prepared by C Rangarajan and Paul Mampilly on the relationship between total costs and the size of a bank comes to the conclusion that on the basis of average costs, economies of scale are available upto Rs 600 crores of deposits. This figure can move upward as a result of inflation. It can also move upward if the methods and procedures used in a bank as well as its organisational structures are improved. The two management experts feel that there is no constraint on the size of operations of a bank from the management viewpoint. In other words, the prospect of diseconomies of scale in banking is not as real as it might appear at first sight. Effective methods are available to reduce their incidence. The argument is in favour of having large-sized banks from the point of view of increasing the range of services also. The smaller number of banks would make it easier to implement effectively the Reserve Bank's credit policies and the government's policies for banking development. It would be much more convenient if the authorities had to deal with only a few large and equal-sized banks.

All-India Banks with Regional Bias

The attempt to divide banks into all-India and regional categories, as suggested by the Commission, would create first and second class status among banks. This would have adverse effects on the growth of banking. The better course would be to have 5-6 all-India banks. The existing banks should be integrated in such a way as may give each unit almost an equal number of branches and an equal volume of deposits. What is more, each unit should have a distinct regional background. For a country of continental sizes, 5 or 6 all-India banks cannot be considered too many. This is a very sensitive area and the authorities should give careful consideration to the problem before taking any decisions. Pending that, the present structure should not be disturbed. In fact other recommendations of the Commission can be implemented independently of the structural reorganisation of banking.

The Commission makes a substantive contribution to the little explored area of the cost structure and profitability of banking. The Study Group on banking costs has done pioneering work and come out with many revealing findings. The profile of an all-India average bank branch shows deposits of Rs 62 lakhs and advances of Rs 42 lakhs. This average is undoubtedly high when one takes into consideration the opening of a large number of rural branches in recent years. Out of its total expenses of Rs 0.55 lakhs for the quarter, 40 per cent is accounted for by deposits, 18 per cent by advances, 15 per cent by bills and 12 per cent by remittances while the remaining 15 per cent relate to other services. Deposits are a clerical-oriented activity, while advances are an officer-oriented activity. Expenses at the head office common to all services work out to 8 per cent of the total cost at the branch level.

While servicing charges are the highest for current deposits and the lowest for fixed deposits, the position is reversed when the interest cost of funds is taken into consideration. The per voucher costs for current deposits, savings deposits and fixed deposits are estimated at Rs 1.88, Rs 1.78 and Rs 6.29, respectively. The average number of vouchers per account per quarter for savings accounts are only about 2 as against 30 for current accounts, indicating that a large number of savings accounts are maintained by

depositors for conserving surplus funds. The servicing costs for small-scale industries and advances to farmers are high, 3.4 per cent and 2.7 per cent, respectively, as against only 0.3 per cent for large as well as medium-scale industries and 1.9 per cent for personal as also professional loans and other advances, mostly to trade.

The servicing costs per item of remittances are estimated at Rs 5.18 for drafts, Rs 5.55 for mail transfers and Rs 13.90 for telegraphic transfers. As regards cheques and clean bills, other demand bills and usance bills the cost per item for negotiation, collection and remittance of the relative proceeds are estimated at Rs 4.89 Rs 8.48 and Rs 10.89, respectively. Head office expenses on these services consist mainly of interbranch reconciliation and work out to 0.2 per cent of the branch level expenses. The analysis of the data in regard to foreign exchange business reveals that imports and exports each account for about one-third of the cost of total foreign exchange business, while clean remittances and other business (such as bills covering exports on a consignment basis, medium-term export credit, deferred payments and other guarantees, etc) account for 13.4 per cent and 21 per cent, respectively of the total. The foreign exchange business as a whole is less clerical-oriented than deposits and more clerical-oriented than advances. The average profit to banks on sterling remittances comes in the region of 0.25 per cent and 0.12 per cent for sales and purchases, respectively, during the survey period. For foreign business as a whole, the exchange profit works out to 0.21 per cent. Therefore, the Commission would like the banks to pay great attention to the cost factor in foreign exchange transactions. There is need for banks to examine carefully their existing procedures and methods of handling foreign exchange transactions and also for developing methods of cost and profitability analysis in this field. The Commission would like the FEDA to re-examine the schedule of minimum rates prescribed for different types of commission charges.

The report then makes several useful suggestions. It would like banks to formulate profit objectives. In the light of that, the price structure for the services rendered by banks should be suitably altered. The main components of the price structure are interest rates and service charges The Commission has also shown how to estimate profitability of a branch in a realistic manner. It recommends the use of inventory control techniques for cash management. The balances held by most of the branches appear to be considerably larger than necessary. The safe reduction in the percentage of cash to deposits varied from 0.6 to 7.2 for sample branches.

The Commission is in favour of doing away with secret reserves. The purpose of secret reserves in the past was to add an undisclosed strength to banks which could be useful in times of stresses and strains or in an emergency. With the nationalisation of the major banks, this purpose has lost its validity and the public are entitled to know the true position of banks through their published accounts. If the position of the bank is good it does not need secret reserves as a strengthening factor. On the other hand, if its position is unsatisfactory, secret reserves will really be of very little use. Recently, in the UK the clearing banks collectively decided to reveal their true profits and reserves. The legal aspect of this question is discussed at length by the Commission.

Research and Training

There is one more important recommendation made by the Commission to promote competition in the field of deposit mobilisation. From the point of view of maximising deposit mobilisation, the deposit interest rate structure has to conform to the expectation of the public about the appropriate rates for deposits of different terms. One method of achieving this is to let banks compete freely for deposits so that market forces can determine the rate structure. In the absence of market determination of rates, a considerable amount of research will have to be undertaken to determine which rates need revision and in what direction. The Commission recommends that this should be initiated by the appropriate authority.

In view of the far-reaching changes taking place in the banking industry, the Commission repeatedly emphasises the importance of research and training. This is a field which is vital to the development of banking but which has been neglected so far. The Economics and Statistics Department has to be strengthened considerably in every bank. It should constantly analyse internal data and place before the management important findings from time to time. It should analyse and interpret economic trends from the angle of the bank concerned. On both these points several useful suggestions are made in the chapter on 'Information System for Banks'. This department can also undertake studies and surveys on specific issues relevant to policy-making. Evolution of the planning function in a bank will require the establishment of other specialised departments such as Organisation and Methods, Management Development, Business Development and Publicity and Public Relations. The report reviews at length the training facilities available in the banking industry and makes many valuable suggestions to improve them through the suitable reorganisation of the National Institute of Bank Management, the Indian Banks' Association and the Indian Institute of Bankers as also through appropriate arrangements with universities and other research or teaching institutes. The set of recommendations made by the Commission in the field of research and education deserve close examination.

The Commission's recommendations on operating methods and procedures as also management development go into details. While going through this part one wonders whether all these details are necessary in an important report of this type. The Commission recommends that the teller system should be adopted in all banks at all important branches for encashment of cheques and receipt of cash for credit to accounts. The practice of half-yearly closing of accounts should be discontinued as it entails considerable labour without commensurate benefits. Banks should progressively switch to mechanised accounting systems. The computer is particularly useful for reconciliation of inter-branch transactions and for processing a large volume of information useful for policy-making and economic research. Although it is costly, banks can hire it on a time or job basis. Alternatively, several banks can purchase it jointly for use amongst themselves on a time-sharing basis. Mechanisation should be introduced by banks, especially at larger branches, by adopting a phased programme and by taking the employees' unions into confidence.

A bank Giro should be established by banks with mutual collaboration as an independent institution, to clear inter-bank credit transactions relating to transfer of funds from one bank account to another and also remittance of funds by a non-account holder to an account holder and vice versa. The Commission recommends the setting up of a Credit Intelligence Bureau as a statutory corporation for compiling and furnishing credit information to various financial institutions in the country. Its

working should be mechanised to ensure speedy collection and supply of data. Further, for administrative convenience, the Bureau may confine its operations in the initial stages to bigger cities. The Commission recommends that a Committee may be appointed under the auspices of the Reserve Bank to consider in detail the question of creation of a common agency for inspection of offices of all National Banks and to formulate standard forms and procedures, keeping in view the advantages of mechanisation on a planned basis. The Commission also recommends that to begin with and on an experimental basis, administrative offices of banks may remain fully closed on Saturdays, the working hours on the other week days being suitably enhanced. The question of introducing a similar change in bank offices dealing with the public may be considered later. As the major portion of the banking industry is now in the public sector, the Commission would like to have a common agency for recruitment of staff for these banks both at the clerical and junior officers level. This agency is to be called the National Banking Service Commission. It will be a statutory commission with wide functions and extensive jurisdiction.

Lead Bank Scheme

The report has certain pertinent observations to make on the Lead Bank scheme. It is not happy with the way in which banks have conducted surveys. It believes that banks were not organisationally prepared to undertake the job. What is more, they are not in a position to take a total view of the situation and correlate the financial plan with the physical one. The report gives the impression that banks have used the surveys as a delaying tactic. The Commission would like the survey work to be done by the district planning authorities. Here the Commission's faith in the district authorities does not appear to be justified. Even in the districts of Gujarat and Maharashtra, banks had to do considerable work to create the economic picture of a district against which its financial institutions can be studied. This difficulty will be all the more serious in the less developed states. Above everything, the survey work has given banks the feel of places and also some ideas as to how banking development work can be undertaken. Banks have been making concerted efforts in their lead areas to open more and more branches, mobilise deposits and extend credit. The progress remains under constant observation of the top management and the Board of Directors. The Lead Bank Scheme is progressing on the right lines. It will not be advisable to introduce any basic changes at this stage. This does not mean that there is no scope for improvement.

The Commission has made valuable suggestions in respect of specialised financial institutions and other non-bank financial intermediaries. The importance of such institutions is yet to be realised in our country. Consequently the recommendations regarding them should be examined in depth, particularly against the background of the emerging financial structure in the country. What is attempted here is a summary of the main recommendations. Merchant banking institutions are needed in the country to offer two types of services — syndication, financing and promotion of Indian projects as well as investment management and advisory services to medium and small savers and to provident funds, pension funds and trusts of various types. Initially there should be four merchant banking institutions located at Bombay, Calcutta, Madras and New Delhi set up by commercial banks and specialised financial institutions. These merchant banks can later set up branches at other important centres. The machinery for providing export credit is considered adequate and hence in the Commission's view there is no justification for the creation of an Export-Import Bank. A two-tier system of housing finance should be created with an apex housing finance institution at the national level and local finance institutions at the district or regional levels sponsored by the local community. Co-operative housing societies should be strengthened, particularly with a view to mobilising resources from members and eliminating malpractices. An apex co-operative finance society should be set up in each state to refinance affiliated primary societies all over the state. Commercial banks should give short- and medium-term credit to builders in order to enable them to undertake mass housing construction programmes. The LIC and General Insurance institutions should devise schemes to guarantee housing loans. Steps should also be taken to create and develop a secondary mortgage market and impart liquidity to housing loans.

The Commission has made important suggestions to improve and regulate the organisation and working of hire-purchase companies, chit funds, nidhis, indigenous bankers and investment companies. It has made a comprehensive study of all the enactments affecting the banking industry. In the light of the study a large number of amendments have been suggested. It is recommended that a special machinery should be set up by the Central Government for constant review of laws concerning and affecting banking. It has also outlined in detail how the restructured national banks should be organised and how they should function.

The Banking Commission has completed its work. The authorities, the Reserve Bank and the Banking Department of the Finance Ministry, have now to start their exercises. In this work they should be assisted by bankers, commercial and co-operative, and students of banking with studied comments and constructive suggestions.

The first major, and so far the most comprehensive book on Bangladesh...

THE GENESIS OF BANGLADESH

A study in International Legal Norms and Permissive Conscience

SUBRATA ROY CHOWDHURY

Barrister-at-Law

"There are other studies of the Bangladesh liberation struggle, but none more soundly researched, and none, of which I am aware, which focuses upon the question of international moral and legal responsibility. The careful documentation of conventions and charters dealing with war crimes and crimes against humanity is a particular strength of the work. It is a major contribution to the framework of knowledge in which the events of the past year will be judged."

Agrarian Transition and the Differentiation of the Peasantry

A Study of a West UP Village

Ashwani Saith
Ajay Tankha

In this paper an attempt has been made to study the respective positions occupied by different sections of the peasantry in the complex socio-economic structure of a village in west UP.

In the process of this study, we encountered several methodological problems which are discussed at the beginning in some detail. While the methodological observations have, strictly speaking, only this village study as their domain, they might be of more general interest.

Also analysed are the prospects with which the so-called Green Revolution confronts the different sections of the peasantry.

We have consciously chosen a wide canvas so as to be able to sketch out, albeit tentatively, the aggregate framework within which alone, in our opinion, a meaningful village study can be conducted.

Organised within a Marxian frame, both the factual content and the inferences of this study have been derived from investigations conducted by the authors at the village.

This paper, which is a sequel to an earlier paper ("Economic Decision-Making of the Poor Peasant Household", Annual Number, February 1972) on the economic decision-making of the poor peasant household, forms part of a study conducted at the Agricultural Economics Research Centre, Delhi.

[We gratefully acknowledge the useful suggestions made and the help rendered during the writing of these papers by Aurobindo Ghose, Ardeshir Jamshed Dalal, R L Narayan and S Ganguli. However, we alone are responsible for the views expressed in the study as also for the errors that remain.]

I
Methodology of Agrarian Transition

(1) Features of Transition

IN most non-socialist underdeveloped countries today, agriculture is in a stage of transition to capitalism. This movement from the feudal mode *via* particular intermediate stages to the capitalist mode displays some uniform characteristics. Firstly, even though the transition process has an increasing rate of progression, it is highly time-consuming. Secondly, the forces that provide the impetus for this transition act with widely varying degrees of influence on the different parts of the pre-capitalist rural economy. Hence, one resultant feature of this economy-in-transition is that it exhibits at the same time and in the same region, a phenomenal array of forms of organisation and relations of production, ranging from pure capitalist relations on the one hand, to accredited feudal relations on the other. Spatially, the variety is only further multiplied. A second important feature is that throughout this period there occurs a continuous strengthening of emerging capitalist relations. In such an economy, the injection of a superior technology alongside increased capital investment catalyses this transition noticeably, and speeds up the development of embryo capitalist relations.

(2) Analysis of Transition: Two False Approaches

A systematic exposition of the "special laws" governing the development of capitalism in agriculture can be made only if the economics of pre-capitalist agriculture and the connecting transitional forms are properly studied and understood. Incorrect or inadequate cognisance of this may lead researchers in this field into formulating inquiries or adopting postures that are not useful to a study in depth of an agrarian economy-in-transition. Thus, one approach sets itself the task of discovering, at the given time, whether agriculture is feudal or capitalist by reference to some stipulated criteria. This heroic labelling approach has increased the semantics/real content ratio of the literature more than our knowledge of the transitional economy. The heroics, however, are assumed to be justified by the need for a "sharp analysis". Another approach faithfully reports the fine detail of reality, but makes no attempt at analysis beyond framing some conjectural *ad hoc* hypotheses of dubious validity. The implicit alibi here is that if any analysis is to explain the "confusing" agrarian scene comprehensively, it would inevitably carry into the analysis the "confusion" that prevails in reality. This is an exceedingly primitive empiricist position.

Both approaches commit serious methodological errors. The former is too mechanistic in its application of the known laws of development of societies, and ignores the role of concrete historical situations in conditioning the operation of the laws themselves. Thus, on account of its rigid adherence to the categories of feudalism and capitalism (which are treated in an as-if exclusive fashion), the no-man's land between feudalism and capitalism gets ignored. The second approach, on the other hand, goes to the other extreme: it makes no use of these known laws of development of societies for the purpose of deriving a criterion of meaningful abstraction from unnecessary detail. Hence, the construction through the use of the method of induction of a

TABLE 1: CLASSIFICATION OF HOUSEHOLDS INTO POOR, MIDDLE AND RICH GROUPS

Group	Number of House-holds	As Per Cent of Total Number of Households
Rich peasant	39	21.08
Rich non-peasant	6	3.24
Middle peasant	29	15.68
Middle non-peasant	3	1.62
Poor peasant	40	21.62
Poor non-peasant	68	36.76
Total	185	100.00

useful analytical framework must await the moment when reality itself throws up the criterion of abstraction, i e, when the characteristics of the new mode become overwhelmingly apparent. Both approaches are unhelpful for the purpose of studying the character of transition. The first is inadmissible because in its search for analytical "sharpness" it abstracts from the very *essentials* of the problem. Apropos the latter we must note that "confusion" is not an intrinsic property of reality. Contrariwise, the existence of "confusion" reflects primarily an inability to explain satisfactorily the historical phenomenon of transition — and this in turn reflects the inadequacy of the analytical framework being employed.

(3) ANALYSIS OF TRANSITION: METHODOLOGICAL IMPERATIVES

The main conclusion to be drawn from the preceding discussion is that in the context of a study of agrarian transition, it is neither scientific nor necessary to label the economy "capitalist" or "feudal". The starting point must be a recognition of the simultaneous existence and overlapping of aspects of two or more distinct modes of production. The necessary functions of the study of transition then become:

(a) an analytically meaningful characterisation of the complex of production relations prevalent, and the position of the different sections of the community in this complex.

(b) to unearth the underlying logic, and analyse the operation in concrete terms of the process of change which transforms the material and social basis of production from the pre-capitalist to the capitalist ones.

(c) to assess the extent to which this process of transition, with its inherent logic, has carried the community towards capitalism.

Another moral to elicit is that this simultaneous existence and overlapping of different modes of production in the agrarian economy holds some methodological imperatives for the study of such an economy.

(1) Since a structure of economic analysis is designed in relation to some particular class of historical situations, its usefulness is *ipso facto* confined to that class of situations. And since the institutional and organisational bases of the overlapping feudal, other pre-capitalist and capitalist modes is totally different, a particular analytical structure developed to study the laws of functioning of feudalism (or other pre-capitalist modes) will be irrelevant for studying the corresponding laws for the capitalist mode. Furthermore, neither the transition process, nor the transitional forms can be analysed purely within the "capitalist" frame of analysis, since in the transition phase, there will exist only small areas of the economy where the capitalist categories of analysis will possess corresponding real counterparts. It is necessary, therefore, to analyse the functioning of the pre-capitalist areas of the economy in transition within a framework based on premises relevant to that particular pre-capitalist historical and institutional setting. Thus for an analytically meaningful characterisation of the complex of production relations prevalent, and for a comprehensive study of the respective prospects and positions of the different sections of the community in this complex, a separation of these different analytical areas becomes imperative. But beyond this, if the study is to attempt to be scientific, it must account for the analytical implications of the fact that the functioning of each of the separable areas (where different modes predominate) is significantly affected by the simultaneous existence of another area (where a different mode predominates). This point will be illustrated in the following section.

(2) However, since historical development definitively reveals that pre-capitalist modes are replaced in this process of agrarian transition, by the capitalist mode, it would not be enough to study the separable analytical areas, each in isolation, and so to derive respective analyses of their functioning. We must develop another area of analysis: one which atempts to unearth the mechanism by which the old order dies out and is replaced by the new one. In other words, we must study, at a different plane of generality, the logic of motion of the pre-capitalist mode into the capitalist mode. This is imperative if we are to make any sense of the direction, and the character of process of transition to capitalist relations in agriculture.

The criterion applied for delineating the analytical areas is the predominance in the separated analytical areas of (aspects of) different modes of production. The mode of production is identified by its primary contradiction (its fundamental relation of production) landlord-serf, or capital-wage-labour, etc. It would seem perfectly possible, therefore, to list all the relations of production entered into by the households of the community, and then to classify these relations (each of which would be recognised to be characteristic of one mode of production or the other) into separate analytical areas; for by so doing, it would seem that we would *ipso facto* have separated out the domain of the different modes.

However, such a classification, as well as the areas that would emerge through it, would not be particularly useful from the point of view of the objectives of the study of the transitional agrarian economy: for we are interested not in the relations of production *per se*, or for their own sake, but rather in the study of the position and prospects of the several households that are involved at either end of these various relations of production. Of course, a study leading to a thorough understanding of the character of the relation itself is vital for this objective. But if the analytical areas are to be meaningful, they must be demarcated *in terms of households and not relations* for it is the household that must be the unit of study for our purpose.

TABLE 2: CLASSIFICATION OF HOUSEHOLDS BY DIFFERENT CRITERIA

Classification Criteria	Rich		Middle		Poor	
	No of House-holds	No of HHs in Common with Criterion 1	No of House-holds	No of HHs in Common with Criterion 1	No of House-holds	No of HHs in Common with Criterion 1
(1) Criterion used in this study	45	—	32	—	108	—
(2) Land owned*	27	26	29	14	129	107
(3) Land operated (rabi)**	29	20	31	12	125	105

* Here a rich peasant household is assumed to own 10 acres or more; middle, 5-10 acres; and poor, less than 5 acres.

** Here a rich peasant household is assumed to operate 10 acres or more; middle, 5-10 acres; and poor, less than 5 acres.

TABLE 3: OWNED AND OPERATED LAND HOLDING BY SIZE CLASS (IN ACRES) (Rabi 1969-70)

Size Class (in acres)	Owned Land				Operated Holding in Rabi			
	No of HHs	% of Total No of HHs	Area (acres)	% of Total Area	No of HHs	% of Total No of HHs	Area (acres)	% of Total Area
0.00	97	52.43	0.00	0.00	77	41.62	0.00	0.00
0.01-1.00	8	4.32	3.84	0.57	18	9.73	11.06	1.53
1.00-2.50	10	5.41	18.72	2.75	13	7.03	22.07	3.05
2.50-5.00	14	7.57	43.73	6.43	17	9.19	56.34	7.78
5.00-7.50	22	11.89	129.38	19.04	16	8.65	92.73	12.81
7.50-10.00	7	3.78	63.50	9.34	15	8.11	134.54	18.59
10.00-12.50	9	4.86	94.76	13.94	16	8.65	168.68	23.31
12.50-15.00	8	4.32	108.42	15.95	6	3.24	82.75	11.43
15.00-20.00	6	3.24	100.16	14.74	3	1.62	54.95	7.59
20.00-30.00	3	1.62	64.58	9.50	3	1.62	62.49	8.63
30.00+	1	0.54	52.50	7.73	1	0.54	38.12	5.27
	185	100.00	679.59	100.00	185	100.00	723.73	100.00

The upshot of this is that analytical areas must be demarcated not by classifying all the existing *relations of production* corresponding to the different modes, but by classifying *households* which predominantly display combinations of relations of production associated with each different mode. The substance of the analytical area must be households. However, the classification of households into analytical areas along these lines runs into two problems.

(1) The first problem is encountered in the identification of the modal character of specific production relations as they exist in the transitional village economy. Some accredited feudal relations are capable of being metamorphosed into new relations whose modal characteristics are somewhat different. Thus, in response to the altering economic forces and superstructural factors, the production relation of tenancy often changes its particular forms, thus making itself capable of expressing a different class content. Are all the tenancy contracts in the village feudal in their modal character? We do not think so at all. Virtually all these contracts are annual/crop contracts which are entered into each year through a process of individual bargaining prior to the cropping season. Both parties to the contract attempt to bargain for the most profitable conditions and terms, and practically no extra-contractual obligations or relations between the two parties exist. Of course, the economic conditions and status of the poor tenant may lead him into "opting" (does he have alternative sources of income?) for particularly exploitative terms. But this relation, while continuing to be so exploitative, does not conform to the tenancy production relation as it existed historically in the feudal mode. This point is further emphasised when we consider the very capitalistic rationale of the rich professional non-landowning tenants. So also, in the complex concrete setting of the village, it seems perfectly rational for a large capitalist farmer to be employing one or two semi-permanent/permanent labourers. Such a relation, especially when the employing household is one which was once a feudal estate, seems to be feudal. However, if we observe that this hiring in is economical considering the employing household's time pattern of demand for hired labour, it must be accepted that this surviving aspect of the feudal mode reflects, in the historically altered aggregate situation, a different economic rationale.

These points must be borne in mind when classifying households into different analytical areas on the basis of the modal character of the production relations that these households enter into.

(2) The actual classification of households into the different analytical areas on the basis of the relations of production entered into by the households raises the second problem whose origin lies in the basic features of the transition process. It turns out that the contours that demarcate the different analytical areas do not unambiguously assign every household into one area or another. Particular households display a combination of production relations which do not all "belong" to any one mode. How are such households to be classified? By way of illustration, consider the case of the household of Mohan Chand. Mohan Chand serves as a semi-permanent labourer with Ram Lal (a capitalist farmer), share-crops a small plot of land for 6 months, works as a casual agricultural labourer for 4 months, and runs a music band (he owns all the instruments) where he employs some poor non-peasants for fixed wages! Even though there is only one Mohan Chand in Parhill village, there are a very large number of households which exhibit this multiplicity of "contradictory" relations of production. Classification of such households *is made somewhat arbitrarily, but not* necessarily unscientifically. Indeed it would be as unscientific as it would be futile — in the context of the study of *agrarian transition* — to demand separate analytical areas which are strictly mutually exclusive in terms of both households *and* relations of production. (In fact, this is the motivation underlying the use of the term "analytical area" in preference over the familiar term "domain of the mode of production".)

Households are therefore to be classified in accordance with the modal character of the production relations that the households display in a predominant fashion, *viz, from which they* they earn the major portion of their incomes.

(4) TRANSITION FROM FEUDAL TO CAPITALIST RELATIONS

The significance of the above observations will be amply illustrated in this section, in which we will attempt to sketch the historical emergence of the complex of relations currently existing in the village. It is only through the medium of such a historical perspective that a meaningful assessment of the *current process of transition* can be attempted. The character of the village economy is sketched out briefly, employing three reference periods.

(a) *The Feudal Era*: Below we outline a somewhat idealised picture of feudalism as it existed in this region through the nineteenth, and most of the first half of the twentieth centuries.

The village economy revolved around the five feudal *pattidar* families whose estates constituted all the village land and with whom the government had made the original land revenue settlements. Large tracts of these *mahals* were cultivated by a wide variety of tenants of different statuses and sizes. These tenants, who paid highly exploitative fixed rents, often had further subtenants (many of whom were sharecroppers). Around the *pat-*

tidars (and their bigger tenants) was built the social division of labour, organised along *jajmani* lines. Apart from the several *jajmani* producers and groups of tenants, a class of permanent and semi-permanent labourars was also attached to the *pattidars*. Even though the rent was collected in cash (for the convenience of the *pattidars*) most dealings and payments between the *pattidars* and the serfs, tenants and *jajmani* households were conducted in kind; barter trade was widespread within the village, and production for the market was minimal. The landowning feudal classes displayed the social and cultural features usually associated with them. Another notable point is that there apparently existed a significant correspondence between the caste of the non-cultivating households, and their respective positions in the social division of labour at the level of the village. Caste could be viewed as a superstructural factor cementing the social division of labour.

(b) *Breakdown of Feudalism*: This feudal set-up began crumbling noticeably during the first half of the twentieth century, largely on account of the operation of two concrete forces. Firstly, successive land legislations (carried out particularly with the objective of providing security to the tenants) especially those of 1926, 1939 and finally 1951, broke up the old feudal land system, by granting the occupancy tenants heritable, transferable and ownership rights. Over the period, therefore, the feudal domination of the tenant and small peasants by the 5 feudal families and the major *pattidars* was largely demolished. The old feudal families had their land-holdings severely cut, and historically there emerged a class of peasants who had virtually all rights over their land. This class of peasants comprised the several categories of tenant households of old: the *kanooni kashtgars;* the *maurusidars;* even the old *"tenants-at-will"*. As noted earlier, these tenants had been leased land-holdings of all sizes, with the result that this historically created class of peasants comprised widely differentiated peasant households, ranging from the very rich, to the very poor. The one common aspect was that they were all family farms cultivating largely their own land mainly by the use of the family's own labour. These events undermined the cohesion and stability of the social division of labour. Also undercut significantly was the class of permanent labourers, many of whom had to seek other means of livelihood.

The second primary force which

TABLE 4: OWNERSHIP OF LAND-CUMULATIVE PERCENTAGES

Note: Of the total 185 households, 97, or 52.43 per cent of the households own no land at all.

hastened the breakdown of the feudal social division of labour, including the *jajmani* system of occupations, was the secular development of capitalism in industrial centres, and its gradual penetration of the hinterland. Even with the breaking up of the big estates, the *jajmani* artisan and functionaries had lost significant portions of their demand. Now, with the coming up of small townships and the widening of the industrial market, these producers began to sell their goods and services in the local markets, where they now faced increasing competition. It is also possible to detect a shift in the character of the production of the *jajmani* households. From production under feudal *jajmani* contracts they shifted increasingly to commodity production for the market, and acquired the character of household enterprises. At the same time, the households which earlier provided *jajmani* services began to participate in agricultural labour as a subsidiary occupation to prevent their incomes from declining. Thus, the village economy is now semi-feudal in character; there exist large areas in the village economy where household commodity production (family farm or household production enterprise) is dominant.

(c) *Transition to Capitalism*: The most significant event of the post-1951 period was the injection into this complex production structure of the village economy of large doses of improved resources and methods of cultivation. The widespread biological and mechanical innovations concentrated in the post-1961 period generated large surpluses for the rich peasants, who progressively expanded their scale of operation, and improved their methods of cultivation. Some rich peasant households began to display capitalist features: mechanisation, predominant use of hired labour in cultivation, production for the market.

At the same time, the *jajmani* production organisation broke up further, and the old *jajmani* production households began to produce largely for the non-*jajmani* market; and *jajmani* activities began to occupy only a subsidiary position in the production programmes of several such households. The household character of these production enterprises became indisputable. The further erosion of the *jajmani* services reflects itself in an increasing reliance of such households on petty trades and on agricultural labour.

It is interesting to note, however, that a class of agricultural labourers, in the formal sense, has not as yet crystallised. Of the 86 households participating in agricultural labour, only 36 have agricultural labour as their main occupation, and of these, only 5 have agricultural labour as their *only* occupation. Most of these specialised agricultural labour households are really semi-permanent labour households which are attached to some rich peasant households. Thus, while the capital-wage labour relation exists in widespread fashion, and while it is possible to identify a handful of capitalist cultivators among the peasants, a *class* of agricultural labourers as such does not exist yet. Most of these agricultural labour households are engaged in other economic activities which gives them the character of household enterprises producing a commodity or a service,

TABLE 5: LAND OWNED AND CULTIVATED (IN RABI 1969-70) BY POOR, MIDDLE AND RICH PEASANTS

Group	No of Households	Owned Area (acres)		Area Cultivated in Rabi (in acres)

or engaged in trade.

A further point to note is that alongside the decline of feudalism — of which a few identifiable aspects still survive — the old correspondence between the caste system and the social division of labour has broken down in very large measure. Moreover, caste has long ceased to be a force restricting the pattern of economic activities of households.

(5) DEMARCATION OF ANALYTICAL AREAS

It becomes convenient, from the point of view of analysis, to divide the households of village Parhill into two distinct analytical areas.

(1) *Capitalist Area*: Here would be included those households in which the emergent capitalist relations of production and forms of organisation have crystallised. Pre-capitalist relations of production have been almost completely replaced by new relations pivoting on the capital-wage-labour relation. It must be remembered here that the marginal employment of permanent labour would not prevent an otherwise capitalist household from being classified in this area. Secondly, as mentioned in the preceding discussion, a class of proletarians who rely essentially on agricultural wage labour for their livelihood does not appear to have crystallised in the village. We would expect such a distinct class to emerge as the process of transition progresses further. Hence, this analytical area includes households representing only one aspect of the capital-wage-labour relation.

(2) *Pre-capitalist Area*: In this area would be included all such households in which relations of production and forms of organisation of the pre-capitalist mode still prevail, albeit under pressure from latent tendencies towards capitalism. This area would include the prominent feudal remnants, the large sections of household enterprises and peasant family farms producing partly for the market, and also the petty trade and service, and the labouring households.

Within this area comprising the whole peasantry and the labouring classes, it is necessary to draw further distinctions: even a cursory glance reveals the profuse diversity existing amongst the peasant households — some are operating on near-capitalist lines, whereas others, who own almost no land, survive by selling their labour and/or traditional village products. Hence, as a second approximation within this analytical area, it becomes vital to make a distinction between the different groups of the peasantry.

In a rough fashion, we can delineate the upper group of peasants (or the rich peasants), the middle group of peasants, and the bottom group of peasants (or the poor peasants). This grouping is initially done by using as a major criterion the relative land-resource ownership position of the households involved. However, a closer study shows that households with a similar land-resource ownership position in the aggregate display widely different production relations and forms, and earn their livelihood in widely different ways. Analytically, therefore, these households would be very distinct, even though an initial statistical classification would place them in the same group. In order to transcend a pure statistical classification and obtain an analytically relevant economic classification a further approximation becomes desirable. This is made by introducing a further criterion of classification. Distance between households is measured not just by their relative land-resource ownership positions, but also by their positions with respect to the old and the new modes of production. Several additional variables become important, e g, the size of the family in relation to the resources it owns; ownership of modern productive assets like tube-wells, tractors, etc, amount and proportion of non-cultivation income and its sources; the intensity of its cultivation activities; its tenancy position; whether the household receives large money remittances from family members working outside the village; its credit position *vis-a-vis* both official and non-official agencies; ownership of pucca houses and durable consumer goods; the character of its several production relations; and its relative position in the political power structure of the village.

The employment of these variables leads to significantly different contours of delineation of the rich, the middle and the poor groups of households; a significantly large proportion of households are revealed to have been wrongly classified by the land ownership criterion used for the initial classification. Table 2 sets out the extent of the misplacement of households by the different criteria. In the main, a careful use of the above variables leads to an analytically meaningful classification. Some middle peasant households turn out to be analytically contiguous to the poor peasant/labouring households which are fighting desperately against forces, making for their proletarianisation; other middle peasants are similar-

TABLE 6: SPREAD OF TENANCY (RABI 1969-70)

Group	No of HHs in Group	No of Tenant HHs in Group	Total Area under Tenant Cultivation in Group (acres)	Average Area Leased in by Tenant HHs in Group (acres)
Rich peasants	39	6	26.49	4.62
Middle peasants	29	17	123.94	7.29
Poor peasants	40	26	44.55	1.71
Total	108	49	194.98	3.98

ly contiguous to the rich peasants group of households. Here, it must be readily admitted that the final classification is "arbitrary" at the borders dividing contiguous groups of the peasantry. It is possible that a few households do not fall into appropriate groups. Analytically, a further distinction can be made within each of these groups between peasant and non-peasant households.

Thus we note that the peasantry displays a very wide diversity both from the analytical and the statistical points of view. But as we move away from the middle ranges to either extreme of the peasantry, the analytical divisions and class affiliations crystallise and become increasingly unambiguous. Thus, when we approach our first major area of interest, the rich peasantry, we discover that the households concerned display certain strikingly similar features which facilitate the study of the transformation of the rich peasants into capitalist farmers. Again, when we move to our second major area of concern, the bottom group of households, we find that the households involved — even while exhibiting a truly phenomenal range of economic activities, forms of organisation and relations of production — all display economic characteristics which are fundamentally identical. It therefore becomes possible to cordon off a group of households in whose sphere of economic conditions, activities and decisions, it is possible to study the resistance put up by the declining parts of the pre-capitalist modes against the embryo forces of capitalism which threaten these households with eventual pauperisation and proletarianisation. Before we pass on to the study of the rich and the poor peasantry, we must point out that in the ensuing study of differentiation, we have treated the capitalist farmer and the rich peasant households together; no formal reference will be made to the capitalist farmers of Parhill; they will be merged with the rich peasants group. This proves expedient without damaging the study, for the purpose in the rich peasantry section is to uncover the factors which make for the movement of capitalist relations.

(6) Differentiation in the Village

In an earlier paper we had considered and rejected an incorrect approach which asserted that the small peasantry displays irrationality and inefficiency in its economic activities in that they wilfully participate in activities which have "negative profits" and furthermore, forfeit the advantages of specialisation in the activity of maximum profit by

Table 7: Poor Peasants and Tenancy (Rabi 1969-70)

greatly diversifying their activities, thus lowering the average rate of profit for the household. It was shown that this erroneous view stemmed from methodological errors (from an application of inappropriate industrial accounting methods and categories of analysis) or from the necessity of the "political" economist to demonstrate that if the peasant households are poor, they have only their own irrationality to blame, making it appear that prosperity must await the infusion of the spirit of capitalism. But as was seen, this position is false. Sound economic reasoning explains the peasant household's behaviour which represents, paradoxically, not irrationality, but a calculated endeavour on the part of the household to eke out a subsistence in the face of changes which threaten to pauperise the household altogether.

In the following sections, we will attempt to shed some light on the operation of the process of the differentiation of the peasantry in the concrete village set-up. The essence of the process of differentiation lies in the historical conversion of the peasantry, which is not a class as such, into two identifiable classes which are ranged at the opposite ends of a capitalist social relation. The operation of historical socio-economic forces differentiates, from within the varied mass of the peasant households, between the rich and the middle and the poor peasants. On the one end of the spectrum of the peasantry, it transforms the rich peasants (and some of the middle peasants) into capitalist farming households (relying largely on hired labour, producing essentially for the market, using modern cultivation methods and machinery for large scale farming); at the other end, it pauperises the poor peasant households and the worker peasant households by destroying their economic basis, and thereby their major sources of income, and through this process, converts these households into proletarian households, relying largely on agricultural labour for their livelihood. The middle peasant households are not free of these turbulent tendencies, and are drawn towards either end of the scale depending on their concrete economic circumstances.

* These households all maintain milch cattle for the production of milk and ghee which is sold to a middleman.

In what concrete forms is this process at work in the village? And up to what stage has this process developed?

Further, the contents of these sections will provide the appropriate backdrop for a critical appraisal of a widely held view of the character of the distribution effects of the capitalist transformation of the agrarian economy. Contrary historical and statistical evidence notwithstanding, there exists a popular view which maintains that as capitalism diffuses into the mores of pre-capitalist society through the medium of the "green revolution", *all* classes of the rural economy slide significantly upwards along a prosperity scale. An implicit assumption is that the social and economic linkage multiplier effects generated by the "green revolution" will serve as carriers of the new prosperity into the hinterland of the impoverished small peasant and labouring classes.

In anticipation, we might state here that our findings stand in general disagreement with the inferences and the implications of such a view. The precise reasons for this disagreement will become apparent as the conditions and the prospects of the poor peasant/non-peasant category of households are studied in greater detail.

II

Basic Features of the Village Economy

In order to provide the appropriate perspective for the study of the process of differentiation of the peasantry, we will present in this section some information about the village economy in general, and some other data pertaining to the position of the various classes in the economic structure of the village. The tables referred to provide data pertaining to the agricultural year 1969-1970.

Though there exists considerable diversification in the cropping pattern, Parhill remains essentially a wheat growing village. (Other crops include cotton, sugarcane, tobacco, gram, barley, pulses, oilseeds, vegetables etc.) Situated as it is in Aligarh, a Package Programme District, Parhill displays all the outward manifestations of the so-called 'Green Revolution' — tube-wells, tractors, new seed and fertiliser, etc. The fact that it is one of the interior villages in the region (the nearest roadhead is five miles distant) does not seem to have stifled the absorption of the new technology.

The village population of 1,073 is accounted for by 185 households. The village land, all of which is irrigated, and most of which is fertile, is 535 acres (1961 Census). In the study, however, we have included also the land owned by the village households in neighbouring villages. This extended area owned amounts to 679.59 acres.

Some basic economic features relevant to the study are noted below in summary form.

(1) The village has a highly skewed distribution of ownership of land. Thus 97 of the 185 households, or 52.43 per cent of the households, own no land at all; and the top 8 per cent households own over 48 per cent of the land. A similar distribution characterises the ownership of other fixed capital goods (*cf* Tables 4; 12; 13).

(2) This fact reflects itself in a superabundance of labour resources in relation to other resources available (at the level of the village), as also in relation to the level of technology (*cf* Table 10).

(3) A careful (though admittedly and inevitably arbitrary) classification divides the 185 households into 45

rich peasant and rich non-peasant households; 32 middle peasant and non-peasant households; and 108 poor peasant and poor non-peasant households. These last 108 poor households, on whose economic activities we will be focusing attention, comprise 40 cultivating (i e, peasant) households (of which only 21 own any land at all, average land owned being 1.92 acres); and 68 poor non-peasant (i e, non-cultivating) households (*cf* Tables 1; 5).

(4) The large majority of these 108 poor households display a phenomenal variety of occupations in their annual production programmes (*cf* Tables 10; 11).

(5) The poor group of households possesses a very traditional pattern of skills. In fact, a considerable number of them are unskilled. But virtually all these households, whatever their main occupation, are capable of performing agricultural labour.

(6) The stock of capital owned by the poor group of households is very low, and invariably embodies an old technology tied to the traditional skill pattern associated with the old *jajmani* system of division of labour between occupations at the village level. Hence, this capital stock is specific to use, unshiftable, and considering its character, quite unsaleable.

(7) These factors — including the historical hang-overs of the old decayed *jajmani* division of labour — restrict the mobility of several poor non-peasant households within occupations. The historically governed (and often inherited) patterns of resource and especially skill endowment of the households, in themselves, become entry barriers.

(8) Contrary to popular belief, small time tenancy is rampant. And a significant proportion of households involved in tenancy cultivation are poor peasant households who collectively account for only a very low proportion of the total area of land under tenancy cultivation in the village (*cf* Tables 6; 7; 8).

(9) One fundamental fact which needs to be borne in mind throughout the study is the degree of impoverishment of most poor group households, which hovers perpetually around — and quite often below — levels where the household has to fight to keep malnutrition at bay.

(10) Politically, the rich sections are dominant, and in some aspects, all-powerful. They control the Panchayat; the village pradhan is a typical

rich peasant; the VLW, the Patwari, small-time co-operative officials etc, all cater to the interests of the rich whenever called upon to do so. In real terms, the weakness of the poor sections is to be attributed to the primitive state — at present — of class consciousness and political organisation based on class identity. We will not comment on the political dimensions of agrarian capitalist transformation as evidenced in Parhill, as this deserves specific and detailed attention.

III

Differentiation: The Poor Peasantry

(1) INTRODUCTION

In section I we made some comments about certain methodological issues relevant to a study of the peasantry. In this section we will attempt to study the overall economic conditions of the poor category of households; their position and magnitude in the village economy; the manner in which the economic forces unleashed by the so-called green revolution are affecting, and are likely to affect in the near future, the economic conditions of the household; the impact that altering conditions are likely to have on the household as a form of production organisation; and on the pauperisation and proletarianisation of the small peasantry in general.

In this study our primary interest centres around an analysis of the processes making for the economic transformation of the agrarian economy, rather than in making sensational statements about the level of poverty of the small peasants, or in suggesting measures of 'reform'. Admitting these pre-occupations into the study only tends to obfuscate the analysis of the processes of transformation.

For the purpose of our study, we focus attention on a category of households whose important feature is that they combine a multiplicity of occupations in the process of earning their livelihood. As often as not, these households own a small plot of land which cannot, even by a long stretch, provide them with the means of subsistence for the year. And as often as not, once again, those who do not own such a plot, lease in a similarly small plot for tenant cultivation. Almost invariably, the plot of land cultivated by such households is considerably smaller than the largest plot that the household could cultivate were it to specialise in cultivation alone. The peculiar tendency, however, is to combine the cultivation of the small plot with several other occupations. Neither is the phenomenon of multiple occupations limited to those who cultivate land — landless labourers who are not tenants also exhibit such a pattern of occupations.

To be able to make an assessment of the place of the households of the poor category in the process of differentiation, we will study the impact that incoming capitalism has on the economic conditions under which the several occupations displayed by these households are carried out.

(2) CATEGORISATION OF OCCUPATIONS

The activities of the 108 small peasant-cum-multioccupational households are divided into three groups. In the first group are the several artisan and handicraft production occupations, services, petty trades and shopkeeping. The *second group* comprises occupations that are closely connected with cultivation, i e, own cultivation, tenancy cultivation, and agricultural labour. The motive behind this division is essentially analytical expediency. Thus, the immediate impact of the new technology is absorbed by the second group, and only second-round effects of the new technology are felt by the first group. Occupations in this group respond more to the secular development of the forces of capitalism in the rural economy. The new technology alters radically the conditions of operation of the occupations in the second group, but it gets to affect the first group occupations only insofar as the first round impact of the new technology generates forces which enhance the speed of the emergence of capitalism in rural economy. However, these groups do not have a neat line of division. There exist occupations which could be placed in either group, *viz*, oil extraction, cotton ginning, gur making, etc. Furthermore, these groups do not exhaust the occupations followed in the rural economy. The rapidly changing economic conditions in the countryside have ushered in several new occupations. These occupations — which are categorised in a *third group* — have been generated essentially through the linkage-multiplier effects of the green revolution's technological and infrastructural requirements. These new occupations of the third group are of two kinds: firstly, those which are associated with the new technological requirements, i e, skills made necessary by the process of mechanisation or the adoption of better techniques of cultivation, *viz*, tubewell fitting and repairs, elementary electrical work, masonry, tractor servicing and driving, etc; secondly, those vocations which are thrown up by the infrastructural linkages of the green revolution at the district or the state level, i e, jobs with the block or district administration or co-operatives, district transport services, school teaching, etc. We might note here that the poor households almost never display these occupations of the third group; they seem to be largely

the monopoly of the rich peasantry and town dwellers.

The manner in which the small peasant households are affected by the changing economic conditions, and in particular by the pervasion of capitalism into the countryside, depends upon several factors:

(i) The overall skill and resource ownership position of the household and its opportunities.

(ii) The manner in which the occupations in which the household is involved are being affected by the changing conditions.

(iii) The extent to which the household is involved in those occupations which are adversely affected.

(iv) The ability of the household to shift its resources into more profitable activities from occupations which are on the way out.

We will take up the group one, two and three occupations in that order.

(3) Village Handicrafts, Petty Trade and Services

Let us first consider the occupations involving petty production at the household level (*cf* Table 10).

The household's capital resources — whatever the form — are minimal. Its skills are also limited to certain traditional vocations that do not involve the use of much capital. The only resource that it possesses in any degree of abundance is labour. Thus, the resource position seriously limits the opportunities for productive employment. These opportunities are further constrained by institutional forces which cut the mobility between occupations.

The technique of production is exceedingly labour intensive and also very primitive. Within these limits, some degree of division of labour is possible in production at the level of the household, through the involvement of female and child labour in certain functions.

Market conditions are depressed and competition variable. The demand for several village products is disappearing due to the changing tastes of the buyers. Demand for others is on the decline because the new technology makes them unnecessary, e g, leather buckets for irrigation. For yet others, demand is cut because of the availability of cheap urban manufactures, e g, weaving products. Apart from falling aggregate demand, the market position is bad for any one household because there are too many competitors vying with each other for a share of the market, directly or indirectly. This is less so for the *jajmani* occupations and trades where the markets are relatively sheltered by the prevalence of institutional contracts. But here, demand has been eroded by a switch to urban manufactured substitutes on the part of the consumer and also because with successive generations the number of households catered to by any one *jajmani* producer has been falling. (This is both on account of the erosion of the market for the product as such, as well as because of a falling share due to the practice of dividing the *jajmani* contracts between the sons of the *jajmani* producer on his death or retirement.)

Surpluses from these occupations are very low, if at all they exist. But even where they do exist, their economic significance is limited because worsening demand conditions prevent their use for expanded reproduction in the same industry and they are not likely to save the household from the deteriorating conditions of the occupation. Neither are there any lucrative alternative opportunities open to the household for productive investment of small surpluses. Such surpluses, while they last, are more likely to be consumed than saved. However, the negative surplus-making households in these occupations find it worthwhile to continue in these activities because the marginal returns are greater than the marginal real cost of labour power in a period when there is no alternative employment.

Production occupations thus provide an increasingly smaller share of the household's total income. The demand for income, however, does not register a similar fall. Hence, the household must, of necessity, seek to cut its losses by participating in another occupation — usually one which does not have stiff entry requirements. We can infer safely, therefore, that the households that rely on such occupations for a major portion for their incomes are likely to be adversely affected as these occupations get phased out; and this phasing out is likely to be more rapid, the greater the speed of the emergence of capitalism. The activities that we feel are going to expand under pressure of these declining occupations are the services, shopkeeping and petty trade occupations. And, as we will note from illustrations pertaining to the cases of shopkeeping and the petty trades, these occupations do not have particularly profitable possibilities either.

As the market conditions worsen for the petty trades, the hawkers have to go farther and farther afield to tap new markets. Here we might mention that the lengthy trips of the petty trader testify neither (a) to a highly organised social division of labour in the rural economy nor (b) to the wide economic 'extent' of the market. Regarding (b), there are two points to note. First, that the village market for products sold in petty trade, e g, bangles, gola misri, ices, etc, is easily exhausted and, therefore, to be able to earn a certain minimum amount from this activity, the bangle-seller, or any other roving trader, must walk to the next village hoping to corner some demand there. Secondly, his competitors are not just petty traders selling the same ware (bangles), but also all other traders who sell substitutable knick-knacks whose cross-elasticity of demand for bangles is high. If we accept the premise that a certain given amount of the income of the people in the village is earmarked for expenditure on knick-knacks such as these, then the bangle-seller's local village market gets even more easily exhausted and as a consequence, his selling rounds become even lengthier.

Now consider an illustration from the occupation of shopkeeping. There are 12 shops in the village as against four a few years ago. For a village of 185 households this appears to be an abnormally high figure. Some of this increase can be explained away by the increases in the volume of trade on account of the increase in the population of the village; and some again, by the increasing prosperity of certain sections of the village community. However, there seems to be a particular reason for the increase in the *number* of shops. Our interpretation is that households which cannot for particular reasons enter other occupations, find even the low profit margins in shopkeeping attractive enough to effect an entry into the occupation. Further, shopkeeping is peculiarly vulnerable to this tendency because it is the least exacting of all the occupations from the point of view of entry conditions. All you need is some unemployed female or child labour and some working capital, which can be borrowed from the village moneylender. Thus, a shop might be set up temporarily for a few months when the household is unemployed, and be given up when better employment opportunities present themselves. Explicably then, it is usual to find shopkeeping to be only one of several activities of the households involved. It must also be clear by now that the expansion in the number of shops in a village does not necessarily reflect prosperity — and certainly not in Parhill.

Returns to this group of non-agricultural occupations are exceedingly low and the trend downwards for the reasons indicated above. Surpluses, too, are very low if not negative, and the technology only marginally viable. An interesting characteristic of these occupations is the stop-gap role assigned to them in a poor household's production programme. These are activities which at the margin have been preferred to unemployment, and in most cases likely to be characterised by marginal returns which are well below average daily consumption rate, though the marginal returns might be somewhat greater than the marginal real cost of labour used up.

How depressed the situation is can be gauged from the fact that though the petty trades take up almost no working capital, and have at least positive returns, most households stay unemployed for anything from two to five months in the year. The reason for this is that in these seasons there are almost no employment opportunities available. Those who have the contacts and the capability, and some others who have neither but have the desperation, move out in the long lean months and work at brick kilns in towns many miles distant. Several households are known to move out annually in groups to Agra for this purpose.

Let us now look at the second group of occupations — those connected with cultivation i e, own cultivation, tenancy cultivation and agricultural labour. Each of these is distinct in itself and must necessarily be considered separately, since it is likely to be affected differently by the forces

Table 12: Ownership of Selected Assets in the Village

of incoming capitalism. The reason for grouping them together in the first place was that these occupations bear the brunt of the first impact of the new technology, and are thus more directly affected by the so-called green revolution. However, the economics of each of these activities is very different.

(4) Own Cultivation

To the extent that the new technology is divisible, i e, in the use of fertilisers and improved seed, the small farmer can benefit from the green revolution to the extent that he has land. Hire facilities also tend to make fixed inputs (such as bullock power and tube-wells) divisible, but only to a limited extent; because at the hire prices prevalent, the hiring small farmer uses these inputs at lower levels of intensity than he would have had he owned them. While the size of the subsistence plot falls on account of the increase in productivity per acre, whether or not the household can meet its subsistence requirements in the new situation depends on the size of its landholding. Land owning small peasant households are generally speaking better off on account of the new technology than the non-land owning poor households. Furthermore, a surplus in cultivation is a progressive surplus as it makes it possible for the household to intensify its application of inputs, thereby further increasing its output. Thus, multi-occupational households which earn a reasonable portion of their income through cultivation of own land are better placed to withstand the forces making for proletarianisation than the other poor households.

But how much land does the peasant household in question own? Very little indeed. Thus the 108 households that fall into this category own only 43.40 acres of land. For the 24 households that own all this land the average holding is 1.71 acres. This figure is well below any accepted subsistence-plot size for the average size family. This minimal land-holding also limits the extent to which the small peasant can benefit from the new technology.

(5) Tenancy Cultivation

Here we are only concerned with those tenants who are small peasants. Large scale professional tenancy cultivation is not considered. While both the cash rental and share-cropping forms of tenancy are prevalent, from the point of view of both the magnitude as well as the economic significance, share-cropping is the more important form. Our observations are limited to this tenancy form.

Total	185	38	26,430	11	1,352	27,782	14	14,100

Share-cropping a small plot throws up a smaller surplus than own cultivation. Indeed, the activity may be a zero surplus activity, but it is taken on largely because of the vital place it occupies in the technological matrix of the household's annual production programme. It also facilitates a fuller utilisation of the household's labour resources throughout the agricultural season.

The profitability of tenancy cultivation is cut because of two reasons.

(a) The tenant receives only 50 per cent of the gross output. The observed terms of cost-sharing make up this amount only partially.

(b) The reliance of the smaller tenants on *desi* fertiliser instead of the new chemical fertilisers makes for lower yields than would otherwise be possible. The reasons for this may be several. Usually, the small tenant does not possess the resources to finance the expensive fertilisers. Alternatively, it is normal practice for large owners of land to give out a small fraction of their land for share-cropping on the condition that it be fertilised only by farmyard manure, as it widely believed that such a rest from chemical fertilisers is necessary for the soil to recoup its fertility.

The tenancy cultivation occupation has another feature. Whatever the profitability of the occupation, the poor household has no certainty at all of its ability to procure a tenancy contract in any given year. The amount of land that is available for the purpose of sharecropping is variable and is largely governed by the requirements of the landowners. Thus, if a contract has been obtained for a year, there is no certainty that it will be available in the future as a constant source of income. Even regular leasers out are wont to change their tenants, as well as the particular plots they lease out almost annually, for fear of losing their rights over them. Thus from the point of view of a particular household, the tenancy contract is essentially of the nature of a windfall. Because of the uncertain conditions prevailing in the tenancy market, tenants have no inducement to invest in resources making for greater efficiency in their cultivation activity.

Another interesting fact is that this kind of tenancy invariably involves a rich, 'progressive', new technology-conscious farmer and a poor peasant household which owns no land.

(6) Agricultural Labour

Because of the nature of the occupations and the wide seasonal fluctuations in its returns, the supply of agricultural labour is highly elastic. The only entry condition imposed by this occupation is that the household possess labour resources and the most rudimentary of skills. It is not surprising therefore that very different kinds of households subscribe to this occupation. There are households which are traditionally and essentially agricultural labour households; others for whom agricultural labour is a subsidiary occupation; and yet others who participate only in the harvesting operations when supply runs short and wages are high. The supply of agricultural labour is augmented by the induction into this occupation of those households which are involved in decaying traditional occupations and which feel the need to supplement their declining incomes. The entry of these households into this occupation, especially in the slack season, worsens the demand-supply balance which goes to determine the short term wage rate.

Table 16: Utilisation of Loans from Non-Official Sources — By Purpose, 1969-70

(A) Other than in land, tube-wells and tractors.
(B) Including expenditure on land litigation.
(C) Including tenancy losses.
(D) Including durable consumer goods, expenditures on marriage, death ceremonies, etc.
(E) Since any household may have borrowed money for more than one purpose, the total number of cases of borrowing (by purpose) will exceed the total number of borrowing households.

The demand for labour has been affected by the fact that techniques of production have been becoming increasingly mechanised — a process that predates the so-called green revolution. Thus, the installation of tube-wells has cut the demand for labour for the irrigation activity. In one day spent on controlling tube-well water flows, a labourer can help irrigate a multiple of the amount that three labourers could with the old technique of irrigation with leather buckets and a well. Even those who do not own tube-wells can purchase their water requirements from tube-well owners and save on the use of hired casual labour. For the operation of tube-wells no serious manual operations are required and usually the family labour is quite enough. However, other functions such as weeding have maintained their demand. (Here the demand could have risen marginally.) It is only in the harvesting activity that the demand has risen convincingly.

It would be useful to study the implications of this increase. Apparently the demand at harvest time is so high that it necessitates the import of harvesting labour from nearby villages and roadside townships. Though this shows that the demand for labour registers a significant increase in the harvesting season, we cannot from this make facile inferences about the increase in the prosperity of the agricultural labourers.

Firstly, while money wages do rise in response to the increased demand, the upward pressure on wage rates is damped by increases in supply, due to (a) the import of external labour, and (b) the entry of a wide range of small peasant and multi-occupational households from within the village into the ranks of the agricultural labourers. Secondly, it must be remembered that the harvesting activity has to be carried out rapidly, and is usually finished within a fixed period. This is for fear of the crop being destroyed on account of grain-shedding or unseasonal rain. Since the period of harvesting lasts only for a short duration, it permits the village households only a certain maximum number of days of employment. The fact that there is a larger crop to be harvested does not mean that a longer time will be taken to gather it, only that it becomes possible for a larger number of labourers to find employment for the relatively fixed harvesting season.

The gains from increased employment opportunities thus accrue mainly to agricultural labour imported from outside the village; the gains to the regular agricultural labourer classes on account of the so-called green revolution are not nearly as fantastic as they are made out to be. This is especially so when one remembers that the demand for agricultural labour for operations other than harvesting has, if anything, registered a decline.

The natural conclusion for this category of agricultural occupations is that the only occupation where the green revolution has perceptibly increased the incomes of the small peasant-cum-multi-occupation household is

TABLE 17: REPAYMENT CAPACITY OF HOUSEHOLDS FOR LONG-TERM LOANS (AS CALCULATED BY GOVERNMENT AGENCIES)

Repayment Capacity	No of Households Having Repayment Capacity as Under (Rupees)								Total No of HHs
	1-500	500-1000	1000-2500	2500-5000	5000-7500	7500-10000	10000-15000	15000-20000	Over 20000

Total	4	4	13	18	11	14	14	6	4	88

the activity of cultivation. Now if we recall that the small peasants own a negligible proportion of the land, and that this is parcelled out amongst several families, we get the inescapable result that whereas the own-cultivating peasant households of this category might have become slightly better off than their non-landowning comrades, they are badly off all the same, and without the passport to gain an entry into the green revolution's land of plenty. As far as tenancy cultivation and agricultural labour are concerned, we find that they have not become as rewarding as would appear at first glance.

(7) NEW OCCUPATIONS

We now pass on to the third group of occupations — the group which comprises activities which have been generated by the linkage-multiplier effects of the 'green revolution'. We have observed already that both the first and the second group occupations have not experienced any marked improvement in their conditions. Indeed, some of the occupations have suffered on account of the first round or second round impact of the 'green revolution'. Let us now see if the economic conditions of the households improve on account of their participation in the new occupations, which are stated to be an integral part of the process of diffusion by which the benefits of the linkage-multiplier effects of the new technology are meant to seep through to the small peasant and labouring classes in the village. We will consider the technological and the infrastructural employments in turn.

(a) *Technology-linked Occupations* (e g, tube-well fitting and repairs, electrical work, construction and masonry, elementary tractor servicing and repairs, driving, etc, and operating other mechanical devices). While some technology-linked occupations have been established at the village level, these are restricted to skills which can be easily acquired through a learning-by-doing process, e g, minor repairs to tube-wells. However, many such occupations require a level of skill and sophistication not easily acquired in the village, e g, tractor overhaul, and have been established only in the large urban centres and at best in the local townships. It is only here that the employment multiplier effect has been felt to any substantial degree. It is not possible for the poor household to effect an entry into these professions because the so-called mobility and versatility of the small peasant does not, and indeed cannot, extend to these modern technological skills. Further, the option of learning-by-doing is limited to those who possess these mechanical equipments and instruments themselves. These are invariably the rich peasants.

(b) *Infrastructure-linked Employments*: (e g, clerical work, low level administration jobs, school teachers, etc). The infrastructural employments all demand a different kind of skill, *viz*, administrative skill, but even more than that, the ability to read and write (preferably English). These skills are acquired only after a long period of investment in education. To become a teacher, a basic training certificate is necessary, and currently these jobs are open to those who started, and have maintained, their education over the past 15 years. It is not surprising, therefore, that the principal gainers from these occupations are once again the rich and middle peasant households. Furthermore, the ten years of the green revolution in this area has not reflected itself in the education pattern in the village. Secondary and higher education has become more popular, but it continues to be a monopoly preserve of the rich.

In conclusion, it would be largely correct to say that there exists no automatic process internal to the working of the green revolution that makes for the diffusion of the new prosperity to the impoverished sections of the agrarian economy. If anything, the logic of the green revolution seems to work to the contrary.

(8) ECONOMIC OPTIONS

Let us extend the analysis further and consider the various options open (by way of shock-absorbers) to the small peasant-cum-multi-occupation household which is making negative surpluses in relation to its simple reproduction costs of labour power. Five independent options suggest themselves.

(a) *Switching to More Profitable Occupations*: Switching is resorted to continually i e, each year the household's production programme may be quite different, depending on which sequence of activities is the most profitable given the circumstances for the year. However, this switching is restricted to those occupations to which households of this category have entry. As we have seen, these households are more or less debarred from the progressive and the more profitable occupations, *viz*, cultivation and the new occupations, on account of their poor resource and skill ownership pattern. Hence the option of switching occupations is exercised essentially to make the best of a bad situation; it cannot be used to change radically the character of the fundamental economic conditions of the households themselves.

(b) *Sale of the Capital Resources of the Household:* A part of the household's capital stock could be sold in order to meet a shortfall in the annual income flows. This option is hardly ever exercised, and for good reasons. The only saleable capital that these households possess is either land or equipment on which traditional occupations are run. Land, which is security against total penury, is generally unsaleable; and selling the other capital equipment (in the poor selling market that exists for them) would only postpone the shock, because now the annual shortfall in income would be aggravated, since the future earning capability of the household would be cut. Thus, sale of capital becomes a relevant option only when the household decides to migrate.

(c) *Consumption Loans:* This widely exercised option helps the household to escape the trap of secular underconsumption, but only temporarily. Even though the rates of interest are exploitative (up to 48 per cent), consumption loans are resorted to, in part due to the knowledge that the principal does not really have to be paid back so long as the household is regular with its annual interest payments. (In some cases, instead of paying the annual interest charge, households perform an equivalent amount of manual labour for the money-lender. These cases are limited to households which are unable to pay the interest charges continually.) As the interest charges are recurring, and as the household has almost no chance, under normal circumstances of repaying the principal, buffer consumption loans cumulatively increase the burden of repayment on the household's production programme, which was running in the red to begin with. Furthermore, there seems to be a low ceiling to the total amount of consumption loans that the poor household can take in from other households. Moneylenders possess a fairly accurate picture of the interest paying capacity of the households which regularly seek consumption loans against dubious security. Hence, while almost every poor peasant and poor non-peasant household has outstanding loans against it, this option does not represent a permanent or a painless way out of the household's under-consumption problem (*cf* Table 16).

(d) *Secular Underconsumption:* In the absence of any radical improvement in the economic conditions of the households, the option which the household is obliged, of necessity, to exercise is to limit its consumption essentially to what it can earn from its productive activities, i e, to resign itself to underconsumption. It is exceedingly difficult to estimate incomes of particular households (especially when they have a multi-occupational character), and we will therefore not enter that maze of conceptual and statistical dead-ends. On the basis of the information and knowledge of the village that we have at our disposal, we could venture to say without hesitation that the large bulk of the poor peasant and poor non-peasant households live on the border, and very often well below, what has euphemistically come to be known as the Poverty Line. (This Poverty Line could, under some assumptions, be regarded as a rough approximation to the simple reproduction costs of labour.)

(e) *Migration:* The ultimate option before the household is to migrate permanently to the local or district towns. We do not know of any poor peasant or non-peasant household which has moved out in this fashion in recent years. The reasons are readily available. Firstly, for the poor peasant, the insecurity and the uncertainty associated with this move are exceedingly high. Secondly, existence is a much more costly affair in the towns than in the village (where in extreme cases, institutional buffers are temporarily available). Thirdly, if the household owns some patch plot of land, it is certain of earning a life-maintaining amount of income, an assurance which is lacking is the unskilled casual labour market in townships. What we find, therefore, are some natural compromises. Some individuals from hard pressed households migrate to the towns, leaving their families behind. This step enables them to earn and remit some (even though minimal) money to the family, which in the mean while, attempts to make the best of opportunities open to it in the village. Other households move out collectively in particular seasons, when work is more or less assuredly available in local townships, or at brick kilns upto fifty miles distant. The potters and muleteers manifest such behaviour in seasons when the opportunities are not forthcoming, or rewarding enough.

TABLE 18: MONEY-LENDING

Class	No of HHs in Group	Amount Lent (Rupees) 1-250 Number	1-250 Amount	250-500 Number	250-500 Amount	500-1000 Number	500-1000 Amount	1000-2000 Number	1000-2000 Amount	2000+ Number	2000+ Amount	Total Number	Total Amount

IV

Differentiation: The Rich Peasantry

A detailed study of the rich peasantry would fall outside the purview of this paper. However, in order to understand the place of the rich peasantry in the process of differentiation, we will set down, albeit in summary fashion, the basic economic characteristics of the rich peasantry. Thereafter, we will briefly examine—firstly, tendency towards concentration in land ownership/control, and secondly, the role of credit and the household's internal surplus in the mechanics of differentiation.

(1) *Economic Characteristics:* The rich peasants have cultivation as their main occupation—of the 45 rich households, 38 have own cultivation as their main occupation. These 45 households (24 per cent of the total number of households) own 523.31 acres of land (77 per cent of the total village land). 38 rich peasants (a little

over 20 per cent of households) own 90 of the 142 draught cattle in the village (over 63 per cent of the total). 18 rich households own all the 13 tube-wells, while four rich peasant households own all the 3 tractors in the village. Both the flour mills are owned by rich households. Thus the rich peasant households own the vast proportion of the productive fixed capital of the village.

Their superior resource position reflects itself in their cultivation practices. Invariably they use the high-yielding seeds, fairly large quantities of chemical fertiliser (even though not in the optimal dosages), and liberal quantities of irrigation water. They have almost all registered impressive increases in their incomes and surpluses. Cultivation—which has come to include some commerical crops—has become increasingly market oriented, and makes considerable use of hired labour. Furthermore, they make a fair amount of income from the sale of irrigation water and hiring out of tractor services and bullocks to the poor peasants, as the marginal cost of the use of these resources is much lower to the owners than the hire price of these facilities. Such hire charges recover, for almost all the tube-well owning peasants, the total expenses involved in maintaining the tube-wells, including costs of irrigating their own fields as well as the interest charges on the loans which financed the tube-well purchase.

These households are also in a favoured position *vis-a-vis* the new occupations to which they have ready access. This is reflected, amongst other things, in the large number of individuals from rich peasant households who have migrated to towns to take up infrastructural jobs. This is to be contrasted with the distress seasonal migration of some of the poor households. Indeed, these rich migrants send back sizeable remittances to the parent households in the village.

(2) *Concentration in Land Ownership/Control:* A glance at the record of land transactions made during the last twenty years reveals the interesting fact that the current class of rich peasants has, since 1951, increased its area of land owned by a net purchase of 60.86 acres, which forms 11.6 per cent of their current owned land area. Of this, the post-1961 decade saw net increase of 23.55 acres, or 4.5 per cent of their current owned area. In contrast, both the current middle and the current poor households have registered a fall in the areas of land owned over the same periods. Thus, the poor households owned land holding has diminished since 1961 by 7.09 acres, and since 1951 by 9.04 acres, which are 16.3 per cent, and 20.8 per cent, respectively, of their current land owned area.

Let us now look at data concerning the other device through which concentration of land-holding occurs, *viz*, through leasing of land under short term tenancy contracts. We would usually expect in the process of differentiation, the concentration of land-holding with the rich peasants to be increased further through tenancy transactions—which can be effected even when increase in outright ownership is constrained by economic and legal factors. However, when we examine the inter-class leasing data, we find that in the reference year, Rabi 1969-70, the rich peasants had leased out 78.17 acres *net* to other classes, while both the middle and the poor groups, on the balance, leased in areas of 81.05 acres, and 36.28 acres *net*, mostly from the rich peasants. Thus, rich peasants leased out 14.9 per cent (net) of their owned land, while the corresponding net leasing—in percentages for the middle peasants and the poor peasants turn out to be 71.8 per cent and 83.6 per cent respectively. These movements go strongly contrary to the mild tendency towards concentration observed in the land sale/purchase figures.

How are these two opposing phenomenon to be explained? The conjectural interpretation that follows seems to us to be plausible in the context of the village.

The first clue lies in the economic motivations underlying the tenancy contracts made by the poor and the middle peasants. The leasing-in by the middle peasants is largely motivated by a desire to bring their operational holding size in closer relation to the fixed cultivation reasources that they possess, especially their ownership of draught cattle. We find for the middle peasants, the figure for average area cultivated per pair of draught cattle rises, and comes closer to the norm for the area "commanded" by a pair of bullocks. The leasing-in of land by poor peasants is largely a distress phenomenon, and the motivation of the rich peasants is essentially twofold: (a) by rotation, to give plots of his land "rest" from chemical fertilisers by leasing out to poor peasants who are obliged, contractually, to use *desi khad* only; (b) to exploit the labour of the poor tenant. (A detailed study of tenancy in this village is under preparation.)

The second point is that, currently, while rich peasants are aware of the economic advantages of large scale capitalist farming, a major shift to such cultivation is yet to be effected. Thus, while the worth of land as wealth largely explains the mild concentration tendency in land ownership since 1951, the current deployment of resources by class, and the techniques of cultivation make existing tenancy transfers desirable from the point of view of the classes leasing-in. The maturing of large scale capitalist farming is likely to introduce forces which will tend to revert the current direction of leasing.

(3) *Credit and Differentiation:* Mechanisation, and the adoption of the new technology by the rich peasants has proceeded at a rapid pace, especially since the mid-60s. This process has been strongly aided by the co-operative and the district credit programmes. These programmes have an in-built bias towards the rich land owning household. Using as they do, assessments of repayment capacity based on land ownership, they debar the smaller land owner from procuring a loan to finance the bulk of the investment in fixed capital resources. For example, no poor peasant is even formally eligible to acquire a standard Land Development Bank loan of Rs 5,000 for the installation of a tube-well. The Land Development Bank and the Agro-Industrial Corporation provided long-term credit totalling Rs 56,718 to 12 rich households. This is over 98 per cent of the loans given to this village, and forms 33.3 per cent of the total assets owned by the rich peasants in the form of productive capital in agriculture. Co-operative finance has made it both economic and possible for the rich peasant household to invest in fixed investment goods to an extent greater than it could have of it had to rely entirely on its internal surplus. The low rates of interest charged by the co-operative in relation to the borrowing rate of interest in the village market (9 per cent as against 24 per cent or over) are crucial in this respect. So also are the easy hire purchase terms at which the Agro Industrial Corporation offered credit till 1970—four-fifths of the finance for the purchase of tractors and the purchase of other agricultural implements was provided in the form of credit. These easy terms at which the rich landowners can borrow State finance is the major factor which explains the heavy overinvestment in certain fixed investment goods, e g, tube-wells.

The crucial economic significance of the rich household's easy access to liberal State finance at lucrative terms is that the investment plans of the household get divorced from the savings (real and potential) of the households—at least in the short run. Since both working capital as well as finance for fixed investment can be procured from outside, the larger part of the household's surplus is dissipated in consumption, or in unproductive investment e g, pucca house construction, durable consumption goods etc, and in expenditure on such status symbols as dowries. 31 rich households own pucca houses constructed at a total cost of Rs 3,02,550, twenty of them in the last five years. An interesting point to note about this investment is that not one of these households has outstanding credit (from non-official sources) on this count. Further, 38 rich household own durable consumer goods (bicycles, electric fans, watches, transistors etc etc) valued at over Rs 15,000. Another sizeable amount goes into money-lending—24 rich households had lent out a total of Rs 26,365 (net) in the reference year (nearly 92 per cent of total money lent by village households). Thus, but a fraction of the large surpluses thrown up by the new technology are ploughed back or channellised into other productive investment.

Thus, the rich peasant households—who serve as the chief carriers of the new technology—are in a vastly superior position to benefit from the 'green revolution' and its linkage and multiplier effects, for the primary reason that they own and control land, that vital resource without which it is impossible for a peasant household to gain from the 'green revolution'. This elementary rule seems to form the core of the complex process of capitalist transformation of the countryside.

V

Concluding Observations on Differentiation of Peasantry

(1) The peasantry is not a class as such; it is a surviving aspect of the old precapitalist modes of production. Even as such a category, the peasantry does not comprise homogeneous units; there exists tremendous economic differentiation between the rich, the middle and the poor peasant households.

(2) The emergence of capitalist relations, catalysed by the rapid adoption of the new technology leads to a marked expansion of the forces of production in agriculture. In this process the innovators and the carriers of the new technology and methods are the rich and the middle peasants.

(3) This rapid expansion in the forces of production in turn intensifies the process of polarisation of the differentiated peasantry, thus transforming the rich surplus-making peasants into machine using capitalist farmers on one end of the scale, while pauperising, and eventually proletarianising the small peasants and especially the village artisans and handicraft petty producers. Hence, it follows that the peasantry forms a historically crumbling category.

(4) Even though the process of differentiation is, historically a progressive movement, it does not follow that it spells prosperity for all the households and classes involved in it. The rich peasants, on account of their favourable position in relation to the ownership of the means of production, corner the benefits of the expansion of the forces of production. The same process, however, spells the ruination of small working-peasant classes. An inescapable conclusion must be that the 'diffusion-of prosperity' hypothesis that we referred to in an earlier section does not stand up to scrutiny.

(5) The rich peasant corners the benefits on account of the advantages of large-scale farming (*viz*, a higher rate of surplus); his superior resource ownership position; the bias towards the big landowners in the credit policies of the State agencies; and the fact that the rich peasants can use their political power for consolidating their position *vis-a-vis* the poor peasants and labouring classes.

(6) The poor worker-peasant is impoverished not because his economic decision-making displays irrationality of any kind. Indeed, the poor peasant displays a high order of economic efficiency in organising his annual production programe. However, despite this 'efficiency', the poor working peasant household is pauperised on account of the fact that the acute weakness of its resource ownership position precludes it from moving into the high return occupations in a big way. In fact, the changing economic conditions erode the viability of the traditional economic basis of the household. Indeed, it would be reasonable to say that if the harvesting operation was mechanised, many pauperised households would migrate to the local towns on a large scale, because the crucial and most profitable employment opportunity — high wage harvest labour — would dry up.

(7) We must also reject the petty bourgeois utopian view which eulogises the "superior efficiency" of the small peasant households and recommends its organisational form as a prototype of agrarian reform. Superior productivity per acre is stated to result from the "industrious nature" of the peasant, who is seen to spare no labour in squeezing out the last grain of output physically possible from the limited resources at his command. Multiplicity of occupations at the household level is then made out to be an illustration of his "versatility" and the wide extent of the market is assumed to be a manifestation of the high degree of social division of labour in household industry in the rural economy. In this context, the continued historical survival of this category of peasant worker households is considered to be a reflection of the "innate resilience" of the peasant economy. The preceding analysis has amply demonstrated the falsity of these assertions adequately. We find in the literature an exceedingly interesting parallel in the debate over the nature of Tsarist Russian agriculture, in which a petty bourgeois utopian school of thought characterised the peasant household and the peasant economy as ideal forms, through much the same line of reasoning as we have rejected. This school, with Bulgakov as a leading spokesman (and allegedly Chayanov as the leading theorist) was given a comprehensive reply by Lenin, who used Kautsky's earlier analysis to show conclusively that the 'versatility' of the small working-peasant household was either fictitious, or anachronistic and therefore historically doomed; that the 'resilience' of this household was really its desperate struggle for survival; and that the exceedingly hard work put in by the poor worker-peasant on odd jobs for a pittance, testified not to his 'innate industrious nature', but to the altered economic conditions which give him the crushing alternative of working for much less than subsistence through the long winter months, or to be altogether idle, and be buried in the spring.

In conclusion, we must state, at the risk of sounding tendentious, that many sterile debates exist in the literature over issues covered in this paper in particular, and over agrarian theory in general, which would have been pre-empted if Lenin's pioneering works on the economics of the capitalist transformation of agriculture had received the attention they so richly deserve.

The Rashtriya Swayamsevak Sangh—IV

Jan Sangh and Other Organisations

Walter Andersen

There is much evidence which suggests that the RSS leaders expected to influence politics in a Congress Party dominated by Vallabhbhai Patel. When the Congress Working Committee passed its resolution preventing RSS members from joining the Congress in late 1949 and when Patel acquiesced in this, the RSS did begin to look for some alternative way to influence politics.

Those elements in the RSS who proposed more direct political involvement received a hearing within the organisation that would not have been possible before 1948. This was the backdrop to the formation of the Jan Sangh and the RSS's role in it.

To extend the RSS's influence, a large number of other institutions were formed to spread the RSS ideology among various types of groups (i e, students, labour, teachers, etc). Rather than 'infiltrate' existing institutions, the RSS helped form separate groups. Because RSS members were excluded from many interest groups and political parties in the post-independence period, this option was, in a sense, forced on the RSS.

[This is the fourth, and concluding, instalment of this study of the RSS. The first three parts discussed the origins and growth of the RSS, the relationship between the RSS and the Hindu Mahasabha and the ban on the RSS following Gandhi's assassination which led many in the RSS to conclude that the organisation would have to transform itself into a political party if the movement was to survive.]

X

THERE are still many unanswered questions on the role of the RSS in the formation of the Jan Sangh. It is fairly clear that Vasantrao Oke, a prominent RSS pracharak in Delhi (and a strong supporter of the RSS itself becoming a political party) contacted Mookerjee as *early as in* 1949 on the feasibility of a new party. We also know that N B Khare met Mookerjee in Delhi on July 31 or August 1, 1950, when Mookerjee indicated that he was already in contact with Golwalkar on a proposed political party.[281] However, the position of the RSS was very much in doubt regarding official RSS support of a new political party, despite the active efforts of many RSS swayamsevaks. Balraj Madhok *insists* that, during the ban, most of the younger RSS members were in favour of the RSS itself becoming a political party.[282] Many RSS leaders have disagreed with this statement. Apparently, the feeling for a political party was stronger in Delhi and the Punjab than elsewhere. It does not seem to have been very strongly held in the birthplace of the RSS — Maharashtra. We have seen the Golwalkar himself opposed any idea of the RSS becoming a political party.

There is much evidence which suggests that the RSS leaders expected to influence politics in a Congress party dominated by Patel. When the Congress Working Committee passed the resolution preventing RSS members from joining the Congress in late 1949 and when Patel acquiesced in this, the RSS did begin to look for some alternative way to influence politics.[283] The HM was neither viable nor did its leadership get along particularly well with Golwalkar. This was obvious when the RSS refused to give any statement of support to the HM at their session in 1949 *in* Calcutta. The relations between the RSS and the HM had deteriorated considerably during the early 1940s. In 1943, Savarkar's office sent out a memo to provincial sabhas stating that, in many localities, "actual preaching is carried on against the Hindu Mahasabha and the Congressites control the Sangh [i e, RSS] activities. . . ." It was suggested that in such places HM members begin their own volunteer corps.[284]

There are contradictory opinions on whether Mookerjee initiated discussions with Varantrao Oke about a new party before or after he resigned from the Cabinet.[285] Whichever is true, it is a fact that Golwalkar was in no hurry to rush into an arrangement committing his organisation to any political party. In his recent biography of Mookerjee, Balraj Madhok points out that

> "The RSS leadership with its greater stress on organisational working and its keen desire to have the real control of the new party in its own hands wanted to take its time to usher it into existence. The delay irritated Dr Mookerji who, at one stage, even thought of going alone."[286]

RSS leaders have strongly denied this statement. They do not deny that Golwalkar delayed committing his organisation to any political party, but not because he wanted to establish RSS control over the new party. Golwalkar is known to be very cautious and keen to establish a consensus before making a decision. *It seems likely that any* delay was due to his attempt to reconcile both those who wanted the RSS to become a political party and those who wanted it to remain strictly aloof from politics. Madhok himself admits that the final decision was a compromise based on the RSS's relation with the Jammu and Kashmir Praja Parishad. In that case, the RSS loaned workers and support, but remained a separate and "cultural" unit.[287] *Evidence indicates* that Graham is correct when he attributes the delay to the common concern of Mookerjee and the RSS over the outcome of the Congress struggle for power. The victory of Nehru was rather conclusive evidence that the RSS and Mookerjee could exert influence on politics only through a new political party.

There is some evidence that suggests that Madhok was correct in stating that Mookerjee was somewhat apprehensive about RSS co-operation in his new political venture. The RSS Sanghchalak of Delhi and Punjab, Lala Hansraj Gupta, Pandit Mauli Chandra Sharma, and Madhok visited Mookerjee on October 11, 1951, proposing that he be the president of the new all-India Jan Sangh. He accepted but not until he had thoroughly discussed the relationship of the Jan Sangh with other "national forces", presumably the RSS. He had insisted that the Jan Sangh must be the "spearhead" of nationalist forces in India and must be open to all Indians.[288] This was agreed to. One

of Mookerjee's closest friends in Calcutta notes that Mookerjee had no intention of "playing second fiddle" to the RSS within the new party.[289] This point should not be unduely emphasised however. Golwalkar has always been convinced that politics as such is not an effective way to "change character", and "character change" is the primary goal of the RSS. Golwalkar has always insisted that the Jan Sangh and the RSS remain separate organisations. In an article which he wrote in 1956, Golwalkar reports that in his discus*cussions* with Mookerjee, prior to the formation of the Jan Sangh, he insisted that "RSS could not be drawn into politics, that it could not play second fiddle to any political or other party", nor could it be "a handmaiden to political parties". According to Golwalkar, Mookerjee insisted that the Jan Sangh could not be subservient to any other organisation. Both agreed.[290] While the issue is not discussed, there is little doubt that Golwalkar has never considered the Jan Sangh the "spearhead" of the nationalist movement. The RSS has always viewed itself as the leading force of nationalism in India.

From its inception, the Jan Sangh drew on the RSS for its organisational cadre. It is clear that Mookerjee saw the advantages of a delicated cadre from the RSS who could staff the young party. It is reasonable to assume that he saw the RSS members and sympathisers as an electoral base of support. Should the Jan Sangh ever leave the path of nationalism, as defined by the RSS, the RSS could withdraw support from the party and this would cripple it.[291] This ensures that the influence of the RSS on both policy and personnel will be significant.

RSS swayamsevaks, anxious for a new political party, began preparation for a regional nationalist party in Delhi and Punjab as early as in January 1951 shortly after the death of Sardar Patel. Prominent in the discussions were the RSS Sanghchalak for Delhi and the Punjab, Lala Hans Raj Gupta; Arya Samaj leader and editor of the Urdu daily *Pratap*, Mahashe Krishan; Siri Chand, a leader in the Jat politics of Haryana; Pandit Mauli Chander Sharma; Sanatan Dharma leader and old revolutionary, Lala Bal Raj Bhalla. Madhok and Mookerjee were also involved. They met in Delhi to draw up plans for a new party in the Punjab, PEPSU, Himachal Pradesh and Delhi, precisely those areas in which RSS sentiment for a new party was strongest.[292] A subcommittee was chosen to make arrangements for an áll-India party. Because of certain misconceptions that people might have, Mookerjee suggested that the name of the new party not include the term Hindu. He felt its nationalist intent would be better understood if the term Bharatiya were used.[293]

On April 18, 1951, Mookerjee announced in Calcutta his decision to form an all-India party. On May 5, he announced the formation of the People's Party in Calcutta.[294] In June 1951 the first public meeting of the People's Party was held in Shraddhanand Park in Calcutta. In his address to the meeting Mookerjee said that this party would soon align itself with similar organisations in India.[295] One such group had been formed in Jullunder, Punjab, on May 27, 1951[296] This party called itself the Bharatiya Jan Sangh and its activities were restricted to PEPSU, Punjab, Himachal Pradesh, and Delhi. At the time, Madhok wrote.

> "An organisation with the same name and with similar objectives has been formed by Dr Shyama Prasad Mookerjee in Bengal . . . But that has no connection, direct or indirect, with the Jan Sangh of Punjab. It is, however, possible that Jan Sangh may extend its field of activity to cover the whole country in the near future."[297]

Within the next two months, similar conferences were held in Lucknow and Indore to form a Jan Sangh in Uttar Pradesh and Madhya Bharat.[298]

Mookerjee delineated three major concerns for the new party — rehabilitation of refugees, economic development and civil rights. His approach to the economic problems of India was eclectic. To tackle the pressing problems of food and clothing, he suggested that the government not adhere to any ideology. He emphasised the point that private enterprise alone could not succeed in overcoming India's economic problems.

> "We cannot ignore realities; we see before our eyes the clear limitations from which the present class of Indian capitalists suffers and how with all their good wishes they are unable to make their contributions to check the impending economic crisis. . . . India's economic structure cannot be made the plaything of powerful groups and cartels who will control the vital units of production and distribution of India's economic structure."

He advocated a land to the tiller policy, industrial decentralisation and regional self-sufficiency. Needless to say, he also proposed a strong policy towards Pakistan. His party would be what the HM was not — ". . . open to all citizens of India irrespective of caste, creed or community". Moreover he saw the necessity of honouring the culture of Bharat.[299]

On September 9, 1951, office bearers and prominent workers of provincial Jan Sanghs of Punjab, PEPSU, Himachal Pradesh, Delhi, West Bengal, Uttar Pradesh, and Madhya Bharat met and drew up plans for an All-India Conference at Delhi. On October 21, 1951, the All-India Bharatiya Jan Sangh was formed at Delhi with Mookerjee as president.

XI

The RSS became involved in several other groups as well as the Jan Sangh. With the exclusion of RSS from various areas of endeavour, the RSS leadership felt that the only way to propagate their ideology was to begin organisations in which their members would have a leading role and their ideology would be predominant.

The first of the organisations launched with the support of the RSS was the Akhil Bharatiya Vidyarthi Parishad — a student's organisation. A prominent organiser of this was Balraj Madhok. He has stated that he formed the first organisation in Ambala, Punjab, at the DAV college there, during the ban and without the prompting of RSS leaders.[300] This point is disputed, however. Ved Prakash Nanda, a former Vidyarthi Parishad president in the Punjab at the time that Madhok says he formed the Vidyarthi Parishad, contends that the RSS did influence the formation of the group and the RSS also deputed workers to go into this work.[301] Moreover, Giri Raj Kishore, the 1969 General Secretary of the VP notes that about one half of the founding members of the VP were RSS swayamsevaks.[302] It is unlikely that Madhok, a staunch RSS member at the time, would have formed a group like this without consultation with RSS leaders. Moreover, during the ban, similar groups were formed all over India.[303] Krishna Bahadur, a professor at Allahabad University, and an early leader of the VP in Uttar Pradesh, notes that similar groups were formed in most of the major universities and colleges in Uttar Pradesh during the ban.[304] As noted above, the RSS formed a number of "fronts" during the ban, typical among which were college units like the one Madhok was associated with. Because of its popularity and the obvious need to influence college students who did not want to undergo the rigorous demands made in the shakha (primary unit of the RSS), the VP continued after the ban was lifted. It has grown into one of the largest and best organised student

groups in India. It is noteworthy that the RSS should enter this field just at a time when the Congress was de-emphasising political involvement of student. Since Independence, the student movement, according to Philip Altbach, has all but collapsed.[305] This de-emphases provided an excellent opportunity for the RSS to spread its ideology among college students and faculty. Moreover, the change in the social composition of the student body favourably worked to increase RSS influence. Increasingly, the students were drawn from the middle and lower middle classes rather than the pre-independence situation where the students came from wealthy urban groups. The communists had been active in student politics since the early 1930s. The RSS and the communists have, since independence, competed for the loyalties of the college population of India — particularly in the Hindi-speaking areas of north India.

The Vidyarthi Parishad is a rather unique student organisation in that it includes members from both administration and faculty. This fits the general ideology of the RSS which seeks to reconcile the interests of various groups. In fact, this is one of the Vidyarthi Parishad's major points of disagreement with the communists and other student groups.

In 1949, at Delhi, a constitution was drawn up to unify the various branches of the Vidyarthi Parishad into an all-India organisation.[306] Organisers were loaned to the group by the RSS and the initial membership base was drawn from students who were swayamsevaks. These organisers toured the country, spreading the VP.[307] The new organisation was most successful in the areas of RSS strength — Uttar Pradesh, Punjab, and Madhya Pradesh.[308]

Why did the RSS decide to sponsor a new student movement? One of the chief reasons was the exclusion of RSS members from existing student groups in 1948-49. The National Union of Students had barred RSS members from joining it.[309] There was no question of their joining the Communist-led Students' Federation. The present general secretary of the RSS has noted that the RSS had no intention to see its sympathisers excluded from influence in the student field.[310] Moreover, the RSS leadership was genuinely concerned with the growing influence of the Students' Federation. The much expanded enrolment brought with it a large increase in the number of swayamsevaks attending college. Reuben Auspitz has observed that the RSS feared losing these people when they were exposed to an environment in which many teachers and organisations were hostile to the RSS. The Vidyarthi Parishad would preserve the RSS ideology, but not have attached to it the adverse image of a communal group that was attached to the RSS. Moreover it provided a nationalist forum for those who might not have participated in the RSS (i e, Christians).

A second RSS endeavour that appeared in the post-Independence period was its entry into the field of journalism. Within a few years several newspapers were begun with money raised by individuals sympathetic to the RSS. The first such daily was formed in 1948 at Nagpur, the headquarters of the RSS, named *Rashtra Shakti*, edited by a swayamsevak, C P Bhishikar.[311] Prior to that Gopal Rao Ogale's *Maharashtra* had given favourable publicity to the RSS in Nagpur. With mounting criticism of the RSS after the assassination of Gandhi, the RSS leadership felt it needed news organs of its own. There was some misgiving in the RSS on its launching such papers. The RSS had not made use of this kind of publicity since its formation in 1925. Many older RSS leaders felt such techniques undermined the RSS view that the most effective work was done at the face-to-face level. This kind of publicity, it was felt, could not spread the "real" work of the RSS. Moreover, it might lead to a striving for popularity rather than the "harder" task of building character. After the ban was lifted, these arguments were not as persuasive. The ban had shocked both the leaders and followers of the RSS. Few newspapers defended them. Moreover, many frequently attacked it. A group of RSS leaders in Nagpur decided that it was to the advantage of the RSS to form a chain of newspapers sympathetic to it. They purchased N B Khare's *Tarun Bharat*. Before the ban, the RSS was instrumental in forming an English weekly in Delhi that would represent its viewpoint. Speculation regarding the wisdom of forming such a weekly had started in 1946, but the *Organiser* was not launched until 1947. It has remained the chief journalistic expression of RSS viewpoint. Like the *Tarun Bharat* in Nagpur, it was financed by the sale of shares. The shares were purchased by RSS sympathisers or members.[313] Since then, a large number of weeklies and dailies have been begun by RSS sympathisers all over India. The trustees of most of them are RSS members.[314] Like the two other organisations mentioned, the RSS has delegated pracharaks to staff many of these ventures.

Another new and related organisation is the Hindustan Samarchar, begun by one of the most active RSS propagandists, S S Apte.[315] It was launched in Bombay in August 1948. The early workers were almost all RSS swayamsevaks. The purpose of the new group was to provide news in the vernacular languages. Until then, vernacular newspapers needed to translate news stories from English. The Hindustan Samarchar also presents news items about the RSS in a more favourable way than other news agencies. News agencies in 1948 and 1949 were not likely to carry stories reporting the RSS in a favourable way.

Conclusion

The RSS was organised in 1925 to build a nationalist cadre that would unite and defend the Hindu "nation" The leadership of the new group believed that a reunited and rejuvenated Hindu society would not only preserve the "best" of Hindu culture, but also bring colonial rule to an end. There is much evidence that suggests that Hedgewar intended the RSS to be the action arm of a nationalist movement that would eventually rid India of foreign rule. The increasing communal antagonism in the 1930s and 1940s, however, blurred this objective. To preserve itself from restrictions and a ban, the RSS did little that antagonised the British. It was not that their desire for independence declined; from 1925 to 1947 the RSS leadership consistently favoured full independence. Like the HM, many of their leaders feared that the Muslims would win too many concessions from the British. Both Muslim and Hindu groups (e g, the RSS) anticipated an armed struggle for control of British India after World War II. To antagonise the British would give the other side advantages in the struggle for eventual control of the subcontinent, it was thought. Moreover, the present Sarsanghchalak is not as convinced of the efficacy of political action as was his predecessor.

Since Independence, the RSS' role changed considerably. The ban and the direct assault on the organisation by an independent Indian government were traumatic. Those elements in the RSS who proposed more direct political involvement received a hearing within the RSS that would not have been possible before 1948. To extend its influence, a large number of institutions were formed to spread RSS ideology among various types of groups (i e, students, labour, teachers, etc). Rather than "infiltrate" existing institutions, the RSS helped from separate groups. Because they were excluded from many interest groups and political parties in the post-Independence period, this option was, in a sense, forced on them.

On the ideological plane, the RSS felt the Congress leadership in post-Independence India was committed to models of development "imported from the outside" (i e, socialism) that could not arouse the masses to make sacrifices for the goals of development. In fact, much that the RSS proposes is quite similar to that proposed by the "westernised" leadership of the Congress; the disagreement comes over the lack of Hindu symbols.

Since its inception, the RSS has recruited its cadres primarily from high caste middle class Hindu in the urban areas of the Hindi and Marathi speaking regions. To a large extent, these groups in north and central India were mobilised rather late into a nationalist consciousness and found their entry into politics and the economy blocked by existing elites with a style of life and ideology considered somewhat "foreign". It is not surprising that the RSS has been something of a populist movement, speaking for the common man and against the bureaucratic and economic elites, who they felt to be representatives of an imported culture.

Since its inception, the RSS has also been something of a Hindu bhakti sect with the Nation as the bhagavanta (object of veneration). Anyone is admitted who subscribes to behaviour patterns considered proper. Because these behaviour patterns are more salient to high caste Hindus, the membership has come largely from high caste Hindu groups. However, there are members from the backward classes and they are welcomed. The aim of this form of bhakti is worship of "Bharat Mata". One's primary loyalty "should be" to the collective unit, according to the RSS. This emphasis on national loyalty over local loyalties and the RSS' reliance on the Great Tradition of Hinduism have alienated many who are not attracted by either.

The RSS has succeeded in building a cadre which can be mobilised for whatever tasks the leadership sets before it. Moreover, it has provided the recruitment pool for a large number of organisations (i e, Jan Sangh, Vidyarthi Parishad, etc) providing these groups with a disciplined cadre.

Agricultural Development Branches Being Opened

R K Talwar on Need to Remove Hurdles

Shri R K Talwar, Chairman, State Bank of India, has announced the Bank's programme of opening 150 Agricultural Development Branches all over the country to provide finance in accordance with the assessed needs of selected areas.

He emphasised the need to demarcate areas for development among different financial institutions so as to avoid over-lapping of efforts as also the risk of over-exploitation of the ground-water potential. He also appealed to the State Governments to remove legal disabilities of commercial banks in the financing of agriculture.

In his speech at the Seventeenth Annual General Meeting of the shareholders, held in Calcutta, on Friday, the 24th March 1972, Shri Talwar said:

IT gives me great pleasure to welcome you all to the seventeenth annual general meeting of the State Bank of India, particularly because this is the first opportunity I have had — or any chairman of the Bank has had — of meeting the shareholders in Calcutta. As you are aware, the first 14 annual meetings were all held in Bombay. In 1970 we broke that monopoly and convened the meeting in Ahmedabad. It is the intention of your Board of Directors that in future years these meetings should be held in different cities as often as practicable, taking into account the likely attendance of the shareholders.

On an occasion like this, when we have gathered to review our business operations during 1971, one feels impelled to refer to the significant events that culminated, as it were, in a regeneration of what is basic in our national character. We have witnessed a victory for Truth and Justice under the inspired leadership of our Prime Minister, Shrimati Indira Gandhi. The unseen hand of the Supreme guides the destiny of our nation, and, while we pay homage to those who fought and laid down their lives in the cause, we do so in the sincere hope that we shall make ourselves worthy of a much more glorious future that awaits us.

Working Results

The annual report including the balance sheet as on the 31st December 1971 and the profit and loss account for 1971 is already in your hands. I am happy to state that, as was hoped for by us last year, our working has shown better results. The profit figures for 1970 and 1971 are, however, not comparable; this is due to the fact that the bonus paid to staff, instead of being treated as an appropriation from balance of profits as in previous years, has been shown as a change thereon. This is as it should be, because bonus is no longer an *ex gratia* payment and is, in point of fact, an item of expenditure on staff, like any other.

Fall in Credit Demand

As brought out in the annual report, the deposit growth of the Bank during 1971 was higher than in the previous year while its pace of credit expansion slackened. By and large this would appear to have been true of the entire banking system. During the year the Bank improved its liquidity, as indeed it had been called upon to do during the earlier months of stringent money conditions, and the credit/deposit ratio came down. In the latter part of the year, the Bank did not suffer from any lack of resources in dealing with credit demand from the various sectors of the economy.

Small-Scale Industries

Our loans to small-scale industries went up during the year by Rs 25 crores. The pace of growth was lower than in the previous year; this could be attributed to the impact on small-scale industry of the decline in the growth of industrial production. There is evidence to show that the credit needs of small-scale industrial units were, by and large, being met.

Employment-Oriented Lending

Our most important scheme for generating self-employment relates to the financing of technician entrepreneurs. The number of such entrepreneurs securing assistance from our organisation kept rising in 1971 at the rate of roughly one for every working day. At the end of the year, we had 807 entrepreneurs on our books with credit limits aggregating Rs 10 crores. We know a lot more still remains to be done, and are making conscious efforts to make ourselves more useful and effective in helping young men seeking to set up their own establishments.

We have, in addition, selected 60 pilot centres throughout the country with a view to gaining first hand experience in self-employment-oriented lending for individual artisans, craftsmen, etc. We propose to so organise ourselves at these pilot centres that anyone — particularly the educated unemployed — approaching the Bank with a proposition that gives evidence of a sincere desire and effort to venture on gainful and profitable self-employment will receive sympathetic and objective response. Creation of fresh and/or gainful employment opportunities requires a high degree of almost total planning and complete co-ordination amongst various governmental and financial agencies in any given region. Our work in the pilot centres will, we expect, receive the support needed from State authorities and help to throw up the likely impediments in productive lending and in the designing of suitable promotional measures for progressive extension of our activities in this direction to many more centres.

Financing of Agriculture

I made the point last year that commercial banks should adopt the policy of area approach in financing agriculture. As for the State Bank Group, I indicated our intention to select about 150 Intensive Centres throughout the country. We have already identified 87 of these, mainly in areas covered by the

Government programmes for small farmers and other weaker sections of the rural population. Forty-six of these Centres have been cleared with the concerned State Governments; such consultations with the State Governments are essential for the sake of ensuring co-ordination with other agencies connected with agricultural development. Each of these centres is expected ultimately to cover anything upto 100 villages.

At each Intensive Centre we propose to open an Agricultural Development Branch, supported by technical and other field staff. We already have the Reserve Bank's approval for the opening of 33 Agricultural Development Branches, and 20 such branches have been opened. Outside the Intensive Centres Scheme, our programme of Village Adoption is also gaining momentum, about 2,400 villages having so far been adopted.

As each Intensive Centre is identified, the surrounding area is surveyed by our technical staff and special schemes are prepared to provide agricultural finance in accordance with the assessed needs of the cluster(s) of villages taken up for attention in the first phase. Further clusters of villages would be similarly covered in later stages. Schemes will be tailor-made to cover the special requirements of individual groups of villages; the objective will be to find out how best the Bank's credit should be invested to create surplus income for the farmers, out of which they would not only be able to repay the bank loans but also improve their living standards, and the economy of the region.

The magnitude of finance required for this purpose all over the country will be stupendous. The term loan requirements for agricultural development schemes around each Agricultural Development Branch may be well over Rs 2 crores even on a very conservative basis. If we were to take the total requirements at one centre at even Rs 1 crore, the total term loan requirements at the proposed 150 centres will aggregate about Rs 150 crores, and this in addition to crop loans and finance for allied agricultural and non-agricultural activities. In view of the long-term nature of these investments we shall naturally lean heavily on the Agricultural Refinance Corporation. The importance of this lies not only in financial support that will enable us to maintain our liquidity, but, even more so, in the benefit we shall consequentially derive by subjecting our schemes to a second look at the hands of technical experts of the Agricultural Refinance Corporation. We have already submitted to the Corporation schemes involving a total outlay of well over Rs 50 crores and approvals of these have started flowing in.

One major problem which is bedevilling our programme for opening Agricultural Development Branches relates to co-ordination with the co-operative banks and demarcation of the respective areas. Co-operatives are spread all over the country, although they have not been successful everywhere. Even in States which are well developed in this field there are gaps and inadequacies which the commercial banks can help to fill. Where co-operatives have done substantial lending, or have programmes to do so, it will be inadvisable for commercial banks to come into the picture. Elsewhere, to avoid overlapping of efforts and the risk of over-exploitation of the groundwater potential, it is necessary to identify villages, in clusters, which could form the area of operations of different institutions. Our experience, repeated over a number of places, is that although we expend much effort in identifying the areas of operations of our Agricultural Development Branches, either the State Government's clearance is not promptly forthcoming, or, if that hurdle is crossed, the co-operative land development bank is not agreeable to area demarcation. It seems to me that a high-level body at the State level — one for each State — should be formed without delay and charged with the responsibility for the much needed co-ordination in this respect and for resolution of wasteful conflicts. I venture to suggest that the Reserve Bank of India, as the apex body for agricultural credit operations throughout the country, might perhaps take the initiative in instituting these arrangements as soon as possible.

Yet another problem in this field relates to the legal disabilities of the commercial banks. The important ones arise from (i) legal obstacles in the way of the farmers raising loans against mortgage of land; (ii) heavy stamp duty and registration fees on the creation of mortgages; (iii) cumersome and time-consuming processes involved in the creation of mortgages; and (iv) the statutory prior charge which co-operatives enjoy over the farmers' land. The Expert Group appointed by the Reserve Bank, of which I had the privilege of being the Chairman, went into this matter in great detail and has made several recommendations with a view to removing the various legal disabilities of commercial banks in the financing of agriculture. This Group took pains to suggest a Model Bill which, if enacted, would save the State Governments the labour involved in searching all the relevant current legislation and finding out what all amendments would be called for. Both the Reserve Bank of India and the Government of India have supported the recommendations of the Expert Group, and have urged the State Governments to take steps to adopt the Model Bill. I would appeal to the State Governments to give evidence of their keenness for commercial banking support to agriculturists by expediting the necessary amending legislation. Surely it is they who are concerned more than anyone else.

Expansion of Branch Network

On the expansion of our branch network, also, our record has been good. In 1970 the commercial banks opened as many as 2,137 offices, followed by another 1,805 in 1971. In this two-year period, the State Bank also increased the network of its offices by 814, or by almost half as many as were in existence at the end of 1969. The Bank and also its Subsidiaries are now drawing up plans for expansion in the three-year period 1972 to 1974, for which the Reserve Bank of India has compiled a perspective plan envisaging the opening of 5,000 new offices by all commercial banks. This means opening 139 new offices a month as against the average of 149 a month from June 1969 to October 1971. The perspective plan emphasises the need for priority to the relatively underdeveloped or under-banked States like Assam, Bihar, Jammu and Kashmir, Madhya Pradesh, Nagaland, Orissa, Uttar Pradesh and West Bengal.

There are no two opinions on the need for expansion of banking facilities at as fast a rate as possible. However, I venture to suggest that our enthusiasm in this respect has to be tempered by awareness of the realities. The pace of expansion of branches in the last two years has imposed an almost unbearable strain on trained manpower resources, and we are already faced with the reality of the lack of adequately trained personnel for jobs requiring competence of a high order. While on this subject I would like to reiterate that though we are doing all we can to expand our recruitment and training programmes and facilities, in the ultimate analysis there is no substitute for experience on the job. Preliminary training prepares staff to discharge their duties com-

There has also been a deceleration in the growth of electricity generation. According to official statistics, generation of electricity, showed an increase of 14.3 per cent in 1969-70. In 1970-71 the rate was lower at 9.2 per cent. Judging by available data for the first six months of 1971-72, the rate of increase in this year will further fall to about 7 per cent.

Serious shortages of power have developed in various parts of the country and lack of adequate inter-regional power transmission lines has compounded the difficulties.

We earnestly hope that allocation of resources in future will be based on more realistic input-output relationships among the various sectors and that inter-sectoral balances will be better maintained.

Steel

The steel supply position had already deteriorated considerably at the commencement of the year. Some of the positive steps taken by Government redeemed the situation, if only in a limited way. Banning of the export of prime steel and importation of steel in order to meet export obligation have been steps in the right direction. There have also been some meaningful attempts to step up indigenous production. Nevertheless, in the context of the need to lower the level of imports and the time-lag between efforts and results in the matter of raising domestic output, anxiety in the steel sector continues.

Company's Operations

We have increased our turnover from about Rs 14 crores in 1970 to about Rs 15 crores in 1971 and have maintained production at the previous year's level, despite the setbacks we suffered in the first quarter of the year due to shortage of steel. Our profits for the year are around Rs 42.24 lakhs against Rs 25.64 lakhs in the previous year.

Our Export Efforts

Our exports during the year 1970-71 have been around Rs 6.17 crores and we had orders on hand worth nearly Rs 24 crores as on 30th September, 1971. During the year we completed a turnkey job, received in 1968, in Sudan, valued around Rs 6 crores and won sizeable orders worth about Rs 15.5 crores from countries in Middle East and South East Asia.

Business in India

I referred to the Power Development Programmes in India in some detail earlier.

The IDA has granted a substantial loan for transmission line projects in India. In addition, the Union Government has detailed plans for interlinking various power systems in order to cope with shortages of power in several regions. A number of transmission lines are awaiting finalisation under the Five Year Plan. We expect that there will be appreciable improvement in the Indian order position in the period ahead in regard to both supply of towers and construction.

Diversification and Expansion

I had mentioned in my statement to you last year certain specialised items we have developed for rural electrification. I am glad to say that we have already executed orders for these items worth about Rs 40 lakhs. Our efforts at further diversifying our production are progressing apace.

Our Rolling Mill Project is progressing satisfactorily. We expect to do trial production in April this year. This plant, when it goes on stream, will significantly enhance our production capabilities.

Management Systems

Management of an organisation of our size and complexity, needs a high degree of sophistication. As an integral part of our efforts to modernise our managerial systems and techniques, we have, over the years, computerised a number of our operations covering such areas as Designing, Planning and Control, and Financial Accounts. Recently, in order to widen the area of application, we took a decision to have our own in-house computer. Acquisition of this facility would help us greatly in maintaining our technological parity with our competitors in other parts of the world.

Expansion of Capital

In order to sustain the increasing scale of our operations, especially in the export field, we decided at a special meeting of the shareholders held in January 1972 to widen our capital base. The legal formalities in this regard are now under way.

Outlook for the Future

There has been improvement in both production and turnover during the first five months of the current year compared to the corresponding period of the year under review and we hope to better the results in the period ahead.

Role of Government

The support we received from agencies, like the Ministry of Foreign Trade, the Office of the Iron and Steel Controller, the Steel Priority Committee, the Engineering Export Promotion Council, the ECGC, the banks and the financial institutions, has been indispensable to our success and we are grateful to them.

Personnel

It gives me great satisfaction to state that our relations with our staff and labour has been most cordial. Their understanding and supportive efforts are the basis of all our planning.

Our Friends in India and Abroad

As in the past year, a number of dignitaries, foreign and Indian, visited our works and we are grateful to them.

Conclusion

Your company is sensitive, to an exceptional degree, to the environment in which it operates. An essential part of that environment today is the prevailing climate of confidence and optimism. It is perhaps natural that in times of crisis we, as a people, should show a strength and cohesion that are seldom apparent in normal times. The challenges of conflict and survival have a way of dramatising their own urgency and of drawing us out; the challenges of peace and progress, however, tend to dissolve into the dreary details of day-to-day living. Yet our capacity to recognise them and face them alone can be the true foundation for our confidence or our optimism.

I express my sincere gratitude to the workers, members of the staff, officers and my colleagues on the Board for all their endeavours in the performance of our common tasks.

Note: This does not purport to be the proceedings of the Annual General Meeting.

ITC acknowledge the vital and enlightened role played by their Employees and Unions. It is with them that ITC wish to share the credit for winning the 1971 Award of the Federation of Indian Chambers of Commerce and Industry for outstanding contribution to Industrial Relations.

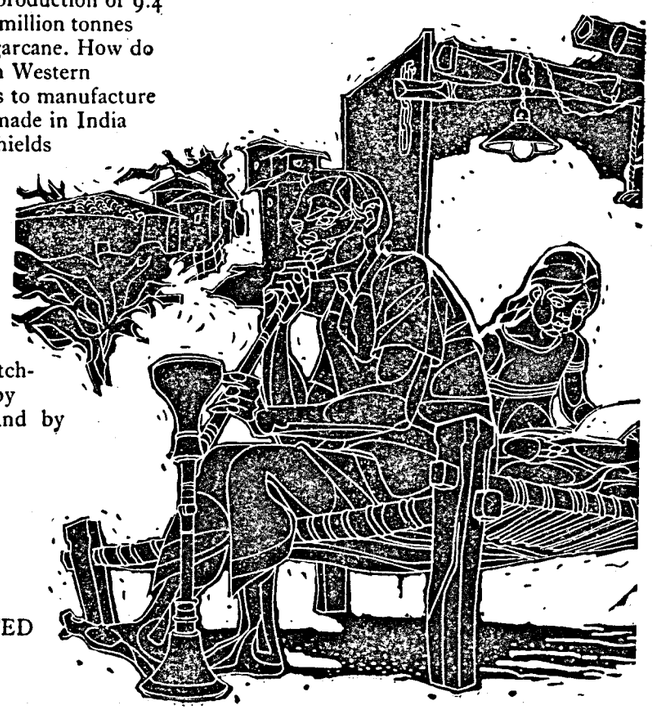
INDUSTRIALISATION FOR THE FORCED MARCH

CASTE AND STATUS IN AN INDIAN CITY



INDO-BANGLADESH TRADE

About half a million villages need the power to see light

so we're becoming power conscious

We're aware of the possibilities of nuclear power. And we're developing new capabilities to foster its growth. After all, 1200 MW nuclear power can energise 25,800 additional tube wells; produce annually phosphatic fertilizer (206,000 tonnes P_2O_5) nitrogenous fertilizer (370,000 tonnes N) and 50,000 tonnes aluminium; generate employment on farms for 1.4 million people; result in additional agricultural production of 9.4 million tonnes of foodgrain, 1.8 million tonnes potatoes, 11.2 million tonnes sugarcane. How do we know? From a study made in Western U.P. So we're using our energies to manufacture equipment that has never been made in India before—steam generators, end shields and calandrias for the atomic plants in Rajasthan and Madras —equipment that means more power for our people.

Power production is one field of our activity. Power Control is another. We design and manufacture a wide range of switchgear to control power. We do it by adapting foreign technology. And by developing Indian technical talents. It's been our job for 30 years. Right now we have over 10,000 people. That excludes another 10,000 or more, who work in the 600 ancillary units we have assisted and developed over the years. And each year we find we need more people to pool their talents with us.

The Diminishing Deterrent

THE 'domino theory' survives in a very peculiar form. This was demonstrated when the Americans decided not to sit at the table in Paris where the Vietnam talks were going on. The American calculation obviously was that now that President Nixon was going to Peking and later to Moscow, he could sort out the Vietnam tangle in these two places. The Vietnamese were in any case dominoes. One can shuffle dominoes. It might have been wrong to presume that they could be shuffled by the Americans. But very likely they could be shuffled by the Chinese and/or the Russians. As with many earlier calculations of the Americans in Vietnam, this reasoning missed the important point that what they were up against in Vietnam was not a game of dominoes but a people's war. It is amazing that after nearly 100,000 deaths they have not yet grasped this simple truth.

The miscalculation, of course, was that Peking and Moscow either singly or jointly would be able or willing to sell Vietnamese interests down the Mekong. They had done that once before in 1954. But that was a tragic mistake of such magnitude that it cannot be repeated. The Americans, of course, have repeated their own tragic mistakes. They played a wrong game in China. That did not deter them from involving themselves on an even larger scale in Vietnam. Nor did the Vietnamese involvement prevent them from extending the war to Cambodia and putting Lon Nol in power. They have been blind to the reality that Lon Nol, like the last Moghul Emperor in Delhi, may soon be ruling an area not larger than his palace. The day they decided to ignore the Vietnamese and call off the Paris talks, it was clear that the Vietnamese would react and react effectively.

The latest Viet Cong offensive in Vietnam is just that reaction. President Nixon has been shown that Quang Tri is not safe. And Hue is not far off from Quang Tri. The Americans have of course claimed that their heavy air and naval attacks have slowed the Viet Cong advance. Even if this claim were to be accepted uncritically, the Viet Cong have demonstrated that the much advertised Vietnamisation plan has failed. General Creighton Abrams must have seen that the only 'deterrent' worth its name in Vietnam now is American air power and this deterrent cannot escape the law of diminishing returns.

But the Viet Cong have not launched and sustained their offensive simply for the satisfaction of proving General Abrams wrong. In the tortuous negotiations with the Americans and the exchange of plans and counter-plans for a settlement, the Vietnamese have been insistent on two points: first, the setting of a deadline for American withdrawal from South Vietnam and, second, the removal of the puppet Thieu government. Vietnamisation — the expansion and arming of the puppet South Vietnamese army — has been the American answer to keep the Thieu regime intact even as American ground forces are withdrawn. Of course, there would be, besides, American air power operating from bases in Thailand and aircraft carriers at sea, to contain any major thrusts by the Viet Cong.

In the eight days of fighting so far, the South Vietnamese army has been routed and even the massive air strikes by the Americans against Viet Cong positions in the South as well as the 'punitive' attacks on the North have had no decisive effect. All this cannot but have a profound political impact within South Vietnam and the impact will be the greater if some major towns, like Quang Tri, were to fall. Use of air power by the US may temporarily stem the Viet Cong offensive on the battlefield, but it is no answer to the progressive weakening of the Thieu regime in Saigon — already left naked by the diminution of the physical American presence in the South.

The Viet Cong offensive has been interpreted as an attempt to put the Vietnam issue back on the US political map on the eve of the presidential election. It has also been seen as a warning to President Nixon that he can hope to gain nothing by trying to bargain with the Russians over Vietnam during his coming visit to Moscow. The Vietnamese are, of course, fully aware of the importance of American domestic opinion for US policy in Vietnam. Already, following the latest offensive, Senators Edward Kennedy and Mike Mansfield have called upon President Nixon to recognise the ineffectiveness of Vietnamisation and to resume the Paris talks. Similarly, the thought of some limited Russian-American understanding on Vietnam may not be entirely absent from the minds of the Vietnamese leadership. But very likely these considerations are subsidiary to the basic calculation of the Vietnamese that relates to the situation within South Vietnam itself. The Viet Cong offensive may thus be best seen as part of the effort to liquidate the *political* defences of the Thieu regime. The ill-considered American decision to walk out of the Paris talks clearly hastened the timing of the attempt.

Import Policy—I

Is There a Plan?

IF there is anything at all noteworthy about the import policy for 1972-73, it is that it continues the policy of allowing liberal maintenance imports, initiated in the wake of the devaluation in 1966. Nothing else could perhaps be expected at a time when the government appears so concerned about raising industrial output through better exploitation of established capacity. With the accent so much on production — *any* production — this is clearly the wrong time to be asking whether the government has any priorities in respect of the industrial sector (*pace* the Prime Minister's statement to the FICCI that growth rates of production were not everything and the Planning Minister's homily to Parliament on the need to curb production of articles of upper income consumption).

There are, however, certain other considerations having some bearing on import policy. First and most obvious is the prospect of reduced foreign aid receipts this year, which government spokesmen themselves have been harping upon. Second, there is the established fact that in the first three years of the Fourth Plan the rate of growth of exports has been nowhere near the Plan target of 7 per cent per annum. Finally, there is the prospect of a sizeable normal increase in imports on account of a pick-up in investment and the goading of industries to expand output.

If these considerations have not escaped the framers of the import policy for the current year, then their expectation appears to be twofold (apart from the Foreign Trade Minister's continued wonderland attitude to growth of exports, both past and future). First, aid prospects are really better than the government has been making out. Robert McNamara has evidently inspired confidence about generous World Bank group, especially IDA, assistance. Also, there is confident expectation of something substantial on the debt rescheduling front emerging out of the next meeting of the Aid Consortium. Finally, it is apparently believed that even the United States cannot remain out of the aid business much longer. There are pressures within the US (e g, from companies which are threatened with loss of exports to India) and the Government of India, for its part, is ready to forget the past provided some appropriate soothing political noises are made from Washington.

The second consideration which may have weighed with the import policy-makers is the availability of fairly large foreign exchange reserves which can be drawn down to cover a deficit in the balance of payments. At the end of January this year, after the latest allocation of SDRs, the reserves stood at Rs 876 crores (as against Rs 797 crores at the end of January 1971). There can be no objection, of course, to using up the accumulated foreign exchange if this is done as part of a plan for larger investment in industry and increased industrial output. But does such a plan exist?

Import Policy—II

More of the Same

THE import policy for 1972-73 does not reveal any fresh thinking in either import substitution or export promotion. Announcing the policy, the Foreign Trade Minister more or less repeated what he had said last year — that imports of some more items have been banned, that import of some more items are being canalised through public sector agencies as a result of which the share of the public sector in total imports would go up, and that on the whole the policy is aimed at greater self-reliance.

Fifty-six items have been added to the list of those whose imports are canalised through public sector agencies. Among these are copper scrap, certain iron and steel items, some categories of ferro alloys, a number of chemicals including caustic soda, and some petroleum products. These agencies, it is claimed, will thus handle additional imports of about Rs 100 crores in 1972-73. This is an exaggeration insofar as import of some commodities, like kerosene, though not formally 'canalised' were already being made through public sector agencies. Similarly, the claim that the proportion of imports handled by public sector agencies would increase to 75 per cent in 1972-73 is difficult to accept. In spite of the increase in the number of commodities handed over to public sector agencies for import, the proportion remained around 62 per cent between 1967-68 and 1970-71. It is difficult to understand how it will go up to 75 per cent, particularly since PL 480 imports on government account have already been phased out.

As part of the effort towards self-reliance, import of 160 items has been banned in addition to the 170 banned last year, and import of 87 items has been curtailed compared to 67 last year. What one would like to know, however, is how these items are picked and how far, apart from mere domestic availability, cost considerations are taken into account. Import substitution in complete disregard of the cost aspect can only take the country back to the situation that prevailed prior to the 1966 devaluation.

The import policy also does not show any awareness of the fact that the government's export incentives have, over the years, become fairly chaotic. We now have a *de facto* multiple exchange rates system, with much trafficking in import licences. Large-scale trading in import licences is taking place and parties not only quote their premiums on licences but also seek customers through newspaper advertisements. And yet Volume II of the Import Trade Control Policy document, which relates to registered exporters, continued to claim that the import replenishment scheme, introduced after the 1966 devaluation, is intended to provide exporters with the actual import content of their exports.

A scrutiny of the rates of import replenishment available for different export items and the permissible items of import against the replenishment licences, however, clearly suggests that the so-called replenishments share many of the features of the pre-devaluation import entitlements. The rates of import replenishment are invariably far in excess of the actual import content. For such items as diamonds, the import replenishment rates are as high as 80 per cent while the actual import content is reliably put below 50 per cent. A number of items like leather goods, fruit juices, and handicrafts, which have hardly any import content, are granted attractive import replenishment. The discredited import entitlement scheme has thus been revived.

Also, there appears to be little co-ordination between the import replenishment and the cash subsidy schemes. If export incentives are to increase the country's foreign exchange earnings, then the level of effective export subsidy (through the two schemes) should bear some relationship to net foreign exchange earnings. Thus the level of cash subsidy should be determined on the basis of net foreign exchange earned after allowing for import replenishment. This calls for better co-ordination between the DGTD, which is responsible for the import replenishment scheme, and the Export Assistance Division of the Ministry of Foreign Trade which determines the levels of cash subsidy.

NUMBER AND VALUE OF IMPORT LICENCES ISSUED

Calcutta

A Flat Calm...

A Correspondent, just returned from Calcutta, writes :

In slogan-scarred Calcutta, the Congress's election-winning slogan 'renounce violence, live and let live' hits one from every angle. The message of peace and goodwill, inscribed on trams, shuttles across the city from dawn to dusk. It is Congress, Juba Congress all the way. And, judging from the relative paucity of CPM election scrawls in a city that, despite the Indira wave, remains inclined to the Left, a thorough job has been done to keep democracy safe.

No one denies that there has been systematic intimidation of political workers. That there was rigging of the ballot is equally freely admitted, Election Commissioner Sen-Verma's silence on this issue notwithstanding. According to one story going the rounds in Calcutta, to a journalist's complaint that his vote had been cast well in advance of his arrival at the polling booth, the reply given by a top state official was: "your franchise was exercised; what then is the complaint?"

Ballot-rigging, it is said, is not unusual in West Bengal. Those who believe in containing the CPM assert: "We paid them in their coin". But who is "we"? The inspired petit bourgeoisie? The 'Naxals' — quite different from the Naxalites — who have singled out CPM as the enemy? What is the relationship of the Juba Congress with the 'Naxals'? No clear answer can be had to these questions. One election scrawl of CPM, often quoted in Calcutta, parodies lines from a Bengali play thus: "Truly Seleucus, this is a strange land; Congressmen by day [turn] Naxals by night".

There is demoralisation on the Left. The preoccupation of the subdivided, fragmented Left with the power equation not only disgusted the petit bourgeoisie but made the Left a sitting target for the 'Naxals'. There is now vague talk of closing the ranks. However, the CPM's cadres have been badly mauled. Many, including Naxalites, are reported dead, wounded or missing. Not a few have been weaned away. Unbelievable though it may seem, the editor of a well known journal bemoan-

ed the sudden scarcity of Leftist writers.

Bengal is India's mini-Indonesia. True, the Army was confined to the barracks, but this omission was made good by a task force created by the establishment. An estimated 3,000 were recruited to identify political 'undesirables' in every locality and to 'root out violence'. The force, it is alleged, was strengthened by detenus, held on minor charges, who were allowed to escape from overcrowded jails. Naxalites returning from rural Bengal were not the only ones to be overwhelmed by this force of police underlings.

The task force did a splendid job. But is the task done? The force has not withered away. Pipe guns remain freely available and the knowhow for making ammunition has struck deep roots. The clean-up yielded handsome results on the political front. What could be more logical now than to start a clean sweep of trade unions still dominated by the Left parties, mainly CPM which, despite everything, netted 29 per cent of the votes in the elections?

The elections are over. The Congress has been returned to power with an absolute majority. Jyoti Basu and Promode Dasgupta bewail that the elections were a fraud but say in the same breath that never, never would CPM turn from the ballot to the barricade. Alas, a *modus vivendi* eludes Calcutta. Wagon-breakers carry on with impunity in Dum Dum and its environs. In the distant suburbs, police bullets take care of protesting students and workers. Trade union leaders are beaten up in broad daylight. 'Red Guards' are on the rampage in the factories around Calcutta, seeking trade union zamindaris as their pay-off.

The Congress has won the elections to restore law and order. The Left is on the defensive. The faded posters around the Esplanade proclaiming labour's "Dabi" will soon be washed away by the rains. The garish lights of Chowringhee blaze upon row after row of parked cars outside the posh restaurants. Calcutta could not be more normal. Commuters in the overcrowded buses and trams mingle sweat and breath without murmur. Pedestrians quietly take the circuitous route to the tram and bus terminus under the watchful eyes of 'volunteers' outside Howrah station where subways are under construction. One fails to detect even a flicker of irritation on the hurrying faces. Passions no longer vibrate the Bengali: "... a flat calm — the giant mirror of ... despair"?

Land Ceilings

No Substantive Change

NOW that the newly-elected state governments are in office, practically all of them with thumping majorities, it would be interesting to see how expeditiously they proceed to implement one of the Congress party's major election promises: lowering of the ceiling on land-holdings. This may also be the time to usefully recall the experience of the first round of ceiling legislation. After considerable cajoling by the Central leadership for over a decade, the state governments undertook the enactment of ceiling laws around the beginning of the sixties. After about six years, the Draft Outline of the earlier abortive Fourth Five-Year Plan (1966) gave this categoric verdict on land ceilings: "The main object of the ceiling which is to redistribute to the landless at a reasonable price on a planned basis has been largely defeated" (p 131).

The reasons for the failure were many. First, there were many deficiencies and loopholes in the laws themselves. The levels of ceilings, fixed in an arbitrary manner with many supplementary provisions, exemptions and exceptions, were generally high; they were unrelated to the quantum of surplus land required for redistribution among the landless and marginal farmers. In a majority of the states, the unit of ceilings was the individual and not the family, which facilitated clandestine transfers of land among members of the family. The provisions of the law for disregarding such transfers were of a half-hearted nature. In two states there was no provision to disregard such transfers, and in two more the transfers were to be disregarded provided they were made after the date of the enactment of the ceiling legislation. In as many as 10 states, transfers were to be disregarded only if they were made after the introduction of the Bill or its publication.

Secondly, there was considerable delay, inefficiency and corruption in the implementation of the legislative provisions. This was clear from the fact that even after about a decade of the operation of ceiling laws in different states, only about a million hectares of land were declared surplus (see Table). This was less than 0.8 per cent of the net area sown and less than 8 per cent of the area held in holdings of 50 acres and above. Of the surplus land, only 6.40 lakh hectares were taken possession of by the state governments. Further, land redistributed came to only 4.64 lakh hectares. Besides administrative lethargy in selecting allottees, the redistribution of surplus land has been hampered by litigation by landlords and the poor quality of land surrendered by landholders.

In sum, the unwillingness of the political leadership to undertake a revolutionary measure of this nature, connivance of the administrative machinery with the landlord elements' efforts to evade the ceilings, and the existing legal framework which left ample room for litigation — all contributed to defeat the objectives of the first round of ceiling legislation throughout the country.

IMPLEMENTATION OF CEILING LEGISLATION

State/Union Territory	Date of Enforcement of Act	Ceiling in Terms of Standard Acres	Net Area Sown 1965-66 ('000 hectares)	Implementation as in March 1971

Source: Note on Ceiling on Agricultural Holdings, Central Land Reforms Committee.

It is against this background that the current proposals to enact fresh legislation, reducing the level of ceilings, fixing the family instead of the individual as the unit and removing other loopholes, have to be viewed. If ceilings are kept at an average of 15 acres, about 45 per cent of the land-holdings would be affected, and 63 million hectares may have to change hands as compared to the one million hectares declared surplus under the existing laws. Yet none of the circumstances which have thwarted the implementation of the existing laws has really changed. There is no reason to believe that the efficiency of the administrative machinery has improved. There is also no reason to believe that the balance of economic and political power in the rural community has undergone any change and so the administrative machinery may be expected to continue to collude with the landlord class. As for the new political leadership, we have the instance of the Punjab Chief Minister who believes that if ceilings are lowered below 40 standard acres, land-holders would be pushed below the poverty line!

Cement

Through the Backdoor

THE last time the cement industry received a price increase *as* a price increase was in 1968. It was a substantial increase of Rs 7 per tonne to match 'increases in the cost of production'. Cement was to be decontrolled two years later, but, under pressure from a major part of the industry which feared erosion of margins under competitive conditions, control was continued on the pretext that shortages were imminent — anticipated by industry to be 5 mn tonnes in 1975. Meanwhile, for all the overt official resistance to price increases demanded by the industry, the price has been raised three times to date: once in October 1970 by Rs 3.20 'to replenish' the cement regulation fund under the Cement Controller for financing the operations incidental to distribution and supplies; again, by Rs 2.50, following the 1971 railway freight increase to compensate the industry for the rise; and most recently by Rs 2 to make up for the latest freight increase. As a result, the for destination price now adds up to Rs 138.83 per tonne — as against the Rs 100 per tonne, which is the uniform retention price the producer gets in his hands.

Meanwhile, the Tariff Commission has been entrusted with the task of examining the issues of progressive decontrol, diffusion of ownership, interim upward price revision, and advisability of freight pooling arrangements — all the issues that Government presumably must have considered before it was poised to decontrol cement two years ago. What purpose could one more review of the basic issues serve, except to stall for time and to postpone decontrol? Moreover, as every industry that has been under the Tariff Commission's 'cost-plus' control knows, the cost categories of the Commission are more of the accounting type than of the cost-control type.

That there is a case for decontrol and for expecting the cement industry to lower its costs through inter-unit competition is as clear today as it was two years ago. For all the reports that appear in the daily press with incessant regularity, about current and impending shortages, it must be underlined that these are local in character and (as ACC, the largest single producer, has been at pains to point out) are more due to wagon non-availabilities and transport bottlenecks than due to any overall shortage of capacity. These complaints emanate mostly from the northern areas which want their own local capacity in cement; whereas the southern units occasionally complain of stocks accumulation. With an all-India rated capacity of 18.28 mn tonnes, a demand of about 16.5 mn tonnes estimated for the past year should have posed no problem — especially if, as the Cement Manufacturers' Association claims, capacity utilisation is anywhere between 80 and 90 per cent. Moreover, profitability ratios in the cement industry have risen since 1969, a fact which has been duly reflected in the 53 applications for fresh capacity creation and 34 for expansions.

Pharmaceuticals

Growth plus Diversification?

THE pharmaceutical industry's worst fears about drug price control have been amply disproved. In his annual statement to shareholders last year, the chairman and managing director of Unichem Laboratories, A V Mody, had complained that "the reality [of price control] has turned out to be more grim than what I had anticipated". It is doubtful that Mody will want to stand by this judgment today. For Unichem the year ended September 1971 was hardly a grim one, with sales increasing by 33 per cent (compared to a little less than 13 per cent in 1969-70). Rapid increase in sales appears to have been the common experience of most of the larger units in the pharmaceutical industry last year. It would be interesting to know how much of the growth was attributable to increase in demand resulting from the lowering of prices of a number of pharmaceutical products which price control is supposed to have brought about. One would also like to know how much of the increase in turnover is to be attributed to the policy of diversifying into non-pharmaceutical products which many pharmaceutical companies, including Unichem, had initiated well in advance of the coming into operation of the price control on pharmaceutical products. In Unichem's case protein biscuits have been a major item of diversification. In his statement to shareholders last year, A V Mody had frankly stated that "with increasing restrictions on pharmaceutical industry, such diversification is absolutely a must for the healthy growth of the company".

The urge to diversify into non-pharmaceutical — and often less essential and even non-essential — items may well be strengthened by the reported findings and recommendations of the Bureau of Industrial Costs and Prices. The Bureau, which had been asked to determine the prices of certain basic drugs which had not been covered by the earlier Tariff Commission inquiry, enlarged the scope of its inquiry to include conversion norms and mark-ups in respect of formulations (see "More Scope for Price-Cutting", March 4, pp 528-9). According to A V Mody, the recommendations of the Bureau are "likely to affect substantially the entire profit pattern of the pharmaceutical industry". Like others in the industry, Mody is evidently hoping that the government will take no immediate action on the Bureau's report. Whether Unichem is at the same time pressing ahead with its programme to diversify into non-pharmaceutical products, he does not say.

Unichem's exports of over Rs 20 lakhs in 1970-71, though only about 4 per cent of sales, is noteworthy for an Indian company without the advantage of well known international brand names and established foreign markets. To boost exports, Mody puts forward the

idea of setting up export zones for manufacturing products for export. The idea of export zones itself is not new, but its suggestion in the context of the pharmaceutical industry is certainly interesting. Usually it is industries which are likely to export all or most of their output which are considered for location in export zones. The pharmaceutical industry, however, exports less than 5 per cent of its output. A V Mody's stipulation that the units in the export zone, which are to be allowed liberal access to foreign exchange for imports, should earn net foreign exchange of 25 to 30 per cent is not unattractive considering that quite a number of our so-called non-traditional exports, which qualify for incentive import licences, contribute much less than that in terms of net foreign exchange earned.

Kamani Engineering

From the Power Base

DESPITE the difficult steel supply position and the steady fall in targets and achievements in the country's power programme — which the chairman of Kamani Engineering has diligently pointed out — the Corporation has fared quite well. While production in 1971 was maintained at the previous year's level, turnover actually increased from Rs 14 crores to Rs 15 crores, and profits for the year were far higher at Rs 42.24 lakhs as against Rs 25.64 lakhs in 1970. Exports, at Rs 6.17 crores, account for a sizeable part of the turnover, and for these the Corporation would be entitled to steel at the import price parity. It had on hand, as on September 30, 1971, further orders worth Rs 24 crores. Evidently exports are a gainful outlet: during the year, Kamani Engineering completed a Rs 6-crore turnkey project in Sudan, and won orders worth Rs 15 crores in the Middle East and South-East Asia. This, in a year when engineering exports were tending to slacken.

The Corporation's fate is ultimately tied up with the country's power plan and particularly with the grid interconnections and transmissions programme. Here there is not great cheer. Although, as a Planning Commission study shows, annual expenditures have been above the outlays approved, the growth in installed capacity has been below expectations in each of the first three years of the Plan. Besides, the targets themselves have been lower in each successive year (1.63 million kW, 1.32 million kW, and 1.18 million kW). Similarly, while the Mid-Term Appraisal has underlined the need for rationalisation of the all-India power industry, requiring more intensive and wider transmission links and interconnected systems, progress along these lines has lagged behind. Although, unlike its competitors in the field, Kamani Engineering — thanks to its significant export orientation — has not suffered from the slowing down of this internal programme, it would benefit from the finalisation of the pending plans for transmission lines etc. It has, meanwhile, sought to diversify into specialised items where the margins are more attractive.

Banking

The Non-Conformist

MOST commercial banks like to see the highlights of their operations in the last few years in terms of growth of deposits, number of new branches opened, and amount of money lent out to agriculture and other 'priority' sectors. To cope with what they like to call their new social responsibilities, they have perhaps set up agricultural finance departments at their headquarters and appointed a handful of agricultural graduates and others as 'experts' to guide their operations in unfamiliar terrains. And, of course, there is the ritual obeisance to the Lead Bank scheme.

Interestingly enough, in his annual statement to shareholders (see April 1, pp 728-31) not even once does R K Talwar, chairman of the State Bank of India, refer to the Lead Bank scheme. There are no tiresome lists of districts surveyed or statistics of branches opened and money lent in the Lead districts. And yet the State Bank appears to have done rather more home-work than other banks on the *modus operandi* of financing agriculture and allied rural activities. Starting with the area approach, the State Bank proposes to select 150 Intensive Centres throughout the country, at each of which it is proposed to open an Agricultural Development Branch supported by technical and other field staff. As each Centre is identified, the surrounding area is surveyed and schemes are prepared to provide agricultural finance to clusters of villages taken up for coverage in the first phase. Further clusters of villages would be covered in later stages. According to Talwar, 67 intensive centres have been identified so far, though only 46 of these have been cleared with the concerned state governments. The Reserve Bank's approval has been secured for opening 33 Agricultural Development Branches and 20 such branches have been actually opened. What has been the experience of these branches, Talwar does not say.

One major problem facing the opening of Agricultural Development Branches, according to Talwar, relates to co-ordination with the co-operative banks and the demarcation of the respective areas of the two. The problem of co-ordinating the activities of co-operatives and commercial banks is a general one faced by other banks as well, though the Reserve Bank continues to sweep it under the carpet. Incidentally, the State Bank's approach to agricultural financing is likely to create problems of co-ordination with other banks as well. For instance, how does the Intensive Centres scheme fit in with the overall approach to commercial bank financing of agriculture and allied rural activities based on the Lead Bank concept?

The State Bank chairman also refers at length to the changes introduced in the bank's organisation structure. The State Bank recognised the need for change before the other banks did and, by 1971, had introduced the first phases of a new organisation structure. Branches have been organised on the basis of customer-groups so as to help focus attention on the needs of different types of customers. It is only right that banking, as a marketing industry, should be customer-oriented in its structure. But branch reorganisation on customer lines adds up to little if the higher management structure is based on the traditional family tree pattern with one man at the top, with three below him, each of whom has three below him and so on with dreary symmetry. No amount of sensitivity of branches to customer needs is likely to be useful unless this sensitivity is ensured in the top management structure. This can hardly be done while at the same time maintaining a hierarchic organisation.

Most banks face the problem of poor communication of objectives to the unit level. Efficiency, after all, is measured at the extremities. And efficiency, to a large degree, depends on the perception of corporate objectives at the level where the action takes place. There is little appreciation of this in the State Bank chairman's statement. When organisations are restructured on misplaced perception of needs, dichotomies develop between the organisational structure and the working of the organisations. A new organisation structure then becomes accepted simply on the basis of the new positions it creates.

Back to Normal

Romesh Thapar

HE election posters are peeling off ıe walls. The painted slogans might ɜmain to recall promises and invocaons. The squatter colonies are no ıger the focus of municipal attention. he newly installed taps and lavatories re there, but the water tends to trickle. he price of second-hand jeeps is fall-ıg. The heat and dust of summer desend and with them life at all levels is ɜaping back to normality. Sai Baba is ɨsiting the Capital and drawing the ɨnd of crowds reserved only for Indira ʌata, but then he draws them without he massive aid of audio-visual techniques. He will be in residence for a ew days, performing as always, and ıe has already won the divided loyalty ɔf several ministers. Why be a minister f you cannot enjoy "presences" such ıs these. US Ambassador Keating has ılso succumbed and now flaunts a Sai Baba ring.

It is quite a season. There are rose shows, dog shows, book shows and art shows. The Prime Minister unlike her committed ministers attends all these "functions", often accompanied by her baby grand-daughter. Image building? Certainly not. Just showing the flag, as it were. She certainly seems to be everywhere all the time, and could give Sai Baba a lesson or two in this art. Unfortunately, the council of ministers busies itself largely in all manner of peripheral activity.

A bunch of these gentlemen have launched a series of seminars, symposiums, workshops, and what have you, for the managers of the public sector. Naturally, the luxurious Ashoka Hotel is the venue for these "battery-chargings". Knowledgeable circles in the Government of India study these goings-on, and encourage participation, in the hope that a Sai Baba might emerge with a trick up his sleeve. Meanwhile, decision-making in various crucial management-oriented ministries is in the hands of rather suspicious non-official operators — a fact that is only whispered in the quiet corridors of power.

Another bunch of ministers is more seriously concerned about the monies which they squeezed out of various businessmen and which they did not disclose to the party. The cause of the flutter is that Indira Gandhi has taken a dim view of a colleague's action in declaring savings from his personal election fund as an income tax-free "windfall", in the nature of a prize in a State-run lottery. Sai Baba or the Mother in Pondicherry would surely have an answer, but...

In this mood of normality, it is only natural that we should have held an international gathering on a favourite theme: Neo-colonialism. The sponsorship was discernible. Delegates had a common colouring. The betting was that Czechoslovakia would not be mentioned, and we were right. The trouble with a lot of us Indians is that we still don't understand the meaning of crucial words in our alien mother tongue. And that goes for the annual meeting of the Federation of Indian Chambers of Commerce and Industry (FICCI) addressed by the Prime Minister. Her call for co-operation and partnership is seen as marking the beginning of a new era of money-making. After all, such eras have in the past been sparked by a few well chosen words. If only the speech writers knew their invisible contribution to high blood pressure and history...

This, and much more, has been going on in the Capital. Awards and honours have been doled out. There have been troubles, too — with the Army Chief's promotion, for example. There is excitement about new ministers, new MPs, new bureaucrats, new fixers. But it is all at a lower tempo. Even a quorum in Parliament is seldom registered. Summer has come. And there are no foreign trips until the parliamentary session is over. Then, I suppose, we will be without a government. Very normal.

April 3

LETTERS TO EDITOR

Modern Indian Historiography

I READ Sudhir Chandra's note on "Modern Indian Historiography" (March 18, pp 621-2). I was astonished to find him including me among the "sociologically-inclined historians" whose conclusions "confirm the earlier imperialistic view of Indian history" (p 622). Sudhir Chandra, whose heart is in the right place, strongly disapproves of both these schools of historians.

It is indeed flattering to be listed among the practitioners of a hoary and prestigious discipline but honesty compels me to declare that I am only a social anthropologist/sociologist and have no claims whatever to be a historian, let alone a historian of a particular brand.

I may also add here that while I have stressed that caste is an important social institution nowhere have I argued that it is "the fundamental category to understand Indian society", whatever that may mean. Even a cursory acquaintance with my work would show that I am aware of the importance of other institutions. I was under the impression that historians as a rule were more scrupulous about their sources than other social scientists.

In my book "Social Change in Modern India" I have narrated briefly how I came by the idea of Sanskritisation. While Sudhir Chandra is generous enough to add that he does not "accuse anybody [Srinivas and Mishra] of plagiarising", nor does he wish "to belittle the importance of their undoubtedly significant, though sketchy (*sic*) work", I may be pardoned if I am hesitant about accepting him at his word. I cannot easily forget that the initial reaction of many of my colleagues in India and a few abroad to dismiss Sanskritisation as of little or no account has now given way to a tendency to trace it to earlier and unacknowledged writers. (Incidentally, I do not think that Risley could have had any idea of the ramifications of the Sanskritisation process and its links with Westernisation which I have discussed at some length in "Caste in Modern India" and "Social Change in Modern India".)

As one who has only carried out micro-studies during his professional life, I welcome Sudhir Chandra's call for similar studies by historians. But I do not share his doubts and fears about them as, given the right perspective, they yield valuable hypotheses which can then be tested systematically in different regions. It has been a matter of considerable gratification to me that such ideas as have emerged from my work have been found fruitful

in the analysis of cultural and social processes in many other parts of India. Perhaps herein lies one of the ways of exploring fruitfully the problem of "unity in diversity". (Incidentally, why not also "diversity in unity"? I am not being frivolous when I suggest this as I hope to write briefly on this topic in the near future.)

Micro-studies offer an area in which sociologists/social anthropologists and historians can fruitfully co-operate. There is a great need for salvaging documents lying with village- and caste-headmen, and in temples and monasteries and *taluk* offices. It is a task to which the newly-constituted Indian Council of Historical Research may consider giving priority.

Finally, I have also found micro-studies productive of valuable hints and suggestions about past conditions of society. It is obvious that much caution and discrimination will be essential in making use of them. But given such caution, historians may be able to use them as hypotheses in analysing data about the past. Sudhir Chandra would perhaps frown on this as a devotee of "pure and objective history" but a few of his colleagues may be more willing to take some risks.

Copper for Breakfast

MAGNUS (March 18, 1972) is highly readable but he sounds typically private-sectorish in his criticism of the sleepy giant, the HCL, entrusted with the management of the ICC. He does not like a well-managed undertaking such as the ICC to be taken over by the government. He wants the public sector undertakings to make profits. He gives no ground to the reason that such basic minerals, for long in short supply, should never have been in the private sector. The same considerations apply to coking coal. Whether these undertakings earn profit or incur loss becomes immaterial when one considers that exploitation of these minerals would need considerations not fully grasped by profit alone. But somehow this has become the criterion in performance appraisal even when profit is not only possible but undesirable. The exploitation of seven small copper mines and other details in this context are not unique in the case of HCL; earlier, we had similar instances of perpetual gestation in NCDC, NMDC, Fertiliser Corporation and Hindustan Steel. The term "well-managed" is protean in this context. It depends on the criteria applied for assessing performance, allowing for the objectives sought to be satisfied and the conditions in which performance takes place.

This kind of venture would perhaps never have been attempted in the private sector in this country. Many such attempts would have been rejected as uneconomic by commercial standards, while some would perhaps be taken up only in doses over a long period. The question is, can we do this? I believe there is difference of opinion on this, but my answer is an emphatic no. The quality of management that we have in the public sector is not germane to it. In fact, it is not far worse than in the private sector. The difference lies in the fact that not much is known of private sector management. Whether public sector management is allowed to work freely is a different question. But in this we have the long-term solution. Magnus offers poor logic when he tells us about the dismay of 26,000 shareholders on the compensation price which could have brought another small copper mine into production. Unlike Magnus, I have long wondered why we should have waited for such a long time; these activities should have been nationalised as far back as 1948 when the Industrial Policy Resolution was adopted. Our lack of a sense of priorities was shown at that time itself Thus, it is not a case of private sector's copper for public sector's breakfast; it is one of public sector's iron for private sector's dinner.

PARESHNATH CHATTERJEE

Calcutta

Magnus writes:

PARESHNATH CHATTERJEE has missed the main point about Hindustan Copper taking over the management of Indian Copper Corporation. If base metals are in short supply, all actions should be aimed at achieving, or improving, their production. Handing over a producing unit to another group, whose ability is suspect, will not achieve this. Profits may not be the sole criterion of efficiency, but HCL is poor by any criterion: it has not completed any part of the Khetri complex in 12 years, while ICC and Hutti, to name two companies, designed and built complete new treatment plants in less than five. HCL's financial estimates for Khetri have last week gone up from Rs 93 crores to Rs 115 crores, and its schedule put back by yet another year to 1974. Public or private, the agency taking over a running concern should be of proven merit and achievement. Merely being in the Public Sector is neither an achievement nor does it endow any merit. Given the right political climate, projects taken up by HCL could certainly be taken up by private industry.

In a short time, one may expect the gypsum and cement industries to be nationalised. The prices will probably go up. Would Chatterjee applaud?

Must Business Economists be Objective?

In "Must Business Economists be Objective?" (March 4, p 537), some of us have been quoted as having argued that a merger of the automobile manufacturing companies in India is not feasible "despite experience the world over of mergers in this industry". I am afraid this is likely to present a misleading picture of the arguments that we had put forward.

Our arguments briefly were:

(i) The idea of merger was mooted so that economies of scale could be availed of by the three car manufacturing units in the country. The logical extension of this line of thinking would be that the units already in the field should be expanded. However, instead of doing this, Government was in fact licensing several new units for the manufacture of small cars and was in the process of setting up its own car manufacturing plant. In this context of further fragmentation of the automobile industry, it is contradictory to talk of achieving economies of scale by merging the existing units in the field.

(ii) The three car manufacturing units were already facing tremendous problems in their operations. Their immediate task is to control costs and improve quality to the extent possible. The proposal for merging their facilities would only divert their attention from the main task. Thus the higher echelons of management would possibly have to be removed and replaced by new men. Furthermore, since these units were located in different parts of the country, widely differing management practies and labour productivity norms were prevailing in each of the units. This situation would make the problem of merger far more intractable than would appear at a casual glance.

Rise in Costs No Bar

Hansavivek

MAHINDRA AND MAHINDRA's Jeep vehicles have been accepted by the defence forces of Yugoslavia, Jordan, and Ceylon. The company has also received inquiries from Australia, New Zealand, and Malaysia. Last year, an agreement was concluded with an Indonesian firm for supply of 2,004 vehicles, against which shipments are being made since March 1971. The company expects government decision soon on an increase — from 10 per cent to 20 per cent — in the rate of cash incentive on exports of vehicles. During the year to October last, M and M produced 11,377 vehicles and sold 11,472 vehicles, against 10,168 and 10,008, respectively, in the year before. Production in the first quarter of the current year rose by about 23 per cent over the corresponding period last year. Sales were up by 10 per cent, but the management expects further improvement in the remaining part of the year. Meanwhile, a new line of vehicles (based on the existing engine, transmission, and axles, etc) is being developed and some of the functional parts of the vehicle are being improved. Manufacturing operations at the Kandivli plant have been streamlined to ensure optimum utilisation of plant and equipment. At the same time, bottlenecks in capacity have been overcome by developing subcontracting facilities. The new foundry building at Kandivli has been completed, and a large portion of the plant has been installed. Benefits from this unit should become progressively available.

M and M's *steel division* witnessed a significant change last year; owing to shortage of steel, export of steel has been virtually stopped except for pig iron and a small quantity of rails. Orders secured for import aggregated 271,705 tonnes, of which about 182,000 tonnes are scheduled for shipment during the current year. The *machine tool division* registered substantial increases in sales and profits. The suspension of US AID loans is likely to affect the import of American equipment, but this is expected to be compensated by increased sales of indigenous machines. The *instrumentation division's* production and sales for the first time crossed the Rs one-crore mark. *The electronic division* has finalised foreign collaboration proposals on 3 'letters of intent' for the manufacture of professional grade electronic components. This division has also developed a prototype gear-box controller for the 'Vijayanta' tanks under the Army's specifications. The electronic temperature controller developed by the division has been well-received by the industry. Letters of intent have also been secured for indigenous manufacture of oil-flow meters and some items of electro-medical equipment. The *agro-aviation division* fared well in its first full year

*15 months.

of operations. In spite of a rise in costs M and M has produced good results for the year to October 1971, with higher sales and gross profits. The dividend is unchanged at 11 per cent.

Among the subsidiaries, *Mahindra Owen* experienced all-around increase in costs of production. It will now manufacture two new products for the Army: the Wrecker Equipment and the Speed Loader. For this it has already secured orders worth Rs 38 lakhs. *Mahindra Sintered Products* expanded its turnover and profits last year. It has developed a number of structural parts and is also installing plant and machinery to produce iron powder. MSP has also been permitted to manufacture carbon brushes. *Indian National Diesel Engine* was able to clear a large unsold stock of engines carried over from the previous year. Production, resumed during the latter part of the year, is soon expected to reach target capacity. *Mahindra Electro-Chemical Products* has wiped out the accumulated losses of previous years. A proposal to merge it with the parent company is being considered by the management.

EMPIRE DYEING needs additional finance and proposes to raise Rs 56.25 lakhs in the form of 'right' equity shares of Rs 15 each on a one-for-two basis at a premium of Rs 10 per share, Rs 160 lakhs as debenture stock, and Rs 30 lakhs in preference shares. The Vitrum glass division, engaged in making quality glass hollow-ware, is proposed to be expanded by installing automatic bottle-making machines. The project is expected to go into production by mid-1973. The performance of the Garlik engineering division is also intended to be improved. Garlik and Company merged last January with Empire; it has a factory each at Ambernath and Madras and a foundry in Bombay. Pursuant to the scheme of amalgamation, Empire has allotted 1,10,000 equity shares of Rs 15 each fully paid-up to members of Garlik. Working results of this division will find reflection in Empire's results from this year onwards. S C Malhotra, Chairman, views the company's future with optimism. During the 62nd year to December last, Empire increased its turnover and profits. Net profit turned out to be lower owing to increased provisions for depreciation and taxation. Even so, the 20 per cent dividend on an enlarged capital was covered twofold.

ELPRO INTERNATIONAL is soon putting on the market a new vertical fluoroscopic cum radiographic unit, 20 ma x-ray generator and a simple type of x-ray diagnostic table, developed last year. The work of designing and development of new motorised diagnostic x-ray table and table column, 60 ma, 100 kvp x-ray generator and 300 ma x-ray generator of higher kvp rating has also been taken in hand. The company is registered with DGTD for manufacture of cobalt 60 teletherapy equipment and associated items. Production of this new item is expected towards the end of the current year. The company achieved sizeable increases in sales and profits last year although the preceding accounting period was of 15 months. But its net profit turned out to be lower owing to the tax liability, which took away Rs 19 lakhs against nil last year. Even so, dividend stepped up two points to 12 per cent, part of which is expected to be exempt from tax, is still covered 1.5 times. Major contribution to the increase in turnover came from lightning-arrester and x-ray product-lines. Exports of the company's products also showed an appreciable increase.

THE FOURTH ESTATE

Making News

Nireekshak

IT is not often that journalists make news in this country. However, the last few weeks have proved to be an exception. Cartoonist Abu Abraham's elevation to the Rajya Sabha, editor Kuldip Nayar's, political commentator Dilip Mukerjee's and correspondent B K Tiwari's interviews with the Pakistan President Z A Bhutto in Karachi, Rawalpindi and Larkhana and the sad demise of two very enterprising journalists — editor Nandan Kagal of *Indian Express*, Delhi, and chief reporter S Ramanathan of *Mail*, Madras — were events that hit the headlines of most newspapers.

Abu ranks among the four or five best cartoonists in the country. Now with the *Indian Express* group, Abu had earlier worked for *Observer* in London where he was among the very few emigrants from this subcontinent who had made a name for themselves in Britain. He could have remained in that country and reached greater heights in his profession, but friends like P N Haksar (formerly of the Indian High Commission, London, but now principal secretary to the Prime Minister) persuaded him to return to Indian journalism. Abu can have no reason to regret the decision.

After the 1965 Indo-Pak war, journalistic contact between the two countries had almost snapped. Except for the brief period when S Nihal Singh of *Statesman* was posted in Pakistan, exchange of newsmen was never revived. The resistance came more from the Pakistani side. India was always willing to accept Pakistani journalists but on a reciprocal basis. It was on this basis that Nihal Singh was sent there. A Pakistani counterpart was supposed to come here, but he never arrived and Nihal Singh had to return on the expiry of his six-month visa.

Hopes of Indian newsmen visiting Pakistan receded further after the recent Indo-Pak war. Then came a message from Rawalpindi through a Western newsman who happened to meet Bhutto after he had come to power. Bhutto had told him that he would be willing to meet senior Indian newsmen if such a request was ever communicated to him. This was in January. The big newspapers took the hint and applied to the Swiss Embassy for visas for their senior journalists. The request was granted in no time — "in ten seconds", as B K Tiwari was later told by Bhutto's friend, W M Jamot.

Dilip Mukerjee of *Times of India* and B K Tiwari of *Indian Express* were the first to meet Bhutto on March 14. The meeting took place at Larkhana, Bhutto's home-town, about 300 miles from Karachi. For an hour and 20 minutes the two Indian newsmen grilled the Pakistani President who talked of peace, "the sweep of history", "misunderstanding in India" and his keenness to shake Indira Gandhi's hand. Above all, Bhutto was anxious to sit at a negotiating table with the Indian Prime Minister. He hinted at his country's readiness to disengage from Kashmir but one could see that this was really a bait to get the 93,000 POWs in India released. Better indicators of his true intentions were his other remarks such as that "I will agree to nothing which runs counter to Pakistan's national interest..." and that "If I can support the people of Vietnam and Latin America, how can I say we abandon that right in Kashmir".

Bhutto's Line

The resident editor of *Statesman*, Delhi, Kuldip Nayar, met Bhutto in Rawalpindi 12 days later. In between Bhutto had been to Moscow and Kuldip was fortunate to probe the Pakistani President's mind after his meetings with the Soviet leaders. The most outstanding feature of Kuldip Nayar's encounter with Bhutto was the former's penetrating questions. "An average Indian believes why should there be the return of POWs comprising four divisions when Pakistan has attacked again and again in the past and when the chances are that it may seek the help of China to have another round?", was Kuldip's first loaded question. It produced an evasive reply on the lines "...let us prove him [the common man] wrong for a change", "India is still a bigger country than ours" and "If China is to grow in resources, you have a treaty with the Soviet Union".

Some other interesting questions Kuldip asked Bhutto were: "What about a non-aggression pact between India and Pakistan?"; "You have been in favour of confrontation. Have you changed?"; "Would you like to accept the Kashmir ceasefire line as the international border?"; "It seems to me that the people in Pakistan do not know about the atrocities committed in Bangladesh. Muslims killed not Hindus but Muslims as well. What do you say to this?" and "Looking back would you say that the two-nation theory has failed?"

Bhutto's answers were equally interesting and revealing. On a non-agression pact: "No war pact means surrender... that we conclude not a high-lifting word like the treaty, but a joint communique or some other document to the extent that we will settle all our problems..." On confrontation: "I am not ashamed of confrontation... now that position does not exist any more. I know it better than others. It is not going to exist in future also." On the Kashmir ceasefire line: "Mr Swaran Singh has offered me a much better line." On atrocities in Bangladesh: "Horrifying things took place... but Mujib's figure of three million was utterly wrong. According to us only 45,000 to 50,000 died." And on the two-nation theory: "I will say that the theory has not been shattered, it has received only a crack... after all, countries have shrunk in size before. Look at the British Empire."

On their return all the three Indian journalists have written articles on the mood in Pakistan after the military debacle. Kuldip Nayar intends to write a book on Indo-Pak relations since 1947 and may visit Pakistan again, if Bhutto would permit him.

Few newspapers in India have thought it worthwhile to permanently station correspondents in Bangladesh. Even the national news agencies like the PTI and the UNI have failed to give the lead. Both are depending on news officially supplied by the BSS, the Bangladesh news agency. *Amrit Bazar Patrika* of Calcutta was the first to start a news bureau in Dacca. The lead has since been followed by *Hindu* of Madras which has stationed K Krishna Moorthy, a very active correspondent, in the capital of the new republic. Not only this, *Hindu* seems to be giving much prominence to news items from its Bangladesh correspondent. The paper's issue of March 27 revealed, for the first time, that Sheikh Mujibur Rahman has not been keeping good health. "The physical strain of the past two and half months has caused some pain in Mujib's chest and in one of his arms, according to one of his close associates" reported the *Hindu* correspondent. Krishna Moorthy has written with caution about what he describes as "the rising tide of political criticism". Yet the reports bring out that political trouble is brewing in Bangladesh.

The recent speech of the Soviet Communist Party Secretary, Leonid Brezhnev, before the Congress of Trade Unionists in Moscow, suggesting that the Soviet plan for "collective security in Asia" is being revived, has provoked editorial comments from most newspapers. According to *Hindu*, the Sino-American axis "has got Mr Brezhnev worried... while developments *vis-a-vis* China and the Arab world are matters of concern to Moscow, Mr Brezhnev could point to the closer relations forged during the past year with India and Bangladesh as big gains counterbalancing whatever influence Russia might have lost elsewhere". In the revival of the Soviet plan for "collective security in Asia", *Hindu* sees a Russian strategy "that countries in the region should all sign with one another treaties like the Indo-Soviet and Indo-Bangladesh treaties of friendship, a chain of such treaties linked to the Soviet Union at one end. The forging of such a link-chain is likely to be the principal objective of Soviet policy in Asia in the coming years." *Hindustan Times* too sees it as "a counter to any Sino-US move to delimit spheres of influence and to offer instead an alternative co-operative framework for Asian development and security... a Soviet bid to fill the so-called vacuum that might be left by US withdrawal from the region". The *Statesman* was more forthright in rejecting the Soviet-sponsored collective security system for "it may indeed be altogether incompatible with the concept of voluntary co-operation within the region..."

Lethal Red-Tape

Human interest stories are a rarity in our newspapers. News desks have a knack of seeing them buried. *Searchlight* of Patna buried one such local story recently on page 3 when it should have been on page 1 of any newspaper. Here are the facts of the story. A senior Additional District Magistrate, Vishwanath Ram, with 30 years of service and due for promotion as District Magistrate, died a pauper in Gaya and for his cremation the District Magistrate of Gaya, R N Das, had to raise funds. Vishwanath Ram had been transferred to Gaya about a year ago as Special Officer of Gaya Municipality. Since his transfer he never got his salary as the Accountant-General's Office had some technical objections to issuing him his pay slip. Ram sent fervent appeals to the AG's Office but to no avail as his file had by then got wrapped in very thick red-tape. Meanwhile Ram fell ill and spent the last few days of his life bed-ridden. The tragedy came to light after he had died and the District Magistrate of Gaya had to raise a subscription among fellow officers and the public for his cremation. That a fairly senior state government officer had died of starvation and without proper medical treatment was a big story by any standard. Yet, *Searchlight* buried it on an inside page. Next day, however, it carried an editorial captioned "Murder by Delay" and profoundly commented: "The tragedy that has occurred in Gaya is nothing short of murder although technically it may not be so."

A poor apology for a great story missed!

Statement by Chairman, Prakash Tandon

Stc Group

Provisional results—
Year ended 31st March, 1972.

1971-72

Exports up 31%. Imports up 43%.
Profits up 124%. Expenditure down 4.7%.

1971-72 was a year of gratifying progress. *We exceeded our targets of exports, profits and imports, but were below target in expenditure. There was altogether a healthy improvement over last year.* For the first time, the total group turnover exceeded Rs. 300 crores. Exports, at a total of Rs. 97 crores, while exceeding the target, just fell short of our coveted century, though next year we are aiming at Rs. 128 crores.

	Rs. Crores		Rs. Crores		
Exports rose from	74.1	to	96.8	by	30.6%
Imports ,,	154.0	,,	220.7	,,	43.3%
Total Sales ,,	233.8	,,	328.6	,,	40.5%
Profit ,,	7.2	,,	16.1	,,	123.6%
Expenditure fell from	6.4	,,	6.1	,,	4.7%

Expenditure to sales ratio further fell from 2.7% to 1.9%
Stocks ,, ,, ,, ,, ,, 15.1% to 10.1%
Debtors ,, ,, ,, ,, ,, 10.7% to 8.2%

1972-73

1972-73 promises well export-wise, budgeting a bold increase of 32.2%, from Rs. 96.8 crores to Rs. 128 crores. However, we have taken a conservative view of our total imports by provisionally assuming more or less last year's total level of imports because there are some uncertainties arising from the cessation of PL 480 funds for some of our staple lines of tallow, soyabean oil, newsprint and industrial raw materials. These were also among our most profitable lines.

We have, consequently, also had to provisionally scale down profits suitably, allowing at the same time for some domestic price support operations like rubber and tobacco which result in losses. However, we will strive for better profits as the year develops, hoping that imports will also show a significant rise, and that we will also be able to take better margins.

	Last Year 1970-71 *Actual*	This Year 1971-72 *Provisional*	Next Year 1972-73 *Budget*
	Rs. Crores		
Export Sales	74.1	96.8	127.5
Import Sales	154.0	220.7	236.9
Domestic Sales	5.7	11.1	10.1
Total Sales	233.8	328.6	374.5
Profit before tax	7.2	16.1	11.0
Expenditure*	6.4	6.1	6.7
Stocks	35.3	33.2	23.9
Debtors	25.0	27.1	22.9
Equity capital	8.8	9.8	9.8
Reserves	11.7	12.4	15.7
Net worth	20.5	22.2	25.5
Expenditure to sales	2.7%	1.9%	1.8%
Stocks ,, ,,	15.1%	10.1%	6.4%
Debtors ,, ,,	10.7%	8.2%	6.1%
Cash Position	Overdraft		Credit Rs. Crores.
1.4.1970	—		1.4
1.4.1971	7.1		—
1.4.1972	—		4.1

*Excluding interest, depreciation and provisions.

Profits

STC lives in an interesting world: when it makes good profits, some object to it; equally, when it makes less profits, some say it is sliding down. STC took this to heart, and this year made an all-out effort to improve its profits, and has more than doubled it. *Our management in now fully cost and profit conscious, consistent, of course, with its social obligations. Actually, by the standards of industry's profits in India of nearly 10% on turnover, and private trades' even higher, our 4.9% is quite modest.*

Cash Management

Our cash management has been good. Despite the normal and inflationary escalations, the costs of our new foreign offices, and the substantial rise in sales, expenditure was well controlled and actually fell by 4.7%—a rare achievement by any standards. The employment of cash, despite the buffer stock operations for fats and oils and rubber, was kept under strict control. Consequently we have periods of surplus cash, which we suitably invest and are helpfully lending to our export associates in the small scale sector.

Another innovation introduced this year is the switching of our surplus funds for use within the STC group, from one corporation to another, to ensure the maximum utilization of available resources and minimisation of interest payments.

We hope thus to run a nearly Rs. 400 crore business next year on a more or less self-financing basis.

Shareholder

Interests of our shareholder, the Government of India, remain paramount with us. We made another bonus issue during the year, raising the equity capital from its original Rs. 2 crores in 1968 to Rs. 8 crores, and the dividend correspondingly from 10% to 20%, now paid quarterly instead of annually. We today pay Rs. 160 lakhs instead of the Rs. 20 lakhs in 1968—an eight-fold improvement.

We have greatly appreciated the help and encouragement we have received from our Ministry and particularly from the Minister and Secretary.

Service

At home, we have organised assistance to small-scale industry through a separate States Marketing Division, which liaises with small industries development corporations, both at the States and their apex levels. We have now begun to adopt small industries' many problems, particularly in the field of exports, and have recently also agreed in principle to invest in the equity capital of some state small industries development corporations, to involve ourselves in their affairs, to guide and to help. These innovations will significantly help the small scale sector.

To serve the interests of industry and trade in general, we have now about 40 consultative committees, which meet regularly to keep us advised on our import planning.

Abroad, service to our customers and associates and our marketing divisions is being improved through a chain of 20 offices, from New York to Sydney, backed by a newly created International Operations Division at headquarters. After having established our new regional offices in South East Asia, U.S.A. and Europe, we are now looking closely at Latin America, an area entirely new to us.

To consolidate our rapid growth, we carried out a second major internal reorganisation, creating many new, more viable and compact marketing divisions, duly supported by a range of of service and advisory divisions. HHEC and IMPEC'S organisations are also under review.

To encourage management education, we have decided to endow two chairs, one at the Administrative Staff College, Hyderabad, for Industrial Relations, and the other at the Indian Institute of Management, Ahmedabad, for International Marketing.

Staff

There is a direct ratio in an organisation between its efficiencies and the calibre of its men. Manpower-wise, therefore, while we have also been economical, recruiting only such specialist and technical personnel as we cannot find within, we have been giving full support to those who work with us to rise through training and promotion.

A management trainee scheme has been organised to attract young talent into the group; but of special interest is our new scheme initiated for the employment exclusively of young talent amongst men and women belonging to scheduled castes and scheduled tribes for service in STC's managerial cadres.

This is an account of a year of satisfactory progress, but, I repeat, we are only too conscious of our shortcomings and of the long way we have to go.

PUNJAB

Tussle over Ceilings

THOUGH land ceilings should be viewed as an integral part of a wider land reform and economic development programme and not in isolation, they have assumed independent importance in Punjab. On this issue in fact hinges the future of the new ministry. Addressing Congress MLAs at Chandigarh on March 15, S D Sharma, AICC General Secretary, conveyed the Prime Minister's wish that lower land ceilings should be among the ministry's foremost objectives. But this directive has landed Chief Minister Zail Singh in a dilemma. Almost throughout Punjab, there is considerable opposition to the move for lower ceilings, though all political parties profess to support it. Even CPI has shied away from the subject, abandoning the stress on radical land reforms laid in the party's 1967 manifesto. The CPM's state unit has come out in favour of a comfortable 18-acre ceiling.

Though Central leaders are pressing for lower ceilings and Jammu and Kashmir has opted for a 12 standard acres limit, Zail Singh maintained in an interview recently that "if the size of a farm goes down below 30 acres, we cannot achieve the living standards that we want", adding however that "much depends on the location and quality of land". On March 21 the Punjab Congress Legislature Party unanimously recommended to the government a uniform ceiling of Rs 2.5 lakhs on rural and urban property in the state. The Chief Minister said he favoured the removal of all economic disparities. The next day the State Governor announced in his address to the Assembly that the government would pay special attention to the completion of agrarian reforms; tenancy legislation would be unified for the entire state, all loopholes plugged and exemptions withdrawn.

The liberal exemptions granted to mechanised farms, co-operative societies and orchards have in fact made a mockery of land reforms in Punjab. How the Punjab ministry will implement the Central directive and the Congress MLAs' resolution while safeguarding the interests of large landowners—the mainstay of every ruling party—remains to be seen. The crux of the matter is strict implementation of the laws. In past years land legislation in Punjab, as elsewhere, has largely remained on paper. The evasion of the ceiling by transfer of land to sons, daughters and other near relations, often with official connivance, resulted in very little land becoming available for redistribution. This had virtually become a scandal. On March 30, however, the government climbed down. The official resolution which the Assembly unanimously passed omitted reference to the Rs 2.5-lakh limit. It merely authorised Parliament to prescribe a ceiling on urban immovable property.

Conforming to the current fashion, the Punjab Finance Minister decided to leave uncovered the Rs 14.69-crore deficit in the 1972-73 budget. Since the state was one of the most heavily taxed in the country, and the Bangladesh levies imposed last winter were intact, he said, it would not be fair "for the present" to impose further taxes. Like the Centre and many of the states, Punjab too hopes to partially cover the deficit by tightening the tax collection machinery. Besides, it will seek institutional finance, especially from the commercial banks which have absorbed a good part of the gains from the Green Revolution. The government has also decided to mop up a part of the prosperous farmers' savings through Centrally-backed debentures. But barely four days after presenting the budget, the Finance Minister anounced that he would impose taxes on the rural and urban rich when he next came before

the House with his final budget proposals before June 30.

Himachal Pradesh has altogether different problems because of its hilly terrain and the peculiar features of its economy. Even so, it has fallen in line with the other states in expressing its determination to enforce the ceiling on property. Outlining the new Congress ministry's policy in his address to the Assembly on March 28, the Governor announced that a Land Reform Bill would be introduced very soon.

The Himachal Government has, however, expressed concern over the manner in which Wealth Tax was being assessed on agricultural and horticultural lands in the state. It intends to take up the matter with the Centre. How the Government's loudly professed socialistic objectives are to be reconciled with protests against Wealth Tax assessments is not clear. Presumably, the vested interests in Himachal's apples and potatoes (major revenue-earners) still dominate the political scene.

India-Bangladesh Trade Treaty

Nachiketa

WITH the signing of the trade treaty between India and Bangladesh, much of the uncertainty surrounding the nature of trade relations between the two countries has been removed. Though India was toying with the idea of channelling a major portion of trade between the two countries through state trading agencies, it was all along obvious to many on both sides that it would be impractical, given the character of the two economies, to ban trade through private channels.

The Indo-Bangladesh trade treaty has provided for 'border trade' between the two countries, whereby permits would be issued to people living upto 16 km on either side of the border. Persons holding such permits would be allowed to carry across the border personal consumption goods in specified quantities and money upto a value of Rs 100 only once a day in each direction or any two specified days of a week and only through some specified routes. As 95 per cent of the population of Bangladesh lives in non-urban centres, almost the entire population along the border would be in a position to take advantage of the provisions.

However, in view of the stringent limits placed on the quantum of goods and cash that could be taken across the border, traders would find it difficult to operate. In all probability, goods thus traded will travel beyond the 16 km limit even though people residing only within the 'belt' are permitted to carry on the border trade. Moreover, in the present unsettled conditions in Bangladesh and the inadequate administrative machinery, the government would find it difficult to delimit the border trade to people living in the 16 km limit. After the 1965 Indo-Pakistani conflict, Pakistan had banned trade between erstwhile East Pakistan and India, but considerable smuggling even in such bulky commodities as jute valued at several crores of rupees was reported to be taking place every year. Both the governments will probably soon find that it would be difficult to control movement of goods across the border unless they liberalise the present provisions on border trade.

Along with the provision for border trade, the trade treaty between the two countries envisages balanced rupee trade worth Rs 25 crores each way. While it is difficult to quantify the likely magnitude of border trade, it may be safely said that the rupee trade of Rs 25 crores a year, each way, forms the core of the trade agreement. The agreement mentions, specifically, that the objective of bilateral trade "can best be secured by organising trade between the two countries on a State-to-State basis as far as possible".

By this part of the agreement, among the important commodities that India has agreed to export to Bangladesh are cement (Rs 4.5 crores), raw tobacco (Rs 10 crores), cotton textiles (Rs 25 lakhs), cotton yarn (Rs 1.5 crores), coal (Rs 4 crores), asphalt (Rs 1 crore), gramophone records (Rs 20 lakhs), movies (Rs 15 lakhs), chemicals and pharmaceuticals (Rs 25 lakhs), and machinery and spare parts (Rs 50 lakhs). It should be noted that the value of the commodities flowing into Bangladesh from India would be far greater than those indicated here, as the bulk of the Indian goods would be covered under the already announced aid totalling nearly Rs 200 crores. Thus, as far as the flow of Indian goods into Bangladesh is concerned, the trade treaty would be of subsidiary importance.

As regards Bangladesh's exports to India, some of the important commodities would be fresh fish (Rs 9 crores), semi-tanned cow-hides including wet and blue (Rs 1 crore), raw jute (Rs 7.5 crores), furnace oil, batching oil and naphta (Rs 1.5 crores), newsprint and low-grammage writing paper (Rs 3 crores), books, periodicals and gramophone records (Rs 20 lakhs), and movies (Rs 15 lakhs).

Payments for import and export of commodities in excess of their specified values are to be settled in hard currencies. There is also a provision for an interest-free technical credit of Rs 5 crores, and if the technical credit requirements exceed this limit, interest would be charged on any additional facility they would be provided. As regards technical credit, it may be emphasised that the interest-free limit of Rs 5 crores is considerably higher in relation to the size of rupee trade between the two countries, compared to the interest-free technical credit limits granted to other bilateral trading partners. Another interesting feature of the agreement relates to the absence of gold clause. Both these features are sufficient indicators of the anticipated close mutual relations between these countries.

This three-tier trade agreement is confined only to one year with a specific provision for a mid-year review at the end of the first six months. As things stand, the present trade agreement should not be interpreted as a pace-setter for the future pattern of trade relations which would evolve as more experience is gathered. Both countries are aware that they have not yet made up their minds about this problem. There is also a mention about the possibility of establishing a preferential tariff system or a free trade area or a customs union. Talk about either a 'free trade area' or a 'customs union' at this time is certainly unrealistic and may even prove detrimental to Bangladesh which is still industrially very much less developed as compared to its neighbouring region of West Bengal. Such an arrangement would perpetrate industrial backwardness of Bangladesh leading to possible misunderstanding between the two countries. The jute manufacturing industry in Bangladesh would not have developed so rapidly if Pakistan had not emerged as a separate country after the Partitioning of the Indian subcontinent. At its present stage of industrial development, Bangladesh would find it difficult to compete with the already well-established industrial units in the eastern part of India. In the interest of maintaining better relations, it may be more worthwhile thinking in terms of evolving an area of preferential tariff arrangements conducive to the industrial development of Bangladesh.

HARYANA

Supersession of Municipal Committees

Partap Singh

MUNICIPAL government is subject to legislative, judicial and administrative control. The state legislature controls municipal bodies by enacting the necessary legislation, by amending statutes, and by discussing and debating their functioning. Like other higher levels of government, municipal government is subject to the usual control of the judiciary. Courts of law interpret municipal laws, and may declare *ultra vires* those municipal acts which are deemed to be in excess of the powers conferred on the municipal body. But it is the executive government alone that has to deal with municipal authorities continuously with regard to their day-to-day administration. The entire Municipal Act is replete with overriding powers to the state government on the various branches of municipal administration.

Of all the powers the state government exercises over the municipal committees, the power to supersede could properly be described as 'a sledge hammer type of power'.[1] On supersession of a committee, the municipal councillors including the president and the vice-president have to vacate their seats and their functions are performed by an administrator appointed by the state government.[2] Yet supersession of a municipal committee means the supersession of the people's rights of self-governance since a municipal committee is as much representative of its area as the state legislature is of the state as a whole.

In Haryana, supersession of municipal committees has been very frequently resorted to by the state government.[3] The view that, if a municipal committee abuses its powers or is considered incompetent to perform its functions, it should be superseded is mistaken. As Maheshwari so aptly puts it, "Mankind has not yet, and cannot ever, contrive a fool-proof legislature or, for that matter, any human organisation. If that were so, the judiciary would not have declared so many state and even parliamentary acts *ultra vires* of the Constitution. The decisions of the High Courts are sometimes rescinded by the Supreme Court. Many actions of the bureaucrats who, as a class, tend to regard themselves as the acme of wisdom and uprightness, happen to invite the wrath of the judiciary."[4]

A municipal committee, duly elected by the freely expressed choice of the people, should not therefore be superseded on vague charges of incompetence or abuse of powers. But the fact is that municipal committees are in most cases superseded for political reasons. Municipal committees in which the interests of the party in power are safely looked after escape regulatory action, even if they are in a worse state of administration than those which get superseded. That the supersession of municipal committees is on political grounds is amply seen in the fact that judicial decisions in most cases have gone against the state government. For instance, the orders of the Haryana government superseding the municipal committees of Fatehabad, Karnal, Kaithal, etc, were quashed by the High Court. In the case of the Kalka municipal committee, the state government had superseded the committee on flimsy grounds; the committee filed a writ petition in the High Court. While the Court was hearing the case, the government withdrew its order of supersession evidently since it apprehended adverse remarks from the High Court on its action.

Municipal committees are, moreover, kept under supersession for inordinately long periods. There are some municipal committees in this state which were superseded as long ago as in 1966. Since then, the state government has not taken any steps to hold elections or to restore the democratic working of these committees. Elections to the superseded committees are also postponed to suit the political convenience of the party in power. For instance, elections to the Hissar municipal committee, long overdue, are not being held. This clearly has something to do with the fact that the opposition group there is more powerful than the party in power, *viz*, the Congress.

Nor is supersession of municipal committees a satisfactory remedy for the maladies from which the committees may suffer. The appointment of an administrator to carry on the functions of a committee could be used as a drastic and timely treatment for an ailment; but no such remedy should become part of normal routine in dealing with municipal bodies. The incompetence of municipal committees in performing their functions is largely the result of the faulty administrative structure which queers the pitch for the working of the municipal bodies. The weaknesses of this structure include the absence of a strong and independent executive, undue interference by the elected members in executive matters, inefficient and unqualified municipal personnel, inadequate resources, losses due to improper assessment and collection of taxes, and wasteful expenditure. Unless these defects are removed through structural changes, a municipal committee cannot be expected to perform its duties efficiently and effectively. It is on such changes that attention needs to be focused. Political supersession of municipal committees take the system nowhere towards achieving the objectives of municipal government.

BIHAR

Many Faces of Caste Politics

N K Singh

CASTE forms the basis of politics in Bihar. All the parties in the field recognise the force of casteism and, at election time, put up candidates on caste calculations as a matter of course. It is interesting that when R L S Yadav, a Congress leader, expressed his dissatisfaction at the way party tickets had been distributed for the recent elections — favouring the upper-castes, particularly the Brahmins, and leaving the Yadavs in the cold — New Delhi's reply was simply that no favour had been shown to any particular caste! And the caste-wise 'quota' was given as proof: Brahmins 28, Rajputs 34, Bhumihars 26, Yadavas 33, other backward castes 40, Harijans 45, Adivasis 29, and Muslims 26. The point is that in doing so the Congress was merely revealing the new strategy in caste-based politics.

Weightage of Castes

The Brahmins, Rajputs, Kayasthas and Bhumihars constitute 13 per cent of the total population of Bihar. The Rajputs and the Bhumihars — constituting about 10 per cent of the population — are the landowning gentry, accounting for 78.6 per cent of the landowners in Bihar. The urbanised Kayasthas are not a landowning caste but, being one of the most educated castes in the state, they have dominated the services and professions. The Brahmins, the highest in the hierarchy, form a special case in Bihar. Though socially recognised as the upper-most caste, they are economically among the poorest.

The so-called 'backward castes' of Bihar comprise as much as 52 per cent of the total population, and include the Yadavas, Vaishyas, Dhanuks, Telis, Kurmis, Koeris, etc. Though called 'backward', economically these castes — especially the Yadavas, Kurmis and Koeris — are reasonably well off in agriculture and cattle-breeding. But these neo-rich landowning backward castes are not considered social equals by the Brahmins, Bhumihars, Rajputs, and Kayasthas, and they have yet to attain the urbanity and sophistication of the upper castes.

The 'lower castes', known as 'scheduled castes' in government vocabulary, who account for 14 per cent of the total population, include the untouchables or Harijans. They earn their livelihood as sweepers, agricultural labourers, or landless labourers.

Historical Background

It must be remembered that, till 1911, Bihar was a part of the province of Bengal. Almost all the important offices, such as the headquarters of the provincial and central governments, the high court, and the university, were located in Calcutta. Consequently, the Bengalis more or less monopolised the jobs that were open to Indians. Understandably, the Kayasthas — the traditional scribes without much landed property — were the first to take to the colonial system of education. Faced with tough competition from the Bengalis, they spearheaded the movement of 'Bihar for Biharis'. They were joined by the Rajputs and the Bhumihars. Predictably, with the bogey of Bengali-domination out of the way, conflicts arose among these same castes. Leaders such as Ganesh Dutt (Bhumihar) and Sachchidanand Sinha (Kayastha) were merely 'caste reformers', working for the upliftment of their particular communities and not for society as a whole.

The subsequent — and consequent — caste alignment in politics may be considered under three periods: (1) the Rajput-Bhumihar domination, (2) the backward caste domination and (3) the 'all caste' period.

The first period, of Rajput-Bhumihar domination, runs roughly from the 1937 general election to the 1967 general election, i e, the era of Congress domination in the state. Before 1952, voting rights were based on property and educational qualifications, so that politics were the monopoly of a handful of rich, upper-caste people. All the Hindu members of the first Congress Ministry in Bihar, after the 1937 elections, were Rajputs and Bhumihars. Even after 1952, the political scene was dominated by these two castes. Though constituting only about 10 per cent of the total population, they dominated the state's politics through the undivided Congress. However, tough mutual competition in the social, economic, and political fields had bred enmity between them. The other castes generally sided with the one or the other faction according to their own convenience.

Adult franchise made a difference, by bringing the backward castes within the political arena. At the same time, the rise of the opposition parties was able to cash in on this change. Among the political parties, the main beneficiary of 'backwardism' was the SSP which, under the leadership of the late Ram Manohar Lohia, made 'backwardism' into a near-creed. It was able to emerge as the second largest party in the 1967 elections and again in the 1969 mid-term poll. With the SSP's backing and their numerical superiority (52 per cent of the total population belonging to this group) backward caste leaders soon came into the limelight and were able to make wide political gains. Of the seven Chief Ministers of Bihar since 1967, four have been of backward castes and one a Harijan.

A peculiar feature of the 'backward domination' period (1967 onwards) was the temporary alliance with the Brahmins following the Congress split. This 'united front' proved of mutual benefit to both castes; they captured 26 seats out of 53 in the 1971 mid-term parliamentary poll — a big improvement on their performance in the first general election. But the alliance was short-lived and broke up just after the parliamentary poll.

The other upper castes seem to have realised the folly of fighting among themselves and handing over power to the *shudras*. Hence their unity in the 1971 mid-term poll. In that election, for the first time, the established leaders of the Bhumihar and Rajput castes joined hands under the Organisation Congress which had a more feudal outlook than the ruling Congress.

Fresh Imperatives

But it was too late. The backward castes were well entrenched in the political game. However, with the Rajput, Bhumihar and Kayastha alliance, at least 'backwardism' as a basis for gaining party support has diminished in value. Political parties are now in the process of moving from their old strategy of counting on a particular caste or group of castes for political support to devising a well-proportioned amalgam of all the castes.

The 1971 election was a pointer in this direction. The ruling Congress was the first to use the new strategy, which partially explains its spectacular victory. The Organisation Congress and the SSP, the two main opponents and losers, had not yet caught on to the changed needs. While the Congress (O) was boasting of its support from the ruling

trinity of Bhumihar, Rajput and Kayastha, the SSP was still harping on the tune of 'backwardism'. The results were disastrous for both parties. As against this, the Congress (R), while it drew its main support from the Brahmins, scheduled castes, and backward castes, gave a well-proportioned representation to the Bhumihars and Rajputs.

Needless to say, in all the power politics, the position of the untouchables, living in starvation and semi-starvation, has been deplorable. In all these years, they have made hardly any progress — economic or political.

Parties, Leaders, and Castes

Just how entrenched have the political parties and their leaders been in the various castes? Partywise, the Congress, the largest political group, has been the hotbed of political casteism. Almost all its top leaders have been connected with their respective caste associations in a major way. Rajendra Prasad, who held office as President of India, was for three decades connected with the All India Kayastha Conference and had presided over its Jaunpur session in 1925. His weakness for his castemen and his distribution of favours to them were well known. A N Singh, another prominent leader, was connected with the All Indian Kshatriya Mahasabha. S K Sinha's association with the Bhumihar-Brahmin Mahasabha, and his use of it to put political pressures, are also well known.

Initially, there were six groups in the Bihar Congress: the Bhumihar group led by S K Sinha, the Rajput group led by A N Singh, the two factions of Brahmins, one led by L N Mishra and the other by Binodanand Jha, the Kayastha group led by K B Sahay, and the backward castes led by R L S Yadav. These groups were not altogether at peace among themselves. For instance, while the L N Mishra faction of Brahmins was supporting the powerful Bhumihar group, Pandit Binodanand Jha was supporting the Rajput faction. K B Sahay, the Kayastha leader, was supporting the Bhumihars till 1957, but after that he defected to the Rajput group. The backward castes' leader R L S Yadav was the political *chela* of Sahay and his loyalty used to change with Sahay's. After the death of S K Sinha, Binodanand Jha became Chief Minister. In the meantime, A N Singh had died too, and the leadership of the Rajput faction was conferred on his son, S N Singh. In the same manner, M P Sinha inherited the leadership of the Bhumihars from his father. While the Rajputs supported the 'Brahmin Raj' led by Jha, the Bhumihars, the L N Mishra faction of Brahmins, the Kayasthas, and the backward castes opposed it.

The Jha Ministry could not face such a strong opposition and the Chief Minister had to resign — under the Kamaraj plan. 'Kayastha Raj' followed, with K B Sahay as the head. He successfully won over the Rajputs — a fact that caused disaffection among the Bhumihar camp. The new power equation thus was: Kayasthas, Rajputs, a faction of Brahmins, and backward castes *versus* Bhumihars and the Binodanand Jha faction of Brahmins.

After the Congress Split

The Congress split in 1969 meant a realignment. While all the established leaders of the Rajput, Bhumihar and Kayastha communities, *viz*, S N Singh, M P Sinha and K B Sahay, remained with the organisational wing, the backward castes, who had by then split into two factions — one led by R L S Yadav and the other by his young competitor Daroga Rai — as well as the Brahmins switched their loyalties to Indira Gandhi's Congress.

At the moment there are four caste groups within the ruling Congress: Brahmins led by L N Mishra; Daroga Rai and R L S Yadav factions of the backward castes; and the Harijan group led by Jagjiwan Ram. There is yet another group, a joint front of all the upper castes (except the Brahmins), which being weak is not directly involved in politics.

The non-Congress parties have by no means had a clear, non-caste, basis or programme. In fact, till 1967, under the Congress domination, their attitude towards the ruling party depended on who, representing which caste, was in power. For instance, when Bhumihar S L Sinha was Chief Minister, the then leader of the PSP legislature, Ramanand Tewari was very critical; yet when Binodanand Jha came to power, Tewari's attitude softened — even as Basawan Singh, another PSP leader, became more critical. Tewari is a Brahmin and Singh a Bhumihar. Similarly, Thakur Prasad, the Jan Sangh chief used to maintain a lukewarm attitude towards the government headed by K B Sahay. Both are Kayasthas. At the time of the Congress division, too, the so-called ideological discussion inside each political party was actually guided by caste considerations. While the Brahmins and the backward castes of most of the opposition parties fell for the 'progressive ideas' of Indira Gandhi Congress, the Bhumihars, Rajputs, and Kayasthas, supported the old Congress.

Even the CPI has not kept clear of caste-politics. It draws its support from a section of the upper castes — especially the Bhumihars — who look upon the Congress as 'a dead horse'. Swami Sahajanand Saraswati, one of the founder-leaders of the Kisan Sabha, a CPI mass organisation, was associated in a big way with the Bhumihar-Brahmin Mahasabha. And he wrote numerous books regarding the superiority of his clan. More recently, both CPI ministers in the first UF government have been Bhumihars.

The Jan Sangh is called a 'Marwari-Bania-Zamindar party' in view of the support extended to it by the trader community and the Rajput landlords. Since the traders do not want to participate in active politics, the party is led by Rajputs and Kayasthas. One of the main accusations levelled by dissident Jan Sanghis — who recently formed the 'Rashtriya Jan Sangh' — against the state JS chief, Thakur Prasad, was 'casteism'.

Among the non-Congress parties, the erstwhile SSP — now the SP — is most influenced by casteism. It tries to draw support from the backward castes on the basis of two slogans: (i) reservation of 60 per cent seats in the legislative assembly and council, and in the services, and (ii) 'Abolish English' because it has been the language of the upper castes. Since its very inception, a struggle has been going on between the backward and the upper caste leaders of the party. While Karpoori Thakur, the party's chairman, and Bhola Singh are regarded as leaders of the backward castes, Ramanand Tewari represents the upper castes.

Nor are eminent personalities like J P Narayan 'neutral'. The Sarvodaya leader's sympathetic attitude towards K B Sahay, and later on towards Mahamaya Singh, is not without significance. All three men are Kayastha. 'JP' was vocal when the police firing took place in 1955 at Patna, but he was completely silent when Sahay took to repressive measures, and police firings took place throughout the state. Ram Briksha 'Benipuri', the noted Hindi writer, and also a very prominent leader of the Socialist Party, used to say that he was first a Bhumihar and then a Socialist. Such then is the state of political awareness in Bihar.

CEYLON

Tea and Rubber and Consciousness

Vinayak Purohit

R S PERINBANAYAGAM ('Civil Strife and Doctrine of Responsibility', December 11, 1971, pp 2491-2) has written the concluding sentence of his rejoinder to my 'Emerald Island Turns Bloody Red' (Special Number, July 1971, pp 1521-4) with hurt in his heart: "While passion, ardour and guts are imperative, intelligence and knowledge are indispensable in any programme of change". He has also subsumed my views under the category of "romantic yearning of parlour revolutionaries".

I do not propose to examine Perinbanayagam's credentials to intelligence, or knowledge or 'real revolutionism'. Such trite debating points would fall outside the tradition of lusty polemics to which Marxists are heirs. For the latter, a close examination of the contents of the opponents' thoughts is an indispensable preliminary to angry irony. Perinbanayagam has not applied his mind to the issues raised in my July analysis. I had written:

> "All independent observers are agreed that the insurgency has been more or less confined to the youth. This means that it has been confined to that segment of the population which is, one may presume, least interested in death and imprisonment and which is most interested in a future freer and better life. If Perera is not interested in the consciousness reflected by this group, then in whose consciousness is he interested? Whose consciousness is he going to raise?"

In other words, the so-called Left parties in Ceylon, the larger LSSP and the smaller CP, had abdicated their political roles during, and even more important, *before* the crisis enveloped Ceylon. When *The Nation*, an organ of the United Front, could devote a full page to 'Our Right-Wing Guevaraists' as early as December 1970, when it is conceded that the JVP was growing over the period of the last four/five years, then what efforts did the leaders of the Trotskyists and Communist Parties make to enter into a political dialogue with the rebels? What political discussions were organised? Was any attempt made to understand the political demands of the disaffected? Or did it happen that the 'real revolutionists' were engaged in 'summit politics' and 'parliamentary permutations'?

Next, let us look at the defence offered by the apologist. Is intelligence to be perverted for puerile purposes so as to condone police brutality as Perinbanayagam suggests? Does revolutionary morality demand that once young men take to arms, they must be held responsible for tortures inflicted upon them by their jailors? Since rebels rebel, anything goes? As the revolutionaries have taken the risk of protesting, therefore, should burials and cremations be organised for them 'without benefit of witnesses'? Must we be thankful to Sirimavo Bandaranaike for not allowing her military minions to go so far as to make soup out of human flesh as Hitler's underlings fried? And does international revolutionary solidarity require us to keep silent in the face of atrocities committed by the bogus Leftists of Ceylon? Yes, the atrocities cannot be blamed on the military and the police alone. Yes, the atrocities cannot be laid at the doors of Sirimavo and the SLFP exclusively. I must point my finger specifically at the criminal deeds performed with full personal responsibility by N M Perera, Leslie Gunewardene, Colvin R De Silva, and Peter Kuneman!

The real issue concerns these four Cabinet Ministers. Why did they not resign? What kind of vulgar lust for power did they acquire in British jails in India and Ceylon? How did they put such a distance between themselves and the youth of Ceylon that they could converse with the guerillas only through the rat-tat-tat of machine guns? Having abandoned the political role available to them, the LSSP and CP leaders had only a military task left to perform. And I remind the Noskes and Scheiedmanns of Ceylon that the system will expel them, or ease them out of power, as soon as their limited 'military role' is exhausted. They have raised their rifles to bring down the Guevaraists, but having performed this 'historic task' they will themselves be at the receiving end fairly soon. The portents are already visible. J R Jayawardene is joining Sirimavo and the so-called Left parties are already in disarray after N M Perera's harsh budget speech.

It has been stated that "besides vague and mindless references to expropriation of tea and rubber plantations and their conversion to usage by peasants, there was no theoretically informed and practically workable programme forthcoming from the insurgents at any stage of their four or five years of existence". One marvels at the ignorance of Perinbanayagam and their ilk! It is obvious that the partial or total, anyway planned, conversion of tea and rubber estates for the use of peasants after expropriation is an eminently just, theoretically very well informed, and absolutely practicable plan for Ceylon.

First, tea and rubber estates in Ceylon, as in India, have misappropriated large tracts of land from the peasants which are *not under tea and rubber*. That such a situation obtains, will come as a surprise not even to bourgeois economists. These uncultivated acres are supposed to provide for future expansion, for periodical revolutions and consequential tax-dodging, for a hundred-and-one similar bourgeois predilections. In a planned economy, such a gross waste, amounting in India to between two-thirds and three-fourths of the overall area owned by the major tea plantation companies, will certainly not be permitted. In a socialist economy, the area actually under tea and rubber will be determined on the basis of strictly national priorities, and cultivation of tea and rubber will be expanded or contracted according to the real needs of the people.

Secondly, the objective of Ceylonese revolutionaries is not to help the tea and rubber companies to make as much money as they can. The objective for a socialist Ceylon is to feed, clothe, and care for its people. This is the supreme and the only valid aim. Export earnings out of tea and rubber are useful only so long as — and to the extent that they can — improve the standard of living of the people. Tea and rubber are not for us the gods that they are for the bourgeoisie. Only for alienated petty bourgeois who are frightened by the shadows of commodities are tea and rubber Bodhisatavas! If it is necessary to cut down every single tea bush and every single rubber tree, in order to advance the real welfare of the people, then this must be done. If it is necessary to reduce the acreage under tea and rubber in order to fill the bellies of the poorest folk in Ceylon, then that too must be done. That is why the socialist plan is so thoroughly practical. It really plans for the real human beings living in a society. If for 10 years it is necessary to give up tea and rubber cultivation in order to feed the Ceylonese, then I am sure that Ceylon's socialist planners will not hesitate to deprive the white women and men of the 'Civilised Nations' of their cups of afternoon tea and of the spare tyres for their 'Oh, so sleek!' cars.

In fact, I am very happy to learn from Perinbanayagam that the JVP had the courage and the sensitivity to put forward an absolutely correct demand for expropriation of tea and rubber estates and their socially pre-determined conversion for use of peasants. The day that the needs of the Ceylonese peasants and workers will receive higher priority than those of the tea and rubber plantation owners, that day will witness the liberation of Ceylon from not only the vestiges of British finance capital, free not only from the grip of their brown compradors, but also from their social reformist, militant militarist, hired black-legs.

LONDON

Unloading Ulster?

THE British Parliament has almost unanimously voted to abolish the independent administration of Northern Ireland, Stormont. The easy passage of the Bill removes the hope of the Protestants of Northern Ireland that there might be a revolt of Conservative backbenchers on the issue. Only sentimental ties between Ulster and the British Establishment now remain, and those can no longer do what the material ties between the two did before the First World War. Then the defence of Ulster seemed to many Tories to be the defence of the Edwardian Establishment itself, the defence of an absolutely vital beachhead of Anglo-Irish imperialism, and worth breaking the Constitution, fostering a mutiny in the army and defying the British Government.

Times have changed. Now the British Establishment regards Ulster with distaste. Its old-fashioned loyalism to Queen and Country is, in times of peace, just a joke. Economically and politically, Ulster is a liability which the British Government would happily unload on the impoverished Southern Irish if this did not involve such a catastrophic loss of face and a betrayal of the Ulstermen.

Only Alternative

Yet betrayal is becoming more and more the only possible alternative, and the abolition — or, as it is officially known, suspension — of Stormont is, in the eyes of many, a powerful step in that direction. For whatever is said, it does represent a substantial victory for the Provisional IRA. It is also a direct result of the British army massacre of 13 demonstrators on Bloody Sunday, last January 30th. Stormont embodied the power of the Ulster Establishment, of the Orange Order, the most intransigent opposition to the reunification of Ireland. With its removal, the IRA can now feel that it requires only one more determined shove to force London to give up Ulster to Southern Ireland. For the Protestants of the North also, the prospect of unification — not on Stormont's terms, but on London's — has come a step nearer. The two-day General Strike last week, the mass demonstration of the Protestant Vanguard and the development of its para-military forces, the reunion of the Orange Order militant leader, William Craig, and the erstwhile 'moderate' Stormont Prime Minister, Brian Faulkner, demonstrate the anger of the Ulstermen at their betrayal. It is said they are burning Union Jacks in the stronghold of Belfast loyalism, the Shankhill Road.

Basically the Same

However, the strategy of the British Government has not basically changed. On the one hand, its main effort has gone into massive repression, interning any and every even remote oppositionist. On the other, it has made sporadic noises supposedly to soothe and woo the Catholic middle class, in the hope that this would make possible a regime combining Protestant and Catholic middle classes embodying all the supposed virtues of the centre: moderation, secularism, equity. This, it was thought, would prevent the raising of any other issues, such as the appalling social conditions of the North, as well isolate the wild men on the fringe, the Catholic terrorists and the antiquated Protestant vigilantes. Of course, as many people pointed out to the British Government, a policy of repression and internment made any successes in the second area quite out of the question. Catholic middle class noses were also getting broken by British troops, whatever the propaganda said.

The abolition of Stormont is the first step of substance to try and woo 'moderate' Catholic opinion. The British Government pins a lot of hope on the Social Democratic and Labour Party of the North as the potential Catholic participant in an Ulster coalition. In the past, the SDLP could never afford to be seen collaborating with the British while the hard-faced men of Stormont continued in power and the British retained internment. The first condition for collaboration has now been achieved, and the SDLP has greeted the end of Stormont warmly. The centrist Catholic organisation, the Northern Ireland Civil Rights Association, has called for a month's truce on all demonstrations and activities.

Of course, the British strategy is not entirely unrealistic. No doubt a centrist consensus either to keep the present relationship with Britain or to merge with Eire is possible if only the leadership on each side can ditch its base in each community and the Protestant Establishment can be guaranteed a paramount position. The Protestant leadership would probably not resent a few Catholic Uncle Toms, provided the mass of Catholics can be excluded. For the Protestant leaders are not at all as unrealistic as they often like to appear. Even Ian Paisley, supposedly of the extreme wing of the Protestants, has been mending his fences with the Dublin Establishment, no doubt on the calculation that if there is to be unification with the South, it better be a sellout on his terms rather than those of London.

Both sets of leaders are fully aware of the dangers to both in the present situation if it is allowed to continue. But they cannot put into reverse processes they have fostered for so long. The Protestant working class, after years of being told of the Catholic menace and of being encouraged to discriminate — if need be, physically — against Catholics, cannot suddenly be told to love their neighbours, let alone abandon the whole *raison d'etre* for their existence, the relationship with Britain. The Catholic working class, for so long repressed and attacked by the Protestants, cannot suddenly be told that really their experience is a lie. The response of the IRA which embodies this experience is a bone in the throat of Ulster which cannot be removed. It is also a bone in the throat of Southern Ireland.

Crisis in the South

Eire's Prime Minister, Lynch, has been in an extremely difficult position throughout the crisis, for the turmoil of the North comes at a peculiarly painful moment for the South, a moment when

all the betrayals of Irish independence seems most vividly felt. The South is a Right-wing authoritarian Catholic regime, still heavily dependent on Britain and with an ailing economy. When the cheque of independence was cashed, it turned out to be almost worthless for the vast majority of Irishmen. Emigration continued to be the primary solution for the problems of peasant poverty, and the great exodus persists each year. Right at the moment, things are at their worst. The targets of the Third Five-Year Plan (1968-1972) are now no more than a joke, made sour by the failures of the British economy upon which Eire depends. Investment stagnates, company profits are falling, visible exports declining, and tourism — the second largest industry — in recession. Even more important, over 8 per cent of the insured population is now unemployed, and the rate of redundancies is running at three times what it was last year. The ferocious militancy of Irish workers is proverbial, and is now more and more directed against a Government unwilling or unable to offer even modest hopes.

These material agonies challenge not merely Lynch and his government, but the whole social order of the South. The IRA campaign in the North offers a return to the pristine virtues of the republican movement which seem long since betrayed in the South. Lynch has to assert his republicanism and the demand for Irish unification; to do otherwise, would be to court political suicide. Yet this brings him into some kind of support for the IRA, even though his main emphasis falls upon a rejection of IRA methods. The difficulties are compounded because the IRA also opposes the Dublin regime and is very popular in the South. The IRA argues, with some justification, that it is the only force to have advanced the cause of Irish unity one iota in the past fifty years, and that successive governments have long since in practice shown that they have sold out to British imperialism. Lynch would no doubt like to do to the IRA what King Hussein did to the Palestinian guerillas, but he is not as secure as Hussein was and must tread with more circumspection.

British Repression

Like Heath and before him, Wilson, Lynch has drifted. Heath deplored the symptoms of Protestant supremacy in the North but nevertheless used his troops to preserve it. Lynch deplored British repression in the North, but did nothing of any substance to change the situation. In practice, Lynch has been relying on Heath to do something, anything, while simultaneously protesting politely at the more brutal aspects of British policy. Heath has, by default, relied on escalating the violence — arbitrary arrests and concentration camps, secret courts and tolerated brutality in the prisons. It all did no more than increase the IRA attacks — there were 5,000 incidents in the second half of 1971, over 1 every hour — and immensely stiffen Catholic resistance (the nine-month rent and rate strike of Catholics in the North shows how collective has become the opposition).

The only qualifying aspect of British repression has been its incompetence. The usual parade of propaganda about 'our brave boys doing a difficult job in very trying circumstances' should not obscure small details like the fact that 140 prisoners escaped from Crumlin Road gaol in the last half of last year. Indeed, the gaol apparently cannot possibly be secured, so that at least part of the internment policy became a joke. The border could not be closed, so that gun-running and the escape of wanted men became reasonably easy. In addition, even where the prisoners could be held, the results seem paradoxical. The internment camps — the notorious Long Kesh, for example — have become training grounds for the IRA, the place where the mildly rebellious are converted into real oppositionists.

The abolition of Stormont has only partly changed all this. The Catholic middle class still cannot collaborate until internment is ended and the troops pulled back to the barracks. But the change does make easier a deal between London and Dublin, and Lynch needs that. He needs to demonstrate that his style of politics can win victories, that the IRA must fail. Whether Heath will do him that favour is another matter.

Little Choice for Protestants

For the radicals in the North, it has always been true that there could be no real change without a transformation of Dublin. Only then will the mass of Protestants be prepared to accept unification. The deadlock in the North depends upon the deadlock in the South. Of course, any radical change in the South would then dissuade London from collaborating. The points of the triangle have to be set in the right direction at all three corners before there can be a circuit.

Yet in the last analysis, the Protestants have little real choice. UDI was no more than late night talk. Ulster is not an economically, let alone politically, viable entity. That is why there is unlikely to be a real Protestant backlash, simply because that is likely to bring in either or both the British and Eire armies, and the Ulstermen will be the losers in both cases. For the moment, the Ulstermen must hang on to the British as the lesser evil; English generals seem less frightening than Irish bishops. If Lynch could be toppled in the South, that might not be so convincing a calculation.

The International Monetary Crisis

(From a Special Correspondent)

THE international monetary system has been faced with recurring crises over the last few years. As is usual with bourgeois analysis, the form of the crisis is allowed to hide the content, with the result that symptoms are mistaken for causes. For instance, we find it said that the cause of the crisis is shortage of gold, or that it is the lack of confidence in the dollar.

An analysis of the underlying trends of capitalist development will show that monetary crises are rooted in the fundamental contradictions of this system of production; that crises develop not because of a shortage of gold, but that the shortage develops because the crisis creates a general demand for gold.

Credit is an important aspect of finance capital. Through the banks and other credit institutions, a great accumulation and concentration of capital is achieved. Through the State machinery, the monopoly capitalist class is able to appropriate a large share of the total national product. This method of financing through credit-creation, however, increases the instability of the whole financial system.

The power to fix prices and control the monetary and fiscal (government expenditure and taxes) system is used by monopoly capital to limit the share of the national product that goes to labour. Through budgetary deficits and public debt, the monopoly capitalists can finance expenditure greater than their receipts (this is used especially for war finance); and if trade unions are able to win wage increases these can always be nullified by corresponding price increases.

The ability of a group of monopolists to act in this manner is, however, limited by competition from other national groups of monopoly capitalists. Since the method of financing is inflationary, it has its repercussions in the international sphere, in changes in the competitive position of the various national monopoly groups. A country which has a slower rate of inflation (i e, is able to control its labour more effectively) will improve its competitive position and *vice versa*.

There is a further and more important international consideration which limits the internal power of the capitalist class, through the budget, price-fixation, and credit-creation, to spend more than it 'earns'. Excess of expenditure over receipts will also show itself as an excess of payments to foreigners over receipts from foreigners. This external deficit cannot, in a world of national economies and currencies, be financed in the same manner as the internal deficit (i e, by credit creation). An external deficit must normally be financed by running down the country's reserve of gold and foreign exchange. Thus the ability to incur deficits in international payments is limited by the country's reserve of gold and foreign exchange.

It is obvious that, if a country could have its currency accepted by other countries, then it would have the great advantage of being able to continuously incur such deficits. The process whereby a country's currency becomes an acceptable reserve is, of course, the process of imperialist domination. The colony, which is the most secure form of economic territory, can always be forced to maintain its reserve in the metropolis country's currency. Thus, in the heyday of British imperialism. India and other parts of the Empire held their reserves in sterling and formed the sterling bloc. Britain could finance its deficit with the rest of the empire merely by making these countries hold sterling. Further, through the sterling bloc, all the surpluses earned by the Empire (in dollars, etc) were placed at the disposal of the British capitalists for their own use, and, in fact, formed the basis of Britain's export of capital to America and Europe.

After the Second World War, the US emerged as the strongest capitalist economy. US imperialism had amassed huge profits during the War, and it was able to take advantage of the weakened position of the European countries to undertake large-scale expansion in Western Europe. These countries were short of capital to rebuild their industries and Marshall Aid was the main instrument of US penetration of the European economies. This was followed by inflows of large amounts of private US capital. The process of penetration has been aided by the position of the US dollar.

Like British imperialism earlier, in its days of hegemony, now US imperialism was able to force the dollar on the world as the international currency. The paucity of funds in Europe and the acceptability of the dollar (owing to the relative strength of the US economy) helped the US to dominate and exploit its rivals in the imperialist camp. Of course, we must not here forget the European fear of Soviet domination and the corresponding dependence on American arms.

Once the dollar was accepted as the international currency, it was no longer necessary for the US to balance its external payments position. Foreign economic and military 'aid', foreign investments — all these were made possible at the given scale by the position of the US dollar. Any excess of payments over receipts, was automatically converted into a reserve by the countries that had surpluses. Thus the US did not have to take any measures to adjust its international payments position. And, in effect, Europe was itself paying for the transfer of its industry into American hands. American capitalists bought up European industry and paid for it in dollars. These dollars ended up with the central banks of the countries concerned, which then either directly held them or transferred them to New York, where they were invested in US government securities. Thus for the price of US government securities in the hands of European governments, US capitalists bought up European industries. Europe got a low-earning asset (which could anyway be created almost at will by the US government) and lost a high-income asset.

Further, since this debt of the US (i e, the government securities held abroad) was in the hands of official parties (governments and central banks) it was easy to control its use. The US government as the chief defender of imperialism in the world could use its political-military relation with its allies in the imperialist camp to pressurise them into not doing anything too drastic. In fact, a large part of the various agreements entered into in the sixties among the Group of Ten (the club of the major imperialist countries) were measures to shore up the falling position of the dollar. These measures helped to convert privately-held dollars (which were volatile and not so amenable to US government pressure) into officially held debt (which was easier to control). The SDRs, hailed as paper-gold, are nothing but a final step in granting credit to the US.

Such a process of exploitation, however, has its own limitations. The US could successfully continue to do this to the extent that (*i*) its international

TABLE 1: US INTERNATIONAL FINANCIAL POSITION

(US $ billion)

Year	Gold	External Liquid Liabilities	Ratio of 1 to 2
1950	22.82	8.9	2.73
1956	22.06	14.9	1.59
1962	16.06	24.07	0.67
1971	11.04	44.13	0.25

Source: International Financial Statistics; IMF.

financial position (measured by, say, the ratio of US gold holdings to its external liquid liabilities) was strong, so that foreign holders of dollars (especially private holders whose speculative activities triggered off crises) did not feel any danger in continuing to hold dollars; and (ii) it was able to dominate, and thus force its allies to follow certain policies (the ability to do this being largely determined by the relative economic strengths of the various countries and, the overall political-military situation in Europe).

The ratio of US gold holdings to its total external liquid liabilities has rapidly dropped, from 2.73 in 1950 to 1.59 in 1956, to 0.67 in 1962, and to as low as 0.25 in February 1971 (see Table 1).

Table 2 also illustrates the deterioration of the US international economic position. In 1970, the US for the first time had a deficit on its trade account (i e, a surplus of imports over exports). At the same time, its earnings from services (i e, insurance, banking, etc) and from its capital investments abroad, have not been sufficient to offset its payments on account of military expenditures abroad, US Government loans, and export of private capital.

Underlying these changes in the financial position are the changes in the sphere of production. Productivity (roughly calculated as index of production divided by index of employment in manufacturing) only increased from 103 in 1964 to 109 in 1970 in the US, whereas over the same period it increased from 110 to 209 in Japan, 108 to 145 in West Germany, 107 to 152 in France, and 107 to 124 in the UK. The uneven development of the major capitalist countries is easily seen in their growth rates — the compound rate of growth between 1958 and 1969 has been 5.3 per cent for the US and 13.3 per cent and 7.8 per cent for Japan and West Germany, respectively.

The economic strength of the European countries (consolidated through the Common Market) and of Japan has enabled these countries to take advantage of the weakened international financial position of the United States, thus bringing about the recurrent financial crisis. In attempting to defend its position, the US capitalist class has been forced both to control its proletariat more effectively (through wage freeze) and to hit at its competitors (through an additional import duty). However, the defeat of the US in Indo-China and the increasing struggles of the oppressed people at home (spearheaded by the Afro-American movement) have left the US ruling class with little room to manoeuvre; with the result that it has been forced to devalue the dollar (and to seek an agreement with China). This action signifies the end of the United States as the undisputed leader of the imperialist camp.

Some immediate consequences follow from the present situation. The dollar, having been devalued, will no longer be as acceptable as a reserve currency, and exports of capital will have to be matched by a surplus on the trade and other accounts. As we have seen, the US in 1970, for the first time since the War, had a deficit on the trade account. Thus US exports of capital will tend to diminish.

The export of capital is, however, necessary for the continued profits of US monopoly capital. Having lost the 'natural' advantage of hegemony, they will now have to try other direct means to better their competitive strength and assure themselves markets, raw materials, and profits. Thus, from the US there will now be increased pressure to transform dependent countries from semi-colonial to neo-colonial status. At the same time, the other major imperialist countries (West Germany, Japan, and the USSR) are now in a position to, and need to, increase their exports of capital. All these countries are faced with a labour shortage and the clogging of investment opportunities. Both Japan and West Germany had favourable trade balances of about $ 4 billion in 1970 and reserves of about $ 4.8 and $ 13.6 billion, respectively. The USSR has been busy working out trade agreements and increasing its exports of capital — also using the East European countries' surpluses for the purpose. Now that the US can no longer use the privileged position of the dollar, there are bound to be increased efforts by all the imperialist countries to step up their capital exports at the cost of the United States.

In "Economic Problems of Socialism", Stalin had considered the question whether wars among the imperialist countries were still possible after the Second World War, which saw the emergence of a considerably enlarged group of socialist and people's democratic countries. He had answered that such wars were still possible, since they were the result of an imperialist redivision of the world. The events of the recent past bear out the increased competition among the imperialist countries: there is a process of redivision going on.

It is the established position of the United States which is now (or will soon be) the major obstacle to the expansion of the USSR, Japan, and Europe. The hegemony of the US dollar was one way of maintaining this position. Military strength — not only to dominate its rivals but also to prop up client and puppet regimes — is now left as the main prop of the worldwide US business interests. The Soviet Union is the best-placed to take advantage of the present situation. The Soviets have, over the last decade, built up a sizeable navy (larger than that of the United States). But Japan, especially, is also preparing to assert itself militarily. This is already apparent in the pace of Japan's re-militarisation and its declaration regarding Taiwan and South Korea as areas within its defence perimeter. Such a situation could well lead to another war among the imperialist countries, which can only hasten the collapse of the capitalist system.

TABLE 2: US BALANCE OF PAYMENTS

(US $ billion)

		1962	1967	1970
1	Exports	25.9	39.3	53.5
2	Imports	24.1	38.6	54.2
3	Trade Balance (1 — 2)	1.8	0.7	—0.7
4	Services	3.0	4.5	4.8
5	Net Real Transactions (3 + 4)	4.8	5.2	4.1

12	Net financial transactions (10 — 11)	—5.9	—8.1	—5.9

Left, Right, Left: Industrialisation for the Forced March

Ranjit Sau

The Modernisation Imperative and Indian Planning by Baldev Raj Nayar; Vikas Publications, 1972; pp xii+246; Rs 30.

WITH a liberal-democratic political system, why did India adopt a particular type of economic strategy in the mid-1950s that was terribly demanding in terms of the current sacrifice by the masses? To Nayar, the economic strategy and the political system in India are incongruent. His main thesis in this book is that, not the motivation of long-term welfare to the people, but the aims of political sovereignty, military security, and economic independence have provided the main impulse for the course of economic development that has been followed by India.

There are two basic approaches in social sciences in the study of society and social groups. One is the 'systems' approach which conceives of society as an entity with interdependent parts. Systems and functionalist theorists posit an integrated social system with a consensus on shared values among the constituent social groups, see the social system in equilibrium, and evaluate social facts from the viewpoint of needs and functions of the society as a whole. Talcott Parsons is one of the eminent exponents of such systems analysis in social sciences.

At the other extreme, and opposed to the systems approach, is the 'conflict' approach which looks upon society in the light of dialectics; which sees it in a state of constant change; which assumes as the basic characteristic of society not consensus, but conflict and struggle along with coercion and exploitation of the subordinate classes by the dominant class; and which evaluates social phenomena from the perspective of groups within society and the struggle among them. Karl Marx has given the most forceful expression to the 'conflict' theory, perceiving the history of man as "a history of class struggles, contests between exploiting and exploited, ruling and oppressed classes".

Clarity of exposition is a major virtue of this book. Right at the outset the author unambiguously declares that "this study will more or less adopt the perspective of systems analysis". If you ask why, his answer is rather unconvincing. "The exigencies of manageability and feasibility" are cited as the fundamental reasons for the author's acceptance of the systems approach, and, by the same token, the rejection of the Marxian 'conflict' approach. Does he really mean to say that a Marxian analysis of the economic strategy of India is unmanageable and non-feasible?

In any case, the study is clearly based upon the premise that in India nationalism has proved to be a more deep-rooted social phenomenon than class conflict. Now, following the lines of David Apter, the author classifies government types or models as follows: (a) mobilisation, (b) reconciliation, (c) bureaucratic, and (d) theocratic. Here only the first two are relevant.

The *mobilisation* system does not accept the existing state of society, but rather seeks to reshape and radically transform society, shattering the old structures of institutions and values, and replacing it with a new one, the fervent and sacred vision of which is fortified by a comprehensive ideology. In the process, such a system tends to politicise the entire gamut of social life, with the State extending its network of control over ever-widening spheres of society. The goals of economic growth are of the greatest importance in the mobilisation system which places great emphasis on austerity, discipline, and sacrifice.

RECONCILIATION TYPE

Unlike the mobilisation system, the *reconciliation* system, on the other hand, more or less accepts the society as it is and provides a framework for the processing of only moderate change. The system's goals emerge, in the fashion of the market place, out of conflict among many groups with different aims; they correspond more closely to the capabilities of the system as well as to the demands of the important groups. Economic development can proceed only at a rate that is acceptable to key groups in the population. Economic policies therefore would be moderate and realistic, involving investments in short-term projects with a high rate of return, and realisable within the limits of available resources. Economic growth at a rapid rate, however, is not impossible, but it requires extensive self-discipline, popular participation, and great civic devotion. But these preconditions allegedly occur only very rarely in new nations. David Apter believes that governments of the reconciliation type may be condemned to such a slow rate of economic progress that they create their own disaster.

Nayar characterises the Indian political system as one of the reconciliation type. And against this background he examines the economic strategy adopted in India since the Second Plan. It is a strategy of stepping up the rate of investment rapidly; of investing in heavy and basic industries which employ relatively few people and produces return only in the distant future; and of achieving a self-reliant industrial base. Is the mass welfare in the long run the main impulse for this path of economic development? Nayar laconically adds: "If mass welfare alone were the objective of economic development there would be considerable merit in the advice of the comedian to declare war on the United States and immediately surrender." Indeed, the United States is the global godfather of mass welfare!

At this point, with copious quotations from plan documents and the speeches of such VIPs as Mahalanobis and Nehru, the author tries to establish that it is the compulsions of fervent nationalism in the form of economic independence and military preparedness that are at the root of the economic strategy of India. Of course, a strong industrial base is essential for military power.

The conclusion as such may be correct in fact. But the way Nayar has arrived at it reminds me of shadow boxing. He reads too much into the words of the plan documents and the speeches of the great men like Nehru, Mahalanobis and Patel. As a matter of fact the sections under the headings "Goals in Indian Planning", "A Note on Patel" and "Plans, Planners and Nationalism", which run into some fifty-odd pages, consist mostly of lengthy quotations.

Not surprisingly, when in the last chapter Nayar actually does examine the deeds rather than the words, the actual performance of the Indian economy rather than the pious hopes as embodied in the plan documents, he finds not a trace of economic independence in

India. He himself narrates how India's industry lies prostrate at the feet of foreign capital, and how India is pressurised from time to time by aid-givers.

In short, this is a lucid, clearly written, interesting book. But even if one grants the basic premise of the author, the book fails in its own logic. And, of course, one can always question the basic premise as well.

Spread Effects of Amul

N S Jodha

Spread Effects of Dairy Enterprise: A Case Study of Anand by Small Industry Extension Training Institute, Hyderabad, 1971; pp 82; Rs 5.

PUBLICATION of a study evaluating the spread effect of 'Amul' (Kaira District Milk Producers Co-operative Union, Anand) in its Silver Jubilee Year is most timely. But the study under review is disappointing. Firstly, a large part of the book consists of material almost bodily lifted from the publicity handouts and related literature produced by Amul itself. Secondly, in the part in which the study depends on its own investigations, the whole approach (both methodologically and analytically) is oversimplistic (for instance, chapter 3). The intention here is not to belittle the achievements of Amul, but simply to point out that an opportunity to properly and objectively assess the linkage effects of Amul during the 25 years of its existence has been missed.

The book is divided into seven chapters. Chapter one presents a profile of the Kaira district while the second chapter is devoted to historical development of the dairy industry in Anand and description of the present organisational and operational set-up of Amul. In the subsequent three chapters, the impact of Amul is studied in the contexts of (1) the economy of the milk producer, (2) the overall rural economy of the areas covered by dairy co-operatives, and (3) the dairy-linked industrial development of the area around Anand.

Criteria Not Specified

The chapter dealing with the impact of Amul on the milk producer's economy is probably the weakest in the whole study. Entitled 'The Small Milk Producer: Sample Study' and supposed to be a study of small milk producers, the chapter indicates that the average per household income of the 100 sample producers from dairying is Rs 1,547 (from agriculture it is Rs 6,583) as against the average income of Rs 800 from dairying for the members of Amul as a whole. Neither the methods employed for computing income nor the criteria for calling the selected producers as small producers are specified. Further, in the entire chapter there is strangely no mention either of actual milk production or the production base, i e, the dairy size or even of other factors affecting milk production.

The selection of ten villages (and 10 farmers in each village) was made on the basis of actual supply of milk to Amul. Ignoring all the farm level factors affecting the marketed supplies of milk (from production side or demand side), the study relates the absolute supply of milk (average for the whole village) only to factors like total population of the village or the latter's distance from the dairy plant at Anand (even when the price paid to the farmer is the same irrespective of the distance, and transportation of milk is Amul's own responsibility). Other discussion of the income and asset position of milk producers (attributable to Amul), investment in buffaloes, average income per buffalo, etc, is again presented in terms of village-wise totals or averages of the 10 households. It is impossible to make out from the Tables and discussions how farmers with different dairy size (or even land-holding) stand *vis-a-vis* benefits from the dairy.

The next chapter on 'Impact of Dairy', largely reproducing the findings of an earlier paper by Amul's staff, is quite interesting and informative. The impact of Amul is judged partly by the extent of creation of infrastructural facilities, adoption of scientific animal husbandry and generation of additional income and employment in the areas covered by Amul; and partly by comparing the situations in areas covered by dairy co-operatives (described as 'Cattle Development Area or CD) and the control area where no dairy co-operatives exist as yet.

It has been reported that average monthly income per milking animal in CD area is Rs 97.35 as against Rs 64.59 in the control area; milk yield of buffalo in CD area is 48.1 per cent higher than in the control area; a higher proportion (16.6 per cent) of animals are in milk in the CD area compared to the control area. Within the CD area overall milk production during 1969 increased by 50.3 per cent as compared to 1961. Along with increased milk production milk consumption has also increased. The per day per head milk consumption (in 1970) was 145 and 67 grams for producers and non-producers respectively, in the CD area. The corresponding figures for the control area were 108 and 34 grams. Further, it has been stated that more of agricultural labourers and small farmers (Table 4.3) have adopted dairying in the CD area.

Comparison Not Meaningful

but comparison of CD and control areas is not very meaningful, particularly since Amul has covered more than 75 per cent of the villages and the villages constituting control area are the left-overs and the most backward ones which will be the last to come into the Amul fold.

Chapters V and VI discuss the industrial impact of Amul. In the former about 7 establishments located in or around Anand, linked to dairy enterprise as input suppliers (e g, those manufacturing milk vessels, plastic measures, spoons, curd-churns, packing papers, etc) are discussed. These employ about 90 persons and represent an investment of Rs 9,41,000. Another group of 10 industries located in the area are not directly linked to the dairy, but have been discussed here to give a complete picture.

It is difficult to isolate the industrial impact of Amul from the impact or role of other agencies such as the Gujarat State Finance Corporation (Vithal Udyognagar Industrial Estate), the Charutar Gramodhyog Mandal and the policy of ruralisation of industries operating in Gujarat, all of which have contributed to the development of the industrial complex around Anand.

On the other hand a discussion of linkage effects of Amul remains incomplete unless account is taken of other factors such as growth of the number of automobile workships, etc, which have come up particularly because of operation of hundreds of private trucks used for milk assembly from the villages to Amul.

The study concludes by suggesting (in chapter 7) that through enterprises like Amul, Myrdal's spread effects can be achieved without any sacrifice in terms of backwash effects. With some more effort and methodological care the study would have been a valuable contribution.

A Policy Frame for Self-Reliance

Bimal Jalan

The purpose of this paper is twofold.

Firstly, it is an attempt to develop an analytical framework for consideration of appropriate policies for premature *self-reliance in a developing economy, dependent on foreign aid to finance part of its planned deficit in external payments or investment requirements. The need for such an analytical framework arises because while all developing countries frequently profess their anxiety to achieve self-reliance as soon as possible, none has tried to define this objective in an operationally meaningful way or attempted to devise a policy frame which would make the objective credible either to themselves or to their benefactors.*

The second object of this paper is to examine the issue of self-reliance in the wake of suspension of United States aid to India, particularly with reference to the Fourth Plan — or what is left of it.

IT should be emphasised that the paper is concerned with policies for "premature" self-reliance and not self-reliance *per se* or ultimate self-reliance. The object of aid, as we have all been told, is to end aid. Similarly, all developing countries have been planning for self-sustaining growth and for the day — however distant — when they can generate an acceptable rate of investment and growth out of their own resources. Such 'ultimate' self-reliance is the explicit objective of all normal planning exercises, development strategies, and foreign advice and this paper has nothing to add to that. However, there may be situations, when a country either as a result of realistic assessment of aid possibilities in the future or as a matter of internal or external political objective may decide to terminate aid in the near future before the point of self-sustaining growth is reached and well ahead of the anticipations of its own perspective plan. This naturally requires a mid-course adjustment in the direction of the economy and adoption of policies specifically directed to a reduction in the country's external dependence in the short or medium term. Policies directed to this end may be thought of as policies for 'premature' self-reliance as distinguished from normal development policies which would usher self-reliance "in due course".

II

Specification of the Objective

Self-reliance is a word which means different things to different people, and the first need is to specify in a more concrete and quantifiable way what exactly is meant by the term as a statement of a country's objective. Thus, in one sense, self-reliance may refer to the objective of national or intra-national *self-sufficiency* or the minimisation of the country's external or internal trade. This is the sense in which the word is used when one speaks of communities which grow their own vegetables and basic needs as being self-reliant or of import substitution as a step towards self-reliance. National self-sufficiency in food and certain other basic commodities (e g, steel and fertilisers) is thus frequently considered as being synonymous with self-reliance. This interpretation of self-reliance is, however, outside the purview of this paper.

Gross and Net Aid

In another sense, self-reliance may refer to the elimination of aid — either *gross* or *net*: Elimination of *gross* aid at some future date is implicit in the objective of "self-sustaining growth" espoused by all developing countries. It is also implicit in the emerging international consensus on the desirability of relating the terms of assistance to the debt-servicing capacity of the developing countries. The Indian Fourth Five-Year Plan on the other hand, formulated the objective of self-reliance in terms of elimination of *net* (rather than gross) aid by 1980-81. This meant that even if the objective were fully achieved, the country would have continued to receive aid, at least for some time, up to the limit of its own debt servicing obligations.

For countries which have already been borrowing for a long time, the distinction between *gross* and *net* can be quantitatively very significant. Thus, for example, in 1971-72, gross aid to India amounted to Rs 778 crores as against net aid of only Rs 328 crores — a difference of Rs 450 crores. For the last three years of the Fourth Plan alone, the difference between gross and net could amount to as much as Rs 1,400 crores or half the anticipated deficit in our balance of payments during this period. For the developing countries as a whole the difference between gross and net aid in 1970 was of the order of Rs 4,300 crores and is likely to increase in future.

Formulation of self-reliance targets in terms of *net* aid, it must be confessed, is odd and perplexing. Since aid negotiations and decisions are almost always made in terms of gross aid, it may lead to the paradoxical situation where the country becomes technically "self-reliant" but its quest for fresh aid intensifies! This could happen when fresh inflows of aid are falling over time while debt service obligations are increasing. Sometime in future the two would become equal, and the country would actually have to seek larger fresh aid from that point onwards in order to meet its rising debt service obligations. Otherwise, the country would soon become "*over*-self reliant"! This is a somewhat unwieldy concept and can be easily avoided by defining self-reliance as the state when gross aid is zero, and choosing an appropriate time-horizon for achieving this.

Time Horizon

Choice of an appropriate time horizon, it hardly needs to be said, is crucial for giving operational meaning to the objective of self-reliance. Aid that is not stolen, is either consumed, invested in new projects, or used for sustaining the existing industrial structure. *Ceteris paribus*, elimination of aid is therefore likely to affect the rate of growth of income or investment or both, and there is likely to be a clear

trade-off between the rate of growth and investment on the one hand and the level and duration of aid on the other. Much as one may want to have self-reliance as soon as possible, the question of an appropriate time-horizon thus involves a little more than finding out the terminal date of the nearest Five-Year Plan. Such a choice can be made only after an assessment of the trade-offs between investment/growth and self-reliance at different points of time.

However, there may be situations when no such choice with respect to time horizon exists — either because of internal political reasons or because of decisions made by others over which the country has no control. In such cases, the only interesting question is the period of time over which the country's balance of payments has to adjust itself to the new situation; because of the availability of short-term balance of payments support (primarily from the IMF) and reserves, the period over which such adjustment is to be achieved may be longer than the date at which aid is to be terminated. Depending on the magnitude and complexity of the adjustment problem, a country may, therefore, choose to run deficits in its balance of payments beyond the date of aid termination and finance it out of short-term borrowings or reserves. This is tantamount to "stretching" the time horizon for effective self-reliance.

Whatever the time horizon, it is clear that self-reliance would be the easiest thing to achieve — if there were not certain other growth or development objectives that had to be satisfied at the same time. All countries, developed and developing, have multiplicity of objectives, and the decision to eliminate aid may affect any one or more of them. In considering a policy frame for self-reliance, it is, therefore, necessary to specify the *minimum* of other aid-dependent objectives that have to be met at the same time. For example, a country may have been receiving aid for increase in "essential" consumption (e g, food imports), growth in industrial production (e g, raw material imports), and new investment (e g, capital goods). Elimination of aid may affect the target rate of growth in all these areas, and in planning for self-reliance it may become necessary to consider the trade-offs, if any, among these different objectives (e g, new investment *vs* capacity utilisation in existing industries). In some dependent economies, the sum of minimum expectations in all areas may turn out to be inconsistent with self-reliance over the chosen time horizon; in such cases, either expectations in some areas have to be revised downwards or time horizon has to be stretched.

II

Policy Instruments

Self-reliance over the given period would require adoption of a policy framework calculated to increase the rate of savings (over what it would have been if aid was taken) as well as improve the balance of payments. In some cases, the two processes would mean much the same thing — for example, when export surpluses provide the bulk of investible resources or when savings are sought to be increased by reduction in consumer imports. In some cases, however, separate policies for savings and balance of payments may be required; for example, this would be the case when a planned deficit in balance of payments is sought to be met through a reduction in imports of investment goods. In this paper, we shall concentrate on policies to improve the payments position on the assumption that, if required, countries would be willing to raise additional domestic resources through taxation.

There are three further points which need to be emphasised before a discussion of specific policies: (i) we are concerned only with policies which would bring forth the *additional* effort required for self-reliance — over and above what the country would have done anyway; (ii) policies that have a recognisable pay-off in the short and medium term are *ipso facto* superior to those with uncertain pay-off in the never never future. This is so because an unexpected balance of payments crisis (and the consequent "bailing out" operation by creditors) in the course of vigorous pursuit of self-reliance would be embarrassing, to say the least; and (iii) the present discussion is about feasible policy alternatives in real economies rather than "optimal" policies in idealised economies which satisfy the conditions necessary for general equilibrium. Pretence of technical objectivity notwithstanding, much of the economic discussion of public issues (especially when countries concerned are "somewhere out there" rather than one's own) suffers from a value-bias in favour of policies which promote a preferred economic system or a preferred form of economic organisation. The following discussion would attempt to steer clear of presumptions regarding superiority of one sort of measures over others on value grounds, although it must be recognised that a country could quite legitimately choose to reject some of the available options on precisely these grounds.

Export Growth

The habitual response of governments seized with a desire for self-reliance is to wish for a faster growth in exports and import substitution. While one can have little against these policies as such, the trouble with both these courses of action is that their outcome is often likely to be outside the control of the planning authorities. The issue here is not whether exports can grow or the pace of import substitution can be strengthened, but whether these can be made to grow *faster* than the rate already planned for the future — prior to the adoption of the self-reliance objective. In come countries it may be possible to do so but in some it may not be, depending on (a) how optimistic the export and import projections were to begin with, and (b) the length of time horizon chosen for self-reliance. The more ambitious the earlier targets and the shorter the time horizon chosen for self-reliance, the greater the likelihood that exclusive reliance on these policies would come to grief. Unless, therefore, one can demonstrate precisely how a faster rate of growth of exports or import substitution is to be brought about, self-reliance through these policies cannot be considered a credible objective.

It has sometimes been suggested that exports can be increased at any rate, provided a country is willing to follow a policy of a "realistic" or "equilibrium" exchange rate. However, not only is the concept of equilibrium rate in a growing and changing economy of doubtful theoretical validity, there are also other considerations which severely restrict the utility of this suggestion. Obviously, such a policy cannot be pursued by all developing countries at the same time since a large part of their exports are non-competitive with those of the industrialised countries and face a low elasticity of demand. For any particular country, on the other hand, "exports at any price that the foreigners are willing to pay" is a feasible option only if exports play an all too marginal role in the economy. Otherwise, loss in welfare and income through a deterioration in terms of trade would become significant — and self-defeating. Outside of a few socialist countries, there are hardly any countries for which this will not be true.

The possibility of import substitution depends on (a) the composition of existing imports, (b) the stage of development of the economy, and (c) import-intensity of domestic production. In all aid-dependent economies, import-intensity of domestic production outside of agriculture and simple resource-based manufacturing is likely to be high both in terms of raw material inputs as well as the initial capital cost. This becomes a matter of crucial importance if the structure of current imports is such that further import substitution can be attempted only in industries with a long gestation period. During the initial period, *absolute* dependence on imports in such cases is likely to increase rather than decrease. Paradoxically, therefore, accelerated import substitution for self-reliance in the short or medium term may be feasible only in countries which are either too underdeveloped (and, therefore, provide scope for import substitution in simple lines) or highly developed, with a well-diversified economic structure.

In countries where additional exports or additional import substitution do not provide feasible routes to self-reliance, other policies for achieving a turn-around in balance of payments have to be considered. These are likely to consist of the following: (i) change in industrial priorities in order to reduce import-dependence per unit of investment/output; (ii) cut in imports (as distinguished from import substitution), within the planned pattern of investment; and (iii) rescheduling of debt service obligations on past loans.

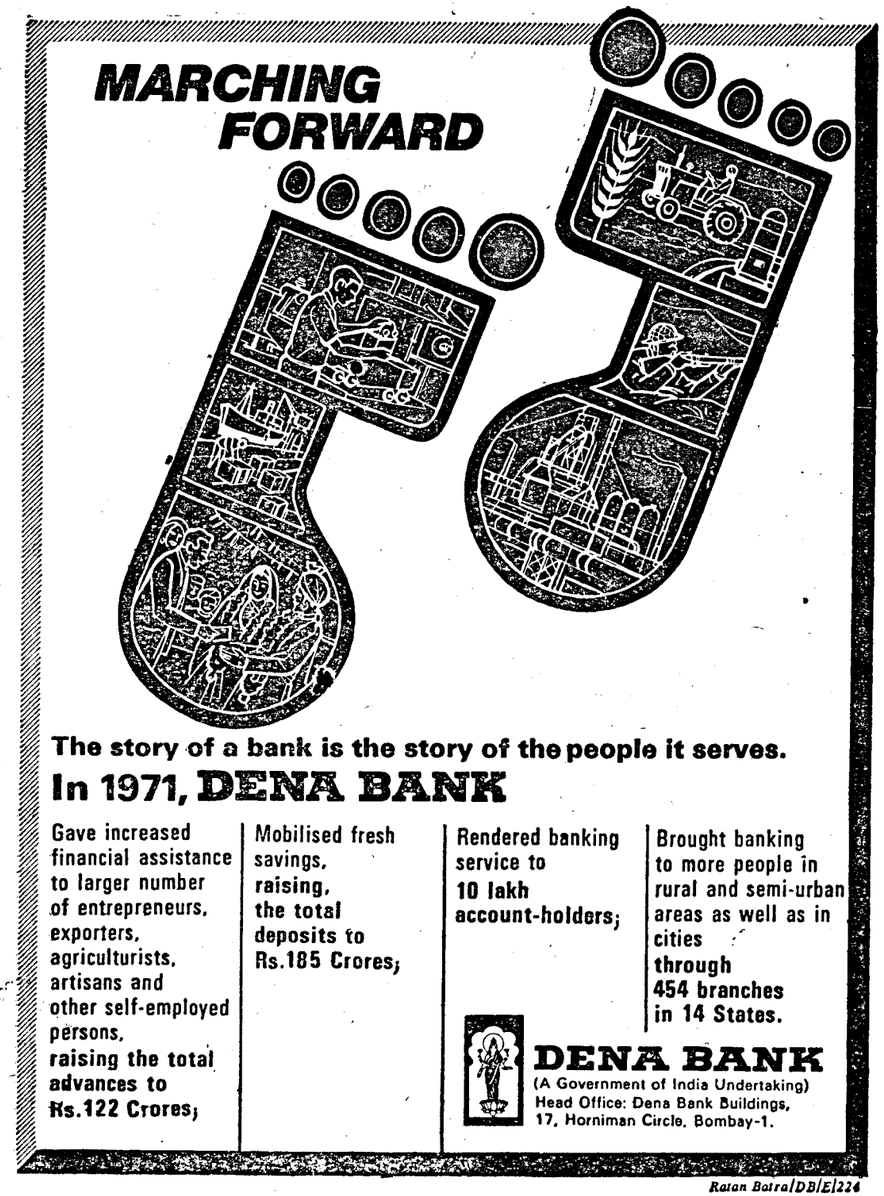
The first option, it will be recalled, has frequently been urged on developing countries faced with a "foreign exchange constraint". The desirability of this policy under any given circumstances should, however, depend on whether the change in priorities can be accomplished *within* the framework of a country's chosen development strategy and in keeping with its long-term development objectives or whether it calls for a major departure from the chosen strategy. When it is the latter (for example, when a shift away from heavy industries to light industries or from industry to agriculture is involved), this course of action would affect not only the *pace* of development but also the content of it. This is tantamount to salvaging the present by mortgaging the future and must, therefore, be resisted. Except in those cases where aid is the "engine of growth", elimination (and, for that matter, acceptance) of aid should be considered as determining the rate of progress towards development objectives rather than the objectives themselves.

A planned cut in imports, painful as it is, is one of most effective courses of action in the short and medium term. This is also what most countries do in the event of a balance of payments crisis. In a crisis, however, the measure becomes unnecessarily disruptive of development since imports are cut either across-the-board or on an item-by-item basis without sufficient regard for inter-industry relations and overall economic costs. If in the absence of aid, the level of imports needs to be reduced, it is much better to do so over a period and on the basis of economic criteria likely to maximise the development impact of any planned level of imports. Opinions, of course, vary on what constitutes "development impact", and each country will have to decide this for itself. For countries where imports are already down to the bone, the choice will be particularly difficult: they may well have to choose between the claims of existing industries and the need for new investment for long-run development of the economy.

Rescheduling of debt service obligations on past development loans can be an eminently sensible course of action for countries opting for premature self-reliance, especially when debt outstanding is high. However, rescheduling can take various forms, and some of them can do more harm than good. It is, therefore, necessary to lay down the conditions for a successful arrangement: (a) rescheduling should cover all development loans. Partial rescheduling, according to either source or terms of loans, is likely to create more burden-sharing problems among aid-giving countries than it solves; (b) rescheduling should cover as long a period as possible. Fifty years (which is the period of IDA credits) is likely to be a good rule; and (c) rescheduled amounts should bear near-zero interest.

The success of rescheduling operations obviously depends on the attitude of the creditors. In the past, their attitude has not been overly helpful, and rescheduling has taken the form of short-term bailing out operations in response to debt crises (except in the case of India) and has usually carried stiff terms and conditions with it. In part, this attitude has been conditioned by the fact that many of these crises had arisen because of gross mismanagement of the economy by present or past governments.

Proposals for rescheduling in the context of self-reliance, however, have to be sharply distinguished from such past cases. The presumption of bad management should not normally arise; and since the total commitment of the aid-givers would be decreasing in future, it may be assumed that their desire to keep the receiving country on short leash would also be less. There would certainly be a minor income loss to the aid-givers as a result of rescheduling, but this would be more than compensated by gain from stoppage of aid. However, if pursuant to political reasons (or prejudice) aid givers are still reluctant, unilateral action by the borrower cannot be ruled out.



To sum up, it is clear that the set of policies necessary for self-reliance is likely to vary from one country to another depending on factors such as its chosen development strategy, present stage of development, the time horizon, the composition of its imports and so on. In some, choice of policies would be fairly easy; in others, painful choices would have to be made among conflicting ends. In most cases, however, it is likely that much more than exhortation for more exports or import substitution would be required if the desire for self-reliance is to become a credible objective of development policy.

III

The Indian Case

More than most other developing countries, India has tried to relate its five-year plans to a long-term perspective of development. Undaunted by external circumstances and temporary setbacks, in each successive plan, allocation and priority decisions have thus broadly been in conformity with the long-term strategy which was identified soon after the beginning of planning. Programming of foreign aid, however, has been an important exception. There has been no clear strategy, and the Indian attitude to aid and self-reliance has fluctuated sharply from one plan to the next depending on requirements and other circumstances.

Thus, in the First Plan, the attitude to aid was conditioned by three facts: (i) India had large sterling reserves which, together with exports, could be expected to cover the external requirements of the plan; (ii) Soviet Russia had planned "successfully" without relying on outside assistance; and (iii) India had wanted to play an active, and possibly, a balancing role in foreign affairs. It, therefore, could not risk outside interference. Accordingly, the

First Plan was firmly (and loudly) self-reliant, and allowed for only a minimal role for foreign aid in India's development. The Plan thus laid down that "external assistance is acceptable only if it carries with it no conditions, explicit or implicit, which affect even remotely the country's ability to take an independent line in international affairs." During this period, India asked for and received very little aid (amounting to Rs 204 crores).

The declining sterling reserves, the much larger resource requirements of the Second Plan, and finally the balance of payments crisis of 1958, however, soon transformed this attitude. During the crisis (India had lost Rs 500 crores in reserves in the first two years of the Second Plan), the Aid India Consortium was organised and was successful in preventing a complete disruption of the Plan and the country's external finances. This experience had a profound effect on the planners, and India became firmly pro-aid. It had planned for about Rs 800 crores by way of aid during the Second Plan, but ended up using Rs 1,500 crores (21 per cent of Plan investment).

The fondness for aid was fully reflected in the financial arrangements for the Third Plan. The Plan provided for (and received) Rs 2,200 crores by way of aid (36 per cent of Plan investment). Reliance on large inflow of aid was explained thus: "it would be advantageous from the point of view of recipient countries as well as donors to plan for substantial amounts of external assistance for a relatively short period rather than proceed with varying and uncertain amounts over an indefinite period." The period of the Third Plan, however, coincided with the period of "aid-weariness" in donor countries, and mounting tensions in the aid relationship resulting from excessive interference by aid agencies in economic policies of the recipient countries. The latter years of the Plan which culminated in the devaluation of the rupee, and the subsequent three years of Annual Plans were economically particularly difficult for India, and marked the beginning of the era of disillusion and discontent with regard to aid.

The Fourth Plan was formulated during the period when foreign aid to India had begun to decline and debt service payments were increasing sharply. There was also considerable international pessimism about the future of aid. These factors shaped the strategy of the Plan with regard to aid, and for the first time a specific date was laid down for the elimination of aid. Aid, net of debt service payments, was to be reduced to half the "current level" by the end of the Fourth Plan, and eliminated altogether by the end of the Fifth Plan (1980-81). Interestingly enough, the Fourth Plan objective has been more than fulfilled in 1971-72; net aid (of Rs 328 crores) last year was less than half the average net receipts during the Third Plan or the three Annual Plans!

However, very little satisfaction can be derived from this fact. Insofar as this can be termed self-reliance, it has been entirely the result of decisions made outside the country, and has been accompanied, not by an increase, but by a substantial shortfall in the rate of savings postulated by the Plan for these years. Balance of payments has been held in check, not by exports shooting up to meet the rising import requirements of a high growth economy, but by a substantial decline in imports consequent upon a fall in the rate of investment and industrial production. Hardly the state of affairs that would arouse the envy of the aid-dependent countries of the world!

The current search for self-reliance has to be considered against this background. Obviously, the original Fourth Plan objective with regard to aid no longer provides an adequate basis for action. It is also clear that self-reliance alone is not enough; in order to be meaningful, it has to be accompanied by an acceptable measure of progress towards other development objectives. In the context of the Fourth Plan, the first task, therefore, is to redefine the self-reliance and other development objectives in a way that would be operational as well as mutually consistent.

On the basis of balance of payments projections presented in the mid-term appraisal, it can be easily seen that "total" self-reliance is not a feasible objective so far as this Plan is concerned. Since total external payment requirements for the last year of the Plan are projected at Rs 2,913 crores (composed of imports of Rs 2,383 crores, debt service of Rs 480 crores, and other payments of Rs 50 crores) as against export receipts of Rs 1,907 crores, total self-reliance in that year would require closing the deficit of over Rs 1,000 crores by means other than aid receipts. This would require a reduction in import requirements of 40 per cent or an increase in exports of 50 per cent — *over and above* what has already been assumed in the Plan by way of import substitution and export promotion. Within the framework of the Plan and the current development strategy, this is clearly unrealistic. A much longer time horizon for total self-reliance is, therefore, likely to be necessary; and this choice, as mentioned earlier, should be exercised only after determination of the trade-off between investment/growth and self-reliance at different points of time in the future. If early and total self-reliance is considered politically imperative but turns out to be inconsistent with the present pattern of development, the country may have no choice but to undertake a radical restructuring of its present development strategy and objectives.

While the dimensions of the longer term task are yet to be specified, partial self-reliance with respect to aid from the United States has already been thrust upon the country. Therefore, whatever else one may or may not wish to do, the policies and targets of the Fourth Plan have to be made to adjust to at least this circumstance. This requires an assessment of the likely deficit in the balance of payments in the absence of US aid — and in the absence of mitigating policies. The Table below provides an estimate of the likely deficit for the last three years of the Plan (1971/72-1973/74). Figures for import requirements, export receipts, debt service and other payments in the Table are taken from the mid-term Appraisal; normal aid-utilisation from non-US sources is assumed to continue at a slightly higher rate than in the first two years of the plan; and "extra-rapid" drawdown of pipeline from both US and non-US sources is assumed to amount to Rs 100 crores a year.

The estimate below of payments deficit, in the absence of US aid, is subject to three qualifications: (i) all of this deficit is not directly *attributable* to the suspension of US aid. Fresh authorisation of aid from the US averaged Rs 250 crores in the first two years of the Plan as against average

TABLE: PROJECTED FOREIGN EXCHANGE PAYMENTS AND RECEIPTS, 1971-74
(Rs crores)

Payments	
Imports	6658
Debt servicing	1412
Other invisible transactions (net)	147
	8217
Receipts	
Exports	5327
Non-US external assistance	1500
Drawdown of pipeline	300
Deficit	1090
	8217

aid utilisation of Rs 330 crores. Therefore, even if the US had continued authorising aid at past levels, a part of the deficit would have still remained uncovered; (ii) Plan estimates of future import requirements are based on certain assumptions regarding the future level of investment and production activity in the economy. If the expected level of domestic savings and investment is not forthcoming, import requirements and projected deficit would be correspondingly reduced. At a certain lower-than-projected level, the deficit might entirely disappear! It, therefore, has to be recognised that a failure to raise adequate savings, not altogether an unlikely prospect, may simultaneously solve the balance of payments problem; and (iii) it is likely that in the last three years of the Plan, India would receive on an average at least twice as much assistance from the International Development Association (IDA) as it did in the first two years (Rs 214 crores). However, because of the lag between aid authorisation and utilisation, the full impact of this will not be felt until after the Fourth Plan.

Subject to the above, the suspension of US aid would thus require an annual adjustment of about Rs 360 crores in India's balance of payments for the rest of the Fourth Plan. Of the available policy options, it should also be clear that no amount of exhortation for further import substitution or export promotion would be sufficient to bring about this adjustment. The reason is simply that the projected imports and exports *already* assume "a determined and sustained drive towards import substitution and rationalisation" as well as an unprecedented increase in exports. Thus exports in the last three years of the Plan have been assumed to increase by an average of 7.5 per cent a year. If this is realised, this would be unprecedented for any recent three-year period of Indian planning. This is also considerably higher than the rate of growth realised in the first two years of the Plan. It would take a miracle (or another change in recording procedure!) for the country to do better than what has already been targeted.

As regards imports, the estimate of requirements provides for a decline in food imports to Rs 30 crores (from Rs 213 crores in 1970-71) and continuation of present restrictions on imports of consumer goods. In addition, for steel, "a smooth and uninterrupted operation of HSL plants has been assumed and a moderate improvement in the capacity utilisation in existing plants during the rest of the Plan period... In the case of fuel oil, although the current trends in consumption reveal a high rate of growth, it has been assumed that demand would be restrained by either imposition of fiscal levies or through physical controls... The estimates of requirements of machinery during the remaining years of the Plan have been worked out on the basis of the anticipated levels and nature of investment" (Mid-Term Appraisal, December 1971, p 35). It is difficult to see how the country can be expected to do even better than the existing, by no means modest, plans for import substitution.

The option of changing development priorities — from industry to agriculture or from heavy to light industries — as a means of reducing import dependence can also be summarily dismissed in the current Indian situation. For two good reasons: firstly, it is the industrial sector which needs revival through more investment. Growth in industrial production and investment has been well below plan targets in the last six years, and unless there is much larger investment in this sector we should be going though a period of de-industrialisation of the economy. Secondly, much of our plans for import substitution are dependent on fulfilment of production targets in industries such as iron and steel, basic metals, metal products, industrial machinery, fertilisers, newsprint, petrochemicals, railroad and transport equipment etc. Many of these items figure heavily in India's current import bill.

This leaves us with four possibilities for covering the estimated payments deficit: (a) more aid from non-US sources, (b) more bilateral trade with Eastern European countries, (c) rescheduling of debt service payments, and (d) a planned cut in imports. The success of the first two options, it can be conceded, is outside the country's control. It is possible, although unlikely, that other western countries would come forth with more aid in order to make up for the loss of US aid. More trade with Eastern European and other countries which can supply part of India's import needs is certainly a more likely possibility and needs to be explored. Since the outcome is likely to depend on the attitude of these countries on a case-by-case basis, very little can be said about the likely prospects at this stage.

There is, however, a good case for rescheduling of India's debt service payments. For the last four years, India has been receiving debt relief from consortium countries amounting to Rs 75 crores a year. This is reckoned as part of the normal aid flows and does not constitute an addition to transfer of net resources to the country. Apart from this general debt relief, however, there is a special case for an agreement on moratorium of debt service payments to the United States. The logic of development through long term loans implies a certain stable flow of gross aid until such time as a country is able to generate export surpluses over and above its own requirements. Suspension of aid at a time when import requirements are greater than export potential and the development job is still far from completed may, therefore, be deemed to constitute unilateral repudiation of a fundamental assumption behind the giving and taking of long-term development loans. Under these circumstances, the economic and moral case for debt moratorium on past development loans becomes very persuasive. Moreover, continued debt service payments to an erstwhile lender in a situation where other countries and agencies continue to give aid is tantamount to a diversion of aid from the latter to the former. This is contrary to all international understanding regarding the purpose of aid.

If an agreement on debt moratorium can be reached, this would reduce India's payments requirements by about Rs 100 crores a year. There would, therefore, still be need for a planned cut in imports of the order of 10 to 15 per cent over projected requirements. Since the scope for further tightening of direct consumer or luxury imports is almost non-existent, such a cut would naturally have to be made with respect to so-called essential imports. Moreover, since almost eighty per cent of import requirements are for maintenance imports, it is likely that a large part of the planned reduction would have to be made in this category. A cut in industrial imports can be effected in a manner so as to affect the current level of activity in specific industries only or new investment. A difficult decision would, therefore, have to be made as to where the country's industrial priorities lie in the next two or three years.

To conclude, it may be contended and, I believe, with some justification that the above discussion in terms of the Fourth Plan projections is largely academic since neither exports-imports nor savings-investment are likely to (or even expected to) behave as projected. Nevertheless, the paper would have served its purpose if it can contribute to a more reasoned debate on specification of the self-reliance objective, and policy instruments available for achieving it within a given time period.

Indo-Bangladesh Trade: Problems and Prospects

Sunanda Sen

The prospects of Indo-Bangladesh trade are circumscribed by two opposite sets of forces. Some, like the locational advantages, the political co-ordination between the two governments, the possibilities of economic co-operation, and the current ban by Bangladesh on trade with West Pakistan, tend to brighten prospects of mutually profitable trade between India and Bangladesh.

However, there are other factors that considerably limit the possibilities of such trade. The structural and policy changes in the two countries over the past two decades of Indo-Pak hostilities have replaced the earlier pattern of complementarity by a competitive relationship between the two economies. Further, Bangladesh's exports to India are not likely to substitute commodities previously exported by East Pakistan, and there therefore remain for Bangladesh the possible dangers of a diversion of exports away from third markets; and, since trade between India and Bangladesh would be financed by rupees, such trade diversion, re-export, or export of import-substitutes would amount to an increase in the foreign exchange liability of the country exporting them.

It is in the long-term interests of both trade partners that possible misunderstandings should be avoided on the 'grant' component of the trade relations between them. Exchanges between the two countries are likely to be influenced by large-scale 'smuggling' across the frontier and by possible disputes on different issues such as transit trade, fiscal allocations, quota provisions, or financing methods for trade. Here, the two decades of Indo-Pak trade disputes could provide useful lessons for policy-makers in both India and Bangladesh. The contents of such policies would be crucial to determining both the overall 'trade-bias' and the net implications of such bias for the trade between the two countries.

I

The Perspective

THE Special circumstances in which Bangladesh became independent bring to the forefront the issue of its trade prospects with India. Economic co-operation and a high level of trade were always considered vital to the wellbeing of India and Pakistan since their emergence as two separate political entities in 1947. The strained relations between the two had, however, restricted the feasibility of such programmes. Political developments in the recent past have, however, more than removed the obstacles to such co-operation between India and erstwhile East Pakistan. While the special circumstances of the initial period may for some time overrule considerations of economic efficiency, the long-term outlines of such trade will be determined largely by the economic exigencies of the developing situations. It is thus crucial at this moment to examine the problems and possibilities of Indo-Bangladesh trade in all their possible dimensions.

Three distinct aspects of Indo-Bangladesh trade relations are relevant in an analysis of their trade prospects. One needs to recognise the historical aspect of the trade relations between India and Pakistan and to distinguish its influence from the structural aspect of trade between the two. The two aspects, while interrelated, may be further distinguished from a third which encompasses such additional problems and prospects as are related specifically to the emergence of Bangladesh as a nation state — this may be called the Bangladesh aspect. While much consideration is being devoted to the problems of the trade relations between the new political unit of Bangladesh and India, less attention seems to have been paid to the first two aspects. In the following, the three aspects are examined to seek an assessment of India's trade with Bangladesh in the light of past experience and future development.

II

Indo-Pakistan Trade: Lessons from the Experience

Analysis of the experience of India and Pakistan in their bilateral trade relations provide certain broad lessons for the future policy decisions on Indo-Bangladesh trade. While many forces which dominated Indo-Pakistan trade during the earlier period are not relevant to Indo-Bangladesh trade, that experience can still be used with profit in the latter context. The issues which are relevant relate to the disputes that India and Pakistan had on crucial matters such as the problems of transit and border trade, the technicalities of entrepot trade, the size and range and implementation of quota limits in the trade agreements, questions relating to re-exports and re-imports, issues related to the imposition of different taxes and the allocation of revenues therefrom, and lastly, the problems related to the functioning of payments arrangements between the two countries. One could also draw on the experiences of India in her trade relations with other neighbouring countries, like Afghanistan, Burma, Ceylon, and Nepal, which like Bangladesh have geographic proximity as well as a past political affinity with India.

The question of transit and border trade was given considerable attention in the different trade agreements between India and Pakistan during 1947-65.[1] The problem was also considered important in India's trade agreements with Nepal and Afghanistan.[2] The Indo-Pak trade arrangements (August 1947 to December 1949) declared no restrictions on the free movement of commodities between the newly separated territories during an interim period. Consideration was also given to the removal of barriers in the way of the border, entrepot, and transit trade between them. The arrangements, however, were violated and there were successive escalations in the trade disputes between the two; these, together with disputes on certain other issues, led to a total blockage of trade during January-March, 1950.[3]

Provisions of transit trade were also included in the Agreement on Trade and Commerce concluded with Afghanistan in 1952. These aimed to provide facility for transit trade, by removing barriers on all transit traffic where the value of the consignments remained unchanged during transit.[4] The provisions, however, were of limited value, and frequent trade disputes between the two

countries often paralysed such trade.

Transit provisions were similarly included in India's Treaty of Trade and Transit with Nepal (1960).[5] The success of transit trade, again, was subject to the different forces shaping the relations between the partners to the agreement.

Quota commitments for the commodities supplied under the trade accords provided another major area of disagreement between India and Pakistan. Retaliatory actions against the violation of the minimum quota targets for certain essential commodities ultimately led to a total deadlock in such trade during January to April, 1950.[6] Despite attempts by both countries to revive trade between themselves, evident in the three-month 'Barter Contract' of April 1950 and subsequent trade conciliations between them, the total turnover of Indo-Pakistani trade came down from Rs 184 crores and Rs 87 crores in 1948-49 and 1949-50, respectively, to as low as Rs 52 crores and Rs 27 crores in 1952-53 and 1953-54, respectively.[7] The months of the Korean War were marked by the superior bargaining power of Pakistan, the primary commodity exporter. It was therefore unwilling to include any minimum quota limit for raw cotton in the agreement of February 1951. Thus India's raw cotton imports from Pakistan dropped from Rs 16.3 crores to Rs 6.9 crores and Rs 27 lakhs in 1949-50 and 1950-51, respectively — and later to even negligible levels.[8] Fulfilment of quota targets proved a major area of possible discord by 1951, and such minimum limits were restricted in February 1951 to items covered by state-trading. It was also decided that the quotas unutilised at the end of the agreement could be carried forward to the next term.[9] Quotas, both actual and targeted, were deleted from the Agreement of 1955 and the payments arrangement of December 1958 stipulated promotion of trade under the cover of the Rs 25-lakh swing limit for the (inconvertible) rupee account. It financed trade in selected items to their stated quota limits.[10] The arrangements continued through later years with changes in the value of the swing limit, but the value of trade, while it revived considerably during 1960-61, was but a fraction of the earlier figures.

Quota limits were also significant in India's trade with Burma. The difficulties in the implementation of the quota targets led to downward revisions of the target limits in the successive agreements. Trade, under the US Surplus Agricultural (Trilateral) Commodity Disposal Agreement, committed Burma to purchase textiles from countries (Japan, West Germany) which also imported raw cotton from the US and a large part of its purchases from India were diverted to other channels. Simultaneously, disputes over the price of rice, the major item of India's imports from Burma, led to an exclusion of the item from the commodities covered by the balanced accounts envisaged under the Rupee Payments provisions of 1958 and later years.[11] The above reduced the total turnover of trade between the two countries to a level which could be sustained only by their balancing policy.

Quota limits were also operative in India's trade agreements with Ceylon for 1953 and later years. The actual value of trade, however, was subject to the influence of different forces.

Taxes on imports and production provided another area of disagreement between India and Pakistan. The two countries differed on the question of allocating excise on Pak-grown raw jute imposed by India at Calcutta port. Similarly, the trade partners could not agree on the claims made by Pakistan to a share of the excise levied and collected by India on textiles consumed by Pakistan.[12] Despite the attempt to remove the fiscal barriers between the two countries, evident in the rebates granted by India on all excisable commodities exported to Pakistan, the question of fiscal barriers came once again into the forefront. Thus, in December 1949, India raised the export duty on jute products and the move had all its likely impact on prices paid for imports of raw jute.[13]

Unlike the rest of her trade-quota arrangements, India's trade arrangement with Ceylon provided for preferential tariffs for the items listed under the quota schedules. The device, however, was hardly successful in sustaining the flow of trade, which was influenced by other adverse forces.[14]

Trade and payments can also be severely affected by possible disputes over exchange rates. Thus the payments arrangements India has concluded with countries in the Soviet bloc and South Asia all contain an exchange guarantee to avoid possible disputes. The disagreement between India and Pakistan on the question of their exchange rate, during September 1949 to February 1951, led to different retaliatory measures by the two countries during the period and to consequent declines in the value of trade between them.[15] The issue, therefore, like the questions of border, transit, and entrepot trade, the quota limits, or the tariff rates, had been important in Indo-Pak trade relations over the past two decades. It would be in the long-term interests of India and Bangladesh if the lessons from the above experiences could be utilised to avoid the possibility of disputes in future.

III

Changing Structure and Implications

Trade between India and Pakistan was subject to significant changes during the last two decades. It was the frequent trade disputes and tensions that were largely responsible for the falling value and changing composition of the trade between the two countries. The autonomous changes in the demand and resource patterns of the two nations, though they were partly responsible for the actual pattern of the trade between them, were often less important than the above forces in explaining the changes in Indo-Pakistan trade. The impact of the trade-disputes on the course of Indo-Pakistan trade was felt in two directions: first, in its repercussions on the pattern of production and trade in the two countries, and second, in the changing pattern of official policy in both countries affecting the respective production and trade patterns. The two aspects were often interrelated, and the changes in official economic policies brought about by the frequent trade disputes often precipitated these changes. Similarly, the changes in trade pattern due to the frequency of disputes also necessitated corrective changes in the official policies of the two governments.

The present section outlines the major changes in Indo-Pakistan trade during the last two decades and relates them to the relevant official policies in the respective countries. The account is supplemented by another, about the simultaneous variations in the respective patterns of production, which often explain the trade patterns.

Trade opened between the two new States of India and Pakistan in mid-1947, but the bilateral relations were considerably strained by early 1948. The early years of trade disputes between the two countries were marked by significant declines in the volume of trade in a number of items, including cotton textiles, raw jute, raw cotton and coal. Such trade, in turn, provided the earlier base of complementarity between the adjacent regions. This was also watched by simultaneous declines

in the rest of the items traded between the two, and the total turnover of Indo-Pak trade fell by more than 71.7 per cent during 1948-49 to 1952-53.

Textile industries were developed in the subcontinent during the later years of the British period and the two countries started to depend on each other, both for supply of their inputs and for consumption of the finished goods. Thus the textile mills in India used to rely on Pakistan for the supply of raw jute and raw cotton, while India supplied large values of cotton textiles to it. Disputes between the two led to large-scale import substitution of the commodities in both — sometimes supported by a re-direction of such trade to other countries. This was accompanied by increases in manufacturing capacity in both countries — often supported by the official trade and industrial policies. Thus Pakistan's surplus of exportable raw jute and raw cotton was remarkably reduced during the period, and it was processing a considerable part of such imports. The spate of import-substitution of raw materials needed for textile production increased the output of raw jute and raw cotton in India,[16] and the country reduced its purchases of these items from Pakistan.[17] For raw cotton, India's imports were also diverted to other sources (the US and Egypt) which in turn substituted the Pak-grown raw materials. The reduced dependence of India on Pak-grown raw materials for its textile industry were matched by a similar fall in Pakistan's purchases of finished goods from India. Pakistan started to process a major part of its raw jute output, and by the end of the first five-year plan, in 1959-60, emerged as a major exporter of jute textiles with a simultaneous decline in the value of raw jute exported abroad.[18] By 1964-65, Pakistan produced all of its total supply of cotton textiles (domestic consumption plus exports), of which 20 per cent again was exported abroad. This indicated a considerable increase in the domestic capacity of cotton goods. Its domestic production had a 5.3 per cent share in the *total* supply of the commodity during 1951-52.[19] Incidentally, unlike jute manufacture (which was largely concentrated in the jute-growing areas of Pakistan), the cotton textile industry was more dispersed as between the two wings of Pakistan.

The changes in the composition and direction of trade in the two countries was supported by corresponding government policies, in each, on trade and investment. Deliberate attempts were made during the period in both countries to follow a price and incomes policy which encouraged the production and exports of manufactured items. In the case of Pakistan the fiscal measures were supported by the export bonus system which subsidised the major manufactured, and a few non-traditional primary, exports of the country since 1959. The discrimination in favour of the manufacturing sector was evident in the loss for agriculture in its international terms of trade consequent on the government policy adopted during 1951-52 to 1963-64.[20] The country's industrialisation plans also included other fiscal and trade devices which stepped up the production of manufactured commodities. By 1964-65, domestic supply was adequate to provide, respectively, 88.6 and 85.0 per cent of the total supply of consumer and intermediate goods. The corresponding figures for 1951-52 had been 22.5 and 26.7 per cent only.[21] By 1964-65, 50 per cent of imports were of goods needed for investment and related activities.[22] The self-sufficiency in consumer goods, however, concealed the regional disparity in the production pattern. Thus East Pakistan was still dependent for imports of food and textiles on the industrialised Western wing.[23] In India, too, production and trade patterns during the period were subject to significant changes. Official attempts were to encourage production and exports of manufactures. Apart from the fiscal devices like tax relief, subsidies, and transport concessions, use was made of a discriminatory system of import control and export promotion under cover of the import-entitlement system (1961-66). The scheme, however, was less pervasive than the Pak bonus scheme and the value of exports covered by it was a smaller proportion of total exports. The devaluation of the Indian rupee in 1966 led to a change in the Indian trade control devices and the liberalisation measures included the removal of the above scheme. The fiscal and other controls retained, however, still provided a large measure of protection for the manufacturing industries in the country.

On the whole, therefore, India and Pakistan both grew along very similar lines in the early stages of industrialisation, with marked changes in their previous pattern of interdependence. Thus the countries have become competitors in relation to each other in the third markets — both for their major exportables (say textiles, tea, hides and skins, leather) and for the import of crucial raw material (say, raw cotton, cotton yarn and thread). Trade disputes as noted above, played a significant role in shaping the structural changes in the two economies by compelling the two governments to pursue an autarkic policy. The overall pattern for Pakistan, however, sometimes concealed the disparate trends in production and trade in the two wings of it.

IV

Bangladesh and Trade with India

The emergence of the Bangladesh as a separate nation-State and economy has added several new dimensions to the possibilities of India's trade with the region, previously East Pakistan. Such prospects, moreover, have become brighter with the close political links between the two regimes over the early months of liberation of Bangladesh.

While trade between the two countries would be influenced in the immediate future by the short-term priorities thought important by the official agencies, letters have been exchanged finalising a Rs 25-crore commodity grant from India and loans of Rs 10 crores in kind (including supply of Indian commodities and services for railroad construction) and £ 5 mn in foreign exchange. The commodity grant specifies a list of Indian exports considered essential for the post-war reconstruction of Bangladesh. A separate trade communique has further specified a list of perishable and other food items India will be freely importing from Bangladesh.

The article covered by the commodity grant include essential consumer items (sugar, salt, baby food), drugs and medicines, raw materials (superfine cotton yarn, oilseeds, cement, chemicals, steel) light equipments (steel products, ferry engines, power generation and transmission equipments), and petroleum (crude and products).[24] The Rs 10-crore loan, in turn, will finance the construction of railways and 42,000 tons of foodgrains. The £ 5 mn loan is paid in foreign exchange and is repayable at 2.5 per cent rate of interest in 15 equal instalments commencing 15 years after disbursement. All commodities are to be delivered through state trading channels, and it has been proposed that the STC in India will be helped by the Indian Oil Corporation and the Indian Fertiliser Corporation for specific commodities. This list of commodities is entirely based on an *ad hoc* principle of priorities which overrules any criterion of efficiency during an emergency. Thus the list of exportables from India includes com-

moditjes which are normally exported elsewhere, produced at home as import substitutes, or even actually imported from third markets.[25] Unless the domestic production of these commodities can be raised and maintained to ensure an exportable surplus for Bangladesh, India will have to incur a foreign exchange cost for her grant programme. The latter, incidentally, will be *additional* to the real cost of such transactions. Losses in foreign exchange will also arise in the country's trade programmes with Bangladesh so long as similar articles are exported for imports which are not normally purchased by foreign currency. While Bangladesh would not pay for the Indian imports in foreign exchange, she is even less likely to offer, in exchange, commodities which economise India's foreign currency payments. Unless India is ready to *grant*[26] foreign exchange to Bangladesh, the current commodity schedules will have to be revised to a more rational pattern in keeping with the future exchanges between the two countries.

It is worth analysing the issues relevant to a far more long-standing trade relation between the two countries. The long-term prospects of trade between India and Bangladesh are likely to be influenced by the joint operation of two distinct forces. First, by the changes in production and consumption patterns in the respective economies, which in the past, have often been oriented by the Indo-Pakistan trade disputes towards a pattern of competitiveness. Second, both by the changed context in which trade between the two countries is being opened up, and to the contents of official policy during this new phase of their economic relations. The new directions of such policy may sometimes partially offset, or even reverse, the effects of the structural changes on future trends in Indo-Bangladesh trade. The determining factors including the current ban on Bangladesh trade with Pakistan, the content of production, distribution and trade policies in both countries, steps taken by the two governments to avoid the possibilities of smuggling, problems of border, transit, and entrepot trade (which are more common in the land-borne trade between two adjacent countries), and lastly, the success of the two governments to avoid disputes on matters of common concern like the quota targets for essential articles, the internal taxes affecting trade between the two, and the mode of payments for the trade between them.

Bangladesh's trade with West Pakistan constituted a significant portion of the country's extra-regional trade. The question, therefore, becomes relevant whether the newly opened up trade with India will in the long run substitute the previous inter-wing trade of East Pakistan. The outcome will depend on two factors: first, whether Bangladesh will like to retain the previous pattern and size of her inter-wing trade, and second, whether India will be able and willing to trade in items which were important in such transactions between the two wings of Pakistan. The answer to the first will depend on the future economic policies of the new State, which, in turn, is more likely to orient its foreign trade to a pattern consistent with the *new* production and consumption policies envisaged. The industrial policy of the new regime has not yet been clearly defined and it may be too early to anticipate the likely changes.

In a recent study of the two-wing Pakistan economy,[27] the rural sector of East Pakistan is shown to have an estimated per capita expenditure-elasticity of consumption higher than the corresponding estimates for the urban population (in both wings) for 1960-85. The estimates relate to essential consumer articles such as food, tobacco and clothing. The corresponding estimates, however, are higher for the urban sector for other items of consumption (including housing and local fuel). As for the pattern of food consumption, the estimates of calorie elasticity (percentage change in calorie consumption/percentage change on food expenditure) are seen to be significantly smaller than the expenditure-elasticity for rural East Pakistan — a fact which indicates a low protein-content of such food consumption.[28] If the income-distribution policies of the new Bangladesh regime are oriented towards a larger share for the rural sector, and if consumer preferences are given more weightage in the official policies shaping the final pattern of consumption, one can anticipate the following changes in the future pattern of consumption in Bangladesh. First, there will be a likely increase in the consumption of food, tobacco and textiles, and second, a less than proportionate rise in the consumption of protein food. The above, however, may be supplemented by consumption of housing materials by the government sector (say, due to subsidised housing schemes).

The assumption of a redistribution of income in favour of the rural sector of the Bangladesh economy would, therefore, open up prospects of a larger demand for food and textiles. The short-run supply situation may make it convenient to increase the imports of textiles from India while the larger food demand is not likely to curtail the export-surpluses of Bangladesh for specific food articles such as fish and fish products of interest to India.[29] Such redistribution, combined with likely increases in the absolute levels of urban consumption and industrial activity, would brighten the prospects of the country's trade with India. It may not, indeed, be too optimistic to conclude that the consumption changes in Bangladesh will largely be pro-trade-biased, and that such changes, again, will include increases in the import demand for commodities like rice, raw cotton, cotton textiles, cement, rape and mustard seeds, tobacco and manufactures, machinery and millwork, etc, which were also important items in the inter-wing trade of erstwhile Pakistan.[30]

The question whether India's trade with Bangladesh will substitute the inter-wing trade in Pakistan, would also depend on the absorptive capacity and willingness of the Indian economy. Among the commodities which featured in the inter-wing exports of East Pakistan, tea, jute goods and paper products constituted the major portion (56 per cent of total inter-wing exports valued at Rs 87 crores in 1968-69).[31] India is an exporter of the first two articles and can hardly provide any outlet for them in her domestic market. East Pakistan used to export to the outer world raw jute and jute manufactures and the respective shares were as large as 47.3 per cent and 42.2 per cent of her aggregate foreign exports (Rs 154 crores) during 1968-69. Similarly, fish, fresh vegetables, and paper products are items India would import from Bangladesh. But for paper, these articles were not exported by East Pakistan to the Western wing, and such trade will, therefore, *divert* some part of Bangladesh's likely third country exports to the Indian market (assuming the exportable surplus does not increase). Thus the pattern of Pakistan's inter-wing trade is *not* likely to influence the composition of Bangladesh's future exports to India. The possibility is thus strong of a diversion of other exports from third markets, when the *foreign exchange criteria* should be an important consideration in judging the *desirability* of such exports for Bangladesh. The inter-wing imports of East Pakistan consisted of articles which can be supplied by India even during the short run. Among the inter-wing imports of Bangladesh cotton textiles (11 per cent), tobacco and its products (9.9 per cent), wheat and wheat flour (2 per cent), machinery and millwork (4 per cent), and rice (6 per cent), were more important during 1968-69.[32] India could supply these articles (but for rice) without much difficulty provided again such trade does not conflict with the *foreign exchange criteria.*

The pattern of the newly opened up trade between India and Bangladesh will be influenced also by the trends in the official policies in both countries. As for the likely policies in the new regime, the production pattern will depend on industrial policy, the contents of which have not yet been defined. The government, however, has declared its plans to have a more equal distribution of income and, if this really comes about, the effects of an egalitarian distribution (in favour of the poorer section, the rural sector) along with a programme of industrialisation, as noted earlier in this discussion, are not likely to be autarkic for its trade with India. The recent decision of the new regime to declare its rupee to be at par with the Indian rupee (equivalent to a devaluation of the currency) will have its significance for mutual relations. The policies actually adopted, however, will have a significant influence both on the relative competitiveness of India and Bangladesh in third markets, for, a number of their major export items (textiles, hides and skins, tea, etc) and on the course and content of future trade between the two. Similar changes in import licensing or in other policies of relevance to the trade between the two, are also quite significant.

The long-term pattern of trade between the two countries will also be influenced by the locational advantages enjoyed by the two proximate regions in transporting the commodities for each other. The countries may actually find it mutually convenient to divert a part of their trade from other regions and have a larger transaction in items which are cheaper to transport in land-borne trade. Thus India would be a profitable source of coal for Bangladesh which gets its coal from Poland at Rs 300 per ton.[33] The comparative cost of the majority of the commodities traded between India and Bangladesh will be similarly affected by the lower unit cost of transport in the land-borne trade, and this may make it worthwhile to divert trade even at the cost of loss of other markets.

The closeness of the two regions will, however, introduce certain additional problems in the trade prospects between the two. The first relates to the possibility of large-scale smuggling along the frontier. Such evasions of the official trade channels may be specially profitable when the price policies in the two countries — especially in contiguous areas — are widely divergent, and second, the structures of such prices are insulated from each other by various restrictions on trade. The unofficial channels may also be profitable for re-exports to the country maintaining tight import control. Smuggling may even be the common practice with a possible unofficial flow of labour or other factors of production if the two regions have wide disparities in the respective prices of such inputs. The possibilities of such smuggling could be minimised by a vigilant customs frontier which may virtually substitute the border security forces of the earlier regimes. This might involve considerable fiscal expense for both, so that it might be worthwhile to compare the welfare implications of an alternative system of customs or economic union between the two countries which would remove the incentives for such smuggling. Even in the absence of such plans for economic integration, the two countries might find it worthwhile to provide some disincentives for such smuggling by maintaining a minimum degree of consistency in their respective price policies.

The future patterns of trade between the two countries will also be influenced by the areas left open in Bangladesh to *private* foreign capital and enterprise. The Indian private sector will seek an outlet in the other economy by opening collaborator firms and trading agencies. The services of the trading agents may be temporarily welcome to the private sector in Bangladesh wherever these trade channels were previously organised by people belonging to West Pakistan. The question of collaboration will be settled by the new regime when it takes decisions on the major industrial policies.

The longer-term prospects of trade between India and Bangladesh seem to be circumscribed by two opposite sets of forces. Some like the geographical proximity, the political co-ordination between India and Bangladesh, the possibilities of economic co-operation, and the current ban in Bangladesh on trade with West Pakistan, will tend to increase the size of mutually profitable trade between the two countries. There remain, however, factors like the lack of complementarity between the two countries, the difficulties of substituting the inter-wing exports of Bangladesh by additional exports to India, the possibility of a diversion of exports from third markets (or re-exports), and the related foreign exchange costs, the ineffectiveness of official channels consequent on large-scale smuggling, and the possibility of trade disputes between the two countries — all of these factors will tend to have adverse repercussions on the trade between the two. The actual turnover will depend on the relative strength of these opposing forces. The observations, however, are largely tentative, and a firm prediction of the future trade developments between India and Bangladesh can only be based on detailed empirical studies of the demand and the comparative cost patterns in the two countries.

Notes

Government of India, White Paper on Indo-Pakistan Trade Relations, August 15, 1947, to December 31, 1949, pp 1-4. For border trade provisions, Trade-Quota Agreement, September 1955. Trade and Payments Agreement, February 1957, in Government of India, "India's Trade Agreements", 1957. An analysis of the working of the different bilateral trade and payments arrangements between India and other countries is available in a separate study by this author: Sen, Sunanda, "India's Bilateral Payments and Trade Agreements", Calcutta, 1965.

2 See, the Indo-Nepal Treaty on Trade and Transit, September 1960. Indo-Afghan Treaty of Trade and Commerce, 1952 (Articles X, XI): Government of India, "India's Trade Agreements", 1962.

3 A chronology of the violations may be recorded as follows:

(i) October 1947: Restrictions by Pakistan (Sind provincial government) on the movement of commodities between the two territories and on the entrepot services of the Karachi port.

(ii) April 1, 1948, India treated as a 'foreign territory' by Pakistan following exchanges of *aide-memoire* between the two countries during October 1947 to April 1948.

(iii) Review Session, Calcutta (April 1948) and Karachi (May 1948), discloses transit difficulties for Indian goods *en route* East Bengal.

(iv) Raw jute in transit through Pakistan as purchased by India before September 1949 (the date when currencies of the two countries ceased to be at par following Pakistan's decision to avoid devaluation) detained by Pakistan. The Government of India suspended, from December 25, 1949, all despatches of coal to Pakistan. The latter act specifically violated Article V of the 1949 Trade-Quota Agreement and the decisions reached on the movement of coal on

July 13, 1949.

Government of India, "India's Trade Agreements", 1955. See also Sen, *op cit*, pp 169-176 for analysis of the impact of Indo-Afghan agreements on trade.
Government of India, *op cit*, 1962. Difficulties in fulfilling quota limits for essential articles (coal, imported steel, raw cotton, raw jute, etc) and the commitment to have free trade in perishables (Agreement on Mutual Supply of Essential Commodities, May 1948) made it necessary to have downward revisions in the quota schedules of the Trade-Quota Agreement, June 1949. A disagreement on the exchange rates following the unilateral devaluation by India led to a sequence of reprisals, which included: (i) Pakistan's suspension of OGL for Indian imports, September 21, 1949; (ii) refusal of Indian Jute Mills Association (IJMA) to purchase raw jute at the minimum prices offered by Pakistan; (iii) restrictions imposed by India on the OGLX covering essential imports from Pakistan; (iv) deadlock in trade but for coal for which Pakistan was ready to pay from the Reserve Bank of India account; (v) India's ban on all coal movements to Pakistan on December 25, 1949 — leading to a total blockade of trade between the two.

Sen, *op cit*, pp 181-7.
Ibid, pp 150-2.
The domestic output of raw jute increased in India from 2,055 bales in 1948/49 to an average of 3,722 bales during 1952/53 to 1955/56. This went up further to 4,641 bales in 1959/60 and 4,062 bales in 1960/61. Similarly, the domestic production of raw cotton, at 2,188 bales for 1947/48, was more than doubled by 1954/55 — followed by more significant increases during the later years. (Source: *RBI, Reports on Currency and Finance* 1954-55, 1961-62.)
17 The value of India's total imports of raw jute (all from Pakistan) was Rs 71.2 crores in 1948/49, an average of Rs 15 crores during 1952/53 to 1955/56, Rs 3.4 crores and Rs 7.5 crores for 1959/60 and 1960/61. India purchased Rs 16.38 crores worth of raw cotton from Pakistan during 1948/49, which was sharply reduced to Rs 6.9 crores in 1949/50 and to figures negligible during later years. (Source: *Ibid.*)
18 The share of (cotton and jute) textiles in Pakistan's total exports went up from an average of 0.7 per cent (1951/52 to 1954/55) to an average of 20.2 per cent during the Second Plan years of 1960/61-1964/65. The corresponding share for raw jute declined from 46.1 per cent to 39.2 per cent. A large part of the increased output in jute manufacturing was exported and the percentage of the total intermediate goods production, which was exported in 1959/60, was 51.7 — a figure much higher than the 0.5 per cent share for 1951-52. (Lewis, S R: "Pakistan: Industrialisation and Trade Policies", OECD, 1970; pp 12-13.)
19 Lewis, *op cit*, pp 107-8.
20 The ratio of the actual to hypothetical terms of trade (which could exist in the absence of the economic policies) for agriculture, as calculated by Lewis, was considerably small — indicating the discrimination against agriculture under government policies. Such loss, incidentally, was all the larger for East Pakistan which was also less developed industrially. See, Lewis, S R: 'Effects of Trade Policy on Domestic Relative Prices: Pakistan 1951-64' *AER*, March 1968; Also, Lewis, S R, *op cit*, pp 148-149.
21 Lewis, S R, *op cit*, p 107.
22 *Ibid*, p 11.
23 See, data on Inter-Wing Trade from *Economic Survey, op cit.*
24 *Statesman*, January 18, 1972.
25 India imported an average of Rs 91.16 crores of iron and steel, Rs 17.7 crores of medicines and pharmaceutical products, Rs 115.0 crores of petroleum and its products, Rs 30.3 crores of fertilisers, and Rs 85.6 crores of raw cotton, during 1967-68 to 1969-70. The country, moreover, exported sugar to the US and UK (together comprising 80 per cent of the total sugar exports by India during 1969-70), while for cement and coal the domestic production was inadequate to meet local demand. The short-run scarcity in coal is evident from the recent claims put forward by the West Bengal coal miners that the industry needs an additional supply of 3-4 thousand wagons per day in order to reduce the current stock of pitheads (which exceeded by 4.5 mn tons in 1971 the 4 mn ton figure of 1968). The transport bottleneck made itself felt in the rise of coal prices in the northern states of India. Similarly, the Indian Engineering Association has estimated the country's aggregate requirement of steel for 1972-73 at Rs 75 crores — a figure much larger than the official plans for Rs 50 crores. The open market prices of steel rose by 15 per cent in December 1971, following the news of the cut in steel imports. See, Reserve Bank of India, *Reports on Currency and Finance*, 1969-70. Statement 91 p S 142. *Economic Times*, February 1, 1972, and December 31, 1971.
26 The emphasis on the *grant* element of trade is significant since the transactions of two equal values of commodities may theoretically imply a foreign exchange cost for one country when its exports to the other consist of re-exports (of goods purchased by foreign exchange), import-substitutes, or commodities which do not have any export surplus, while the corresponding imports do not entail any saving in foreign currency.

Vijaya Bank's New Deposit Schemes

VIJAYA Bank has introduced the following four new insurance oriented deposit schemes:

1 Treble Insurance Fixed Deposit Scheme,
2 The Two-Year Insurance-Cum-Deposit Scheme,
3 Insurance Oriented Fixed Deposit Scheme,
4 Premium Linked Deposit Scheme, and three other deposit schemes.

In the Insurance Oriented Deposit Schemes, the client deposits a fixed sum with the Bank and the Bank agrees to pay the premium on the policies which are linked with the deposits. Each of the first three schemes is linked with a different type of policy issued by the LIC, while the last scheme can be linked up with any policy of the LIC. The premiums are payable out of the interest.

In all these schemes, the interest payable by the Bank attracts the provision of section 80 (L) of the Income Tax-Act. The premium paid to the LIC also attracts the provisions of Section 80(C) of the Income-tax Act. The amounts therefore are eligible for tax rebate which is a substantial benefit accruing to the depositor.

Caste and Status in an Indian City

Mark Holmstrom

Caste, in traditional India, implied a certain kind of value judgment: power was to be respected only when it was shown in its proper relation to religious duty. This judgment was clear even when the boundaries and rank of groups were not clear. It was still possible to say: 'Status means caste rank; this is the only thing that confers a moral claim to respect, and any kind of status that is valued must be turned into and called caste'.

This is no longer so. But people continue to use the same moral vocabulary in making judgments about status.

In this article are examined the kind of status judgments that are made in modern India — specifically, in a village which has become a part of an industrial city — to show that, while people use the same words, they often mean something quite different by them, and that the key to what they mean lies in changes in ideology.

It is not hard to see why people in an expanding industrial economy should have changed their ideas like this. The author maintains that it is not economic determinism, however, to say that their situation gave them reason to think one thing rather than another; it is simply that in revising their social categories — which is what social change means — people take circumstances into account. People also take ideas into account directly — ideas they get from parties or sects or reading or travel or contacts.

[This paper is based on fieldwork for an Oxford D Phil thesis in social anthropology, which was supervised by D F Pocock and made possible by the Astor Foundation, the Cyril Foster Fund, the Frederick Soddy Trust, the Ministry of Education, the Nuffield Foundation and Nuffield College, Oxford.]

I SHALL deal with two problems: what does 'caste' mean in modern India; and how far can we apply our categories of 'class', 'status', etc, and theories of stratification developed in western societies, to another society.

The best starting point is Weber's distinction of status and class. He uses 'class' like Marx, to mean a position of economic power, which is a matter of objective judgment; but unlike Marx, he distinguishes class from 'status', which is a subjective judgment on someone's position, by reference to some standard of value: achievement or breeding or goodness or racial superiority or something else. Weber recognises that in most societies status is closely matched to class or economic power. This is an important empirical fact, and we can see good reasons for it; but it does not follow directly or necessarily, and it is not always true. Wealth or power *by themselves* hardly ever entitle anyone to respect: there must be wealth plus something else, like time or manners or generosity or a white skin; and some positions are respected although the people in them are poor. Weber goes on to make a distinction — which fits modern India very well — between class relations on the scale of the national economy, and relations among status groups which often mean most on the scale of small communities of residence or birth.

But having distinguished class and status, we are no nearer a general theory of how they are related in different societies — in other words, of how status can be justified, and wealth (for example) can be turned into status. To make comparisons, we need more subtle terms and relations between terms; and the place to find these is not in some *a priori* theory of stratification and its causes, but in people's social experience of different situations, and the concepts they use to make sense of this experience.

'Caste' is one of these concepts. It is a straight translation of an all-India word, or rather two words, *viz*, jati and varna; but for my purpose, jati is the important one. It means any of the ranked, more or less closed, groups one is born into. The limits of your caste depend on the situation: it may mean one thing for marriage, another for occupation or as a reference group in the village, something else as a political pressure group. These different groups are sometimes distinguished as subcastes and even sub-subcastes, but Indian languages use the same word jati for all of them.

It is a mistake to identify caste with apartheid or the colour bar or a type of 'stratification' in which status depends on birth into closed groups, because this external similarity hides a basic difference in values. This part of my thesis is taken largely from Dumont (1961). There is no point in repeating or defending his arguments in detail. Here I assume that the traditional ideology of caste is relatively uniform throughout Hindu India; and that Dumont's account of it is generally true, and is borne out by a mass of ethnography of rural India.

The racialist believes in equality, with racial difference as a special exception: all (white) men or all (black) men are created equal, and the more this equality is insisted on inside the group, the higher it is necessary to raise the barriers which separate groups. Society is, or ought to be, like a pile of homogeneous slabs lying on top of one another: here the metaphor of 'stratification' is especially appropriate. You could take out one slab and have a complete, working, all-white or all-black society. This is what apartheid means.

But this slab-like image does not fit caste society at all. Caste follows from a belief that the natural order of society and the universe is hierarchical, and that relations of equality are the exception. The only final or religious justification of caste is that it is a realisation of a continuous hierarchy ranging from God, through gods, Brahmins, other castes and untouchables, to animals and things. The highest castes are closest to the divine sources of purity, and the rules about contact among castes express this fundamental polarity of purity or spirituality, and gross matter or biological process. Individual people or castes get value only by occupying a place in this hierarchy, and by keeping the moral rules appropriate to their level. The point about castes is not that they are ranked, and that each is necessary to the whole: a caste could not exist in isolation, though a race could. In this ideology, every kind of work is necessary, and in principle the work you are fitted for is

a consequence of your rank; you are not ranked *because* you do a certain job. To call this a division of labour is to miss the point, which is a religious point. In the same way castes are endogamous because they are ranked, not the other way round.

Endogamy follows from two beliefs: (i) status depends on birth, and (ii) close contact with lower castes is polluting. This is a matter of degree, not of clear-cut yes-or-no choices: since intercourse pollutes a man less than a woman, hypergamy is often allowed, and is fully compatible with caste ideology. To say this is to shift the emphasis from castes to caste as an aspect of social relations, or from the boundaries between groups to the idea of a hierarchy running all the way down. The boundaries between named 'castes' are more marked than the boundaries between 'sub-castes' in a caste and between families of different prestige in a sub-caste, but this again is a matter of degree.

It is true that not everyone believes in this ideology with the same conviction: for obvious reasons, Brahmins and dominant castes make the most of it. But then caste morality is not the whole of Hindu morality; nor is caste the whole organisation of Hindu society. This is what caste means to most Indians: people can justify their actions quite explicitly by appealing to the commonplace judgments that each caste has its own rules which are right for it but not for others, they all serve each other, etc. Non-Indian are not free to redefine this name for an Indian institution to suit themselves; and to stretch its meaning to cover other kinds of stratification, such as apartheid, is to do violence to the facts — if people's understanding of their own society is a fact.

In principle, caste ideology is very rigid: a caste's position is divinely ordained and fixed for all time. But in practice, it is quite flexible: there have always been ways for rich castes, or groups, of intermarrying families to form a separate sub-caste or marriage circle, to use a rise in economic status to justify a collective rise in social or religious status, without admitting it. The relative rank of castes is often doubtful. A caste can claim it has fallen from its true position: castes divide, coalesce and change their names; and it is not always clear which caste a sub-caste belongs to or which sub-castes a family can marry into.

So 'caste' in traditional India implied a certain kind of value judgment: power was to be respected only when it was shown in its proper relation to religious duty, and this judgment was clear even when the boundaries and rank of groups were not clear. If we except the *sanyasi* or ascetic, who was outside ordinary social relations, it was still possible to say: 'Status means caste rank. This is the only thing that confers a moral claim to respect, and any kind of status that is valued must be turned into and called caste'. This is no longer so; but people continue to use the same moral vocabulary in making judgments of status. I shall examine the kind of status judgments that are made in modern India, specifically in a village which has become part of an industrial city, to show that although people use the same words they often mean something quite different by them, and that the key to what they mean lies in changes in ideology.

Garudapura

I call the village Garudapura.* It was founded near Bangalore around 1800, and has an establishment of old families, belonging mainly to peasant castes, who produced food for the city market until the village was surrounded by the city in the 1950s. A cigarette factory was founded near the village in 1912, and some of the villagers worked there. There are still a few fields and vineyards. The richer peasants planted vines 40 years ago, and used the profits to become building contractors, wholesale merchants, and landlords to immigrant workers. Their sons, who had been educated in Bangalore schools, trained for skilled jobs in Bangalore's post-War industrial boom, and the village attracted immigrants, some of them skilled, to work in the newer factories making aircraft, machine-tools, telephones, car parts, electronic equipment etc.

The city now has 1.4 million people the village 6,800. Half the villagers are literate—or two-thirds of the males aged over 12; a few men belonging to old village families are professional or highly skilled men. Half the people, mainly immigrants, speak Tamil; the rest speak Telugu and Kannada, which are related to Tamil. Of the people 18 per cent are Christians, and there are a few Muslims. The rest are Hindus, belonging to over 20 named castes and many more sub-castes, some of which intermarry. Traditional service relations among the castes have almost gone, except as an ideal to be revived at festivals: barbers and washermen, for example, are paid in cash and generally at piecework rates. All families of good caste must have a Brahmin at their weddings — usually a paid Brahmin from outside — but there is only one old Brahman family in the village, that of the temple priest, who also works full-time in the aircraft factory.

As far as status in the village is concerned, the top of the hierarchy in practice is the large block of castes which call themselves 'middle' castes, together with most Christians. This block contains two-thirds of the population. Men of this group, except for a few vegetarians, will eat with other men of the group: often women will eat only with their own caste or relatives. Outside the village, most men eat with anyone: men who keep rules of pollution inside the village say explicitly that these do not apply in a restaurant or factory canteen, where you can eat with anyone. A liberal minority ignores caste rules entirely, even endogamy: and apart from possible complications with close relatives, there is really no sanction, or even any strong feeling, against them — they can do as they like.

Though all 'middle' castes are roughly equal, the hierarchy is more marked in the lower ranges: the small group of 'low' castes (washermen, barbers and voddas or navvies, in that order); and below them the Harijan or ex-untouchable castes who live outside or on the edge of the village; except for some immigrant Tamil Harijans who live in the village centre, either openly among tolerant neighbours or passing for members of a higher caste.

But in spite of this rough equality among the castes that most people belong to, the idea of separation and rank is still present: implicitly in the rules about marriage and eating together; explicitly in the myth of the four varnas which people can use to justify the separation of society into castes, and in the commonplaces about each caste having its own special aptitudes and duties and rules which it has found by long experience are best for it but not for others. These differences do not amount to much in practice: little details of the wedding ceremony, or caste reputations, are given an inflated importance simply because there is nothing else left to distinguish one caste from another, when most people's job has no relation to their caste. Just to be different is a matter of pride, though the difference may be trivial; and it does not matter that the relative rank of middle castes is never tested since

* See my account of a municipal election there (Holmstrom, 1969).

the two poles of the hierarchical structure are clear: Brahmins at the top (theoretical Brahmins, often the ideal Brahmins to be distinguished sharply from the lazy, greedy, cunning Brahmins you see these days) and untouchables at the bottom.

A caste group on the village scale is usually a number of households bound together by a complicated pattern of marriage, especially marriages with cross-cousins and nieces. The households may be joint or nuclear; they live apart but they are closely linked by sentiment and mutual support. Within this local caste group, the word 'kudumbam' (Tamil) or 'kutumba' (Kannada) 'family' can mean either a household or a loose federation of households bound together by no consistent pattern of descent or alliance, but recognising a common head or 'big man' on ceremonial occasions and sharing a reputation. Lineages are important only for certain purposes, like the cult of family gods.

Marriages are arranged inside or outside the village, between households. Families of similar status within a named caste have probably always tended to intermarry and to continue their alliances within more or less closed groups, especially on the South Indian preference for cross-cousin marriage. It is hard to draw a line between marriage with preferred relatives, a strong desire for continuing alliance between families and a firm rule of caste endogamy. A separate caste name or customs may reinforce the rule, but these things are neither necessary nor sufficient to make an endogamous group. Customs are forgotten or imitated. Names change; castes take on prestigious mythological names; the name of a part comes to be used for the whole, or *vice versa*. Any caste-like community is a possible base for marriage alliance; and each family arranging a marriage has to define the circle of acceptable alliances for itself, according to its ambitions, its ideals, and the pressures of its relatives. To marry into a group with different customs is hard, to marry into one with a different name may be harder, but either may be more acceptable than making a marriage which is unacceptable in other ways, such as a marriage with a family of different economic class or education.

Take the Golla caste, traditionally cowherds. Like similar herding castes elsewhere, they call themselves Yadavas (Krishna's clan). Forty years ago, some of them claimed that Yadavas were really Naidus, these being a badly-defined group of castes with pretensions to high status. These so-called 'Yadava Naidus' stopped marrying ordinary Gollas and tried to marry Naidus instead. Some Naidu castes, which intermarry, also marry Gollas; but the Yadava or ex-Golla Naidus, who once tried to raise their status by calling themselves Naidus, now find that many Gollas refuse to marry them.

There are two main sub-castes of Gollas, called One-pandal (or One-marriage-booth) and Two-pandal Gollas, because of a difference in wedding customs. A One-pandal family became the richest landowners in Garudapura, and their sons were well-educated. They were faced with a shortage of suitable brides and grooms. One related family solved the problem by marrying a Golla girl across the border in Madras state but their orthodox relatives boycotted them. A young lawyer of the leading family refused to marry an uneducated cousin and married, for love, a girl of his sub-caste whose brother and other relatives had married out of caste altogether, because they belonged to a reformist sect and observed no caste rules. His family and the village were split dramatically at the time, but he and his wife are now highly respected. His younger brother wanted to marry this man's wife's sister, and the family quickly arranged a marriage between them. By this time, the One-pandal/Two-pandal division had become a joke to younger people: an educated Two-pandal man suggested to his parents that he should marry a certain One-pandal girl, related to them by a long chain of marriages outside the village, and the marriage was arranged. Within three months, there were two more marriages between the sub-castes. Then the top One-pandal family, which had boycotted the family that married into Madras state, married into the Madras family themselves. The Two-pandal family in Garudapura, which had first married into this One-pandal family, completed the triangle by marrying into the Madras family.

There are similar ambiguities about the boundaries between different Naidu sub-castes, from ex-barbers up; between two kinds of Okkaligas; and between Mudaliars and other Tamil groups, including untouchables who pass as Mudaliars. Then there are a surprising number of marriages, even arranged marriages, between Hindus and Christians, who may or may not belong to castes; and a small but growing number of marriages which are openly out of caste.

Most of the intermarriage is almost accidental, a by-product of a tendency to explore a wider field especially for bridegrooms. Caste comes into match-making as one thing to be weighed against others and setting certain limits — like money and education. Castes are still supposed to be endogamous, and there is not much left to separate most castes, except this theoretical endogamy.

To put it another way: two-thirds of the people get some status from belonging to a middle caste, it does not matter which, provided that it is still distinguishable *as a caste*. Caste is now part of status, but it does not mean status as it did in traditional India. The reason is that caste ideology accounts for the division of labour within a small unit, and justifies it in religious terms. The modern division of labour is market economics, tempered by nepotism and influence, organised on a large scale with alternative careers and training. It might be reconciled with the *existence* of castes, but not with anything that could be called a caste *system* or caste *ideology*.

The Tamil word which means, roughly, status is mariyadai 'respect' (maryada in Hindi is different). Garudapura people use the word or its Kannada or Telugu forms often, to mean either a subjective attitude of respect or signs of deference. They distinguish the two separate aspects when they say for instance that respect given to creditors or rich men is forced or insincere. The assumption seems to be that respect is given freely. The case of those who have to give it becomes an exception to be explained.

There are two kinds of deference: deference owed by an inferior in any relation, e g, to parents or an elder brother and the deference owed to anyone, even an inferior, in an exchange of courtesies.

If one asks how respect is shown, the first example people give is attending weddings. Every wedding should be respected as a holy occasion, but to attend a wedding is to approve of it and to recognise that the couple's status is not too different from your own. You must attend weddings of relatives, or of your caste in the village. It is a sign of belonging to an old village family that you attend weddings of other families in this group without invitation, including weddings of low castes like barbers though not Harijans. You show more respect by eating the wedding meal, and low castes are said to employ firms of Brahmin cooks so that 'middle' caste guests can eat the food.

The few idealistic men who attend weddings of Harijans, or of workers of a much lower grade in their own factory, do so explicitly as a gesture of equality. When the context of a wedding is given, mariyadai can mean a wedding present.

Other ways of showing respect of the exchange of courtesies kind — the respect due to equals or inferiors — are visiting them in their houses, stopping to talk to them in the street, listening to their troubles and offering sympathy if not practical help, and above all spending a long time in their company. Respect of the substantive kind — i e, to a superior, even a temporary superior like a son-in-law on his first visit — is shown by listening patiently, deferring to his opinions, looking after his comforts, and not meeting him in situations which imply equality and make it hard to keep a respectful distance. The word 'respect' is used especially when people are accused of lacking it, behaving badly in public, or not showing respect to elders or respectable men. Mariyadaiyullavan (maryadesta in Kannada) 'respectable men' generally means someone who is entitled to more respect than others.

The ideal view of respect is that anyone has the opportunity to acquire it, through age, good conduct, and associating with the right people. Good conduct means behaving modestly, showing courtesy to everyone equally, helping neighbours (finding them jobs, serving food at their weddings, arranging funerals), serving the village by spending for the public good, organising festivals and public events, reconciling others who quarrel etc. Bad conduct which loses respect means quarrelling, using bad language, watching girls in the street, and making suggestive remarks, keeping a mistress, bigamy, drinking, cheating, interfering unnecessarily in others' affairs etc. A respectable man spends his time with other respectable people, either friends of his own age or older people. Wealth, education and caste should make no difference: many people can name a highly respected Harijan, though they would not eat with him or have him in their houses. If most Harijans are looked down on, this is said to be because they drink and have dirty habits.

The New Gap

Clearly many kinds of respectable conduct are only open to the rich and influential, who can spend on temples and festivals, find jobs for others and mix with respectable people. The criteria for respect coincide closely but not exactly with differences of wealth and power. The cynical view is that respect *ought* to be given to those who behave well or have some other moral claim to it, like age, but it *is* given only to the rich and powerful. A rich man can do anything, his sins are quickly forgotten, as the example of rich men who have kept mistresses, falsified documents, or married bigamously shows. This is because people have become selfish, they no longer live simply and work for the common good, their respect is self-interested etc; alternatively, it is because they are still 'backward' and have not learned to be independent fo the rich and to work for the common good etc.

This cynical view is also a moralising view: the ideal is put in the past or the future, and contrasted with the present practice of other people. Whatever expedients one is forced to justify, a pure cynicism, making no distinction between wealth and status, or between what is and what ought to be, is almost unthinkable as a rule anyone could defend in public.

The internal counterpart of respect is manam 'honour'; it is one's conception of one's own worth, a concern for the opinion of others. It may be used almost as a synonym for manasu 'conscience'. It is generally used in the compound mana-mariyadai 'honour and respect' (or 'respect for honour'). Honour should be a sufficient condition for respect: people should respect someone because he is a manastan or 'honourable man'. In practice, it is a necessary condition but not a sufficient one. In consequence, the word is almost always used negatively, as when someone is said to have lost his honour, or to have no honour. You do not accumulate honour as you accumulate respect, for example by spending for public purposes: everyone has it until he loses it by some offence. In principle, at least, honour is egalitarian where respect is hierarchical. Honour belongs to a man as a man, while respect belongs to honourable men who are born into or work themselves into respectable positions. An offence which costs you your honour affects the 'name' or reputation of your family rather than the honour of its individual members, though this is not entirely clear.

Vetkam 'shame' is a synonym for honour, in its aspect as sensitivity to public opinion: for women it means modesty or chastity. To call someone a 'shameless one' or 'one without honour' means that he no longer cares about the legitimate criticism of others, that he is not only doing wrong but refuses to be corrected, for instance someone who insolently refuses to pay a debt. Even worse is mana-mariyadai-vittavan 'one who has abandoned honour and respect'. It means that he does not care for either of the complementary values on which social morality is based: the honour which must not be lost, and the respect which must be gained. A man's social position is defined by the complementary pressures of his conception of his own worth, which is honour, and the extent to which others accept this valuation, which is respect.

A whole caste group, a loosely organised family, or a household, may have a 'name' (per) or reputation. In the case of a family, this is literally a name: not a surname — South Indian Hindus have no true surnames — but the name of a 'big man' who is consulted on family problems and who acts as master of ceremonies at weddings; or of a dead man who acquired a great personal reputation, often because he first built up the family's fortunes. A household is more or less free to bask in the reflected glory of a respected relative, or to strike out on its own. A household which becomes an embarrassment, perhaps because of an undesirable marriage, may be cut off by others in its circle; some 'big men' have been angry when their names were printed on relatives' wedding invitations without permission.

Andastu (antastu in Kannada) 'rank or dignity' means 'prestige' in Banton's (1965:37) sense of a ranking of roles, as distinct from 'esteem', which is an evaluation of how well someone performs his role. Banton says, roughly, that:

prestige + esteem = status.

For Garudapura people, when they take the ideal view of respect, this would read (in Tamil):

andastu (prestige) + manam (honour) = mariyadai (respect).

This 'prestige' belongs especially to roles involving wealth, power and influence. The word distinguishes these aspects of status, as something objectively given, from those which involve a moral claim to respect, like good conduct, age, and perhaps education. From the point of view of village opinion, prestige is an ascribed status, even if the qualifications for it (e g, money) have been achieved elsewhere. Caste also comes into prestige: it is something given, not achieved. An occupation may have it, but this is closely related to the income that goes with it. Thus it seems that, 15 years ago, skilled manual workers had less prestige than clerical workers, but this is no longer true: skilled work is better paid, and technology is in fashion. 'Prestige' on the local level reflects class positions which can be seen as a system only on the scale of the national economy, or at least the city. A family arranging a marriage will try, among other things, to improve its class position, and to ensure the material comfort of its sons or daughters by an alliance with a family of high class and 'prestige': I think the word is most often used in the context of matchmaking.

There are several words for someone who is generally respected: the commonest means 'big man'. It can be used for the head of a group like a family, but the 'big men' of the village are a loosely defined local establishment, often spoken of as if they were a group in relation to the village. They all belong to 'middle' castes and have some kind of 'prestige', but not all of them are rich. The Patel or headman has 'prestige' only because of his office, though he has no power; another man has political connections etc. If you ask what 'big men' do, the stock answer is that they take part in panchayats or arbitration courts, though now these are seldom or never called. They do take the lead in many kinds of joint action: they are temple trustees; they attend meetings to organise festivals, they help find jobs, and at elections they conduct public meetings to decide which candidate the village should support for the party 'ticket' or at the poll. Even when they agree, they can no longer be sure of carrying even a majority of the village vote with them. They are expected to behave in the approved ways, to live and dress simply, to mix with everyone, talk to them and attend their weddings, to spend money in the proper ways, preferably on public objects like festivals and entertainments rather than private objects like weddings. They all belong to old village families, and this is the key to their position: in a situation where most functional and economic relations are outside the neighbourhood or urban village, and where village religion and other institutions are kept alive out of nostalgia or idealism, these 'big men' are associated with the idea of the village as a place where relations are moral rather than functional, and where those who deserve respect get it. Not only members of the old families, but many immigrants who are emotionally attached to the village, appear to accept this valuation of the 'big men's' position. In urban conditions, where hardly anyone is now a peasant, a sort of pastoral myth lies behind this extraordinary idealisation of such village institutions as the establishment of elders or 'big men'.

So 'respect' in the village has an objective, *de facto* component: wealth or influence or inherited position. Using the people's own category, and extrapolating from the common use of the word, I call this andastu or 'prestige'. It has a moral, *de jure* component, which is manam or 'honour'. The 'big men' are the most respected group. They emerge from the respectable old village families, whose members enjoy certain formal advantages, especially on religious occasions, and the real advantage of a connection with the 'big men'. Their social equals, except in these two regards, are the respectable Hindu or Christian immigrants with some education and skilled, semi-skilled or clerical jobs. Below them are the poor, illiterate, unskilled labourers, old families or immigrants, divided chiefly into known Harijans and others.

These are status groups in Weber's sense, with what Weber calls their own 'styles of life' and restrictions on 'social' intercourse. The words for respect mean something very like Weber's 'status' or 'social honour'. Members of these groups also have status in other kind of groups, e g, in regional caste networks and at work. But the village is what Bailey calls an 'arena', in which claims to respect can be made and an important man can get a reputation which is both satisfying and useful to him. This is why big fish continue to live and accumulate status in this small pond, instead of losing themselves in the larger ponds which are the fashionable middle-class suburbs.

This does not explain why other people, especially immigrants, should play the respect game as well. Apart from the idealisation of the village, with a common good which the 'big men' guard, it is an asset as well as a satisfaction to have some personal and family reputation, and some connection with the 'big men', in a community of densely populated small houses, where one's private affairs are often common knowledge; where mutual aid between neighbours provides some social security against illness and unemployment, as well as services like child-minding to replace the vanishing joint family; and where it is useful to have friends with contacts in different circles outside the village. There is always someone to arrange a funeral, find a job, take an application to the right official or recommend a printer for wedding invitations. The village or neighbourhood is not a social system but a clearing house for diverse interests, and the man who is respected has his interests cleared first.

Many of these interests have their origin in the wider society, particularly the economy. 'Prestige' is the channel through which class positions in this economy are introduced into the village or projected on the village scale of values, to be modified there by the moral judgment of honour. Honour is no longer much influenced by the consideration of caste, partly because the ideological justification for equating 'good' and 'high' caste has been undermined by devotional religion and democratic ideals, partly because almost all those who have any claim to prestige belong to the middle block of castes. If caste rank is held constant, the chief caste relations are not in or between local caste groups but within the networks of existing or potential marriage circles, which lead far outside the village.

Instead of the more straightforward correspondence between status and economic, political or caste relations, which seem to have existed in Garudapura 15 years ago and still exist in country villages, status as a moral fact is separated from prestige as an objective one, and the standards of moral judgment applied tend to be universalistic. Only a few men, like shopkeepers and contractors who have some of the village poor dependent on them, can compel respect and turn prestige into status directly. In all other cases a fiction of equality must be kept up, at least in public: a man will have time for everyone and dress like a peasant in a place where hardly anyone is a peasant and everyone knows he is a rich wholesaler. The quest for status is an immensely strong motive for action, but a man who wants to be respected must himself respect the autonomous judgments of other villagers, who in principle are free to give or withhold respect.

Thus the fit between the facts and the old ideology of status is getting looser. Caste is adaptable and can include new kinds of relations, but it no longer includes status. Nowadays endogamy follows from class as much as from caste, and it does not matter so much whether the endogamous group has a caste name or not. To the extent that a caste still has a rank, this is justified directly by the kind of work its members are believed to do, and changes accordingly.

Are there any unifying principles

behind these ideas of status, something that could be compared to ideologies of status elsewhere? Not the forms of status groups themselves: it is much too simply to say, for example, that class is replacing caste, 'achieved' status is replacing 'ascribed' etc. We have seen it all before: it happened elsewhere and now it must happen in India; the only question is when. Alternatively, this is what happened when the bourgeoisie with its liberal ideology triumphs over feudalism. This is to assume we know the answers already. People's ideas make sense in their situation, and we should get as much mileage as possible out of their reasoned explanations before looking for different or deeper reasons. But to get at the unifying principles we must look in the middle ground between people's own explanations which may be true but explain too little, and general theories of stratification which try to explain too much because they start from general principles and then account for each case by appealing to some economic or psychological determinism.

It is true that as caste boundaries changed, now self-conscious kinds of caste group have emerged, with caste associations, political pressure groups, etc. It is sometimes suggested that these streamlined forms adapt caste wonderfully to modern politics and economics, and that they will last. But caste associations are completely irrelevant to many people who, in other situations, act as members of castes (including almost everyone in Garudapura); their practical importance, even in politics, may have been exaggerated; and in any case the division of society into competing blocks cannot be reconciled with traditional caste ideology and there is no worked-out ideology to replace it.

The last link between modern caste and caste ideology, which was the *movement to sanskritise* or purify one's customs in order to gain prestige of the traditional kind, has gone or is going. That particular game has lost its point. What is left is not a new ideology but short-term expediency which is visibly just that — naked and unashamed. In politics it is called casteism. The use of caste — as distinct from particular relatives — to get jobs and favours, is seen as a necessity in a phase of cut-throat competition and unemployment, and is not as universal as some people suggest. One ought to look after one's own, there is a strong moral obligation here, but the value of caste itself is no longer universal; it is relative to particular situations. Castes have their own customs and reputations, but these tend to be signs of separate existence rather than different status. Moral thinking tends to be universalistic: what is right for one caste is right for another.

Harijans, for example, used to be in a position of absolute moral inferiority, but since they were in that position it was positively right for them to eat beef, remarry widows etc. Now moral standards belong to a common culture: Harijans can only be condemned for having 'dirty' or 'backward' customs, if the implication is that they can reform their customs and be accepted into respectable society. The same commonplace is used both by upper-caste men who want to justify inequality, and by those who for moral reasons want to see it ended. The point is that inequality has to be justified at all.

Wealth still cannot confer status directly. It has to be converted into status by generosity and the right kind of consumption; but it is the individual and his immediate relatives who get the status rather than the whole caste, who by universalistic standards are not responsible for this man's respectable behaviour. To be a self-made man, to have risen from humble origins by one's own efforts, is itself a source of pride, and the lower the origins the greater the pride.

It is not hard to see why people in an expanding industrial economy should have changed their ideas like this. It is not economic determinism to say that their situation gave them strong motives for thinking one thing rather than another, and that in revising their social categories — which is what social change means — people take circumstances into account. They also take ideas into account directly: ideas they get from parties or sects or reading or travel or contacts. We should distinguish clearly between these two kinds of changes in thought — the taking into account of changes in circumstances of constraints or institutions, which may be historically based in changes in *someone else's* ideas, (e g, politicians' or administrators' or businessmen's ideas), and the direct intellectual or moral confrontation with ideas which are understood *as ideas*, as distinct from taking into account of external circumstances.

This may sound like the old, exploded commonplaces about the transition from traditional to modern, folk to urban, or Gemeinschaft to Gesellschaft. But the old commonplaces were very often true: the mistake was to think that they were necessarily true. Thus one can see good reasons why industrialisation should go with individuation, a universalistic ethic and an idea of status that can plausibly be defended by universalistic standards, but there is no necessity about it. It could have been otherwise; in some countries it probably is otherwise: and if it is happening in India, this is not something inevitable but an important new fact.

Modi Spinning and Weaving

MODI Spining and Weaving, which has already invested over Rs 20 lakhs in other companies' shares, proposes to make fresh investment of upto Rs 65 lakhs in 'Modi Rubbers' — a new company promoted by Modi Industries to manufacture automobile tyres and tubes. Modi Rubbers proposes to issue equity shares of the face value of Rs 6 crores. Modi Spinning's proposed investment will thus be equal to 10.83 per cent of the proposed total subscribed capital of Modi Rubbers. The proposed new investment, together with investments already made by Modi Spinning in other bodies corporate, may exceed any or all of the percentage as specified in section 372 (2) of the Companies Act, 1956, and the provisions thereto. The company is therefore seeking approval of the shareholders and will thereafter approach government for necessary sanction. The directors evidently expect Modi Rubbers to declare dividends at about 15 per cent per annum, from 1975 to 1978, and thereafter at still higher rates. These dividends will not be liable to income-tax in the hands of the company for about 5 years in view of the provisions of section 80-K of the Income-tax Act. This investment will provide the company with a 'constant' flow of income which will be available for distribution to the shareholders in the form of dividends and/or bonus shares.

Mea Culpa

THE annual farce over the procurement price of wheat has been dutifully staged. As usual, the Agricultural Prices Commission sent in its report recommending varying cuts in the prices of different varieties of wheat and, as usual, the Chief Ministers, after journeying all the way to the capital to "discuss" the Commission's report, have told the Commission to go suck its thumb. All this has become very familiar by now. And yet the Agricultural Prices Commission may be pardoned if, for once, it had some faint hope that its labours might be at least partially rewarded this year. For, had not almost all the states been brought back under the Congress umbrella once again? And was it not true that the political influence of the Congress party's central leadership over its state units was stronger than perhaps at any time in the last decade? Many of the new Congress Chief Ministers — Zail Singh of Punjab, for instance — had been hand-picked by the Prime Minister. Finally, had not the opposition in most of the states been so decimated in the recent assembly elections that the Congress governments did not have to worry about the political consequences of taking an unpopular decision? The impression that at last the states might be brought to heel was confirmed by the pronouncements of Central Ministers prior to the Chief Ministers' conference. In her reply in the Lok Sabha to the debate on the President's address, the Prime Minister herself had stressed the need to strike a balance between the interests of producers and consumers of foodgrains and warned that maintenance of prices of farm produce "at artificially higher levels" would generate inflationary pressures in the economy.

And yet the Chief Ministers not only summarily turned down the suggestion to reduce procurement prices, but also — once again contrary to the Agricultural Prices Commission's recommendation — got the Central government committed to a target of procurement of 6.5 mn tonnes of wheat. Further, they even stipulated that they should be consulted before the Food Corporation made any open market sales of wheat in their respective states. As interesting as the extent of the Centre's capitulation was the ease with which it was extracted. The Chief Ministers' conference was left to be handled by the Minister for Food and Agriculture, who is on the verge of being retired to a state governorship and is by common consent among the most ineffectual members of the Central cabinet. The Finance Minister and the Planning Minister also put in appearances at the conference, but from newspaper reports it does not appear that they contributed anything besides sundry witticisms. The Food Minister himself did not present anything which might be described as the Centre's position on the question of wheat prices; indeed, he did not, or could not, even rebut the wild charges flung at the Agricultural Prices Commission by the spokesmen of the states. But most intriguing of all was the Prime Minister's own absence from the conference. Everything considered, this was a very different situation from the one before the assembly elections when the Prime Minister appeared to shuffle Chief Ministers and party candidates with such ease and aplomb. The difference is perhaps explained by the fact that in the one instance she was dealing with individuals, in the other with entrenched interests. And yet the government would still have us believe that these same Chief Ministers will now proceed to lower the ceiling on agricultural holdings and distribute the surplus land among the landless and, further, to administer a stiff dose of taxation to the richer peasants — once the report of the committee on taxation of agricultural income and wealth is in their hands!

—

The implications of "artificially higher" purchase prices of wheat are not only for the Central Budget, substantial as these are going to be this year. It is significant that though mainly only three states were interested in high wheat prices, almost all the Chief Ministers opposed any cut in procurement prices. The other states no doubt expect similar price support operations on behalf of the crops in which they are particularly interested when the need arises. Gujarat, for instance, has not been slow to point to the inequity of the Centre's treatment of wheat and cotton in the matter of price support and has succeeded in getting the Cotton Corporation involved in cotton purchases. This, one may be sure, is only the beginning. All this makes little sense at a time when a basic economic task before the government is that of mobilising a much larger amount of investible resources from the agricultural sector. Clearly, it is unrealistic to entertain too high hopes of direct taxation in this regard. As a contributor to this journal recently pointed out ("Mopping Up the Agricultural Surplus", March 25), apart from taxation of agricultural income and wealth, a number of fiscal and para-fiscal measures, such as "stiff indirect

levies on agricultural inputs, . . . lower prices for agricultural commodities procured by the state trading agencies and increased betterment levies and irrigation charges" would be needed if adequate agricultural surpluses are to be siphoned off for industrial growth. But as things are, it would appear that more than whatever the land-owning classes are made to part with through direct taxes — if and when they are levied — would continue to be surrendered to them in the form of subsidies and so-called incentives.

The government evidently seeks a respite from these immediate tasks of economic mobilisation by losing itself in a review of the development strategy as a whole. The Prime Minister was the first to don ashes and sack-cloth in public. In her by now widely noted address to the annual session of the FICCI, she questioned the wisdom of having had growth of GNP as the basic objective of planning. The cry was picked up by the Minister for Planning in his speeches in Parliament while initiating and winding up the discussion on the annual plan for the current year. "The centre-piece of the Fifth Plan" he is reported to have informed the House, "will have to be the provision of basic immediate needs to our people within a time-bound schedule." In the meantime, the Planning Commission has formulated the basic approach to the Fifth Plan calling for a "direct approach to reducing poverty" (see report from our Delhi Correspondent elsewhere in this issue).

While discussion of the new approach must wait till more details are available, the obvious point needs to be stressed that provision of even substantially larger allocations for employment-oriented programmes and social services, though very desirable in itself, is not the same thing as a strategy which would lead to a minimum level of living for the entire population within a given period of time. Indeed, it does appear at first glance that the government is about to abandon one misconception — that rapid economic growth measured in terms of rates of increase of national income would solve the problems of poverty and unemployment — only to plump for another — that it is possible to achieve a minimum level of living without aiming also at high rates of investment and growth. A plan which seeks to expand employment and raise incomes and consumption at the lower reaches of the population must bring about a reduction of consumption at the higher reaches so that a high level of investment can be achieved simultaneously. True, in his reply to the debate on the annual plan in the Lok Sabha the Minister for Planning did refer to the need to restrict "conspicuous consumption". However, a strategy for a minimum level of living and a high rate of economic growth — the two have to go together — would need to restrict not only the "conspicuous" consumption of the top one or five per cent of the population but also the not-so-conspicuous consumption of much larger sections of the people. How precisely does the Planning Minister expect to achieve this — if it can at all be achieved within the framework of the present political-economic system? Surely, the answer to this question ought to be at the core of any strategy of planning for a minimum level of living, not simply the allocation of larger funds for rural works programmes and social services or the substitution of employment targets for those of growth of production and national income.

Pakistan

Midway to Anywhere

ALL the publicity that the three Indian journalists who visited Pakistan have given Bhutto only helps prove that he has told them so much that he has told them nothing. More pertinent than his conflicting statements are the contradictory pressures at work on him. And one can only make reasoned guesses as to the nature of these pressures. Bhutto's decision to end Martial Law (in force since 1958) with the proviso that his interim constitution be approved first, his casual delay in changing the Governors of the North-West Frontier Province and Baluchistan as desired by Wali Khan and Maulana Mahmood, his walkover election as President of the National Assembly, all perhaps point to a certain degree of confidence that the crucial make-or-break period for him is over.

Yet, there are other indications that these may be the days of relative calm before the storm. The delay in changing the Governors could be a sign of derision for the potential regionalist pull of the National Awami Party of Wali Khan or it could be the result of the ever present centralist pressures from the army and the large group of Punjabi members within his party.

Nor does one know how the interim constitution was arrived at. If reports that it is modelled after the British 1935 Act concerning the governance of India are correct, then there will be some devolution of power to Pakistan's four provinces, but in Islamabad, Bhutto will presumably have the same veto powers that the person-age in the Viceregal Lodge had between 1935 and 1947. Is disguised viceregal rule about to substitute military rule? If this is the case, the portents for Bhutto are not too happy because apart from those outside his party who tend to see him as a megalomaniac, there are some within the People's Party who are beginning to regard him with suspicion. Two members of the National Assembly elected on the People's Party ticket have already resigned from the Party and one of them recently fumed: "We have no faith in the Government because the past of its members is black". In Bhutto's home state of Sind there are also signs of student and peasant restiveness. But these negative signs for Bhutto could all be outweighed if he has managed to win the confidence of the army, assuming that it is still a fairly homogeneous and disciplined force. And on this point it is difficult even to guess.

Credit Policy

Uncooked Hares

WHAT is known in Indian banking parlance as the busy season, is drawing to a close. Data available so far on credit trends in the season remind one of an old adage or a variant of it: the banks seem to be catching more hares than they can cook! The date for which the latest data are available (March 31) also happens to coincide with the last day of the financial year 1971-72. Over the year, the growth in the scheduled commercial banks' deposits was Rs 1,106 crores (19 per cent) and in their credit (including bills) Rs 496 crores (10 per cent), giving an incremental credit-deposit ratio of about 45 per cent — compared to around 80 per cent in the past decade. In terms of its impact on "money supply", which is expected to expand over the year by more than Rs 900 crores (12.5 per cent), net bank credit to the commercial sector is negative during the year — the credit expansion of Rs 462 crores (including bills) being more than counterbalanced by time deposit accruals to the extent of Rs 682 crores. Incidentally, with movements in foreign exchange assets being negligible, almost the entire increase in "money supply" would be taking place under bank credit to the government sector (estimated at nearly Rs 1,000 crores).

Reverting to the seasonal trends, the Reserve Bank had at the beginning of the busy season projected a credit expansion "of a higher order than last year" and given currency to a figure of Rs 480-500 crores of credit growth during the season. It stuck to this view even in its mid-season review in this February. But what is taking place appears to be quite different from what was expected. Between end-October 1971 and end-March 1972, bank credit expanded by Rs 416 crores against Rs 487 crores during the comparable period of last year. True, there has been practically no additional drawal of credit for food procurement — not so much because the Food Corporation has operated its stock for bringing down wheat prices as because its repayment obligations to government have been put off. Net of food procurement, credit during the comparable period last year was Rs 392 crores. An interesting development in the current busy season is the sharp decline in the quantum of credit expansion under "Inland Bills Purchased and Discounted". Under this head there was an expansion of Rs 260 crores during the first four months of the 1970-71 busy season. This time the expansion has been only Rs 96 crores, reflecting the discontinuance of the old Bill Market Scheme. The new Bills Rediscounting Scheme has gathered some momentum and Bills rediscounted with the Reserve Bank had reached Rs 42 crores by March 31 (they were Rs 9 crores a year ago).

On the whole, the resources position of the banks is so comfortable that they are operating under a credit-deposit ratio of 74 per cent during the peak of the season, almost the same as it was at the beginning of the season (73.4 per cent) but considerably lower than the level at this time in 1971 (80 per cent). In March, the busiest month, credit expanded by only Rs 80 crores as compared with Rs 119 crores in March 1971 when borrowers and banks were both just settling down to the stringent credit policy measures announced in January 1971. The increases in output and prices of major industrial commodities have been certainly higher during these months than in the same period last year (except, perhaps, for sugar).

True, on the eve of the current season the Reserve Bank Governor had enjoined upon the banks "a cautious approach so as not to aggravate the inflationary factors in the economy". In the same breath, banks were advised "to provide all possible assistance for achieving a step-up in industrial production and meeting the requirements of financing food procurement, priority sectors and defence-oriented production". The caution against inflation had been there even earlier, but the major banks, being still "commercial" in their outlook and operations, were anxious to employ a large part of their deposit accruals for credit expansion so as to earn a profit. Is this "commercial" spirit getting eroded under the public sector dispensation? For, otherwise, caution against inflation and all that cannot fully explain the idling away of over 50 per cent of the deposit accruals in low-earning assets other than bank credit.

True, in the past, there were ready takers of bank credit among the large business houses and speculators and hoarders. The long delay in the availability of banking statistics prevents one from speaking of any definite trends in this regard. However, that bank nationalisation combined with a relatively cautious credit policy has curbed bank credit to these elements is evident from certain indicators (other than the complaints of the affected parties, of course!).

The Reserve Bank's latest study of 290 large private sector companies (with paid-up capital above Rs 1 crore but accounting for 72 per cent of the share capital of the RBI's sample of 1,501 companies) reveals that their additional bank borrowings were Rs 103 crores in 1966-67 and Rs 95 crores in 1967-68. Thereafter, there has been a noticeable decline; in 1970-71 additional bank borrowings amounted to Rs 38 crores. During the three years 1968-69 to 1970-71, these companies experienced an output growth of about 40 per cent accompanied by only 12 per cent increase in bank borrowings. A part of the decline is explained by reduced stock holding, but bank borrowings as a proportion of inventory have also declined over these years. The lower inventory holdings were probably partly due to the credit squeeze, particularly in respect of speculative hoarding of scarce raw materials. Many of the companies were known to finance even a part of their long-term assets through bank credit. On the recommendations of the Dehejia Committee (1969), this was sought to be discouraged, and the Credit Authorisation Scheme, whereby the Reserve Bank's prior authorisation was acquired for bulk lendings of Rs 1 crore and above, was restructured with a view to "aligning bank credit with Plan priorities" (Reserve Bank's Annual Report 1969-70, p 70). In June 1970, the scheme was widened to cover credit appraisal by banks "with a view to imposing financial discipline on the large borrowers" (Reserve Bank's Annual Report 1970-71, p 70). The discontinuance of the old Bill Market Scheme and the attempt to persuade banks and their clientele to opt for the new scheme must also be bringing about a gradual change in the methods of bank lendings.

These procedural changes themselves, however, do not explain the slack in bank credit, nor even the selective credit controls on advances against raw cotton imposed with a view to curbing speculative hoarding. The fact is that there are a sufficient number of potential borrowers with socially acceptable productive schemes. At the same time, the banks possess surplus funds. The safe limit prescribed by the monetary authorities for credit expansion during the busy season has not been reached. This situation is likely to continue for many months to come.

The major issue, which has long-term ramifications, is, therefore, that of the organisational preparedness of the banking system to shoulder the new responsibilities that have devolved upon them. These organisational constraints have, of course, been recognised, but more as apologia for the recent setback in lending to the "priority sectors" in respect of which there has been a significant levelling off of the growth of bank advances in recent months (Economic Survey 1971-72, pp 48-9), rather than as part of a serious appraisal by the government and the banks with a view to evolving a sensitive management structure, working strictly on commercial lines, undertaking risk and responsibility and absorbing the import of new methods, procedures and directions of lending. If these organisational reforms are not attempted immediately, the possession of excessive liquidity by the banking system (in a capital scarce economy) will sooner than later compel the monetary authorities to make relaxations in favour of the old order. Multiplication of slogans and labels like "priority sectors", "social schemes", and "differential interest rates" will not stop the drift. The answer lies in a sharp motivational change in the top managements of the nationalised banks, which, everything considered, still prefer to play safe.

Vietnam

Nixon's Credibility Crisis

A Correspondent writes : —

BY resorting to the use of the heaviest available weapons of destruction, the United States may still be able to hold some ground in Vietnam. But there is little doubt that like the Tet offensive of 1968, the current thrust of the various liberation forces in Indochina will destroy the credibility of Nixon's claim that peace is round the corner in that region. In fact, it will now be impossible for him to use his other foreign policy manoeuvres to cover up his abysmal failure to evolve a new policy towards Vietnam.

This may hurt him grievously in the forthcoming elections. Many observers in America and abroad had begun to take it for granted that Nixon would be returned to power again and no Democrat could hope that any of his available nondescript candidates would beat the Republican leader. The situation can now be expected to change radically, particularly if the United States is to commit more of its ground forces in the area. The Vietnamese always knew that the crucial vote in the American elections was going to be theirs and not Mao Tse-tung's or Brezhnev's. Their current attempt to gain military victories may in fact have been caused by the thought that Nixon would be able to use his efforts to improve relations with Russia and China to win the next elections which, in the absence of a revision of American policies towards Vietnam, could only mean a prolongation of the agony of its people. It is interesting that the Vietnamese decided to launch their assault on the American forces after Nixon's visit to Peking and before his visit to Moscow. This throws Nixon's policies towards the two communist great powers out of gear because neither of them can directly refuse to support the people of Vietnam.

Whether this will lead to the postponement of Nixon's visit to Moscow is not yet clear. But if he does decide to go there, he will have to do so in the full consciousness that his position *vis-a-vis* the Soviet Union has now become much weaker than it was a few weeks ago. If his visit to China had given him some extra levers in dealing with the Soviet Union, the crisis in Vietnam deprives him of virtually of all of them.

This development illustrates, as much as Bangladesh did, that the present international situation does not permit the great powers to attempt to build any superstructure of accord among them which ignores the interests and aspirations of other peoples. The whole question of peace in Asia, therefore, may have to be viewed in an entirely different perspective not only by the United States but also by the Soviet Union and China. The smaller Asian powers are bound to count for a great deal unless all the great powers can agree to deny to them their sovereignty and independence. It is most unlikely that such a situation will ever come into being and certainly there is no sign of it yet.

It is in this context that the Soviet call for a collective security system in Asia and its explanation that such a system is only meant to improve relations among the states and would not be directed against any country, acquires great significance. If Nixon goes to Moscow, he may well choose to use the occasion to discuss the Soviet proposal in all seriousness and to see if it does not lead to the creation of a solid base for the superstructure which he is apparently determined to build. The domestic compulsions on Nixon are such that he cannot easily admit that he has failed to evolve a meaningful policy towards Asia. He can, however, now face the American electorate only if he can convince them that the old Nixon doctrine is dead and that some new approaches are being thought of. It is not impossible, therefore, that Nixon's Moscow visit will turn out to be an event of historic significance and it will go down as the occasion where the Americans admitted their defeat and sought the co-operation of the Soviet Union in saving themselves from even greater disasters.

Banking

Beyond the Statistics

FOR the commercial banks, 1971 was a year of unprecedented deposit increase, slackening of growth of advances and fairly rapid branch expansion. The Union Bank fits fairly smoothly into this overall picture. Its deposits increased by 20.5 per cent, close enough to the average of 20.6 per cent for all scheduled commercial banks. The distribution of the incremental deposits between demand and time deposits also conforms to the pattern for the banking system as a whole, with time deposits increasing at a rate only a little less than twice as fast as demand deposits. Where Union Bank's experience diverges from that of banks as a whole is perhaps in regard to advances. Its advances increased by 21.3 per cent which, while well below the increase of 29 per cent achieved in 1970, was very much higher than the 11.5 per cent rise in the advances of the banking system as a whole. Consistent with this, profit (before provision for bonus) rose to Rs 74 lakhs from Rs 49 lakhs in 1970.

Significantly, advances to the 'priority' sectors played an important part in sustaining the growth of Union Bank's overall advances. These sectors accounted for 58 per cent of the total increase in the bank's advances during the year, small-scale industries accounting for 22 per cent of the increase, agriculture for 13 per cent and export credit for 10 per cent. Though still small in absolute amount, advances to retail trade and small business witnessed a threefold increase during the year from Rs 71 lakhs to Rs 213 lakhs. As a result, the share of the priority sectors in the bank's total advances increased from 38.8 per cent at the end of 1970 to 42.2 per cent at the end of 1971.

About the only discordant note in Union Bank's performance in 1971 is struck by branch expansion, the number of new branches opened in 1971 being only 59 as compared to 101 in 1970. The Directors' Report claims that the slower pace of branch expansion was "in line with" the experience of the banking system as a whole. But the drop in the rate of opening of new branches for the banking system as a whole in 1971 was not anywhere near as sharp as that for Union Bank. The Directors' Report pleads that fewer branches were opened last year because of "acute personnel constraints" — which could only be the result of a serious failure to anticipate personnel requirements.

So much for the statistics. What one misses in the Directors' Report is a discussion of the qualitative aspects of Union Bank's entry into new areas of activity and of the problems it must have encountered. Thus, while the statistics show the bank's agricultural advances at 10 per cent of its total advances at the end of 1971, what has been the bank's approach to agricultural lending? Has it followed the area approach? Has it tried to tie up its lending with the operations of input, particularly fertiliser, suppliers? What arrangements has it made for provision of the minimum extension services to farmers? What has been its experience with regard to supervision and follow-up of agricultural advances?

On the lead bank scheme, again, the bank appears to have followed the textbook. It has completed surveys of its five lead districts, opened branches at all the centres allotted to it in these districts and set up district consultative committees in all of them to secure the co-operation of state government officials and other local bodies. This is all to the good, but one would have liked to have some discussion of the bank's efforts to initiate development activity in the lead districts — which is the role assigned to lead banks.

Following the nationalisation of the 14 major banks, many new ideas have been introduced into commercial banking. The lead bank scheme and commercial bank lending to agriculture are two of these. Banks are in the process of determining the approach, organisation and procedures to undertaking these new tasks. At this stage it is important, therefore, that there should be exchange of experience and discussion of problems. This is much more important than retailing bland statistics.

Textiles

Not Trendy Enough

EXPORTS of mill-made cotton textiles which rose consistently from Rs 82 crores in 1967-68 to Rs 115 crores in 1970-71, suffered a setback in 1971-72, declining to Rs 110 crores. The decline was shared mainly by cotton piece-goods and cotton yarn, while exports of apparel increased substantially. During the last five years exports of cotton piece-goods have fluctuated between Rs 60 crores and Rs 68 crores. What is disturbing about cotton yarn is that exports spurted from Rs 7 crores in 1967-68 to Rs 29 crores in 1969-70 but thereafter they declined rather sharply to Rs 21 crores in 1970-71 and Rs 14 crores in 1971-72. Exports of apparel, however, reveal a steady growth from Rs 3 crores in 1967-68 to Rs 13 crores in 1971-72. The decline in overall exports of cotton textiles last year could be partly explained by the unusually high prices of raw cotton. From present trends it appears that availability of raw cotton would improve appreciably in the current year and this should improve the competitive position of our exports.

Though cotton piece-goods continue to be the most important single item of export among textiles, their performance has been rather disappointing during the last ten years or so. Exports of piece-goods increased marginally from $ 97 million in 1961 to $ 103 million in 1964 but thereafter declined steadily and stood at $ 86 million in 1971. In the case of cotton yarn, in spite of the decline last year, exports increased from $ 8 million in 1961 to $ 36 million in 1970. Similarly exports of apparel increased from $ 0.3 million in 1961 to $ 13 million in 1971. Thus the relative stagnation in exports of mill-made cotton textiles is primarily due to the unsatisfactory trend in exports of piece-goods. Of course, it is not only the mills sector which has fared badly; handlooms and as well as the other sectors have not performed particularly well either.

The main factors responsible for the stagnation in textile exports appears to be the country's inability to adjust to the changing composition of world demand and of the international trade in textiles in the last 15 years. The changing pattern of international trade is clear from even a cursory analysis of the post-War success of Japanese textile exports. Japan's total exports of all textiles and clothing increased from $ 692 million in 1955 to $ 2,207 million in 1970, reflecting a 9 per cent annual rate of growth over the 15 years. During the same period, exports of cotton fabrics declined from $ 230 million to $ 188 million while those of non-cotton fabrics (especially synthetics) increased from $ 208 million to $ 940 million and of clothing from $ 107 million to $ 462 million.

It would thus appear that India is trying to compete in a declining world market of cotton fabrics while world trade is increasing rapidly in synthetic and mixed fabrics and clothing. India has entered both these fields only recently and that too in a hesitant manner. Due to the relatively small scale of manufacture and high domestic prices, synthetic and mixed fabrics manufactured in India continue to be non-competitive in world markets. The same holds good for clothing as the basic materials used continue to be high-priced. Our inability to fulfil even the modest quotas granted by developed countries like the UK is sufficient proof of the fact that demand in these countries is shifting fast in favour of synthetic and blended fabrics. The future for our textiles exports would thus appear to hinge on selective modernisation of mills tied to specific export commitments and the pre-emption for export of a substantial proportion of the projected increase in production of synthetic fabrics.

STC

Streamlining without Purpose

THE STC Group has brought out, within three weeks of its year-end, a performance budget for 1972-73 and a performance review of 1971-72. This record, commendable in any enterprise, is particularly so for a large enterprise such as STC.

The document is akin to what Unilever would have brought out in the colonial days to record its trading operations up-to-date. There are in STC's performance budget figures on past forecasts, actual trading operations, and expected operations; these are depicted group-wise while cost estimates are given branch-wise, with a further break-up under heads such as advertising and promotion. The whole exercise would satisfy the taste of any business tycoon anywhere in the world; and so would the sales-talk which Tandon appends. He follows up with impressive references to 'profits', 'cash management', 'shareholder', 'service' and 'staff'. One could not ask for more from a commercial enterprise.

But is this a sufficient basis for STC's operations? There are two questions that arise: one from what is stated and the other from what is not stated but is significant.

First, as regards the budget for 1971-72, the latest estimates show that STC's performance was better in imports and domestic sales, but is the same in exports: as other agencies in this country have also found, it is easier to excel import targets than export targets. It is not surprising that the profits before tax show a rise, from Rs 8.8 crores (in the budget) to Rs 13.8 crores (latest estimated.

Further, the STC promises that, in 1972-73, its exports will rise faster (from Rs 94.5 crores to Rs 127.5 crores) than imports will (from Rs 228.2 crores to Rs 236.9 crores); of the rise, Rs 19 crores is accounted for by STC and Rs 11 crores by the Projects and Equipments Corporation. One must watch whether, with the further canalising announced in the new import policy, imports do not in fact rise faster than estimated.

Secondly, one looks in vain, in all the talk of 'inventories reduced' and 'cash generated', for a purposive policy on operating the STC to meet India's needs. Almost two-thirds of STC's operations still comprise imports. Increasingly, these imports come from general currency areas, with imports from 'Credit Sources' (US AID?) declining heavily — for STC alone, from Rs 65.29 crores in 1971-72 to Rs 28.61 crores in 1972-73. Imports from, and exports to, 'Rupee Trade Areas', are expected to show a marginal increase only.

It is in fact this lack of purposive philosophy with regard to trade that is most striking in STC's operations. The objective seems to be to take the easy way out, muscling in on existing trade relations and showing fancy profit and balance-sheet positions, rather than to attempt the more arduous path of building up new markets abroad. Exports to such markets — such as in Africa and Asia — might be less glamorous and may not run into crores of rupees in the near future; but STC must be judged by its ability to build up the country's *export potential*, not by its rupee profits. It is time STC moved away from its new-found slickness to a more purposeful approach.

Indian Council of Social Science Research, New Delhi

Training Courses in Research Methodology

The ICSSR is organising training programmes at different centres of higher learning. These programmes are specially meant for students registered for Ph.D and for young lecturers and scholars.

The courses run this year are of two types. The GENERAL COURSE is designed to give the trainee an orientation to research methodology — the logic of scientific research, the techniques of data collection, knowledge of basic statistics, and the mechanics of analysis and report-writing.

The SPECIAL COURSES are discipline-based and are at an advanced level.

Following is the schedule of Training Programmes:

Venue	Date of Commencement	Duration	Course Director
I *General Course*			
1. Tata Instt. of Social Sciences, Sion-Trombay Road, Bombay.	17.4.72	8 weeks	Dr K. G. Desai
2. Council for Social Development, 53-Lodi Estate, New Delhi.	15.5.72	8 weeks	Dr B. N. Mukherjee
3. Loyola College of Social Sciences, P. O. Sreekariyam, Trivandrum.	15.5.72	8 weeks	Rev. Dr. J. Puthenkalam, S.J.
4. A. N. Sinha Institute of Social Studies, Patna.	5.6.72	8 weeks	Prof. Sachchidananda
5. Indian Institute of Technology, Kanpur.	4.9.72	8 weeks	Prof. Kamta Prasad
6. Department of Political Science, Rajasthan University, Jaipur.	4.9.72	8 weeks	Prof. S. P. Varma
7. Department of Psychology, Utkal University, Bhubaneshwar	30.10.72	8 weeks	Prof. R. N. Rath
8. Indian Statistical Institute, Calcutta.	3.10.72	8 weeks	Prof. R. Mukherjee
II *Special Course*			
9. Department of Anthropology, Saugar University, Sagar (M.P.) (Emphasis: Anthropological Research)	1.11.72	4 weeks	Dr Leela Dube
10. Madras Institute of Development Studies, 74-Second Main Road, Gandhi Nagar, Madras-20. Venue: Department of Economics, Andhra University, Waltair. (Emphasis: Economic Research Methodology)	8.5.72	6 weeks	Dr B. Sarveswara Rao
11. Sardar Patel Institute of Economic & Social Research, Ahmedabad. (Emphasis: Mathematical and Statistical Methods in Economics)	3.4.72	8 weeks	Dr R. J. Mody
12. University School of Social Sciences, Gujarat University, Ahmedabad. (Emphasis: Sociological Research)	4.5.72	6 weeks	Dr Vimal P. Shah

Those desirous of participating in any of the training programmes listed above should contact the Course Director concerned immediately, giving the following details: Name; Date of Birth; Academic Qualifications (Degree, Discipline, Division); Whether registered for Ph.D., if so when; University; Name of Guide; Topic of Research; Any research publications (list them); and Address.

The application should come through the guide or head of the department.

Selection will be made by the Course Director. Selected Candidates will be given second class rail fare. Lodging and boarding will be free. No fees will be charged. Set of books on research methodology will be presented.

Groping for Relevance

Romesh Thapar

A POINTER to the psychological state of the Capital is the kind of speculation that is sparked the moment Indira Gandhi declares that she is off on a two-day holiday. This is a rare event in the crowded, disorganised life of the Prime Minister, but immediately the rumour spreads that she is "withdrawing" to Dehra Dun to finalise the belated reshuffle of the Union Cabinet. Sitting here, one wonders why so much time and effort is spent on such speculation when the material available for ministership is so non-descript.

Our tiny middle class elite must of necessity titillate itself on the game of ministerial chairs because it doesn't have the perception to realise that power has passed to a single person and no really independent contribution to decision-making is possible from the ministers unless solid homework is done by them. The ministerial team now assembled, and likely to be assembled from those available in Parliament, lacks the capacity or inclination for such independent action. After all we are what we make of our feudal selves — servitors, by and large.

The pressures are also most unlikely to build from the Lok Sabha and the Rajya Sabha. These very expensive, resource-consuming institutions, which are the backbone of democratic functioning, find it difficult to muster the tiny quorums which permit uninterrupted debate. The bulk of MPs seem to be interested or involved in activities other than parliamentary. And there is no one to crack the whip — or no one who wants to.

If our politicians present a lazy spectacle, this should not persuade us that we are drifting. Indeed, we are in a tense, busy period. The war situation in Vietnam is apparently entering a qualitatively different phase with Hanoi moving for decision. At home, the long-awaited negotiations have begun with Pakistan; we will have to stress a final settlement of all borders on the subcontinent as part of a generous peace and friendship package. All this requires a great deal of diplomatic skill. What's more our relations with the USA and China will have to be watched. So much for external affairs. The overriding concern remains the internal economic situation, full of immense possibilities and yet enveloped by gloom.

Significantly, for the first time, after many years, and despite the plethora of socialistic talk, one can again hear the thesis propounded that only a clearing of the jungle of controls, regulations and inhibitions, can restore health to the national economy. The confusion which prevails in the socialist/communist camps, and their failure to produce meaningful solutions to the problems which have arisen, are persuading devotees of planning to think of freer markets! This debate, far from the limelight as yet, will spill over the policy planners if they do not work out sharply different alternatives which make sense.

The Prime Minister will not be immune from these pressures. Powerful as she is, she cannot function in isolation from the political calculations thrown up by these pressures. The doodles of the Planning Commission — the promise to abolish poverty by 1982! — attempt to hide the programmatic bankruptcy in almost every ministry of the Government of India, but anyone who bothers to study Delhi's doings knows that at this rate of progress Indira Gandhi will have to change the slogan of *Gharibi Hatao* into *Gharibi Ghatao*. Then the politicians will be *gheraoed*.

It is surprising how many thinking people see the outlines of a crisis situation developing before the end of this year. There is health in this. It means that the exultant Indian is after all a creation of the Western newspaperman. The MPs may not think so, judging from their attendance in Parliament. The ministers may not think so, judging from the even tenor of their cliches. But the people, roused as never before, are concerned. Those who share their concern will become relevant.

What we are witnessing today at the political, economic and social levels is the search for relevance in a changed situation. It is not as simple as it sounds. The slogans are easily coined. Their implementation boggles the best of minds, for the answers to the challenges are not written in the stereotyped models of the Right and Left. And, so, the groping continues.

April 10

LETTER TO EDITOR

Holding Together on the Left?

I HAVE carefully read your correspondent's article on West Bengal, "Holding Together on the Left?", published in your Annual Number, 1972. I do not intend to comment on the diverse opinions and articles of faith of your correspondent with which he has embellished his article. I only want to record my protest against the mischievous misrepresentations and insinuations that he has put in there. Though no name has been mentioned, I take it that I was meant. For I am the Head of the Political Science Department of Vidyasagar College for Women, Calcutta. I was threatened by an alleged 'Chhatra Parishad' organiser of the Vidyasagar group of Colleges and his accomplice on January 12 last. I took the matter before the West Bengal College and University Teachers' Association that very evening. The General Secretary of the Association, Mrinmoy Bhattacharyya, reported the matter to the Police Commissioner, Calcutta, and wrote to the Governor demanding immediate steps. It was further decided that a number of teachers would escort me to the College on the following days. An Emergency meeting of the Executive Committee was held on the following evening where a resolution condemning the action of the two rowdies, demanding strong measures by the government and delineating further steps for mobilising public opinion was unanimously adopted. It may be noted that the meeting was attended by members belonging to the Congress and the CPI(M), as well as members of other political parties, besides non-party individuals.

The Association took the following steps: (1) A press conference was organised and the matter received a 'good press', excepting in two well known Calcutta dailies; (2) a meeting with other teachers' and non-teaching staff associations was held which passed a similar resolution and decided to hold a public convention; (3)

a meeting was held with representatives of students' associations, including the Chhatra Parishad. On January 17, the President of the Chhatra Parishad, Subrata Mukherjee, issued a press statement condemning the action. It was when the representatives of different teachers' and non-teaching staff associations met to finalise the draft resolution that the decision was taken not to mention any names, as the demand to mention the name of Chhatra Parishad was countered by the demand to mention CPI(M) rowdies, where the latter had been the tormentors. This meeting, too, attended by both CPI(M) and Congress members, took the decision unanimously. All agreed to focus attention on two basic issues, *viz*, (i) the right of free access to the place of occupation by teachers and members of non-teaching staff, and (ii) freedom of academic institutions from vandalism by rowdies. Though all political parties were approached to send representatives to address the convention, the CPI(M) and other 'Left Front' parties declined to do so, as the Congress was not being condemned by name. Only Chitta Basu, Forward Bloc MP, and Principal Santi Kumar Dasgupta, ex-Minister for Education, of the Congress party spoke on be half of their parties. There was no question of putting up "a Congress(R) teacher as the main speaker". He certainly did not speak of "paying CPI(M) back". He congratulated the organisers for holding such a convention, but added that it should have been held some time back when Congress teachers were being beaten up.

Further, it was completely false to say that CPI and other teachers had sat idle while CPI(M) teachers had been subjected to intimidation. The WBCUTA had always condemned such acts, but, as Mrinmoy Bhattacharyya the General Secretary of the Association said, this was the first occasion when a victim had directly appealed to the Association for intervention when steps could possibly be taken.

Incidentally, will your correspondent kindly inform his readers as to how he has come to know of the following gem: "Pathetic pleadings by the victim, that his party was a close ally of Congress(R), cut no ice with his tormentor..."? How does he know how I pleaded? He was certainly not present on the occasion. I was alone with my "tormentors" for about twenty minutes, joined later on by the Principal of my College. He certainly did not contact me. Or, has he some secret channels of communications with these same "tormentors" who have supplied him with such lurid but utter falsehoods? Are not correspondents expected to follow certain codes of honest journalism? Or, maybe, I am wrong. He is referring to some other teacher in some other college, involved in some other incident. This is very unlikely, but it needs clearing up.

SYAMAL CHAKRABARTY

Calcutta

Our Calcutta Correspondent replies:

SYAMAL CHAKRABARTY's elaborate reference to West Bengal College and University Teachers' Association (WBCUTA) is largely irrelevant. This organisation unites under its banner teachers of many shades of political opinion. If the general secretary of this body belongs to CPI, the president and one of the vice-presidents are CPI(M) activists. Aware of this reality, this correspondent did not refer to WBCUTA as such. His critical comments were directed against CPI circles.

Chakrabarty has, by implication, admitted the subsequent blunting of the edge of the campaign that followed his ordeal. But he has sought to exonerate CPI circles from any responsibility in the matter, by referring to the unanimous decision of the meeting of the representatives of the mass organisations that sponsored the convention. This is only a half-truth. While the Executive Committee of WBCUTA, meeting on the the morrow of Chakrabarty's encounter with the Chhatra Parishad toughs, according to *Kalantar*, the CPI daily, (January 15, 1972), had named the principal culprit and had demanded his arrest, the draft resolution put forward in the sponsoring bodies' meeting, according to this correspondent's information, by a leading CPI teacher-activist, merely condemned vandalism in educational institutions in general without naming any name. This reporter has been further told that CPI(M) cadres present in that meeting of the sponsoring bodies had strongly and persistently pressed for a specific mention of the miscreants in the particular case, but in the face of the CPI circle's inflexible opposition to the demand, had finally acquiesced in accepting the draft for the sake of a consensus.

This reporter's appreciation of the reaction of the CPI circles to the victimisation of CPI(M) teachers is confirmed by a long article by a leading CPI teacher-activist published in *Kalantar* (January 26). Writing under the caption "Educational World under Attack" he not only all through harps on CPI(M)'s past misdeeds, but also pointedly concludes:

> "It would be utmost unprincipled opportunism to seek political profit from the present situation by forgetting (one's) own past practice. We all have to admit that we started during the second UF regime an unparallelled example of wide outside interference in educational institutions with a view to establishing the hegemony of political parties. The people of our country got the preliminary instructions under the tutorship of the Education Ministry [under a CPI-M Minister] of the second UF cabinet [in such matters as] that an old man can be murdered by entering into an educational institution, that a teacher can be ousted by gherao, that management can be acquired by using the Writer's Building [the State Secretariat] — and in all these misdeeds, strong alibis can be established in favour of the miscreants by putting the blame on the victimised side. Unless self-criticism is made on the basis of how many teachers were killed, how many beaten, and how many forced out in 1969, nobody will have faith in the sincerity of the present movement. The student leaders of the Presidency College subsequently joined CPI(ML). When its laboratory was smashed, they were workers of the CPI(M)-influenced student organisation. Can the CPI(M) leadership deny the responsibility for the smashing of the Presidency College laboratory?"

That the former Congress Minister was the main speaker at the Convention is clear from the report in *Kalantar* (January 26), unless of course the CPI daily was guilty of incorrect reporting. Of all the many speakers at the Convention, *Kalantar* in its coverage quoted from his speech only while it dismissed one other speaker with just a few words — "Forward Bloc leader Chitta Basu, MP, spoke at the meeting". And, this is how the Congress leader spoke at the meeting, according to the same source:

> "It would have been better if this effort had been made in 1969. The present situation is not more deplorable than the grave situation at that time. As the acting principal of the Birati College, I was then faced with such a bombing spree [bomb-bazi]...
>
> "At last, Shri Das Gupta said in his speech that some persons had done this in the name of Chhatra and Yuba Parishad and Chhatra and Yuba Parishad leaders have openly condemned them." (*Kalantar*, January 26.)

This reporter got the account of Syamal Chakrabarty's 20-minute encounter with his gun-toting tormentors from dependable CPI sources. These sources expressed their utter disappointment that even after Chakrabarty had made the offer to take the 'dispute' to Siddhartha Sankar Ray, the tormentors did not relent. If this report lacks substance, this correspondent tenders his apology.

No Longer the Props

Hansavivek

ASSOCIATED BEARING's board says that steps are being taken to set up the company's own selling organisation, but SKF Ball Bearing has been re-appointed as sole selling agent for another five years from May 9 next. Sale of all the company's products will be carried out by the selling agent up to the end of 1974. It is stated that, as from the beginning of 1957, the company will itself take over sales of its entire range of products, except for bearing replacement sales amounting to about 30 per cent. These deliveries will continue to be handled by SKF as "it will be more economical for our Company". A special resolution is proposed to seek the shareholders' approval, since B Fredrikson, Technical and Managing Director, is also Managing Director of SKF. Sole selling agents' commission for 1971 exceeded Rs 74 lakhs, and for 1970 it was over Rs 66 lakhs. SKF has been marketing the company's products since it was founded 11 years ago. Fredrickson's own remuneration from the company during 1971 amounted to Rs 1,93,413. The total payment to and provisions for the approximately 1,100 employees of the company aggregated less than Rs 95 lakhs.

Despite a 12 per cent increase in turnover, ABC's gross profit shrank by 6 per cent during 1971. It is stated that additional profits were "more than counterbalanced by a substantial increase in the cost of raw materials". As the past years' tax reliefs and allowances had been completely utilised in 1970, the full impact of tax was felt in 1971. The reduction in tax relief to priority industries and the surcharge on income-tax introduced in the supplementary budget further increased the tax burden. Moreover, the company became liable to sur-tax for the first time, with the result that net profit turned out to be substantially lower than the previous year's. Even so, to please the shareholders, dividend is stepped up by 2.5 per cent to 15 per cent — of course at the cost of the cover, which has shrunk from 3.22 to 1.73 times. Nearly three-fourths of the dividend is expected to be exempt from tax.

The company attained full licensed capacity for ball bearings and textile items. It has still not received 'letters of intent' for the manufacture of additional ball bearings and textile items, though its applications submitted in June 1970 and were past the Licensing Committee stage in early 1971. Meanwhile, prices of raw materials and capital goods have increased and will probably increase further by the time the industrial licences are received and implementation of the project starts. The capital cost of the project will thus be higher than originally budgeted. The development rebate of 35 per cent to which the company was previously entitled has already been reduced to 25 per cent and will be abolished completely in respect of plant and machinery installed after May 1974. As most of the equipment required for the expansion programmes will be received after this date, the tax burden on the company would also increase.

The company has not been permitted to import materials from sources of its own choice, and this has adversely affected costs. Efforts are being made by the company to be restored on the IDA list.

INDIAN ALUMINIUM commissioned its Taloja sheet mill in December 1971. All the major items of equipment, including the hot mill, the cold mill, and the remelt furnaces, are in operation. At Belgaum, 50 out of the 82 pots in the fourth potroom were commissioned last year. The company has applied for an industrial licence to expand further the Belgaum smelter by addition of two more potrooms with the associated expansion of bauxite and alumina facilities. The two additional potrooms will add about 20,000 tonnes per annum to Belgaum's metal capacity. During 1971, production from the company's smelters was 79,901 tonnes — 29.6 per cent over the preceding year when there had been a 90-day strike at the Hirakud smelter. Metal production at Alupuram was 19,282 tonnes (18,257 tonnes), at Hirakud 23,138 tonnes (16,198 tonnes), and at Belgaum 37,481 tonnes (27,210 tonnes). Production of alumina at Belgaum, during the first full year of operation of the plant, was 88,100 tonnes; at Murf production of 78,600 tonnes created a new record. Bauxite mining at Chandgad and Lohardaga kept pace with the increased alumina requirements. Record production levels were also achieved at the sheet rolling mill at Belur and at the extrusion presses at Alupuram. The Kalwa plant was shut down for two months owing to labour trouble, and foil production was therefore lower at 2,062 tonnes (2,249 tonnes). Powder and paste production at Kalwa was almost unchanged. Output from the properzi mill at Alupuram was lower than in the previous year due to interruption in production for installation of larger holding furnaces to effect better quality control, INDAL's sales, at 75,758 tonnes, reached a record level in 1971 and showed about 21 per cent increase over the year. The sales realised Rs 39.94 crores against Rs 35.40 crores. With margins enhanced, gross profit rose from Rs 8.20 crores to Rs 12.87 crores. Despite the considerably increased provision for depreciation and the tax liability taking away Rs 1.92 crores against nil, net profit was Rs 1.65 crores higher than in the previous year. Equity dividend is stepped up 3 points to 17 per cent and still enjoys cover of 1.33 times. The directors complain that raw material prices are increasing rapidly and that despite representations, government has not allowed any increase in selling prices fixed by and large at the levels of the company's net selling prices obtaining in February 1970. They add that costs were kept under reasonable control through improved efficiencies at all the plants, but the overall impact of rising raw material prices is now becoming increasingly evident as the "margin for further improvement in efficiencies is progressively narrowed". The management is also concerned about the increase in the effective rates for power supplied to the company's smelters in Kerala and Orissa. The company continues to resist these increases through legal remedies, and cases are pending in the High Court of Orissa and at the Supreme Court.

DUNLOP INDIA established a new export record in 1971 by earning foreign exchange worth Rs 3.34 crores — an increase of about 10 per cent over 1970. It exported to 71 countries, including highly developed ones such as the US. As an export house, the company developed overseas markets for a wide variety of goods made by small-scale manufacturers. A large number of tennis and squash rackets were exported to Dunlop Sports Company in the UK. Last year, the company spent about Rs 30 lakhs on technical development activities, which enabled it to introduce new and better products and achieve further progress in import

substitution. One of the recent projects has been the development of the mainwheel tyre for the Boeing 747 Jumbo Jet. The company is now establishing a research and development centre for cycle tyres and tubes with a view to exporting knowhow for the manufacture of these products. Dunlop's expansion applications, both for automotive tyres and industrial products, are pending with government. During 1971, demand for automotive tyres and tubes increased by 15 per cent. Although the company's production was higher than in 1970, demand could not be fully met. Dunlop's production would have been still higher, but for losses suffered at the Sahaganj factory because of power-cuts and high absenteeism — particularly in the first half of the year. Demand for industrial products, particularly conveyor-belting, could not be fully met either — owing to limitations in capacity. Following the declaration of national emergency, the company's employees worked on Sundays and holidays to produce for additional defence needs. Dunlop is the only manufacturer in the country of aircraft tyres and military tank tyres. The expansion programme for 2.5 lakh automotive tyres and tubes at Ambattur, for which an industrial licence was received in December 1969, was completed last year. That factory also started production of bicycle rims. Efforts are being made to undertake new lines of production as a part of diversification programme. The range of Metalastik rubber-to-metal bonded products was enlarged with the introduction of draft-gear pads required for the centre buffer couplers of railway wagons. Although Dunlop's total income for the year, at Rs 99 crores, was once again a record and exceeded that of the previous year by 12 per cent, pre-tax profit declined by over 14 per cent to Rs 6.03 crores. R G S Nairn, chairman, ascribes reduction of margins to the static selling prices of automotive tyres and tubes coupled with substantial increases in various cost components. He points out that growth in production volume and turnover is essential if selling prices are to be contained and a reasonable level of profits is to be earned in an inflationary environment.

KAMANI ENGINEERING, despite steel shortage in the first half, could marginally raise its production of towers and other structures during the year to September last. Production could have been considerably better, but for the strain on working capital on account of exports aggregating Rs 6.17 crores. The completion of the turnkey job in Sudan has enhanced the company's prestige in the international market. Fresh orders for execution of turnkey projects worth Rs 15.5 crores have been received from West Asia and South East Asia. As at the year-end, export orders aggregated Rs 24 crores. In order to increase its effectiveness in the international arena, KEC has started using computer for development of designs. Efforts are also being made to accelerate the management information systems to facilitate clearer and more timely managerial decisions. The rolling mill, established at Jaipur with a capacity of 20,000 tonnes per annum, will soon commence trial production. With it, the problems relating to obtaining the availability of non-rationalised and matching steel sections would be eased. The turnkey job of the hydro-power station at Ukai — one of the biggest contracts undertaken by the company and requiring deep rock excavation, heavy civil engineering work, mechanical erection and commissioning of equipment including turbines and generators — is nearing completion. With increase in margins, a small rise in turnover has more than doubled the gross profit. Equity dividend is stepped up by a point to 10 per cent and is covered 5 times as against 3.43 times previously.

NEW DELHI

Planning the Fifth Plan

THE work of framing the Fifth Five-Year Plan may be said to have formally begun with the full meeting of the Planning Commission under the chairmanship of the Prime Minister on April 7. Revision of the Fourth Plan, about which there had been much talk earlier, has now been pushed into the background. It dos not seem likely that such an effort would now be made. The step-up in Plan outlay, provided for in the Budget for the current year, would appear to be the most that the government is in a position to do to salvage what it can of the Fourth Plan. If the higher outlay can be spent effectively and a similar increase in investment is achieved next year, the Fifth Plan may yet start from a more viable base than appeared possible even a few months ago. This prospect appears to have revived interest in problems of planning to some extent. Also, the Planning Commission appears somewhat more confident about firmer and more purposeful political support to its efforts.

The drawing up of a time-schedule for the preparation of the Fifth Plan was the principal item on the agenda for last Friday's meeting of the Planning Commission. However, this is only the formal aspect of the work on the Fifth Plan. More interesting and noteworthy is the document prepared by the Planning Commission entitled "Towards an Approach to the Fifth Plan". It attempts to outline what is sought to be described as a new development strategy. To the extent it can be made the basis for the formulation of the Fifth Plan and gets the necessary political and administrative backing, it may at last end the prolonged period of *ad hoc*-ism in economic policy-making since the close of the Third Plan in the mid-sixties.

The main point of departure of the Approach paper is that the Fifth Plan must make a "direct approach to reducing poverty" and that this should become its "main thrust". The earlier plans proceeded on the assumption that a fast rate of growth of national income would create employment and higher living standards, but that the scope for reducing disparities in income and wealth through redistributive policies *per se* was limited. The Approach paper now takes the position that if one were to rely on growth alone without directly tackling the problems of unemployment and income redistribution, it may take another 30 to 50 years for the poorer sections of society to reach minimum levels of consumption.

The assumption of a conflict between growth and social justice was, according to the approach now outlined, based on the argument that whatever surplus could be created was needed for investment to raise the future rate of growth and that only a small part of the surplus could be spent to meet the requirements of social justice or improving the living standards of the people. This does appear to be an oversimplification; for, it can hardly be contended that all these years the entire available surplus has been committed to investment and that very little has been diverted to satisfying the needs of current consumption. However, the authors of the Approach paper themselves concede that the emphasis on growth in the initial years of planning has some justification. What they argue is that the economy has today reached a stage where larger availability of resources makes it possible to launch what is described as a direct attack on unemployment, underemployment, and poverty, while at the same time assuring adequate growth. To this extent, the achievements of the first phase of developmental effort are seen as the starting point of the new approach.

The claims of evolving a new strategy notwithstanding, the profile of the development effort proposed for the Fifth Plan does not appear to be radically different from that of the earlier plans — and in the Fourth Plan, in particular. The two main areas which have been given importance in the new approach are a programme of large-scale rural employment combined with a significant expansion of social services, and provision of the means of social consumption in the form of education, health services, nutrition, drinking water supply, housing, communications and electricity, particularly in the rural areas. It can hardly be contended that these schemes and programmes did not find a place in the earlier plans. What the new approach calls for is a major step-up of effort and larger outlays in these fields. The economy, as stated earlier, is probably in a much better position now than in the past for such a step-up of efforts.

The 'basic minimum needs programme', as it is called, is spelt out as follows: elementary education upto the age of 14, minimum health facilities integrated with family planning and nutrition for children, rural water supply, rural roads, rural electrification and home sites for the landless in the villages and slum improvement in the larger towns. It is estimated, very tentatively of course, that this programme, if it has to make any impact at all, will require resources of about Rs 3,000-3,500 crores in the Fifth Plan. Another Rs 7,500 to 8,000 crores would be required for the employment programmes, mainly in the rural areas, relating to minor irrigation, soil conservation, area development, dairying and animal husbandry, forestry, fisheries, warehousing and marketing, small-scale industries including agro-industries, roads and such special programmes as SFDA, MFAL and CSRE, and programmes for drought-prone areas. All of these have been included in the Fourth Plan but have been badly neglected in implementation. In this context, the Planning Commission has taken note of the importance of the administrative machinery, and recognised that without effective implementation the "considerably increased outlays on these may degenerate into large-scale doles and/or get diverted into the hands of middlemen".

In effect, therefore, what the Planning Commission is proposing for the Fifth Plan is a big step-up in outlays — of the order of Rs 11,000 crores or even more — on rural works programmes and social services. The Approach paper admits that these programmes alone cannot constitute the Fifth Plan and that in fact they will constitute the smaller part of the Plan. It is suggested that to expand the production of goods and services and to safeguard future growth, the total outlay on the Fifth Plan would have to be around twice the size of the Fourth Plan. However, the provision of larger employment opportunities and the basic minimum needs of consumption will determine the sectoral rates of growth of production and the composition of investment as well as the implied effort at resource mobilisation.

To finance the outlay envisaged, it would be necessary to raise an additional Rs 6,000 to 7,000 crores by way

of taxation during the Fifth Plan. This will mean an average additional tax effort of between Rs 250 to 300 crores per annum at the Centre and Rs 150 to 200 crores in the states. This will have its own policy implications, though the document prepared by the Planning Commission contains no fresh thoughts except for a reference to the Wanchoo Committee report on direct taxes and the Raj Committee on agricultural taxation.

The above outline of the new approach should make it clear that what is being proposed is not a radical departure from the previous plans. However, some ideas have been thrown in which, if elaborated and developed, can point to new lines of action. Stress has been laid on reorienting investment and production policies so that production of items of mass consumption receives priority. Again, radical land reforms and land redistribution are advocated and it is suggested that land ceilings should be brought down to 10 to 15 acres for irrigated land and 20 to 35 acres for unirrigated land. Land reform, it is said, would have to be a "major surgical operation rather than the usual tinkering with the symptoms here and there".

It may be taken for granted that there will be general agreement on the ideas contained in the Approach paper. The problems will arise when they are elaborated and precise programmes of action are formulated.

In its approach to the Fifth Plan, the Planning Commission appears to bank heavily on the restoration of political stability and the emergence of a strong political leadership. Speaking of radical land reforms, for instance, it says that the "government is better placed today than perhaps at any other time in the past to take up a programme of land reform which is designed to make a significant contribution towards the elimination of poverty". The Approach paper also speaks of the massive mandate received by the present government and the assurance of political stability during the period of formulation of the Fifth Plan and in the Plan's early years. This emphasis on political stability might be somewhat misplaced, considering that powerful lobbies of vested interests are still very much in existence and have to be reckoned with — as is clear enough from the fierce opposition to the Agricultural Prices Commission's recommendation to lower wheat procurement prices and to land reforms.

The issues raised by the Planning Commission in its Approach paper will come up for discussion before the National Development Council next month. The proceedings of the Council will, therefore, be interesting to follow. According to the programme drawn up in Yojana Bhavan, the final Approach paper on the Fifth Plan will be ready by September this year and the first version of the draft outline of the Plan will be out by April next year so that it can be presented to the National Development Council by June 1973. The aim is to have the final version of the Plan presented to the nation by the end of June 1973 — well before it is launched early in 1974. If this schedule is maintained, it will be the first time that a plan will be ready before it begins to be implemented.

GUJARAT

Crisis as Usual

THE new Congress government in Gujarat has had to get down to business right away. In fact, some of the newly appointed ministers have had to shuttle between Ahmedabad and Delhi even before they could move their families to their ministerial bungalows in Gandhinagar. The power and coal shortages and the slump in cotton prices have presented the government with something of an *economic* crisis. Besides, the rise in edible oil prices suggests that, as in practically every year in the past decade, the distribution of edible oil at fair prices is likely to be a major headache for the government this year as well.

The stoppage of supply from the Tarapur atomic power plant necessitated a 25 per cent cut in power supply to industrial units — a majority of which in Gujarat consists of textile and cotton ginning and pressing units. The power cut was recently reduced by half, thanks to additional supplies from Mysore. But the power shortage will continue till the middle of May when the gas turbine unit at Dhuvaran is expected to start generating electricity.

As for cotton, neither the state government (under President's rule) nor the Centre had planned any policy for the marketing of the very much larger crop this year. And so cotton prices in the state came tumbling down after the harvest. Of the crop of about 24 lakh bales, about 15 lakh bales still remain to be sold and a good deal of the rest was disposed of at distress prices by the smaller farmers. Many co-operative societies relying upon cotton cultivation and trade are on the verge of bankruptcy.

As the power supply situation shows little signs of improvement, the mills are cautious in their offtake of cotton, despite the relaxation of the ceiling on stocks. In this way the power cut and the larger cotton crop have combined to cause the near-crisis situation in the state. The cotton grower is now waiting for the Cotton Corporation to bale him out.

The power generation capacity in the state is not insufficient to meet the state's requirements. The problem is of inadequate and uncertain supply of fuel — gas and coal — for the power stations. Though gas is produced in Gujarat, its supply to the power stations is controlled by the Union Petroleum Ministry which has been haggling over its price for a decade now. Similarly though coal is not in short supply, Gujarat is starved of it because of difficulties of railway transport. Thus while under successive five-year plans large sums of money have been invested to build up sufficient generating capacity to meet Gujarat's growing demand for power, not enough planning has been done to ensure regular supply of fuel to make full use of the generating capacity created. The result is that while gas from the oilfields gets burnt and coal gets piled up at pitheads, Gujarat's power capacity remains idle and the state's industry (and now even agriculture) is every year threatened by power cuts. In this context, it is often suggested that creation of a national grid is the answer to Gujarat's power supply problem. But a national grid will not solve the problem of adequate supply of fuel to Gujarat's power stations. The new state government, now that it is of the same party which rules at the Centre, must persuade the Centre to arrive at a permanent and enforceable agreement on the question of price of residual fuel oil (RFO) and the allocation of railway wagons for transport of coal to the state's power stations.

The decline in cotton prices has been somewhat stemmed by the decision of the Cotton Corporation to enter the Gujarat market, ostensibly in a big way. But the sharp slump in cotton prices this year has shown that while the government seeks to encourage growers of cash crops to take to high-yielding varieties, it has no policy to handle the larger production that results. As it is, cotton and oilseeds have been losing acreage to wheat and bajra over the last decade. This trend may be strengthened by the mishandling of this year's bumper cotton crop. The fall in cotton prices began some weeks ago, but it took a month to persuade the Union Foreign Trade Minister, L N Mishra, to move the Cotton Corporation to enter the market. True, the Reserve Bank did go through the motions of tinkering with the margins on bank advances against cotton. But in the face of the continuing power shortage this predictably had little impact on purchases by traders and mills. Gujarat's demand for bulk purchase of cotton by CCI is difficult to resist considering that for the last four years the Food Corporation has been subsidising the wheat growers of Punjab, Haryana and UP in the face of the repeated recommendations of the Agricultural Prices Commission to lower wheat procurement prices. As it is, the belated entry of the CCI is likely to help mainly the large growers who could wait, whereas the small ones have already sold their cotton at distress prices. The large growers and the intermediaries are now organising to extract the maximum benefit out of the CCI's entry. The CCI wants to have 1969 prices as the floor, but the growers want at least 25 per cent more on the ground that use of the high-yielding varieties has raised costs by one-fourth compared to 1969.

Like the power cut, the problem of edible oil prices has become an annual ailment of Gujarat's economy. The new Minister in charge, Sanat Mehta, had in the past, as a PSP leader, led several agitations against high edible oil prices. Now as the concerned Minister he knows that he has no solution to the price rise which will reach a crisis point soon. He is toying with the idea of setting up a public corporation for procuring oil (through a levy or through co-operative purchases) and distributing it at fair prices. But this is not going to work so long as the outflow of groundnut and groundnut oil from Gujarat to vanaspati producers outside the state cannot be brought under regulation. The outflow is likely to increase further as edible oil imported under PL 480 is no longer available to vanaspati-makers.

Tailpiece: It has not gone unnoticed in Gujarat that while the commercial banks have been lending money to Food Corporation to finance its massive wheat price support operations at 8 per cent per annum, the Cotton Corporation is required to pay 12 per cent — the same as for private cotton traders and 1 to 2 per cent higher than the banks' normal *commercial* lending rates — on bank advances for its cotton purchases.

Differential with a Difference

(From a Special Correspondent)

THE decision of the government of India on differential interest rates on advances by public sector banks has come as a disappointment to all who have been following this issue closely. The exercise which was started about two years back and had raised high expectations has ended, so to say, in a whimper. It is clear that the government has meekly surrendered the initiative and succumbed to the traditional conservatism of bankers.

The statement of the Union Finance Minister refers to the policy of differential interest rates as one of the steps taken "to bring about basic changes in our economic institutions and policies for furtherance of our social and economic objectives". It is also claimed by the Finance Minister that banks will use their "ingenuity, imagination, and resources" to make the differential interest rate policy one of the important instruments for reducing disparities in income and wealth and for encouraging talent and enterprise that go waste for lack of support. The interest rate structure has thus been elevated to an instrument of socio-economic transformation, it should be wielded effectively and with purpose. There is no evidence of this in the scheme now announced.

What has finally emerged is not a policy of differential interest rates. A differential interest rate structure, as understood in plain language, has necessarily to consist of two segments —higher rates for certain categories of borrowers, i e, the affluent, and lower rates for the opposite categories. The differential should also be wide enough to make the structure meaningful. It is easy to see that what has been formulated now is merely a scheme for lending to certain vaguely defined categories of borrowers at a concessional interest 2 per cent below the current bank rate. To characterise this as a policy of differential interest rates is either a misunderstanding of language or a distortion of facts. This is indeed differential interest rate with a real difference!

The test of government's boldness and sincerity lay in its ability and willingness to charge a wide ranging differential rate, levying a higher interest rate to borrowers belonging to affluent sections. Apart from the social philosophy implicit in it, the significance of a higher interest rate for affluent borrowers would be that it would enable generation of resources and in turn widen the field to be covered by lowering interest rates for the smaller borrowers. In other words, there is a direct link between higher rates and lower rates and unless this totality is kept in view, the very rationale of differential interest rates goes overboard. The official hand-out mentions that the question of charging higher rates from the affluent borrowers is beset with operational difficulties. What these operational difficulties are and why the government is not able to solve them, nobody knows. It would not be incorrect to presume that the government is not willing to hurt these sections of people even to the smallest extent.

The details of the scheme as enunciated make curious reading. Borrowers have been described by various categories and by different sectors. Why this elaborate categorisation has been undertaken is not evident. One of the criteria for qualifying for lower interest rates—this, it should be noted, is an essential condition—that the borrowers are "prepared to work hard". It is easy to imagine how and in what manner bank managers will conduct a test for hard work! Another condition is that the borowers should become economically viable within a period of three years. About the sectors where banks should look for parties who deserve the differential interest rates, a statement on the following lines is made: "People *physically* engaged on a *modest* scale in the fields of cottage and rural industries... [for example] cutting cloth and sewing garments, making *reasonably cheap* eatables, home delivery service of articles and commodities of daily use, running wayside tea stalls, plying of *self-owned* manual rikshaw and cycle rikshaw, basket making by hand, etc. A better example of vagueness and lack of clarity would be difficult to find. It is obvious that the conditions attached to the categorisation and the illustrations would render the operation of the scheme impossible, particularly when the implementation is to be entrusted to bank managers who are traditionally opposed to lending to the smaller men and the poorer sections.

Having thus watered down the differential rate structure to one of just concessional interest rates and having further fettered its implementation by a variety of conditions, the scheme goes further to limit its own scope. The magnitude of lending for the deserving categories of borrowers

is stated to be about Rs 20 crores for the whole country. It is also stipulated that each bank should select one branch out of every 8 or 10 and in making such a selection, it should ensure that backward pockets are well represented. It is also laid down that banks will have to maintain continuous touch with the borrowers to whom the benefit of the differential is extended. The amount of Rs 20 crores works out to a mere ¼ per cent of the aggregate lending of the banks in a year.

It is obvious that the amount allotted is extremely meagre and distributed all over the country on the basis of the criteria laid down, only a small number of borrowers in each district will benefit by the scheme. The scheme will have no significant impact on the distribution of credit in the country.

It is useful to recall that the Committee on Differential Interest Rates whose recommendations have formed the basis of the present decision of the government was set up with the following terms of reference.

(i) To review the scope and the extent to which differential interest rates are already being charged by banks to borrowers in each sector.
(ii) To determine the criteria for identifying the borrowers who could be granted the benefit of a lower interest rate within each sector.
(iii) To indicate the range of the differential that could be allowed in each sector.
(iv) To examine if any other concessions could be granted either in lieu of, or in addition to, lower interest rates.

While the present decision of the government covers the recommendations of the committee in respect of the terms of reference (i) to (iii) no decision has been announced on item (iv). In fact, the Committee made a departure from its general conservative approach and recommended that depending on merits, unsecured loans could be sanctioned and unconventional items also accepted as security. It also suggested that margin requirements may even be entirely dispensed with in deserving cases and loans sanctioned to the extent of the full value of the security offered. In his dissenting note, Ashok Mitra rightly pointed out that the inequalities in the credit structure embrace margins and collateral and there is a built-in regressivity in the present arrangement regarding margins, with affluent parties receiving more favourable treatment all along the line. The government decision ignores these important aspects which, in fact, constituted the only unanimous recommendation of the Committee.

Nothing tangible seems to have emerged for more than two years on this important aspect of credit policy. There is lack of direction on the part of the political leadership and there is the usual indifference on the part of the administrative bureaucracy. In his dissenting note, Ashok Mitra rightly stressed the need for national credit planning involving allocation of credit among different sectors and groups in terms of national priorities and in line with socio-economic goals. No attention has been paid to these observations. The present position was summed up by Mitra in the following terms:

> "Bank advances have been used in the past to foster, nurture and enhance the inequalities of incomes and asset-holdings in society. Those in charge of loanable funds not only diverted the overwhelming proportion of such funds to favoured groups; the funds were offered to these groups also at relatively favourable rates, terms and conditions. If I may reiterate, I regard the task of this Committee as one to provide a scheme for the correction of this historical perversity. True, such perversities cannot be eliminated overnight. There is a certain inertia in the system which we cannot get rid of at one fell stroke; to try to do so might do damage to the production process. It is however necessary that we do not err at the other extreme, and shun exploring the range of reforms that are possible to be accomplished in the short run even within the constraints of the given situation."

The future will not perhaps be very different and years later another committee set up by the government may sum up the position in not very different terms.

MYSORE

Not Quite a New Era

THE elections to the state Assembly seem to have confirmed the trend made evident in the mid-term poll, though this further manifestation of the Indira wave was thought to be unlikely by many. For, in Assembly elections, local issues, alignments, and personalities play a more important role. Moreover, in Mysore, caste has always been a major factor in politics. It was clear that the Congress in Mysore was finding it no easy job to distribute tickets: allowances had to be made for castes, groups, regions and even districts. It was therefore expected that Congress(O) would be able to put up a stiff fight. Some commentators even forecast a comeback by Congress(O). However, the result has been a massive win for the Congress.

This turn of events has to be appraised against the background of Mysore politics prior to the mid-term poll. After the split in the Congress, Mysore remained solidly with Congress(O). The Veerendra Patil Ministry was well-entrenched. It had acquired a reputation for dynamism and efficiency. Significantly, it enjoyed the support of the two major communities in the state — the Lingayats and the Vokkaligas. Ever since the reorganisation of states, the Lingayats have enjoyed an enviable degree of political power. Every ministry since November 1956 has been headed by a Lingayat: Nijalingappa, Jatti Kanti, Patil. It is this power of the Lingayats which was really responsible for the demand for 'Old Mysore' — a cause championed, in the main, by Vokkaligas who, prior to 1956, were politically on top. For most people there was little prospect of a non-Lingayat Chief Minister in Mysore. And the prospect of a non-Lingayat non-Vokkaliga Chief Minister was so remote as not to exist.

In the light of this, the achievement of the present Chief Minister, Devaraj Urs, to build up the Congress party is quite remarkable. There is little doubt that he and his band of followers were given a tremendous boost by the mid-term poll and the Indira charisma. All the same, Devaraj Urs' efforts should not be underestimated. He belongs to a minority community. That is the biggest handicap for any aspirant to leadership in Mysore.

After the mid-term poll, the Congress received an avalanche of defections. The defections were of such magnitude that, in no time at all, the Congress was in a position to form a Ministry. That it did not do so is a tribute to the political astuteness of Devaraj Urs.

A section of the party headed by Siddaveerappa, then the leader of the Congress in the Assembly, was anxious to form a ministry. Their theory was that it is never too early to form a government. Siddaveerappa is a Lingayat who hails from Davangere, the stronghold of Lingayats in old Mysore. He was a member of K Hanumanthaiah's cabinet (1952-56). Later he was in the wilderness largely due to personal antagonism between him and Nijalingappa. Still later he joined the Janatha Paksha which consists of an odd assortment of people, largely veterans. Then he joined Congress(R).

Siddaveerappa, a very old hand at the political game, is Urs' main rival in the party. In the bid to form a ministry he was supported by quite a few Vokkaligas also, like M V Krishnappa, now an MP. Urs opposed the move. His logic was that a ministry then formed would largely consist of defectors and the party could never have a fresh team. Secondly, Urs must have seen in Siddaveerappa's haste an attempt at becoming Chief Minister. The support of some Vokkaligas for forming a ministry indicated the anxiety of the two major groups to block the emergence of a leader from a minority community. However Urs has always enjoyed the support of the High Command and has won the day.

Prior to the elections, Urs announced that he would not contest the elections — a move wrongly interpreted by many as the end of his hopes of being the Chief Minister. Actually, Urs played his cards well. Had he contested, he would have been forced to step down from the Presidentship of the party, thereby losing control over the selection of candidates. As it turned out, he supervised the selection of candidates. This is not to deny that compromises were made. In Mysore city itself, K Puttaswamy, a Minister in the Patil Cabinet, was preferred to Jayadevaraj Urs who has been largely responsible for building up the party in Mysore district. But this merely illustrates the victory of a major group — in this case the Vokkaligas — over a minor group — the Ursus. Nevertheless, Devaraj Urs was able to have a big voice in the selection of candidates.

Once the elections were over, Urs' hat was in the ring for the leadership of the party. So was Siddaveerappa's. When it appeared that a large section of the new MLAs would plump for Urs, the Lingayats and some Vokkaligas panicked. Kollur Mallappa, a Lingayat MP, appeared on the scene. In the guise of a peace-maker, striving for a consensus, Mallappa began to mobilise opinion in favour of Siddaveerappa — or alternatively himself. There seems little doubt that the Lingayats and Vokkaligas tried to form a common front against Devaraj Urs. When the party met on March 18 to elect the new leader, a resolution was passed, moved by Siddaveerappa and seconded by a veteran Vokkaliga, S Kariyappa — leaving the choice of leader to Indira Gandhi.

It is obvious now that Indira Gandhi and the High Command supported Urs because of their keenness to break the 'communal' hold over Mysore politics. Urs is the first man from outside the two major groups to emerge as a leader in Mysore. However, it is too early to assess the impact, of Urs' election as leader on the caste factor in Mysore politics. In the formation of his ministry Urs has had to make the usual allowances for representing different groups and regions. Still, there are some noteworthy features.

Siddaveerappa gets only the relatively minor portfolio of health. The hope of the Vokkaligas that one of their senior men, S Kariyappa, would be Minister for Education has been unfulfilled. The education portfolio is held by A R Badrinarayan, a Brahmin. Chennabasappa, a Lingayat, but a firm supporter of Urs, gets Public Works, although Major Irrigation has been detached from his portfolio. Finance is held by M Y Ghorpade, the Sandur prince—versed in economics and a Cambridge product. The one major portfolio for Vokkaligas is Industry and Commerce, held by S M Krishna, now an MP. But Krishna is young and enjoys a reputation for dynamism; it is not a choice to be cavilled at. An important feature of the ministry is the clean swing in the balance towards old Mysore.

Urs claims that his ministry is a blend of youth and experience. But then this is a claim made by Chief Ministers all over the country. There is some new blood which is welcome—Ghorpade, Krishna, Nanje Gowd, and one or two others. But the normal concessions have all been made.

In spite of this, the two major groups feel frustrated. The truth is that they are yet to reconcile themselves to the loss of the leadership of the state. There are already remours of a Lingayat-Vokkaliga axis against Urs. Such a caste-alignment cannot be ignored with caste being so deeply entrenched in Mysore politics. It may be too much to hope that the present success of Urs has ushered in a new era in Mysore politics.

SOUTH

Impact of the Wave

Mohit Sen

THERE is no doubt that the so-called southern states would take some time to settle down following the impact of the Indira wave. The results in Andhra and Karnataka would have repercussions beyond the frontiers of these two states, above all in Tamil Nadu where the DMK rules and in Kerala where the Congress is in coalition with the CPI, Muslim League, RSP and a few others. The wave, however has not settled issues but provided a new setting in which these would be fought out.

Incidentally, the results also indicate the all-India character of Indira! How many pundits, including those quite active in party affairs, had confidently predicted that the Indira wave would not have that kind of effect in the southern states as north of the Vindhyas. Some had based on this prediction their forebodings and, perhaps, hopes for the fragmentation of our country. Others had built an entire revolutionary strategy on the concept of regional take-overs to be followed by some linkage at some future date. They, too, are more than a little taken aback at the fairly even nature of the sweep. Both these sets of political analysts have overlooked the fact that India is not only a country of uneven development among its regions and states. It is that, of course. But it is something more also. It is also an evolving community of peoples— a community shaped by a long history as well as the united sweep of the freedom struggle. It has been further advanced by post-Independence developments which have created a unified market and a spreading material base of productive forces (including the new Indian working man) while at the same time accentuating regional disparities. Every now and again national political events demonstrate that the superstructure is responding to, being shaped by and reacting back upon these developments at the base.

It is necessary, therefore, to get some kind of clarity as to the nature of the wave and what it has accomplished. Of course, it has a many-sided content and so would its consequences be multilinear. But there is a central thrust to it. And this is the moving to positions of confused radicalism of the millions. As Lenin had said long ago, serious politics begins where the millions are and not in the overheated atmosphere of coffee shops. One has to grasp both the confusion and the radicalism. An example of this is provided by the way

in which many women of traditional Left families voted for Indira Gandhi as they saw in her the symbol of their liberation from their double oppression. And this is characteristic of large numbers of the new generation who have swung behind the Prime Minister.

Failure to understand this quite complex phenomenon leads to extremely curious political analysis producing diversionary and disruptive political slogans for action. A quite classic example of this is the now notorious "theory" that all is to be explained by "rigging". Starting from 18 constituencies in West Bengal it has spread in A K Gopalan's imagination to Andhra (though the Andhra Committee of his party has been more circumspect in this regard) and Dinkar Mehta of Gujarat has thought up a whole machine which produced stamped ballot papers! Strange "rigging" that the top leader of the West Bengal unit of the CPI(M) was blissfully unaware of anything in the offing as late as the very last day before the actual voting since he writes in the official party paper that his party would secure a majority. A "rigging" against which also not a single protest action has so far been organised anywhere in that state. One has to go into this point here since future plans of campaigns and action in Andhra, for example, cannot even begin to get off the ground if this spurious explanation was to hold the field.

It is absurd for the CPI(M) to deny that in Andhra its vehement and indiscriminate anti-Congressism combined with a concentration of fire on the CPI has led it to a total fiasco. Not only did the CPI secure seven more seats compared to its solitary win but the former's vote was about double the latter's. The undoubted initial revival of the communist movement in Andhra is clearly taking place around the CPI given the debacle of the Naxalite movement and the downfall of the CPI(M). The problem confronting this reviving movement is how to link up to and raise the level of the confused radical masses to that of concrete action for concrete radical change. Its problem is that of simultaneously winning an extending mass base which would act as the nucleus for this linkage and grow through this linkage. It cannot even begin to think of how to solve this problem if it thinks that semi-fascism has advanced through the "rigged" victory of Indira Gandhi.

A peculiarity of the situation in Andhra is that the massive Congress victory achieved on the basis of this equally massive confused radicalism has combined with a sharpening of the factional struggle within the Congress. The appeal for stability for progress has led to a return of Congress MLAs and Independents who can combine and recombine in a bewildering variety of patterns. The cross-voting in the recent Rajya Sabha elections and the subsequent suspension of prominent Congress leaders are important signals. The Congress in Andhra has never been more unstable than it is today.

The reason for this is not only that the Brahmananda Reddi faction is on the warpath. This is certainly a major factor but not the main one. The main factor is that the Congress in the state has not seriously felt the impact of the conflict over policies which had led to the dramatic division at the top in 1969. The nature of the Congress being what it is, the failure of significant policy differences developing led to the factional pre-eminence and consolidation of the Brahmananda Reddi group. It should be remembered that the separate Telengana movement which erupted at around this time also aided the process of Brahmananda Reddi being bolstered up by the very forces in the central Congress leadership which might otherwise have compelled a policy conflict if not change. And the eruption of this separatist movement also held up the coming to the fore of the challenge of the forces of radical change which for about two years were thrown on the defensive.

The result is that the change of Chief Ministership signified absolutely no change in course. As was stated in these columns at that time Tweedledum was replaced by Tweedledum, even Tweedledee did not seem to be around. Consequently the factional squabbling has erupted with full fury immediately after the elections. All the faction leaders know that in Andhra Pradesh factions cohere not so much on a caste basis and not at all on questions of ideology or policy. Factions in the state hold together mainly on the basis of patronage. This was the secret of Brahmananda Reddi's so-called power And if P V Narasimha Rao or anybody else is to finally break that power he must demonstrate that patronage can no longer be extended by the ex-Chief Minister. Naturally that doughty manipulator is not going to let this happen easily. And he is helped by the ineptitude and lack of will displayed by the present Chief Minister who does not at all seem to know what to do.

Obviously, the Left parties can have nothing to do with this faction fighting in the Congress which has absolutely no principle involved in it whatsoever. But this faction fighting certainly would help to reduce the power of attraction of the Congress as well as the capacity of the state machine to disrupt and repress mass movements for radical reforms. And it is in these movements that all the hopes of Andhra's advance are reposed. There is any amount of inflammable material around in the myriad villages of this peasant state. The increase in the spectacular forms of assault upon the Harijans is only a sign that the landlords of both types in the villages are wanting to strike down the emerging new force of the agricultural labourer who cannot now be avoided or evaded by anybody in Andhra. In his smouldering rage and new aspirations lies the strength of the state which soon enough must come into its own.

The Naxalite-Sarvodaya Syndrome

The Patnaik Case

M R

ACHARYA Vinoba Bhave's *bhoodan* (land gift) campaign, launched over 20 years ago from Pochampalli village in former Hyderabad state, was the Gandhian answer to the communist challenge that had taken the form of armed struggle linked to an agrarian programme in Telengana. Land was the key issue in the struggle. Cominform intervention forced an end to the armed struggle and CPI settled for peaceful constitutionalism in 1951. Bhoodan has since been part of the Sarvodaya movement, which functions outside the spectrum of parliamentary politics and seeks to achieve through change of heart what legislation cannot achieve. By Sarvodaya norms, even legislation is violence.

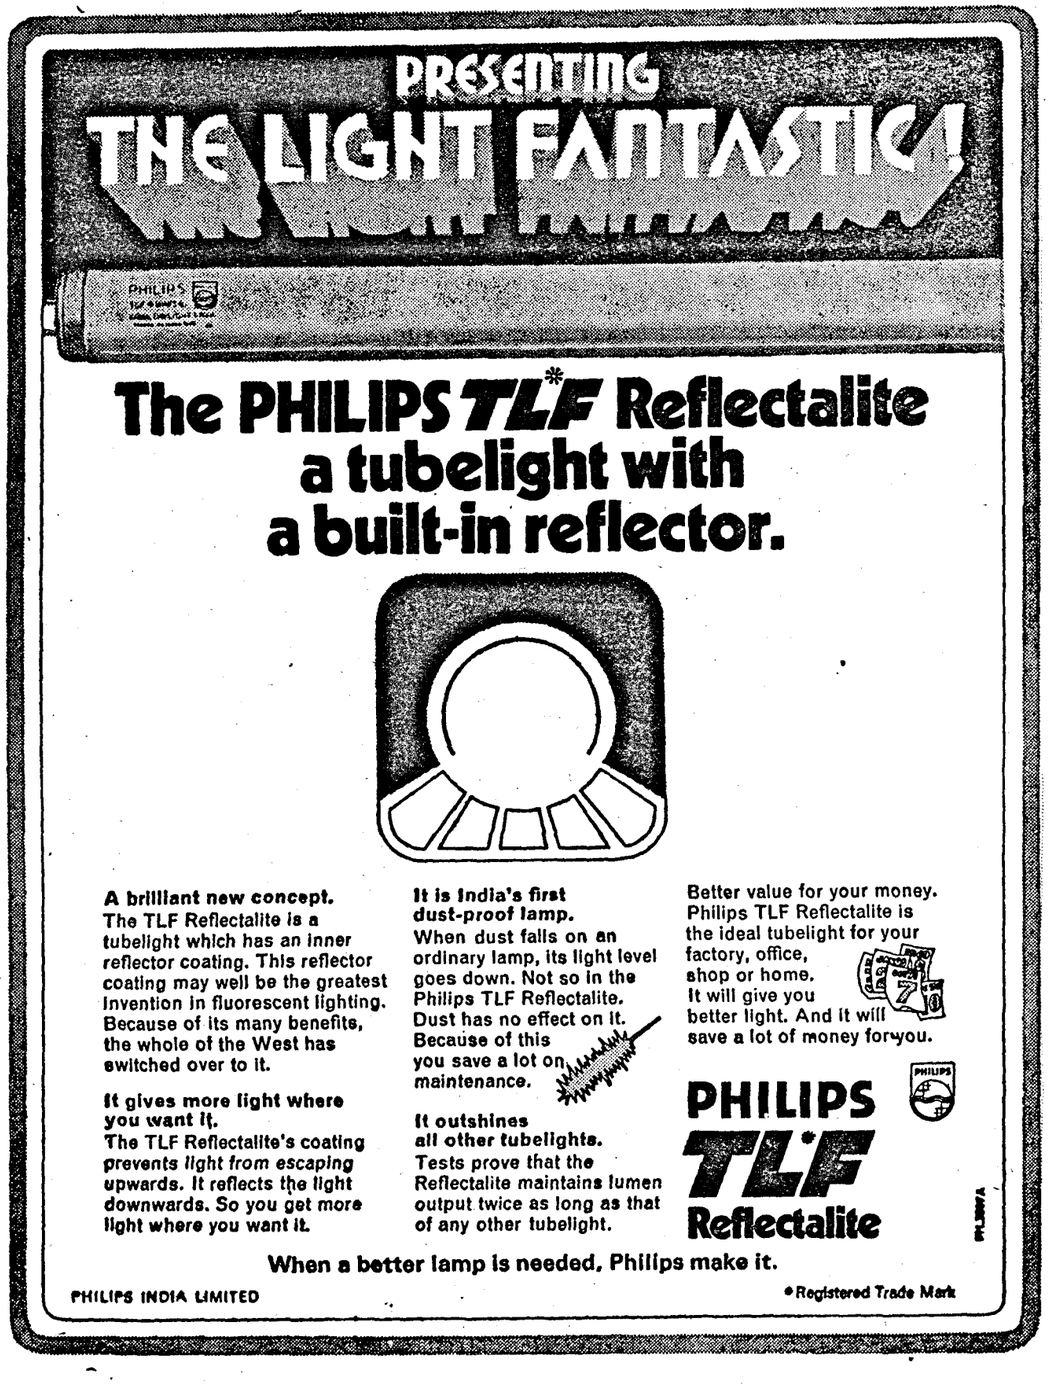
Nearly two decades of the Sarvodaya movement alongside land reform legislation have failed to solve the land problem. The minuscular Maoist uprising in the tiny enclave of Naxalbari in West Bengal underlined this failure. Naxalbari threw up more Naxalbaris, big and small — in Srikakulam, Mushahari, Debra-Gopivallabhpur, and other pockets. It also marked the beginning of the Maoist perspective in the Indian communist movement, and threw up an extra-spectrum movement which owes its relevance to the land problem. The circle was complete. The challenge posed by the Telengana armed struggle returned after two decades of Sarvodaya work and legislation. The Naxalite movement seeks to achieve, through a Maoist model revolution, what neither change of heart nor legislation and parliamentary politics could achieve. Herein lay the significance of Naxalbari.

The Rationale

It was a bizarre spectacle, when Sarvodaya leaders like Jaya Prakash Narayan were prepared to go with the Naxalites upto a point and the parting of ways began when it came to the vexed question of means. In Orissa, the Chief Minister once branded all Sarvodaya workers 'Naxalite' agents because they were sheltering wanted Naxalites and were working with them among the peasantry. Both are extra-spectrum movements aiming at solution to the land problem. Both are convinced of the futility of legislation and participation in the parliamentary system. The Sarvodaya workers are getting disillusioned with their non-violent methods too, in the face of class violence of the landlords and the violence of the State machinery which backs the landlords. Yet they are not prepared to accept violence as the means. All the same, they are willing to go a long way with the Naxalites. This is the rationale of the Naxalite-Sarvodaya syndrome.

The syndrome finds striking expression in the Nagabhushan Patnaik episode. Patnaik, a 36-year-old CPI(M-L) Central Committee member from Orissa has been sentenced to death for the murder of a landlord in Srikakulam district across the Orissa-Andhra Pradesh border. Though a lawyer by training, the unrepentant Maoist leader refused to participate in the trial or to defend himself. When sentenced to death, he refused to appeal against the judgment or plead for mercy. His father and wife have sent in a mercy petition to the President of India, several members of the Orissa legislative assembly and the Parliament have signed an appeal to the President. Jaya Prakash Narayan has written to the President pleading for commutation of the death sentence on Patnaik to a life-term.

Even a common criminal is entitled to amnesty, if he pleads for it. Here is a case where the accused had no personal motive or objective in carrying out the alleged murder. It was in implementation of his party's line of annihilation of class enemies. The inadequacy of Anglo-Saxon jurisprudence, on which our criminal law is based, stands exposed here. The only technical hurdle in the way of amnesty for Patnaik is his refusal to plead for mercy. Petitions from his aged father or his wife are inadequate from the law's point of view. Patnaik had all along held that he recognised only the people's court and that he would not defend himself before any other court or plead for mercy.



Active in the campaign to save Patnaik's life have been the Sarvodaya workers of Orissa. Ratan Das of the Orissa Sarva Seva Sangh and Nabakrishna Choudhury, former Chief Minister and a respected Sarvodaya leader, are among them.

No political prisoner has been executed after Nathuram Godse who killed Mahatma Gandhi. The system is now on trial. Another case, also from Andhra Pradesh and involving three Naxalite prisoners, provides an interesting commentary on the situation. The Supreme Court has given special leave to the state government to appeal against the High Court's judgment raising *inter alia* a question of law: Whether under the Indian Penal Code a deliberate and planned murder committed by a Naxalite was different from a murder committed by any other persons; and whether the fact one sincerely believed in political violence as the means of achieving an ideal society warranted reduction of a death sentence to a life-term.

No Faith in Bourgeois Courts

The three Naxalites were charged with the murder of a landlord in Nellore district in May 1970. The Naxalites denied the offence and pleaded not guilty, but refused to engage any counsel at the trial stage. They did not cite or examine any witness in their defence and refused to cross-examine prosecution witnesses, on the plea that they had no faith in the bourgeois courts. Even when the services of a criminal lawyer were offered to them, the Naxalites were not prepared to instruct him. The trial court sentenced two of the accused to death and one to a life-term.

In disposing of an appeal preferred by the third accused (against his life-term) and also the 'referred' trial for confirmation of death sentence on the other two, the High Court recalled some of the prosecution witnesses and gave the accused an opportunity to cross-examine them. The High Court observed that the two sentenced to death appeared to labour under the sincere belief that organised violence in rural areas, directed against rich landlords who are labelled by them as enemies of the people, would lead to a revolution, and thereafter to the abolition of inequality and to happiness, prosperity and peace for all. The High Court thought: "While it is true, on the one hand, that the accused killed an innocent person who had done them no harm, it must also be borne in mind, on the other hand, that they did not act out of any personal motive but out of what they conceived to be a public motive. They had no personal animosity against the deceased and they sought no personal gain. The means of murder employed by the accused as a step to achieve their ultimate goal was certainly blameworthy, but it cannot be said that their motive, according to their contention, was low or mean. While it

is necessary to recognise that the dictates of conscience which lead to injury to others may also merit severe punishment, sometimes it is also necessary to recognise that people acting out of genuine and passionate motives according to their conscience do not merit extreme punishment."

The Andhra Pradesh government does not share this view of the High Court and has gone to the Supreme Court in appeal. The issue simply is this: Can a political murder, which has no personal motive, be treated on par with other murders? In the past, the State has made no distinction between the two nor the courts, and have not treated them as cases of culpable homicide not amounting to murder.

The Andhra Pradesh High Court seemed to realise the implications of this in an extreme case, where the accused refused to participate in the trial. The Sarvodaya leaders are seized of the issue and are doing everything possible to save Nagabhushan Patnaik from the gallows, while the Left parties functioning within the parliamentary system are disinterested in the basic issue raised by Patnaik's conviction. Left intellectuals find it more comfortable to demonstrate for the release of Angela Davis; but to campaign for Nagabhushan Patnaik's life needs extra courage which only the Sarvodaya workers seem to possess.

DACCA

A Conversation with Bhashani

AN *open door*. No personal guards outside. No people hanging around. An ordinary, single room in the Hotel Purbani, Dacca, where so many Indian *journalists stay*. April 2, 45 minutes before his first public speech in the capital of Bangladesh. He is sitting cross-legged on the bed in a not too recently washed greyish-white kurta and lungi. Collected and calm. A slightly bent figure with a pillow on his lap and his forearms relaxing on his knees. Short, probably not much more than five foot two, happily plump, a pleasant grand-fatherly face, only slightly wrinkled for his ninety eventful years. Wispy white beard, middling length. He is quiet, but a murmur of talk among the ten or twelve simply dressed, gentle party faithfuls and working class men and two or three pious looking women in the room. Happy to see a journalist. Do I speak Bengali? No. Urdu? Hesitation on my part. (Have been told that Urdu-speakers are not too popular.) So I say I speak Hindi, not Urdu. Decidedly he says, he will speak in Urdu. No opening question from me. But without any prompting he launches into a softly spoken, very articulate, unhesitant but rambling, discussion — mostly monologue — in chaste but unpretentious Urdu.

His first remark: "If you want to know about Bangladesh, find out about its kisans and mazdoors". Then a long statement on how East Bengal has always been exploited. By the landed classes and the Marwaris before 1947 and the Pindi regime after that. Digression into political history, much of it early twentieth century. Congress' Surat split of 1907. The factions. The Muslim League. Reference to the convolutions and contortions of nationalist politics. All the changes, but no change for the people. Unlike most other political leaders, he does not refer to personalities at all in his 15 minute historical narrative. Then he switches to today. The price of rice has gone up to Rs 80 per maund. Even during the worst part of the Pakistani occupation the price was Rs 30. "The kisan or mazdoor earns one rupee a day. Half the population are women. They usually earn half what the men get. With one and a half rupee per day per family, how can they manage? They cannot buy anything. During the fighting the price was thirty rupees. Now due to chorbazaari it is eighty rupees. Smuggling to India is the problem... We are grateful to India but due to those who smuggle the friendship could come to an end. That is why Marwaris and smugglers must be kept at bay by India... Pindi ke Marwari aur bhi behtareen hai! (Pindi's Marwaris are even smarter!)." Further discussion on Marwaris and their bothersome role.

"One is not Hindu or Muslim; there are poor everywhere in India and Bangladesh.... Rasta revolution hai (The path is revolution). Your Prime Minister has said that there will be socialism through parliamentary means. Our Prime Minister also thinks like your Prime Minister. But this has never happened anywhere. Socialism can only come through revolution." I manage to push in a question: "Who, which party, group, is going to organise for, bring about, the revolution?" Bhashani: "The Krishak Samiti and National Awami Party will play some part in bringing socialism through revolution. The kisans are becoming conscious of being a separate kaum (community with a definite identity) and not being just Hindus or Muslims. This consciousness will bring about revolution." I interject: "Mujib is popular." Bhashani: "Naya cheez mazedaar hota hai (A new thing is fun, tasty)". (The reference is evident.) Then, perhaps, thinking of the future of the Awami Lague, he goes back to the fate of the Muslim League. (But this is only conjecture on my part.) He says: "The same Muslim League that created Pakistan is now dead. Hamare log zindabad zor se lagate hai aur murdabad bhi zor se lagate hai (Our people shout 'long live' loudly and they also shout 'death to' loudly)."

Rather cussedly I come back to the organisational aspect of revolution and ask again: "But which group is organising the people?" Bhashani: "Kisan khud-b-khud organise kar rahe hai." Gives me the feeling that he has an almost sentimental faith in the peasantry. I add: "What do you think of the Naxalites?" Bhashani: "Naxalites ham pasand nahi karte (We dont like Naxalites)." "Why?" "They have no programme. They are not for the kisans, the people." This is the only occasion where his tone is sharp, curt.

Then we ramble on again and he talks a little about himself, for the first time. He takes pride in always having been in opposition. And says that he will always continue to oppose (the Establishment). "Getting power is not difficult. It is more difficult to do something with that power. No government (in East Bengal, in the subcontinent?) has done anything for the poor."

Someone interrupts and says that the Maulana is getting late for his public meeting. I try to retreat. He insists I must have tea. But no tea available. As I get up he puts one, then another, banana into my hand, saying that I should not leave empty-handed. I cannot but help liking this kind, gentle, incorruptible man of the people. But I dismiss any vague ideas of a Bengali Mao that I might have had before, as I leave the room.

— J L

ITALY

Marx plus Madison Avenue

THE thirteenth congress of the Italian Communist Party (PCI), which took place in Milan in the middle of March, was unusual in several respects.

First of all, this was the first congress held during an election campaign. The premature poll was ordered because of a serious political crisis. Secondly, it was the first congress of the Italian party in the post-War period which was not preceded by a draft thesis setting out the guidelines. This would imply a more democratic pattern of discussion than on earlier occasions. Thirdly, the congress marked the change of guard which brings to the top a man whose political maturing took place after the War. Bowing out was the aged ailing 72-year-old Luigi Longo, a veteran of the Spanish war and companion of Palmiro Togliatti who laid the foundations of an ideological thesis which helped Western communist parties to break away if they wished from the central direction of the Kremlin. The successor is 49-year-old Enrico Berlinguer whose non-revolutionary temperament makes him something like the chief executive of Siemens or Philips. The proceedings of the Milan congress are of special interest because the PCI is the world's best organised non-ruling communist party.

Immediately after the War, when de Gasperi led the Christian Democrats to power in Italy after more than two decades of fascist rule, one South Indian newspaper headlined the event as "Italy rejects communism". But the democratic experience of Italy since the War has been bedevilled by the splintering of non-communist parties. In recent years, political factionalism has reached such a stage that one would need a knowledge of integral calculus to assess the impact of each one of the numerous parties.

The Italian elections are scheduled for May 7 and 8 and Berlinguer, in his report to the congress, said: "We are the only party which can give guarantees, after defining the programme and political proposals which we will present to the electorate". Three years ago, when the congress met in Bologna it had to acknowledge a decline in its popularity. Between the end of 1969 and the end of 1971 it added some 20,000 new members. And Berlinguer claimed that this year the party added 80,000 new members including 18,000 young people, taking the membership tally to 1.6 million.

Berlinguer's report, sprawling across five full pages of the party paper, *L'Unita*, concentrated on domestic matters — a sort of election manifesto. The Milan Congress marks a significant departure which confirms the non-revolutionary approach of the PCI today in a country which has become heavily industrialised and prosperous, thanks to more than a decade of rapid growth, fortified by the Common Market. At Bologna three years ago, the PCI changed its stand to constructive opposition from the earlier campaigns of continuous struggle. This constructive opposition meant non-participation in the central government in Rome but influencing the government from inside parliament, and a bid for regional and commune authority. Now the PCI is presenting its claim to a share in government, provided it is an administration which sets its sights on "democratic renewal". The face the PCI is presenting to the electorate is that of a prudent and reasonably party which wants to be democratic.

As Berlinguer put it in his emphasis on the need to give a new political direction: "In a country like Italy, a new perspective can only come about through the collaboration between the three great popular currents: communist, socialist and catholic. For this collaboration, unity of the left is a necessary but not a sufficient condition.... We are disposed to assume our responsibilities."

Berlinguer, in his report to the congress, went on explain why participation in government can now be justified. He said: "Participation is admissible on two hypotheses. The need to face a reactionary attack which creates a situation of emergency for the fate of democracy, or the existence of conditions which allow the implementation of a programme of renewal which has the conscious and active support of the great masses and tends to strengthen the unity of the workers. The nature of the Italian crisis is such that these two conditions tend today to coincide."

In Berlinguer's view, the PCI does not seek an enlargement of the centre-left coalition which has tried to manage Italian affairs for some time. It proposes doing away with it, and "the ending of the anti-communist discrimination".

Co-operation with the communists has emerged as a major issue even for the Christian Democrats. The PCI chief put this "as the central problem of the life of our country". The PCI strategy involves appealing to the Socialists and the left-wing Catholics. The leftist groups among the Catholics are the more important, and the PCI aim is to splinter the Christian Democrats and create a break-away leftist catholic group which will co-operate with the socialists and the communists. If the PCI strategy is to have any chance of success in the next elections, the Christian Democrats would have to lose both to the rightists and the leftists. The rightist bogey is necessary to make the communists acceptable.

Berlinguer went out of the way to be soft in his speech to the Socialist PSI which has been co-operating with the PCI in local and regional administrations. The PCI's aim is the destruction of the centre-left coalition which has been a feature of Italian politics during most of the sixties. The PCI wants the loose arrangements to be replaced by a strong leftist majority rule, with communist participation. Immediately after the Milan Congress, the PSI secretary, Giacomo Mancini, rejected the ground rules set by the communists. The PSI said it was not giving any undertaking not to join yet another centre-left coalition.

The more Marxist sections lost no time in mocking at the constitutionalist pretenses of the PCI. The pragmatism of Berlinguer can be praised as political flexibility or condemned as opportunism pure and simple. The PCI chief's report went to the extent of saying that further nationalisation measures were not generally necessary on the economic front. The PCI described the role which private enterprise can play. In what is possibly an appeal to the Catholics, the PCI declared its opposition to the permissive society and easy divorce!

One European commentator has described the Italian Communist Party as a "compound of Marx, Machiavelli and Madison Avenue". While the PCI has stated that it will not be permissive on a matter like divorce, in the economic field a permissive attitude to the private sector is evident. This attitude came out clearly in a series of interviews in the left-wing Italian magazine, *L'Espresso*, given by Luciano Barca, a member of the central committee and others. Barca talked aloud of the need for a great increase in social consumption like houses, schools, hospitals which could win the support of a wide-based alliance for progress. "We hold," Barca added, "that private enterprise will have its own role to play at every level, provided that it is conditioned by clear programmatic and political options".

Barca did not fight shy of borrowing ideas from Wall Street when he described the American Stock Exchange regulations as the basis for reforms of the Italian stock exchanges, to convert the Italian bourse from a speculative centre into a financial market. Fiat need not be taken over, it would only have to reduce its emphasis on private cars and produce more public transportation vehicles.

Naturally, the PCI reasserted its independence from the Kremlin, at the Milan Congress. "The socialism which we propose to build in Italy", it said, "does not seek to copy any of the existing models which are based on economic, social and cultural situations which are different from ours. The socialism which we want will be what our working class and our people want it to be."

KATHMANDU

Hopefully a New Chapter

Bhola B Rana

NEPALESE Prime Minister Kirti Nidhi Bista begins a fortnight's offical visit to India on April 17. Bista was originally scheduled to visit India last December. But then the war with Pakistan erupted. Immediately after the war Delhi was preoccupied with the state elections which again forced the postponement of the Prime Minister's visit to India.

Bista knows India well and has travelled widely all over India. He studied at Lucknow University for his Master's degree in Political Science. His old university will confer an honorary doctorate on him when he returns to the UP capital, this time as the Prime Minister of Nepal.

Bista has established close personal contacts with the present Indian leadership during various missions to India and the visits of Indian leaders to Nepal. He will, therefore, be in the midst of old friends — a factor which should help in initiating a fruitful dialogue between the leaders of the two countries. For Bista, personally, the visit could not have been better timed. He has outlived the anti-India image that was tagged onto him, presumably because of his demand in 1969 for the withdrawal of Indian military personnel from Nepal's northern border with China. Ruffled feelings have now been soothed and there is increasing awareness in official Indian thinking that the withdrawal call was not made at the instance of any foreign power and that, in asking for the withdrawal, Nepal was only trying to make its non-aligned policy more meaningful — a process which is in the interest of non-alignment and also in the long-term interest of better understanding between India and Nepal. The withdrawal of Indian military personnel has, in fact, made it possible for Nepal to become more cordial towards India without incurring the displeasure of China. The presence of Indian military personnel was not beneficial to Sino-Nepal relations nor did it help Nepal to adopt policies which would promote a closer Indo-Nepal relationship.

To cite another instance of misunderstanding, Nepal's demand for an alternate overland transit trade route *via* the Indian town of Radhikapur on the Bangladesh (then East Pakistan) border raised a hornet's nest in India and delayed the signing of the Indo-Nepal Treaty of Trade and Transit for about nine months. When the Treaty was finally signed after much haggling, Nepal did not get the transit facilities it wanted through Radhikapur. India then interpreted Nepal's demand as politically motivated although New Delhi has now agreed to provide those very facilities after the creation of Bangladesh.

Nepal's future trade with Bangladesh is expected to figure in Bista's talks with Indira Gandhi. India envisages a tripartite arrangement between itself, Bangladesh and Nepal in order to start the flow of trade between Nepal and Bangladesh. Kathmandu has already placed an order in Bangladesh for three hundred tonnes of newsprint which is in short supply in Nepal and is keen to export stone chips for construction purposes to Bangladesh. A trade delegation will shortly be flying to Dacca to explore the possibilities for development of trade between the two countries. India wants to curb the outflow of unwanted commodities into its territory from Nepal. But if, for this reason, India places severe administrative and inspection checks on Nepal-Bangladesh trade, it would be impossible for Nepal to develop trade ties with Bangladesh under such circumstances.

Recent developments, like the emergence of Bangladesh and the rapprochement between China and the United States, have led to new power equations in the South Asian region. While Nepal has welcomed the moves towards normalisation of Sino-US relations as a vindication of Kathmandu's policies there is obviously growing scepticism in India over the nature of the Sino-American *detente*. The Indo-Soviet Treaty of Peace, Friendship and Co-operation, in the Nepalese view, seems to have furthered the Soviet aim of embracing South Asia in a collective security scheme which would include Nepal. Kathmandu is averse to such a security system because it is aimed aganst China with whom Nepal enjoys friendly relations. These developments in South Asia are expected to figure in the Bista-Gandhi talks. Committed as Nepal has always been to an absolutely neutral policy in regional affairs, it will be surprising if it abandons its present policy of maintaining an equidistance between Peking and New Delhi, despite the emergence — with Soviet backing — of India as the dominant power in this region.

Bista's visit to India has been described as purely a "goodwill" mission. However, the leaders of the two countries will, no doubt, utilise the opportunity to review several aspects of Indo-Nepal relations, particularly economic co-operation between the two countries. Despite its commitments to Bangladesh, India is expected to offer additional assistance to Nepal for the construction of the central sector of the Mahendra Rajmarg which is an ambitious plan to link east and west Nepal by a five hundred mile motorable road. India has already agreed in principle to construct the central sector of this road at an approximate cost of Rs 22 crores. The eastern sector linking Itihari with the sacred city of Janakpur has almost been completed with Indian assistance. Indira Gandhi is also expected to convey India's readiness to buy power from the proposed Karnali hydel project in west Nepal to meet the current shortage of power in parts of UP. The Karnali scheme is as ambitious as India's Bhakra Nangal project. When it is finally completed, the entire economic picture of west Nepal will change, bringing Nepal very large revenues from the sale of power alone to India. The lack of a market for the power to be generated by the Karnali hydel scheme was stalling Nepal's efforts to get the plan beyond the drawing board.

India is apparently very keen to reassure the new and youthful King Birendra of its best intentions towards Nepal. It is not a mere coincidence that the Nepalese Prime Minister has chosen to visit India first before going on missions to other countries. This will be his first foreign visit after the unexpected death of King Mahendra three months ago. Bista's visit to India underscores the importance that Kathmandu attaches to its relations with New Delhi.

Union Bank of India

Report of the Board of Directors

THE year 1971 saw bank deposits far outstripping bank advances. This was because of much better accretion to deposits on the one hand and lower demand for bank credit on the other, as compared to the previous year. Despite the fact that during the year National Income increased by only 4 per cent and industrial production was in a state of near stagnation, the aggregate deposits of scheduled commercial banks increased from Rs 5,685 crores on the last Friday of December, 1970 to Rs 6,856 crores on the last Friday of December, 1971, thus registering an increase of Rs 1,171 crores or 20.60 per cent as compared to the increase of Rs 808 crores or 16.58 per cent in the year 1970. On the other hand, as a result of subdued industrial activity the demand for bank credit was on a low key. During the year bank advances increased by Rs 514 crores, from Rs 4,452 crores to Rs 4,966 crores, i e, an increase of only 11.54 per cent as compared to the increase of Rs 836 crores or 23.13 per cent in the previous year. Consequently, by the end of the year, the credit-deposit ratio had declined from 78.32 per cent to 72.43 per cent.

Compared to 1970, the branch expansion programme of scheduled commercial banks slowed down a bit in 1971, with only 1,805 new branches being opened in the year as against 2,137 opened in the previous year.

In the above background, Union Bank's performance during the year under review was quite satisfactory in all respects, despite some unfortunate spells of industrial unrest.

The Bank's deposits at the end of 1970 which stood at Rs 163.79 crores (after disregarding, as clarified in the last year's Report, Rs 11.95 crores of application money in respect of a new share issue, placed with the Bank in current deposits during the last fortnight for a very temporary period) rose to Rs 197.34 crores at the end of 1971, i e, an increase of 20.48 per cent. If the deposit figures of the last Fridays of 1970 and 1971 are compared, the Bank's growth rate came to 28.39 per cent as against 20.60 per cent for all scheduled commercial banks.

Traditionally, in the deposit-mix of the Bank, the current account deposits have always been preponderant. This trend changed during the year under review. As in the Banking system as a whole, the Bank's time deposits expanded at a faster rate of 27.48 per cent than demand deposits which increased by 15.64 per cent. As a result, time deposits constituted 43.25 per cent of the total deposits of the Bank as against less than 41 per cent in the previous year.

Another redeeming feature of note in deposit mobilisation during the year under review was that, contrary to popular notion, the Bank's branches in rural areas achieved a very encouraging deposit growth rate, as can be seen from the following table showing area-wise distribution of deposits of the Bank:

(Rupees in lakhs)

Area	Total deposits at the last day of		Increase during	Percentage Increase during
	1970	1971	1971	1971
Metropolitan	91,97.84	106,96.74	14,98.90	16.30
Urban	41,91.46	51,65.69	9,74.23	23.24
Semi-urban	19,44.18	24,08.73	4,64.55	23.89
Rural	10,45.82	14,62.68	4,16.86	39.86
Total	163,79.30	197,33.84	33,54.54	20.48

Though the demand for credit was perceptibly low for the major part of the year, the total advances of the Bank, as at end of 1971, reached Rs 135.34 crores (including Rs 5.00 crores for food procurement) from Rs 111.54 crores at the end of 1970, i e, an increase of Rs 23.80 crores. This increase of 21.34 per cent is well below the increase of 28.95 per cent during the previous year, but compares quite favourably with the increase of only 11.54 per cent in the banking industry as a whole. In line with the trend of declining credit-deposit ratio of all scheduled commercial banks, which dipped from 78.32 per cent on the last Friday of December 1970 to 72.43 per cent on the last Friday of December 1971, the Bank's credit-deposit ratio also declined from 76.02 per cent to 69.75 per cent during the corresponding period.

The Bank's assistance to the priority and hitherto neglected sectors increased at a faster rate than the growth rate of total advances during the year. Credit to these sectors increased from Rs 43.30 crores to Rs 57.07 crores i e, by Rs 13.77 crores. Thus, though the Bank's total advances during the year increased, as stated before, by 21.34 per cent, its advances to priority sectors improved by 31.80 per cent. If, however, the traditional priority sector of exports was excluded, the growth in the Bank's assistance to other sectors claiming socio-economic priority amounted to over 44 per cent. Admittedly, the growth rate of 31.80 per cent does not compare well with the growth rate of 59.02 per cent by the Bank in these sectors during 1970. Apart from the fact that growth in the first full year after nationalisation, when the banks diverted their attention to these sectors for the first time, was bound to be steep, the comparative slower growth in 1971 can also be attributed to the overall sluggishness in the economy. Yet, the share of advances to the priority sectors in the total advances portfolio of the Bank improved from 38.82 per cent in 1970 to 42.18 per cent in 1971. Considering that investible funds increased by Rs 22 crores, the diversion of as much as Rs 13.77 crores to the priority sectors measures upto well over 62 per cent of the incremental investible resources of the Bank. Table A on p 799 reveals that the Bank's lending operations are characterised by an increasing emphasis on assistance to priority and neglected sectors.

In the matter of branch expansion, it was felt that in view of the acute personnel constraints the Bank should concentrate on consolidation of its position before embarking on further expansion. The Bank, therefore, opened 59 branches only during the year under review as compared to 101 branches in 1970. This lower rate of branch expansion was in line with the expansion of commercial banks as a whole. Out of the branches opened during the year, 49 were opened at centres having population of less than 1,00,000,

Area	Union Bank of India			All Commercial Banks		
	June 1969	Dec 1971	Percentage Increase	June 1969	Dec 1971	Percentage Increase
	No	No		No	No	
Rural	47	136	189.4	1832	4889	166.9
Semi-urban	59	121	105.1	3322	4224	27.2
Urban	62	89	43.5	1447	1850	27.9
Metropolitan and Port Towns	72	87	20.8	1661	2022	21.7

of which 39 were in unbanked centres. With the opening of 17 new branches in the Bank's Lead Districts all the identified centres allotted to the Bank have been banked. The vigorous branch expansion programme implemented by the Bank since nationalisation, with a bias towards non-urban centres, is reflected in the figures at end of column 2 on p 798.

As a first step towards intensifying the Bank's assistance to the hitherto neglected sectors, the schemes in force in the Bank were re-aligned with the recommendations contained in the Thakkar Committee Report. Several special schemes have already been implemented and various others are under process of implementation. Schemes have been evolved and implemented for artisans, craftsmen and other categories of self-employeds like handloom weavers, bamboo-mat weavers, potters, bangle-makers, rope and broom-makers, basket weavers, toy-makers, launderers, etc. and for transport operators including rickshaw and hand-cart pullers, and educated self-employeds like engineers and women holding diploma in dress-making. Similarly, schemes have also been devised for gainful employment to retailers like hawkers dealing in eggs and dry fish and fruit and flower vendors. Apart from such schemes for direct assistance to these sectors, the Bank has entered into an arrangement with the Invention Promotion Board to finance the inventors for commercial exploitation of their inventions patented and approved by the Board. Under similar arrangements with financial institutions notably Uttar Pradesh Financial Corporation Ltd, Kerala State Finance Corporation Ltd, and Gujarat Industrial Investment Corporation Ltd, the Bank provides working capital assistance to such units as have been financed by the Corporations for their fixed capital requirements.

With the completion of the survey reports in respect of all the five lead districts allotted to the Bank, attention was directed towards effective implementation. Initially, the Bank had set up one office for the four lead districts in Uttar Pradesh and one in Ernakulam district in Kerala, to exclusively look after the lead bank operations. With a view to intensifying the developmental efforts, an additional Lead Office is being set up in Azamgarh in UP. As noted earlier, all the centres identified in the survey and allotted to the Bank have now been banked. Emphasis is now being placed on initiating new schemes for assistance to borrowers in these centres. Besides, the developmental process being a continuing one, it is proposed to undertake further surveys with a view to assessing the impact of the Bank's developmental efforts so far and locating fresh credit gaps. Special schemes like finance to handloom weavers in Varanasi, carpet-weavers at Bhadohi in UP, and bamboo mat-weavers in Ernakulam were evolved. District Consultative Committees have been set up in all districts with a view to seeking co-operation from officials of State Governments and representatives of other local bodies, in the developmental efforts of the Bank.

In consonance with the qualitative changes brought about in the Bank's functioning during the last few years, the Bank's organisational set-up was closely reviewed and redesigned. Apart from suitable re-structuring of management at the centre, new levels of operation management have been created in various regions as a further step towards decentralisation.

Significant efforts were made during the year to bring about far-reaching and qualitative changes in the training programmes conducted for staff at various levels at the Bank's Staff Training College in Bombay. The training programmes have been geared not only to cope up with the quantitatively growing requirements but also to equip the Bank's personnel in handling operational and organisational problems that have assumed new dimensions in the recent past. The process of redesigning the existing training programmes initiated last year was continued and during the year the curriculae were further revised. Besides the new specialised courses for financing agriculture and small-scale industries, a new programme in the form of a workshop for the senior personnel in the Central Office designed to develop decision-making skills was also introduced during the year. So far, the training of the new entrants was confined to on-the-job grounding and had remained the responsibility of the Branch Managers or departmental heads. With rapid expansion, at several branches officers with short service and limited work experience had, of necessity, to be posted to responsible positions. These personnel, themselves imperfectly trained, could hardly be expected to train others. In the circumstances, training centres for new entrants became a necessity. With this objective, Regional Training Centres were planned at a few centres. One has already gone into operation in Bombay, where three Induction Courses, each of four week's duration, have been conducted before the year ended.

With a view to improving the standard of customer service and reducing operational costs the Bank had, as reported last year, initiated rationalisation of procedures, most of which had a great safety and security bias. The effect of these changes and innovations is reflected in improved profitability in the year under review. Despite the fact that in

1971 the Bank absorbed a substantial burden of establishment expenses arising from the revision of pay scales and emoluments of the officer staff, the net profit of the Bank, after making all usual and necessary provisions, amounted to Rs 74,05,467.18 which has been appropriated as under:

1970		1971
Rs		Rs
9,75,000.00	Amount transferred to Reserve Fund in terms of Section 3(6) of the Banking Companies (Acquisition and Transfer of Undertakings) Act, 1970.	18,00,000.00
21,50,000.00	Amount provided for Bonus to Staff.	37,55,000.00
17,48,826.75	Balance amount to be transferred to Government in terms of Section 10(7) of the Banking Companies (Acquisition and Transfer of Undertakings) Act, 1970.	18,50,467.18
48,73,826.75		74,05,467.18

The year under review witnessed an unfortunate setback in the hitherto cordial industrial relations in the Bank, culminating in agitations and strikes. Both the Management and the workmen's Union are actively engaged in taking steps for restoring the old harmonious relations. It is hoped that with proper appreciation of, and mutual respect for, each other's role and areas of functions there should be no room for conflict.

In conclusion the Board express their thanks and appreciation to the Custodian, Executives, Officers and other members of staff, but for whose hard work and devotion to duty these results would not have been possible.

For and on behalf of the Board,

P. F. GUTTA
Custodian

Bombay,
29th March, 1972.

THE FOURTH ESTATE

A Range of Vested Interests

Nireekshak

THE big newspapers are in a quandary. With newsprint quotas trimmed, a bill to regulate prices of newspapers passed, and the prospect of advertisements attracting tax, it cannot be otherwise. To top it all, the possibility of a newspapers ownership diffusion bill in the next session of Parliament hangs like the sword of Damocles over them.

The mouthpiece of the big newspapers, the Indian and Eastern Newspaper Society, has done much lobbying in Delhi recently, but it has failed to extract any assurance from the government that the *status quo* will continue. On the other hand, the Indian Federation of Working Journalists — whose sole right to represent the working journalists has been recently challenged by the newly formed National Union of Journalists — is gradually building up political pressures for changes in the structure of the newspaper industry.

Interestingly, both the I&ENS and the IFWJ base their case on the recommendations of the Press Commission set up almost 20 years ago. The I&ENS has discovered there a case for *status quo*, while the IFWJ interprets the recommendations to be revolutionary. Since the Press Commission submitted its report in 1954, many changes have come about in the Indian press — some of them not even contemplated by the Commission. It is high time to investigate how these changes have affected the functioning of the press. Another Press Commission is called for.

The big newspapers also constitute the quality press, because, with their huge financial resources earned mainly from heavy advertising, they can afford quality editorial services. They can also provide the widest news coverage. Wages apart, the facilities the big newspapers extend to their correspondents, earn the envy of many a journalist working on small newspapers, though few would like to see these trimmed. What the IFWJ and other professional bodies want is their extension to the have-nots in the profession. The IFWJ has a grouse not against the journalists working in big newspapers but against their proprietors who, having other businesses, besides newspaper business, try to use the mass media controlled by them for purposes other than journalistic.

MISPLACED ATTACK

But in their crusade against the big newspapers, the government and the IFWJ often take untenable positions. For example, addressing the Newsprint Advisory Committee last week, the Minister of State for Information and Broadcasting, Nandini Satpathy, said that the growth of bigger newspapers was unhealthy because their economy was based "More on advertisements than on circulation". The *Hindustan Times* was quick to catch the Minister on the wrong foot and editorially commented: "Apparently the Minister of State for Information has little idea of the basic facts of newspaper publishing. There must be few, if any, newspapers anywhere in the world where there is a free press whose overheads or even direct costs are fully met from circulation revenues. A newspaper is one product which is frequently priced below its actual cost — and for good reason. If a reasonable measure of advertising support were not available, newspapers could not sustain their sizeable costs on paper, printing, and editorial services, and would either have to be priced far beyond what the average reader could afford to pay or would have to be heavily subsidised, thereby undermining the freedom of the press. It does not need the proposed fact-finding committee on newspaper economics to discover this basis fact."

Kashmir has always provided good news copy. It was so again last week. The release of 164 political detenues in the state and the withdrawal of the externment order on Begum Abdullah provided the occasion. Then followed the statement of Mohiuddin Karra, president of the Jammu and Kashmir Political Conference, that he and his party have accepted the view that the state's accession to India is final. Karra made no secret of the fact that the recent events in Pakistan and the emergence of Bangladesh made him and his colleagues change their earlier views on accession, though they would still like to bargain on the quantum of autonomy that the state enjoys within the Indian Union. Sheikh Abdullah also expressed similar views in his interviews with the correspondents of *Reuter* and the *Times*, London. This change in Kashmir's political climate has been editorially noted by most newspapers.

KASHMIR ISSUE

The pro-RSS-Jan Sangh English daily, *The Motherland*, has welcomed Karra's statement and "the new mood in the state"; but in the same breath it struck a note of caution: "The way Shri Karra has raised the issue of autonomy while eschewing secessionism is not a good augury. All kinds of reactionaries are likely to flock to his new banner and try to vitiate the atmosphere in the state. Shri Karra's suggestion that Sheikh Mujibur Rahman should mediate on the question of 'securing a place of honour and dignity for Kashmiris' is sinister. There is a lesson for the Centre also in this. At the root of the autonomy demand is the 'special status' mistakenly given to Kashmir in the Constitution. How Sheikh Abdullah got Article 370 inserted in the Constitution has been exposed in the recently published book, "Sardar Patel's Correspondence". There is nothing in the Instrument of Accession signed by Maharaja Hari Singh to warrant any special status for Kashmir. Now is the time to have Article 370 scrapped."

The *Hindustan Times*, which has been a staunch critic of the Central Government on the Kashmir issue, has also hailed the "welcome change in Kashmir politics" and has discussed the "new opportunities opening for reconciliation in Jammu and Kashmir" which, it insists, "must be seized". The paper is confident that "an honourable reconciliation of opposing viewpoints, without prejudice to Indian sovereignty and vital interests, is possible and many past wrongs will automatically be dissolved in this reconciliation which will also give fulfilment to the aspirations of the people of Jammu and Kashmir. An internal settlement on these lines would greatly strengthen the Government of India's hands when it comes to negotiating a settlement with Pakistan."

Hindustan Standard of Calcutta sees developments in Kashmir from a different angle. "This [Karra's changed attitude] may shock all those who were hoping that the Bangladesh developments would help secessionist trends in Jammu and Kashmir. There is no state in India which does not want more powers for itself and Mr Karra's revised demand should not attract official opprobrium as long as he seeks an accommodation within the framework of the present relationship between the Union and the state."

OCCASION FOR PUNGENCY

The recognition of Bangladesh by the United States Government was another important event of the week. That it came late and was more or less expected deprived it the first lead position in the newspapers. But it did produce some hard-hitting editorials. Most pungent was New Delhi daily *Patriot's* comment. Wrote *Patriot*: "Mr Rogers who spoke on behalf of Mr Nixon and his mentor, Dr Kissinger, has shown them (Peking and Islamabad) how easily a bitter pill can be swallowed. Without batting an eye-lid and magnanimously forgetting that the Seventh Fleet task force would have suppressed the freedom of the people of Bangladesh, if it only could, the US Secretary of State talked of the 'good wishes of all the American people' and hope of "good relations with the new country'."

Hindustan Times saw in American action "its willingness to take a second hard look at the realities of South Asia and adjust its policies to them". Commented the *Indian Express*: "In the circumstances, the US recognition proceeds from a situation of weakness rather than strength. That fact seems to have escaped the notice of President Nixon and his advisers. It has not escaped the notice of some other people." According to Bombay's *Free Press Journal*, US recognition of Bangladesh is part of a calculated strategy. "If things cannot be brought back to the pre-March 1971 level, then the next best thing surely is to establish some leverage in Dacca so that India at least may be put in its place. Putting India in its place is also Peking's declared objective, *vide* the Sino-American communique."

'April fool' reports are not the Indian press's cup of tea. But the press does take delight in reporting how other newspapers elsewhere in the world fooled their readers. The story filed by the *Associated Press*, as to how the Jakarta newspaper *Indonesia Raya* fooled its readers by reporting a coup in the Portuguese part of Timor located between Australia and Indonesia, has been used in most provincial dailies. According to *AP*, one of the victims of the Jakarta newspaper's hoax was the Foreign Minister of Indonesia, Adam Malik. Someone in this country too played the April fool joke with Air India: a bomb scare at Delhi's Palam airport. It made a good box item for most Delhi and Bombay newspapers. Madras had its own April fool story. Reports *Hindu*: "Attracted by an advertisement in a morning paper, they (persons eager to buy fancy goods) rushed in cars and taxis to Pallavaram. The advertisement has stated that a foreigner leaving the city, would sell 'golf sets, stereo LPs, tapes, electric toys and cosmetics at 9 a m on a first come first basis'. But the prospective purchasers who arrived at the notified address, found no such seller and the whole thing turned out to be a hoax."

MEETING OF MINDS

The New Delhi Representative of *Financial Express*, Kewal Varma, has unearthed an interesting instance of virtual plagiarism in high quarters — to wit, the Prime Minister's speech-writers. In his New Delhi Letter of April 13, Kewal Varma quotes extensively from a recent article by the Pakistani economist, Mahbub ul Haq, to show how similar the themes of the Prime Minister's last few economic policy statements have been to the ideas contained in Haq's article. However, it is not merely a case of borrowed ideas; as Kewal Varma says, "some of [Haq's] sentences were physically lifted and incorporated in the Prime Minister's speeches". Examples:

Mahbub ul Haq: "The very institutions we created for promoting faster growth and capital accumulation frustrated later on all our attempts for better distribution and greater social justice."

The Prime Minister: "The very institutions we have created for promoting faster growth and capital accumulation now seem to frustrate our attempts for better distribution and greater social justice."

Again, Haq: "Once you have increased your GNP by producing more luxury houses and cars, it is not very easy to convert them into low-cost housing or bus transport."

The Prime Minister: "Once resources are committed to luxury goods it is not possible to convert them into commodities of mass consumption like bus transport or houses for the poor."

A not altogether unhappy portent for the Prime Minister's forthcoming summit with Bhutto, one might say!

Trot-Bits

Tirril Harris

On Lenin by Leon Trotsky, translated and annotated by Tamara Deutscher; with an introduction by Lionel Kochan; Oxford University Press, 1971; pp 204; Rs 10.

"WHEN a really great revolution comes, a great people always find for every part a suitable actor, and one of the signs of the greatness of our revolution is that the Communist Party advanced from its midst... so many able people suited to this and that governmental function. Most of all suited to their parts are the two strongest of the strong — Lenin and Trotsky." This was the view of A V Lunacharsky, Soviet Commissar of Education, in 1923, and it has been increasingly widely accepted in the last fifteen years, after decades in which Trotsky has been the standard target for all malignments and misrepresentations. And indeed the reissue of these notes 'On Lenin' is the measure of exactly this reinstatement; for, as Trotsky himself said, it is a 'sketchy work', not a full study of Lenin, published in a hurry in 1924 before he had even assembled all his reminiscences, and only in the context of an already existing interested reading public is it worthwhile to issue such books. It has not appeared in English since 1925, and is often omitted from bibliographies of Trotsky's works. The present edition is filled out with some additional material, texts of speeches and articles in *Pravda* translated for the first time by Tamara Deutscher.

Disappointing Verdict

As the verdict of one of the strongest of the strong upon the other it is disappointing. Large sections of it seem to share with subsequent Soviet accounts of Lenin a semi-religious adoration: personality characteristics are listed to show that Lenin is the embodiment of the two classes behind the October revolution: "there seems to exist between the vital forces of the country and the leader some organic, indissoluble link deep down at the roots of his being...". The occasion of his being wounded by a terrorist attempt on his life, or of his first stroke, call forth tributes from his devoted comrade which, if they were not at the time, have since been rendered cliches by the mountainous volume of subsequent hagiography. In another chapter Trotsky analyses in meticulous detail some not even particularly charming childrens' poems about Lenin, summarising them and then redescribing Lenin along similar lines. In another we are given a picture of Lenin 'on the rostrum' which amounts to little more than a catalogue of his movements and gestures, with barely a mention of what he might be talking about. This might fill a gap for those who have never seen a silent movie of Lenin speaking, but coming from Trotsky's pen it is disappointing. Even when he takes issue with Gorky and with H G Wells for the false portraits he considers they have given us of Lenin, he does not make him really come alive for us. These two articles are, however, unlike some of the other sections, good literary Trotsky. Particularly in his review of H G Wells his dialectical approach is clear — he neatly derives the English Fabian's conceit in reporting his conversation with Lenin from his political position of collective evolutionism, and the whole piece is cleverly pointed against the MacDonald government. The text resounds with that scathing irony so familiar in his later analyses of Stalinist logic and those skilful verbal side-swipes reducing Wells' comments to pure ridicule: "Now you will understand, I hope, why Wells did not at all notice that famous laughter of Lenin about which he had been told so much. Lenin was in no mood to laugh. I even fear that he might have been a victim of quite the opposite temptation. But his versatile and clever hand, as usual, rendered him a service by concealing just in time an unkind yawn from a visitor preoccupied with his own person." Trotsky's treatment of Gorky, while less of a literary performance, is also well grounded in his appreciation of the political differences between Gorky and Lenin, and hints at the complex issues dividing Bolshevism from the progressivism of the left intelligentsia which he expounds so brilliantly elsewhere in his theoretical analyses. But it still does not really convey to the reader what Lenin was like. This begins to emerge in some of the historical chapters, many of which will already be familiar to readers of Trotsky's "History of the Russian Revolution" and his autobiography. Here we are given graphic pictures of Lenin taking political decisions and arguing with that uncompromising concentration which was his hallmark. In some of the sketchier chapters about the post-1917 years too we get some insight from anecdotes, many of which suggest an unexpected tendency to giggling in Lenin. In one of these Trotsky tells how he phoned Lenin to remind him of a new 'rule' they had introduced together to the Council of Peoples' Commissars that anyone coming more than ten minutes late to a session should pay a fine, and to warn him that he had only three minutes left before the next session: "'It's all right' answered Ilyich with a little giggle the sense of which I understood only later." On arriving at the meeting Trotsky found Lenin already there: "True it seemed to me that someone resembling Vladimir Ilyich flew by towards the Cavalry Building, but I could not imagine that the Chairman of the Peoples' Commissars would — in the full view of all — rush like a hurricane across the esplanade of the Kremlin. Ilyich was chuckling; he was triumphant."

Sauce for the Titbits

As sauce for these titbits there is an introduction by Lionel Kochan while combines a sympathetic outline of Trotsky's own life with some rather questionable remarks about the importance of Jewish membership on the Central Committee of the Bolshevik Party for maintaining the internationalist ideology, and about Stalin's "greater sensitivity to extra-Russian affairs than Trotsky" (*sic*). He notes the 'fulsome adoration' that Trotsky shows for Lenin in these notes and gives a sensitive account of their relationship over the years and the stages of the revolution to explain it. But to leave it at that level of individual psychology is perhaps to do Trotsky an injustice. His admiration for his leader, it is true, borders on hero-worship at times in this volume, but this can be forgiven, for it appeared shortly after Lenin's death. While it may not be clear here, it emerges in his "History of the Russian Revolution" not as a freakish adoration but as an historical judgment, albeit extreme, but entirely convincing on the basis of the evidence assembled there: "Had I not been present in 1917 in Petrograd the October Revolution would still have taken place — on the condition that Lenin was present and in command. If neither Lenin nor I had been present in Petrograd, there would have been no October revolution: the leadership of the Bolshevik Party would have prevented it from occurring — of this I have not the slightest doubt." This is why this little book 'On Lenin' can never be more than a side-dish to the main meal of his other work.

Badly Chewed Cud

M D Nalapat

Sales and Excise Taxation in India by Walter R Mahler, Jr; Orient Longmans, 1970; pp 426 + xv; Rs 45.

THIS book, based on a thesis submitted to Syracuse University, contains strands of thought that are too elementary to be called 'analyses' and has too few statistics to be called a compendium of information on the subject of indirect taxes in India. Mahler begins by stating that "the most important concern of fiscal policy in general — and of taxation policy in particular — in the underdeveloped countries, is with economic growth" (p 1). He then follows up with a 19-point list of tax 'objectives'.

Mahler knows his Ricardo well — perhaps too well — as witness this comment: "In developed countries *the best contribution a tax system can make to growth is to maintain as much neutrality as possible among different incomes and expenditures*" (p 2) (italics mine). Even Samuelson would blush at this.

Persistence with Self-Evident Statements

Had Mahler confined himself to documenting the contours of the indirect tax system of India, the book might have gained. But he persists in making self-evident statements, such as that "for an underdeveloped country India has a very complex and sophisticated system of taxation" (p 5) or wrong statements such as that "the relative importance of direct taxes tends to increase (in the stage of growth in which India is)". Even theoretically (*vide* Hinrichs, "A General Theory of Tax Structure Change during Economic Development", 1966) it is accepted that, in this stage, excise taxes dominate over the rest; it is only in the final stage, of 'maturity', that direct taxes become preponderant.

Mahler follows the text-book economists well, in that such unmentionables as illegal incomes and tax evasion are beyond him. He puts down the decline in the share of customs duties from 39 per cent in 1950-51 to 22 per cent in 1968-69 as proof of the doctrine that "the economic development of a country is accompanied by a decline in the relative importance of customs duties" — such factors as smuggling not entering the picture at all!

The next 46 pages are a rehash of economists' views on equity, inflation, incentives, *et hoc genus omne*, interspersed with his own views that exhibit naivety in analysis and ignorance of the many implications of the present income distribution in India. There are also statements such as: "The increase in the price level which results from a commodity tax is unlike the usual inflation because it does not give rise to additional money income which generates further inflation" (p 38). The government presumably just hoards all this money.

TEC Sneered At

Mahler then proceeds to give a tedious account of trends in excise revenue, while mentioning policy objectives and giving commodity breakdowns. He sneers at the Taxation Enquiry Commission's desire to encourage production by labour-intensive methods by superciliously remarking: "Apparently the TEC felt that inefficiency deserves protection if it results in increased employment" (p 77). Surely, labour-intensive methods, given India's capital-labour mix, need not be economically inefficient. Besides, employment provided is also an index of the 'efficiency' of government policy if not of the particular industry concerned.

Among Mahler's beliefs, one (p 86) is that "there is very little to support the contention that the distributive trade has the degree of monopoly power attributed to it". This is incorrect: without appeasing the distributive trade no small producer can get his goods into the market or hope to get the retailers to push them. The distributive trade may not seem so powerful when it is itself dealing with a monopolistic producer but this is not true when it is dealing with by far the major section of India's producers.

After wrapping up the entire Indian excise system in 139 pages, Mahler devotes almost the same number of pages (140, to be exact) to sales taxes! And, expectedly, the mistakes are not long in coming.

Informing us that "there are five basic types of sales taxation in existence in various parts of the world", Mahler, in the next paragraph, asserts that he feels the "major advantage of the multiple stage sales tax over single stage sales taxes is basically political [how does this square with his earlier preference for a single-stage excise levy?]; it can raise a given amount of revenue at a lower rate of tax; this lower rate tends to simplify administration somewhat as it reduces the gains to be achieved by evasion of the tax" (p 141). If you want to raise Rs 25 crores from an industry with a turnover of Rs 100 crores, with five processes (or, in the book's terminology, 'stages'), each accounting for Rs 20 crores, you would have to levy tax of one-fifth of Rs 25 crores on each stage, *viz*, Rs 5 crores, *viz*, a 25 per cent levy on each stage! Has Mahler forgotten that 'rate' is computed on a percentage basis, and that a Rs 5-crore tax on a Rs 20-crore turnover is as hurtful as a tax of Rs 25 crores on a Rs 100-crore turnover? Also, while the absolute gains (from tax evasion) may be less in this system, the percentage gains need not be. And this is more important. It is foolish to try to tell a manufacturer that he is 'better off' because he is paying only Rs 5 crores as tax whereas he would be paying Rs 25 crores had the tax been on the final turnover of Rs 100 crores; for, in the latter case, his turnover too would have risen (to Rs 100 crores). It is only if he faces an elastic market for his final product but has an inelastic demand for his raw materials — which is unlikely — that he will suffer more under a single-stage system than under a multiple-stage one.

Superficial and Inadequate

In his inimitable way, Mahler goes on to tell us what may be the best type of sales taxation for India (p 205: "There is very little agreement on what would be the best pattern of sales taxation in India"); then to give general suggestions for reform (p 216: "There is a very good case for doing away with multiple point sales taxation in India"; and then to state the reasons why, which are all summarised in a mere four paragraphs. It would be to give too much importance to the book if I were to detail these here. The book is superficial and the topics are covered inadequately. It is not a book to be recommended to any serious student of the subject.

The 1972 Election in West Bengal

Biplab Dasgupta

The spectacular victory of Congress in the 1972 election in West Bengal has come as a big surprise to many. Although many observers probably expected a Congress victory — because of Bangladesh and other factors — the result was anticipated to be a close one, particularly because this time CPI(M) was contesting in alliance with almost all the Left-wing parties in the state. That the number of seats won by CPI(M) should crash from 113 in 1971 to 14 in the recent election was totally unexpected, as was the Congress party's tally of 216 seats.

Here the author examines the various theories which have been advanced to explain the startling results of the 1972 election in West Bengal. A detailed, quantitative analysis will follow later.

THE spectacular victory of Congress in the 1972 election in West Bengal has come as a big surprise to many. Although probably many observers expected a Congress victory — because of Bangladesh and other factors — the result was expected to be close, particularly because this time CPI(M) was contesting in alliance with almost all the left-wing parties of the state excluding CPI. That the number of seats won by CPI(M) should crash from 113 in 1971 to 14 in the recent election was totally unexpected as also the tally of 216 seats for Congress. Many experts have now begun saying that the CPI(M) would now end up the way parties like Congress(O), Jan Sangh, Swatantra, PSP and SSP have ended in the rest of India. This victory of Congress also marks the gaining of power through absolute majority after a gap of five years during which in three successive elections — in 1967, 1969 and 1971 — the Congress party was defeated in attaining this objective.

Is this the end of CPI(M)? Certainly not. The number of seats bagged by that party in the recent election is misleading and unfair as a measure of its popular support. Even ignoring the complaints about the unfair nature of this election, CPI(M)'s share of votes, at 28 per cent is quite high. If the number of seats obtained by it reflected its popular support in terms of percentage share of votes, there would be 78 CPI(M) members in the assembly now instead of 14. This percentage share is higher than the 19 per cent CPI(M) obtained in 1969, although it is lower than the 32 per cent votes the party registered in 1971. Its position in terms of percentage share of votes is only slightly worse than that of Congress (29 per cent) only a year ago, in 1971. So, if the Congress organisation was not finished by the votes it obtained in 1971, CPI(M) can hardly be said to have been destroyed because of the reverses it has suffered this time. On the other hand, there is no evidence of a uniform swing of public opinion against CPI(M). It has lost in many constituencies, but it has also gained in many others. The CPI(M)-led front as a whole has managed to get about 36 per cent of the votes and 20 seats.

Here I propose to examine various theories which have been advanced from various quarters for explaining the startling electoral results of the 1972 election. A detailed, quantitative analysis will be taken up some time in future.

One popular hypothesis can be stated as follows: The people of West Bengal twice rejected Congress and voted the United Fronts of left-wing parties to power during 1967-71, but on both of these occasions their expectations were not fulfilled. Not only that the United Fronts failed to produce good government or to introduce significant changes, but they broke up eventually because of serious factional conflicts within the United Fronts. The people of this state, after having tried the United Fronts for several years, are now convinced that alternatives to Congress would not work, and so are prepared to give Congress another chance to prove itself.

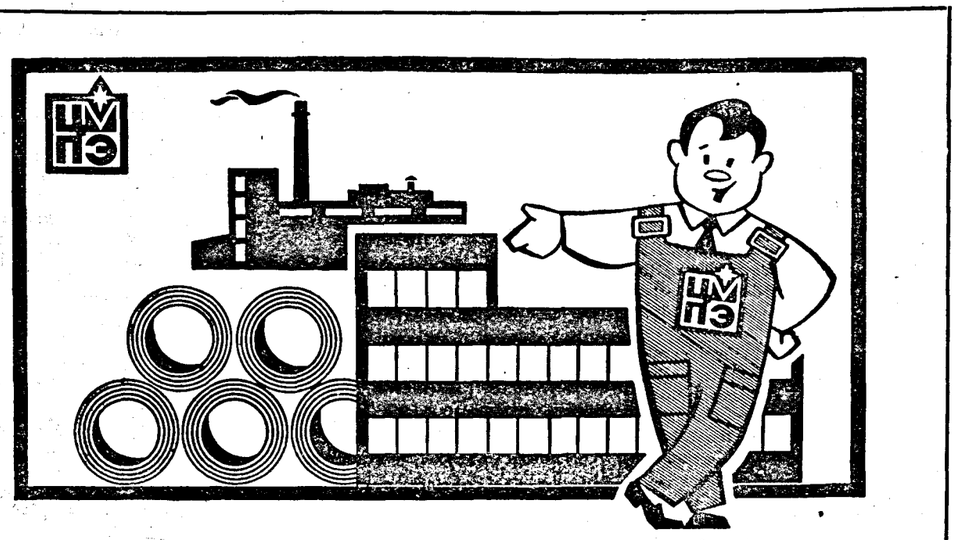
This hypothesis, although widely publicised by the Congress press of Calcutta, contains many flaws irrespective of one's opinion about the performance of the United Front governments of 1967 and 1969-70. First of all, the records of the United Front governments were discussed and voted upon during the 1971 election, when the voters gave their massive support for CPI(M) by increasing its percentage share of votes from 19 per cent in 1969 to 32 per cent in that election — a fantastic growth by almost any standards. In any case, this issue is incapable of explaining the differences in voting behaviour between the elections of 1971 and 1972. Secondly, although CPI(M) was the largest group within such United Fronts, Bangla Congress and CPI followed CPI(M) in order of strength inside the United Front, and these two parties have now joined the Congress alliance. During the 1967 United Front government these two parties together had more seats than CPI(M), and in the 1969-70 government also these two parties, with the support of some other parties in the United Front, matched the strength of CPI(M) within the alliance. In fact on both of these occasions the Chief Minister was Ajoy Mukherjee of Bangla Congress who has now returned to Congress, and the CPI(M) leader Jyoti Basu was denied that post because of strong opposition of these two parties. So, even assuming that the record of the United Front government was not very impressive, these two parties which are now constituents of the Congress alliance are as much to blame for that as CPI(M) or other parties. (However, the question of the performances of the United Fronts in West Bengal during these two terms in office should be discussed separately because of its obvious importance.) Thirdly, although it is true that both of these two United Fronts suffered from internal differences, and eventually broke up, the differences were mostly of ideological character — on issues like land reform, police policy, industrial relations — with their necessary educative implications. These differences underlined the class composition of various parties in the United Front, forced the rich peasant parties like Bangla Congress to come out openly in support of their supporters and helped their disintegration as political entities. On the other hand, both the Congress ministries which were set up during the 1967-71 period — P C Ghosh's ministry of 1967-68 (for five months) and Ajoy Mukherjee's 3-month ministry following the 1971 election — broke up after very short periods be-

cause of rivalries between different Congress factions. It it significant that the newspapers of Calcutta hardly mention these two ministries in their account of the 1967-72 period, not to speak of their record or of the way they eventually disintegrated. On the other hand, if one treats the terms under Governor's rule as Congress rule (in fact during 1971-72 it was Siddhartha Ray, the present Chief Minister, who was ruling West Bengal as a Central Minister), the United Fronts only ruled for 21 months out of the 60 months of the 1967-72 period, and for two-thirds of the time the state was under Congress rule of various sorts. Considering also the fact that under the Indian constitution and the existing financial arrangements the states are not powerful autonomous bodies, and the Centre is largely responsible for the developments in the individual states, the verdict of the people on the basis of the present state of affairs in West Bengal, should have gone against Congress.

The explanation for the massive Congress victory, and the defeat of the CPI(M) front should be sought in the events which took place during the twelve months following the March 1971 election — such as the creation of Bangladesh, the stability of the Central government, the "left" image of Indira Gandhi, the alliance of Congress with CPI and the firm support of the Soviet Union, the liquidation of the Naxalites and their implications for the Congress organisation, the growth of Youth Congress and the systematic terrorisation and suppression of the left-wing parties by the joint activities of the police and the military and the anti-socials. In the following pages I will make an attempt to examine the implications of these events for the 1972 election figures.

First of all, Bangladesh, a subject which has always been very close to the heart of the Bengalis of West Bengal. This event certainly influenced the decision of the election strategists of Congress to hold elections in West Bengal in March 1972, whereas earlier this state had not been included among those where elections were to take place. What is not clear is why the verdict on Bangladesh should go against CPI(M). Unlike its position on the border war with China, which was not popular, CPI(M) was this time on the right side of the popular sentiment from the very beginning. It was the first party to demand the recognition of Bangladesh, and one of its main criticisms against the Indian government was that the latter was not doing enough to help the liberation fighters and was looking for a solution of the refugee problem within the framework of Pakistan. If the party has done so well in the past in spite of its unpopular position on the question of border war with China, why should it suffer now when it cannot be faulted as standing against the prevailing mood of popular opinion. Perhaps, the vote in 1972 was not against CPI(M), but it was in favour of the Indian government for sending the army and liberating Bangladesh. It is true that all the parties co-operated with the government on this issue; Bangladesh was a national issue, but the party in power was always likely to gain most from a popular government action. The Bengalis were grateful to the Indian government for marching to Dacca, and securing the surrender of the oppressive Yahya army, and it was a vote of support for that action. All the other issues faded into insignificance in comparison, and the verdict should not be interpreted as support for Congress policy in other spheres, or as a vote of no-confidence in CPI(M). The appearance of Sheikh Mujibur Rahman alongside Indira Gandhi at the Calcutta Maidan, and the former's expression of gratitude to the Indian government only a few weeks before the election, certainly helped Indira Gandhi in monopolising the credit for the liberation of Bangladesh.

For various reasons, mainly because of the more effective propaganda machinery for the ruling party, the unfavourable implications of Bangladesh for the ruling party were never in the limelight — for example the alliance of Congress with Muslim League (a party which was opposed to the formation of Bangladesh) in running the three-month government following the 1971 election in West Bengal and its continuing alliance with that party in Kerala, or the case for greater autonomy of the states and a reallocation of power between the Centre and the states in favour of the latter, or even the question of suppression of democracy in West Bengal. But in the long run these issues, arising out of the Bangladesh struggle and concerning secularism, democracy, and regional autonomy, would assume more importance than the fact of the creation of Bangladesh as a new nation of 75 million Bengalis.



Can it be said that it was not so much Bangladesh after all, but the victory of the Indian army over the arch-enemy Pakistan, the undoing of Partition to a certain extent, and the establishment of India's claim as a major power in this part of the world which were the real issues which roused aggressive nationalistic feelings and helped the victory of Congress? As regards West Bengal this is not likely to be an important factor influencing the outcome of the election in such a big way, although in other states the feeling of national pride probably played a significant role in crushing all opposition to the Congress party.

Another explanation is the so-called "Indira wave" which has swept aside all opposition to the ruling party all over the country including West Bengal. One main difficulty in accepting this explanation is that even in 1971 the "Indira wave" was very much in evidence in the rest of India and all the opposition were crushed, but in West Bengal the tide was effectively stemmed by CPI(M), which came out with half of the parliamentary seats for that state. West Bengal proved to be an exception last year, but why has it lost that distinction this time? The difference between the two elections in terms of Indira Gandhi's image in West Bengal can be found in the following factors — Bangladesh which we have already discussed, the role of CPI and Soviet Union which we will discuss below, and the establishment of a stable government at the Centre following the 1971 election victory for Indira Gandhi.

When the assembly elections took place in West Bengal in 1971 there was no guarantee that Congress would be returned with a large majority in Parliament. The country was being run by a minority government, and the situation was chaotic in most states. In West Bengal in particular there was no prospect of Congress being returned to power as a single majority party. In contrast the present election took place under more stable conditions — Indira Gandhi was firmly established in power, and the Congress party was expected to win the election in all the other states (ignoring Goa and Meghalaya). Indira Gandhi in her 20-odd election meetings all over West Bengal promised more money for West Bengal for projects like Haldia Port, the second bridge over the Hooghly, an underground railway in Calcutta and for solving the unemployment problem, but while making these promises she made them conditional on a good Centre-state relationship and a vote for the Congress in the state elections. It is not unlikely that some voters were influenced by the "bandwagon" effect of Indira Gandhi's victory in the rest of the country, and also by the fact that the development of West Bengal was not possible without the support of the

Centre which was not going to come without a Congress government at the state level. The daily press of Calcutta, particularly the editorials, went over and over this point, that progress of West Bengal could be ensured only by having a Congress ministry. They were frank and truthful in admitting that a non-Congress government in West Bengal would be discriminated against by the Centre and Indira Gandhi also made no attempt to hide this fact in her election speeches.

Seeing it in this way, then the vote for Congress in West Bengal in 1972 was a vote for the political power at the Centre which promised support for West Bengal's development. It was not a vote for the Congress in West Bengal, which has not been trusted by the Bengalis since 1967. Such interpretation would explain both the vote for Congress in the elections and the lack of jubilation on the part of the people

V/O TSVETMETPROMEXPORT gives co-operation in the construction of facilities to mine and beneficiate ores containing non-ferrous metals, bauxites and other aluminium-bearing raw material.

We are always ready to help our customers collect initial data for designing said facilities;

carry out relevant surveying and research work;

do the actual designing;

deliver and install fully integrated ancillary equipment;

commission said facilities;

train local personnel, either in the customer country or at Soviet enterprises, to operate said facilities.

We draw extensively on domestic and world experience, take due account of local conditions and duly meet our customers' special requirements.

because it has brought to power the disreputable Congress politicians of that state.

A third explanation is the support for Congress by CPI and the Soviet Union. During the 1971 election CPI contested separately in alliance with a number of other parties like Forward Bloc, Socialist Unity Centre, and SSP, although in a large number of constituencies the CPI front, Bangla Congress and Congress made 'no-contest' agreements and put up jointly supported candidates. This time CPI was formally a part of the Congress alliance, the front led by CPI was split, but the major portion of it participated in the CPI(M)-led front. The crucial question before the election was how the 19 per cent vote that the front secured would be divided between Congress-CPI front and CPI(M)-led front. One possibility was that CPI, by joining Congress, would simply lose its credential as a Marxist and non-Congress party, and hence would become a liability to the Congress organisation. On its own it would be unable to win a single seat, and by tailing Congress it would merely destroy itself. Another theory was that the support of CPI, which is known as a left-wing party, would make the Congress slogan of "banish poverty" credible to the people, and would help it to assert its claim as a "leftist" party. At the same time CPI would also gain in terms of seats, whatever be the long-term implications of such a policy. Both CPI and Congress also gained from the fact that the Soviet Union was seen as the most dependable ally of India on the question of Bangla Desh, and the pronouncements of the Soviet leaders on the "progressive" nature of Indira Gandhi's regime also helped to improve its image among the masses.

While the Congress party certainly gained from the support of CPI, particularly in areas like Midnapore or 24 Parganas, the CPI(M) led front also gained from the support of parties like RSP, SUC and Forward Bloc. During the 1971 election CPI(M) was for all practical purposes contesting alone because the parties which joined its front were no more than splinters, but if all the parties which joined CPI(M) in 1972 had supported CPI(M) in the previous election the latter would have got a comfortable majority in that election. The front which was established during the 1972 election included all the major non-Congress and left-wing parties of the state excepting CPI. This time it could not be said that CPI(M) was isolated. Taking both sides of the equation into account, on an *a priori* basis at least it was not clear why Congress should gain more from the support of CPI than the gains CPI(M) made from the support of all the other left-wing parties.

A fourth explanation is that the people voted on the issue of law and order. This is the least convincing of all the explanations. If one makes a graph of the number of violent incidents in the state, the graph would show a sharp increase after May 1970, when the Naxalites launched their offensive "annihilation campaign" in urban areas. During the one year of the much-maligned United Front rule of 1969-70 there were about 70 political murders, all resulting from clashes between rival armed groups either in mines or factories or in the course of land struggles between the kulaks and the landless. In comparison in the following two years of direct or indirect Congress rule there were several weeks when the weekly murder figure reached 70 or more. The targets of Naxalite attacks were either CPI(M) functionaries or petty businessmen or low level police officials. Very few members of the other political parties were attacked by the Naxalites during this period, whereas about 800 CPI(M) sympathisers or members were killed. The responsibility for Naxalite violence rests on Congress for several reasons — the Congress leadership in West Bengal never criticised or condemned the Naxalites and instead blamed CPI(M) whenever they were attacked by the Naxalites for "giving birth to the cult of violence", in many places the Congress worked in close link with the Naxalites in "liberating" areas from CPI(M) as also during the 1971 election and the anti-social element in the Naxalite movement joined the Youth Congress after July 1971 and has been very active since in conducting their anti-CPI(M) activities. There is also suspicion that after May 1970 there was large-scale penetration of the Naxalite organisation by police informers, who misdirected the movement against CPI(M), and after July 1971 in a series of operations covering a period of barely two weeks liquidated the serious element in the Naxalite movement while at the same time causing the defection of the criminal element of the movement to the side of Congress. Since then it is Congress which has continued the offensive against CPI(M), and has been responsible for a large number of murders in co-operation with the police, CRP, and military. Neither at the government level (because of its inability to curb violence, and also because of the way it employed the coercive powers of the state against the opposition), nor at the party level (by recruiting anti-socials and creating a reign of terror through them), can Congress escape the responsibility for the present state of affairs in that state.

Perhaps such an explanation in terms of the law and order issue can be justified to some extent in the following ways: (1) Because until July 1971 the two main parties in the conflict, as seen by the people, and as publicised by the press, were CPI(M) and Naxalites, both claiming allegiance to Marxism, the people wanted to reject both and favour a party like Congress. This is probably true in places where cases of violence were few, but where the propaganda about violence, and the alleged responsibility of CPI(M) for it, reached through the Congress-dominated press. (2) Because the press, which is traditionally pro-Congress in Calcutta, maintained a "conspiracy of silence" about the role of Congress rowdies in committing violence and creating a reign of terror, the people in general (excepting those who were directly affected by it) were not kept informed. Excepting for papers like *Economic and Political Weekly* or *Economic Times* or some foreign papers which have made mention of the "strong arm methods" of Indira Gandhi's boys, the scope and extent of terror unleashed by the Congress gangsters has remained largely unreported in the popular press. There has also been many deliberate distortions. For example, in a recent case, a CPI(M) activist Nirmal Chatterjee was hacked to pieces in front of his wife, and his wife was raped, in Sonarpur, and subsequently his wife made a statement implicating a local Youth Congress leader and his gang for this murder and rape, but the daily press published a report with the headline, "Congress leader Nirmal Chatterjee murdered by CPI(M) gangsters". By both suppressing the truth and by suggesting the false, and by throwing away even the pretence of unbiased reporting, the press of West Bengal has helped the cause of Congress. It is not only terror, but terror plus propaganda which makes out the victim of terror to be responsible for terror, which to a certain measure has influenced those who have not directly witnessed the atrocities. (3) It is also possible that some people still voted for Congress, knowing fully about the role of Congress in perpetuating the atmosphere of violence in the urban areas of West Bengal, in order to see an end to the continuation of the present unsettled condition even if it meant that the undisputed rule of Congress rowdies would be imposed. There are always some people in every country who would prefer stability to progress when these two are presented as alternatives to them, although in the case of West Bengal it cannot be ascertained how

many voted for Congress for this reason.

Lastly, we will examine the allegation of CPI(M) that the election was not free and fair. It is not for the first time that such allegations have been made against the way the elections are conducted in India. At one time it was quite commonplace for a candidate to buy up his opponents and to ensure an uncontested election, and at least in one election in Kashmir the opposition was routed as a result of the nomination papers of the opposition candidates being rejected. Large-scale imprisonment of opposition candidates during election took place in Kerala (particularly in 1965 when CPI(M) won a majority in the state legislature, but 28 of its candidates had to fight from prison), as also in West Bengal (in 1971) in the past. In this election also four of the candidates contested from prison and two were not allowed to go to their constituencies for campaigning. Impersonation, false voting, tampering with the ballot box, all these have also been alleged from time to time.

The CPI(M) allegation is related to a number of points. First of all it is related to the general atmosphere in the state — with 16,000 to 20,000 persons in prison without trial, with about 2,000 murders in two years, with the application of Prevention of Violence Act and Maintenance of Internal Security Act against the opposition, with the threat of arrests hanging over the heads of thousands of CPI(M) workers, it was not possible for the opposition to work openly without fear. In addition, the Congress rowdies were taking over ("liberating" in their language) one area after another from where the CPI(M) workers were being thrown out through massive attacks with the support of police and military. According to one estimate, there are about 10,000 CPI(M) "refugee families" in Calcutta and 24 Parganas who had to leave their home under the threat of murder, and in many places had to leave their jobs as well, and who have now crowded into areas which are more effectively protected against such attacks. But every week such areas affording protecting are shrinking and open political activity is becoming impossible. It is probably not a gross exaggeration to say that during the 1972 election about three-fourth of the CPI(M) organisation had to work in the underground. In many places there was no question of openly asking for votes for CPI(M), and the party tried to reach voters either through their women volunteers or through the post. But the women also came under attack, and in fact about 20 women volunteers or workers have lost their lives over the past two years.

The usual method for "take over" of an area by Congress is for the police to move in first, to make a number of arrests and killings, and then to allow the Congress rowdies to move in.

Secondly, the degree of violence varied from one constituency to another. In Kalna for example, the offensive was launched in mid-1971 by the murder of the local CPI(M) secretary at the railway station, followed by 29 other murders, and by the time of the election the CPI(M) activities had been erased from that area. No form of campaigning of any degree was possible in the circumstances, no posters could be pasted, no person could be approached for campaigning, no office for campaigning could be opened, and no polling agent could be sent to the booths. It was a walk over. In this traditional CPI(M) seat its candidate managed to get only 929 votes. In Burdwan also the same story was repeated. There were 11 murders between April and August 1971, and the CPI(M) organisation was similarly thrown out of that area. Similar stories are being told about 52 constituencies where gangsterism was at its height during the election. All these constituencies share a number of common properties — the left movement was traditionally strong in these areas and the CPI(M) front was expected to win almost all these seats in a fair election. In all these places the offensive against CPI(M) was launched some time towards the middle of 1971, in some of them there was no trace of the CPI(M) organisation during the election, and in others CPI(M) could survive only in a small part of the constituency. In all these constituencies CPI(M) polling agents were driven out of most of the booths, and there were reports of false voting coupled with reports that genuine voters were not allowed in.

As evidence is support of their allegation the CPI(M) leadership has produced figures for various booths and constituencies. One feature of these figures is that the turnout of voters in the disturbed constituencies is exceptionally high, much higher than the previous record for the same constituencies, and inconsistent with the general voting trend in the other constituencies of the state. These high turnout figures are also surprising because these constituencies were the most affected by disturbances even during the election day. It was also surprising that the voting was completed in many of the booths within four hours of the start of polling despite the introduction of a new and time-consuming voting system in this election. A significant example is Baranagore, the constituency of Jyoti Basu, the CPI(M) leader, where about 90 per cent turnout was reported despite widespread clashes all throughout the day, including the murder of three workers of CPI(M), and the imposition of section 144 in a section of the constituency. In almost any constituency the number of those who have left or died or were sick, disabled or otherwise busy, and so on, would give a figure of more than 10 per cent. To register a 90 per cent turnout would practically mean that all those who were capable of voting have voted, which is incredible by almost any standard.

Another feature of these figures is that in these constituencies, which are known as left-wing strongholds, Congress has won this time with huge majorities of 40,000, 50,000, and even 60,000 in some cases. Such majorities are neither consistent with the past record of those constituencies, nor with the trend in the rest of the state. In fact in about 47 constituencies which are known as Congress strongholds the CPI(M) front has increased its vote. The explanation offered by CPI(M) is that Congress concentrated its gangsterism in areas which were previously known for their anti-Congress tradition, while they did not find it necessary to employ the same tactics in its own strongholds. CPI(M) has also alleged rigging of various other kinds in 87 other constituencies. It is significant that, despite this large majority for Congress, there is no sign of jubilation among the people. The historic mass rejoicing of the days of 1967 and 1969, when Congress was defeated, has not been noticed. This also would support the view that the election results do not reflect the popular mood.

It is not easy to assess the impact of the Congress terror tactics on the share of votes for the contestants. Since the Congress margin of majority is huge, the daily press of Calcutta is now willing to concede that the election was not free in 50-odd constituencies, but then they are also commenting that even with these 50 odd seats CPI(M) could not win the elections. According to them, Congress would have won anyway — for Bangladesh and other reasons — and the strong arm methods have only increased the Congress majority. Probably they are right, probably not, but how can one assess the impact of such tactics on votes? If the ruling party is capable of crushing opposition by annihilating and terrorising the workers of the opposition party, then it is also capable of other less spectacular unfair practices. By employing these methods the ruling party has put the entire election machinery into disrepute, and the electorate system has lost credibility.

On the Notion of Admissible Programmes

Jayabrata Bhattacharjee

Kornai in his pioneering attempt in 1965 (available in English in 1967) on multi-level planning techniques, raised the question of "politically admissible" planning programmes. Though he did not carry his analysis to any length, Kornai threw up some extremely suggestive pointers on the dichotomy between "feasible" plans and "admissible plans" which have been explored further in this paper.

An attempt has been made here to concretise the problem area and to set the planning process in its relevant socio-political context. This is however an exploratory approach intended to demarcate the regions where further research is called for. A conceptual framework has been built up within which the inter-relationship of "feasibility" and "admissibility" is studied and a behavioural pattern sought to be established.

[The author expresses his gratitude to Vinod Mubayi for his invaluable help and co-operation.]

KORNAI[1] in his discussion of "politically admissible" planning programmes introduces a threefold distinction between "feasible" programmes (F), "possible" programmes (K) and "politically admissible" programmes (H). F comprises the set of all programmes which satisfy the resource constraints and the optimisation of an economic objective-function subject to such constraints. Thus F is arrived at by solving in detail the mathematical model of planning incorporating the parameters associated with the particular economy. The set K is an estimate of the set F and comprises programmes which are not obviously unattainable but which are impossible to finally categorise as "feasible" or "non-feasible" without going through the exercise referred to earlier. In Kornai's terminology therefore, the process of "technocratic" planning is one of weeding out the non-feasible elements in set K to finally arrive at set F. In a typical two-dimensional case, we can depict the situation as in Figure 1.

Supreme Politico-Economic Bodies

In Figure 1, x_1 and x_2 are the two economic variables which constitute the planners' targets. In this case set F is wholly contained within set K; a more reasonable assumption would of course be a situation where F and K have a large intersection without F being a complete sub-set of K. The process of planning however does not come to an end with the demarcation of set F because not all the constituents of F are admissible to the "supreme politico-economic bodies" as Kornai labels them. Since final decisions rest with the political authorities, we now have to reckon with a third set, H which denotes the set of "admissible" programmes. A simple example of the limitations imposed by the presence of set H is brought out in Figure 2.

In this case, the only plans which would be approved by the highest political authorities are those that guarantee a minimum level x_1 (H) of x_1 and x_2 (H) of x_2. The set H therefore is the area marked by vertical lines, bounded on its left and lower sides by straight lines reflecting the constraints x_1 (H) and x_2 (H). The intersection of H and F is the area with a chequered pattern and portrays the set of programmes which are both feasible and politically admissible. It is only when this area is demarcated that the planning process may be said to have been logically completed.

We can modify Kornai's approach slightly and attempt to place the notion of admissible programmes in the newer context. The planning process is still a two-stage operation, in the same way as Kornai's complete specification of the process as a movement from K to F and F to H, but the interpretation is as follows.

Stage 1: Optimal Attainment of Feasible Targets

We assume there are m planning targets, $x_1, x_2 \ldots x_m$, which include all goods and services in the society. These targets are measured in terms of a common unit which could be money for example. This approach might seem a heroic simplification but on closer inspection this does not turn out to be so. We could have dealt with targets in physical terms and then chosen the appropriate price vector to reduce everything to a common denominator — a problem which invariably arises when dealing with national income measurement and evaluation.

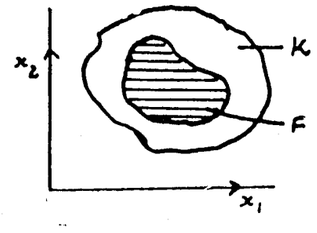
The planning operation begins at time t=0. At this point of time there are certain resources (raw material, labour, installed capital goods, etc,) which we shall call $r_1, r_2 \ldots r_p$. The planners specify feasible targets which are arrived at, in Kornai's terminology, by weeding out the non-feasible targets in K with the help of resource-based consistency exercices. Let the feasible targets be called θ which can be then thought of as a vector in the $x_1, \ldots x_m$ space. Adding the time element t to denote the fact that these targets are time-related, we now have.

$$\theta = [\, x_i(t),\ i = 1, \ldots m \,]$$

The θ targets will be reached optimally by solving the following:

$$\frac{dx}{dt} = f\left[\, x_i(t) \ldots x_m(t), r_1 \ldots r_p \,\right] \quad \ldots (1)$$

where $r_1 \ldots r_p$ are the resource-constraints as mentioned earlier; subject to the minimisation of



$$J = \int_{t_0}^{t_1} f\,dt \quad \ldots (2)$$

t_0 is the period when the planning begins and t_1 is the terminal period marking the completion of the process.

Pontryagin Principle

This is a simple application of the Pontryagin principle,[2] the implications of which in the present case are interesting. $r_1 \ldots r_p$, the resource-constraints, are the 'controls' in the Pontryagin sense, and the solutions of Equations (1) and (2) yield the optimal

Figure 1

arrangement of the controls. In other words, when we solve the system of Equations (1) and (2), we get the best possible combination of the community's resources required to achieve the feasible targets in an optimum manner.

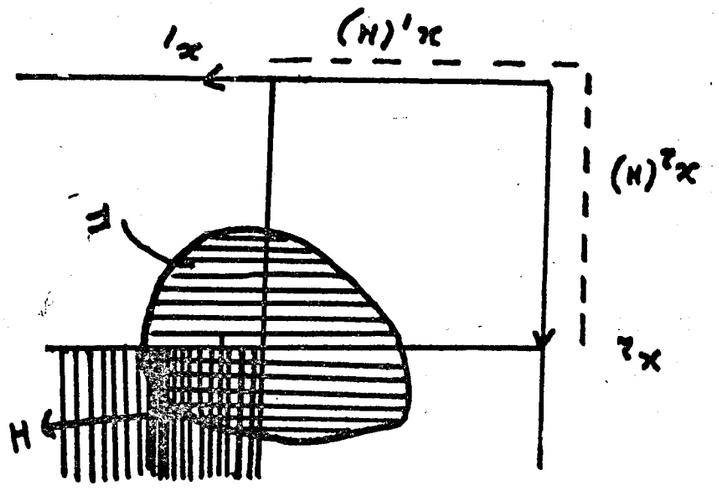
Stage 2: Matching the Feasible and the Admissible Targets

We label the politically admissible targets ψ which can be thought as a vector in the $x'_1 \ldots x'_m$ space where the x_i's are politically admissible amounts of goods and services e g,

$$\psi = [x'_i(t), i = 1 \ldots m]$$

The x'_is are generated because of the actions of the class-forces or interest groups which constitute the final political decision-making authority in the country. The simplest assumption of the *modus operandi* of these class-forces would be of the following type. We have earlier assumed that the targets are measurable in a common unit. Since the targets include all goods and services in the community, the summation of the targets will give us a measure of the National Product, however imperfect it may be. We can therefore say

$$\sum_{i=1}^{m} x'_i = Y$$ where Y is a measure of the National Product.



We can now put forward a definite hypothesis of the operations of the class forces.

Hypothesis of Class Behaviour: If there are k class-groups constituting the political decision-makers of the country, we postulate that the class-groups endeavour to appropriate a minimum proportion P_i of each target to themselves. This proportion P_i is dependent not only on the targets x_i but also on the variables $u_1, u_2 \ldots u_k$ which represent the operations of the class-forces. The relationship between the u_is is known to start with, based on sociological concepts and observation. The summation of the proportions in each target which the class-groups want to appropriate would give the proportion of National Product kept by the class-forces

$$\sum_{i=1}^{m} P_i (x'_i, u_1 \ldots u_k) \; x'_i = A$$

A represents the *minimum acceptable* proportion of National Income below

FIGURE 2

which the class forces will not permit the planning process.

We can now formalise our hypothesis of class-behaviour. The object of the class-forces is:

$$\text{Maximise} \sum_{i=1}^{m} x'_i = Y \quad ..(3)$$

subject to the constraint

$$\sum_{i=1}^{m} P_i (x'_i, u_1 \ldots u_k) \; x'_i \geqslant A \quad ..(4)$$

This is a Lagrange multiplier optimisation problem, the solution of which gives us the x'_is (the politically admissible targets).

The dynamic path through which the ψ targets are reached is traced by the following equation

$$\frac{dx'_i}{dt} = h[x'_i(t) \ldots x'_m(t), u_1 \ldots u_k] \quad ..(5)$$

The job of the planners still continues since they have to reconcile the difference between feasible targets and admissible targets. The function of the planners is not only to minimise the difference between θ and ψ, but also to minimise the difference between the approach paths based on the feasibility criteria and the admissibility criteria respectively. Minimising $|\theta - \psi|$ is merely a static exercise but a dynamic minimisation procedure of the following type,

Minimise

$$L = \int_{t_0}^{t_1} (f-h)^2 dt \quad ..(6)$$

where t_0 denotes commencement period and t_1 termination period of the planning process; minimises the absolute difference between the feasible path and the admissible path as well as the absolute difference between the end products θ and ψ. It is only when Equation (6) is solved that the planning process comes to its logical conclusion.

The foregoing is in the nature of a conceptual framework with operational ramifications. By its very nature it has had to be as general as possible but we believe it can be made into a fully working model specially if the hypothesis of class-behaviour is explored further and an attempt is made to quantify it. This can be done on the basis of a study of past trends, concentrating on the identification of the P_is and A of Equation (4). In any case the aim of this effort has been to demarcate a region where fruitful inter-disciplinary research is possible, blending the elements of modern economic and sociological theory.

Regional Differences in Profitability and Growth

A Comparison between Gujarat and Maharashtra Firms

K K Subrahmanian
T S Papola

This paper attempts an assessment of the differences among regions in terms of their attributes as economic environment. The purpose is to discover whether there is a 'regional effect' on the growth of manufacturing industries—if other variables such as industry and size are controlled.

Regional differences in the profitability and growth records of manufacturing units are thus studied. The two regions compared in the paper are Maharashtra and Gujarat. The analysis is on the basis of the performance record of a sample of quoted companies, selected from the two states on a random basis, and studied in a comparative cost framework.

It is seen that there are no significant differences between the averages of return to capital and the differences in the average rates of growth of companies between the two regions. But there are regional differences in their performance, to the extent that, individual industries have been more profitable in one region than in the other. There is thus evidence to suggest 'relative regional effect' for industrial growth.

THIS is a study of regional differences in the profitability and growth records of manufacturing units, the purpose being to assess the differences among regions in terms of their attributes as economic environments. The question is: if other variables such as industry and size are controlled, is there an independent 'regional effect' on the growth of manufacturing industries? Regional environment may be considered an important variable influencing the performance record of firms. To draw an analogy from agriculture: the firm is as a seed of a given variety (industry), the seeds (firms) being planted (located) in different plots of land (regions). The yield (performance record) would vary from seed to seed (from firm to firm) depending upon factors such as the variety of seed (nature of industry), the treatment received (regional environment), and the time period. A comparison of the performance record of comparable firms over a given time period in a given pair of regions would thus indicate differences if any between the regions as economic environments.

While economic environment represents a composite of a large number of circumstances, some of its easily identifiable components are: external economies in terms of infrastructure facilities and conglomeration economies due to the location of input-supplying and output-consuming industries, expanse of the market, proximity to the transport mainheads, availability of requisite capital and labour supplies, and institutional factors such as taxation and pricing of electricity etc. Once significant differences are observed in the growth of firms as between regions, it may be worthwhile to go into their causes in terms of these factors.

A comparative study of the regional record of performance could also form the preliminary basis for assessing the overall advantage of one region over the other for industrial location. The locational decision of an entrepreneur is influenced largely by his estimate of the performance prospects in the region The average performance of the existing enterprises in a region can be expected to have a bearing on the entrepreneurs' estimate of performance prospects. If there are regional differences of significance in the mean profitability, the expectation of the entrepreneur planning to locate the production unit in the region with the higher mean would be to do better on average than in the region with the lower mean — other things remaining the same. It is plausible that the mean profitability rates would not differ among regions: instead they would tend to be equal for comparable industries in all the regions since they determine and reflect the regional allocation of industrial capital. But this would be true in an equilibrium situation only, and in the real world this equilibrium need not exist. If there are some cost differentials of significance arising from differences in regional environment, the mean profitability of the regions would be invariably different — unless there are compensating advantages. If there are observed similarities in profitability between any given pair of regions, it would mean that the cost differentials are negligible or that the compensating advantages are of such significance that entrepreneurs are indifferent in their choice as between the two regions for industrial location.

The two regions compared in this paper are the states of Gujarat and Maharashtra.[1] The analysis has been made on the basis of the performance record of a sample of quoted companies selected from the two states. The procedure has been to make a selection, at random, of 50 companies which have their plants located exclusively in the Gujarat region.[2] Each Gujarat company has been then matched by a company whose plant is located exclusively in Maharashtra, and which is in the same industry, and is of similar size as that of the Gujarat company. The sample population of 100 companies covered in the analysis thus consists of 50 Gujarat companies and 50 comparable Maharashtra companies. The object has been to compare like with the like as far as possible in order to assess the comparative advantage of a manufacturing unit being located in Gujarat as compared to Maharashtra or *vice versa*.

The company accounts data required for the study have been compiled from the Stock Exchange Directory.[3] The period covered is 1962 to 1968, and the sample companies have continued to be in existence throughout the six-year period. The book value of the total capital employed has been taken as the indicator of the size of the company and the yearly percentage changes in the size has been taken to measure the rate of growth. Gross profit (inclusive of interest charges but exclusive of depreciation provision) expressed as percentage of the relevant asset size (total capital employed) has been regarded as the relevant profitability rate and in some sense indicates the rate of return to capital.

To begin with, we have computed the regional means of profitability and growth rates and tested for the statistical significance of difference between the two sample means. The mean pro-

fitability rate of the sample for Gujarat has been 7.6 per cent and that of Maharashtra 6.8 per cent. The figures of mean growth rates have been 12.0 per cent and 10.3 per cent, respectively. Gujarat region would appear as having an edge over Maharashtra region in average performance, the first having provided the manufacturing units located in it marginally higher rates of profitability and growth. Tests have shown, however, that the differences in the regional means have not been statistically significant: For profitability value of $t = 0.87$ and for growth $t = 1.01$, neither being significant at 5 per cent level.

The alternative method of handling matched observation is to test the mean of differences between the paired companies rather than the difference between the regional means. Such a test has, therefore, been made on the data of profitability and growth rates of paired companies. For profitability $t = 1.36$ and for growth $t = 1.012$; neither of which is again found significant at 5 per cent level.

The analysis of both regional means as well as paired means thus shows non-significant differences as between the two sample means. The evidence thus fails to signify a difference in the average performance record of firms as between Gujarat and Maharashtra. This does not necessarily mean, however, that the economic environments of both the regions have the same effect on industrial growth; it only means that the analysis does not provide convincing evidence to the contrary.

The analysis made so far has been on the basis of univariate, rather than bivariate, relationships while we have assumed locational decision to be dependent on both growth and profitability. In order, therefore, to take into account the characteristics of a linear combination of growth and profitability, for distinguishing Gujarat from Maharashtra companies, the use of discriminant function analysis has been made. The test for significant discrimination has then been considered equivalent to testing for significance in the differences between two-dimensional column vectors composed of the regional means of growth and profitability. A discriminant function of the type,

$$d = \lambda 1\ g + \lambda 2\ p$$

(Where g = growth, p = profitability, $\lambda 1$ $\lambda 2$ are the respective constants) has been used so as to optimally distinguish Gujarat from Maharashtra observations. The calculated discrimination function has been:

$$d = 0.0002156\ g + 0.000629\ p$$

The calculated value of F is 1.12749, which is not significant at 5 per cent level. Thus the analysis of the means of growth and profitability in both univariate and biavariate relationships did not show up evidence of difference between Gujarat and Maharashtra as environments for the performance of manufacturing units.

Range of Performance Record

The analysis made so far has been confined to mean performance. The mean is only one moment of a given distribution, whereas the other moments are also important to draw economic implications of the observations. For instance, let us suppose that the regional means are equal between a given pair of regions but the regional variances are different and the distribution symmetrical. Under such conditions, although the expectation of future profitability on the basis of past record would be the same in both regions, a firm planning to locate in the region with smaller variance would have on average a smaller chance to fall short of its expectation as compared to the region with the larger variance. In other words, the entrepreneur who chooses the lower variance region may have a lower chance of doing very well but certainly also bears a lower risk of doing very badly. On these considerations, the locational advantage might lie with the lower variance region as compared to the other, notwithstanding the same regional means. The point for emphasis is that characteristics other than the mean of regional distribution are relevant for drawing up conclusions on the relative advantage of the regions as economic environments for industrial growth.

Let us, therefore, first examine the characteristics of the distribution of the two regions under study. The simplest tool to study the difference between the two distributions appears to be the x^2 test. The distribution of the companies by mean profitability and growth presented the following picture (see Table 1).

The calculated x^2 for the distributions of both profitability as well as growth (6.796 and 5.3844) have been found to be non-significant at 5 per cent level for five degrees of freedom. Thus the tests do not suggest significant evidence of difference between the regional distributions. It may be noted, however, that when the distribution classes have been reduced to four, from six, significant values have been obtained so the two regional distributions appeared different rather than similar. The contradictory results only suggest that the power of x^2 test varies with the size of the sample and cannot therefore be entirely relied upon for drawing conclusions. Besides, tests have been performed on univariate regional distribution, whereas the bivariate effect of profitability and growth may be significant. Further tests have, therefore, to be made on the regional observations.

For this reason, a discriminant function analysis has been used to distinguish the two samples on the basis of the variance of distribution. For computational convenience, the range of growth and profitability have been used in place of corresponding variances. Let r (g) be the range of growth over time (i e, the difference between the largest annual percentage increment in growth and the smallest) and let r (p) be the corresponding profitability. The calculated discriminant function of the type specified earlier yielded the following result:

$$D = -0.00007958\ r\ (g) + 0.000039992\ r\ (p)$$

The value of F is 2.354, which is not found significant at 5 per cent level. There is thus no evidence to suggest significant differences between the regions in the variance of rates of growth and profitability.

So far we have been considering the aggregative variation in the average differences in regional performance record, the total variation can be resolved, however, into its components and each source of variation be considered separately. The total variation has, been resolved into three components: (1) Industry (2) Region and (3) Time. All these sources act individually, or may interact with each other. For instance, industry as a whole may have better performance in one region as compared to in the other; at the same time a particular industry may flourish more than average in a given region because that region is particularly suited to its needs. The sources of variation may thus be studied by using the technique of analysis of variance.

Table 1: Distribution of Companies

Range	by Mean Profitability		by Mean Growth	
	Number of Gujarat Companies	Number of Maharashtra Companies	Number of Gujarat Companies	Number of Maharashtra Companies
≤ 3	7	16	6	6
$3 \leq 6$	8	5	7	7
$6 \leq 9$	20	15	7	7
$9 \leq 12$	8	5	10	10
$12 \leq 15$	6	5	11	4
> 15	1	4	9	16
	50	50	50	50

Table A

Industry	Asset Size Class (Rs lakhs)							
	Less than 100	100-200	200-300	300-500	500-700	700-1000	Greater than 1000	Total No
Textile	1	6	5	6	2	2	1	23
Engineering	2	3	5	1	2	—	—	13
Chemicals	1	—	1	—	1	2	1	6
Paper	2	1	—	—	—	—	—	3
Electric power	1	—	1	1	—	—	1	3
Pottery and glass	—	—	1	1	—	—	—	2
	7	10	13	8	5	4	3	50

The companies in the sample have been classified into six industry groups. The groups' means of profitability and growth were calculated for each year, 1962 to 1968, for each of the two regions, *viz*, Gujarat and Maharashtra. These aggregation provide six groups of observations over six years for regions.

The analysis of variance table for growth has revealed (see Table 2) that there are no significant variations between the regions considered as a whole.[4] The time-region interaction is also found not significant: as time has proceeded the regions have not become more different. Similarly, the industry-region interaction is also not found to be significant. Time and industry interaction, however, has been significant so that individual industries have become more and more different through time when the regions are considered together.

The analysis of variance calculation for profitability has revealed (see Table 3) that there are no significant differences between regions considered as a whole. But region-industry interaction is found significant so that the average performance of each industry in terms of profits has been affected by the region in which the industry is located. This seems an important result, especially when there are no significant differences between the regions considered as a whole. Thus, although regions, as such, do not differ from each other, individual industries do differ and the difference between them depends on the region in which these industries are located.

This study in a comparative cost framework made on the profitability and growth rates of manufacturing units in Gujarat and Maharashtra regions shows that there are apparently no significant differences between the averages of return to capital and the differences in the average rates of growth of companies between the two regions. In other words, it may be possible to distinguish between Gujarat and Maharashtra companies on the basis of mean difference record when the influences of time differences between industries are averaged out in making regional comparison. Thus, although, on average, there was no difference in the performance between the Gujarat and Maharashtra manufacturing units — if these are compared in regional groups — there are regional differences in their performance to the extent that individual industries have been more profitable in one region than in the other. There is thus evidence to suggest *relative* 'regional effect' for industrial growth. The performance record *inter alia*, has been found to depend on the region where the manufacturing unit is located so that some industries are more suited to Gujarat and others to Maharashtra. The better than average industries in each region, however, more or less balance with the worse than average — with the result that Gujarat and Maharashtra appear similar as economic environments in the overall attributes of industrial location.

Nevertheless, the observed similarity between Gujarat and Maharashtra in the preference record and, by implications, similarity in the overall economic environments of the regions suggests that, given a free choice, an entrepreneur would be indifferent in deciding the location as between Gujarat and Maharashtra. Of course, there would be issues like the type of industry and the specific areas within the regions. Given all these, the observed similarity in the actual performance record, and and thus the expectation of prospective entrepreneurs, the policy question boils down to the competing fiscal and other measures that each regional government can provide to make the respective regional environment relatively more profitable and assure steadier rate of growth for industrial activities.

Table 2: Analysis of Variance for Growth

Sources of Variation	Degrees of Freedom	Sum of Squares	Squares Mean	F
Region (R)	1	66.0480	66.0480	2.2866

* Significant at 5 per cent level

Notes

1 In a study made by Hart and Macbeen in respect of companies in Scotland and England on the basis of mean measures, it was shown that there were no significant differences between the regions (see Hart and Macbeen, 'Regional Differences in Productivity, Profitability and Growth: A Pilot Study', *Scottish Journal of Political Economy*, Volume 8). The conclusion of Hart and Macbeen was subsequently questioned on methodological grounds. (See Smyth, R L 'A Note on Regional Differences in Productivity, Profitability and Growth', *Scottish Journal of Political Economy*, Volume VIII, and G Fisher 'Further Calculations on Regional Differences in Profitability and Growth', *Scottish Journal of* Political Economy, Volume 9). The present study takes care of the methodological objections raised against Hart-Macbeen study and the suggestions made by the later authors.

2 The 50 companies randomly selected from Gujarat region reflect the industry-wise and size-wise distribution (See Table A).

3 Issued by Stock Exchange, Bombay.

4 It is, however, noteworthy that calculated F value lies close to the significant margin level.

Dissecting the Tax Structure

A Comment

Ved P Gandhi

I WISH I could spend more time to point out the misrepresentations and misstatements about my book "Some Aspects of India's Tax Structure: An Economic Analysis" which Amaresh Bagchi has made in his review.[1]

In the Preface to my book I wrote "This book has no pretentions to providing final answers. Its major objective is to generate meaningful discussion on the economic analysis of India's tax structure." I am grateful to Bagchi for taking the time to read the book and writing a lengthy review. Unfortunately, a large part of his review was directed to only two chapters[2] and I only wish that the rest of my book also had received equal attention from him.

In may opinion, Bagchi's comments can be divided under three broad headings: (a) misrepresentations and misstatements; (b) analytical comments (which I consider somewhat minor); and (c) emotional comments (which, by the way, are his substantive comments).

Misstatements

Let me briefly refer to some of his misstatements and misrepresentations of my position and dispel them quickly so as to get on to his more substantive comments.

For example, Bagchi quotes my sentence "Every tax has an explicitly defined base" (which clearly was made to initiate a chapter) and accuses me of having implied that Indian income tax has an explicitly defined base. Not at all. Did I not say that income taxation everywhere has the practical problems of measuring self-produced income, the tax treatment of durable consumer items, incomes received in-kind, etc? (Book, pp 4-5) Did I not say, once again, that in administering the income tax, the authorities are likely to face the problems of separating business from personal expenses and of differentiating capital from income? (Book, pp 8-9) Then where was the need for Bagchi to describe the serious problems of separating capital from income receipts (Review, p 108) or business expenses from personal expenses (Review, p 110)?

Again, Bagchi misrepresents my position when he says that I consider income tax in India to be based on the "accrual" concept (Review, p 109). This comes as a surprise since I have said in no ambiguous terms that "In view of these difficulties in measuring accrued income of an individual, income taxation in many countries, including India, has been based on the concept of 'realised' income". (Book, p 4) I even went on then to describe the problems of the latter. All that was said in my book was that to the extent the annual value of house property and income in-kind of individuals do get taxed in India, the concept inherent in India's tax structure went past the "realised" stage and came closer to the "accrual" stage and this was readily acceptable in the circumstances. I explicitly mentioned that the Indian income tax ignored "unrealised" capital gains and undistributed profits of the companies accruing to the individual but yet "unrealised" by him (Book, p 6). Bagchi himself does not seem to be saying anything more than this (Review, p 109).

Let me point out another misstatement. Bagchi complains that I have ignored the non-tax influences on corporate profitability in my chapter on the incidence of the corporation tax (Review, p 111). Is that really so? My PAT/NW ratio for the corporate sector is explicitly shown to be a function of the "average" tax rate as well as the ratios of sales to capital employed, investment to national income, inventories to sales and per capita income (Book, pp 77-78). What else are the latter factors if not the non-tax factors? Anyone who reads Chapter 7 would easily see that the inclusion of the non-tax factors in the incidence of the corporation tax was the major thrust of my own empirical analysis.

Another gross misrepresentation of my position is when Bagchi states that I recommend the taxation of profits on the basis of accountants' profits and then goes on from there to narrate the problems with this base (Review, p 110). Bagchi obviously picks this statement out of the context where I compare the corporation tax in India with that of other countries and conclude that the "ideal" tax will be one which for all practical purposes does not exist and which, I categorically say, does not lie in the realm of practical politics (Book, p 108). As a matter of fact, how could I be said to have made this recommendation when I explicitly recognise the justification of the total disallowance of some of the corporate expenditures for tax purposes (Book, p 46).

Then Bagchi accuses me of not providing a clue as to the reasons for the divergence of my own results regarding the incidence of corporation tax with those of the earlier studies (Review, p 111). Did I not state the basic differences in our methodologies and point out the methodological problems with the earlier studies (Book, p 73-75)?

I could go on describing such misstatements and misrepresentations of my position by Bagchi, but I believe no useful purpose will be served by it. For the benefit of the readers, as well as for policy purposes, I consider it more useful to concentrate on his minor and major comments.

Minor Comments

Bagchi distrusts the quality of published data I have used in my empirical work, and these include, among others, the published data of the Reserve Bank of India and the Income Tax Department, and consequently he distrusts the conclusions derived from them. Surely the quality of data in a country like India can always be questioned but, in the present case, they appear to be unacceptable to Bagchi particularly because they do not yield the conclusions more akin to his own feelings and prejudices.

It is not only the data gatherers who Bagchi thinks are not doing their job well; the same applies to lawmakers, tax administrators and auditors. The lawmakers apparently are not doing their job well because they deliberately leave so many loopholes in the tax legislation (Review, p 108). The tax administrators are not doing their job well because they let the previous years' cases accumulate (Review, p 110) and do not tax the in-kind benefits properly (Review, p 109). The auditors are not doing their job well because they fall prey too easily to the interests of the taxpayers (Review, p 110). In a situation of this kind, is it a surprise that Bagchi does not think that no researcher can do his job well either!

Bagchi not only dislikes my using the published data and my having faith in these professionals, he also questions my partial equilibrium approach. I admit having used it in my analysis of corporation tax incidence but then the difficulties of using a general equilibrium approach in this regard are well known to any fiscal economist and I have yet to see a single study based on the latter. But what surprises me is Bagchi's statement that I have used it all along in my book, the exception being my chapters on agricultural taxation (Review, p 107). He does not readily give me the credit of pointing out the relevance of the public expenditure patterns in my analysis of personal income tax (Book, p 22) and corporation tax (Book, p 108).

Let me now highlight the substantive issues which are implicit in Bagchi's long review and which, I believe, have serious policy implications. A meaningful discussion of these issues amongst economists and policy makers is clearly called for.

Major Comments

There are three major comments which Bagchi seems to have made on my book. First, he is in favour of the levy of a capital tax on corporations and does not accept my arguments against this tax. Second, he rejects my arguments in favour of the value-added tax as unconvincing and presents his own reasons for rejecting the tax. Third, he admits that India is the "highest-taxed nation" (and that the "scope for .... stepping up the rates of direct taxes is nearly exhausted") but then does not accept my conclusion that such high rates of direct taxes have serious disincentive effects on personal savings as well as corporate investment. His argument is that if my conclusions are valid then how does one explain the "conspicuous consumption that hits one in the eye" (Review, p 107).

Conspicuous Consumption

To take his last point first, Bagchi is puzzled by the fact that, despite the high rates of direct taxes in India, conspicuous consumption like the capacity utilisation of five-star hotels, huge businesses of dazzling shopping centres, impressive celebrations of weddings and festivals, years-long queues for the cars, exhorbitantly expensive housing constructions, etc, are all visible to the naked eye. How does one explain it? The question obviously is a pertinent one and its answer must be sought in right earnest.

The answer given in my book is that high direct taxes have discouraged the motivation and propensity to save and have encouraged private consumption. Besides, they have encouraged the rich taxpayers to avoid taxes (Book, pp 20-21) in order to consume rather than save. Consistently, therefore, as the government raised tax rates in the past in order to raise more revenues, it simply encouraged further erosion of the tax base, expansion of consumption and reduction of savings. This applied not only to individuals but to companies as well. High corporation tax rates encouraged companies to incur "wasteful" expenditures and inflate their wage bills through the grant of "generous" perquisites, bonuses, employees' welfare expenses, etc (Book, pages 81, 115, 126, 185, 188). I, therefore, suggested that "the simultaneous existence of so many tax avoidance devices in the income tax structure reduce its effectiveness ... It may be advisable to close these loopholes and simultaneously reduce the extremely high tax rates presently levied on high income brackets" (Book, p 14). By the way, this was also Kaldor's advice in the mid-fifties.

Obviously, Bagchi is not satisfied with these answers. (Or, perhaps he believes that not enough emphasis has been placed on these in my book.) Let us see what his own answer is. Bagchi feels that direct taxes in India are high in "nominal" terms only. In "effective" terms they are not high because of the "ingenuity" of the taxpayers in taking advantage of the loopholes like HUFs, trusts, etc. The direct taxpayers not only avoid taxes, they also evade taxes. Companies for example, are helped by "dishonest" auditors in evading taxes. In his opinion, thus, both tax evasion and tax avoidance have eroded the tax base and significantly reduced the "effective" rates of direct taxes. For Bagchi, it matters little whether it is avoidance or plain evasion which has caused it (Review, p 110).

Evidence

To support his argument, he presents three pieces of evidence: (a) the inelasticity of income tax in India[4] (b) the low ranking of India in an IMF cross-section tax effort study; and (c) the bullish tendencies in the stock market in 1970. Bagchi asks if the "effective" burden of direct taxes were high in India how could one explain all these facts.

Let us look at his evidence closely It is totally untrue that income tax in India has low income elasticity. Taking a much longer period, a more recent IMF study has estimated this elasticity to be 1.7[5] which is substantially over unity. The same IMF study also establishes India to be a country with an extremely high tax performance[6] — taking into account both the "static" and "dynamic" indices of tax effort. Thus neither of the first two pieces of evidence presented by Bagchi is valid.

Regarding the performance of the stock market in 1970, Bagchi chose to omit the reference to the difference favourable budgetary factors made as stressed in the source quoted by him.[7] In any case what is relevant is not the short-run performance of the stock market but the long run. And here the facts reveal quite the contrary. According to the Reserve Bank of India, the index number of variable-dividend-industrial-securities has rarely reached the level it had in 1960/61 so that the gross yield on these securities has declined from 8.11 per cent in 1965/66 to 5.53 per cent in 1970/71.[8] I would suggest to Bagchi not to use the performance of the stock market as evidence on the question of the relationship between direct taxation and its effects on savings.

All the same I would be the last person to deny the importance of large exemptions, allowances and even loopholes in India's direct taxes and this, as I have indicated above, is accepted in my book as well.[9] I would also readily admit of the fact of large tax evasion, especially by the rich; this, once again, is pointed out in my book (Book, pp 31-32). Yet I refuse to admit that the inverse causal relationship betwen high direct taxes and personal savings does not exist. I still remain to be convinced that whatever "savings" are generated through tax avoidance and tax evasion are utilised to earn more incomes (with the knowledge that they will be subjected to still higher taxes) than to enjoy "luxury" consumption. I believe this to be an area of further research.

Capital Tax

My own arguments against the levy of a capital tax on the corporations are given in the book and it would be no use repeating them here. However, I would like to comment on Bagchi's arguments in favour of this tax.

Bagchi gives two main arguments in favour of the tax. First, wealth constitutes an index of the 'ability to pay' and should, therefore, be taxed. Second, the levy of a capital tax on the corporations is an effective way of reaching the "unrealised" capital gains of income taxpayers.

The concept of the 'ability to pay' as evolved in the theory of taxation is based on the sacrifice principle and as such relates to the individuals. It is not clear what the 'ability to pay'

[The views expressed in this paper do not necessarily reflect those of the organisation with which the author is presently associated. The author wishes to thank S P Gupta for his kind help in the preparation of these comments.]

of a corporation is which is to be measured by its wealth.

Again, it is true that the "unrealised" capital gains of the individual go untaxed under the income tax, but do they also go untaxed under the individual wealth tax? If individuals do get taxed on the appreciation of the value of their corporate stocks under wealth tax, what is the logic of "double taxation" of the same? In any case, a capital tax on the corporations will seriously affect their retentions and encourage debt capital over equity capital.

It was largely for these reasons that Kaldor and Gulati intended that wealth tax be levied only on individuals and unincorporated businesses and not on corporations.[10] It was also precisely for these reasons that wealth tax on companies was abolished in 1960-61. It is surprising to find Bagchi making the arguments which have been rejected by economists and politicians alike.

Value-Added Tax

Once again, my arguments in favour of the Value-Added Tax (VAT) are given in the book.[11] I shall, therefore, concentrate on Bagchi's reasons for rejecting the tax.

Bagchi believes that the tax will be inequitable—it will tax the wage earners, if passed backward and it will be regressive, if passed forward. Secondly, he believes that the tax will be difficult to administer and will in all likelihood be evaded.

Regarding the equity aspect of the tax, it will obviously depend upon the incidence of the tax. As indicated in the book, while in the short run consumer prices may rise somewhat,[12] in the long run I believe that the tax will be shifted backwards. Even if the wage bill is to be exempted from the tax (although the case for this is not necessarily clear), VAT will still be borne by interest and rent incomes and this will be an improvement over the existing profits tax especially because it will, at the very least, not discourage equity capital and encourage debt capital.

The administrative difficulties of VAT, as mentioned in my book, are no more or less than those of any other new tax and just because there is a likelihood of evasion that is no reason to reject a tax. Surely every tax is likely to be evaded, some more than others, and if that were the criterion all tax reform would be shelved.

Yet one finds that in country after country, VAT is being adopted successfully. "In 1965, VAT was used only by France with Finland and Michigan using modified forms. Today it is one of the world's most productive taxes and its rate of introduction is accelerating".[13] In the less developed world Ivory Coast, Senegal, Malagasy Republic in Africa, and Brazil, Uruguay and Equador in Latin America are administering the tax with great success. Value-Added Tax legislation is also being drafted in Colombia, Argentina, Mexico and Taiwan as in all these countries the tax has been accepted in principle. Besides, even Value-Added Tax administrators themselves have admitted that "there is no unusual nor basic difficulty in the administration of a value-added tax... that administration of this tax need not be a serious factor in any decision regarding its merits".[14]

However, the real question is: Will the tax exasion be more serious under the value-added tax? I will let Kaldor answer this question. "The most important administrative advantage of a universal value-added tax is its self-reinforcing character which would provide the revenue authorities with an invaluable weapon against tax evasion, and not only in the enforcement of this particular tax, but of other taxes as well".[15] It is only if the standards of tax morality and administrative competence are considered extremely low or collusion among businesses is very widespread that the Value-Added Tax would become ineffective. But then this would be a very harsh commentary on the reality in India.

NOTES

1 *Economic and Political Weekly*, January 15, 1972, pp 107-114.
2 Chapters 2 and 9.
3 Nicholas Kaldor, "Indian Tax Reform", p 3.
4 Sahota's estimate of 0.565 which Bagchi quotes relates to the "built-in elasticity" of the income tax of early fifties and this is a less relevant measure for the issue in question. It ignores the effects of substantial revisions of tax rates, extension of tax base, etc, which have been associated with planned tax effort. Including these factors, Sahota made a "buoyancy" estimate of 2.04 for income tax in the early fifties. Bagchi misuses my own statement insofar as my reference to regressivity of income tax in India is "inter-temporal" only. See G S Sahota, "Indian Tax Structure and Economic Development", p 20.
5 Raja J Chelliah, "Trends in Taxation in Developing Countries", *IMF Staff Papers*, Vol XVIII, No 2, July 1971, p 265.
6 *Ibid*, pp 304-305.
7 To complete his quotation (Review, p 107), "But by far the most encouraging factor was the Budget, the positive points of which exceeded even the most optimistic anticipations... the tax exemption limit in respect of income arising from investments in the Unit Trust of India and shares of Indian companies was raised to Rs 3,000... Marginal relief was also granted in direct taxation and the limit of exemption in respect of wealth tax was enlarged". *Commerce*, Annual 1970, p 324.
8 Index numbers of variable-dividend-industrial-securities were as follows: (1960-61=100)

1965-66	75.9	1969/70	95.8
1966-67	81.1	1970/71	100.1
1967-68	77.5	Nov 1971	89.0
1968-69	87.9		

9 But, unlike Bagchi, I would not ridicule the taxpayers for taking advantage of these. He should perhaps blame the politicians. Simon once very aptly described the coexistence of high tax rates and loopholes as a "subtle kind of moral and political dishonesty... a grand scheme of deception, whereby enormous surtaxes are voted in exchange for promises that they will not be made effective. Thus, politicians may point out with pride to the rates, while quietly reminding their wealthy constituents of the loopholes". Henry C Simon, "Personal Income Taxation", p 219.
10 Nicholas Kaldor refers only to individuals as taxpayers in his recommendations on net wealth tax. See his Indian Tax Reform, pp 19 and 26. Also see I S Gulati, "Capital Taxation in a Developing Economy", pp 37, 116 and 199. Apparently, when the Government levied the wealth tax on companies in 1957, simply to abolish it in 1960, Kaldor supported it only half-heartedly. See his "Essays on Economic Policy", Vol I, pp 223-224.
11 By the way I never said that VAT will result in lowering of prices of consumers goods (Review, p 112) which is another misrepresentation by Bagchi.
12 The NEDO Report which Bagchi himself quotes forecasts a price rise of only 1 1/2 to 2 per cent from a value-added tax and this is shown to be consistent with the behaviour of prices before and after the introduction of VAT in the Common Market countries. See E G Horsman, "Britain and Value-Added Taxation", *Lloyds Bank Review*, January 1972, p 33.

We tailor

We call this application engineering — where every "link" is strong, and one electrical component supports another.

The result? An integrated electrical system with a high degree of technical excellence engineered to match specific applications.

Lucas-TVS produce original, electrical equipment for cars, trucks, buses, tractors, two wheelers, stationary and marine engines. They meet the demands of customers in Britain, U.A.R., and Yugoslavia, as well as in India.

Sold and serviced by — **Lucas Indian Service Limited** Madras, Bombay, Calcutta, Delhi, Bangalore and **TVS & Sons (Private) Limited, Madurai** and all its branches.

THE LUCAS-TVS RANGE

STARTERS-DYNAMOS-ALTERNATORS-REGULATORS - IGNITION COILS - DISTRIBUTORS - HEADLAMPS - HORNS - SWITCHES - FLASHERS - WINDSCREEN WIPERS

With Such an Enemy...

WHEN — after more than a decade of futile military involvement in a distant land, after the blanket and blind killing of hundreds of thousands of mostly non-combatant Vietnamese, after the mindless destruction of an entire countryside by a higher tonnage of bombs than was dropped during the entire Second World War, after a so-called wide-spread anti-War agitation within the United States, after the forced withdrawal of a President from seeking re-election, after the attempted *neutralisation* of the other two super powers by another White House incumbent and, most vitally, after the Vietnamese people have made clear their determination to control their own country — an American President can do no better than pop out his politically impotent fighters and bombers to try and settle a crucial political issue, then the efficacy and the very *raison d'être*, not only of Nixon and the American political system, but of the way of life of an entire people must come into question.

Too often have the horrors inflicted on Vietnam by the Americans been fobbed off by blaming a Johnson or a Nixon or their advisers or the Pentagon or 'the military-industrial complex'. Excuses have been poured out about the basic 'decency' and 'niceness' of the God-fearing American man and woman. Yet, even today, after eleven lost years and after hundreds of thousands of lost lives, there is no more effective protest within America than the 'sit-ins', the breaking of campus window-panes and the mouthings of liberal senators and congressmen and presidential hopefuls. And after all this Nixon will probably be voted into power again by common consent. The crude fact is that tens of millions of Americans are so insensitised and so wrapped up in the self-seeking, rampant individualism which is an intrinsic and necessary part of Western industrial societies that the violence, the War and the killing, especially of Asian 'gooks' and 'dinks', is to be forgotten, if not to be positively encouraged. It is not that the Americans have a monopoly of insensitivity or racial arrogance which makes the American system a destructive monster, but that this arrogance is married to a technological and economic machine which through a vicious circle is creating destructive, anti-social beings.

In contrast, North Vietnamese society, for all its exposure to violence, is not reacting like a self-destructive engine. Does this have something to do with the conscious creation of an economic and social system which is geared towards collective effort, the fruits of which are equitably dispersed and not concentrated in a few hands? Added to this is the relative imperviousness to disruption of a self-sufficient peasant society. Its resilience and intrinsic community consciousness and cohesion make it impossible for the Americans "to bomb it back to the Stone Age". While the violence and criminality of the Vietnam War are being carried back to an already tense and violent American society, there are no indications that the War is having any such effect on North Vietnam.

It could be said that the North Vietnamese and the Viet Cong would not be able to sustain their struggle without external — mostly Russian — armaments. But the Americans themselves admit that Russian military aid to North Vietnam and the NLF last year — amounting to some $ 100 million — was only about five per cent of that given to the Saigon regime by the United States, quite apart from the gigantic expenditure of the American forces themselves. If the human cost and the ideological bases of the War could be momentarily set aside and an audit of the War done purely in American business efficiency terms, the American side of the audit would be a recital of colossal waste and a totally inefficient use of resources. In contrast, the North Vietnamese and the NLF would stand out as ingenious, frugal and economic users of the relatively meagre resources at their command.

At any and all levels — military, psychological, economic, political and even technological — the Americans have proved to be bunglers. They just have not been able to use the abundance of instruments they have for the right role at the right time. The most glaring instance is their blind use of air power to try and win a war, when all the accumulated experience — including their own "Strategic Bombing Survey" of the effects of bombing on Germany — show that mass air bombardment has a counter-productive effect. It usually steels the will of the opponent to keep on fighting, destroys much civilian property, but does not significantly affect the capacity of the opponent's armed forces to continue a war. Yet, we find a morally and politically bankrupt leader and his nation resorting to the same sterile tactic. With such an enemy, the Vietnamese can manage without friends, perhaps, as the Russians and the Chinese are learning.

Soviet-Iraq Treaty

Another Special Relationship

A Correspondent writes:

WHETHER in personal life or in international politics, the value of special relationships vary *inversely with their* number. The signing of the treaty of peace and friendship between the Soviet Union and Iraq could not, therefore, have been particularly welcome to Egypt. Not that it could do anything to prevent such a development. And it may even try to use the Soviet-Iraqi treaty to its advantage. Cairo's bargaining position *vis-a-vis* Moscow can improve a great deal if it can have the co-operation of Baghdad in framing Arab demands on the Soviet Union and other socialist countries.

But if its relations with Baghdad do not remain cordial enough for such co-operation, Moscow can play one against the other in order to ensure that the Arabs do not want anything more than what it can concede. The fact that historically Baghdad has always attempted to emerge as a centre of Arab revolution and to deprive Cairo of some of its appeal to fellow Arabs in the east makes it obvious that it may not be easy for President Sadat to work out a new pattern of relationship with Iraq.

There is also the problem of the role and place of the Baath parties in Arab politics. Neither Egypt nor Syria is at the moment well disposed towards the Baathists and the new prominence of Iraq may once again project this particular brand of Arab socialists as a viable alternative to the existing regimes, particularly in the Levant.

The Soviet Union has scrupulously avoided a public position on the issues of domestic politics in various Arab countries. But it is bound to have its preferences in this regard. There is little doubt that some of the developments in Sudan, Egypt and Libya would have caused some worry in Moscow and, even if President Sadat has been able to convince Russia that these would make no difference to Soviet-Egyptian relations, it may not be easy to fathom what precisely the Soviet Union wants.

The emphasis on Iraq certainly opens up new options for Moscow in the Arab world. It also could mean an attempt on its part to turn the focus of Arab politics on inter-Arab relations rather than on the need to avenge the various defeats at the hands of Israel. Even if the reports of a softening of Soviet attitude to Israel are not correct, there is enough evidence to indicate that the Soviet Union is reluctant to permit any further Arab action against Israel in which the Arabs may once again be defeated. In this context, the Soviet attitude becomes understandable though it may mean serious trouble for the present regime in Cairo which is apparently still trying to find its feet.

There can of course be another way to interpret the Soviet-Iraqi treaty. It is obvious that the non-Arab countries of West Asia are emerging as powerful factors in the politics of the region. It is in these countries that the Western powers have major interests and a large number of friends among the ruling classes. With the collapse of the unity of Pakistan, Iran in particular becomes an extremely important force for West Asia. There are some indications that its ambitions in the region are growing and that it might like to make some gains. While the position of the Arabs remains weak and the situation of the Arab world fluid, the Soviet-Iraqi treaty could prove to be an insurance against the southward movement of the non-Arabs in West Asia. This is particularly relevant for politics in the Persian Gulf which, in its turn, is interconnected with the politics of the Ocean. At least, from the Iraqi point of view, this would have been the major rationale for the treaty. The Soviet Union, however, does not intend to antagonise either the Iranians or the Turks and moves are currently afoot to further strengthen Soviet-Turkish and Soviet-Iranian relations. The standard Soviet explanation that the treaty is not aimed at any third party may, therefore, be far more significant in this case than in the case of the other two treaties that Moscow has signed in recent months.

Monopolies Commission

Irrelevance Abounding

A N Oza writes:

THE government remains as confused as ever about the role of the Monopolies Commission. After the Commission's appointment in August 1970, it was not till late January 1971 that the first case was referred to it. The government's reaction to the Commission's subsequent working has been such as to give the impression that it regards the Commission essentially as an embarrassment to the industrial policies it wants to pursue.

The Monopolies Commission got going just when the growth of industrial production was at its lowest. Without a planned approach to reviving industry, and unable to effect a significant rise in public sector industrial investment, the government had no answer to the private sector's cry that industrial growth was being kept down by procedural delays in industrial licensing, etc, and the so-called curbs on the private sector. Prominent among the 'curbs', as private industrialists saw it, were the activities of the Monopolies Commission.

True, the government did refer to the Commission some two dozen proposals for expansion or setting up of new units, though only half of them were of any significance from the point of view of concentration of economic power, involving large projects and large groups like Tatas and Birlas. In contrast to the casual approach of the government's industrial licensing machinery, the Commission went into details of the projects concerned, calling for a certain amount of awkward but meaningful information from the sponsors and even inquiring into the socio-economic credentials of some of the projects. Also, its approval of projects was qualified and contingent upon fulfilment of conditions relating to capital structure, price, exports, etc.

The results were not unexpected: the Monopolies Commission immediately came under a barrage of criticism from influential industrialists. The manner of conduct of the Commission's inquiries and its approach to the problem of concentration were, it was alleged, holding up major industrial projects in the 'core' sector and generally providing a damper on investment by the large houses.

The government's discomfiture over the working of the Commission has been aggravated by the fact that in almost all important cases (e g, Century, Telco, etc) the Commission has been divided in its verdicts. The divided verdicts of the Commission in important and politically sensitive cases have made decision-making difficult for the government. The government has been compelled to take the safe way out of accepting the majority view, even though this meant permitting some of the largest business groups to expand.

Some time ago, when the Leftist elements in the Congress were pressing for a more effective policy of curbing concentration, the government is said to have considered splitting up the Monopolies Commission and constituting an independent body to deal with control of monopolies and restrictive practices and another (to be called perhaps the Industrial Reorganisation Commission) to tackle the question of concentration of economic power. However, the low rate of industrial growth, the lack of any coherent policy to lift industry out of the recession and the consequent dependence on large business groups soon made the government abandon the idea of a separate commission to tackle the problem of concentration. Now the government is falling back on tinkering with the size of the Commission. Induction of a few more members is expected to take care of the problem of division of opinion within the Commission as well as that of delays in the Commission's investigations.

The reasoning betrays the government's lack of seriousness about the Monopolies Commission. For instance, it is no answer to the problem of differences within the Commission to pack it with new members who will take positions acceptable to the government. Differences in the approach to concentration cases will be inevitable in view of (i) the absence of any guidelines on the manner of conducting the Commission's inquiries (this came out prominently in the Telco case), (ii) the MRTP Act's definition of inter-connected undertakings having become operationally meaningless after the abolition of managing agencies, and (iii) the interpretation of the effects of concentration having become highly subjective as a result of the Act's very broad criteria of public interest.

It is true that the present size of the Commission is not adequate for it to perform all its three functions — investigation of concentration cases and investigation and control of monopolies and restrictive trade practices. But as things are, even the present three-member Commission does not have enough work to do. In the last three months only a minor case relating to concentration has been referred to it. This being so, there is no case for expanding the Commission on the ground that the volume of work before it is more than it can cope with.

If the government were serious about tackling the problem of concentration — which it clearly is not — the right thing to do would be to have another body which would be concerned only with controlling concentration. This body would investigate cases of existing concentration without waiting for a large group or a dominant undertaking to apply for an industrial licence for expansion or for setting up of a new unit.

At the same time it is difficult to appreciate the Monopolies Commission's complaint that the government is not referring enough cases for it to investigate. Surely, the members of the Commission know that the Act gives the Commission *suo moto* powers to take up for investigation the behaviour and performance of monopolistic undertakings and restrictive trade agreements? What is more, such investigation will in many cases necessarily extend to the problem of concentration of economic power in the hands of large groups. For, almost every one of the 20 largest groups control at least one or two giants which in their respective industries are in a dominant or oligopolistic position. Thus the Commission could have, under its *suo moto* powers, taken up for investigation all the important cases that it has examined so far, such as Century and Gwalior Rayon, Hindalco, Telco, DCM, Dunlop and Vidyut Metallics, even if these units had not sought expansion licences and their cases had not been referred to it by the government.

To sum up, the government is becoming increasingly reluctant, under pressure from the private sector, to refer cases of concentration to the Monopolies Commission and the Commission, for its part, is unwilling to use its powers to take up cases of monopoly and restrictive trade practices for investigation on its own without waiting for references by the government. Clearly, in the circumstances it is as irrelevant to expand the Commission as it is to set up a separate body to deal exclusively with concentration of economic power.

Money Supply

Non-Credit Credit

MONEY supply data for the financial year 1971-72 have just been released by the Reserve Bank. Over the year, money supply as officially defined (currency plus demand deposits, including 'other deposits' of RBI) has surged by a phenomenal figure of Rs 918 crores as against Rs 750 crores in 1970-71. Among the major factors affecting money supply, net bank credit to the government sector has increased by as much as Rs 1,185 crores (as against Rs 511 crores last year), while net bank credit to the commercial sector actually contracted by Rs 42 crores (against an expansion of Rs 390 crores in 1970-71). This, it may be suggested, is as it should have been. For, the burden of looking after the refugees from Bangladesh as well as that of the war with Pakistan imposed a severe strain on the finances of the Central government so that in the circumstances the central banking authorities had to restrain credit to the private commercial sector. However, even after making allowance for these factors, the data put out by the Reserve Bank are not readily comprehensible.

On the government side, against the net bank credit of Rs 1,185 crores, the budgetary deficit of the Centre and states together is only Rs 68 crores higher in 1971-72 than in 1970-71 — the deficit of the Centre rising from Rs 285 crores to Rs 385 crores and that of the states declining from Rs 225 crores to Rs 138 crores. These figures were recently furnished by the government in reply to a question in Parliament. They are apparently based on the revised estimates for the Centre and on the likely outstandings of borrowings by the States from the Reserve Bank (net of variations in cash balances with RBI). In respect of the Centre, it is unlikely that there would be any significant variation between the revised estimates and the actuals. In regard to the states, however, it appears from the data on loans and advances by the Reserve Bank that their deficit in 1971-72 would would be around Rs 200 crores or Rs 62 crores higher than the amount mentioned above. This would give a total

* Excluding Reserve Bank.

budgetary deficit of Rs 585 crores, which still falls short of the figure of net bank credit to the government sector by as much as Rs 600 crores.

It is true that the budgetary deficit of the Centre, as defined by variations in the Reserve Bank's holdings of *ad hoc* Treasury Bills and government balances with RBI, is a concept narrower than 'net bank credit to Central government'. The latter concept takes into account variations in (i) Reserve Bank's holdings of rupee securities in its Issue and Banking Departments, (ii) bills purchased and discounted by Reserve Bank (including government Treasury Bills), and (iii) Reserve Bank's rupee coin holdings. But these do not account for the gap of Rs 600 crores mentioned above. The Reserve Bank's holdings of Government of India rupee securities in its Issue Department rose by Rs 484 crores between March 26, 1971 and March 31, 1972. But during the same period its holdings of rupee coin declined by Rs 15 crores. Figures of government securities in the Banking Department are not separately available. Everything considered, over Rs 150 crores of credit to government do not get accounted for. Where they have come from is a minor mystery.

That there have been some accounting re-adjustments during the year is suggested by one of the contractionary factors in the process of money creation, namely, net non-monetary liabilities of the Reserve Bank, which showed a sharp increase of as much as Rs 377 crores. This must have worked as an offsetting factor against the expansion under credit to government. As for these liabilities, the only factor of significance known to the public is the contribution of Rs 60 crores to the three agricultural and industrial long-term funds maintained by the RBI (see Reserve Bank's Annual Report, 1970-71, p 110).

It seems thus that net bank credit to the government sector at Rs 1,185 crores is definitely higher than what is warranted by the real budgetary gap, though exactly by how much the figure has been inflated it is difficult to work out. Surely, it is necessary in the interests of an understanding of the actual trend in money supply in 1970-71 that the Reserve Bank makes known to the public any methodological changes which it may have effected in its money supply data.

Yugoslavia

Socialist Stock Exchange?

THE Italian Communist Party has found it necessary to de-revolutionise its concepts and to publicly assign a major role to private enterprise. In neighbouring Yugoslavia, the ruling maverick communists under the leadership of Tito are contemplating what may be deemed by orthodox Marxists to be further de-socialisation on the economic front.

An attempt towards a form of shareholding in business enterprises was made in the middle of 1968 by the Red Flag automobile factory which makes several Fiat models adapted to Yugoslav needs. It sold bonds which entitled the purchasers to have priority in the allotment of cars for which people sometimes have to wait for two years. Other firms thought they could emulate the example of the big automobile factory but were stymied by opposition from Edward Kardelj, the leading theoretician of the Yugoslav self-management system.

The demand for an even more direct capitalist type participation in ownership has come from Slovenia, the home republic of Kardelj. The Slovenian Prime Minister, Stane Kavchich, is the sponsor of the idea. Slovenia, bordering on Italy and Austria, is the most advanced of the six republics which comprise Yugoslavia. It is some months since the proposal was mooted and the central government and the party have not taken any steps to implement or condemn it.

According to Kavchich, since more and more Yugoslavs are holding surplus money from their labour, it would be natural and useful if they could provide their money to some enterprise to expand its production according to the shareholding principle. He has said: "Instead of travelling to the Fiji Islands or spending a million dinars on a vacation, it would be much better to give the money to an enterprise which could invest it, return interest and perhaps a little more, according to the net profit realised." The Slovenian Premier's argument is: "Socialism should create new instruments of integration, and one among them should be the investment of private capital in the socialist sector, and the participation of private capital in the realised returns, as stipulated by society."

Kavchich claims that he is not alone in advocating the shareholding system in Yugoslavia. Among the Croats there are many who share the Slovenian approach to greater liberalisation of the economy. Croatia is next to Slovenia in level of economic development. Slovenia is small, but Croatia is the second biggest in size and population of Yugoslavia's six republics. In recent months, many of the advocates of liberalism and nationalism (provincialism in Indian terminology) in Croatia have lost their party jobs in a widespread purge. What is of interest is that Kavchich's ideas have found an echo in Serbia, the largest of the republics, and a region considered to be the centre of comparatively orthodox Marxist thinking in the Yugoslav context. The Prime Minister of Serbia, Milyenko Boyanich, has also suggested the introduction of the shareholding system.

Boyanich has said highly favourable conditions exist in Yugoslavia for the shareholding system. He has rebutted doctrinaire communists who say that the system of shareholding would mean a restoration of capitalism. Boyanich has stated that "socialist stock is absolutely justified." The shareholders would have to buy and sell, and *Boyanich claims that a stock exchange* need not be capitalist, but could be a socialist stock exchange!

Branko Horvat, a Yugloslav economic theoretician, has suggested the introduction of a system of "share-bonds" which would not provide the right to ownership but would provide a voice in management. The shares would be transferable on a financial market. The keenness to deny the concept of ownership is a rider to ensure the socialist protestations of the Yugoslav system.

Nutrition

Protein Is Good for Some

THE Protein Foods Association has just celebrated its fourth annual general meeting with much fanfare. Its members, totalling 32, include such major companies and institutions as Tata Oil Mills, Glaxo, Cadbury-Fry, the Food Corporation of India, and the Government-sponsored food research institutes in Hyderabad and Mysore. The purpose is to make people aware of the need for balanced nutrition and to promote the demand for fortified foods — which, incidentally, most of the members produce or mix. Such foods include 'fortified' atta (flour), protein-rich biscuits, beverages, powders, etc. More products are under development. The dissemination of nutritional awareness is organised with professional competence, and in 1970-71 cost the Association Rs 7 lakhs.

The Association has also managed to convince government of the importance of its activities. Government thus bears the cost of the fortification of atta (a programme which is today limited to Bombay and Calcutta) and has waived excise duty on the 'Indian Multipurpose Food' made up mainly of edible oilseed flour and claimed to contain 39 per cent protein.

Who are the people whom the Protein Foods Association hopes to benefit through its activities? According to the Association's own claims its lowest economic 'target group' consists of families earning Rs 250 to Rs 500 per month. It should be clear from this that 'the nutrition problem' that the PFA talks about is simply not *the* nutrition problem in the country. The government's financial and other support of the PFA's programmes has to be judged in this light.

If PFA were to restrict itself to manufacturing products for which there is effective middle-class demand and promoting its market by spreading awareness about balanced nutrition, it would be operating like any commercial organisation. But in its attempt to promote its markets and exact official concessions, it has been using the facts and images of undernourishment as it exists at the lowest levels of society — far below the 'lowest segments' aimed at by its commercial campaigns. The 54 per cent of urban poor and 38 per cent of rural poor who emerge from Dandekar and Rath's study of Poverty in India (January 2 and 9, 1971) as being below the poverty line are undernourished because, at their levels of income, they simply cannot afford enough cereals and pulses, not because normal Indian diets — whatever that be — are not nutritively balanced. Pulses are protein-rich, but their production has been stagnant and their new 'catch' varieties have still to be seriously promoted. So has production of edible oils lagged behind.

In his presidential address to the Agricultural Economics Conference last month, P V Sukhatme has drawn attention to the distortion of priorities in agricultural planning in developing countries caused by the new, internationally promoted 'synthetic protein' cult. In a series of papers, conferences and resolutions, UN bodies have been selling the idea of the crucial role of protein nourishment in body sustenance and growth, and the need, therefore, to give synthetic protein 'supplements' to the undernourished of the world — through fortifying foodgrains with protein or through supplementary feeding programmes. According to Sukhatme, while the undernourished do suffer from protein deficiency, it is false to argue that protein deficiency can be overcome by increasing protein *per se* in the diet in much the same way that calorie deficiency can be made up by supplying more calorie intake. There is a complex relationship between calorie and protein intake and in developing countries, protein malnutrition is the indirect result of inadequate energy intake. If people were to have a sufficient calorie intake of rice/wheat *and* pulses, their energy as well as protein or body-building and tissue-replacing needs would be fully met. If a diet is protein-sufficient but does not have enough calories to synthesise and retain the protein, the primary need is for more food than protein *per se*. The point is elaborated with reference to sample studies of populations and to biochemical and metabolic findings.

With a large proportion of India's population undernourished in calorie terms, it is wasteful and inefficient to think of protein-rich feeding programmes without first ensuring that the calorie requirements are adequately met. Here, the constraint is lack of *effective* demand or purchasing power among these sections of the population. Clearly, no amount of supplementary feeds can solve the problem of poverty. Sukhatme himself says: "... our efforts should be to encourage pulse production and involve the small farmer as best as we can into the effort of food and milk production ... Emphasis on amino acid fortified foods can be understood in affluent countries which have an appreciable part of their population overfed. Consumption of large quantities of protein relative to energy intake may be beneficial in reducing body fat. Where, however, under-nutrition is rampant, it is important that the first priority should be given to more food (energy) than to protein *per se*." In our circumstances, school feeding programmes and the like emphasising protein fortification smack of Victorian do-gooding for commercial ends.

Sports Goods

Export Hopes Belied

THE initiative taken by the Trade Development Authority (TDA) in sponsoring an international team to study India's sports goods industry is expected to significantly improve the export prospects for Indian sports goods, particularly to Europe and North America. Although Indian sports goods are even today exported to a number of countries, TDA's present initiative should be considered the first major attempt to systematically tap the large markets for sports goods in Europe and North America.

India was expected to emerge as a leading exporter of sports goods following the partial withdrawal from this field of the industrialised countries — particularly Japan. But India's share in the international trade in sports goods has remained very small. While in 1969-70, the total world trade in sports goods was about Rs 27 crores, India's share in this was only Rs 61 lakhs. The Sports Export Promotion Council had fixed an export target of Rs 2 crores for 1970-71, but actual exports came

to only Rs 80 lakhs. This is largely because India has not been able to make a dent in the major markets such as the UK, West Germany, Australia, Canada, Middle East, and East Africa. China, Hong Kong, Pakistan and Japan have a big lead over India.

The main hurdles to increasing India's exports of sports goods are the limited exportable surplus, non-availability of the right quality of goods popular in foreign markets, and uncompetitive prices. Thus the present production of sports goods is worth only Rs 3 crores per year, and of this only one-fourth is available for export. Further, India is not able to meet the demand for high quality leather footballs and waterproof leather hockey balls much demanded in European countries and being supplied mainly by China, Hong Kong, and Pakistan, who also have a price advantage over India.

It is evident, therefore, that the present initiative of the TDA to promote exports of sports goods would have to be underpinned by systematic efforts to strengthen the indigenous sports goods industry. First, the output would have to be increased to create the necessary exportable surpluses and those items would have to be produced which have a ready and growing overseas market. At the same time, unless the increased production is at lower unit cost, it would not be possible to withstand competition from the other exporting countries.

This is no easy task. India's sports goods industry, which produces as many as 190 items is wholly in the small-scale sector. There are as many as 660 units, employing over 20,000 workers, and the industry is concentrated in Delhi, Jullundur and Meerut and to some extent in Bombay and Calcutta. There are, in addition, 175 firms which are engaged only in exporting sports goods, mostly operating without first-hand knowledge about preferences in the importing countries. On the other hand, the export prospects appear promising in view of the availability of good leather which accounts for about 25 per cent of the total cost in leather balls manufacture. This gives India competitive strength *vis-a-vis* some other competing countries such as Hong Kong and China who use synthetic material in place of natural leather. Several countries prefer leather balls, so that if India can produce goods in the required type and quality, new markets can be captured.

But it would still be necessary to modernise existing production methods which are outdated. While the industry's concentration in the small-scale sector may be a hurdle to major modernisation, applications from certain units for importing the latest machinery at small foreign exchange cost have been pending a long time with the government. It is in areas such as this that the TDA and the STC can be of direct assistance to the industry. These organisations could also undertake — in addition to TDA's present project — periodical market surveys in overseas markets, so that the changing preferences and the size of demand for various sports goods in different markets are properly assessed.

LETTERS TO EDITOR

Who Won in West Bengal?

ASHOK RUDRA's "Who Won in West Bengal?" (April 1, pp 691-2) reminds me of a cryptic remark that Keynes once made, writing about the German inflation after the First World War: "If it be true that university professors in Germany have some responsibility for the atmosphere which bred war, their class has paid the penalty." It is all very well for our Indian Professor to talk about "armed insurrection", so long as he is sheltered and nourished by the society which he wants *others* to destroy. But if an armed revolution does take place, will he escape its wrath? In a society where a person earning just Rs 5,000 per year comes within the top one per cent of the population, where does our professor belong? Would his earning be reckoned as mere "wage"? And what may be the rate of return that he now enjoys from the investment that was once bestowed on him? But perhaps our professor feels in his bones that an armed insurrection is not a likely contingency even in West Bengal and that he does not need to worry about anything happening, in spite of his literary exhortation, for which he, or his class, would be called upon to pay a penalty.

A K DAS GUPTA

New Delhi

Mode of Production in Indian Agriculture

I WAS dismayed to read the article on "Mode of Production in Indian Agriculture" by Paresh Chattopadhyay (Review of Agriculture, March 25, 1972). Chattopadhyay begins by attributing a certain view to me and then quotes from a statement of mine which should make it evident that that is not my view. I doubt that Chattopadhyay is so naive as to think that my statement that there are difficulties in applying the concept of class to the study of rural India is equivalent to the view, which he attributes to K N Raj and myself, that "it is not possible to apply the Marxist method of analysis" to the study of Indian society. K N Raj has written extensively on the Marxist approach; why does Chattopadhyay have to rely on something that Raj is reported to have said while ignoring the many things that he has written? I fail to understand what people like Chattopadhyay seek to gain, materially or morally, by distorting the views of others in this way.

ANDRE BETEILLE

Delhi

The Radicalisation of Indian Economists

YOUR report on the seminar organised by the Department of Economics of Bombay University ("The Radicalisation of Indian Economists", April 1, pp 697-8) contains a serious error in regard to the conclusion of my paper. My paper as well as my oral presentation highlighted the empirical evidence available from the NSS and the Rural Labour Enquiry to the effect that the problem of open unemployment or even of visible underemployment (defined as involuntarily part-time work and reflected in the availability of persons for additional work) is much less widespread than we tend to think. However, it would certainly be erroneous to infer from this that the problem of disguised unemployment is less widespread. To quote from my paper, I emphasised that "the links between the problem of employment and unemployment and poverty in India are not amenable to measurement through the time criteria. An improvement in the level of productivity or income is the crux of the matter". Even with respect to agricultural labourers, "the problem of equality of employment appears more important than that of the duration of employment".

PRAVIN VISARIA

Bombay

In Search of New Pastures

Hansavivek

WESTERN INDIA MATCH COMPANY is exploring new fields of activity to augment its earnings. The objects clause of the Memorandum of Association is being amended to include a wide variety of new businesses. Listed among the diverse businesses are manufacture of paper, pulp, boards, containers, drums, tubes, packings, electrical and electronic apparatus, instruments, accessories, razors, razor blades, vacuum flasks, pencils, advertisement materials, foodstuffs and food products, pharmaceuticals, drugs, chemicals, fertilisers, dyes and dyestuffs, petroleum products, soaps, cosmetics and even businesses of cultivation of land, and export and import of various goods. No indication, however, has been given by the management as to which specific lines the company intends to take up in the immediate future.

During 1971, WIMCO's production of paper was adversely affected by industrial unrest in Calcutta coupled with load shedding and other technical problems. Output of paper dropped from 5,581 tonnes to 4,628 tonnes, but that of chlorates rose from 5,066 tonnes to 5,304 tonnes, perchlorates from 3 tonnes to 20 tonnes and of salt from 19,500 tonnes to 25,645 tonnes. Production of matches declined by 11,622 cases from the previous year. The company's production was fully disposed of and, in addition, some quantities of matches purchased from the small-scale sector were marketed. Akbar Hydari, chairman, complains that the company's share of the market has fallen further, while that of the small-scale industry has risen from 660,000 to 7,00,000 cases. The output of the latter, he adds, has been rising steadily to show an increase of 41 per cent over the past 7 years. He points out that excise duty is being evaded on a growing scale of match manufacture, and his estimate is that more than Rs 12 lakhs per month are being lost to the exchequer. Besides, the duty-evaded supplies are underselling legitimate goods and constitute a 'serious threat' to WIMCO in a number of markets. Hydari expresses the hope that the committee set up by government to review the excise payment procedures will effectively tackle this evil.

WIMCO earned a lower profit in 1971 compared to the preceding year in spite of considerably higher net sales. This is ascribed to all round rise in costs. The company commissioned the perchlorates plant in the second half of the year. As demand is on the rise, the company may soon consider expansion.

TATA MILLS, after 60 years of its career in the cotton textile industry, intends to diversify its activities so that it should not have to depend for profits solely on textile operations. For

* For 1969 and 1970. **Adjusted against previous loss.

quite some time now, the industry has been passing through 'a crisis of a magnitude unprecedented in its history'. The company has applied for an industrial licence for manufacture of flat steel products in coil form. Total cost of the project, based entirely on indigenously available scrap and sponge iron, is estimated at Rs 10 crores; and the foreign exchange requirement for the equipment will be Rs 4.3 crores. The project, based entirely on indigenously available scrap and sponge iron, is intended to be set up in the industrially 'backward' area of Chanda in Maharashtra. The proposed diversification is expected to lend a degree of stability to the profit position of the company. It is also proposed to carry on the business of purchase and sale of chemicals, such as soda ash, sodium bicarbonate, benzene hexachloride, bromine, etc, and to undertake, at an opportune time in future, the manufacture, purchase and sale of any type of plant, machinery, tools, etc. Owing to 'difficult trading conditions', Tata Mills showed a poor performance during 1971, with a 26 per cent drop in gross profit at Rs 61 lakhs despite a 5 per cent increase in sales at Rs 11.17 crores. Net profit was higher than last year's since provision for depreciation was required for one year, as against two years last time. During the year, plant and machinery worth about Rs 41 lakhs was installed. Value of works under construction and of machinery awaiting installation at the year-end was Rs 4 lakhs. Further orders have been placed in the current year for machinery, of the value of about Rs 17 lakhs. Exports declined from Rs 39 lakhs to Rs 26 lakhs, owing to a steep rise in cotton prices, which undermined the company's competitive capacity in international markets.

SVADESHI MILLS had to contend with frequent 'labour disturbances' last year. Since July 1971, some of the 2-loom and 4-loom weavers whose one and two looms, respectively, could not be worked for want of beams refused to shift to alternative 2 looms and 4 looms offered to them and continue to work only one and two looms, respectively. This resulted in a loss of 6,000 loom-shifts during 1971. The company had filed an application in the Labour Court to have the recalcitrant attitude of weavers declared as an 'illegal strike'. The Labour Court, however, took the view that the dispute was not an industrial matter. The company went in appeal to the High Court, whose judgment is awaited. The disruption in work on account of the industrial unrest in the textile industry in Bombay in October 1971 on the question of bonus for 1970 resulted in a loss of production of about 4.25 lakh metres and of a loss of profit of about Rs 3 lakhs. This apart, the 1971 results were affected by the steep increase in cotton prices, coupled with further increases in costs under various other heads. The company earned a lower profit following contraction of sales and margins. Exports declined from Rs 70 lakhs to Rs 43 lakhs, because exorbitant rise in cotton prices made the products uncompetitive in world markets. Prospects for the current cotton season appear to be bright, as prices of all varieties of cotton have come down and they are not expected to reach the peaks witnessed during the last year. Plant and machinery worth about Rs 7 lakhs, including an eight-colour printing machine and a doubler winder, were installed at the mills. 'Coromandel Garments', in which the company has an interest, is doing well, and is expected to double its production by the end of this year. It has on hand several export proposals.

UNION CARBIDE INDIA's programme for the modernisation and upgrading of battery and flashlight manufacturing facilities is progressing rapidly. The company is now able to make indigenously most of its battery manufacturing equipment. Construction of additional battery zinc rolling facilities at Madras is expected to be completed this year. Industrial licences have been received for manufacture of hard-facing and wear-resistance products and also for expanding the capacity of carbon electrodes. The management is also negotiating with government for the expansion of shrimp fishing activities. Application has been made for industrial licences to manufacture agricultural pesticide 'Sevin'. Last year, the company incurred capital expenditure of Rs 3.22 crores, against Rs 3.44 crores in the preceding year. Demand for the company's products showed appreciable increase last year, and shortages in the market were noted because of constraints on capacity, particularly in the case of polyethylene and batteries. The company's application for expansion of existing facilities for production of polyethylene, submitted in 1970, is still being considered by government. The directors say that, despite a strict retail price supervision, batteries are being sold at retail prices higher than those stipulated by the company. Sales of zinc plates were limited by inadequate allocation of zinc spelter and 'substantial' increases in cost of raw spelter. Sales of shrimp were delayed by delay in certain government approvals. Some of the problems were resolved towards the year-end when export sales to USA commenced. UCI has turned out good results for 1971, with increases in sales and earnings in spite of considerably increased provisions for depreciation and taxation. Dividend, raised from 15 to 17.5 per cent, is still well covered.

ANNOUNCEMENT

A Comprehensive Annotated Bibliography on the Economic History of India (1500 A.D. to 1947 A.D.)

The Gokhale Institute of Politics and Economics, Poona, has undertaken the preparation of a comprehensive annotated bibliography on the above subject, with the financial assistance from the Indian Council of Social Science Research. The bibliography will cover all source material available in English language in printed and typescript form, as well as research work done in the various branches in Indian economic history covering the period 1500 A.D. to 1947 A.D. Historical statistics will receive special consideration.

At present, exhaustive check-lists of various types of works, such as books, periodical articles, theses, parliamentary papers, serials, committee reports, etc., are under preparation. The work of preparing annotation cards is also proceeding simultaneously. Supply of copies of check-lists and annotation cards to interested research institutions is under consideration.

Suggestions and queries on the project are welcome and should be addressed to:

Dr. V. D. Divekar,
Bibliography Project,
Gokhale Institute of Politics and Economics,
Poona-4 (India).

Snakes and Ladders Again

Romesh Thapar

EVEN as the tired old dacoits of the notorious Chambal Valley are "surrendering" to non-violence, presumably to make way ("Indian-style"!) for the younger generation, the much feared and much loved Indira Gandhi is finding herself powerless before the united opposition of the entrenched Farm Lobby to a reduction in wheat procurement prices and land ceilings. Indeed, claiming that such matters should be settled at sowing time as against harvest time, the agitation spreads for higher prices and higher ceilings.

All the smiles in the world cannot hide the meaning of these revealing events in the Capital, although our MPs — that is, when they show up! — are obsessed with other issues. Sample: why did our Ambassador L K Jha bring McNamara's daughter on a tour to India!

Dominoes is a Western game, but, as any student of social history will tell you, it is the product of the genius of the ancient Indian who designed many elaborate *pachisi* boards for play. Indira Gandhi, however, confronted by the sweep and complexity of continental politics (which include a million lobbies!), appears to be playing her own game of dominoes, even though it is more in the nature of a snakes-and-ladders operation. She must surely know that some of the inflated Chief Ministers who had to be punctured just before the elections were more relevant than the creatures she installed and who now talk about procurement prices and land ceilings in much the same way as their predecessors. And she must be wondering down which ladder to throw them.

How demoralising the scene is: leaders prancing around with every kind of pretension, but lacking the capacity or inclination to break the lobbies and to move their states to a new plateau of action.

Indira Gandhi has only herself to blame. Repeatedly, as the people thrust more and more power into her hands in the hope that she means business, we are sought to be impressed by apparently co-ordinated exercises to topple and tipple. We are persuaded that things are happening, but we are where we were. The personalities change. The policies and perspective remain the same. And by this it is not meant that we should sing the songs that have made tedious parrots of so many Righties, Lefties and Quickies.

The ruling party has to realise that it can no longer function without a well-structured party organisation at all levels. In other words, the headquarters of the party cannot be a tumbledown bungalow manned by men who are holding on to pathetic little jobs and are only too anxious to move on should opportunity present itself. No one of any consequence works at the head quarters. No information of any consequence, archival or otherwise, can be gathered there. Any day, the birds will take over.

Flair for 'Operating'

What is the matter with the ruling party? It certainly has all the money and more to run a headquarter operation and an all-India organisation. There are some dedicated men within the party who have survived the massive inroads of opportunism and corruption. There are obviously many corrupt men with a flair for "operating". Political activity is a careful blending of both elements. Is the leadership fearful of becoming captive to a party machine? Yes, it's an old fear. It even inhibited the institution-builder, Jawaharlal Nehru.

As Indira Gandhi launches attacks on cliche attitudes to growth problems, she's got to make clear that party organisation is a missing link in the political-economic discussions now under way. Such organisation, properly motivated, remedies the obvious weaknesses of democratic functioning, the weaknesses which lead to the snakes-and-ladders obsession. The frightened whispering in the corridors of power in Delhi is of a gossipy kind because the essential meaning of party organisation is not grasped or is deliberately underplayed. We talk of new growth models, but fail to understand the implications *in practical terms* of what we talk about.

Irritation mounts. There is a desire to shake some of those who are involved in policy-making. Then passions dissolve. Vietnam, gallant little Vietnam, is battering the guts out of the Nixonian strategists. Maybe, what we are witnessing marks the end of America's darkest hour. Out of miserable defeat will come enlightenment. All else pales into insignificance as Asia turns its attention to the undaunted Vietnamese. Indeed, the conviction exists that they would even triumph over nuclear attack.

Against this background, we in India are naturally wallowing in our "unique" activities — dacoits surrendering to Jayaprakash Narayan and a naked Jain sitting in a committee among ministers and MPs in Parliament House. I suppose we shouldn't complain. Something unique will surely turn up to salvage our fortunes. Indira Gandhi is on the hunt for it, snakes and ladders *et al*...

April 17

FROM OUR CORRESPONDENTS

NEW DELHI

Quick End to Great Expectations

THE outcome of the conference of state Chief Ministers has come as a startling anti-climax after the great expectations raised by the state assembly elections and the changes in the government leadership at the state level. It had been suggested that with the commanding position that the central leadership now occupied and given the fact that so many of the state bosses had been cut to size in the assembly elections, the central government's policies in respect of the agricultural sector would be put through without too much difficulty. However, that is not how things have worked out. What was witnessed at the Chief Ministers' conference was a repetition of the pattern, established during the past several years, of the Chief Ministers taking a tough line on behalf of the farm lobby and the Union Food and Agriculture Minister submitting meekly to their dictates.

The issues before the Chief Ministers' conference were of great importance from the point of view of pushing ahead with the development process. The Central government has sought to give the impression, mainly on the strength of the impressive step-up in

Plan outlay provided for in the 1972-73 budget, that at last it was serious about putting the economy back on the growth curve. But this impression has been completely belied by the Centre's spineless performance at the Chief Ministers' conference and the way the Chief Ministers, particularly those of the three states of UP, Haryana and Punjab, were allowed to gain the upper hand, as if by design.

Budgetary Burden

The main item on the agenda of the conference was to consider the report of the Agricultural Prices Commission on the price policy for rabi foodgrains for the 1972-73 season. The Commission had made out an unassailable case for lowering the procurement price of wheat and made recommendations on certain related matters which would bring the price policy for wheat into conformity with the levels of production and productivity reached over the last five years. The recommended policy changes, specially the lowering of the procurement price, had been long overdue and had been suggested again and again by the APC in the past few years. But the changes could not be carried through in the face of strong resistance from the farmers' lobby represented by the Chief Ministers of the main wheat producing states. Wiser from past experience, the APC this time proposed only a marginal reduction in procurement prices of about Rs 4 per quintal in the case of the Mexican and indigenous (common white) varieties and Rs 5 to 8 in the case of the indigenous (red) varieties. Together with minor adjustments in issue prices to flour mills and some economy in costs of procurement, transport and storage, this was expected to absorb a part of the large and mounting losses of the wheat procurement and distribution system. At the prevailing levels of procurement and issue prices the estimated loss or subsidy is estimated to be about Rs 135 crores in 1972-73. This is a direct outgo from Central budgetary resources and leaves that much less financing development programmes or welfare schemes for the poorer sections of the people about which so much is heard these days.

The case for lower procurement prices had found support in the Finance Ministry's Economic Survey as well as in the Finance Minister's budget speech. The Finance Minister was probably better aware of the strength of the farmers' lobby and so he provided Rs 100 crores in the budget to cover the likely losses on the Food Corporation's operations. But even he had hoped to save at least Rs 35 crores of the Rs 135 crores through some adjustment in procurement and issue prices. He had also assumed that the FCI's draft on bank credit would be lower as a result of a larger offtake of foodgrains from the public distribution system which might result if at least a part of the benefits arising from the much-publicised wheat revolution were passed on to the consumer. The APC report made a pointed mention of the fact that bank advances against foodgrains exceeded Rs 400 crores in the last financial year and that, with every addition of a million tonnes to the buffer stock which is already above the planned level, an extra Rs 87 crores would get locked up, while the cost of carrying every such addition would be another Rs 8 crores. The success on the wheat production front, instead of becoming a factor for stimulating the economy and providing surpluses for development, has thus actually become a burden and resulted in a redistribution of income in favour of rich farmers.

Lack of Conviction

The way the Chief Ministers' conference was handled is an interesting and revealing story in itself. Once again it was the Political Affairs Committee of the Cabinet which came into the picture on the eve of the conference. The Chief Ministers of Punjab, UP and Haryana, the three main wheat-producing states which have a vested interest in high procurement prices, were invited to a meeting of the Political Affairs Committee. The newly constituted Economic Affairs Committee, which had been widely publicised as the new 'high command' for directing economic policy, was quietly forgotten even though the issues for discussion with the Chief Ministers were of vital economic significance. This step in effect settled the outcome of the Chief Ministers' conference in advance. The Political Affairs Committee evidently examined the entire question from the standpoint of the rural vote banks and within this framework the three Chief Ministers evidently had no trouble convincing the Committee that they could not afford to hurt the interests of the rural rich who had contributed so handsomely to the Congress party's recent electoral victory.

When next day the Chief Ministers' conference opened, the Food and Agriculture Minister made the usual opening speech. The speech, while it formally endorsed the APC report, lacked conviction and firmness. On the land ceilings issue, in contrast to the strong stand taken by the Prime Minister at the Chief Ministers' conference two years ago and the repeated calls for radical land reform heard more recently, Fakhruddin Ali Ahmed did not even pose the issue of lowering land ceilings. Instead, he obligingly diverted attention to consideration of the secondary problem of the exemptions allowed under the existing ceiling laws. After the Union Minister's inaugural address, the Chief Ministers of UP, Punjab and Haryana were invited to speak, one after the other. Their speeches set the tone for the conference. This was taken as a hint — it was probably intended to be so taken — that the Central leadership had reconciled itself to the rejection of the APC's recommendations once again. The result was that except for West Bengal, which took a forthright stand in favour of the APC's recommendations, and Mysore and Jammu and Kashmir, which expressed some dissatisfaction over the favours being demanded by and given to the wheat producing states in contrast to rice producing and rice consuming states, the other Chief Ministers simply fell in line with the idea of maintaining the *status quo* in respect of both procurement and issue prices. Once again the APC report had been scuttled.

Well-Organised Lobby

A notable feature of the conference was the preparatory work done by the farmers' lobby, proving that it has become not only a strong and articulate group but also a well organised one. This was evident from the discussions in Parliament preceding the conference and the demonstrations against the recommendations of the APC staged outside the conference hall. The line-up in this organised protest was also revealing. From Swatantra and Jan Sangh to the communists — all were together on this issue. With the growing economic strength of the kulak class in the villages, its political influence has increased correspondingly and, far from marking any change in this respect, the recent assembly elections have probably added to the political weight of the kulak. It has been suggested that the Prime Minister has allowed herself to be persuaded to agree to the scuttling of the APC's recommendations in return for acceptance by the states of more radical proposals for lowering ceilings on holdings and the introduction of an agricultural income-tax. This appears to be just wishful thinking. If the modest cut in procurement prices recommended by the APC could not be pushed through, it is unlikely that the Centre will be more successful with radical land reform or taxation of the rural rich.

At the Chief Ministers' conference, like at similar other occasions, figures of the cost of production in agriculture were bandied about freely. The APC had said in its report that "available data, though in need of enlargement in respect of its coverage, suggest that even after the moderate reduction [suggested by the commission], the procurement price of wheat will be comfortably above its cost of production. And this notwithstanding the imposts proposed in the Union budget for 1972-73". The APC did not go into details of the cost of production advisedly, because of the wide variations as between regions as well as on account of other conditions. But the observations it has made in its report are based on detailed studies. The farm management studies data as well as the cost data available with the Commission suggest that in no case would the maximum cost of production of wheat exceed Rs 50 to Rs 55 per quintal and that under favourable conditions it would be as low as Rs 38 per quintal. As against this, the procurement price is Rs 76 per quintal. The APC is convinced that the figure of Rs 80 per quintal claimed by the Punjab Chief Minister as the cost of production in Punjab has no basis whatsoever.

Relative Price Structure

The question of procurement prices for wheat and the manner in which the recommendations of the APC have been scuttled also raise larger issues of policy about relative prices of different agricultural products and their relationship with prices and costs in the economy as a whole. These issues have come to the surface as a result of the furore over the decline in cotton prices. The problem of prices of sugarcane, pulses and other agricultural commodities too demand attention. The APC has been submitting reports on price policy for different crops from time to time and if these reports are put together it is possible that some structure of relative prices may emerge. It is time, however, that the APC applied itself to this task and produced a policy-frame for a system of relative prices which will influence the pattern of agricultural production while bearing in mind the requirements of the non-agricultural sector of the economy, particularly industries based on agricultural raw materials. It may then become easier to build up support for the APC's recommendations in respect of prices of particular crops. It is understood that the APC intends to make such an attempt in its annual report which it will submit later this year.

Here it may be worth mentioning the demand for setting up a special cell in the Food and Agriculture Ministry made at the Chief Ministers' conference and readily accepted by the Food and Agriculture Minister. The suggestion is an old one and had been earlier abandoned by the government after some consideration. The setting up of a cell of the kind proposed is really directed against the Agricultural Prices Commission to which some of the Chief Ministers are not very favourably disposed. If the task of working out the cost of production is to be taken out of the hands of the APC, the Commission's position cannot but be undermined and the body would be made even more ineffective than it is. The idea, which the Food and Agriculture Minister thoughtlessly accepted at the Chief Ministers' conference, has subsequently been dropped and the APC will continue to make the necessary cost studies. But the episode does underline the casual way in which Union Ministers, at least some of them, function.

Poor, Poorer, Poorest

Nachiketa

EVEN as the delegates and dignitaries employ their well-rehearsed rhetoric at Santiago at the Third UNCTAD, political events have cast deep shadows over this international gathering which seeks to evolve solutions to the problem of stimulating trade and development of the developing countries. The US administration is fully taken up with the war in Vietnam and the presidential election. The member-countries of the EEC, as well as intending members of the group, are preoccupied with their own problems. The entry of China has also created an element of uncertainty within the group of developing countries about the role in intends, and is likely, to play. The Soviet group is acutely conscious of the presence of China but is not yet sure what stand it should adopt. in any case, the all-too-easy role of the champion of the developing countries against the developed Western countries has been played out for the Soviet Union. The Second UNCTAD at New Delhi had to extend its scheduled timetable of two months by a whole week because of difficulties in drawing up the final communique. It should, therefore, be no surprise if the current deliberations at Santiago also overrun their scheduled period of six weeks.

Trade Preferences

Even the critics of the UNCTAD will concede that the Generalised System of Preferences (GSP) evolved at the New Delhi meeting is a hopeful development for the poor countries. Though the GSP is not as general as it should have been, it offers different degrees of tariff preferences to exports of manufactures from the developing countries in the markets of developed countries, depending upon the type of preferential scheme they have adopted. Two of the important developed countries, *viz*, Canada, and the USA, have not introduced their version of the GSP while the UK introduced it only a few months ago. It is to be seen whether the developing countries will succeed in extracting commitments from the USA and Canada about the dates from which their GSPs would become operative. At present each of the developed countries has its own list of manufactures not eligible for preferences. Textiles are outstanding among the excluded items as the developed countries want to protect their inefficient industries on the ground of employment. The GSP also does not offer adequate incentives for the development of processing industries in the developing countries which can generate additional income and employment by processing their raw materials at present exported to the developed countries. Even after all developed countries start operating their versions of the GSP, the extra trade that would accrue to developing countries would not be more than $ 300 million a year by the middle of this decade. This is certainly a rather small gain after all the fuss made about the GSP. But in spite of the fact that the gain from the GSP is so limited, the developing countries' emphasis at Santiago is likely to be on international monetary issues instead of on trying to raise the level of preferences and to extend them to more commodities. This will be decidedly unfortunate.

Commodity problems are another subject which are unlikely to get adequate emphasis from the developing countries

at Santiago. Most developing countries rely heavily on exports of one or two primary products that are subject to considerable prices fluctuations. Some of these products, like tea, are also subjected to high levels of customs and/or internal taxes resulting in lower export earning to their exporters. The situation is somewhat different in respect of such commodities as sugar, wheat, rice, vegetable oils, tobacco and cotton. Domestic production of these commodities in the developed countries is heavily protected through import quotas as well as price support policies. It is estimated that all the developed countries including Japan, spend an estimated $ 21-24 billion in payment of direct subsidies or in sustaining managed prices above free market levels. This is far in excess of the official aid flowing from these countries to the developing countries. The developing countries ought to be pressing their case for at least some entry into these protected markets. According to one estimate, the developing countries would stand to gain $ 10 billion of export earnings by 1980 if all the protective devices were removed. It should not be impossible for the developed countries to make a phased reduction of the present levels of production of many of these items as employment opportunities grow in other lines of production. And in the case of those West European countries which are experiencing labour shortage such a scheme could be introduced without causing much economic disruption.

SDRs and Aid

With the recent international monetary crisis still fresh in their minds, most of the developing countries are expected to demand a larger share in the decision-making on international monetary matters which so far have been the preserve of a few developed countries. Some of the developing countries have considerable foreign exchange reserves. India and Brazil, for instance, have larger reserves than Sweden, which is a member of the Group of Ten. The developing countries are also asking for a link between developmental aid and the SDRs. Some of them have pleaded that all the SDRs should be handed over to the developing countries which would eventually returned them to the developed countries through payment for larger imports for developmental purposes. Robert McNamara has already asked the developed countries to agree to link, directly or indirectly, the financing of development to future issues of SDRs. Karl Schiller, the West German economics and finance minister, is agreeable to the proposition that SDRs should be given in larger quantities to the developing countries. One may expect that the developing countries might succeed in getting a larger share in the future issues of SDRs but they are unlikely to get all the fresh SDRs as a development 'gift'. It is also unlikely that they would be able to wrest a significant voice in the framing of international monetary policy. The developed countries would point out that the developing countries require more of long-term development aid and not greater short-term liquidity which is the concern of monetary policy.

On the issue of foreign aid the prospects appear to be rather disappointing. The whole of the American aid programme is in a state of suspended animation. Even at its current level, US aid at 0.3 per cent of the US GNP falls far below the 1 per cent target agreed to by the developed countries. Meanwhile, the European countries have made it clear that they are in no position to fill the aid gap if the US withdraws from the field. The UNCTAD Secretariat's attempt to single out the least developed countries on some criteria of doubtful validity has perhaps already caused some damage to the interests of the developing countries by introducing divisions within the so-called Group of 77. The UNCTAD Secretariat has identified 25 'least developed' countries with a total population of 150 million. The developing countries should perhaps counter the move by fighting for greater aid to the 'least developed' countries but insisting that this should not be at the cost of larger aid to the other developing countries. Such an approach will help to preserve the unity of the Group of 77, while at the same time putting the foreign aid question in the proper perspective.

NORTH

Triumph of the Wheat Belt

IN the well-founded belief that it is difficult for any Punjab Chief Minister to survive for long if the farmer does not secure a good price for wheat, Zail Singh, with the full co-operation of Haryana Chief Minister Bansi Lal, did considerable backstage canvassing before the Chief Ministers' Conference began its session. On the crucial procurement price issue, Punjab, Haryana and UP won the battle, the Centre buckling under the pressures subtly mounted at various levels. The Chief Ministers of this region have returned home with the satisfaction that they have safeguarded the interests of the dominant landowning community — their political masters — against what once seemed heavy odds. The fate of the consumers in the wheat belt seems to be no one's concern. Sound logic, economic arguments and budgetary considerations have all been sacrificed at the altar of political expediency.

The rejection by the Agricultural Prices Commission of the plea that lower procurement prices for wheat would prove a disincentive to the grower has special relevance to Punjab. Wheat, the golden grain, continues to be the Punjabi farmer's best revenue-earning crop. But it would have remained a paying crop even had the price structure been modified as proposed by the APC. According to an official survey, the margin of profit is large enough to absorb some lowering of prices. The average net income per acre for wheat at the National Demonstration Farms laid out in Punjab has been worked out at Rs 845. For cotton the return is stated to be Rs 766. For hybrid maize the return has been estimated to be the lowest, just Rs 119 per acre. The profit margin for wheat being thus far larger, the farmers are unlikely to switch over to other crops. Even granting that the profit at demonstration farms is generally higher than that on average farms, the argument still holds good. Besides, with a considerable area in Punjab assured of regular irrigation through canals and tube-wells and given the ready adoption by the farmer of modern technology, the income from wheat cultivation is unlikely to fall. On the other hand, if, as hinted by the APC, there is some diversion of land from wheat to pulses, in view of the high prices of pulses in north India, this would be all for the good and the farmer as well as the consumer would gain.

Loopholes Galore

On the land ceilings issue the Punjab Ministry staged a *volte face* within a few days of assuming power. The initial fervour has all but disappeared. Virtually over-riding its own resolution of March 21, the Assembly Congress Party on April 5 passed a resolution favouring retention of the present ceiling of 30 acres (which itself has rarely been enforced — so many are the exemptions and loopholes). Before the Chief Ministers' conference commenced, Congress MPs and other spokesmen of the party denounced the Punjab plea against lowering the ceiling. Some even talked of removing from office Ministers who were opposed to adoption of the ceiling norms suggested by the Central Land Reforms Commission. But the CM's endorsement of the Central guidelines on land ceiling exemptions on April 14 does not amount to effective enforcement. Punjab's special problems are to be further discussed "at high levels". The state has not yet enforced even the existing ceilings. In any case, the net effect would be only a slight improvement in the land distribution pattern with a somewhat larger area of land becoming available as surplus after the withdrawal of exemptions.

Landlords in Punjab and Haryana are not therefore very worried about the moves for lowering ceilings. The sting has been taken out of the weapon. Besides, a major loophole has been found in the formula prescribed by the Central Land Reforms Committee which is bound to be exploited by landowners, especially in Punjab. The family ceiling is to be fixed at 10 to 18 acres of land "irrigated from government sources and capable of growing at least two crops". This would exempt all lands irrigated by private tube-wells of which there are almost a hundred thousand in the region, according to the latest figures. Practically every medium-size holding has a tube-well which, like the tractor, has become almost a status symbol. Even canal-irrigated lands are dotted with private tube-wells whereas Government tube-wells number only 865. The prospect of any radical land reform is thus severely limited even if the norms enunciated by the Centre are strictly enforced. The landowners who constitute a majority of both Congress and Akali legislators know this well. This also means that the traditional structure of political power will in turn remain unchanged.

Meanwhile the State Assemblies of Punjab, Haryana and Himachal Pradesh have deferred legislation on land reforms in order to gain more time. As a result, the landlords will now have opportunities for further manoeuvres to evade the ceiling. The Punjab Assembly is scheduled to discuss the revised ceilings on May 9, and the HP Assembly "during the next session". But significantly the three states have already passed resolutions authorising Parliament to enact laws to impose a ceiling on urban immovable property. Evidently, there is no end to dilatory and diversionary tactics.

BIHAR

Gimmick That Boomeranged

N K Singh

THE 'Bihari Bachao' convention in Patna, on February 21, was nothing but a communal mela, organised with an eye on the elections to indict the Congress for its 'silence' over the reprisals against the Bihari Muslims in Bangladesh. In colluding to organise the convention which finally boomeranged on them, the Sangh, Syndicate, Socialists, and their newly-found partners, the CPM, exhibited their political ineptness and their opportunism in formulating issues. In their bid to please both the communal elements in the minority community and the general electorate at the same time, they lost the sympathy of both, and earned further towards their own rout in the Assembly elections. The convention — organised as a vote-catching device just a fortnight before the poll — shocked people so much that a move, designed to alienate the Muslim voters from the Congress, in fact alienated populace from the parties in question.

The convention was organised by some extremist Muslim leaders led by Gulam Sarwar, editor of a local Urdu daily, *Samgam*. Since 1967, Sarwar, known for his support of emotional and communal issues and his fiery oratory, has been notorious in the Muslim politics of Bihar. He was arrested under the Defence of India Rules during the recent Indo-Pak war for his communal writings. As soon as he was released after the cease-fire, Sarwar devoted himself to 'the cause' of the Bihari Muslims in Bangladesh.

Although Sarwar had convened the February 21 meeting, ironically the real force behind the gimmick was the Socialist Party, which entered the picture much before the other political parties — *viz*, the Organisation Congress, the Jan Sangh, and the Marxist Communist Party — entered to exploit it electoral potential. The SP had in fact initiated the idea of the communal mela; and Sarwar and SP were merely hoping to serve their separate ends by it. Pranab Chatterjee, a prominent leader of the erstwhile Praja Socialist Party, was noted as the 'man-behind-the-curtain' at a press conference held on the eve of the convention. Although he sat tight-lipped during the press-meet, there was little doubt of his support when Sarwar said that large numbers of 'Bihar Muslims' had been killed in Bangladesh and if Delhi was unable to ensure their safety, they must be repatriated.

The convention was preceded by a procession on the afternoon of February 21, in which a militant band of 100 or so Muslim boys shouted slogans like "Mujibur Rahman murdabad", "Urdu Bahini Zindabad", and "Bring Back Bihari Muslims to India".

With "Bihari Muslims being slaughtered in Bangladesh" forming the central theme of the convention, a resolution demanding of the Government of India that it protect their "lives, honour and property" and/or repatriate them, was passed at the conference, which was attended, among others, by leaders of the SP, the Congress(O), the CPM, and last but not least, the Jan Sangh. The resolution said: "The Biharis in general and the Bihari Muslims in particular are deeply distressed to hear the harrowing tales of miseries perpetrated on the non-Bengali population in Bangladesh .... It is genuinely felt that attempts are being made for annihilation of the entire non-Bengali population of Bangladesh."

The conference evoked adverse reactions in the country. It was ill-timed: the national pride and euphoria following the war were strong and Bangladesh still the brave new country. The Jan Sangh and the Congress(O), realising the mis-step, has tended to modify their stand on the issue, but the damage was done. Congress(O) leader, Morarji Desai shrewdly but weakly stated: "The Bihari Muslims are free to come back to India but I am totally opposed to their repatriation as such".

But perhaps the most embarrassed of all was the Jan Sangh which had to make a great leap from one extreme point to another. Earlier, the party organ, *Organiser*, had front-paged in its issue of February 12 a special article: 'GOI's Love of Bihari Muslims'.

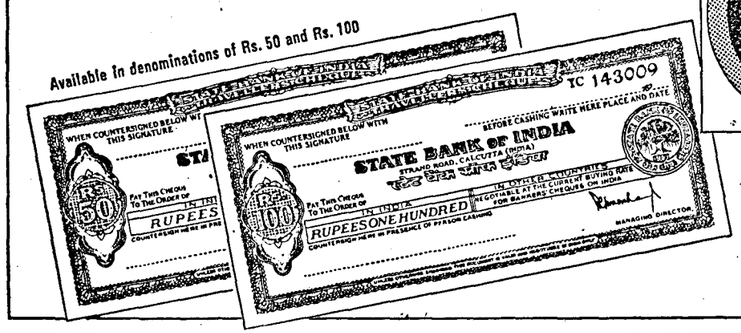
Whether you are planning a quick business trip or a long vacation...

Make sure of a worry-free trip with State Bank Travellers Cheques

☐ It is the safest way—without your second signature no one can cash your Travellers Cheques. Full refund can be obtained in case of loss of Cheques.

☐ It is a free service—you don't pay any commission for using State Bank Travellers Cheques.

☐ It is a service anyone can use—you don't have to have an account with the State Bank.



☐ It is convenient—the Travellers Cheques are available at any branch of the State Bank and at branches of many leading banks.

☐ State Bank Travellers Cheques are good until used—there is no time limit on spending the Cheques.

Apart from the State Bank offices, over 1,500 places—hotels, restaurants, stores and other establishments—displaying this sign all over India will accept your State Bank Travellers Cheques.

WE ACCEPT STATE BANK TRAVELLERS CHEQUES

Available in denominations of Rs. 50 and Rs. 100

STATE BANK

AIYARS-5.273

This was hardly 10 days before the notorious Patna convention. Pouring venom on the Union Government, *Organiser's* Special Correspondent had said in the intro: "Believe it or not, it is not the Bhutto Government alone that is raising a hue and cry about the fate of Pakistani collaborators known as Bihari Muslims in Bangladesh. For, even the Indira Government is advising the Mujib Government to accord generous treatment to these pro-Pakistani elements who have still great potential for trouble in that new State."

Remembering the background and *raison d'etre* of his party, the Organising Secretary of the Bharatiya Jan Sangh said: "There should be no repatriation of non-Bengali Muslims of Bangladesh to India but individual cases of persons who might be wanting to come back to India could be considered on merit."

Later, Thakur Prasad, Vice-President of the Bihar JS, who had represented the party in the 'Bihari Bachao' meet, was asked to issue a clarification on the party's stand. Thakur Prasad, who had earlier demanded before the convention that the GOI ought to take up the question of Bihari Muslims with Sheikh Mujib and arrange for their repatriation, denied direct involvement in the 'Bihari Bachao' convention. In a strained statement issued five days after the meeting he said that he had merely participated in "a meeting held on February 21 where leaders of different political parties were invited to speak regarding protection to be given to Bihari Muslims in Bangladesh". Of course, all he wanted was that individual cases be considered on merit!

Little wonder that the convention only further diminished the credibility of the opposition parties.

SINGAPORE

Casting Bread on Malacca Waters

Harish Chandola

THE Soviet Union must feel very dissatisfied with its latest diplomatic effort in the Far East and in South-East Asia, last month, to seek support for the Moscow-sponsored collective security system for Asia and for getting the Malacca Straits accepted as international waters free for all traffic, including the passage of naval ships. Perhaps not satisfied with the initiative of its diplomats stationed in South-East Asian countries in obtaining support of the governments in this regime for these proposals, Moscow last month sent a special envoy, L I Mendelvitch, on a whirlwind tour of the three littoral countries (Indonesia, Singapore and Malaysia) of the Malacca Straits. But even Mendelvitch received absolutely no support from the leaders of these three countries for the Soviet proposal for evolving a collective security system for Asia, which was first made by Brezhnev in 1969.

According to reliable sources in these countries, Mendelvitch also did not receive any assurance that the Straits of Malacca would be considered as international waters. The leaders of Indonesia and Malaysia reiterated their position that the Malacca Straits belonged to their countries. They, however, assured him that the right of innocent passage through them would be available to merchant ships of all nations, except to oil tankers of 200,000 tons and over, because of navigational difficulties through the narrow and shallow parts of the Straits. It was said that if the large tankers struck submerged rocks or touched the bottom in shallow spots they would leak oil, resulting in pollution and killing of marine life, which deprive the fishermen of the two countries of their catch and their livelihood. But as far as naval traffic was concerned, the roving Soviet envoy was told that it would be controlled by the two states, because it endangered not only their security but also that of the entire region. Malaysian leaders told the Soviet emissary that peace could be maintained in the region only by supporting the Malaysian proposal of accepting South-East Asia as a neutral zone free of interference from the super powers and not by promoting new security or defence arrangements.

Hectic Soviet Activity

In 1969 the Soviet Union had been very active in seeking the reaction of Asian countries to its idea of evolving a collective security system for Asia. But because of lack of positive response to it, the Soviet Union seemed to have either dropped the proposal or placed it in cold storage. The question being asked in this region now is: Why did the Soviet Union suddenly drag the proposal out again last month and initiate an alarming degree of diplomatic activity in placing it before the same Asian nations which had shown their indifference to it in 1969?

In the first week of March, the Soviet ambassadors in Japan and Indonesia sought meetings with the heads of the Foreign Ministries of these countries to tell them that Moscow was still interested in organising an Asian security system and that it considered the Malacca Straits as international waters. As a result, the Japanese Prime Minister made a statement in parliament showing only a polite interest in the first proposal. But on the second point Japan fully supported the Soviet Union. The Malacca Straits are Japan's lifeline at the moment, because the country imports its main source of energy, oil, from the Middle East through the Straits. If the Malacca Straits come under the control of the littoral states and they manage to close them to super tankers taking oil to Japan forcing the tankers to go through the Straits of Lombok and Macassar, the oil shipments will take a week longer to reach Japan, and the price of importing oil will go up by about a million dollars per super tanker.

In the third week of March, the Soviet Union sent a special envoy to Indonesia to explain the Soviet view on these points. But the special envoy was told very clearly that Indonesia and Malaysia firmly stood by their decision to regard the Malacca Straits as their waters. The Soviet diplomatic offensive in this region came on the heels of Nixon's visit to China, which caused uncertainty among America's Asian allies. They were wondering what policies they should adopt, now that they might not have the US military presence to back them. It was precisely at this juncture that the Soviet Union launched its diplomatic offensive in this region. The Soviet timing for the proposal was probably aimed at relieving these US allies of their distress. If one super power was thinking of withdrawing, the other super power would replace it to see that peace and the *status quo* were maintained in the area (which really means providing support to the present regimes) through another collective security system.

But before the Soviet Union could start exploiting the situation in this region following Nixon's visit to China, US Under Secretary of State, Marshal Green visited these countries and assured their leaders that US would continue to abide by its commitments to them and would not desert them. He told

them that by going to China, the US President was only opening an option and that he really did not mean to give up US commitments, including defence arrangements. And no sooner did the Asian allies feel reassured, they began ignoring the Soviet alternative to join the Moscow-sponsored collective security system.

US Most Affected

The Soviet attempts to place its security proposal before the Asian nations again, at what it thought was the right time, is understandable. But what is less understandable is its vehemence in opposing the Indonesian-Malaysian agreement to regard the Malacca Straits as their waters. If Indonesia and Malaysia do exercise control over the Straits, and they appear determined to do so (Indonesian naval ships are already in the Straits and it has been announced by the two countries that they would want notice from all intending to sail their naval ships through the Straits), the Soviet Union will not be the only country affected. Theoretically, the US should be the one most affected, because of its recent decision to extend the area of responsibility of its Seventh Fleet from the Pacific to the Indian Ocean. At the moment the Soviet naval traffic through the Malacca Straits is small compared with the number of British and US naval ships that pass through it. Even if the Malacca Straits are closed to all naval ships, it would not matter much to the Soviet Union, because easy passage through other straits would be available to its warships to enter the Indian Ocean.

In fact political elements in this region had earlier hoped that the Soviet Union might welcome the Indonesian-Malaysian move to assert control over these waters. This hope was based on the thinking that the move challenged the conventions laid down by former colonial powers to control the seas with their powerful navies. It was also under those circumstances that the former colonial powers with large naval forces had imposed a three-mile limit on territorial waters. Beyond the three miles, the waters were considered international waters, a euphemism for the seas controlled by the big maritime powers.

It is only now that small countries are protesting against the gross injustice of imposing a three-mile territorial waters limit on them. Indonesia and Malaysia had, therefore, hoped — erroneously, it now seems — that their move in trying to control the waters in their immediate neighbourhood would be welcomed by the Soviet Union as it was aimed at breaking the unjust conventions imposed by the colonial powers.

It was in November last that Indonesia and Malaysia proclaimed the Malacca Straits as part of their territorial waters and stated that the safety of navigation through them was their responsibility. Two years earlier the two countries had signed agreements delimiting their territorial waters and continental shelves in that area.

Japan, because of its great economic interest, had earlier tried to establish itself as an equal partner with the three littoral states (Indonesia, Singapore and Malaysia) in exercising control over the Malacca Straits. It had proposed separate treaties with all the three to undertake the task of carrying out a proper hydrographic survey of the Straits and dredging its shallow parts to make them safe for the passage of large vessels. But the Japanese effort was frustrated by Indonesia, which opposed Japan signing separate treaties with the three states. After consultations with Indonesia, the Malaysian leaders also declined to sign such a treaty. The Malacca Straits issue will now come up for discussion before the proposed UN Conference on Law of the Sea and it will be interesting to see the position the big powers take on this matter.

China's Mongolian Frontier

Gene Gregory

IN a move apparently calculated to strengthen its northern defences, Peking has quietly made important changes in one of China's major administrative units, the Inner Mongolian Autonomous Region (IMAR), a recent issue of *China Reconstructs* reveals. These changes involve the transfer of a large section of the region's western most territory to Kansu Province and to the Ninghsia Hui Autonomous Region, both of which now have long stretches of common border with the pro-Soviet Mongolian People's Republic. Large parts of the north-eastern area of IMAR were detached in August 1969. As a result of these reshuffles, the region has lost four of its original seven districts and approximately half its territory.

Territorial dismemberment of the region has involved the transfer of a large part of its population, including native Mongolian inhabitants, to the jurisdiction of other administrative units in what would appear to be a major shift in Peking's policies toward 'national minorities'. While native Mongolians, most of whom still live a nomadic existence, have long held the status of a 'national minority', they have been outnumbered 8 to 1 by Chinese in their own territory. Since 1949, Chinese migration to Inner Mongolia has been particularly extensive, resulting in a sharp rise in the overall population of the region. Official Chinese statistics report a population of 7.3 million in 1953, 9.2 million at the end of 1957, and 13 million in 1967. The population of native Mongolians residing in Inner Mongolia itself is believed to be between 1.5 and 2 million.

With the recent divisions of IMAR territory, a significant part of this native Mongolian population has been split up between Manchuria in the East and Kansu and the Ninghsia Hui Autonomous Region in the West. This fragmentation forestalls the development of a sense of national identity among the Mongolian minority, an identity the Soviet Union could be expected to exploit through its close inter-connections with the Mongolian People's Republic.

The transfer of three eastern districts of IMAR to Manchuria in 1969 was clearly a direct result of the Sino-Soviet border conflict of that year. The move was recommended by the fact that there were better railroad and highway connections with other regions of Manchuria than with the central part of the Inner Mongolian Region. As a result of the transfer, the three districts have become part of the extensive Shenyang Military Region, encompassing the three Manchurian provinces of Heilukiang, Kirin and Liaoning. Some observers believe the move also reflected the personal power of the man in charge of the Shenyang military establishment, Chen Hsi-lien, who was elevated to the Party's Politburo in April 1969.

After the most recent transfer of the western sector of Inner Mongolia to Kansu province and the Ninghsia Autonomous Region, it automatically becomes a part of the Lanchow Military Region to which those two administrative units belong. As a result, IMAR has ceased to exist as a major independent military district, with the remainder of the region now under the control of the Peking Military Region. The responsibility for the defence of the Sino-Mongolian border is now shouldered by three powerful military regions, with their centres a considerable distance from the Mongolian frontier.

But there are compelling indications that the dismemberment of IMAR could also have been provoked, at least in part, by the factional struggle that continued to rage within the region well after the Cultural Revolution. At the time of its creation, in November 1967, the Inner Mongolian Revolutionary Committee was chaired by a military commander, Teng Hai-ching, who led army units into the region in February of that year. Consolidation of his power was, however, hindered by factional elements which in mid-1968 resorted to armed resistance. The People's Liberation Army's repression of 'leftist' groups later led to attacks on Teng, who nonetheless still managed to command Peking's full confidence. In April 1969 he was elected to the Party's Central Committee. But Teng's power was short-lived. His enthusiasm in disbanding the Inner Mongolian Red Guards earned him enemies within the party leadership; his expulsion from the party followed on the heels of the influx of additional military units into the area as a result of the Sino-Soviet border conflict.

Once again the latest dismemberment of Inner Mongolia has coincided with the emergence of a new regional strongman in the party committee. The first secretary of the committee, Yu Tai-chung, also from the ranks of the military and formerly known as a 'responsible person' in the Peking military region, is also believed to be in charge of the regional administrative organs. This centralisation of military, administrative and party authority in the hands of one man suggests the degree of concern in Peking for the security of the region.

THE FOURTH ESTATE

Usually Timid, Occasionally Tenacious

Nireekshak

CORRUPTION in high places, when exposed, is excellent material for any newspaper in a country where a free press exists. But the press in this country, though free, follows a cautious policy on such delicate matters. The fear of attracting a libel or defamation suit apart, great regard for established institutions and public figures and self-imposed notions of sobriety and respectability are cited as reasons for the restraint.

There have been occasions, in the past, when this restraint temporarily loosened and corruption in high places was exposed. But even then our press never ventured to extend the gamut of its reports and comments beyond what was stated on the privileged floors of parliament and the state legislatures, proceedings and reports of tribunals and court verdicts. Krishna Menon's involvement in the famous 'Jeep Scandal', T T Krishnamachari's role in the well known 'Mundra Episode', high tribunals holding ex-chief ministers Partap Singh Kairon and Bakshi Ghulam Mohammed guilty of corrupt practices, and the findings of the Iyer and Khanna Commissions confirming corruption allegations against top political leaders of Bihar and Orissa, are some such examples.

What in professional jargon is called 'investigative reporting' is totally discouraged by our newspapers as far as corruption in high places is concerned. It is too dangerous, full of hazards and very risky, they say. Even when our newspapers scent some big scandal, they tend to wait till the matter blows up in a legislature. It is considered safer to report the libellous and defamatory statements made on the floor of parliament or a state assembly than to get the matter investigated by competent press reporters. Though never legally tested, it is an erroneous belief that accurate reporting in the press of the proceedings of privileged legislative chambers, is also protected and privileged. By convention, yes. By law, no. But somehow the belief continues that one can safely print what goes on on the floor of the privileged legislatures.

A case in point is the recent 'cinema construction scandal' in Bombay. It was not that the local press was caught unawares when the Socialist MLA, Mrinal Gore, busted it in the Maharashtra assembly. The press had known for some months that new cinema theatres were springing up all over the city defying traffic and other considerations and that some powerful men, including some ministers, were behind this cinema racket. In fact, there was 'hush-hush' talk all over the town about it. But the newspapers were too scared to report it. They waited till an opposition member of the state legislature raised the issue on the floor of the house. Next day the local press published all the allegations made about the scandal in the legislature. *Free Press Journal's* was the best report — detailed, accurate and well-displayed.

In fact, one notices that *Free Press Journal's* local coverage has improved considerably in the last few weeks. The capabilities of its reporting staff are being fully exploited now. For good display and for featuring local news stories on the front page, one must compliment its news desk. The story, "King's Ransom for Queen's Barrack", on the front page of the April 18 issue may lead to the exposure of another scandal. According to it a plot of 3,300 square metres in the Backbay Reclamation area was sold by the state government through public tenders, for a sum of over Rs four crores at the rate of Rs 12,829 per square metre. The successful bidder was J M Properties. Another bidder, who had quoted Rs 12,000 per square metre and thus lost the bid, was K T Mirchandani of Ultra Construction Company. What Mirchandani told *Free Press Journal's* reporter is interesting. He alleged "that 21 such plots had been privately given to the parties without tender... at a concessional rate of Rs 4,000 per square metre which is approximately one-third of the ruling market price." How could the state government do this, sell land without tenders and at prices so much below the market price? A story worth following up. But will *Free Press Journal* or some other newspaper take the risk of annoying someone high up in the state government?

The Shoe Pinches

The newsprint policy for 1972-73 announced last week has imposed more restrictions on the big newspapers. The flexibility so far allowed to increase the number of pages at the expense of circulation has been curtailed. The editorial reactions of these newspapers have understandably been sharp. *Hindustan Times*, whose newsprint quota was 9,208 tonnes in 1971-72, sees "serious implications" following from the new policy which, it says, has threatened the finances and quality of "a small group of national papers". According to it, if the cut in newsprint is to conserve foreign exchange then it should be uniform and affect small, medium

and big newspapers alike. But since more "liberal provisions than ever before have been made for the grant of imported newsprint to smaller, medium and certain other papers not merely to increase their circulation but to bring their page levels up to 10 pages", *Hindustan Times* suspects, "a deliberate policy to place a limitation on larger papers merely because they are large, quality of service being treated as of no consequence". *Statesman, Times of India, Hindu* and *Indian Express* have the same grouse against the government and view the new newsprint policy as a threat to freedom of the press. *Statesman*: "A newspaper does not belong to the category of a cake of soap. It is a service which is becoming increasingly costly to maintain at any level of effectiveness but which is essential if the free expression of opinion is to survive".

The small newspapers seem to be happy at the prospect that they are getting some attention, though not many have written editorials saying so. *Patriot*, however, has come out with some interesting statistics. According to it, the 40-odd newspapers affected by the government order consumed 95,000 tonnes out of the total of 225,000 tonnes of newsprint made available in 1971-72. The remaining 130,000 tonnes went to 2,500 newspapers and periodicals. Any cut in the quota of 2,500 small and medium size newspapers, according to *Patriot*, would not have yielded a saving of more than 1,000 tonnes, implying that the only way to effect a bigger saving was to cut quotas of the 40-odd bigger newspapers. *Patriot* has also revealed that consumption of newsprint by big newspapers has increased by between 50 and 90 per cent during the last five or six years:

(Consumption in tonnes)

Times of India	12,825 (1964-65)	21,970 (1970-71)
Hindustan Times	6,331 (1966-67)	9,208 (1971-72)
Statesman	4,643 (1965-66)	6,831 (1971-72)
Indian Express	14,166 (1964-65)	26,552 (1970-71)

Perhaps uncharitable has been *Patriot*'s comment that the "monopoly newspapers" are "virtually advertisement sheets illustrated with news". However, the implications of the government's action are being studied by journalists' bodies like the Indian Federation of Working Journalists (IFWJ) and the National Union of Journalists (NUJ). Already suggestions have been made by big newspaper managements that if the government does not retrace its step early enough, they may have to resort to retrenchment of staff and cancellation of news agency contracts. The stringers on retainer and linage basis have already been affected in some newspapers. *Hindustan Times* and *Times of India* have already shrunk to ten pages and announced suspension of many of their regular editorial features. Others are likely to follow suit soon. It is in this context that the national executive of the NUJ met in Delhi last week and expressed "grave concern" at the government's "unilateral and arbitrary action" which would disrupt the economy of the newspaper establishments, including news agencies, resulting in a downward reclassification of newspapers and news agencies and large-scale retrenchment. The NUJ has demanded that the government should immediately scrap the present newsprint policy and take steps to relate the pages published to the price charged, to ensure fair competition and healthy economic development of the newspaper industry. The IFWJ is yet to come out with its view on the subject.

No One Loves Nixon

The escalation of the war in Vietnam was a major editorial subject during the week. In *Indian Express* it attracted front page editorials by the Editor-in-Chief, Frank Moraes, whose comments, like "Hanoi is beginning to shake Washington" and "America is already on the way to being ignominiously chased out of Vietnam" go to show that even pro-West editorial writers are now disillusioned with the juvenile policies of Nixon. According to *Hindustan Times*, "Prolonged hostilities at the present intensified level could reverse the process and even dim Mr Nixon's China halo". Jan Sangh's *Motherland* also had an interesting comment to make. "Replacing human fighters with robots is President Nixon's response to the situation created by the American people's clamour for bringing the boys home from Vietnam. He is planning an escalation of the war while appeasing the American democracy. This is a move as diabolical in its cleverness as in its destructiveness".

Never before has there been such intense debate on the rural vested interests as is being waged in newspapers these days. They are being referred to, in Stalin's terminology, as kulaks. An interesting report by Mohan Ram on this new farmers' lobby in the ruling Congress party appears in *Mail* of Madras. According to Mohan Ram, the kulaks are a factor to be reckoned with. Even Indira Gandhi is conscious of their growing strength. More so because "not only the CPI, even the Soviet ideologues, are enchanted by the role of the new kulaks who have contributed to the spectacular breakthrough in India's food production to give the country the strength to stand up to United States pressures under PL 480 food aid". Indira Gandhi's family newspaper, *National Herald*, has written a hard-hitting editorial on the rise of the new kulaks and has pleaded that the rural neo-rich should not be pampered: "The bulk of the people are poor, and their interest should not be sacrificed in order to keep rich farmers rich. Parliamentarians like Mahavir Tyagi and some Chief Ministers are keen to defend the interests of the affluent peasantry, but the Government and the Congress Party cannot afford to become prisoners of the rural vested interests." C S Pandit in *Sunday Standard* also indicates the growing strength of the kulak lobby: "The way it organised itself on the eve of the Chief Ministers' conference to scuttle the recommendations of the Agricultural Prices Commission has given rise to fears that similar resistance may soon develop to the programme of land reforms and reduction of ceilings on land holdings".

Factions, cliques and pressure groups are gradually developing in the ruling Awami League in Bangladesh. Some interesting reports have appeared in *Hindu* which indicate that Nazrul Islam is emerging as No 2 to Mujib. The position of former premier Tajuddin Ahmed, known for his pro-Soviet leanings, has considerably weakened in recent weeks while Khondakar Mushtaq Ahmed is becoming the darling of Western diplomats in Dacca. Foreign Minister Abdus Samad Azad, a former communist, is also pro-Soviet but a political lightweight, according to *Hindu*'s Dacca correspondent.

Rivalries inside Bangladesh are also reflected abroad. "In Singapore", according to *National Herald*'s South-East Asia correspondent, Harish Chandola, "a University of Singapore lecturer who is a Bangladesh citizen has initiated a bitter and public quarrel with members of his own community that he is the Bangladesh representative in the island republic". With the Indian High Commission's backing, this university lecturer has been throwing lavish cocktail parties much to the annoyance of other Bangladesh citizens, Chandola adds.

Growth in a Finite World

R S Ganapathy

The Limits to Growth: A Report for the Club of Rome's Project on the Predicament of Mankind by Donella H Meadows, Dennis L Meadows, Jorgen Randers and William W Behrens; Universe Books, New York, 1972; pp 205.

THIS book is the result of a collaborative effort of what is now known as the club of Rome, an international association of outstanding people in various walks of life. Its purposes are to foster understanding of the varied but interdependent components — economic, political, natural and social — that make up the global system in which we all live; to bring that new understanding to the attention of policy makers and the public; and in this way to promote new policy initiatives and action.

Early in 1968, the club undertook a project to study the predicament of mankind — the complex of problems troubling men of all nations. Out of this project grew the study of the world, for the first time, as a total system rather than as individual technical, economic, social and political elements. The world, for the first time, was being looked at as a large complex dynamic system consisting of sub-systems interdependent and interacting in the input-conversion — output-feed-back framework. This book is the outcome of Phase I of the project. In this phase, the expert team examined the five basic factors that determine and therefore ultimately limit growth on this planet — population, agricultural production, natural resources, industrial production and pollution. The complex (through conceptually simple) mathematical model of several hundred variable quantifies the relationship among these factors. This dynamic model can be easily simulated in a computer to test out and predict the effects of alternative strategies of growth. Jay Forrester's pioneering studies and research in System Dynamics were the foundations on which this global model was built.

This World Model has two advantages over the mental, intuitive models we have been using heretofore. These are (i) the precise written expression of relationships which are open to objective scrutiny and criticism and (ii) the model's predictive ability. The authors describe in the book the building of the model, the assumptions behind it, its usefulness in predicting the future of the world under alternative conditions.

Most of us think of growth as a linear process. In reality, however, most of the variables in the world system are growing exponentially. It is this exponential nature of the growth process, the authors argue, which is the most dangerous. Exponential increase is deceptive because it generates immense numbers very quickly. Exponential growth has another characteristic: it approaches a fixed limit very suddenly.

Dynamic modelling theory indicates that any exponentially growing quantity is involved in positive or negative feedback loops. Population, for example, increases because of fertility rate and decreases because of mortality rate. Or, industrial capital increases by additional investment and decreases by depreciation. These two feedbacks behave very much like a thermostat. The authors examine the nature of population and GNP growth rates over the past several years in several countries of the world and find them to be exponential. The projection of current rates of growth into the future reveals that economic growth as it is occurring today is inexorably widening the absolute gap between the rich and poor nations of the world. This, of course, is based on the assumption that fertility, mortality, capital investment rate and capital depreciation rates do not change. In reality they might change by specific interventions, designed or unintentional. But in postulating any different outcome from the extrapolated values, one must specify which of the factors is likely to change by how much and when.

The authors examine the economic and population growth potential of the world in terms of its resources. These potential resources are: land, raw materials, fuels, forests, oceans and the ecological systems of the plants which absorb and recycle important chemical substances. The social resources are: peace and social stability, education and employment and steady technological progress. While the physical resources can be quantified in a reasonably accurate manner, the social resources cannot be. The model does the former and assumes that the best possible social conditions will prevail.

In examining the food requirements of the world, we find that the exponential growth of arable land in the past few centuries indicates that we would face a desperate shortage of arable land before the year 2000. For each doubling of agricultural productivity, there is a gain of about 30 years. Other inputs for agriculture — fresh water, fertiliser, implements, etc — would be in short supply before the middle of the 21st century under the most optimistic conditions. Land and water are renewable resources but other resources required for agriculture are non-renewable.

An analysis of the usage of non-renewable resources of fuels and metals over the past several years reveals that these are dwindling very fast and their usage rate is increasing because of industrial advancement. Even though these resources cannot be destroyed, they are converted on usage into forms not easily usable or recoverable. These resources are also very unevenly distributed and used among the nations of the world. The Table indicates the future potential for these resources. The picture as presented in the Table emerges after the model takes into account the many interrelationships among such factors as varying grades of ore, production costs, new mining technology, the elasticity of consumer demand and the substitution of other resources. Also, even under the most optimistic conditions about undiscovered reserves, technological advances, substitution or recycling, the great majority of the currently important non-renewable resources will be prohibitively costly 100 years from now, given the exponential increase of demand for resources. In the context of uneven distribution of resources and their usage all over the world, this problem would get aggravated in the foreseeable future.

Another important factor considered by the model is the observed exponential increase of pollution measured so far in the natural environment. Enough research evidence is not available indicating the ecosystem's upper limits of air, land and aquatic pollution and their impact on human health. We do know, however, that the natural delays in ecological processes increase the probability of underestimating the control measures necessary and therefore of inadvertently reaching the upper limits of pollution absorption capacity of the earth. Moreover, the pollutants

are globally distributed, their harmful effects appearing at long distances from their points of generation and it is not always easy to establish the causal links. The ecosystem's recycling capacity is limited and in selected areas of high industrial activity, this limit has already been reached. The effects of pollution on human health, climate and marine life in the United States, for example, have been well publicised.

The model tests in an elaborate way the relationship among the factors mentioned above. For example, if the use of DDT is progressively reduced from 1970 to reach zero level by year 2000, the DDT in fish will continue to increase for more than 10 years. And its level in fish will not come back to 1970 DDT levels till 1995. Similar system simulation studies to test environmental policies show that any pollution control system based on instituting controls only when some harm is already detected, will probably guarantee that the problem will get much worse before it gets better.

Doomsday Prophesy?

The model estimates that if the 7 billion people of the year 2000 have a GNP per capita as high as that of present day Americans, the total pollution load on the environment would be at least 10 times the present value. The US Council on Environmental Quality has called for an expenditure of 105 billion dollars between now and 1975 to partially clean up the American environment. Any country can postpone the payment of such costs to increase the present growth rate of its capital plant or production of more food, but only at the expense of future environmental degradation which may be reversible only at a very high cost.

The fine art of model building has been used very well by the MIT team. The team's objectives were modest — to understand the broad behaviour modes (tendencies of the variables in the system to change over time) of the population-capital system. The construction of quantitative relationships among highly aggregated variables in the world system is not an easy task. The team has done an admirable job so that meaningful results could be obtained by simulation. By calculating the simultaneous relationships of all these variables over time, the sensitivity of the global system to the various policies that are currently pursued or are being proposed to enhance or change the behaviour of the system, was tested. While precise or detailed estimates of specific variables like food production or distribution in the year 2015 cannot be made from the model, it is possible to gain a fairly good understanding of causes of growth in human society, the limits to growth and the behaviour of our socio-economic systems when the limits are reached. For this purpose, the model utilises the most basic relationships among people, food, investment, depreciation, resources, output, pollution — relationships that are the same the world over, the same in any part of human society or in society as a whole.

Table: Non-renewable Natural Resources

Resources	Static Index(1)	Projected Rate of Growth (per cent per annum)	Exponential Index (2)	Exponential Index, Using 5 Times Known Reserves (3)
Aluminium	100	6.4	31	55
Coal	2,300	4.1	111	150
Copper	36	4.6	21	48
Iron	240	1.8	93	173
Natural Gas	38	4.7	22	49
Petroleum	31	3.9	20	50

(1) *Static Index*: The number of years known global reserves will last at current global consumption rate.
(2) *Exponential Index*: The number of years known global reserves will last with consumption growing exponentially at the projected annual average rate of growth.
(3) *Exponential Index using 5 times known reserves*: The number of years 5 times the known global reserves will last with consumption growing exponentially at the projected annual average of growth.
Source: US Bureau of Mines: "Mineral Facts and Problems", 1970.

The world model computer run predicts, if present trends continue, continuous industrial growth followed by resources depletion, decline of food production per capita and rise of population. These result in the collapse of the world system before the year 2100, resulting in widespread deaths due to decreased foods, high pollution and reduction of industrial output.

Four simultaneous technological policies are introduced in the model in an attempt to avoid the growth and collapse behaviour of the previous runs. In this run, resources are fully exploited and 75 per cent of those used are recyled. Pollution generation is reduced to one-fourth of its 1970 level. Land yields are doubled and effective methods of birth control are made available to the world population. The result is a temporary achievement of constant population with a world average income per capita that reaches nearly the present US level. Finally, though industrial growth is halted and the death rate rises as resources are depleted, pollution accumulates and food production declines. The growth of the world system is halted before the end of the year 2100 and the basic behaviour mode of growth and collapse is not altered under the most optimistic conditions of technological growth which have prolonged the period of population and industrial growth but have not removed the ultimate limits to that growth.

These predictions, however, are based on a critical assumption. The social variables — income distribution, attitudes about family size, choice among goods, services and food — are assumed to continue to follow the same pattern they have followed throughout the world in recent history. No attempt has been made to model the social changes that would take place. Though this assumption is certainly not realistic, any such social change involves political decision-making and a time-delay of several decades.

The model also does not take into account the social side-effects of introducing new technology. The impact of automation, the social implications of the Green Revolution and the like are too well known to be recounted here. While technology can change rapidly, political and social institutions change very slowly. Furthermore, they almost never change in anticipation of a social need but only in response to one.

That there are limits to growth in this finite world has been accepted by everyone. Yet one observes that a whole culture has evolved around the principle of fighting against the limits rather than learning to live with them. This culture has been reinforced by the apparent immensity of the earth and its resources and by the relative smallness of man and his activities. The obliteration of whales over the last few decades demonstrates, for one small system, the ultimate result of the attempt to grow forever in a limited environment. We have not yet learned to live within a limited environment in the anticipation that technology somehow will allow growth to continue still longer. If we do not learn now, while we can, that conservation rather than unlimited growth is desirable then, the alternative is to wait until the price of technology becomes more than society can pay, or until the side-effects of technology suppress growth or until problems arise that have no technical solutions.

This brings us to the concept of global equilibrium. The study searches and finds a series of world system models which are (a) sustainable without sudden and uncontrollable collapse and (b) capable of satisfying the basic material requirements of its people. The model was simulated under the following conditions:

(i) Industrial output and population are held at a constant level from 1975 onwards (births=deaths and industrial capital investment=capital depreciation).

(ii) Technological policies like resource recycling, pollution control devices, increased lifetime of all forms of capital and methods to restore eroded and infertile soil are introduced.

(iii) Some value changes like increased emphasis on food and services rather than on industrial production are introduced.

(iv) Industrial output per capita is three times the world average in 1970.

In the computer run the world system attains an equilibrium by year 2000. Even though resources are depleted, there is enough time by which technology and industry can adjust to changes in resource availability.

If the unrealistic assumption of complete check on population and capital investment by 1975 is relaxed and another assumption that population and capital are regulated within the natural delays of the system, the equilibrium level of population is higher and the level of industrial production per capita is lower than the earlier computer run model. If these policies are instituted in 2000 rather than 1975, the equilibrium stage is no longer sustainable. Population and industrial capital reach levels high enough to create food and resource shortages before the year 2100.

An equilibrium, defined in this way, does not mean stagnation. The alternative mixes of population and capital in a broad sense and individual alternatives in the population-capital system in specific cases are still very large in number. The social system of values, choices and institutions provide an even greater number of alternatives. It is possible to create a society with a much higher standard of living for all its people if we learn the implications of the results of the model. Presently we are taking no action to redefine our goals or pursue consistent alternatives. Taking no action to solve the anticipated problems is equivalent to taking strong action. A decision to do nothing is a decision to increase the risk of collapse.

Is it realistic to conceive of a global strategy to achieve the stable equilibrium in the context of income inequality, unequal distribution of resources, national barriers, international power and military struggles? The effort calls for a fundamental change in our values and attitudes which might take a lot of time to achieve. A sudden change in strategy will generate social tensions of immense magnitude which might be difficult to control. But the sooner we are aware of the writing on the wall, the better and more would be the choices available to us. It is becoming increasingly evident that there is a clear need for planned effort to achieve social innovation to match technical change, for radical reforms of institutions and political processes at all levels.

A section of the Western intelligentsia has interpreted the findings of the study as warranting a freezing of the *status quo* of economic development of the world's nations. This is clearly neo-colonialism and imperialism at their worst. A comparable exploitative attitude was evident in the posture many Western nations adopted on the nuclear weapons non-proliferation treaty issue towards many developing nations. The achievement of a harmonious state of global economic social and ecological equilibrium must be a joint venture based on joint conviction with benefits for all. And this is precisely the situation which is most difficult to achieve.

Planning Organisation at the State Level

B P R Vithal

In this paper the actual practice in, or experience of, different states has not been discussed. The issues involved in determining the planning organisation at the state level and below have been discussed in a purely conceptual framework based on a critical analysis of the recommendations of the Administrative Reforms Commission (ARC).

I

Planning Board vis-a-vis State Government

THE ARC in its Interim Report, submitted in April 1967, made the following recommendation on the setting up of State Planning Boards:

> Planning Boards should be constituted in each state for formulating plans and for evaluating performance. They should each have five members of whom one may be a part-time member. One of the full-time members will be the chairman of the Board. None of the members should be a minister. The provisions relating to the composition and appointment of the members of the Planning Commission will apply *mutatis mutandis* to the State Planning Boards.

Neither the Interim Report of the Commission nor the Interim Report of the Study Team on the Machinery for Planning gave in any detail the rationale for the recommendation quoted above. In the final Report of the ARC on the Machinery for Planning, while the functions of the State Planning Boards have been spelt out in greater detail, nothing further has been stated about the constitution of the State Planning Board or its relations with the state government. The final report of the Study Team, however, deals in detail with the planning machinery at the state level.

The first aspect to be considered is the relationship between the State Planning Board and the state government. The ARC had recommended that none of the members of the State Planning Board should be a minister. The Commission had also simultaneously recommended that the Prime Min-

ister should not be the chairman of the Planning Commission and that Union ministers should not be members of that Commission. The government of India, however, did not accept this recommendation and the Prime Minister continues to be the chairman of the Planning Commission, the Union Planning Minister is the deputy chairman, while the Union Finance Minister is a member.

The Study Team report mentions the "imperative need of having a permanent and non-political body which would undertake the responsibility of preparing long-, medium- and short-term development plans for the state. Such a body should be able to maintain a certain degree of continuity in the process of development irrespective of political changes in the state and co-ordinate development programmes of different regions and districts." It goes on to add that "in our view, State Planning Boards are necessary for the purpose of ensuring the availability of an independent, flexible and continuing planning agency in the state whose advice would be of an expert character and would, therefore, carry greater weight than that given by a departmental agency. With the possibility of changes in the party in power and the existence of different parties in power at the Centre and in the states and, within a state, in different districts, an independent expert planning body at the state level would be in a better position to give independent and expert advice when plan problems are being discussed between the Centre and the state or between the state and various districts than would be possible for a planning department of the state."

Thus, the need to have a body that would be politically independent of the government and the need to maintain "a degree of continuity . . . irrespective of political changes" seem to have impelled the Team to suggest an expert and independent State Planning Board. However, it is interesting that while considering the status of the Planning Commission at the national level, the ARC itself in its Interim Report had taken the view that "in a party system of democracy, each party has its own socio-economic policies", and when such a party is returned to power and forms the government, the government has to work out "its policies through its various agencies. The Planning Commission is one such agency." According to the ARC Report, one of the two main functions of any government is to promote economic development and "if the responsibility for formulating plans for economic development is exclusively handed over to an outside authority, the executive will look like a bird with a clipped wing."

Obviously, the same considerations would apply at the state level. If the Planning Board has to adjust to the policies of the governments that come to power from time to time, the very rationale of its existence is lost. If, on the other hand, it has the power to enforce the conformity of some kind of a perspective plan already drawn up by it, then we would be placing a non-democratic body in authority over the democratically elected government and would thus be putting constraints on the functioning of the new party in power.

There are also certain other distinct disadvantages — besides the political ones mentioned above — in having an independent full-time Planning Board which should be recognised. Even if such a body is only advisory, the moment it is a separate entity, certain planning functions, particularly with regard to the Five-Year Plans, the Annual Plans, and the discussions between the state and the Centre, would all have to remain with a department of the government. There is then the danger that, on the one hand, the activity of the Board would be divorced from the realities of the situation and, on the other, the actual plan schemes would continue to be dealt with in the present fashion without the benefit of the expertise built up in the Planning Board. Also, this would necessitate a parallel Economic Division being set up within the government — apart from whatever similar organisation might have been built up in the Board, for advice on certain economic matters which the state governments are hereafter likely to need more and more.

There is, moreover, an assumption in the recommendation that this form of organisation is necessary for expertise to be built up at the state level — as has been done in the Planning Commission at the national level. No logical justification is given to show why an *independent* body is needed for expertise to be built up. No doubt, the states have not built up such expertise, though this has been done in the Centre. But there is no evidence that at the Centre the expertise grew because of the kind of the composition of the Planning Commission, which itself cannot in any case be said to have been 'independent' till recently since many Union ministers were *ex-officio* members of it. The real reason why expertise had not been built up at the state level was that, in the federal division of work, the area of planning left to the states was such that not much expertise was required under the first three plans. The need for it, however, arose in the Third Plan period, and it can be seen that it is during this time that some efforts to build up the necessary machinery commenced in all the states — particularly in the preparation of the Fourth Plan. The work then suffered a setback again, when the Fourth Plan prospects became uncertain. If, in the process of planning, more and more initiative is given to the states in the preparation of plans, the required expertise is bound to be built up. Since initiative would have to include resource generation and availability also, since without it any initiative would be illusory.

II

Board vs Secretariat Department Organisation

However, there is another sense in which independence and continuity have been envisaged in the report of the Study Team, and this is the independence needed by a planning body from the constraints of normal bureaucratic procedures and the vicissitudes of departmental functioning. This argument of the report is very valid and pertinent.

Another reason given is the inability of a normal departmental set-up "to attract experts from outside the government". The planning organisation will also require freedom to function with a degree of flexibility that may not be possible for a normal department. According to the Study Team report, a Planning Board "will have more flexibility in its operations and be able to develop close and active collaboration with various agencies and individuals whose talent and experience it could draw upon for the functions that it has to perform".

It has to be recognised that some fundamental economic work has to be done hereafter at the state level also. Some kind of perspective planning based on economic analysis and projections, and a more reliable inventory of resources, would be necessary if the medium-term plans are to have any rationale or coherence.

This will require a type of expertise not available at present in the governmental organisation at the state level. Economists at a sufficiently high level would be required for work of this nature. The question, therefore, is whether a governmental organisation would be able to attract expertise of this type and even if it did, whether its method

of functioning would permit effective performance. In a number of matters, work of this nature would also require collaboration with academic and research institutions which an ordinary government department may not be able to do effectively either.

One view has been that, in order to give the organisation that deals with long term planning the maximum degree of flexibility and the capacity to attract talent from anywhere, government may encourage the setting up of an institute dealing with problems of economic development. Such an institute would be either an independent organisation or an institute attached to a university, but in either case will not be a governmental organisation. It will then be given the task of preparing perspective plans and undertaking long-range studies.

There is considerable merit in this proposal, provided there is at least one distinguished and dynamic person who would be willing to undertake the setting up of such an institute. In such a case, the entire work relating to perspective planning and long-term economic projections and analyses could be given to the institute, and the state planning organisation would then deal with only medium-term plans and sectoral plans. Evaluation studies could also be given to such an institute, the state confining itself to periodic plan reviews.

However, even if a separate institute does take up work of a more long-range and theoretical nature, such as perspective planning, there will still be need to build up some economic expertise within the government itself, since on more and more issues both within the state and in Centre-state relations, advice of an economic nature would be required. There might, therefore, be some duplication of expertise and work, but it is likely to be much less than if there were an independent Planning Board.

The real question then is, whether the freedom and flexibility in functioning that an expert body would require to be effective can be achieved only by making the Board at the top full-time and independent of the government. According to the ARC, only one of the five members is to be a part-time member. Whether the members should be full-time or part-time, should be really related to the availability and utilisation of talent rather than to the nature and structure of the organisation or its relation to the government. However, while independence of the Board from government will automatically involve the freedom of its administrative organisation from normal governmental machinery, it does not follow that such freedom for the planning organisation cannot be achieved without the Planning Board being independent of the state government at the level of the Board. If talent and expertise can be attracted and a form of organisation can be worked out that will be flexible and dynamic enough to allow such experts to make their best contribution, the actual composition of the Board at the top will not be a crucial issue. Even a full-time, separate Board can be strangled by bureaucratic procedures as can be seen by the experience of several autonomous public bodies.

III

Internal Organisation of the Planning Board

According to the ARC, the Board secretariat should normally have four units: one dealing with Agriculture and Irrigation, the second with Power, Industry and Transport, the third with Social Services, and the fourth with Evaluation. The Divisions, therefore, are essentially subject-matter divisions and no mention is made of perspective planning, economic projections, etc. The Study Team report is more explicit about the assumption underlying this recommendation when it says that "the scope of state planning agencies is not as comprehensive as that of the national agency. . . . The 'state plans . . . confine themselves mainly to three major areas of development, *viz*, agriculture, economic infrastructure, and social services. . . . We assume that the scope of the state plan would continue to be the same."

While, in practice, this has been true in the past, it is no longer possible to take such a limited or narrow view of the planning function at the state level. The states now must necessarily take a more comprehensive view of the economy of the state and of its problems of development. Even in the context of a Centre-state dialogue for a larger share in the overall financial resources, the attempt has been to place the case of each state in the larger perspective, considering its level of development and the need to bring it up to some desired level within a reasonable period of time.

There is also another major disadvantage in the type of organisation recommended by the ARC. If the State Planning Board is constituted such that its members are experts in specific fields — such as agriculture and industries — and if the Planning Board has strong Divisions for these subjects, the effect may be that the initiative of the departments will get curbed. The kind of person who would be qualified to be selected as a Member of the Planning Board at the state level, is very often likely to have been a former Head of Department. The tendency would then be for him, with the assistance of the organisation of the Planning Board, to usurp the initiative that should rightly belong to the department.

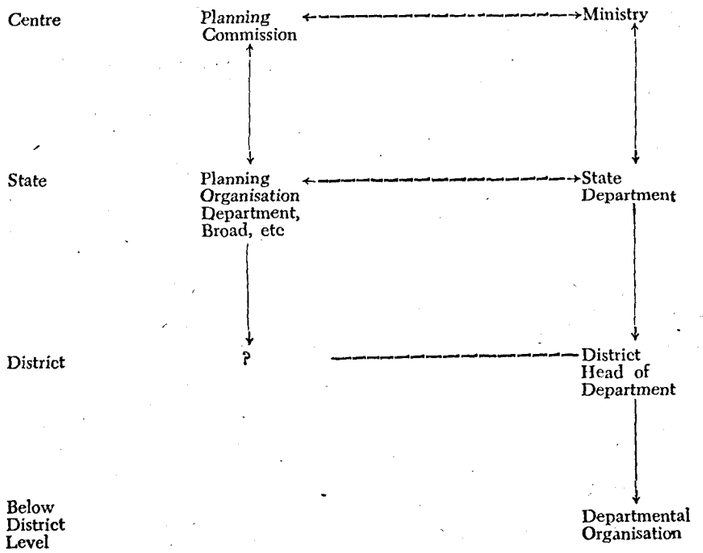
It is, however, undeniable that there is need to strengthen sectoral planning at the state level, particularly in the sectors mentioned by the ARC. The real issue here is whether this strengthening of sectoral planning should take place at the departmental level or at the level of the State Planning Board. Both the ARC and the Study Team have made recommendations for strengthening the Planning Cells in the Development Departments. In fact, they visualise the sectoral divisions of the Planning Board as instruments for strengthening the Planning organisation within the Department itself. But, in practice, the effect of this is likely to be quite the opposite. Sectoral planning can be strengthened only by strengthening the planning organisation within the departments and not allowing the Planning Board to duplicate this effort. This is a lesson that has been learnt in the Planning Commission also.

On balance, therefore, the advantage would seem to lie in strengthening the planning organisation within a department so far as sectoral planning is concerned, and to organise the State Planning Board itself, not on a subject-matter basis, but on the basis of planning functions. One such possible organisation would be to have the following Divisions in the Planning Board:

1 Perspective Planning Division — Economic Projections — Resource Surveys.
2 Economic Division — Economic Analyses — State Income — Economic Policies.
3 Medium-Term Planning Division — Annual Plans — Regional Plans — District Plans.
4 Statistical Reporting and Analysis Division.
5 Evaluation, Review and Training Division.

It is important at the state level that the planning organisation be ultimately linked up with the Finance Department since the operative form which the plan takes is the budget. One way of effecting this is to give the secretary of the Planning Board an *ex-officio* status in the Finance Department. The Division

dealing with mid-term planning, where the annual plans are dealt with, could be treated as a secretariat Division, so that the annual plans prepared by this Division of the Planning Board get automatically incorporated in the budget without any further processing in the Finance Department.



The Departments that would require immediate strengthening in their Planning organisation would be Agriculture, Industries, Education, Irrigation and Power. So far, the setting up of planning cells in these departments has been taken to mean that one of the departmental officers is designated officer-in-charge of planning. This is a totally unsatisfactory arrangement. What is required is the induction of some planning specialists who, supplemented by departmental specialists, would constitute the planning cell in the department. For instance, in Agriculture, an agricultural economist, a statistician and a departmental officer, such as an agronomist, should constitute the planning cell. In Industries, an industrial economist would be required, and in Education, a person with experience of educational planning and a statistician. In Irrigation and Power, an expert in cost-benefit analysis, PERT techniques, etc, would be required, who would be able to fix priorities within the sector on the basis of rates of return, cost-benefit ratios, etc, and would also be able to scientifically review the progress not only in the execution of projects but in the utilisation of their benefits.

With the planning cell being located in the department, and the Planning Board itself being organised on a planning function basis, rather than on subject-matter basis, some experts in the important sectors could be taken as part-time members of the Planning Board without fear of the departmental initiative being sapped.

The issues discussed above can be summarised as shown in Diagram B. In the process of planning, two parallel lines of communication can be visualised between the Central and state levels — one being the line of communication between the Planning Commission and the planning organisation at the state level, and the other between the Central ministries and the corresponding Departments of the State Government dealing with the activity concerned, as indicated in Diagram A.

There are interlinkages between these two parallel lines both at the Central and at the state levels. However, the two parallel and vertical lines of communication are stronger than the horizontal interlinkages between them. There is always a certain similarity, if not identity, of approach between the Planning Commission and the state planning departments in regard to the pressures exerted on them by the departmental claims for allocations, while there is a corresponding fraternal feeling and a certain amount of connivance between the Central ministries and the state government departments in these matters. The planning organisations have to wage a constant struggle to prevent the more energetic or politically influential departments from overshooting their sectoral allocations, while the departments themselves carry on a constant guerilla activity to upset the sectoral allocations.

DIAGRAM A

Note: Broken lines indicate weak communication.

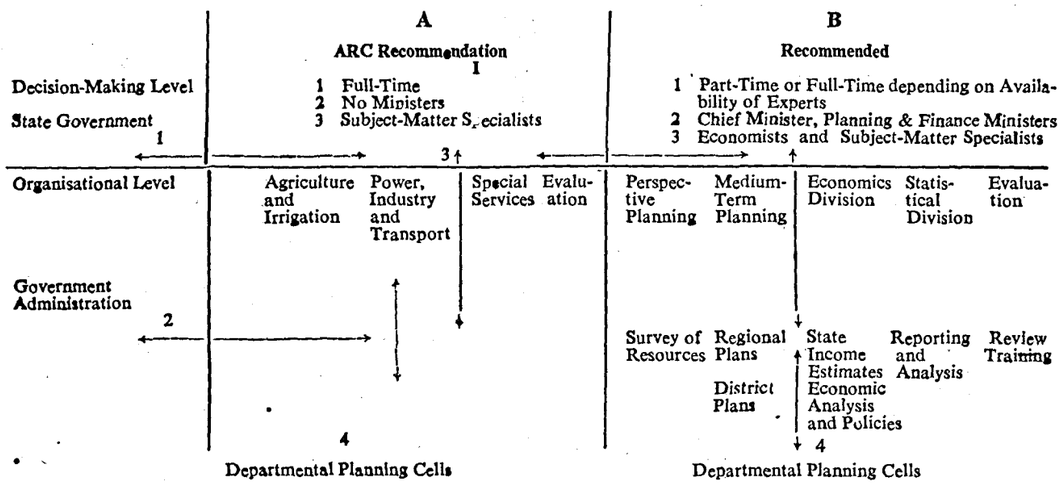
In most states, there would hereafter have to be a regional level in between the state and the district, either because of physical and economic realities or because of political compulsions. Plans would have to be formulated at this regional level very often with a view to removing imbalances between different regions within the state. This would, however, be an activity that would be located within the planning organisation at the state level itself and it is for this reason that regional plans have been specifically mentioned in the functions of the Mid-term Planning Division given above. The planning organisation at the field level will, therefore, really start from the district.

IV
Organisation at District Level and Below

The vertical lines described above continue to the district, block and even village levels in the case of the various departmental organisations, because the departmental hierarchy extends to these levels. However, in the planning at the district level, there is as yet no clarity as to which organisation would discharge the co-ordinating and planning function. The nature of the planning organisation at the field level is closely interlinked with the nature of the planning process itself and, as such, certain basic decisions on the process itself will have to be taken before the planning organisation can be designed properly. However, whatever the process or the organisation, it is inevitable that panchayati raj institutions will have a crucial role to play in planning at the different local levels. These institutions would, therefore, have to be equipped for discharging these functions. This will not in most cases require additional personnel, but the existing personnel will require training in planning techniques.

At this level, greater emphasis would have to be laid on what may be called spatial planning. There has been a tendency, in the past, either to look at district planning purely from the point of view of 'needs', when the fashionable phrase used to be the 'felt needs of the people', or, to duplicate the entire

planning process at this level and look upon the local unit almost as if it were in itself an independent unit. Neither of these exercises has yielded any worthwhile results in practice. The more important exercise at this level would be a proper appreciation of the physical resources available, particularly the pattern of land utilisation in relation to plans for agricultural development and of spatial planning so far as the development of infrastructural facilities and local industries is concerned.



At each local level, the inputs — whether financial or otherwise — available from higher levels and from the state plan may have to be taken more or less as given. Even so, there is need for the entire position with regard to the flow of funds to these bodies to be reviewed in order to facilitate better planning at these levels. At present, resources flow to these bodies from too many different sources, with too many conditions attached. The procedures of devolution of funds would, therefore, have to be reviewed so that these bodies would be in a position to know what resources are available to them; moreover, they would have to have discretion to use these resources in accordance with local priorities. The experience so far cannot be said to be encouraging on the mobilisation of local resources by these bodies. Wherever necessary, they should be given the necessary powers to raise local resources, and thereafter whatever resources are to be devolved to them should be linked in some manner to their own performance in this regard. Since this might place the less developed areas in a disadvantageous position, despite the best of efforts by them, some kind of equalisation arrangement would have to be worked out.

The Prime Minister has recently pointed out that foreign aid is increasingly filling the gap in domestic savings. When one looks at the village community, one has a feeling that the intervention of the state plays a similar role with regard to the local effort. Instead of external resources being a fulfilment at the margin of the local effort, the position gets reversed. This has often led to a loss of initiative and lack of local effort.

It is the fashion nowadays to talk of 'time-bound' programmes. What we require in some of these cases is what may be called 'space-bound' programmes. A space-bound programme would be a programme for a given area, for which other constraints may be prescribed externally, but the time schedule would be stipulated only locally. One of the results of our present approach to planning has been to impose an extraneous time-scale which has not always been relevant to local conditions, and this has sometimes distorted the very purpose of the local programmes. For instance, in works programmes taken up in rural areas there is really no reason why the programmes should in all cases fit into any time schedule of the state or the national plan when it is a purely local programme. Its schedule has to be formulated in accordance with the availability of local labour so that work is provided in periods when they are unemployed in that particular area. By imposing a different time schedule, we very often force the work to be given to a contractor who hopefully can complete it within the time schedule by importing professional labour from outside. If a small connecting road link has to be built from a village to the nearest road, if some drains have to be constructed inside the village, if a tank has to be desilted, there is no reason why these should conform to time schedules prescribed by an outside agency. It is really for the village to plan in how many seasons of unemployment they would take up and complete these works, and in what order. It is these kinds of planning techniques that have to be devised now.

Local planning of the type described above will require considerable strengthening of midde and lower level techni-

DIAGRAM B

Notes: 1 and 2 Independence above the line will automatically entail independence below but an independent organisation below the line can be ensured without necessarily adopting pattern 'A' above the line.

3 Any permutations and combinations of the three factors above the line between A and B can be achieved while still having a choice between alternatives 'A' and 'B' below the line.

4 Whatever the organisation above the line, alternative 'A' below the line will sap the initiative of departmental planning below.

cal staff, so that the planning even at the village level can have an adequate technical bias. And it can be tied to a programme for providing employment to the educated unemployed. Teams of engineering graduates or diploma holders, agricultural graduates, etc, can be constituted for carrying on resource surveys at the village and block levels, on the basis of which local plans can be formulated. Some pilot projects of this type have already been taken up, but the process requires to be extended.

This will require not merely a reorientation of our approach to planning, but in a more fundamental sense it will require a reorientation of the educational system at different levels to meet the requirements of those levels. This will not only help to make education of more immediate use to the community, but will avoid regional disparities in employment. A certain amount of migration will undoubtedly be there and different local units cannot be self-contained or be water-tight compartments. But it is not always necessary that migration should occur right at the most unskilled level. If education is related more immediately to the local tasks of development and if planning at every level assumes as one of its objectives the full utilisation of the locally available manpower, it should be possible to link up to a large extent the products of at least the lower and middle levels of education with the requirements of the developmental programmes of local areas. Such a relationship should also encourage more dynamic approaches to matters such as syllabi formulation, etc, so that the content of the syllabus is not necessarily uniform over a large area but takes into account the environment, the circumstances, and the requirements of the local community in which the education is organised.

V

Conclusion

At the state level:

(1) Any attempt at making the planning organisation independent of the political executive in the name of continuity of the process is likely to prove either illusory of ineffective.

(2) However, the organisation would have to be so designed that it is freed from normal bureaucratic inhibitions and limitations and is capable of flexibility and innovation in its functions and can attract the necessary expertise.

(3) No *a priori* decision can be taken as to whether the Board should have full-time or part-time members. The guiding consideration should be the availability of persons with requisite ability and stature.

(4) The internal organisation of the planning body should be based on planning functions and should not be on a subject-matter basis.

(5) The machinery for sectoral planning should be strengthened in the departments concerned.

At the district level and below:

(1) The nature of the planning organisation at the field level is closely interlinked with the nature of the planning process itself.

(2) Certain policy and procedural changes would be required if the planning organisation at the district level is to function effectively, chiefly in regard to the devolution of finances to the local bodies.

(3) The planning organisation at the district level will necessarily have to be linked to the panchayati raj institutions.

(4) The emphasis in district planning would have to be on spatial planning.

(5) A large-scale training programme would be required for equipping field staff for the planning function.

Working Capital Finance: Criteria of Appraisal

V V Bhatt

Banks, while providing short-term finance, concentrate their attention on adequacy of security and repayment capacity. Once these two criteria are met, banks do not generally carry out any detailed appraisal of the working of the concerns.

Apart from the fact that it leads quite often to double financing, this practice has several other drawbacks. There is no attempt to examine the productive efficiency of an enterprise nor is there any attempt to scrutinise the allocation of available funds by the enterprise for a variety of purposes. As a result, banks play no role in promoting industrial efficiency or rational allocation of resources.

This paper seeks to present, in broad outline, a method of appraising working capital finance applications of large manufacturing concerns. Similar methods need to be devised for other sectors such as agriculture, trade, etc.

THERE is no principle involved in the practice of commercial banks specialising in the provision of credit only for financing working capital requirements; in principle, there should be no objection to their providing term finance also. In India, commercial banks were induced to provide term finance to some extent and it was for that purpose that the Refinance Corporation of India was set up in 1961. The functions of the RCI have since been devolved on the Industrial Development Bank of India. Thus banks have been granting term finance also, and they seem to have done this to a significant extent in 1968-69. Since then, the practice has been to restrict the banks to providing term finance on their own within Rs 25 lakhs for a project, though exceptions are made of cases where they participate in the provision of such finance with the term-lending institutions.

The idea behind this current practice is sound and relates to specialisation of functions. Since the term-lending institutions have developed the necessary expertise to appraise a project, and the banks have not, it is proper that the former should act as lead banks for the purpose of provision of term finance. The banks are expected to develop expertise in the field of working capital finance.

So far, the banks, while providing short-term finance, concentrate their attention on the adequacy of the security and on the repayment capacity of the concerns that seek working capital finance. Once these two criteria are met, the banks do not generally carry out any detailed appraisal of the working of the concerns. Apart from the fact that their current practice quite often leads to double financing, this practice has several other drawbacks. There is no attempt to examine the productive efficiency of an enterprise nor is there any attempt to scrutinise the allocation of available funds by the concern for a variety of purposes. These drawbacks are serious, in that, the banks play no role in promoting industrial efficiency or rational allocation of resources. The very purpose of the nationalisation of banks would be defeated, if these two significant considerations are not taken into account, while appraising applications for working capital finance.

This paper seeks to present, in broad outline, a method for appraising working capital finance applications of by and large manufacturing concerns. Similar methods need to be devised also for the other sectors such as agriculture, trade, etc.

Inventory to Gross Value of Output

The initial step is to find out what precisely are the inventory requirements of a firm — the peak requirement as well as the average requirement during a year. The inventory requirement has to be judged in relation to the value of output and the nature of the industry. On an average, the inventory to gross value of output ratio should not exceed 30 per cent; if it does, it is essential to find out whether there are any special characteristics of this firm that lead to this result or whether it is due to improper inventory management.

Even if the inventory requirement is appropriate, there is no reason why the banks should finance this requirement fully (of course, taking into account the margin requirement, etc). Quite often, a firm gets trade credit and it also gives such credit. Both sets of credit need to be taken into account. The 'drawing power' of the concern has to be measured as: inventory requirement *minus* trade credit to be obtained *plus* trade credit to be given. If the margin requirement is 25 per cent, the drawing power of a concern would be 75 per cent of sum of the items mentioned.

In a number of cases it is found that, bank credit actually extended exceeds this drawing power and inventory requirement is actually financed 100 per cent by resort to bank credit — in spite of margin requirements. This may be due to the fact that at the time of sanctioning limits, the banks do not take into account all the elements that go to determine the drawing power of the units.

Performance Indicators

(per cent)

	Current Year	Previous Four Years 1st Year	2nd Year	3rd Year	4th Year
I *Net Sales*/Value of Production*					
(a) Exports/Net sales					
(b) Exports/Value of output (excluding excise)					
(c) Increase/decrease in net sales over previous year (per cent)

(Continued)

Profit Allocation and Financial Investment

Even after determining the drawing power of a concern, the bank must not give credit to the full extent of the drawing power. It will have to be ensured that the firm's own resources are inadequate for the purpose. One source of funds to the firm is its gross profits (after taxes). If the profit-distribution policy is not appropriate, the firm may not be ploughing back enough gross profits into business. It is therefore necessary to know how gross profits are allocated. Further, even if adequate gross profits are ploughed back, the firm may be investing them in financial instruments like long-term loans or advances to, or shares and securities of, other concerns. If such financial investment is in subsidiary firms or in firms promoted by it, it needs to be examined whether such investment was necessary and whether it implies misuse of funds. Quite a number of firms act more like financial intermediaries than like production agents, and it has to be examined whether this type of financial investment is required for promoting other viable capital projects. In any case, such financial investment should bear some reasonable relationship to the gross net worth (including depreciation) of the firm — say, about 20 per cent, unless there are other sound reasons for greater financial investment.

Even if a bank feels satisfied about the profit-allocation and the financial investments, it may be that it is unable to finance a part of its working capital requirements through its own resources because of an inadequate rate of gross return. In that case, the bank should go into the question of the productive efficiency, sales, management and related aspects of the working of the firm, and should suggest to it appropriate measures to improve efficiency. Its assistance then should be conditional upon the concrete measures that a firm may take to improve its efficiency of operations. The gross rate of return should generally exceed 20 per cent per year; gross return is defined as a ratio of gross profits plus interest to total capital employed.

Generally, bank credit should not exceed 50 per cent of the inventory requirement. If this ratio exceeds 50 per cent, it is essential to investigate whether there are sound reasons for a higher ratio.

Current and Capital Ratios

To ensure that bank finance is not used for other than legitimate purposes, it is useful to give attention to some other indicators also. For example, normally, the gross fixed assets of a firm should be more than covered by gross net worth and term loans. On the other hand, current assets and current liabilities should match. If these two conditions are not satisfied, there would be a *prima facie* presumption that bank finance is being used for purposes other than those which are envisaged. Of course, even if these two conditions are met, cases could arise where the surplus funds of a concern are invested in financial instruments; this aspect has to be checked in any case.

For appraising applications for working capital finance from these points of view, it would be useful to collect and process the information about the firm's operations in the form given in the Table. Once such information is collected and processed on various enterprises, it would be possible to fix norms for the various ratios. For example, in a given industry field, the bank will have such information about a number of firms; with such information, it should not be difficult to derive efficiency norms. Further, this information would also be useful in forecasting trends in investment, output, exports, imports and prices. If such information collected and processed by all the banks is consolidated at one place — say, the National Institute of Bank Management — analytic studies based on the data could be undertaken for a variety of purposes.

Initially, at any rate, each bank can publish this information with it in an appropriate form in its Bulletin, and each bank can separately make projections relating to investment, output, etc. These studies should be the responsibility of the research section in a bank, and they should be undertaken in such a way as to be vitally related to the bank's policies.*

X *Prices of Two Principal Products*

(a) Domestic prices
(b) Export (f o b) prices
(c) Import (c i f) prices
(d) Domestic prices in major producing countries

* i e, exclusive of excise duty.
† Interest paid on borrowings (loans and deposits) minus interest received on lendings/deposits.
*† All borrowings minus loans and advances to associate companies, other companies and others.

New Pattern in Peru

Advancing the Mode of Exploitation

Lajpat Rai

The military junta which took over power in Peru in 1968 has taken a number of dramatic measures including the nationalisation of the US-owned International Petroleum Company and the promulgation of the Agrarian Reform Law. Fidel Castro has gone to the extent of saying about the Peruvian regime: "It matters little that those who started the revolution are a group of army leaders, many of them trained in the United States. If this revolution defends the interests of the people of Peru, if it continues to be anti-imperialist, then it shall have our unqualified support."

These are among the factors which have caused a good deal of confusion as to the nature of the regime. In fact, the 'revolutionary' measures carried out by the junta are tending to develop a new mode of operation within the imperialist system and creating an economic structure that will be dependent in a new way. Such dependency will doubtless be less offensive to the nationalist sensibilities of the intermediate sectors of Peruvian society, but will, at the same time, promote a more complex and entrenched form of exploitation.

THERE has been a great deal of confusion about the nature of the new regime under General Juan Alvares Velasco which came to power in Peru as a result of a military *golpe* on October 3, 1968. Some see Peru as a new Cuba. Others describe the regime as 'populist', 'Nasserite' or even 'Bismarckian'. Still others dub it as 'pro-oligarchy', 'pro-imperialist', etc. This confusion has arisen not only from some of the public utterances of the leaders of the military *junta* and the position that Castro has taken *vis-a-vis* the new regime, but also from different estimations of the 'revolutionary' measures adopted by the new rulers since their assumption of power, notably the Agrarian Reform Law and the nationalisation of the International Petroleum Company (IPC), a subsidiary of Standard Oil of New Jersey. The spokesmen of the regime, from the proponents of 'humanist capitalism' to the easily identifiable conservative groups within the government, proclaim that the reforms now under way presuppose that capitalism will be replaced by "something else", but explicitly reject socialism as an alternative. The leader of the *junta*, General Velasco, has described his regime as 'revolutionary' but which will be "bereft of both the inhumanity of capitalism and the inhumanity of socialism". Recently addressing a large gathering in the San Marcus University — the oldest university in Latin America — he told its students and professors that "we are revolutionaries, but not Marxists, decidedly not Marxists". ("No Somos Marxistas decidivamente".)

A certain amount of confusion about the regime was engendered by Castro's public blessing of the "new leadership in Peru" on July 10, 1969 when he declared that the Peruvian revolution was the extension of the Cuban revolution. In the same speech he said: "It matters little that those who have started this revolution are a group of army leaders, many of them trained in the United States. If this revolution defends the interests of the people of Peru, if it continues to be anti-imperialist, then it shall have our unqualified support." It was noted by Latin American revolutionary circles that in extending his unqualified support to the military *junta* in Peru, Castro had failed even to mention the political prisoners and the Peruvian guerilla leaders (including the well known pro-Castro leader Hector Bejar) languishing in Peruvian jails.

The public utterances of the Peruvian leaders and Castro's attitude to the regime, about which we shall have more to say later, cannot, however, be a reasonable guide to the understanding of the nature and the character of the present military regime in Peru. For that we have to examine its major policies and that too in the new setting which has been described by some Latin American Marxists as the "redefinition of the relations of imperialist domination in Latin America". This "redefinition" is broadly speaking a movement away from what has been called "traditional imperialism" in Latin America with the United States as the hegemonic power operating in the economic field largely through 'enclaves', i e, enterprises totally controlled by imperiaist capital. The shift has been perceived in the following new trends:

(1) Increasing US penetration in the urban-industrial sector at the cost of the traditional agro-extractive sectors. (2) A relative decline in US hegemony and a concomitant rise in the weight of other imperialist powers especially West Germany and Japan. (3) A tendency for old forms of financial domination to be replaced by new monopolistic conglomerates and by supranational nuclei within the imperialist bourgeoisie. (4) Financial and technical aid being given to some of the Latin American countries within the imperialist orbit by some socialist countries. (5) The emergence of nationalist, anti-imperialist and socialist revolutionary movements (as opposed to the reformist, traditional communist ones) in many areas of the continent under the forceful impetus of the Cuban revolution and the struggle in Vietnam.

The shifting of the axis of imperialist domination from the agro-extractive to the urban-industrial sector led to a whole series of economic, political and social changes. The power of the old oligarchy declined, but did not disappear, and new groups appeared in the middle reaches of society — petty bourgeoisie and white-collar workers asserting their demands and competing for political power. Simultaneously, the urban proletariat expanded and became more politically conscious. Revolutionary peasant movements emerged in the countryside along with guerilla bands which represented the highest level of political-revolutionary consciousness of the exploited people as a whole. But the exploited classes still did not have the awareness, the organisation or political ability to find their way out of the crisis of political hegemony which had acquired a new dimension and had been accentuated since the Cuban revolution. Another attenuating factor was the decline of 'populism' which had dominated the Latin American scene to a considerable degree with the rise of such parties as Accion Democrita in Venezuela, APRA in Peru, MNR in Bolivia and the Christian Democrats in Chile. These parties rent with deep ideological crises were split repeatedly and consequently weakened both in organisation and political influence. Alongside, the reformist, traditional communist parties experienced similar difficulties which were further aggravated in their case by the international split in the socialist camp. The popular masses began to abandon these political parties and the well-trodden political paths advocated by them, though yet groping for new paths suited to their new political demands. This state of affairs was soon to engender new forms of politico-revolutionary organisation, new forms of mobilisation and a greater capability for applying pressure and fighting for power.

And finally, the crisis also spread to the traditional agents of legitimisation of the existing socio-economic order, most notably to the Catholic Church and the universities, sections of which became the most outstanding proponents of revolutionary change. Thus at the ideological as well as the political level, class relations and relations of conflict and domination acquired a new complexity and entered a new phase. These general tendencies were embodied in concrete situations and forms which varied from country to country according to the peculiarities of each of them. They affected Peru in its own way resulting in the emergence of a new power relationship, both within the classes in the Peruvian polity as well as this polity's relation to imperialist domination.

II

What were the major economic and political trends in Peru before the military coup of 1968? Since the 1950s imperialist domination of Peru had become broader, more diversified and more deeply rooted. Before 1950, the imperialist control, particularly of the United States, was exercised almost exclusively through its hold on agro-extractive resources. This meant exploitation of agricultural resources with particular reference to products for export, followed by petroleum and mining. Urban-industrial activity did not yet interest finance investors. In the mid-fifties interest in mining suddenly increased and imperialist capital also began to flow into industrial production. As a consequence Peru's economy began to undergo a process of rapid change and diversification. Between 1950 and 1958 the composition of the country's GNP was substantially altered with manufacturing replacing agriculture and cattle-raising in first place and growing at twice the rate of the latter. (See an outstanding study of Peru's economy since 1950 by Anibal Quijano, "Situation and Tendencies in the Peruvian Society", *Pensamento Critico*, May 1968, Havana. Available in Spanish only.)

By the beginning of the 1960s both the agro-extractive sector and the urban-industrial sector were in the grip of foreign exploitative capital, with emphasis on the latter sector. Since the whole development was dependent on foreign capital, it exemplifies a combination of old and new patterns of imperialist control, that is, the appearance of new imperialist interests within a new framework of relations with the native bourgeoisie, over and above those already existing between foreign capital and the agricultural and cattle-raising native bourgeoisie and the *latifundists*. The era of imperialist domination based only and exclusively on the alliance between the native landlord-commercial bourgeoisie and the imperialists came to a close, and a new element, the urban-industrial 'national' bourgeoisie came into the picture. A new model of imperialist exploitation began to emerge whose requirement in relation to the narrowness of the internal industrial market implied the necessity for agrarian reform and for greater participation by bourgeoisie groups (national as well as imperialist) associated with the urban-industrial and mining sectors. This obviously required a redefinition of the country's economic policy as well as a new pattern in the control of state power. The new model of economic exploitation had to have its counterpart in a new model of political relations both intra-class and with imperialism. The military *coup* of 1968 provided such a model and a redefinition of relations within a new type of power structure in Peru.

This new political model emerged out of two sets of conditions. The first set included: the relative weakening of US hegemony in the international capitalist order, the unsavoury reputation of US interventionist policy, increasing internal difficulties caused by loss of faith on the part of American youth, the development of a militant black movement and the American protest movement against the war in Vietnam, the possible conflict or lack of agreement within the US bourgeoisie itself with regard to necessary changes that must be made with the dominated countries. The other set of conditions in operation were: the strengthening of Peru's urban bourgeoisie in close relationship with the army, the irresistible nationalism pervading all sections of Peruvian society (including the Indian sections) during the 1960s, the radicalisation of the army including a section of the officer class and the growth of armed guerilla movements in the countryside under Castroite inspiration, etc. *Within this model a policy has developed which is moving Peru towards a new mode of operation within the imperialist system and is building an economic structure that will be dependent in a new way. Such dependency will doubtless be less offensive to the national sensibilities of the intermediate sectors of society and shall do away with enclaves and shall be more complex and organic.*

The above formulation is confirmed if we examine some of the policies of the military *junta* in the context of the class relations of Peruvian society. But before doing so, it would be helpful to briefly examine the conditions and the processes which catapulted the new economic-political model into being in Peru and which, if it succeeds in Peru, might become a prototype for other Latin American countries (where more or less similar conditions prevail) within the framework of the redefinition of relations of imperialist domination.

Anyone making a study in depth of the measures the military *junta* has put into effect will reach the conclusion that while it is trying to eliminate imperialist control of the production of agricultural exports as well as the 'enclaves' in mining and petroleum, it is at the same time tending to strengthen the role of foreign capital in mining as well as in the urban-industrial sector of the Peruvian economy. Therefore, though it might appear that the military *junta* has initiated a process for the final liquidation of the 'traditional imperialism', the reality cannot be escaped that it is also enhancing the possibilities for a new model (both economic and political) of exploitation.

The agrarian reforms initiated by the promulgation of the law of June 24, 1969 was the most important measure undertaken by the *junta*. It aimed at the total elimination of foreign capital, particularly that of the United States, from the agricultural exports sector. Agrarian reform is an issue of great public concern all over Latin America since the dominating foreign interests in agricultural land hurt the national susceptibilities of the people in a more obvious fashion. Imperialist control in this sector affected principally the production of sugarcane and its derivatives, and to a lesser degree, cotton and rice, all of which were concentrated in the coastal areas because of favourable climate and availability of sea transport. The government also took over the vast agricultural-cattle-raising estates of the Cerro de Pasco Company in the central region, an act which had been approved by the previous Belaunde administration, though it had never been carried out.

The other foreign agricultural interests acquired were the complexes in the Departments of Lambayque and La Libertad as well as in Lima. This was described by Velasco as the "beginning of the real social and economic revolution in Peru".

The agrarian reform measure is no doubt far-reaching and has been carried out with great vigour. But when we come to examine it in relation to imperialism, we are confronted with its limitations. The law, in addition to limited cash payments, provides for payment in bonds to be amortised over a period of twenty years, upto a limit of 270,000 soles or approximately $ 7,000. Above this limit, bonds are to be exchanged for shares of stock in industrial enterprises belonging to the State. Another provision regarding 'expropriation and compensation' stipulates that any landholder whose property is expropriated has the right to cash in his bonds at the Industrial Bank at 100 per cent of their face value, providing that he invests an equal sum in cash in a new industrial plant. The net effect of these important provisions is to convert the agrarian capitalists into industrial ones. More significantly, the law makes no distinction between the native capitalists and the foreign capitalists and thus allows the large imperialist enterprises to shift their capital into industrial activity. As a result, the possibility of imperialist enterprises controlling industrial production increases, though their control over the agricultural sector is eliminated. Thus in place of the traditional axis of imperialist domination, the law strengthens the new axis of domination through urban-industrial production. Besides, the law makes a careful distinction between the control of agricultural resources and the control of industrial plants. For instance, the sugarcane plantations of Grace and Co were expropriated along with the Company's industrial installations, but the latter were promptly returned to the Company despite the fact that they are basically used for processing the agricultural products of the expropriated plantation.

Another important measure which hit the world press headlines and caused angry demonstrations in Peru against American imperialism was the taking over of the petroleum deposits and installations belonging to the IPC by the military *junta*, leading to US threats to invoke the Pelly Amendment and later the Hickenlooper Amendment. The IPC was undoubtedly the major petroleum monopoly in Peru and its presence was a constant object of criticism both by the anti-oligarchy opposition as well as by some of the important groups of the native bourgeoisie. It was considered a "national shame", an outrage to national sovereignty and described as the "award of the British Crown". For more than half a century the IPC was a subject that caused some of the most heated debates in the country. Its expropriation, therefore, eliminated a situation that had become more and more intolerable both for the Company as well as for successive Peruvian governments. The taking over of IPC, therefore, constituted a policy that satisfied the nationalist feelings of the people *vis-a-vis* imperialism and overnight gave a 'revolutionary' colouring to the government headed by the military *junta*. But the problem, however, is more complex than the mere nationalisation of an important foreign enterprise.

The *junta* strongly insisted that this act was totally exceptional and in no way represented a general policy of expropriation of foreign capital. The measure applied only to IPC, a symbol of foreign domination, and did not form part of a general policy. And in fact other oil companies under the control of imperialist capital were not only left untouched, but were permitted to increase their investments and extend their concessions. There are at present seven oil companies in Peru extracting and refining petroleum products, the smallest of them with the participation of native capital. Thus, although the expropriation of IPC liquidated the major American monopoly in Peruvian oil and made PETRO PERU (the state's managing body for the nationalised IPC) the principal oil producer in the country, it has not brought about a fully national petroleum policy. On the contrary, not only have there been no further expropriations, but private US investment in oil in the short period since the *coup*, has become practically equal to that before the expropriation of IPC. In this connection, one must not forgot how the US government reacted to the expropriation of IPC. After its initial protests, threats of invoking the Hickenlooper Amendment and cutting of the sugar export quota, the US government quietly accepted the expropriation of IPC and hastened to normalise relations with the *junta*. Its policy towards the military regime initially was a flexible combination of cautious diplomacy and hesitant financial blockade. Neither the Pelly Amendment, nor the Hickenlooper Amendment was ever applied. On the contrary, the US Under Secretary for Latin American Affairs stated in the Senate that the Hickenlooper Amendment was inapplicable and meaningless, although the same gentleman had threatened the *junta* a month before with "dire consequences".

The redefinition of relations of imperialist domination is also reflected in the new industrial policy enunciated in the Basic Industrial Law and the Industrial Community Law by the *junta*, popularly known as the 'Velasco Doctrine'. Industrial growth in Peru was rapid during the 1950s and 1960s, although it fell within the limits of the import-substitution and processing industries. This growth was largely induced by foreign investment and led to com-

plete corporate, financial and technological control by imperialist interests in this sector of the economy. According to official figures, more than 80 per cent of industrial investment in Peru is foreign, mainly American. It is obvious, therefore, that any regime opting for independent development must take measures to eradicate imperialist control in this area, particularly when urban-industrial activity is becoming the real new axis of imperialist domination in most countries of Latin America.

The 'Velasco Doctrine' defined its four basic policy principles as follows: (1) The main riches and the natural resources of Peru shall belong to the State. (2) Economic development shall accord with national interests. (3) Foreign investments shall also accord with the overall interests of the national economy. (4) All these measures shall be directed to consolidating the country's independence and improving people's living conditions. The Basic Industrial Law and various statements by government authorities, however, point out that the new orientation is intended to stimulate private investment (including foreign investment) in industry, while the State shall retain direct control and management of 'basic industries', such as steel, chemicals and petrochemicals, etc. While the plans that have been announced outline relatively ambitious goals for the State sector, public assurances have also been given that the private investments will be given "incentives and guarantees". Thus Peruvian industrial production will be divided into two sectors, 'basic industry' controlled and managed by the State and manufacturing controlled by private companies. Since the latter are in the hands of imperialism, this division may basically amount to creating the same situation as in countries like Argentina, Brazil and Mexico, that is to say, an arrangement whereby international and supranational monopolies control manufacturing and the State controls basic industries'; where extractive production and the so-called basic industries controlled by the State serve in practice as the infrastructure of raw materials and services for the development of industry, which remains in the hands of imperialism, with all the advantages accruing to the latter.

Dependence on imperialism is, thus, not going to be eradicated. But it must undergo substantial modification; it must be less offensive to national sensibilities. And the terms of this modification are subject to negotiation. The Peruvian State has become the principal figure in such negotiations. Despite all the rhetoric about 'revolutionalism', this negotiated dependence on imperialism will remain the chief characteristic of the Peruvian State structure unless a new and genuine revolutionary process brings this situation to an end.

III

The traditional communist parties of Latin America could not at any stage understand the complex process underway on the continent, in which imperialism was trying to redefine its relations of exploitation in a new context, taking into account the new irresistible forces emerging on the scene. The Peruvian communists are no exception to this. Their understanding does not go beyond the old petrified formula of the 'Three Class United Front' against imperialism and oligarchy. The Oil Defence Front and the National Liberation that they hastily hitched up came to the nothing as they were based on (if at all they were based on anything) forces that had petered out in the current political process and on a political understanding that had no relevance to the realities of the situation. They had, therefore, no choice but to accept the military takeover after some initial hesitation and welcome it as "anti-imperialist and anti-oligarchy" without presenting any analysis of the new forces that had come to occupy the seats of power in the new situation. That the *junta* had given diplomatic recognition to the Soviet Union, nationalised oil and adopted an Agrarian Reform Law was enough for them to declare the regime "revolutionary" and "semi-socialist", which was likely to become "fully socialist" under "people's pressure" organised by now the legal Communist Party of Peru with a functioning office located in a fashionable street of Lima.

Another and a more significant factor which added to the confusion and militated against a proper assessment of the new regime in Peru was the unqualified support given to it by Fidel Castro in his speech on July 10, 1969. Castro had already redefined his relations with the Soviet leaders, the one-time 'revisionists' who aided the Latin American dictators against the heroic guerillas. In 1969, he had embarked on an ideological honeymoon with them, repudiating, though implicitly, many of his former hard-line positions. He had accepted the Russian model of economic development for Cuba, had agreed to attend the World Communist Parties Conference in Moscow and even the Peace Assembly in Budapest. Conveniently forgetting his past declarations, he had supported the Russian intervention in Czechoslovakia and had kept silent over the massacre of students in neighbouring Mexico and finally, and most importantly, had dropped all references in his speeches to the fighting Latin American guerillas and had stopped criticising the Soviet leadership. His *entente* with the Soviet leaders was thus complete, but not yet with Latin America's Moscow-lining communist parties and their leaders whom he had publically labelled as "political charlatans", "spurious vanguards", "eagles without feathers", "election-mongers" and "prattlers", etc.

Castro's bestowal of blessings on the Peruvian military *junta* was the beginning of his *entente* with the Latin American communists. His July 10, 1969 speech was welcomed by Moscow as well as by the Latin American old guard, for they had realised that by recognising the 'revolutionary' character of the Peruvian regime, Castro had implicitly gone back on his stance at the time of the OLAS (Organisation of Latin American Solidarity) meeting. He had now tacitly admitted that revolution in Latin America did not depend on prior destruction of the old military machine and that this very machine could play a revolutionary role under certain conditions. The Latin American communist parties had long ago spoken of this possibility; it was for this reason, and not because they were afraid of starting guerilla struggles as claimed previously by Castro, that they had advocated a peaceful solution to the Latin American crisis. The same analysis had led the Soviet Union to render economic aid to Latin American governments irrespective of their political colour or other attitude to Cuba. This had, in the past, been bitterly resented by Castro. Castro was now proved 'wrong' both in criticising the Soviet leadership and the Latin American communist parties. The Cuban model of the Latin American revolution built so assiduously in the Tricontinental and OLAS conferences was thus demolished. This model was based on the fundamental idea of the destruction of the old military machine (*a la* Cuba) by protracted guerilla warfare organised initially by a revolutionary force based in the countryside.

The Latin American revolutionaries who had hailed OLAS as the new "Revolutionary International" for Latin America could not help noticing a contradiction between what Castro and Che had said before 1967 and the recent hymns and praises lavished on the Soviet Union by Castro in his successive speeches. They wondered whether Fidel's support for the Peruvian 'Revolution' did not fly in the face of the OLAS and Tricontinental revolutions and whether it was not time for Castro to make it clear precisely how his new alliance (political as well as ideological) with the Russian leadership was influencing his views on the Latin American revolution. Suddenly Castro cooled down towards the guerilla movements which had received his unqualified material and moral support in the past. Earlier he had confessed, he "could not make a speech without speaking about our heroic guerillas". But by 1969, the guerillas had practically disappeared from his speeches and from the Cuban press. The weekly international edition of *Granma*, published in four major world languages, which used to be full of news of guerilla activity now carried almost nothing except pictures and reports about sugar, the reception to visiting Soviet ships and the leaders of the socialist (pro-Moscow) world, including for the first time since 1959, the visits of Latin American communists — the former "political charlatans".

Later in 1969, Castro fell out with his old protege, the famous Venezuelan guerilla leader Douglas Bravo, for whose sake he had publicly denounced the leadership of the Venezuelan Communist Party, heaped the worst abuse on them in his memorable March 13, 1967 speech in Havana. The differences between Castro and Bravo came out in public when the latter wrote an article — highly critical of the Cuban leaders — in Jean-Paul Sartre's (a former staunch supporter of Castro) journal, *Les Tempes*. Bravo accused Castro of betraying the guerilla movements in Latin America in general and Venezuela in particular. According to him, Castro stopped aiding the Latin American revolutionary struggles the moment the Cubans decided to rally round the Russian leadership and, on the latter's advice, decided to concentrate on their own economic problems. He alleged that the Cuban leaders had made contacts with the Communist Party of Venezuela through the old-guard Cuban communist Raphel Carlos Rodriguez and had given assurances of full Cuban support in the future. The Cubans had also made the excuse that Castro had made his attack on the Venezuelan Party leadership in haste and anger. Bravo also alleged that the Cuban leadership had firmly decided to put the OLAS resolutions in cold storage.

Whatever may the element of truth in these assertions of a former favourite of Castro, the fact remains that revolutionaries throughout Latin America share Bravo's misgivings, which have increased since Castro's support to the Peruvian 'revolution' and later to the "revolution via elections" in Chile. But they also realise that the course of the Latin American revolution cannot be determined by Castro's attitude to it.

The Peruvian case indicates that imperialism still has manoeuvrability; it still has options, which can be closed only by a revolutionary movement led by genuine revolutionary vanguards, like the one which arose in Cuba in 1959. The failure of the 'foco theory', the death of Che Guevara in Bolivia, the sectarian battles within the remaining 'focos' (Venezuela, Guatemala, Colombia) as well as the total dependence on Russian economic-military support, has led to Cuba's temporary retrenchment from revolutionary leadership. At the moment, Cuba's all-out support to the Russian leadership (which was a *volte face*) makes the degree of ideological independence at the top highly suspect. But the Tricontinental and the OLAS conferences set in motion a new spirit which can only die at the top but not at the base of the world revolutionary movement.

The Peruvian military regime is guided by an ideology of limited nationalism within the imperialist order. It is guided by an ideology of class reconciliation to be brought about by integrating the interests of the workers with those of capitalist enterprise. There is no nationalist anti-imperialist bourgeoisie in Latin America. What does exist is a nationalist bourgeoisie which, in the absence of strong pressures from the exploited classes, or a fight for power, is not likely to evolve a line of conduct capable of effectively eliminating imperialist domination. This fact points to the necessarily limited and transitory situation in Peru. But the Peruvian situation also has within it the danger of the consolidation of the major tendencies towards a new structure of domination by, and dependence on, imperialism. If this happens, it will be a grave set-back to the Latin American revolution.

Housing Problem of a Growing Metropolis

Mahesh Bhatt

A concomitant to the rapid urbanisation of Ahmedabad city has been continuous growth of its slum areas. Much of this environment is hostile to human life at its most basic physiological level.

Despite the very acute housing shortage and the increasing scale of slums in urban Gujarat generally, the outlay on housing in the state as a percentage of total outlay has been reduced in the Fourth Plan compared to under the Third Plan. The percentage is also much below the comparable provisions in the all-India plans.

This article examines the major factors retarding housing activities in Ahmedabad and suggests measures that might help alleviate housing conditions in the city.

ONE of the most important problems attendant to urbanisation concerns housing and slums. Housing ranks next to food in human life. For most families the sort of home they live in affects their happiness far more intimately than does almost anything else in their physical environment. Moreover, housing accommodation plays an important part in maintaining the health and efficiency of the community. Investment in housing is therefore productive investment in human capital. Similarly, housing investment is an integral part of industrial development because house-building absorbs some of the major industrial products such as cement, steel, glass, sanitaryware etc, and it has a considerable employment potential.

The importance of housing in a country like India, which is facing a sharp population growth and a rapid pace of urbanisation resulting in slums and sky-rocketing rents in urban areas, is quite obvious.

According to the Housing Census[1] in Gujarat, in which house lists have been prepared from August to October, 1960, altogether 54.37 lakh houses have been listed in Gujarat; of these, 73 per cent are in the rural areas and 27 per cent in the urban areas. Excluding 6 lakh vacant houses, there are in all 48.33 lakh occupied houses. All these houses are not surely residential ones. Broadly, 38.71 lakh of the 48.33 lakh houses (80 per cent) are classified as residential houses (dwellings) and the rest as non-residential (non-dwelling). Of the 1,000 census households surveyed in the state, 601 occupy single-room tene-

TABLE : TOTAL LAND VALUE PER SQUARE YARD: AVERAGE VALUE OF THE LAND AND PERCENTAGE OF INCREASE IN LAND VALUE BY YEARS

Year	Total Number of Societies	Total Land Value Per Sq Yard (in Rs)	Average Land Value Per Sq Yard (in Rs)	Percentage of Increase in Average Value as Compared with 1941-50	Percentage of Increase in Average Value as Compared with 1960	Percentage of Increase in Average Value as Compared with 1961
1941-50	7	38 56	5.51	—	—	—
1951-55	21	127.24	6 06	9.98	—	—
1956-59	128	1277.06	9.98	81.12	—	—
1960	97	1477.13	14 92	170 78	—	—
1961	42	546.96	13.45	144.10	9 85	—
1962	55	875.10	15.91	188.95	6.64	18 29
1963	30	497.35	16.58	200.91	11.13	23.27
1964	29	669.98	23.10	319.24	54 83	54.82
1965	18	548.53	30.47	452.99	104.22	126.54

ments, 274 two-room, 70 three-room (or more) tenements. "This means that as many as 88 per cent of population live in overcrowded and substandard dwellings."[2]

The National Planning Committee and the Bhore Committee (Report on Health, Survey and Development) have prescribed 100 sq ft per person as the minimum accommodation required per adult and 60 sq ft per child. As compared with this minimum, on the basis of Housing Census in Gujarat, the per person floor space available would be hardly 20 to 25 sq ft since the average number of persons per room is 3.27 and per household 5.30, and the number of households occupying a single room are more than 60 per cent of the total population of the state. Thus the floor space now available to an individual would be much less than what a convict in a jail is prescribed in the Jail Manual,[3] *viz*, 40 sq ft.

Housing shortage in Ahmedabad city is acute. Even in 1958, 64 per cent of the city's population lived in one room or less than one-room households. The situation seems to have become worse since then, as revealed by the Housing Census of 1960. Out of 1,000 households surveyed in Ahmedabad City, 65.3 per cent lived in one room only.

A concomitant of the rapid urbanisation of Ahmedabad City has been the continuous growth of the slum areas. In 1960-61, some 18,652 households lived in areas regarded as slums. Today approximately 60,000 huts stand within the municipal limits. Out of 1,140 chawls, 327 chawls still do not have drainage, and in almost all the chawls, water supply and latrines are highly inadequate. It may be shocking to know that roughly 20 per cent of the population of Ahmedabad live without basic facilities like latrines and water. On the basis of a preliminary study of the slums in Ahmedabad city, carried out by this author, it can be said that the rate of disease, chronic illness, and infant mortality, remain high in these areas. Drainage in the slum areas is open, and choked drains present sickening sights and offensive odours. Much of the environment is hostile to human life at its most elementary physiological level. In fact, Ahmedabad city can be divided into two cities — the eastern side which has been neglected environmentally and is overcrowded, and the western side which is ostentatiously wasteful and extravagant in services, house-lots, roads, etc. The western side looks like a garden suburbia, the eastern side like a terribly overcrowded, structurally decayed ghetto.

Despite this acute shortage of housing and the increasing scale of slums in urban Gujarat, the outlay on housing which was in the Third Plan of the state 3.74 per cent of total outlay has been reduced to 2.38 per cent in the Fourth Plan. This percentage is also much below the provisions for housing made in all-India Plans. All-India figures are, 12 per cent of total outlay in the Third Plan, and 7.4 per cent of total outlay in the Fourth Plan. In terms of the gross state income (1964-65) the state outlay on housing in the Third Plan (at current prices) was 0.6 per cent and in the Fourth Plan it is expected to be approximately 1.2 per cent.

FACTORS RETARDING GROWTH

The housing situation in this growing metropolis is going to become much worse in the future — unless immediate measures are taken to alleviate the housing shortage. It is estimated that the Ahmedabad Metropolitan Area will have a population of anywhere between 60 to 70 lakhs, of which the Ahmedabad urban area will have 50 lakhs by the year 2000. In size, Ahmedabad in next 30 years will be the size of Bombay today. An additional population of 35 lakhs by year 2000 means 10 lakh new dwelling units.[4]

In the context of the acute and growing shortage of housing accommodation, it is important to examine the chief factors retarding the growth of housing activities. The high costs of the two principal components of housing, *viz*, land and construction, are perhaps the chief factors retarding or discouraging housing construction.

The Table provides information on the rise in land-values in Ahmedabad city. Although the data cover land-values paid by the co-operative housing societies, they undoubtedly reflect the general trends in land-values. The average land-value, which was Rs 5.51 per sq yard during 1941-50, increased to Rs 30.47 per sq yard in 1965, indicating a 453 per cent increase. If we take 1960 as the base year, then land-value in the last five years may be seen to have increased by 104.22 per cent. Compared with 1961, the rise in the index of land-value was 126.54 per cent. The annual average rate of increase in the land-value, in and around Ahmedabad city during 1960 to 1965, was 17.1 per cent. This tremendous increase in the land-value is the direct consequence of the increased demand for sites for housing and the scarcity of suitable land for the purpose in the area. The increase in demand for land is again the consequence of the increased population of the city which includes the inflow from outside, and perhaps of the increased income of the urban sector.

From a detailed study of the land-values in Ahmedabad, one finds that that the Ricardian theory of rent fits quite well the case of urban land-values.[5] If we consider the productivity of urban land, in the sense of the convenience of nearness to the centre of the city (marketing area), the rent (or land-value) will be highest in the centre of the city and lower at the periphery. As a city grows, more remote and hence inferior land must be utilised and the difference in the desirability of the two grades produces the economic rent of the location of the first grade but not of the second. Practically all land within a city earns some economic rent.[5] In the case of Ahmedabad city also we find almost a very similar trend. The value in the centre of the city, the main marketing area, is highest and as we move away from the centre there is a gradual decline in land-values. A city may gradually develop several centres for marketing, employment, and other facilities, and the land-values near all such sub-centres of the metropolitan city may be relatively higher than in any area away from such sub-centres. The price of land per sq yard in a marketing centre like Manekchowk, Delhi Chakala, and sub-centres like Town Hall or the marketing area in Maninagar, etc, is much higher than the price of land anywhere outside the city.

The above analysis of the trend in land-values only reflects the fundamental disequilibrium between the supply of land for construction of houses and the demand for such land. The price mechanism of land has its own useful effects. A rise in the price of building land, like a rise in the price of anything else, stimulates economy in its use and encourages the extension of supply. Because of the high land-value, many co-operative housing societies are going for joint-tenement type of construction instead of having independent bungalows. Further, economy in the use of land has recently stimulated construction of blocks of flats in the city. The expanding area of the Ahmedabad Metropolitan Area, gradually submerging many small villages, is itself an indication of how the price mechanism stimulates increased supply of land. Of course, this does not imply that the solution to the problem of high land-values and land speculation should be left to market forces.

Besides land cost, another important component in housing costs is the cost of construction. The cost of construction per sq yard in 1960, was Rs 170.27; this has increased to Rs 240.85 in 1965, indicating a 43 per cent increase. This increase in the cost of construction is much higher than the increase in the cost of construction in Delhi. Also, during the same period, the cost of construction in Delhi increased by 25 per cent.[6] One of the important factors contributing to the increase in cost of building materials in Ahmedabad is the various taxes imposed on building materials.

Building materials are subjected to the following taxes: (1) excise duty; (2) state sales tax; (3) central sales tax; (4) octroi duty. It is estimated that taxes as a percentage of cost of building materials is highest in Ahmedabad city. For example, taxes as a percentage of the cost of materials were 13.22 per cent in Ahmedabad, as compared with 11.41 per cent in Delhi, 8.43 in Hyderabad, 7.84 per cent in Madras, and 8.95 per cent in Patna. The incidence of taxes as a percentage of the total construction costs in Ahmedabad is 9.63, which is again the highest as compared with Delhi, Hyderabad, Madras and Patna.

Having examined the housing conditions and the chief factors retarding the housing activities, we propose to discuss some general measures which might help to alleviate the housing shortage in the city.

(1) One of the chief factors discouraging housing construction, as mentioned earlier, is the high land cost in and around the city. One immediate action which would have a bearing on land-values is the abolition of the Green Belt covering the total area of about 13,000 acres. It is known that the Green Belt was declared as an *ad hoc* measure, pending the passing of the Town and Country Planning Act prepared by the Gujarat Government. One does not know what happened to this Act, but the measure which was undertaken in anticipation of it persists and artificially restricts the supply of land for residential purpose, thereby contributing to the increase in land-values in Ahmedabad city.

(2) Further, to curb land speculation, large-scale acquisition of land becomes necessary.[7] Side by side with such public acquisition, it is necessary to impose a ceiling on urban land-holdings. No individual should be allowed, within and around the metropolitan area, to acquire land beyond a prescribed ceiling. Any plot beyond 400-600 sq yards is held largely for speculative purposes. Obviously, this results in an artificial restriction of supply of suitable land resulting in high land-value.

(3) The vast areas of land traversed by railway track in many residential areas could be utilised more productively for residential purposes, if the railway track is removed from these areas. The sale of the acquired land would make substantial resources available for construction of a new railway track. This would not only increase the supply of land for residential houses but would also remove the annoying obstruction to traffic in these areas.

(4) Rent-control in Ahmedabad city needs to be reconsidered. We believe that the Rent Control Act is an obstacle to building activities and restricts the supply of accommodation available in the market. It is difficult to justify rent control on economic grounds, particularly when there is no effort to 'ration' the accommodation. Rent control without rationing, results in 'hoarding' of house space in that it leads families to occupy larger accommodation than they would normally demand. This type of hoarding of accommodation is prevalent in Ahmedabad city as well as in many other parts of the country. Secondly, the existing Rent Control Act prevents many owner-occupiers and tenant occupiers from sparing the accommodation for renting, so that we find many vacant, unutilised, or underutilised accommodation in the city. However, if complete rent de-control is ruled out, there should at least be a public rationing of houses. It is true that such measures would create several administrative problems and may prove an expensive task. Hence, as an alternative, an exise tax on consumption (or occupancy) of housing is worth considering.[8] This will be a tax on the occupier. An occupier having rooms in excess of the family members may be taxed at a graduated rate linked with the number of excess rooms. Of course, such a tax would create many administrative problems — such as the problem of defining a room or family member etc, but solution to such problems is not impossible. Such tax measures would increase the accommodation available for rent and simultaneously reduce the demand. It would induce families or single woman (or man) with larger accommodation to reduce demand and would encourage them to take in room-mates or move to smaller quarters.

This, indeed, is not a comprehensive list of the measures needed for solving the housing problem. The search for a rational solution to the problems created by a growing metropolis should be the task of the Urban Studies Centre which could pool the necessary talent in the field of economics, sociology, country and town planning and administration.

Report of the Auditors

TO THE PRESIDENT OF INDIA:

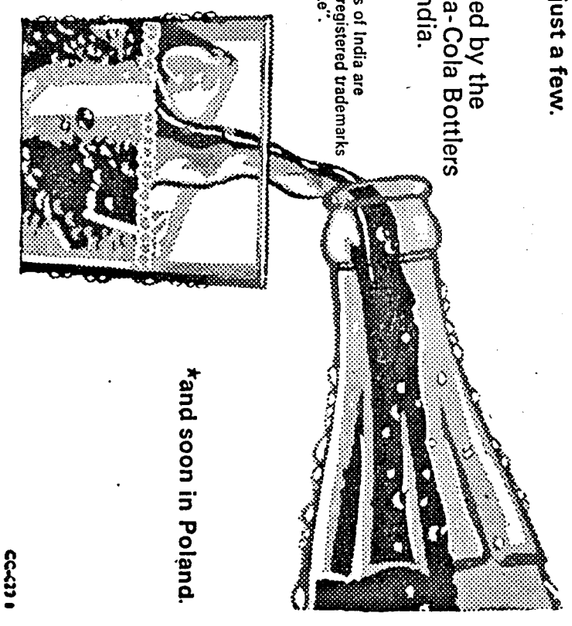
1. We have audited the foregoing Balance Sheet of DENA BANK as of 31st December, 1971 and also the foregoing Profit and Loss Account of the Bank for the year ended on that date, in which are incorporated the Returns from 71 Branches audited by us (26 Branches as on 30-6-1971 and 45 Branches as on 31-12-1971), 143 Branches audited by other auditors, and the unaudited returns in respect of 236 Branches not visited by us, for the exclusion of which Branches from audit, concurrence of the Reserve Bank of India was obtained.

2. The Balance Sheet and Profit and Loss Account have been drawn up in forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with, the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that:

(a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank:
   (i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December 1971;
   (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account.

(b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

(c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;



(d) The Returns received from the officers and branches of the Bank have been found adequate for the purposes of our audit.

At What Cost?

AS usual the Engineering Export Promotion Council (EEPC) has pitched high its export target for engineering goods for 1972-73. At Rs 200 crores, it is fully 50 per cent higher than the level of exports achieved in 1971-72. That engineering exports last year fell short of the target by nearly 25 per cent appears to have left no impact at all on the Council. At the beginning of 1971-72, the EEPC had fixed a target of Rs 165 crores; later this was raised to Rs 175 crores — and this, when exports in the first half of the year had been (at Rs 64 crores) only slightly more than one-third the revised target. Commenting on the EEPC's flighty optimism, it was pointed out in these columns over four months ago that "even on optimistic expectations, engineering exports are unlikely to exceed Rs 140 crores" (December 18, 1971, p 2496). The chairman of the EEPC now claims that exports in 1971-72 would be Rs 135 crores, though on the basis of the trend upto February 1972 they appear unlikely to exceed even Rs 130 crores. For the less than satisfactory performance last year the chairman of the EEPC has his pat explanations: the steel shortage and the stalemate in trade negotiations with the UAR.

Imports of iron and steel amounted to Rs 86 crores in 1968-69 and Rs 81 crores in 1969-70; but in 1970-71 they spurted to Rs 147 crores and rose further to Rs 113 crores in the first half of 1971-72. The increased imports were accompanied, last year in particular, by a considerable reduction in exports of iron and steel. In this context of increased domestic availability of steel, it is difficult to take the EEPC's complaints of steel shortage seriously. As for exports to the UAR, the EEPC was well aware of the uncertainties surrounding Indo-UAR trade relations when last year it scaled its export target upward by Rs 10 crores. The EEPC might at least try to be more convincing when it makes excuses for shortfalls in exports.

The EEPC's anxiety to pitch the export target high at the beginning of each year is perhaps explained by the fact that it uses the target to bargain with the government for larger supplies of steel and for more export incentives. And the government, it appears, readily falls for this tactic. Thus the chairman has disclosed that the government has agreed to meet the steel requirements of engineering exports in full and, further, that imported steel would be made available to exporters at JPC prices. It may be recalled that, a few months ago, the EEPC was pressing the government to pay the difference between the indigenous price of steel fixed by the JPC and the international prices. As the Ministry of Finance was opposed to this new type of export subsidy (which might have amounted to some Rs 12 crores), the Foreign Trade Ministry appears to have solved the problem by shifting the burden of the subsidy to Hindustan Steel, which would now make the necessary supplies of imported steel at JPC prices or the ruling HSL prices when JPC prices are not available. The EEPC chairman has estimated the steel requirements of the export target of Rs 200 crores at 8.11 lakh tonnes, out of which 3.31 lakh tonnes are expected to be available indigenously. HSL would have to pay a subsidy on imported steel in respect of all those categories the landed cost of which is higher than the JPC price.

The EEPC's estimate of steel requirements appears to be definitely on the high side. According to a published study by a senior functionary of the EEPC itself, steel (including pig iron) requirements of an export target of Rs 500 crores would be about 12.2 lakh tonnes. Going by this estimate, steel required for an export figure of Rs 200 crores ought not to exceed 5 lakh tonnes. The EEPC chairman's figure of steel requirements appears even less justified in the context of the government's policy of not encouraging high steel-intensive exports. In a situation where free market prices of steel items are higher than the JPC prices, engineering exporters cannot be unaware of the opportunities for profit from disposing of steel in excess of their requirements in the open market.

The EEPC chairman's estimate of import requirements in value terms — Rs 91 crores for the export target of Rs 200 crores — also appears to be inflated. In 1969-70, import replenishment licences of Rs 26 crores were granted to registered exporters against engineering exports of Rs 97 crores. On this basis, one might place the import requirements of Rs 200 crores of engineering exports at about Rs 54 crores. If anything, this figure is likely to be an overestimate, since the levels of import replenishment are known to be generally in excess of the actual import content of the exported commodities.

Thus the EEPC chairman's estimates of the requirements of the quantity of steel as well as the value of imported inputs appear to be considerably higher than what might be justified on any count. If the cash subsidy, the supply of steel at lower prices and at much above the required levels with

opportunities for selling the excess at a premium, and the liberal allocation of foreign exchange in the form of replenishment licences, are all taken into account, the effective export subsidy on engineering goods might well turn out to be in the range of 60-80 per cent — which gives an exchange rate of Rs 11-13 to the dollar.

Foreign Policy

Rare Consensus

M R writes:

THIS year's Lok Sabha foreign affairs debate (April 24-26) revealed an unusual consensus on policy objectives, indicating the emergence of a bi-partisan foreign policy. This was the first comprehensive foreign affairs debate since the signing of the Indo-Soviet Treaty, the emergence of an independent Bangladesh, Nixon's Peking visit and the escalation of the Vietnam War. And it was a far cry from the days when the right and the non-communist left united to snipe at non-alignment and the same old tired arguments were met by equally tired rebuttals by the communists while the ruling party patted itself on the back with the claim that neither the right nor the left had a *credible alternative policy framework* to replace non-alignment. The pattern was repeated year after year even after the cold war declined and India's non-alignment began losing its credibility with the convergence of super power interests regarding India.

Indeed, this year's debate had its kinks. The Swatantra party would not give up its pet theme — recognition of Israel. The Jan Sangh had its misgivings about the Soviet plan for collective security in Asia. There were minor grouses about India's failure to give full diplomatic recognition to the German Democratic Republic. But overall, there was no basic disagreement among the opposition parties and there was a monotonous identity of views on foreign policy issues. The Soviet Union is not a discredited super power in the eyes of the Indian public and even the extreme right had no objection to the growing Soviet presence in the subcontinent. The United States is a discredited super power and even the extreme right lacked the courage to defend it. In the bargain, the government had its way with its foreign policy.

Throughout the debate, there was little realisation that India's foreign policy has lost much of its dynamism and lacks, what one member called, the posture of involvement. India could rush military aid to Ceylon to crush the youth insurgency last year. It could emerge in the role of a liberator in Bangladesh. But it got cold feet over Vietnam. The Foreign Minister has blandly maintained that the government does not favour: a) a summit meet on Vietnam, b) an International Control Commission (ICC) meet, c) a resolution in Parliament denouncing the US escalation of the War, or d) Indian withdrawal from the ICC in protest against the US role.

There was also little effort on the part of the opposition to seek vital clarifications on Indira Gandhi's Asian peace plan. Earlier this month, the conference in New Delhi of India's Asian envoys discussed it and the envoys went back with instructions to pursue the plan. New Delhi has since maintained that Indira Gandhi's plan, mooted in the course of her South-East Asian tour predates the Brezhnev plan for Asian collective security (first proposed in 1969). Only the Jan Sangh seems to apprehend that the Soviet leadership, unable to sell its own plan, is using India to sell it with an Indian label. What lends substance to the Jan Sangh's fears is the peculiar circumstance that neither of these plans have been spelt out in any detail. The Ministry of External Affairs maintains that Indira Gandhi's plan has met with a good response though it will not disclose the names of the responsive countries and maintains that no big power had opposed it. At the same time the Ministry maintains it has little knowledge of the Brezhnev plan. The Brezhnev plan was revived after three full years and after Nixon's Peking visit. While reviving it Brezhnev also chose to assert that the Soviet Union was also an Asian power. Indira Gandhi's plan was revived a few weeks after Brezhnev's return to his old plan. Before that, early in February, Swaran Singh, however inadvertently, had welcomed the Brezhnev plan (in an interview with Tass) but was more circumspect in his support for it in subsequent statements. The Government of India may not know much about the Brezhnev plan but it certainly knows its own plan which has not been spelt out yet, though its envoys are supposed to be pursuing it with the governments to which they are accredited.

If anything, the debate demonstrated that the pro-Soviet euphoria will take a long time to wear off and the government will continue to have a comfortable policy cushion in foreign affairs. The demands for recognition of the Provisional Revolutionary Government of South Vietnam, for full diplomatic recognition of the German Democratic Republic and for trade with Cuba will be repeated almost ritualistically even by members of the ruling party. But the government will have a free hand in foreign policy matters because a combination of diverse factors has contrived to create a consensus for the first time since the early days of Nehru when non-alignment had not yet come under attack from the social democrats and the right had not yet emerged in strength in Indian politics. India is now close to one super power and has tenuous relations with the other, and is least enthusiastic about normalisation of relations with China. Last year's External Affairs Ministry Annual Report dismissed the United States in just three paragraphs but this year's devotes four-and-a-half pages of sentimental writing based on the hope that the two countries could be friends again. As for China, the report is rather patronising: the reference to Kashmir's self-determination (in the Chou-Nixon communique) amounts to interference in India's internal affairs and cannot be tolerated and yet "we do not wish to provoke China unnecessarily and we are willing to normalise relations with her on a basis of equality, mutual respect and non-interference in internal affairs." Beyond this self-righteous statement there is no tangible change in attitude. Barring Dinesh Singh of the Congress, no speaker in the debate — not even from the CPI(M) — was keen on a dialogue with China to end the *impasse*. In short, the debate amounted to a virtual endorsement of the government's stand and whatever little disagreement there was, was about petty details.

Land Ceiling

The Irrigation Swindle

ONE would not imagine that irrigated agricultural land and land which is dry or not irrigated are particularly difficult terms to define or understand. Yet it is a fact that in the ceiling laws now in force in most of the states, dry land is defined to *include* land which is irrigated (however abundantly) from tube-wells, tanks and all other sources except those constructed or maintained by the state governments. We owe a debt of gratitude to the Union Minister for Agriculture for bringing this — what should have been, but wasn't, a widely known — fact to public attention. Charged with having interfered with the definition of irrigated land contained in the

report of the Central Committee on Land Reforms, which reported last year, the Minister pointed out that the construction put on the matter by his Ministry was completely in keeping with that already used in existing ceiling legislation.

The distinction between land irrigated from government sources and that irrigated from private sources is, of course, perfectly ridiculous; it is even more ridiculous to treat the latter as *dry* land and to extend to it the liberal ceiling provisions applicable to genuinely dry land. The ownership of the source of irrigation is becoming less and less significant since the so-called privately-owned sources are increasingly being constructed with finance provided by government or co-operative financial institutions or commercial banks at concessional rates. As for the effectiveness of irrigation, many of the government constructed and maintained canal systems were set up by and large to provide protective irrigation and are distinctly inferior to privately owned sources of irrigation from the point of view of predictability and controllability of water supply which are crucial to modern, scientific agriculture.

According to the Planning Commission's data, in the first three years of the Fourth Plan, minor irrigation is expected to cover 4.26 mn additional hectares and major and medium irrigation projects only 1.56 mn hectares. True, minor irrigation is a rag-bag which covers a variety of schemes costing less than Rs 25 lakhs each, but there are good reasons to believe that the spurt in minor irrigation in the last few years has been the result mainly of investment in private tube-wells and energisation of wells. Thus in the three-year period, 1966-69, a total of 175,000 private tube-wells were bored. This figure compares with the total of 80,000 such tube-wells existing at the end of the Third Plan. Subsequently another 190,000 tube-wells were estimated to have been dug in the first two years of the Fourth Plan. Similarly, the number of pumpsets in operation increased from 6.5 lakhs in 1966-67 to 10.9 lakhs in 1968-69 and further to 16.4 lakhs at the end of 1970-71. The proliferation of private tube-wells has taken place not only in areas which are without any other source of irrigation but also in the alluvial tracts already commanded by existing canal systems where ground-water is copiously available, making the sinking of tube-wells by agriculturists a very attractive proposition. Thus from being largely a publicly-owned and provided service, irrigation has rapidly become a privately-owned facility.

And yet as far as the laws on land ceiling are concerned all this investment in irrigation has simply not taken place and the lands covered by them remain dry and arid. It has been pointed out that if privately irrigated lands are subjected to the lower ceiling applicable to irrigated lands then there would be no incentive for new investment in irrigation since a holding without any irrigation facility at the time of enforcement of the ceiling legislation (and therefore subject to the higher ceiling applicable to dry lands) would become subject to the lower ceiling applicable to irrigated lands the moment the owner invests in some means of private irrigation. The argument is valid but there is a perfectly simple way of getting round the problem. This is to classify land, for purposes of ceiling on holdings, not according to whether they are actually irrigated or not, but according to whether or not they are capable of being irrigated. Thus lands which are already irrigated, whether from government or private sources, lands which receive adequate rainfall and lands which can be irrigated by construction of some private irrigation source, such as tube-wells, must all be classified as irrigated land and subjected to the lower ceiling now proposed to be applied, quite ridiculously, only to land irrigated from government sources. The incentive argument can then be turned against those opposed to enlargement of the scope of the term 'irrigated'. It can be quite plausibly argued that once the owner of unirrigated but irrigable land is left with a smaller holding as per the ceiling applicable to irrigated lands, he would have a strong incentive to invest in the construction of irrigation facilities and increase yields so as to maintain his total output and income. And with co-operatives and commercial banks now vying with each other to provide finances for digging wells and installing pumpsets and given such institutions as the Rural Electrification Corporation, a farmer who seeks to invest in irrigation facilities of his own should have no difficulty in finding the money.

Of course, all this presupposes that the state governments, who are to be responsible for enacting the proposed new laws on land ceilings and for enforcing them, are serious about the whole business. But are they?

Industry

On Standing Still

THE Annual Report of the Ministry of Industrial Development for 1971-72 deals essentially with three matters: industrial production, performance of public sector units under the Ministry's control and licensing decisions. In all these respects, it brings out unwittingly the dismal performance of the Ministry.

On the facts of industrial production the Report hardly adds anything to what is already known. The rate of growth of industrial production has steadily declined — from 7.1 per cent in 1969 to 4.8 per cent in 1970 to 2.2 per cent in the first nine months of 1971. The Ministry is wisely silent about the performance of small industry or about the index being unrepresentative of the present industrial structure. Significantly, despite the talk of slortage of steel being responsible for the poor industrial performance, in fact it was industries like leather and fur products (—15.2 per cent), transport equipment (—11.9 per cent) and cotton textiles (—7.9 per cent) which mainly accounted for the shortfall in industrial production. On the other hand, electrical machinery (+13.4 per cent) and metal products (+10.3 per cent) showed substantial increase in production over the previous year.

This is also obvious from the detailed production data given in the Report. In items like cement mill machinery and railway wagons, production was lower in 1971 than in the earlier year. In many other industries — structurals, steel forgings, cast iron spun pipes, steel pipes, refractories, etc — while there was a rise in production, there remained considerable unutilised capacity.

The Ministry of Industrial Development apparently has the largest complement of inefficiently-managed public sector units. Instrumentation Ltd (Kota) presents the best picture for 1971, followed by Hindustan Machine Tools which showed a more than 50 per cent rise in output in the last three quarters of 1971. In a country where small industry accounts for 7 per cent of national income, the National Small Industries Corporation reported delivery of machinery worth only Rs 7.90 crores in the first 10 months of 1971. National Instruments and Opthalmic Glass had a production in 1970-71 which was 65 per cent of its 1964-65 output. Bharat Heavy Electricals every year sets a target, revises it downwards and then reports under-fulfilment (8 per cent in 1970-71) in relation to the *revised* target. This window-dressing also extends to its accounts where it reports "Rs 15 million expenditure on social overheads in excess of receipts" — whatever that means. Heavy Electricals (Bhopal) had an output of Rs 26.76 crores in 1970-71 against Rs 27.25 crores two years back.

Hindustan Cables operated far below capacity. Hindustan Photo Films mercifully gives the least amount of information — *presumably to save the Ministry* and the readers of the Report from heartbreak. The Cement Corporation has two cement factories working and two under planning; Hindustan Paper Corporation too has projects at the planning stage.

As regards licensing, the Ministry reports issue of 626 industrial licences and 1,015 letters of intent in 1971 against 363 licences and 438 letters in 1970. Foreign collaborations approved increased from 183 in 1970 to 245 in 1971. Capital goods approvals increased from Rs 84.54 crores in 1970-71 (April-February) to Rs 105.44 crores in the corresponding period of 1971-72. While the Report pays lip-service to backward areas, it does not give data on how many industrial or capital goods licences were issued in these areas.

In its presentation the Report is a slip-shod document. No attempt to reconcile data on capacity and production seems to have been made. This is also the case regarding the public sector units under the Ministry, though it claims to have within it a cell for public sector units. Data on production in 1971 is not given for most units; Hindustan Photo Films does not give data on capacity or carried-forward losses. To cap it all, the Department of Internal Trade under the Ministry gives its own data on production of some items (bicycles, cotton textiles, soap, paper, GLS lamps) output figures for which are already given earlier in the Report. The Report is silent on the implications of the Supreme Court judgment on automobile prices or on the Ministry's contradictory statements on foreign collaboration policy. Apparently our bureaucracy is not even bureaucratic enough to present data in a systematic manner.

Banking Statistics

A Tale of Many Committees

A Correspondent writes:

THERE is to be no end apparently to the number of committees to look into some aspect or the other of the working of commercial banks. The latest to be appointed is the working group on banking statistics which has been charged with suggesting measures to simplify and speed up the Uniform Balance Book (UBB) and other associated returns. The once-widely-publicised UBB system was conceived of by an earlier working group, in August 1968, as an integrated system of reporting bank advances information about which was till then being collected through different surveys. But though the system was introduced in December 1968 and commercial banks have been filing the required data with the Reserve Bank, the public has yet to see in print any of the information thus collected. Interestingly enough, the set of tables on banking statistics which the Reserve Bank supplied to the recent conference of economic journalists called by it were based on either the statutory returns (as under section 42(2) of the RBI Act) or on old forms or on the special forms designed to obtain information on bank lending to the so-called priority sectors.

The Reserve Bank's press note on the appointment of the new working group now refers to "the factors that have inhibited expeditious and accurate reporting" under the UBB proforma. But what has the Reserve Bank been doing these last three years? In any case, why was it necessary to appoint a Working Group to identify the factors holding up the UBB system? Couldn't this have been done quite easily by the Reserve Bank itself? Indeed, the appointment of the working group is all the more incomprehensible, coming as it does close on the heels of the release of the Banking Commission's report. The Commission has given considerable thought to the question of banking statistics. It has brought out, *inter alia*, how different departments of the Reserve Bank continue to obtain, because of lack of co-ordination, a "plethora of returns" from the commercial banks on bank advances which the UBB was expected to cover in a comprehensive manner (pp 324-5). The Commission has also discussed at length the problems connected with UBB. These problems are by no means all restricted to "factors which inhibit expeditious and accurate reporting" by branches of the commercial banks, as the Reserve Bank's press note seeks to suggest. There have been problems galore at the Reserve Bank end — connected with tabulation of the data and lack of co-ordination in using them. After examining all these problems, the Banking Commission has recommended specific measures to overcome them.

To reduce the workload on bank branches and to avoid duplication of labour, the Commission has redesigned the UBB format so as to make it a fanfold of the balance book. It has pointed out how repetition of fixed information every month can be avoided through a system of reference numbers (p 326) and suggested that, given the stress on purpose-wise analysis of bank advances, the accounting systems of banks themselves should be changed to maintenance of ledgers according to purpose rather than type of account (*viz, cash credit, overdraft, etc*).

The recommendations are equally comprehensive with regard to the problems at the Reserve Bank end. It is pointed out that it is unnecessary to tabulate every piece of information every month. While data could be tabulated on a census basis twice a year (for March and September), loans and advances of Rs 10,000 and over could be tabulated for two more quarters (June and December). Only advances above Rs 1 lakh need be tabulated every month. According to data published by the Reserve Bank, as at end-March 1967 (incidentally, the latest period for which information is available) loans of Rs 1 lakh and over accounted for just 2.8 per cent of the total number of loan accounts but covered about 84 per cent of the total amount of loans and advances (see RBI *Bulletin*, December 1968, p 1507). Loans above Rs 10,000 accounted for just 19 per cent of loan accounts but covered over 96 per cent of the loan amount. The proportions may have changed somewhat since then because of the changes in the pattern of bank lending, but the point remains valid that the work of tabulation can be enormously reduced without in any way vitiating the results if a judicious sampling method is adopted. The collection of data on small loans and priority sectors should also be a part of the UBB and the Commission has particularly emphasised that within the Reserve Bank all departments should rely on data tabulated from the UBB system. It has also indicated that data required for watching the movement of advances against sensitive commodities covered by selective credit controls can be obtained by tabulating the returns of just 800 to 900 commercial bank branches (out of over 12,000), which would cover about 80 per cent of the total advances against each of the major commodities (pp 526-7 and 546).

Even in respect of statutory returns, the Banking Commission has drawn pointed attention to the non-comparability of data collected through different returns because of differences in the definitions of some items of assets and liabilities under the various Acts (p 320). This suggestion for standardisation of definitions was in fact made as early as in 1967 by another committee on banking statistics (see RBI *Bulletin*, May 1967) and the recommendation was reaffirmed by the earlier working group on banking statistics in 1968. Of course, such standardisation would need legislative changes, but banking laws have been amended several times during the last few years and it is just that no one has thought in terms of incorporating these changes. Now the Banking Commission has again suggested that the detailed format of returns which the Banking Regulation Act, the RBI Act, and the Deposit Insurance Corporation Act have prescribed should be scrapped and the Reserve Bank should be given the powers to prescribe the format, except perhaps in regard to banks' balance-sheets and profit and loss accounts.

Did the Reserve Bank care to examine these recommendations of the Banking Commission before deciding that it was necessary to appoint yet another working group?

In this context it is pertinent to point out that despite the "plethora of returns" — the Banking Commission has listed as many as 42 of them — which different Reserve Bank departments obtain from the commercial banks, most of the data thus collected are far outdated by the time they are released to the public. Barring its weekly returns and the data in respect of branch expansion and priority sector advances obtained under the government's direction, there is hardly any worthwhile, analytically useful banking data for the past two or three years available in RBI publications. For instance, size-wise distribution of advances is available only for March 1967. Interest rate-wise distribution of deposits and advances are available upto April 1968. Such useful information as that on the ownership of commercial bank deposits has been so far published only upto March 1968 and that on debits to deposit accounts are as old as 1966. Some of these data are also published in the "Statistical Tables Relating to Banks in India" but this publication comes out with a lag of over three years.

Upto the period ending June 1969 the Reserve Bank used to publish a separate report called "Trend and Progress of Banking in India" which was submitted to the Central government under Section 36 (2) of the Banking Regulation Act, 1949. From the year 1969-70 this report was merged with the Bank's Annual Report prepared under Section 53(2) of the RBI Act, 1934. The two reports should have been kept separate for many reasons. Apart from being covered by separate Acts of Parliament, their purposes were entirely different. In merging the two the many useful items of banking statistics which used to be given in the "Trend and Progress of Banking" have had to be cut out altogether. By merging the two reports, the Reserve Bank has also lost an opportunity of widening the scope of its report on banking, for the Annual Report has to be completed statutorily before the end of August every year. This is, perhaps, the reason why much useful information has to be left out of the combined report. Besides, the report on banking also used to contain all important circulars issued by the Reserve Bank to banks. These are now published in the "Report on Currency and Finance" where they quite obviously have no place. The Reserve Bank should seriously consider reviving the report on "Trend and Progress of Banking in India".

Education

Of Spoils and Bureaucracy

A Correspondent writes:

THE success of the agitation for a separate agricultural university for the Marathwada region of Maharashtra was assured even as it was started. It may be more than a coincidence that S B Chavan, who heads the state agriculture department which oversees agricultural universities in the state, has his political base in the region. Moreover, just three years ago, the state government gave in to a violent agitation in Vidarbha, conceding a separate agricultural university that was to cater to both Vidarbha and Marathwada. The Vidarbha agitation had been sparked off because the location of the first agricultural university at Rahuri in Ahmednagar district was interpreted in Vidarbha as just another instance of the general indifference of the authorites to the needs of Vidarbha itself. Having given in to Vidarbha's regional agitation, it was not easy for the state government to stand firm this time. From all accounts, it did not even try. What is more, Chief Minister Naik has already agreed in principle to locating the fourth agricultural university of the state in Konkan — forestalling an agitation there. Maharashtra will thus have the distinction of being the only state in the country with four agricultural universities: no other state has more than one.

Of course, there is nothing inherently wrong in having four agricultural universities as against one. The basic purpose of an agricultural university is to concentrate on the special agricultural problems of a region, to conduct research on them, and then to help the local farmers by taking the results of the research to them and improving their farming techniques through widespread extension programmes. So, if a state comprises a number of agricultural regions with quite distinct problems, it makes sense to start several such universities to cater to specific regional needs. But it was clear from the outset that neither the agitating students nor the government in Maharashtra were inspired by such calculations.

Even if one makes the unlikely assumption that the state government can provide adequately for each of these four universities (each estimated to need Rs 13 crores for the capital block alone), in the absence of any clear conception of the role the universities must play in finding solutions to the agricultural problems in the state, the new universities will soon be reduced to churning out so many agriculture graduates every year. In fact, after several years of existence the two agricultural universities in the state have done little to attack the most important problem confronting the vast majority of the poor peasantry in the state, *viz*, the problem of dry-land farming.

The irrelevancies in which the issue of agricultural universities has got enmeshed are seen in the fact that one of the immediate reasons for the eruption of the Marathwada students' agitation was the allegedly unfair treatment they received from their Vidarbha colleagues at the annual sports. The other grievance stemmed from the loss of employment opportunities: even peons on the Parbhani (Marathwada) campus are from the Vidarbha region. With a university of their own, such 'injustices' may not occur, but whether there will follow any beneficial impact on agriculture in Marathwada is doubtful.

Universities, generally, seem to be facing trials in Maharashtra of late. In most places, it is the vice-chancellor who is at the centre of the controversy. Even though the past centres of turmoil — Rahuri, Kolhapur and Bombay — have been quiet recently, things have reached such a pitch in Poona that the government, through the chancellor, was obliged to appoint a commission of inquiry into the affairs of the university.

Among other things, there are allegations of gross misuse of power by the vice-chancellor. Some of the vice-chancellor's own colleagues on the executive council have made the accusations. Yet the government has requested the vice-chancellor to continue in the post pending the inquiry — although, according to press reports, he did offer to resign. While the government's concern about not prejudging the issue is admirable, it compares strangely with the treatment it meted out to a former director of education — who was suspended from service for

several years, pending an inquiry into mistakes in a school text-book for which he was only formally responsible. He was exonerated later.

In a flourish of wanting to do something about the deteriorating conditions in the universities in the state, the government has decided to legislate a uniform act for all the universities, and it recently constituted a committee to study and report on its proposed bill.

Quite apart from the fact that a uniform act may not be appropriate to treat the diverse problems of universities in the state — since a university in a city like Bombay would have quite different problems from those of an essentially rural university such as Shivaji at Kolhapur —, the proposed bill makes the thoughtless assumption that the present state of affairs in the universities is the result of organisational weaknesses which could be corrected by having the right bureaucratic structure. The very composition of the committee, six of whose nine members are present or former registrars, underscores this misconception that the problems of higher education are simply problems of administration.

No organisational innovations *per se* can overcome the basic maladies of our universities. The total irrelevance of the various curricula for the needs of the students and of the community, the lack of basic amenities such as classrooms, libraries and laboratories in the colleges, and the tyranny by 'senior' mediocrities, are among the ills that beset our educational institutions. But these are not facts independent of the larger system in which the educational institutions operate. And there is little doubt that a uniform act for the universities will leave their problems untouched.

Money Supply

More on Bank Credit to Government

THE note on money supply last week (pp 819-20) omitted explicit reference to commercial banks' credit to the Central government while discussing net bank credit to the Central government in 1971-72. Reserve Bank data reveal that investment in government securities by all scheduled banks (including scheduled co-operative banks) increased by Rs 294 crores in 1971-72. Similar investment by non-scheduled banks is generally around Rs 10 crores, giving a total of a little over Rs 300 crores. Of these, banks' investment in state government securities may be estimated at around Rs 100 crores (on the basis of the state governments' net borrowing through dated securities during the year). The balance of Rs 200 crores may thus be taken as banks' investment in Central government securities.

On the other hand, the revised estimates for 1971-72 show that the Central government's permanent debt rose by Rs 394 crores during the year. If the commercial banks took up about Rs 200 crores of this, the Reserve Bank could not have absorbed more than a maximum of Rs 200 crores or a little less (except in the most unlikely event of net disinvestment by non-banking institutions such as LIC, the provident funds, etc). By contrast, the Reserve Bank's assets and liabilities data place this figure at Rs 470 crores, or Rs 270 crores higher. How are these Rs 270 crores to be accounted for? This, as was pointed out in our note last week, is a mystery for which the published data provide no explanation.

The likelihood that this inflation in the figure of the increase in Reserve Bank's holdings of Central government securities is the result of some accounting adjustment is suggested by the fact that the non-monetary liabilities of the Reserve Bank increased by the startling figure of Rs 377 crores in 1971-72 (as against Rs 80 crores in 1970-71). Indeed it would seem that actual net bank credit to the government sector in 1971-72 was lower than the figure of Rs 1,185 crores released by the Reserve Bank by even more than Rs 150 crores which was the approximate figure we had mentioned last week.

Sugar

Uncharacteristic Behaviour

SUGAR decontrol was introduced in the midst of the 1970-71 season and was continued for the current season. Industry had managed to push up prices by clever manoeuvres even before the 14-day war in December last. Subsequently, fearing total control, industry voluntarily agreed to partial decontrol which became effective from January. Even though the consumer was assured a handsome quota at Rs 2 per kg, prices shot up and there were protests all round. Predictably, industry blamed the state governments' distribution machinery. What it did not tell the public was that it had refused to deliver sugar at the levy price to the states before January. The situation was somewhat better in Maharashtra because the state government here was able to persuade the co-operative sugar factories to supply sugar.

The situation did ease later, though the improvement was hindered by the raising of the tariff value of sugar in January, February and March. And in March the market was flooded with rumours that the excise duty was likely to be increased from 30 to 40 per cent and that the tariff value was also likely to be raised further. Not surprisingly, sugar prices touched a new high of Rs 3.05 per kg.

The Budget, when it came, left sugar untouched. But the prices continued to rule high till the middle of this month. The government must share the responsibility for this; the monthly quotas have not only been reduced but they are announced much in advance. In the last few days, however, prices have registered a fall of about Rs 25 per bag and are now ruling around Rs 280. Demand for sugar is specially high in April-May because of the summer and the marriage season and every season there is a demand for larger releases by traders. But this time traders have kept mum. The releases for April-May total only 650,000 tonnes compared to 875,000 tonnes released for April-May 1971.

Industry too has behaved uncharacteristically this time. It has reduced ex-mill prices from Rs 300 to Rs 274 — and this in spite of the cut in the sugar ration from 2 kgs to 1 kg per month in the cities and from 1 kg to 500 gms elsewhere. The threat of reintroduction of control and indications that area under sugarcane has gone up so that production of sugar in 1972-73 might well cross 4 million tonnes have evidently acted as a check on industry and trade. Though April is about to end, neither government nor the sugar industry has cared to release statistics of output and stocks for March. Periodic reports appear of closure of mills, but figures of mills working at the end of each month this season and in the previous season are not available.

To keep prices in check, at the end of every month government should acquire the unsold quota at the levy price for distribution. As the gap between the market price and the levy price widens, sugar meant for distribution in rural areas is diverted to the free market. As a minister in the then Mysore government told the state legislative council in 1969, the allotment of sugar for one of the villages in the state had been sold in the black market regularly for six years and a school appropriately called "sugar school" had been set up!

New Frames of Action

Romesh Thapar

THE Establishment — and, these days, the term includes the bulk of the academic world — has been titillating itself over the speech of the Prime Minister to FICCI (Federation of Indian Chambers of Commerce and Industry) which included sentences lifted from an article by the Pakistani economist, Haq, a former adviser to Ayub Khan and now an obedient servant of the World Bank.

The charge of "plagiarisation" had been levelled against the speech-writers, and the speculation began around the possible heads which were likely to fall. This activity is very much a part of the "in-sect" community which rules. No one had bargained for the Prime Minister's public defence of what she herself had done, for we have come to believe that the truth is never uttered at the summit of power.

New Content, Old Frame

And now we are waxing eloquent about the horrendous business of borrowing ideas from Pakistani economists. There is little point in defending the PM. She has the right to pick up ideas from here and there, and nothing is going to change her mind. Had the criticism been more intelligent and focused on the fact that a great deal of work has been done in India on the ideas economist Haq is peddling, then we would have realised that somewhere during the long haul of the five-year plans we forgot the people for whom we were planning.

A mass line, for that is what the PM has been trying to project, has been tackled at various levels in India. The fact that no really tangible blue-print emerges as an answer to the pressing problems of poverty is due largely to the repeated attempts to change the *content* of planning without drastically altering the *frame* of planning. We continue to do this, and get ourselves into more and more knots which we cannot untangle without using a hatchet.

Let me take one example to show what happens when well-intentioned politicians and bureaucrats attempt to make their contribution to the *Gharibi Hatao* campaign.

Mass housing is a major slogan. Repeatedly, from Planning Commission to housing corporations, the attempt is to confront the problem of 550 millions in terms of scarce steel, cement and bricks. The challenge is so enormous that an exercise on housing the masses breaks down even as it is launched.

Clearly, until mud or stabilised earth or some easily available local material is seen as the raw material for housing, there can be no realistic approach to the problem. In other words, the villages and jhuggies of India, interlocked by the migration of rural populations to urban centres, have to be transformed immediately into well-designed, comfortable mud *casbahs* which take care of basic needs, with courtyards and gardens, and with public facilities based on good drainage and an assured water supply.

All this *is* immediately possible, but the rigid politician or bureaucrat finds it difficult to adjust to an approach of this kind. He does not see the extraordinary possibilities of helping our people rise out of their present-day hovels until such time as steel, cement and bricks are adequate to house them more permanently. He must be compelled to see or else even the slogan of *Gharibi Hatao* will not be implementable.

The Same Story

What continues to astonish is the obsession at governmental level with vague, high-sounding phrases taken from all and sundry, Pakistanis, Yankees, deshi bhais, babas and the like. It is time we called a halt to this verbal diarrhoea and got down to some fundamental thinking. We certainly have the funds. After all, we will have the pleasure of spending over Rs 200 crores on imitative scientific and technological research this year, a figure, believe it or not, that is likely to be more than doubled within the next two years. This activity, as we all know, is more in the nature of a crash employment programme for our near useless graduates. But what's the harm in giving the "research" some useful direction. Or are we being naive?

Wherever you turn, it's the same story. The fantastic state of anarchy in Indian Airlines! We talk tough, but toughness alone is not going to solve the problem. There must be a perspective, a new frame of action, for reorganising what does not work. In a vast country like India, why do we cling to the concept of a single airline. Why not several public sector airlines, regionally based but competing along certain key routes, compelled to work efficiently to win bonuses. More planes are needed. So what? It would be cheaper in the long run. And you don't need computers to prove it.

The same goes for the dragooned banks, the forcibly united steel plants, the fertiliser and chemical complexes, the scattered machine tool establishments and what have you. Why should they be mechanically regimented by the moronic men in the ministries? Why can't they exercise independent initiative and enterprise in management and productivity? And why should there not be special and rigorous disciplines for employment in the public sector, considering the many hidden benefits built into the system? These questions had better be answered soon or else the people will see planning policies as a stranglehold — and move to break them.

Yes, we are still waiting for that tryst with destiny — in new frames of action.

April 24

LETTER TO EDITOR

Moonshine on Employment

IT was clearly unwise — though logically consistent — on my part to write on Project Evaluation in my letter commenting on what you now call a minor point arising out of your editorial "Moonshine on Employment". This is perhaps a slight shift in your stand as you originally described the point as 'simple if basic' and in my book basic points are not minor.

Be that as it may, the substantive point should not be lost. Your editorial found that 'jobs' was a less relevant or less meaningful measure of employment potential than 'man-days'. I tried to argue that neither of the two 'measures' are particularly helpful and that the whole issue of employment potential is rather more complex than one would imagine. It is of course simple to say that investment providing one job for six months has more employment potential than that which provides one job for one month; but is the problem equally obvious if the comparison is between one job for six months against five jobs for one month?

Sudhir Mulji

New Delhi

Need We Stand Economic Theory on Its Head?

Phiroze B Medhora

IN his article entitled "Let Us Stand Economic Theory on Its Head" (*Insight*, January 1972), Mahbub ul Haq has called for rethinking on the accepted theory of economic development. According to him, the accepted theory stands for maximising the rate of growth (of income or production) leaving the benefits of growth to percolate through to all classes of the population. Mahbub ul Haq argues that such a system creates its own vested interests which prevent the percolation of the benefits to all classes of the population. He also argues that given the specificity of factors, factors devoted to the production of (or transformed into) high-income consumption goods, cannot be used to produce mass-consumption goods and do not lead to the economic welfare of the poorer classes.

On this hypothesis, Mahbub ul Haq argues for a direct attack on the problem of development. He suggests that if unemployment is the problem, jobs must be created; and since the objective of development is to increase the consumption levels of the poorest classes, then consumption goods needed by these classes must be produced. Thus, not production, but consumption needs form the basis of development plans.

The question arises: is this — either production or consumption — all that there is to the development process? If consumption goods are produced on a mass scale, will it solve the development problem? It is apparent that Mahbub ul Haq has not thought through the problems he tackles or the solutions he offers; and, despite his protestations, he still works within the accepted social and theoretic framework.

It can be argued that it is better to let 100 persons own 1 acre of land each than let 1 person own all 100 acres, even if under the latter ownership structure, 100 acres yield higher production — and even if 99 per cent of the production can be (taxed and) distributed as (wages or) dole equally to the remaining 99 persons. This is on a non-economic (but, therefore, not less valid) hypothesis that wage-labour is less satisfying than self-employment, and certainly that wage-employment and self-employment are better than dole-receiving.

Yet this is only (and even then, not wholly) true of agriculture. In industry, self-employment is possible only to a small extent. Two possibilities, therefore, exist in industry: either the production unit becomes individual (for example, spinning with the *charkha*) when little surplus value, above the basic needs of the producer, is produced, or mass production is resorted to. In the latter case, irrespective of the ownership of means of production, a hierarchical organisation structure has to be built up. The problem of differentiation in reward then has to be dealt with.

If this is the case with agricultural and industrial incomes, it is even more so in the tertiary sector where the scope for earning of unequal — and speculative — income is much larger. It is, therefore, futile to say that a production pattern, based purely on consumption requirements, will necessarily be more egalitarian. Demand for goods is a function not of the production pattern but of income distribution.

Significantly, India offers two examples, one positive and one negative, of this truth. The ban on imports of luxury consumption goods has hardly led to reduced demand for such goods. Such goods have continued to come into the country (an obliging and self-seeking bureaucracy allows golf balls to be brought in, in addition to the exemptions for personal imports of luxury items). Moreover, given the demand pattern set by income distribution and the institutional system, local production of such goods (refrigerators, air-conditioners) has become profitable. It is not specificity of production factors, but the income pattern, which brings about the production of luxury, rather than need-based, goods.

This is also evident from a second phenomenon in India. In an attempt to match production to need-based requirements, the government of India has required that a proportion of textile output should be of standard ('controlled') cloth. Producers have found it more economic to pay the penalty and *not* produce standard cloth, and concentrate their resources on producing non-standard cloth. What is important to note is that the producers have not found enough demand for standard cloth to induce them to meet it by expanding total capacity.

The example of India shows that it is not the production pattern, but the distribution of income, which determines the demand for goods. Given high inequality of incomes, controls on the production pattern fail to limit conspicuous consumption: incomes not spent on imported luxury goods get spent on domestic luxury consumption, and a vast system pandering to such needs — ranging from textile advertisements to home decoration to luxury restaurants — has been built up.

The objective of economic growth is to maximise economic welfare. In an aggregative system, such welfare consists in providing the minimum consumption needs of all the people. This can be done not only by providing a certain level of income to all people but by the State providing for social consumption (education and health facilities, school meals); it is only the latter course which enables the production pattern to be insulated from the income pattern.

The trouble is that most people forget the simple economic truth that one cannot have one's cake and eat it too. When confronted with the dilemma *between maximising income and maximising* employment do not we all try to seek the best of both worlds — and, in the process, achieve neither?

In India we have still not faced up to the dilemma: should we produce jari sarees because they provide employment for handloom weavers or should we stop their production because they cater to the consumption of the very rich? Perhaps, the bureaucrat's conscience feels easier when he allows import of steel for refrigerators and cars than when he allows imports of refrigerators and cars (except as personal baggage). And was it not a Reserve Bank Committee which cited the Government's anti-usury legislation to justify charging high rates of interest to small farmers and other neglected sectors? So also trade union practices are used today by the highly paid to increase income differentials in the society. All these reflect a social ethic which talks in terms of incentives for millionaires and discipline for workers.

Economics has always grown by the heresy of economists, and it is necesary that accepted dogma is always challenged. Mahbub ul Haq has raised important issues, not for economic theorists, but for economic policy-makers. It is not necessary to stand economic theory on its head: it would be sufficient if we stood it on its legs and looked at it straight.

To Accumulate Goodwill

Hansavivek

NATIONAL RAYON CORPORATION increased production of all the main items during 1971. Its sales were also higher — except of textile yarn which were affected towards the year-end owing to the emergency. Total net turnover rose by 6 per cent to Rs 21.84 crores, but gross profit fell by over 15 per cent to Rs 4.83 crores. Contraction of margins is attributed to rise in costs, particularly on account of employees' remuneration and benefits which required as much as Rs 5.18 crores against Rs 3.31 crores in the previous year. Not only were employees paid one month's wages and salaries in commemoration of the silver jubilee, but an additional Rs 1.30 crores were provided for payment in terms of settlement with the labour and staff over the question of their demands dating back to March 1969. A few years ago, there had been serious labour trouble at NRC leading to violence. The new management, which stepped in by making various promises to shareholders, has evidently sought to win over the employees by offering them liberal terms. In spite of reduced earnings, an extra 8 per cent is being paid to the shareholders by way of jubilee bonus, making a total of 40 per cent which is in fact short earned.

Kasturbhai Lalbhai, who had been a director right from the company's inception and chairman for nearly 20 years, resigned from the board; so did Krishnaraj M D Thackersey, who had been a director for about 16 years. Maharawal Jaideepsingh of Baria, who had been elected director at the last annual meeting, resigned in February. Sanat P Mehta, a tax consultant, was co-opted as a director at the instance of the financial institutions. P V Raghavendra Rao, a retired I C S, ex-Defence Secretary of the Government of India, and a nominee of ICICI, was co-opted as a special director. C G Mahant has been taken back as General Manager (Administration) from September 23, 1971. R Rajagopalan, a financial management consultant, who was commissioned to go into the set-up of financial administration, has submitted his report. Kirloskar Consultants has been appointed to go into the question of providing a well-knit organisational set-up for the company with a view to 'facing new challenges and achieving better results'. The selling agency of Chemicals and Machinery for sale of chemicals in the Bombay area was terminated in July 1971. Some shareholders served notice on the company to take steps to recover the amount alleged to have been lost in past years due to the negligence of the persons then in management. The Board has written to the then managing agents, *viz*, Chinai and Company, and is awaiting their comments. Most of the ICICI loans to the company have been guaranteed by Bank of Baroda on the basis of counter-guarantee given by Chinai and Company. After termination of the managing agency from January 1, 1970, Chinai and Company asked to be relieved of this responsibility and until then requested to be paid a commission at one per cent per annum of the loans outstanding. The Board is taking steps to give alternative counter-guarantees to bankers and, in the mean time, has agreed to pay commission from January 1970.

Last year, the company paid over Rs 13 lakhs towards the first instalment of knowhow and other fees to Chemtex Fibers and over Rs one lakh to Chemtex Engineering of India in terms of agreements for collaboration in the nylon yarn project. The application to ICICI for a loan of the foreign exchange needed to import plant and equipment is, however, still being considered. The pulp project, proposed to be set up in Himachal Pradesh, has been abandoned, as it was found that soft wood to be made available in that state permitted only a much smaller capacity of plant which would increase the unit cost of the product. Two other factors influenced the Board's decision, *viz*, that two other pulp-manufacturing plants would soon be in operation in India, and that the company needed its finances for projects already in hand.

CAMPHOR AND ALLIED PRODUCTS expects to complete shortly the terpene chemical project at Bareilly for a majority of the items, on receipt of the imported equipments. Work on collection of data and pilot plant trials on terpene resins and paramenthane hydroperoxide are in progress. The plant should be in operation by the third quarter of next year. The commissioning of the Baroda Research Centre, scheduled for the end of June, is likely to be delayed by three months. During the 11th year to December last, CAP raised production of camphor from 636 to 790 tonnes. Output and sale of new chemicals also increased. Turnover expanded by 17 per cent to Rs 295 lakhs and, in line, gross profit advanced from Rs 68 lakhs to Rs 80 lakhs. With the net profit over 50 per cent better than last year's, cover for the dividend, stepped up 3 points to 15 per cent, increased from 2.85 times to 3.11 times.

AMAR DYE-CHEM experienced a sharp setback during 1971 owing to an "unprecedented crisis in the textile mills and stringent monetary conditions", which forced it to reduce prices of many products. While net sales were 10 per cent down at Rs 7.68 crores, gross profit slumped by 37 per cent to Rs 1.43 crores. Net profit was halved at Rs 42 lakhs, and the dividend reduced by 2 points to 12 per cent was covered less than 1.6 times against over three times last year. The equipment for doubling capacity of the beta naphthol plant to 2,000 tonnes has been installed and the expanded capacity is to operate soon. Pilot plant trials of most of the important items of vat dyes have been completed and those of intermediates would be over by the second half of this year. The building work will start after the monsoon. Government has modified the terms of the technical collaboration for the rubber chemicals project, proposing a "far greater amount of export obligation" than proposed by the company. Further steps would be taken only after the views of the prospective collaborators are known in this matter. Capacity of the plant of the subsidiary, KCA, has been expanded.

GUEST KEEN WILLIAMS' latest results confirm and consolidate the company's 1970 achievement and its recovery from the 1967-68 setback. While the company's working in 1970 was affected by a two-month lock-out at the Andul Road works and by persistent shortages of raw materials and essential stores, improved labour relations and better availability of supplies en-

abled the company to achieve new output records in many of its product lines. Price levels previously secured were generally maintained for the full year and in some cases raised to cover increased costs, particularly of raw materials. These factors combined to give GKW a sales increase of 25 per cent to Rs 53.11 crores, accompanied by a profit increase of near 23 per cent to Rs 10.52 crores. With the tax liability taking away a much bigger chunk, however, the gap at the 'net' level is narrowed. The cover for the dividend, uplifted 4 points to 20 per cent, is still 2.39 times (2.63 times). The directors point out that, although in some product lines there is scope for further volume increase within licensed capacity and available markets, on certain major lines either capacity is now fully utilised or the market shows signs of levelling off. "It is therefore unlikely that the rate of turnover increase of the last two years can be maintained", they add. Exports of GKW's products, at Rs 56 lakhs, fell below the target as well as below the 1970 level of Rs 77 lakhs. The company's application for issue of a free scrip, on a one-for-two basis, is pending with government. Also pending is its application for purchase of 1,77,800 equity shares of Rs 10 each in Sankey Wheels at Rs 6.88 per share from Commonwealth Development Finance Company of the UK.

RATHI ALLOYS AND STEEL has an industrial licence for setting up a plant for manufacture of mild steel, high carbon steel and alloy steel billets with an installed capacity of 40,000 tonnes per annum. Two 10-tonne electric arc furnaces have been commissioned. The company is making a public issue 2.70 lakh equity shares of Rs 10 each, and 10,000 9.5 per cent redeemable cumulative preference shares of Rs 100 each, to raise part of the finance required for the expansion estimated to cost about Rs 1.74 crores. The public issue of Rs 37 lakhs apart, promoters have subscribed Rs 15 lakhs to the share capital. Of the balance requirement of finance, nearly Rs 21 lakhs will be met from internal resources and Rs 101 lakhs by way of loans from IFCI, ICICI and IDBI. The entire public issue is fully underwritten by financial institutions and stock-brokers. The cogging mill has already arrived at site, and import licence for the continuous casting plant to be imported from Switzerland has been cleared. With the installation of this plant, molten steel will be directly transformed into billets, thereby eliminating the intermediate stage of ingot casting and reducing the cost of production. An order for an oxygen plant has been placed with Indian Oxygen who will install and commission the plant by the end of 1972. The first furnace of RAS commenced production in September 1971, and sales upto March amounted to Rs 80 lakhs. The second furnace was commissioned recently. Total sales in the first year of production are expected to be around Rs 150 lakhs. The management expects sales for the year to June 1973 to be in the vicinity of Rs 350 lakhs and to rise gradually to Rs 600 lakhs in 1975-76. Pre-tax profits for these years should go up, from Rs 55 lakhs to Rs 155 lakhs. A maiden dividend of not less than 10 per cent on equity is indicated for 1972-73, and at enhanced rates in the future years. The subscribers to the present issue of capital will participate in the dividend from the first year of their investment.

NEW DELHI

Debt Relief for Public Sector

THE suggestion in the budget for 1972-73 that there will be an improvement in the contribution of public sector enterprises to Plan resources is to a degree fictitious. Much of the improvement is to come about through an accounting trick rather than as a result of any real improvement in the performance or profitability of these enterprises. The device is simply to increase the proportion of these enterprises' equity compared to their borrowings from the government.

The managements of public sector undertakings, specially those making losses, have been complaining for long that they have been saddled with large loans on which they are required to pay interest charges. This was said in particular about expenditure incurred on townships and treated as part of the capital cost of the projects. The proposal put forward was that such expenditure should be treated separately and accounted for as normal revenue expenditure of the government. Even the upkeep of the townships, it was suggested, should be treated in the same manner. Alternatively, the responsibility for upkeep should be shifted to state governments on par with normal municipal maintenance of towns.

The proposal as put forward has not been accepted, but its substance has been conceded. Precious little has been done about the conversion into equity of loans advanced by public financial institutions to private sector companies, despite all the public debate on the subject. But oddly enough the device has been used to deal with the problem posed by the public sector enterprises. It has been decided to finance the township costs of public sector undertaking wholly by way of equity. This has resulted in the conversion into equity of sizeable proportions of loans granted in the past to these undertakings. Since the undertakings in question do not make profits, in effect it means that the loans have been made interest free and to that extent the balance-sheets of these undertakings may be expected to look better than in the past.

The scope of the decision to convert past loans into equity does not appear to be confined to township costs only. It is now suggested that in future equity will play a larger role in the financing of the bigger public sector projects now under construction or those proposed to be taken up. Thus Bokaro Steel's authorised capital has been increased by Rs 100 crores — from Rs 500 crores to Rs 600 crores — and this has been fully subscribed to. This resulted in an increase of Rs 100 crores in the provision for the project in the revised estimates for 1971-72.

In the case of Heavy Engineering Corporation, Ranchi, out of a total of Rs 145.75 crores granted as loan till March 1971, Rs 59 crores have been converted into equity. The whole of the Rs 59 crores does not represent expenditure on township; the major part of it represents regular expenditure on the project proper. Similar accommodation in the form of equity, though on a smaller scale, has been given to Hindustan Steel. The central government's share in the equity capital of Mysore Iron and Steel Works has been increased to 40 per cent, necessitating conversion of Rs 11.23 crores of past loans into equity. The total conversion of loans into equity during the last year adds upto Rs 212 crores. All of this amount certainly does not pertain to township costs. It represents simply a decision to widen the equity base of public sector undertakings.

According to the estimates for 1972-73, the contribution of public enterprises under the central government to Plan resources will be Rs 138 crores as against Rs 70 crores in 1970-71 and Rs 111 crores in 1971-72. In the annual plan for the current year this is attributed to increased production and improved operational efficiency of many of the enterprises. This explanation is clearly misleading since it does not take into account the large scale debt relief granted to these undertakings last year. The loss of interest income to the public exchequer on this account would appear to wipe out most of the increase in the surplus that is expected; indeed the net accretion to Plan resources may eventually turn out to be negative. Even the nominal increase expected in the contribution to Plan resources would appear to be doubtful, considering the actual performance of the larger among the public sector undertakings such as HSL, HEC and FCI. The fact that steel producers — HSL as well as TISCO — have jointly pressed for an increase of as much as Rs 100 per tonne in steel prices to cover rise in costs and the production and cost trends in the case of FCI provide little room for hope that they will yield larger returns in the current year.

The provision for loans and advances to industrial and commercial undertakings in the 1972-73 budget shows an increase of about Rs 83 crores over that in the last budget. The total of Rs 385 crores provided for the purpose includes Rs 325 crores for financing fixed capital and Rs 48 crores for meeting working capital requirements. What is likely is that there might be shortfalls in the utilisation of the provision for fixed capital while working capital requirements are likely to go up. The revised estimates for 1971-72 show that a provision of Rs 40.38 crores in plan expenditure on Bokaro, FCI, ONGC and HMT remained unspent. But the non-plan provision under this head was exceeded by Rs 59 crores to make up for shortfalls in internal resources — that is, to make up for the larger than anticipated current losses of several of the undertakings, among them HSL (which accounted for Rs 17 crores), Neyveli Lignite Corporation (Rs 8.36 crores) and Heavy Electricals (Rs 7.22 crores). The grand total of dividends or profits received by the government from its commercial and industrial undertakings (other than those run departmentally) amounted to Rs 11.76 crores in 1970-71 and is expected to be Rs 14.42 crores in the last year and Rs 16.07 crores in the current year. The cental government's investment in these undertakings, which amounted to Rs 2,253 crores in 1970-71, is estimated to go up to Rs 2,930 crores at the end of the current year.

Pointing to the large shortfall in the contributions from public undertakings assumed for Plan resources, the Mid-Term Appraisal of the Fourth Plan had spoken of the urgent need for taking effective steps to improve operational efficiency and utilisation of capacity. Instead what the government has done is to make accounting concessions which will achieve some window-dressing of the accounts of these companies. This is hardly to prod public sector managements towards greater efficiency, but might actually make for greater complacency.

*

Short-term political considerations continue to weigh heavily on the thinking on economic policy in the govern-

ment. As a result, official pronouncements either take the form of vague generalisations or emphasise wholly desirable long-term objectives while skirting the immediate steps to be taken which would eventually lead to the achievement of these objectives. This approach has for quite some time marked the management of the economy; now it is beginning to manifest itself also in the government's thinking on the country's external economic relations and issues relating to economic aid.

It is very much in this manner that the Planning Commissions's document "Towards an Approach to the Fifth Plan" considers the question of foreign aid and the objective of self-reliance. The objective set in the Fourth Plan which was to reduce, by the end of the Plan, net aid to half the level at the beginning of the Plan. In the present document, after stating the objective, the emphasis shifts to what is termed "international economic policy". It is pointed out that net aid which was Rs 701 crores (Rs 472 crores excluding food aid) in 1965-66 had come down to Rs 328 crores in 1971-72 (Rs 202 crores excluding food aid). This declining trend in net aid appears to be at the basis of the Planning Commission's confidence about being able to do without net aid by the end of the Fifth Plan. All this, it needs to be pointed out, is in marked contrast to the conclusions of the Mid-Term Appraisal of the Fourth Plan which had suggested that the Plan would actually need larger foreign aid than had been postulated at the time of its formulation.

After mentioning the prospect of reducing net aid to zero by the end of the Fifth Plan, the Planning Commission goes on to add that self-reliance should not mean merely reduction in the inflow of foreign aid. Instead, it should mean primarily that the Indian economy's dependence on aid would cease to be such as to make it vulnerable to suspension or reduction of aid flows. Second, the emphasis should be on phasing out aid from countries and institutions whose aid is of the "hard type", either because the financial terms of aid are onerous or because the political framework within which aid is provided is unacceptable . The elimination of net aid can be, therefore, consistent with the elimination of gross aid on a "selective basis" and with "a spectrum of relationships with various types of lenders". Thus, in respect of the international institutions, we may decide, as a matter of policy, to stop borrowing on hard terms from the World Bank and continue to abstain from taking loans from the Asian Development Bank but borrow from IDA on soft terms. As for bilateral aid, it is suggested, we may continue to accept aid from countries such as Canada and the UK; on the other hand, we may adopt a policy of early phasing out of bilateral aid from the US, even though the financial terms of US aid are soft. We may also phase out bilateral aid from such countries as Italy, France and Japan and even some East European countries because their financial terms are relatively hard.

The *Planning Commission*, however, admits that while the balance of payments projections need to take into account only the net inflow of resources by way of aid, in actual practice it is gross aid which is negotiated or given up. For, lenders are not obliged to provide gross aid equal to repayments due. In fact, in certain cases where net aid is at present negative, the Planning Commission's approach will even imply our seeking larger gross aid. However, to the extent debt rescheduling is available, the requirements of gross aid can be reduced. It is therefore suggested that we should emphasise debt relief more and more as the preferred form of aid.

ENVIRONMENTAL PLANNING

What a Committee Can't Do

ON April 12, the Prime Minister inaugurated the first meeting of the newly formed National Committee on Environmental Planning. The Committee consists of 14 experts from various fields — science, technology, economics, and management. Of the 14 experts, nine are government officials who head various Central government departments. The composition of the Committee might, therefore, prove a major drawback in the formulation of policies, since the officers may be inclined — being already committed to their own departments — to guard their departmental interests to the full and thwart any incursions on their premises'.

But that is not all. The terms of reference of the Committee are wide-ranging even as the Committee's role is advisory. These include: identifying and investigating the problems of preserving or improving the human environment in the context of population growth and its distribution and economic development; reviewing policies and programmes which have a significant bearing on the quality of the environment and advising government, public authorities and industry on the environmental repercussions of their acts; reviewing existing legislation, regulation, and administrative machinery for environmental management; proposing cost-effective solutions for environmental problems; ensuring that environmental policies and measures are coordinated with economic policies and measures and the results of environmental investigations and research are fully utilised in the wider framework of planning for economic and social development; promoting research in environmental problems and establishing facilities for such research wherever necessary; promoting and strengthening environmental education at various levels in the educational system; promoting and enlarging public awareness of environmental problems through conferences, seminars, symposia or any other means; and co-operating with UN and other international agencies in environmental programmes of global concern, etc. These are enormous responsibilities — far beyond the possible capability of any high-powered committee.

For, a major portion of the environmental problems in India today — whether urban or rural — are such as emanate from the fundamental problem of poverty, not from lack of 'environmental' planning. In the rural areas these comprise lack of drinking water, non-optimal utilisation of arable land and non-conservation of natural resources. In the urban areas they comprise grossly inadequate sewage disposal and sanitation, inadequate water supply and water treatment, urban crowding and 'bustees'. Where will the Committee start, and how will it define its priorities? To be effective in an impoverished environment of such dimensions, it will have to be define its goals and tasks in more limited ways. Its prospects will depend on how, in the existing circumstances, it sets its priorities and scope of action: does it plan to formulate a strategy for reorganising services such as water supply, water treatment, sewage disposal, sanitation, etc, or does it spend large resources on managing industrial and radioactive wastes, planning rapid urban transportation and superfine highways, as do similar bodies in the affluent world? The Committee will be judged by its performance and its ability to deliver specific, though limited, goods — than by its capability to produce voluminous professional reports.

Untoppled Statues

THE DMK's penchant for statues has by now become a well-worn joke. But that has not caused any change in the party's governing style. Statues have a permanent visual impact. In a more immediate sense, they also provide occasion, at unveiling ceremonies, for a reiteration of the ruling party's commitment to Tamil culture, often against heavy odds.

Take, for instance, the case of the statue of Rajaraja Chola. The Tamil Nadu government wanted it located inside the temple built by the emperor in Tanjore. The Centre, under whose archaeological supervision the temple falls, refused to allow this on aesthetic grounds. The state government, with complete faith in its own cinematic standard of taste, protested — but in vain. Finally, the statue was installed outside the gateway of the temple area, and was duly unveiled by the Chief Minister on the Tamil New Year's Day. Speeches on the occasion were of course marked by indignation at the failure of the Centre to appreciate local sentiments. Karunanidhi himself did not dwell on this theme; but to even out honours, he announced that a statue of the Pandya king who had inspired the Madurai Meenakshi temple was scheduled for installation — inside that temple. For this is a case in which the Centre has no say. The Madurai temple being centuries younger than the Tanjore one, seemingly requires no protection from Delhi.

Part of a Wider Programme

Karunanidhi also used the Chola platform to digress on the fascinating subject of statues. He denied the allegation that setting up statues constituted the sole preoccupation of his government — it was only a part of a wider programme. For did not he and his ministers declare open other things — hospitals, schools and the like? And was the record of previous governments entirely statue-free? To drive this point home, the Chief Minister actually came out with a census of statues in Madras city. Only 12 of these statues, he reported, owed their existence to his government, while the balance of 33 were installed during earlier regimes. What he failed to note was that 12 out of 45 makes an excellent score, particularly since it has been achieved in the short span of five years. More than half the non-DMK statues in Madras date back to the British days, starting from the governorship of Sir Thomas Munro. The truer anti-climax, however, came just two days after the Tanjore event, when Karunanidhi unveiled yet another statue — this time of Anna at Madurai.

Despite such diversions, an air of listlessness hangs over Tamil Nadu — an outcome of the onset of boiling summer and the various non-developments that have quite taken the fizzle out of political speculation. Not so many weeks ago, the mood was different. Rumours were thick that a rapprochement between Kamaraj and Indira was all but accomplished. And then, of course, 'toppling' would naturally have to follow. It was only a question of choosing the precise manner and time. The singular majority of the ruling party in the legislature and its structural strength were ignored in a simple, personalised analysis: certainly, 'she' was not going to allow this government to go on for long, and had 'she' not found 'her' Achilles' heel? So strongly did this mood take hold that in some of his more routine public appearances in Madras, Karunanidhi was met, not with the sort of ovation that an idol of the masses would expect, but with greetings of a distinctly valedictory flavour.

Such a state of affairs could naturally not be allowed to continue. Then followed some special 'functions', arranged to shower felicitations and praise on the Chief Minister for his many achievements, including his no longer new doctorate. These have not been entirely without interest. A certain well known non-political figure, reportedly aspiring for a high academic post, was prominent at many of these gatherings. And, on one occasion, he literally sang the praises of the Chief Minister — in chaste Tamil verse.

All the same, Karunanidhi's position is by no means overly comfortable. Rumours of his exit could never have reached the proportions they did without help from inside his party, where more than one dissenting element is reportedly gaining strength. The autonomy issue is the only means immediately available to Karunanidhi to ward off threats to his leadership from inside. But if it is overplayed, there is the danger of threats from outside. Just how real these external threats are is difficult to gauge on account of the Prime Minister's cool and continued silence about developments in Tamil Nadu. But it is a safe bet that she will not stand too much autonomy talk.

Own Form of Brinkmanship

So Karunanidhi has perforce to devise his own form of brinkmanship, launching an autonomy crusade to sustain the loyalty of his colleagues, without allowing it to assume the complexion of sedition in the eyes of the Prime Minister. This is not going to be easy. Already, the Chief Minister seems to have been disturbed by the Bangladesh analogy and the martial metaphors employed by the more fiery orators in the eloquent DMK ranks. His reaction was simple: an outright denial that such things were at all said! In his own statements, he is always careful to work in the wider theme of Indian unity in some manner, however indirect. For instance, unveiling the Chola statue at Tanjore, he likened the 'sanctity' of the occasion to that of the Independence and Republic Days. His references to 'autonomy' are invariably ambiguous. His press, while mounting a tirade against C Subramaniam and Mohan Kumaramangalam, is always respectful, even deferential, in its references to 'Indira Amayar'.

But how long can such a stance be maintained? Not a very relevant question, since in politics the 'long run' has no place. Karunanidhi can safeguard his immediate future only through this ambivalent advocacy of patriotic autonomy. It suits Indira Gandhi to allow him to play at this game. For in this way she can be sure that she has the Tamil Nadu situation in check — again, for the immediate future.

WEST BENGAL

New Crusades

WHILE the mopping up operations in the crusade against the Left in West Bengal are going full steam ahead, nemesis is slowly but steadily overtaking the crusaders. Before the first month of the new Congress Ministry was out, internecine clashes among Congress youth brigades in the district town of Krishnagar had developed into a large-scale bloodbath, necessitating the clamping down of an 18-hour curfew on the town.

Even a considerably toned down report in a pro-Congress newspaper throws a flood of light on the tensions and tussles within the rejuvenated Congress, which had led to the outburst of violence. Wrote *Hindustan Standard*:

"An 18-hour curfew ending at 6 A M on Tuesday [April 18] was clamped down on Krishnagar on Monday noon as violence continued to rock the town.

"On Monday, two young men — Gouri Dutta and Dipak Mazumdar — stated to be members of the 'disbanded' Yuba Congress were stabbed. This was said to be a sequel to the Sunday's incident in which Mantu Das was killed and six others received gun-shot wounds. The seven reportedly belonged to a rival group of the Congress.

"The Food Minister, Mr Kashi Kanta Moitra, and the Minister of State for Relief, Mr Anand Mohan Biswas, both local MLAs, have rushed to the spot to help bring the situation under control.

"Reports received at the State Government headquarters indicated that the two warring groups were supporters of the two Ministers."

Congress Power Struggle

As the newspaper report indicates, the tragic incidents were a sequel to the power struggle between two rival factions of the local Youth Congress, owing allegiance to two ministers of the Ray cabinet hailing from the district. One of the factions, enjoying the patronage of the state leadership of the organisation, had the existing district unit dominated by its rivals dissolved. This led to the eruption of violence in the next round.

Krishnagar is not an isolated case of group rivalry in the Youth wing of the Congress. Leaderships of a number of Youth Congress and Chhatra Parishad units, including units in Calcutta, have been either totally dissolved or partly reconstituted. A spokesman of the Youth Congress State leadership justified these organisational measures on the ground that "some leaders of the parent Congress body had been successful in 'breeding factionalism' in the youth wing of the party" and that sections of the present youth Congress leaderships "were meddling in the affairs of the parent [Congress] body in the districts". In other words, group rivalries in the youth wings have become fused with and are being utilised for power struggles in the state Congress.

The central fact of intense intra-party manoeuvrings for control over the state Congress and the Ministry has become so transparent that a friendly journalist on a Calcutta newspaper has been constrained to remark:

> "Too many people are talking at cross-purposes and creating an impression that the party lacks a central direction, that there is no command on the state level acceptable to all. A party whose constituents are pulling in contrary directions cannot expect to act firm and public avowal of such differences helps its opponents only. Such controversies are bound to impair the administration in the long run and prove once again that stability alone cannot make for purposeful governance."

Qualified Amnesty?

Against this background of rising factional tensions within the ruling party, the presence of armed squads and the danger of their deployment in internal power struggles have been causing grave concern to the party and government leaders. Press briefings, often contradictory, by different spokesmen not only reveal the conflicting pulls within the party but also shed interesting light on the Congress's trek back to power in this state. For instance, while the General Secretary of the State Youth Congress has publicly assured that his organisation "would see to it that persons who would surrender arms, except for those wanted by the police, were not harassed by the Government", a top leader of the Chhatra Parishad who also happens to be a minister in the Home Department has repudiated the suggestion of a qualified amnesty. He has stated that as these possessors of illegal arms could not be regarded as freedom fighters there should be no question of *surrender* of arms by them; arms had to be *retrieved* from them. Both the Youth Congress and Chhatra Parishad leaders have, however, confirmed that "the police hesitated to take action against them as they took part in different types of agitation as members of the Congress, carrying flags of the party". Indeed, the Home Minister said that the police had supplied him with a list of 400 such undesirable persons in the city of Calcutta alone, most of them with criminal charges against them, operating from within the ruling party. He said that he had passed instructions for their expulsion from the organisation and arrest by the police. Some Congress factions believe that these measures are directed against them.

Besides the strictly internal problems of the Congress arising from the presence of hostile armed elements within its organisational periphery, the high-handed and violent actions of the youth wings affecting the wider public have antagonised segments of society which are either indifferent to or appreciative of the Congress party's Left-baiting activities. Actions like the continuous gheraos in the Calcutta University, beating of the Chief Medical Officer and attendants of a suburban hospital, forcible occupation of Sealdah Railway station's traffic control cabin to hold up the movement of trains, etc, etc, have drawn guarded criticisms from the establishment newspapers which have maintained a studied silence about the year-long violence against CPI(M).

Even the Congress's partner in the ruling alliance, CPI, is getting somewhat uneasy. It is reported that there were expressions of alarm voiced by a section of the party's trade union cadres, recently assembled in a conclave, over the growingly aggressive attitude of their Congress allies in the trade union field.

DACCA

The Greed of the Few and the Misery of the Many

WHEN the Sheikh first returned to Dacca, there was clearly a power vacuum. The thin crust of Calcutta-returned Awami Leaguers depended, in the first instance, upon the Indian military administraion for whatever civil effectiveness it might have. The old administrative machine was either in ruins or so hopelessly identified with the *ancien regime* as to be useless.

However, in a brief four months, all that has changed. Whole ranks of new men are emerging, by merit, vehemence or sheer force. Some have moved in to take over businesses and property abandoned by West Pakistani owners, either directly or as administrators of nationalised enterprises. Others have absorbed land or shops belonging to luckless refugees or to anyone who can be accused of being a 'Bihari'. Yet others, higher up the new social order, have become army officers, admirals, ambassadors. One thing the regime is not short on are epaulettes. And then there are all the leading positions in the civil service, the police, the State corporations, the post office, and so on. In no time at all, the ingenious Awami League had managed to run up a passable ruling class, a bit frayed at the edges perhaps but set fair to being as credible as most.

Yet a pork barrel is a tricky way to create ruling classes. It makes for great jealousies and rivalries among the favoured few, something the very leading figures of the regime might not dislike. But also it emphasises the gap between those who get the rewards and those who do not. In Bangladesh there has been precious little with which to reward a whole mass of young people who did actually do some fighting and have relinquished neither their arms nor their unreasonable idealism.

For Mujibur Rahman, tolerating a certain measure of corruption (with occasional well publicised purges) is perhaps the only means available of keeping some friends in most unpromising circumstances. But keeping a few friends again only spotlights those who are not friends. For the non-friends he needs some Leftishness, rhetorical, flamboyant and—in his own inimitable style—redolent with warmth and generosity. And for those tempted not to be friends, the stick.

He promises workers' participation (that hoary stand-by of politicians in a fix). And tries to suggest banning strikes and gheraos, proposes a wage freeze and curbs to fringe benefits. He proclaims his passionate commitment to democracy, and tries to enforce a rule in his tame Constituent Assembly that no Awami Leaguer may advance publicly a proposal unless sanctioned beforehand by the secret party meeting; and if a member criticises the party in the Assembly, he is liable to expulsion from the party; if expelled, he should automatically lose his Assembly seat.

Mujib wants his party dogs tame. Yet despite the cosseting with rewards, th dogs still snap and snarl most churlishly. It is rumoured that Mujib has already had to threaten to dissolve the Assembly — a rather Samson-like gesture—as a curb on the impatience of his followers.

Treading on Thin Ice

Yet Mujib also must tread with great care. The ice is thin. The irritability of his followers is not unrelated to the enormous expectations at large, the hunger and unemployment spead through the country. Things *are* looking better—factories are operating at 50-60 per cent of capacity, the spring crop may not be reduced as much as feared, Indian grants and commodity supplies are beginning to ease bottlenecks. But still much of the distribution network remains in ruins, and much of the factory output merely piles up in the warehouses for want of transport and market. The smuggling of grain out of the country and hoarding exacerbate matters, and have helped to produce a very rapid rise in the price of essential commodities.

Strikes and demonstrations around the country show where the scarcities are biting. They also show that people are no longer willing to accept warm promises in lieu of bread. One result of the events of the past year has been a much heightened political awareness. Nobody could accuse the Bengali middle class of docility even before, but now their willingness to react is much increased, and connects directly with the activism of other classes. More to the point, some of the most active, energetic and idealistic of the young people retain their guns.

Fragmented Opposition

Mujib flounders between the greed of some of his followers and the misery of much of his people. He has no alternative base of power at the moment. His armed forces are too subverted by the ideals of the liberation struggle to turn their guns on a popular opposition. His police are too few. Perhaps the Sheikh waits anxiously for the return of those Bengalis who worked in West Pakistan for the military. They could provide a reliable and orthodox 'steel frame' for the new order.

In the meantime, there has to be a show of willingness to accede to popular demands. The ceiling on land holdings perhaps comes in this category. No family may own more than 100 bighas of land, the same limit, incidentally, that was included in the Muslim League Abolition of Zamindari Act of 1950. But the Sheikh said nothing on the most notorious abuse, share cropping. Indeed, some people argue that the measure will have no effect whatsoever on many areas. The landlords of the Awami League may rejoice to know that Allah has not deserted them in their hour of need.

One important factor on the side of the Sheikh is the confusion and fragmentation of the opposition. Mujib may be a Kerensky for some, but fortunately for him, there are no Bolsheviks waiting in the wings. The Left has learnt only a few lessons in the past year, and some have learnt nothing. Most of the revolutionary Left remains nailed to the cross of rural guerilla warfare, the other side of which is orthodox Parliamentary politics. Few are trying with any urgency to organise the angry workers of the cities. Yet in a year's time, Mujib's regime could be much stronger, much more firmly founded in the districts, no longer a teetering Weimar Republic.

The stronger the Sheikh becomes, the more likely it will be that—as one Dacca newspaper alleges—he will use the section of the Mujib Bahini he has retained in arms to liquidate the Left. No doubt, at the same time, he will nationalise something or other, recognise North Korea, denounce the Vietnam war, and ask the pro-Moscow Communists to join his Cabinet. The recipe—the lathi and Left wing gestures—has cooked a good few geese in Ceylon, West Pakistan and India; so it might still be serviceable in Bangladesh.

Musings before Murree

(Contributed)

THERE has been a great deal of euphoric writing both in the Indian press and, more understandably, in the foreign press about the need for India to open a meaningful dialogue with Bhutto on the ground, among other things, that Bhutto represents the best bet towards stability in Pakistan and that stability in Pakistan means stability in Indo-Pakistan relations and, therefore, stability in the subcontinent. Even granted that Bhutto, unlike the leopard, has changed his spots and that India is no longer his thousand-year *bete noire* and that Bhutto, for his own reasons, wishes to change course from a policy of confrontation to a policy of negotiated peace, how valid are the assumptions that such a negotiated peace will make for stability in Pakistan or, even more, that stability in Pakistan is necessarily good for India?

Will a negotiated peace make for Bhutto's continuance in power? The pressure on Bhutto to seek a settlement with India, we know, comes from his imperative need to work out some arrangement whereby the prisoners of war are repatriated to Pakistan — there presumably to be regrouped into the four divisions that they represented before the surrender in Dacca last December. Clearly, the repatriation of the POWs cannot be a unilateral act despite

Bhutto's appeal to Indian generosity. It has to be part of a wider package settlement including items like Pakistan's acceptance of Bangladesh, the possible conversion of the Kashmir cease-fire line into an international frontier (with suitable adjustments) and a concrete indication of Pakistan's desire to live in peace with us. The past record of dealing with Pakistan is not encouraging. Our post-Tashkent experience is not happy. Then too, as now, Pakistan had an *idee fixé, viz,* vacation by Indian troops of the areas they occupied in Pakistan and once that was achieved, Pakistan went back on virtually every single aspect of the Tashkent accord. And the chief wrecker of Tashkent is today's President of Pakistan. Bhutto cannot expect us to be the victims of a second confidence trick.

Bhutto's behaviour indeed reflects his schizophrenia. He needs a settlement with India to get his prisoners back and stay in power. He also is a prisoner of his own past and cannot accept an overall settlement with India without appearing to sell out to India. Hence his contrary postures of seeking co-operation with India on the one hand and offering to build the Pakistan army into the "finest fighting machine in Asia" on the other. To fight whom else but India?

This offer to the army and the overhauling of the entire military top brass is part of the tenuous relationship between Bhutto and the armed forces. Each depends on the other for its rehabilitation and support.

Alternatives to Bhutto

What indeed are the alternatives to Bhutto? The military? Why should we imagine that the people of Pakistan who have been so thoroughly disillusioned by the performance of their erstwhile army rulers would welcome a change, back from Bhutto to military rule if he were to fail to deliver the goods — in this case the prisoners? Even assuming the army did sweep back into power in Pakistan through *force majeure,* would the army be able to have any credibility with the people unlike the previous occasions when the army was either replacing a civilian government known to be corrupt or appeared as a saviour following widespread political and economic discontent? And this time the army would be seen as killing the renewed experiment of civilian rule.

Let us ponder and see what would happen if Bhutto were, in fact, to be toppled by the army. For some time, to be sure, the army would rule with an iron hand but would be sowing the seeds of further dissension within what is left of Pakistan. What of the other political parties? Bhutto's party is clearly in a majority but this is, it must be remembered, a localised majority. Even as his party has the overwhelming support of Punjab and Sind, it is weak in the Frontier and Baluchistan and the NAP-JUI stand in the same relationship to the PPP as the PPP did to the Awami League in the December 1970 elections. If Bhutto worked in the spring of 1971 to exercise a veto over any constitutional settlement with Mujib on the ground of being the spokesman for West Pakistan, so too could Wali Khan claim the veto in relation to Bhutto's party, especially as his party is not a mere opposition party but a regional majority party. The only guarantee for stability in Pakistan is thus a democracy federal set-up wherein not merely are the people free to decide their future and the pattern of their governance but equally the constituent units of the country feel they have a stake in that future. Even as in the former Pakistan the people of the erstwhile East Pakistan felt themselves to be second-class citizens and resented deeply the hegemony of the West Pakistanis, so too in the rump that is Pakistan the people of the Frontier and Baluchistan would not like being treated as second-class citizens and, with a tradition of rebellion and a trigger-happiness which the East Bengalis did not have, the point of conflagration would come much sooner. Let us remember that the Pakhtoonistan movement has a much longer history than that of an independent Bangladesh and Afghanistan has long felt a deep sympathy towards the aspirations of the Pathans and the Baluchis. If Pakistan chooses not to be a federal democratic republic but a unitary authoritarian state, the warning is clear. The continuance of Bhutto with army support as now or army rule, in turn, may have the facade of stability but would be the surest recipe for mounting instability.

Of Advantage to India

Another way of looking at this problem for an Indian is why we should imagine that an unstable Pakistan is necessarily to the detriment of India? An unstable Pakistan, constantly at odds with itself, might have enough on its own hands not to seek external adventure. One can perceive that this argument can be controverted on the ground that precisely because of such domestic discord an external enemy might be a unifying bond. This failed to be the case last December and is unlikely to be so again, especially as the Pathans and the Baluchis, unlike the Punjabis, do not have, either for Afghanistan or for India, any deep resentment. Memories are proverbially short but it would do us well to remember that the Frontier Province and Baluchistan and, to some extent, Sind were, by and large, part of the larger nationalist movement in pre-independence India. The Frontier, in particular, was an old Congress stronghold which has its corollary in India even today of a sentiment of friendship not unmixed with a feeling of guilt (at letting them down in 1947) towards the Frontier. Badshah Khan is still a revered name in this country and the tradition, at least in the Frontier, is not anti-Indian. The responsible manner in which Wali Khan has spoken of what he regards should be Pakistan's relations with India bespeaks the absence of a pathological hatred of this country so typical of Bhutto and his supporters in the Punjab.

Again, why should we consider that a united Pakistan is necessarily good for India? What would be the consequence of, say, the rise of a separatist movement in the Pakhtoon areas? While it might suit the American and Chinese book and, to some extent, Kiplingesque Britain, to get alarmed at the prospect of an autonomous or independent Pakhtoonistan falling within the Russian sphere of influence and even providing perhaps warm water facilities to the Soviet Union (shades of Czarist ambitions of the nineteenth century!), is there any reason why an India, bound by a Treaty of Friendship with the Soviet Union and whose interests in this region happen to converge with those of the Soviets, should be so alarmed? The fear of Russian expansionism in this region sometimes voiced in the drawing rooms of Bombay and the corridors of New Delhi is a conditioned reflex dating to our earlier British past. It is certainly not what a realistic geo-political appraisal of India's own self-interest demands. A more cynical view may well be that while a united Pakistan would be a stooge of Sino-US global interests, a Pakistan split into separate states would at least allow the Soviet Union some foothold in this area which would not be detrimental to Indian interests.

The argument up to this point is that stability in the subcontinent, while certainly being a worthwhile objective, is not conditional on the preservation of either Bhutto's position or even the preservation of the unity of what is left of

Pakistan. In fact, a break-up of that unity might serve India's interests better for then it will have to reckon with a few small states to its west now that its eastern flank has been secured by the emergence of an independent and friendly Bangladesh. The spectacle of an independent Sind or Pakhtoonistan need not worry us unduly. They may well be more friendly towards India. Sentiment apart, they, along with a still hostile Punjab, will be no more than peripheral states in terms of power equations in the subcontinent.

India a Sea Power

Nor, indeed, as earlier mentioned, should the possibility of some of those states being friendly to the Soviet Union worry us. The Indian Ocean area, despite our protestations that it should be a zone for peace, whatever that may mean, is not going to be left alone by the big powers. We have hitherto adopted a passive approach with regard to Indian Ocean security problems. There is no state, amongst the littoral states around the Indian Ocean, to whom the freedom of the waterways in that ocean and its availability for mercantile and naval navigation is more important than the country after which the ocean itself is named. We are truly dependent on the Indian Ocean in a sense in which no other country is and this calls for a more active and meaningful policy towards our own role in the ocean and proper measures to play our proper part. India has tended, thanks again to the British who used India as a base for their imperialist activity in Asia and as a reservoir for a land army, to think in continental terms and consider herself a land power. Sea power has never really entered our calculations despite the warning uttered by such students of geopolitics as Pannikar. The British could afford to develop India as a land power because the Royal Navy protected their maritime interests. We have inherited — regrettably — the British emphasis on looking at India as a land power ignoring that our land frontiers are not much longer than our sea shores, that we are a peninsular power, that a threat to our security can come as much from across the water as from across the mountains.

We have come to think this way, as India's history is replete with land invasions from the north-west and even independent India's wars have been land wars — in the north-west in 1947 and 1965, i e, Kashmir, the Punjab plains and the Sind deserts and in the north-east in 1962. Naturally enough we have tended to lay emphasis on the role of the army and in our defence forces the army is preponderant in its importance. With the events of December 1971 behind us, how relevant or valid is our assumption that our security problems are tied to our defences on land? How secure are our defences on the sea? The spectacular success which our navy has registered last December should not be allowed to be a flash in the pan. It shows the potential of naval power and calls for a build-up of our naval strength if we are indeed to play the role expected of us in the Indian Ocean and protect our vital sea lanes. It calls, indeed, for a rethinking on our defence strategy and placing much greater emphasis on sea power. In fact, one can only regret that the navy has remained silent too long in pleading its case.

The development of sea power not so much at the expense of our land forces but to supplement them alongside a strengthening of our air defences cannot be delayed much further. India has a positive role to play both on the basis of geography and history in this region. The problem of its relations with Pakistan and other neighbours cannot indeed be divorced from the problem of its near-great power status and the end of an era where, as the sick man of Asia, it was being pushed around by the super powers. Economic self-reliance against the background of a continental economy is a step towards India's natural assumption of this role. Our population is large enough to warrant our being given importance in world affairs. The events of last year should have put paid to the arrant, if not arrogant, nonsense of the US policy-makers to 'equate' (whatever that may mean) an India of 550 million with a Pakistan (as it then was) of 120 million. Whether the US likes it or not, whether the Chinese like it or not, we are a threshold power in the super power league, even without exercising a positive nuclear option. It is up to us to act our size if we are to fulfil our natural destiny.

SAIGON

Putting Paid to Vietnamisation

Harish Chandola

AFTER gaining control of the northernmost part of South Vietnam to a depth of ten miles from the Demilitarised Zone (DMZ), when the Viet Cong or the People's Liberation Armed Forces (PLAF) halted their offensive, Saigon thought they had bitten more than they could chew. But Saigon was proved wrong because on April 23 the PLAF resumed their offensive with 20 tanks on Saigon Government positions around Dong Ha, and they are still fighting to gain further ground. When this renewed offensive came, the Saigon forces were making no attempts to recover their lost positions. With the help of reinforcements from Saigon reserves, they were merely trying to hold on to the positions to which they had been pushed southwards.

While the front in the north is again coming alive, Saigon itself is being threatened by PLAF units advancing towards it from north and northwest, supported by artillery and tank units. In this area the PLAF units are only 40 to 50 miles away from Saigon. Two giant military bases, the US-controlled base of Long Binh and the air and army base of Bien Hoa, lie between this advancing force and the capital of South Vietnam. In spite of the presence of these two massive bases, Saigon feels seriously threatened. Thousands of paratroopers from Central Highlands and Rangers from near the DMZ are being withdrawn and brought back to Saigon to reinforce its defences. But if the war comes to the bases at Long Binh and Bien Hoa, which are almost on the outskirts of Saigon, one can say that it has come to Saigon itself, because then it is most likely that the Viet Cong guerilla units already inside this city will start attacking military positions within the capital itself.

Serious Threat

There is another serious threat building up in the Central Highlands, in Kontum province, just next to the area where the borders of South Vietnam, Laos and Cambodia meet. To prevent the PLAF from marching from this point eastwards to the central coast of South Vietnam, through the provinces of Kontum and Binh Dinh, thus cutting South Vietnam into two, the Saigon Government had last month set up eight

artillery fire-bases on a dominating ridge near the tri-junction. Three of these fire bases have fallen to PLAF assaults (two fell on April 22), exposing two big Saigon army base camps at Tan Canh and Dak To to shelling and attacks. On the central coast itself, the PLAF had captured Hoai An, a district headquarters, on April 19.

Before one proceeds further with the actual military situation, one would like to discuss the change in the balance of forces in South Vietnam which has become evident in this month of April as a result of the large-scale offensive of the PLAF. The Saigon Government had, with US help, raised a large army, one of the largest in the world, with 1.2 million regular soldiers, and nearly a million of provincial and village defence forces. This was in accordance with the "Vietnamisation of the war" policy of President Nixon, which aimed at making the Saigon Government militarily well-equipped and strong enough to defend itself.

In the northern part of South Vietnam, just below the DMZ, the US had built for the Saigon troops heavily fortified strongholds on high peaks and along the communication lines. There were many artillery sites, storage complexes and supply bases and airfields. It was believed that those blockhouses, underground bunkers and strongholds, with maximum US air cover would be invincible and that in them the Saigon army would be able to hold out against any PLAF attacks. It was indeed true that no guerilla force could ever overcome those well dug-in military fortifications and complexes. Only large units of the PLAF equipped with large artillery pieces could destroy those fortifications by shelling them. Tanks were necessary to make an assault on those positions.

Big Punches

In the past, the largest attack that the PLAF could mount at a time was in battalion strength. A battalion-strength attack on such complexes was of no avail. There was therefore much discussion within the South Vietnam Liberation Front in the past few years on building larger PLAF units, capable of assaulting those positions. The Liberation Front had said that in an armed fight the strength of the regular forces was the most concentrated and highest expression of the military strength of each belligerent party. Only with "big punches" of the regular forces could a party launch major annihilating battles and bring about a clear change in the balance of forces on the battlefield. The PLAF therefore started building big military units.

The big unit operations and large-scale co-ordinated actions between various arms and services of the PLAF began with the assault on the Saigon Government strongholds south and north of Highway 9 (leading into Loas from South Vietnam) and along Highway 1 (running along the entire coast of Vietnam) in Quang Tri and Thua Thien provinces on March 30. The attacks began with artillery barrages. In the fighting from March 30 to April 3, the PLAF wiped out or captured 6,500 Saigon troops, wrecked 13 positions, shot down or destroyed 45 aircraft and captured or destroyed 100 tanks and armoured cars. The Saigon troops in this region had consisted of its 3rd Infantry Division, two Marine Brigades, 147th and 258th, and 11th and 20th Armoured Columns, with a number of artillery pieces of 105mm to 175mm calibres. There were also 70 "civil guard" companies. This entire force was decimated. Commenting on the results of the battles waged by the PLAF big units, the South Vietnam Liberation Front said: "The backbone of the 'Vietnamisation of the war' has been broken in its important vertebrae. The Saigon army is unable to stand on its own."

Earlier, it has been mentioned that the Saigon Government had raised an enormous army. In 1970 and even in 1971, while the US troops fought the PLAF inside South Vietnam, this large Saigon force was used for offensives into Cambodia and Loas against the popular forces there. But in 1971 there was the large-scale withdrawal of US forces from Vietnam. As the US soldiers left, the Saigon force had to take over the fight against the PLAF inside South Vietnam itself, and its offensive role was curtailed greatly. For the last six months this large Saigon force got so bogged down in fighting against the PLAF that it was utterly unable to undertake any offensive operation. It is at this juncture that the present large-scale offensive of the PLAF has come. The Saigon force is now on the defensive and the PLAF is on the offensive. This demonstrates the change in the balance of military power inside South Vietnam. This change takes place at a time when the protective umbrella of the US troops is no longer available to the Saigon force.

What are the aims of the PLAF offensive? An indication of them was given recently, at the highest political forum in Vietnam, at the 20th plenum of the Central Committee of the Vietnam Workers' Party. At the plenum it was said: "The urgent task of the Vietnamese party, army and people at the present stage is to persevere in and step up the war of resistance to US aggression *till complete victory*, to mobilise all forces and march forward, to unite and co-ordinate closely with the brotherly Lao and Khmer armies and peoples to fight the 'Vietnamisation of the war' policy and the 'Nixon doctrine' in Indo-China." It was said at that plenum, held at a secret place, that while the US was forced to continue withdrawing its troops, the Saigon force continued to take losses. The Phnom Penh troops were in a disastrous situation and the mercenary army of Laos had taken deadly blows. Neither the increase of strength of these armies nor the intensive air support could help the US to level off the balance of forces in Indo-China. It was also said that the more the people of Vietnam, Laos and Cambodia fight, the stronger they become, whereas the more the US and its "henchmen" fight, the weaker they become and the greater will be their defeat.

Forces Scattered

The Saigon troops are not only fighting at three major fronts (below the DMZ, in Central Highlands and near Saigon itself), they have also to cope with liberation forces everywhere, all over the country. The mobile forces of Saigon are now scattered in many fronts to assume different tasks. The Saigon army has been weakened in numbers and quality. The number of draftees cannot fill the gap created by casualties and deserters. Its morale is low.

Compared to this, how do the PLAF find themselves? They say that they are now winning one victory after another. That they now hold the initiative in choosing where and when to strike. They have more favourable opportunities now because of the deep changes in the battlefields. Over 400,000 US troops have been forced to withdraw, and the US now has "only defeated mercenary armies" at its disposal in Vietnam, Cambodia and Laos. The only 'trump card' left to Nixon is the US Air Force and Navy. But this trump card itself has fallen into disrepute following the failure of the biggest war escalation against North Vietnam and the local war in South Vietnam. The US had launched a full-scale war of destruction against the north in the past, when it had more than half a million expeditionary troops in South Vietnam. In that the US had suffered defeats. Today with most US troops gone from Vietnam, how can the same kind of air war or war of destruction succeed?

The regular units of the Saigon forces are being beaten black and blue. All its general reserves, such as paratroops, marines and rangers, have been hastily thrown into the fight in the beginning of this month. What is more, divisions whose mission is to support "pacification" operations, like the 21st in Ca Mau and the 2nd in Quang Nam and Quang Ngai, have now been rushed into the battle as reinforcements. Saigon is also forced to mass its artillery and armour in Quang Tri and Thua Thien provinces (in the north), in the High Plateaux and in the Central Highlands, while deploying an important part of its air force in the air war against North Vietnam.

As a result its rear defence — the rural areas — is left unguarded and has markedly weakened. The support forces for "pacification" operations and the administration in hamlets, villages and districts, though still impressive in strength, are in doldrums. Many of Saigon's "popular defence forces" have rallied to the Viet Cong side or have revolted. The Saigon government is certainly not in the best situation to fight a large-scale and prolonged war.

THE FOURTH ESTATE

Era of Trade Unionism

Nireekshak

CAN an editor ask his assistant editor to read press proofs? According to a *Times of India* assistant editor, 'no', The Bombay Union of Journalists not only supports his contention but is also helping him with legal advice to fight the editor on this point. The assistant editor has based his case on the Working Journalists Act and the recommendations of the Wage Board (for Working Journalists), which have grouped journalists into various categories and designated them according to the function they perform. Topmost in the newspaper hierarchy is the editor. At the bottom comes the proof reader. In between come assistant editors, news editors, special correspondents, sub-editors, reporters, etc. How can an editor assign to his assistant editor a function which is that the lowest functionary in the hierarchy is the point in dispute between the *Times of India* editor and his assistant editor. The outcome is likely to be watched with interest in the profession.

Regimentation and Rigidity

The dispute does, however, highlight the fact that the Working Journalists Act, as it stands today, and the recommendation of the Wage Board, grouping journalists into various categories, have done little to improve professional efficiency and raise standards. Instead, both have brought about a certain amount of unhealthy regimentation and rigidity in the profession — reflected, in this instance, in the assistant editor's defiance of the editor. After all an assistant editor, even according to the Wage Board definition, "is a person who regularly assists the editor in the discharge of his duties. . .". Surely, such assistance can imply reading proofs of editorials or important articles which the editor may not like to leave to the professional proof reader.

There is also another reason for regimentation in the profession. The editor, instead of being a nucleus of all activities in a newspaper, has preferred to shut himself up in his cabin from where he occassionally issues directions. There have been many instances in big newspapers when the editor has failed to recognise members of his editorial staff. This aloofness has not only deprived the editor of his rightful position of leadership in the profession but has also considerably reduced his moral authority over his colleagues. As a result teamwork — so essential in a newspaper — has suffered a setback. This takes one back to the times when newspapers were not so technically advanced; journalists were not so well-paid and the Working Journalists Act was not there. But what newspapers did have then were men of integrity, loyalty and dedication. The editor then was not merely a name in the printline but a live institution who moved and inspired his colleagues to earn their affection. Now is the era of trade unionism.

This brings us to the Indian Federation of Working Journalists which, till recently, was the only trade union of newspapermen in the country. In the wake of the 'new politics' and the 'new economics' the IFWJ has become a darling of the establishment. Its demand for diffusion of newspaper ownership drew an immediate response from the powers-that-be in New Delhi. Now, one of its most powerful constituent unit, the Bombay Union of Journalists, has come out with a follow-up step. At its recent annual general meeting, the BUJ is reported to have passed a resolution demanding the setting up of editorial councils in every newspaper to guide the newspaper's policy. That this move got overwhelming support, indicates the shape of things to come.

Newsprint Squabble

The Union Government's newsprint policy continues to be a subject of discussion in the profession. The mouthpiece of big business newspapers, the Indian and Eastern Newspaper Society, hinted last week at the possibility of "unpleasant measures like a freeze or even a cut in salaries [of journalists] and a ban on fresh recruitment [in newspapers]" as a result of the new restrictions imposed by the government. These were exactly the fears of the National Union of Journalists and the Indian Federation of Working Journalists. While the former had expressed them in its criticism of the new newsprint policy, the latter had done so hailing the government's decision. However, both the rival unions have demanded the introduction of the price-page schedule without delay. Meanwhile comes the news that a big newspaper has issued about 1,000 retrenchment notices to temporary staff and stringers in small towns. The Prime Minister's assurance in this regard at the Press Association's lunch and Nandini Satpathy's utterances in Parliament last week seem to have had no effect on the proprietors of big newspapers. This battle of wits between the government and newspaper proprietors will be watched with great concern by journalists. Indira Gandhi's newspaper, *National Herald*, has as expected endorsed the newsprint policy and pontificated: "The government have, to ensure fairness, appointed a well-composed fact finding committee which is to report within six months, and the major English dailies have only to wait for the committee's report to learn something more of their own economics. It is but proper that the government should

not reverse policy, with no change in the foreign exchange situation, till the real facts are established."

Patriot of New Delhi has again come out with some interesting statistics about big business newspapers — this time about the percentage of advertisements in them. "A study of some newspapers for a five-week period, from 13 February to 18 March this year, shows that the *Statesman* devoted 62.5 per cent of its space to advertisements, the *Times of India* 54 per cent, and the *Hindustan Times* 53 per cent."

What's in a Name?

A controversy raging in Calcutta newspapers is about the renaming of West Bengal. There have been editorials, articles and letters to the editor galore on the subject. The most favoured proposal, according to an article by Buddhadeva Bose in *Hindustan Standard*, is Pashchim Banga. Some other suggestions are 'Bangapradesh' and 'Bangabhumi'. All this indicates that the state is fast returning to normalcy to be able to indulge in such pastimes.

The performance of the new Congress ministry in the one month that it has been in office has by and large satisfied the Calcutta English daily press that stability has come to stay in the state. The pro-Congress *Amrita Bazar Patrika* has hailed the government's work and commented: "The improvement in the investment climate, the returning confidence of industrialists and businessmen, will naturally be attributed to a marked improvement in law and order situation. The electorate have given a massive verdict in favour of peace and stability."

The ceiling on urban property proposed by Madhya Pradesh, Rajasthan and Punjab has come in for sharp attack by *Hindustan Times* of Delhi and *Pioneer* of Lucknow. Both have raised some interesting points. For example, different states have proposed different ceilings and what happens when an individual happens to have property in different states. Even if a uniform ceiling is imposed throughout the country, great will be the problems of evaluation. According to *Hindustan Times*: "Opportunities of corruption will multiply with the inevitable discretion that will have to go with the administration of legislation of this kind . . . The new law will breed ingenious modes of evasion and benami transactions that will consume much administrative time and energy." Ceiling on urban property at this stage is not practicable, says *Hindustan Times* and adds: "At all events, it would seem that a ceiling on urban property has become a pseudo-radical badge that the government is reluctant to throw away despite the weighty arguments against it on practical grounds." *Pioneer* sees haphazard thinking behind the whole policy which is "sought to be confused by the smokescreen of the term 'socialism' ".

Subversion by Condoms

An RSS-backed All-India Anti-Family Planning Conference in Delhi was extensively covered by the Jan Sangh English daily, *Motherland*, and commented upon favourably in an editorial. According to *Motherland*, the government of India "has no right to spend sixty crore rupees a year of tax-payer's money on making men impotent and women infertile". There are subtler reasons for the paper's opposition, however. According to the editorial, ". . . . it has been observed that some communities are its [family planning's] victims more than some others. For example, the Muslim and Christian religious leaders have consistently rejected family planning. In effect, therefore, this means four wives for some and family planning for some others. This is by no means an imaginery fear. Ever since the first census was held in 1861, the Muslim and Christian percentages have been rising and the Hindu percentage has been falling. At this rate it can be statistically established that in another century or two Hindustan would cease to have a Hindu majority. Such a disturbance of population percentages can have the most disturbing socio-political consequences."

Primary Education: Participation and Wastage

A R Kamat

Primary Education in Rural India: Participation and Wastage by Agricultural Economics Research Centre, University of Delhi; published by Tata McGraw-Hill, 1971; pp 86.

A DIRECTIVE Principle in the Indian Constitution enjoins the State to provide free and compulsory education for all children below the age of 14 within a period of ten years. Yet even 20 years after the adoption of the Constitution the country is nowhere near the realisation of this objective. By and large India still remains one of the most illiterate nations in the world. This raises a number of important questions about facts, their interpretation, the underlying causes and measures to overcome them such as: what is the extent of participation in elementary education? how does one match the figures available from different sources? what is the size of wastage in primary schools? what are the institutional and non-institutional factors responsible for the large number of drop-outs, particularly in the rural areas? These problems are sought to be investigated in the study under review carried out, as a UNICEF project, by a team of economists from Delhi University.

The statistics of participation are available from two sources: figures of enrolment in elementary schools collected from school records and published by the Ministry of Education in their annual reports, and those from the decennial census tables giving the number of full-time students in the below-14 age-group as reported by the households. Since the reference date is almost the same for both for the year 1960-61, *viz*, March of that year, the two figures should be expected to match; but in fact they differ very widely. While the total enrolment for India in classes I to VIII (which should roughly correspond to the age-group 6-14) given by the Ministry is 41.69 million, the number of full-time students upto age 14 given in the Census tables is only 34.60 million, a difference of 7.09 million. When one considers the total enrolment of all students irrespective of age as reported by the Ministry and the Census the figures are 47.97 and 41.38 million respectively, leaving again a difference of 6.59 million. Thus the data on participation from the two sources differ by a wide margin, and this is true for all the states. Matching the enrolment figures in primary schools (classes I to V) and the adjusted Census figures for the below-11 age-group in the different states, one finds the same wide difference between the Ministry and the Census figures. Studying these differences along with the increase in enrolment during the five-year period 1955 to 1960 the authors conclude that the inflated figures of the Ministry are a result of more-or-less deliberate over-reporting on the part of lower elementary (primary) schools, particularly in those areas where primary education expanded rapidly.

Now, it is well known to research workers in education that there is always considerable 'over-reporting' at the primary level, and particularly in the first standard because the reported number is not that of regularly attending pupils but that of the formal enrolment, the bulk of which takes place at the beginning of the school year, the enrolled pupils continuing to be on the school register whether they are 'live' students or not. Many of them drop out during the year but their names remain on the rolls until the end of the school year when the final accounting is done at the time of the annual examination for promotion. This difference between those on the register and the 'live' pupils amongst them is much greater in areas which are newly exposed to primary education and the motive is not always to attract the financial resources of the Central and state governments as the authors suggest. It is largely a procedural bias which the educational administration has not cared to remove. A contributory factor for the wide difference between the Ministry and the Census figures is that while the Census gives full-time students below 14, the Ministry figures are for the classes I to VIII which are expected to, but in fact can never exactly, coincide with the 6 to 14 age-group. There are many more students above 14 in these classes, while those in this age-group attending classes higher than VIII are likely to be relatively few. The Second Year Book on Education published by the NCERT gives this margin as 5.66 per cent for the year 1960-61, that is of the order of 2.3 million. (At the primary level the difference is greater, of the order of 14 per cent.)

The Census educational figures, although not affected by the 'enrolment' bias mentioned above, often suffer from other inaccuracies.[1] From the above-mentioned figures one finds that there are 6.78 million full-time students above 14 according to the Census and 6.28 million students enrolled in classes and institutions other than I to VIII. So now the gap is in the reverse direction. The authors appear to have also misinterpreted the Ministry data in parts; for instance it will be grossly incorrect to treat the 1.50 million pupils listed under Social (Adult) Education, and included in 47.97 million, as full-time students. The situation becomes much worse if we take into account the pupils in Social (Adult) Education classes; the reverse gap now widens to 2.00 million in the Census figure of 6.78 million! Will the authors call this the under-reporting bias of the Ministry in secondary schools and institutions of higher education? This difference is too wide to be bridged by the number of students below 14 who attend classes IX and above. One cannot therefore be too sure that the smoothing for age which the Census analysts do for overall age-distribution is also done for cross-classificatory data by occupation, in which case the gap is perhaps partly explainable by the clustering at age 15. We have gone into these tiresome details to show that research workers treading an area foreign to their disciplines have an obligation to familiarise themselves with the new area and to give careful thought to the ramifications of the problem before running to tempting but hasty conclusions.

Since primary education is the basis of all literacy the appalling wastage at this level of education in India is a subject for much concern among both educationists and others. Less than 40 per cent of the pupils joining primary schools reach class IV, a stage which is generally believed essential to induce lasting literacy. The authors have devoted the rest of their effort to isolating the important causal factors for this wastage and arrive at a set of conclusions with a view to suggesting remedial measures. Before we review this part of the study, however, it may not be out of place to consider the relationship between primary education and literacy on which there appears to be a lot of confused thinking in many

quarters, including among the present authors.

First, the general belief that reaching class IV of the primary school is a must for acquiring lasting literacy is devoid of factual basis. Such an assertion is often based, as the authors have done, on the investigations by Gadgil and Dandekar[2] — perhaps the only systematic attempt of its kind — which, if carefully scanned, reveal that while almost everybody (97 per cent) who reached class IV acquired literacy (ability to read a simple passage and to write a few dictated lines), the same was the case with 88 per cent and 67 per cent of those who left school from class III and class II, respectively. The extent of literacy amongst all those who left primary schools from class II upwards was observed to be 86 per cent. Thus lasting literacy was found to be induced among many of those who left school from class II upwards. Secondly, these investigations were carried out more than 25 years ago and it is therefore necessary to conduct fresh systematic inquiries into lapse into illiteracy in different parts of India to assess the present situation. During this period many more influences helpful to retention of literacy have begun to operate, e g, the spread of newspapers, radio, films and literature for new-literates, etc.

Much confusion is also in evidence about the concept of functional literacy. For instance the authors of the present report state that it is "usually defined in terms of a very low probability of lapsing back into illiteracy at a later stage" (p 24). Those conversant with educational developments, however, define functional literacy as literacy which helps a person in his function in society, that is, in his occupation. The concept was introduced to distinguish it from formal literacy — mere ability to read and write, which may be described as 'literary' literacy. The underlying idea is to reorientate the courses and teaching methods, particularly in adult-education classes, to create a stronger motivation among the learners. However, not much effort has yet been made to reorientate our primary education towards this end which still remains mostly formal and not functional. We hope to elaborate these ideas in a separate essay at a later date. But this brief discussion should suffice to demonstrate that the retention index (ratio of enrolment in class IV to enrolment in class I) which the authors as well as many other education researchers have inevitably to fall back on because of the limitations of data, apart from its other obvious shortcomings such as not following the same cohort, can be looked upon only as a convenient simple index, and not as a measure, of literacy induced in primary schools.

In order to identify the main causal factors responsible for wastage it is convenient to divide the possible factors, as the authors have done, into two broad categories: factors external to the educational system, such as those arising from the socio-economic structure of society and the level of socio-economic development of the various regions; and factors internal to the system such as educational expenditure, facilities provided in schools, timing of the school year, etc. Moreover, the analysis can be attempted at the macro level of the states, regions, etc, or at the micro level of field studies. So far as the external factors are concerned many educational researchers have all along observed that retention and participation, which are both indexes of the progress of primary education, are found to be low in precisely those regions which are socio-economically backward. Some micro level inquiries[3] have also shown that they are related to low income, low caste, low parental occupation and low educational status of the family, which often go together in our society both in urban and rural areas. They have also tried to explore the relevant factors internal to the system including the size of school, facilities provided in the school, pupil-teacher ratio, proportion of trained teachers, per-pupil expenditure, or the teachers' salary which forms the overwhelming part of expenditure at the primary level. So far as the present investigations are concerned they point out to the low rural income at the macro level, and poverty and low caste at the micro level among the external factors, and to the proportion of trained teachers at the macro level and school timings at the micro level among the internal factors. Educational research workers have been aware of them for the last thirty years, but of course fresh confirmation is always welcome.

Viewing the study as a whole, however, one comes to the reluctant conclusion that it has not contributed substantially to understanding and analysis of the problems concerning participation and wastage in primary education, beyond a few already known generalities. One also fails to understand, in the context of the UNICEF support, why the field study should have been so inadequate when with a little more forethought and effort it could have been a lot more fruitful. What is sad to see is that even the quantitative methods used by the investigators should suffer from common avoidable faults. The misinterpretation and mishandling in matching the data from the two sources has been already referred to above. In calculating rank correlation (p 16) between percentage deviation of the Ministry figures of enrolment from the Census figures and the percentage growth of lower elementary (primary) education the analysts have omitted the states of Gujarat and Maharashtra without assigning any reason. Was it because they found them inconvenient or because they could not manage tied ranks? On page 5 in Table 1.2 the figures are a jumble; while the total gives all-India figures covering both rural and urban areas the figures against the states are those for rural areas. This sort of numerical work is bound to make a discerning reader doubtful about the accuracy of percentages given elsewhere in the study where original figures are not quoted. Finally, the reviewer was amused to read the involved argument on pp 58-62 together with the fact that the investigators are combining two sets of widely differing figures for enrolment at the primary level. (This little book thus provides some neat illustrations of common faults in statistical reasoning which may prove useful for class-room teaching.) As though to compensate for the inadequate understanding of the problem, meagre field data and weak quantitative analysis, the study is loaded with unnecessary phraseology from economics which tends to confuse rather than clarify the educational issues and needless spinning of involved argument about hypothetical issues for which quantitative data are non-existent. The reviewer cannot help wondering why a competent team of workers from one of our outstanding research schools could not make a better job of it when all that it needed was a little more patience and understanding, a little more systematic field work and a little more care in quantitative analysis.

Indian Agriculture: Before and After

N S Jodha

Growth and Instability in Indian Agriculture by S R Sen; Firma K L Mukhopadhyay, Calcutta, 1971; pp 128; Rs 15.

THE book under review, a collection of S R Sen's addresses to various national and international gatherings, derives its title from his often quoted address at the Annual Conference of the Indian Society of Agricultural Statistics in 1967. Since the addresses were meant for varied occasions and audiences, they do not deal with a single theme. Still most of them could be grouped into three broad categories.

(a) Those dealing with the problem of growth and fluctuations in Indian agriculture prior to the HYV era.

(b) Those dealing with development planning and the breakthrough in Indian agriculture and the initial as well as second generation problems of the 'green revolution'.

(c) Those dealing with demographic aspects of development planning.

The author analyses the agricultural (mainly foodgrain) production data for the last 5 to 6 decades arranged into the following four periods: (1) 1900-01 to 1923-24; (2) 1924-25 to 1947-48 for undivided India; (3) 1935-36 to 1950-51; and (4) 1951-52 to 1965-66 for the area covered by the Indian Union. After examining the trend in the growth rate of foodgrain production (as well as the index numbers of agricultural production), and the trends in trough points and peak points of production in each of the four periods, it has been stated that the first and the fourth periods were characterised by some growth (the rates being 0.3 per cent and 2.75 per cent per annum, respectively) and high fluctuations in the foodgrain production; the second and the third periods were characterised by decline in foodgrain production (the rates being 0.02 per cent and 0.68 per cent per annum, respectively) and relative stability as indicated by the declining trend of peak points as well as the rising trend of trough points and the convergence of the two. Finally, it is inferred that periods of growth are also the periods of wide fluctuations in Indian agriculture.

Whether in the wake of the "green revolution" (mostly in the agriculturally stable areas) high growth would also be accompanied by high fluctuation is yet to be seen. But if the contention of the Agricultural Prices Commission, that rain fed areas had substantially contributed to our recent foodgrain supplies, is valid, the above phenomenon may probably still hold true.

After looking at the state-wise extent and spread of areas with or without assured water supply and their relative susceptibility to droughts (details presented in an Appendix and a map) the author feels that "the rather thoughtless policy which has ignored, until recently, the importance of geographical specialisation and has encouraged extension of foodgrain production to all kinds of lands in all parts of the country has tended to add to our food difficulties" (p 14). Geographical specialisation on the basis of agriculturally relevant resource endowment and simultaneous reorientation of our agricultural policies (e g, with due emphasis on regional diversification) and irrigation policies (in terms of productivity or protection oriented irrigation) is suggested as a remedy to ensure growth with stability. The remedy may probably apply equally to the problem of growing imbalances in Indian agriculture which has been the subject of much debate recently.

The breakthrough in agriculture in recent years is attributed to "a happy convergence of several things around middle sixties" (p 41). The credit is evenly distributed among scientists (for establishing new varieties); policy makers (for price and input policies favourable to farmer); irrigation authorities (for production oriented irrigation policy); extension agencies (for converting themselves into a more competent vehicle); and the farmer (for discarding his old attitudes). The profitability of HYV is said to be so high that it has attracted businessmen too (p 45).

However, it is difficult to agree fully with Sen's many views about the green revolution. As several field studies show, in some areas it was the "miracle seed" which did most of the job despite the static approach of the extension and irrigation authorities. Similarly, businessmen have purchased lands even in the Rajasthan desert, where there is not even the mirage of a green revolution!

The author suggests several measures for tackling the second generation problems of the green revolution (and the overall problem of rural poverty). Some of these already grace our plan documents. Yet suggestions such as that to supplement 'commodity and technique based' research by 'area based' research to help backward areas deserves attention. As a general strategy for agricultural planning, the author suggests a three-tier system on the pattern of IADP, IAAP and the rest of the country (chapter 5).

The discussion of the demographic aspects — e g, the application of demographic data in development planning and research into the demographic elements of agricultural development — though general, puts the issues in perspective.

Finally, though the lectures included in the volume deal with varied themes and were meant for varied contexts, the author's stock ideas and views (e g, about rural poverty and its solutions, regional specialisation, area based research, etc) are found in most of the lectures. No doubt the ideas are well integrated with the themes of the concerned lectures, but to a reader going through all the lectures collected in one book, they seem repetitious. The last chapter on the Indian Development Prospect is (perhaps due to editorial oversight) a verbatim reproduction of the last section of the chapter immediately preceding it.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

RATHI ALLOYS & STEEL LIMITED

FOR STEEL

(Incorporated under the Companies Act, 1956) Registered Office : 28, Sadhna Colony, Opp. Malviya Nagar, New Delhi-17

ANNOUNCEMENT REGARDING THE ISSUE OF 2,70,000 EUITY SHARES OF Rs. 10/- EACH AND 10,000—9.5% REDEEMABLE CUMULATIVE PREFERENCE SHARES OF Rs. 100/- EACH TO THE PUBLIC

Persons interested in full details may obtain copies of Prospectus and Application Forms from the Company's Registered Office and Underwriters, Brokers and Bankers to the Issue mentioned below.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON WEDNESDAY 3RD MAY, 1972 AND CLOSE AT THE CLOSE OF BANKING HOURS ON SATURDAY 13TH MAY, 1972 OR EARLIER AT THE DISCRETION OF THE BOARD OF DIRECTORS OF THE COMPANY BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON FRIDAY 5TH MAY, 1972.

ACTIVITIES OF THE COMPANY AND PROSPECTS

The Company was incorporated on May 20, 1970 as a Public Limited Company. The Company received certificate to commence business on May 26, 1970. The objects of the Company are fully set out in the Memorandum of Association of the Company, the main objects being to set up Electric Arc Steel Melting Furnace and Continuous Casting Plant for the manufacture of steel billets required by the steel re-rolling industry. The Company was granted an Industrial Licence for the manufacture of 40,000 tonnes per annum of mild steel, high carbon steel and alloy steel ingots/billets. The factory is located at Ghaziabad in U.P. The Company took up the implementation in two phases. In the first phase the Company installed one 10 tonne electric arc furnace which was commissioned on September 17, 1971. The implementation of second phase commenced in October 1971, and as a first step the second electric arc furnace of 10 tonne capacity was installed and commissioned on March 23, 1972. With the commissioning of second furnace, the estimated annual production of 40,000 tonnes will be achieved.

The Company now proposes to install a double strand continuous casting machine with a cogging mill as part of the second phase. The cogging mill plant has already arrived at site. The application of the Company for importing continuous casting plant has already been cleared by the Government of India and the Company has entered into an agreement for the supply of its plant with the reputed manufacturers, M/s. Con-Cast AG, Zurich, Switzerland who are the pioneers in the field of manufacturing continuous casting plants and are principal suppliers of these plants throughout the world.

In a short period of about 6 months ended March 31, 1972 the sales of the Company amounted to Rs. 81 lakhs. Since then the second furnace has also been commissioned which will double the production. With the present shortage of steel in the country, the Company is not expected to experience any problems in marketing its entire production. It is, therefore, estimated that profits before Depreciation and Development Rebate will amount to Rs. 30 lakhs for the year ended June 30, 1972 which is the first year of production. During the second year of production, that is year ended June 30, 1973, the Company would be able to work both the furnaces and cogging mill for 12 months and the sales during this period are expected to be in the vicinity of about Rs. 3.5 crores It can be reasonably expected that barring unforeseen circumstances, the Company would be in a position to declare 10% dividend on Equity Shares for the year commencing July 1, 1972 and will be able to maintain and enhance dividends in the future years.

Political Reconstruction of Bangladesh

Reflections on Building a New State in the Seventies

Rajni Kothari

This paper seeks to point out certain general lessons that we have learnt from the last 25 years of experience in regard to state and nation building in the "Third World".

There is, on the one hand, the modernisation model *which seeks to undermine the autonomy and power of the new states. There is, on the other hand, what may be called the* state-building model which *seeks to conceive of the tasks of modernisation, economic development and the rest as part of a general drive towards consolidating national autonomy and realising the values of democracy, social justice and secularism.*

Bangladesh has come to life when the alternative scenarios can be perceived in their fullness, when the ground for making critical choices has been cleared of a lot of confusion and misleading cliche, and when the real need is for a proper perspective and bold initiatives from the political elite rather than passing on the responsibility to foreign trained technocrats.

BEING neither a citizen of Bangladesh nor an "area specialist" on it, I approach this rather large subject with some trepidation and a clear understanding that these are the thoughts of an outsider. My only excuse in undertaking this analysis is that Bangladesh has come to life at a time when it can draw from a wide range of experience that has already been gathered and when the elements involved in building a viable state — or in undermining it — are no longer mysterious. The contemporary history of the growth and decline of states and nations has led to a considerable body of insights into the conditions that make or retard a polity, the problems it must face up to in the course of realising the values and goals it cherishes, and the fallacies and intellectual bowlers that it ought to avoid if it is to survive as a state, become a nation and prosper as a society. The insights can be used with considerable advantage by Bangladesh; the newest of the new states, as it begins to shape its unique destiny during the seventies and beyond. A majority of the "new states" came into being during the late forties and the fifties, most of them ran into difficulties during the sixties, and quite a large number of them are still in bad shape. Still others which secured their independence long back (e g, the countries in Latin America) or indeed never formally lost their independence (Thailand and Nepal and some countries in the Middle East) continue to face challenges to the integrity of their political systems, and have not been able to make life worth living for the majority of their peoples in the face of serious threats from both within and without. Other countries (e g, in Eastern Europe) which do not fit the rubric of "new states" but underwent major transformations after the War also continue to face similar problems. Bangladesh has to look critically at these various states, the pitfalls they fell into, and the reasons why so many of them are in such bad shape. It has to learn how to avoid these very pitfalls and chart a fresh course for itself. Coming to life in 1972 — after twenty-five years of twilight existence between formal independence and a colonial political status — Bangladesh has a chance to do better than most of these and, in turn, provide some lessons for its older predecessors.

I

The Dominant Model of Development

The fifties and the sixties when a large number of these new states were struggling to become viable political entities were also decades characterised by a dominant ideology of change which set forth a comprehensive design for development. The intellectual stimulation for such a design came from the United States, the hegemonical power of the post-War world, supported by a set of influences from Western Europe which had come under the benevolent influence of the Marshall Plan and had lost their capacity to pose meaningful alternatives, and endorsed by a differently conceptualised model from the Soviet Union but with almost similar consequences. The principal elements of this design set before the leaders and intellectuals of the "developing nations" were as follows:

(1) *New Economism*: The new states were poor. Therefore the principal problem facing them was in respect of their economic development. It was necessary, therefore, that these countries concentrated on problems of "internal" development, keeping down mass consumption, raising saving and investment in the "modern sector", pursuing aggregate rate of growth without immediate concern for distributive goals and maintaining and enforcing peace and stability for all this. Thus came about the new economism of the post-War world.

(2) *Modernisation*: The new states were "backward", "underdeveloped" and "traditional". In the absence of rapid "modernisation", economic development was not possible. Hence the need for first undertaking processes of modernisation and "social mobilisation" — urbanisation, education, physical mobility, adoption of modern means of communication and mass media, building a "rational" bureaucracy and a modern managerial class, and thus getting rid of the "shackles of tradition". In the absence of all this, democratic participation would lead to the influx of "parochial" elites who would undermine the "universalist" goals of modernisation.

(3) *Integration*: The new states were divided and lacked a common identity as a nation. Ibos and Yorubas, Hindus and Muslims, Chinese and Malays, Tamils and Sinhalese, caste and tribal divisions, northerners and southerners, majorities and minorities everywhere — all these had to be "integrated", taught to share a common "national identity", and be subjected to a strong "central authority" that was able to withstand internal pressures, contain centrifugal tendencies and legitimise the established order and its elite. The new states were also characterised by internal violence, prone to give in to chaos, lacking in the instruments of public order. It was therefore necessary to establish internal peace and stability. A strong state was one that ironed out internal differences. The necessity to acquire autonomy and integrity with respect to the external world was not part of this model.

(4) *Necessary Sequences and Prerequisites*: Implied in this whole design was a notion of stages of development, of meeting certain "prerequisites". The prerequisites were rather neatly conceived: economic development before political democracy, modernisation of the traditional society before extension of rights of participation to the common people, national integration before any exercise of local autonomy and self-government and internal consolidation and stability as a necessary precondition of external viability.

(5) *Aid and Alliance*: In order to carry out these various prerequisites — economic development, modernisation, national integration and political stability — it was necessary to have two things. One was resources for these poor countries if the "gap" between them and the rich countries was to be filled. The other was external peace and security. It is here that the role of the developed nations was to be found — provide economic "aid", guarantee peace in the respective regions, and protect the new and fragile states from the viruses of "communist aggrandisement" or "capitalist imperialism" as seen differently by the rivals in the cold war. All that the new states had to do was to accept the terms of the Truman doctrine and its later developments (or their Russian or Chinese counterparts) and preferably join one or other of the defensive alliances or pacts, or at least adopt a position of neutrality and equidistance between the two blocs. Those who were aligned had, of course, a better chance of external security and proportionally greater economic and military aid. Thus took place the doctrines of foreign aid, spheres of influence and ones of security — and the feeling among the new states that they were indeed getting the best of both worlds (in some cases, e g, in latterday Pakistan, the best of many worlds).

Such a design for development acquired considerable vogue throughout the fifties and the sixties. Though largely Western inspired, it was to a considerable extent also endorsed by influences emanating from both the socialist and the non-aligned blocs. The only alternative scenario that was advanced was by the votaries of world revolution and "liberation struggles" to hasten the cause of the world revolution. Unfortunately, however, the revolutionaries hitched their wagons too close to the "internationalism" of the vanguard powers which was no less corrosive of the autonomy and self-confidence of the new states than was the "universalism" of the Western intellectuals. What was common to both was a frantic developmentalism which ignored political realities of the post-War world and produced elites that were more closely aligned to metropolitan centres of the world than with their own peoples. They impeded the logical outcome of national independence movements and the end of the imperial era — namely the creation of self-reliant and viable states and nations as instruments for the realisation of freedom, democracy and social justice, for a vast majority of mankind.

Nehru's sane though hesitant voice against the pernicious political and economic doctrines of the cold war era and his effort to safeguard the autonomy of the new states through the doctrine of non-alignment perhaps saved his own country from falling prey to the full consequences of such a model (although even for India the real deliverance came only after the events of 1971) but on the whole the real parameters of state and nation building evaded the elites of the large majority of the new states. Instead, they got tied up in the peculiarly anaemic dispensation of the dominant model of development: authoritarianism at home, dependence abroad; "economic development" that produced a parasitic elite and high peaks of urban prosperity which created internal colonies and external bondage; doctrine of "modernisation" which reduced self-respect and condemned the native populations to a state of misery because they "lacked motivation"; a compulsive preoccupation with centrifugal tendencies at home so that externally the nations of the Third World continued to be dependent and hence amenable to the politics of "cold war" and "spheres of influence"; a widespread perception of nation-building as essentially an "internal" task while leaving the "external" dimension of nation building to the superpowers. The political consequence of such a model was that the world got neatly divided between "developed" and "developing" nations when the real division was that between dominant and dependent governments — the latter lacking the features of either statehood or nationhood. Government after government was turned against its own people backed by the catchy slogan of "consolidation of central authority" — central authority being perceived as something to be consolidated internally rather than externally. By the same token, extension of democratic rights was withheld from the people lest it may give rise to internal divisions and breakdown of central authority and its "legitimacy". Somehow, the crucial lessons of history, on the one hand that the best way to ensure political integration and legitimacy was by involving the people at large in the operative political structure, and on the other hand that the only way of building and consolidating political authority was through a demonstrated ability to meet external threats and challenges, were lost on the elites of the new states, thanks to their captivity by the model outlined above.

As this happened, the Third World became a breeding ground for the theorists of "identity crisis" and "revolution of rising expectations" and provided the basis for a growing militarisation of the world, large-scale economic exploitation and widening internal disparities as a price for getting a pat on the back as "models" of successful economic development (*a la* Papanek). The political concomitant of this was a continuing sport in which coups and counter-coups were watched with gusto by "concerned" world powers and world press. The anguish and self-denigration of the intellectuals of Latin America, Africa and South-East Asia at this spectacle followed logically from their systematic brainwashing by the dominant theory of development and their failure to recognise the political compulsions of the achievement of statehood and nationhood. The huge army of economic developmentalists, technocrats and international civil servants and do-gooders ensured that the design for dominance conceived by the Truman doctrine and everything that followed it remained impregnable.

II

Alternative Scenario

To be sure, there have been important countervailing factors at work. For one thing, the new states included large and potentially powerful countries like India and China which, despite their early ambivalence (as in the case of China) or mid-course compromises (as in the case of India), were ultimately bound to value their independence and autonomy in political functioning above everything else. Secondly, as against the hordes of politically and intellectually servile elites found in parts of the Third World, there have also been some outstanding men who have valued their own and their nations' self-respect above the immediate considerations of aid and trade, and who have shown a capacity for initiating independent and politically sensitive policies — Mao, Tito, Nehru, Nasser, Nyerere, Ho Chi Minh, Castro, Allende.

Thirdly, the political strategies of the new imperial powers ran into serious trouble when they sought to "overshoot", ignoring the powerful forces that had been let loose by the resurgent nationalism of the mid-twentieth century. The biggest debacle of all was, of course, the war in Vietnam — the symbol of defiance on behalf of struggling humanity against the supposedly invincible war machine of super powers. No less important has been the liberation struggle of Bangladesh and India's role in it, providing an even more decisive defeat to the divisive and manipulative designs of the strategists of regional balances. Less clear but no less significant for the emergence of self-reliant nationhood are some developments in the Middle East, parts of Latin America and the gathering momentum of forces in Black Africa.

Finally, there has taken place a continuing shift in the great power balance which has resulted in strengthening democratic and socialist forces in world politics. Starting (soon after the Second War) with a "bi-polar" power structure of the world which tilted heavily in favour of the military and industrially powerful United States, the development of the last twenty-five years have been a progressive swing towards, first, a more real balance between the West and the East and, still later, a tilting towards the East in which the "North-South" axis played a crucial role. In this the more flexible policies of the Soviet Union which, first under Khrushchev and then under his successors, understood the political potential of the poorer countries in the southern hemisphere far better than the heady rulers of the United States, turned out to be a positive factor in the growth of democratic nationalism and the emergence of centres of independent power — India, North Vietnam, Cuba, Egypt — despite the continued authoritarianism of the Soviet Union itself at home and within the East European region. But even in the latter region a number of independent centres emerged during this period which defied the hegemonical position of Moscow. The net result has been a world in which independent state building — along different models of political development — has become more and more possible.

We have examined the model followed by the elites of dependent countries —essentially a model of economic modernisation in the aggregate at the expense of both the political integrity of these states and the general welfare and democratic rights of their peoples. The model that has slowly emerged from the other end of the spectrum can be summarised as follows:

(1) A vigorous policy of national self-sufficiency in respect of basic economic requirements (even if this meant a relatively lower aggregate rate of growth in the short run). The chief instruments of this have been a comprehensive policy of import substitution and a greater reliance on trade rather than "aid" and on bilateral economic co-operation with a number of countries and institutionalised economic support for specific schemes rather than a generalised aid package as administered by the various Aid Clubs.

(2) A similar attempt at self-reliance in matters of national defence and security through the development of requisite armed forces, the growth of indigenous armaments production (or, in the case of small states, a definite allocation of foreign exchange for arms purchase in the open market) and the availability of local expertise in the fields of intelligence and strategic studies.

(3) A system of production and distribution of goods which prevents concentration of wealth and economic exploitation and hence of the growth of parasitic elites concentrated in urban areas. This will entail a number of steps chief among which are (a) land reforms, labour legislation and redistributive taxation; (b) accent on agriculture and rural and semi-rural employment as a means of livelihood in the early phase of economic development and policies aimed at containing an overgrowth of metropolitan areas; (c) adoption of an incomes policy involving minima as well as maxima (forgetting about "bridging the gap" with rich nations which is an irrelevant chimera); and (d) a design of infrastructural development which attends more to minimum conditions of civilised life for all — clean drinking water, a roof for every family, free medical facilities, cheap education, etc — rather than concentrating on conspicuous superstructures in metropolitan areas. All these steps are with a view to curb the growth of an elite that is disoriented from indigenous society and national purpose.

(4) The development of institutions of a participant democracy — periodic elections, local self-government, free growth of trade unions and peasant and youth associations and an unfettered press — as a necessary basis for political support and legitimacy, a mechanism for change of elites and availability of counter-elites, and a means for accountability of the authoritarian components of the polity, *viz*, the army, the bureaucracy and the ruling party or coalition. (The only alternative, it is now clear, is an authoritarian regime out of touch with social reality which stays on in power through either the backing of the military or external support or both.)

(5) Involvement of the youth of the country in productive processes and decision-making structures, absorbing the constructive aspects and containing the destructive aspects of the "revolt of the youth" which is likely to become a world-wide phenomenon in the years to come.

(6) The need to think of the problem of "ethnic pluralities" and their "integration" as part of the drive of achieving national autonomy and social transformation, and to avoid the pitfall of being overconcerned with "centrifugal tendencies" and the "parochialism" of this or that community, the principal task in the national integration being to disorient local minorities from external stimuli and to remove the suspicion of the majority community about the lack of patriotism of given minority community or communities.

(7) Attention to problems of size, territorial organisation of the country, local autonomy and a reconciliation of the economies of scale on the one hand and the politics of scale on the other — in short, a well thought out policy of decentralisation and of regional and local participation in national tasks.

(8) Consideration of a regional policy *externally* (especially necessary for small countries) as a complement to policies of national self-sufficiency in economic development and national defence, with a view to seeking both economic prosperity and political security, not through a clientistic relationship to an external power but on the basis of co-operation among neighbours who can think of their "interests" in terms of mutuality and common purpose and values.

III

Choice among Alternative Models

What I have tried to do in this paper is to point out certain general lessons that we have learnt from the last twenty-five years of experience in regard to state and nation building in the "Third World". There is, on the one hand, the *modernisation model* which seeks to undermine the autonomy and power of the new states. There is, on the other hand, what may be called the *state-building model* which seeks to conceive of the tasks of modernisation, economic development and the rest as part of a general drive towards consolidating national autonomy and realising the values of democracy, social justice and secularism. Bangladesh has come to life when the alternative scenarios can be perceived in their fullness, when the ground for making critical choices has been cleared of a lot of confusion and misleading cliche, and when the real need is for a proper perspective and bold initiatives from the political elite rather than passing on the responsibility to foreign trained technocrats.

It is not the task of an outsider to tell the citizens or policy-makers of Bangladesh what precise choices they should make; he is not only likely to be misunderstood but he is bound to be wrong when it comes to the details of statecraft. Bangladesh has many advantages over other countries in the "Third World". It is neither too small nor too large in size, fairly homogeneous in population and a country whose various groups have together fought a liberation struggle against one of the worst tyrannies in recent times. It is predominantly rural and lacks any great "megalopolis" with too large a middle class elite which is committed to imported models. It has a large potential of manpower and skill, abundance of hydraulic power, and a large number of small towns which can become the nerve centres of nation building. It fulfils the vision of a land of small farmers and decentralised industry where greater accent will be on realising minimum welfare for all instead of falling prey to the temptation of becoming a mighty industrial power and "bridging the gap" with post-industrial societies. It has as its neighbour a large friendly country which is willing to look upon it as an equal friend and partner in the preservation of peace and security in the region. It will have a large fund of goodwill all over the world which, as it comes out of its initial shock and wonder, is bound to look upon this new state with respect. Bangladesh has learnt its political lessons through bitter struggle and is bound to place the highest value on its independence and autonomy. Above all, it has a large and urgent agenda of tasks at home and an inspiring leadership at the helm which commands nation-wide support. It is fortunate in having such a leadership which has a faith in democracy and pride in belonging to *Sonar Bangla*.

If only Bangladesh can avoid the temptation of other new states in respect of its relationship with "great powers", at the same time not become oversensitive about its relationship with India and make the few critical choices in respect of domestic political and economic strategy — especially avoiding the pitfalls of the prevailing model of economic development — it appears likely to emerge as not only a viable state but perhaps also a norm-setter for others. The manner in which it has started off — with a ceiling on income, curbs on imports of all goods other than bare necessities, and adoption of Bengali, the language of the people, as the language of administration — provides ground for such optimism.

Employment and Income in Rural India

Pradhan H Prasad

The phenomena of low utilisation of labour, low earning, and inadequate consumption of the vast majority of the people in India have to be analysed in the context of the semi-feudal bondage in which a vast majority of the rural population live even today. It is the high concentration of land in the hands of a few, the uneconomic holdings of the small farmers, and the high proportion of landless labourers, that explain the low utilisation of land and labour — there being sufficient empirical evidence that large farmers use land less intensively than do the small farmers.

In the circumstances, land reforms — rather than the present intensive agricultural development programmes — are strongly indicated for improving land and labour utilisation in the country and freeing people from semi-feudal bondage.

Also necessary are widespread sources of supplementary income for the people. Labour-intensive techniques in non-basic goods production is a viable way of ensuring this.

This article argues that the existing manufacturing set-up will not be capable of generating the supplementary income or of diverting the population from agriculture to industry with a view to reducing semi-feudal exploitation. The employment base of the presently patterned manufacturing sector is too low to have any significant impact in the near future.

THE existing phenomena of low utilisation of labour, low earning, and inadequate consumption of the vast majority of the people in India[1] have been understood mainly in terms of dualism, in that, when the vast majority of self-employed persons are given an 'imputed value' in terms of the existing wage rate in the economy, it appears that the resources with which they are working earn a lower (even negative) rate of profit compared with that prevalent in the rest of the economy.[2] The questions that are then asked too often are: Why should such a condition (i e, where supply of labour is greater than the demand for it at the existing wage rate) continue to exist in the long run? Why does it not bring about increasing substitution of labour in place of land and capital wherever possible so as to bring about a higher rate of employment and investment? The explanations that have been advanced have been mainly in terms of capital shortage and wage cost-efficiency equilibrium theories.[3] The implicit assumption has been that the labourers are largely 'free from semi-feudal bondage' that has been the feature of present-day advanced economies in the period following feudalism. However, in a vast sector of our economy, this assumption has hardly any validity.

It is well known that the ascendency of British power in India brought about

a decline in the once flourishing handicraft and cottage industry in the country and also slowly eroded the economic self-containment of the villages. But the colonial exploitation, while adding to the misery and privation of Indians, revolutionised modes of transport and brought about limited industrialisation of the economy. This resulted in capitalist development which was very slow and also uneven.[4] In 1911, the percentage of cultivators and agricultural labourers in the male work force was 66.7, and in 1951 it was 66.5.[5] The percentage share of manufacturing, including household industry, in the male work force was 9.2 in 1911 and 10.0 in 1951.[6] The vast majority of the population in India continued to live in the rural sector. The percentage of rural population to the total population was 89.2 and 82.7 in 1901 and 1951, respectively.

Rural British India, as we know it, existed under a very strong survival of the feudal structure. Tillers of the soil comprised the most oppressed class of the British tenurial system. There existed a long stratification of landowners, tenants and sub-tenants with the actual tillers being mostly at the bottom. This high land rent moreover created a situation in which the large majority of rural households emerged as 'deficit households': invariably, their bare minimum consumption expenditures exceeded their incomes. With the passage of time, these rural households found themselves in the clutches of the rural rich from whom they took loans at exorbitant rates of interest, to whom they sold and mortgaged the land, and who often aided them in return for their becoming bonded persons. The process was responsible for increasing concentration of wealth and land in the hands of a few, emergence of a class of small farmers with uneconomic holdings, and increase in the proportion of the agricultural labourer class. Miserable agricultural wages, high indebtedness, and bondage of labour, etc, resulted in widespread poverty.

This must have aggravated the situation through low utilisation of land and labour: there is sufficient empirical evidence to support the thesis that large farmers use land less intensively than do the small farmers.[7] In the prevailing circumstances, households with positive savings invested them in giving consumption loans to the rural poor at exorbitant rates of interest and in purchasing land from them. Their savings thus financed the consumption of the rural poor, and meant that the net investment in the rural sector of the economy remained almost negligible. The attempt on the part of rural rich was, thus, mainly confined to increasing their hold on the masses by aiding the increasing number of rural poor (on account of increasing exploitation and alienation of land) towards becoming bonded people. The situation, therefore, was inimical to development.

Hardly anything happened in the post-Independence era to effect a directional change in the process. The rate of industrial development has not been high enough to reduce the proportion of population in agriculture. The percentage of cultivators and agricultural labourers in the male working force was still 67.40 in 1971.[8] The percentage of agricultural labourers in the male working force was 14.9 in 1911, 14.8 in 1951, and has increased to 21.0 by 1971.[9] About 7 per cent of male cultivators had agricultural labour as their secondary occupation in 1961.[10] Whereas, in 1951, among the self-supporting persons the percentage of cultivators of land wholely and mainly owned was 46.93, only about 5.01 per cent of them derived subsidiary income as cultivators of land wholely or mainly unowned and as cultivating labourers, and about 5.14 per cent of cultivators of land wholely or mainly unowned (whose percentage was 8.97) derived subsidiary income as cultivating labourers.[11] Cash borrowing (which hardly gives the complete picture of the magnitude of borrowing households on account of a significant degree of non-monetisation found in rural areas) was reported by 51.7 per cent of all rural households in 1951-52 and 48.8 per cent of them in 1961-62 — the most important purpose was reported to be 'Family Expenditure'.[12] The percentage of rural households reporting negative net savings was about 62.62, and their monthly per capita income was about Rs 12.64 in 1962-63.[13] Thus, the majority of those occupied in rural areas are bonded persons and hence, are not able to cover even the bare minimum of their household expenditures out of their earnings in the semi-feudal institutional set-up of rural India. The dominant concern among the rural rich (except perhaps in areas like Punjab, Haryana, Gujarat and Western UP, etc, where the semi-feudal institutional set-up has weakened) is one of enlarging their sphere of influence rather than maximising the rate of return in the capitalist sense of the term. Thus, one finds low net investment and also low utilisation of land and labour in the rural sector. Such is the nature of underemployment in the semi-feudal institutional set-up.

One is tempted at this stage of analysis to borrow Sau's results which are produced in the Table below.[14]

These reveal the strong survival of the semi-feudal structure arising from the uneven distribution of land (the Gini Concentration Ratio is quite high in all states, except Jammu and Kashmir, implying sharp inequality in the distribution of land). Thus the productivity increase is associated with increased intensity of exploitation, and hence with an increasing proportion of persons remaining below the poverty line. The exploited, it seems, are the weaker sections of the rural population, i e, the labourers and the farmers with inadequate land. The unevenness of land distribution, which often results in low utilisation of land and labour, also aggravates the phenomenon of poverty in rural India.

Land reforms to relieve the weaker sections of the population of the burden of debt (inclusive of debt redemption measures) — rather than the existing intensive agricultural developmental programme (which aims essentially at productivity increase by concentrating the distribution of inputs such as improved seeds, fertilisers, and various other aids and subsidies that have created conditions for the growth of 'intermediaries' of all sorts) — are strongly indicated for improving the utilisation of land and labour and for freeing persons from semi-feudal bondage.[15] Thus, the accompanying land augmenting measures and the need for widespread source of supplementary income for the weaker sections of the population are also indicated. It has been shown that adoption of labour-intensive techniques

TABLE: RANK CORRELATION CO-EFFICIENT

	Rural Labour Households as Percentage of All Rural Households (1963-64)	Gini Concentration Ratio of Rural Operational Holdings (1960-61)	Percentage of Rural Households with Less than One Acre of Operational Holding (1960-61)	Net Value of Agricultural Output Per Acre (All-India=100) (1960-61)
Percentage of rural population below the line of poverty (1961-62)	0.88	0.43	0.59	0.46

in non-basic goods' production, increases employment for the same quantity of inputs, leads to increase in costs, and hence, to increased price of the non-basics — without adversely affecting either the rate of profit or the rate of growth of capital.[16] Here there seems to be no conflict between short-run and long-run objectives of employment, unless the demand for the commodity is drastically reduced on account of its increased price. That, of course, may adversely affect output and employment.

There is therefore a case for enforcing the adoption of labour-intensive techniques for production of such non-basics which have a wide and dispersed market. There is always a case for promoting the production of the commodities which have potential markets scattered all over the country, which have widespread production potential in rural sector, and for which the bulk input happens to be labour. We can take a few illustrations to cover each of these types so as to analyse the impact of such a measure.

The textile industry offers a very good example in the Indian context. The product of this industry has a widely dispersed market and has no close substitute. It may be possible to enforce a regulation whereby the weaving of some popular variety of textile is reserved exclusively for the 'process of production not using power'. For example, the 'process of production using power' should be allowed to manufacture only mono-coloured textiles. Processes such as the printing of textiles and the weaving of multi-coloured textiles, would thus be exclusively reserved for the 'household and small producer sector not using power'. This would mean an increase in the relative prices of such textiles (in the absence of a subsidy). Even then, there is likely to be a sufficiently high demand for such varieties. It is even possible to visualise that in the initial phase the demand will be greater than the production. As the demand will be dispersed all over the country, there will be a sufficiently high rate of earning for 'household and small producer sector not using power' resulting in a big push for the expansion of the sector. Suitable policy measures associated with training programmes for weaving and hand-printing of textiles and marketing may result in the quick expansion of this sector all over the country. One can think of other kinds of such protection. In any case, the expansion of 'household and small producer sector not using power' will affect somewhat adversely the textile mill sector. The proportion of population employed in the 'process of production using power' may even decline but the proportion employed in textile production as a whole will increase very rapidly and the increase in employment and earning will be dispersed all over the country. The economic gains to the weaker sections of the population will be considerable. As mono-coloured textiles will be available for low wage and low income earners, these varieties will constitute the basic-good part of the wage-good mix. As subsidy will not be the kingpin of such policy measures, there is little possibility of emergence of 'intermediaries' and parasitic elements which has marked the past two decades of developmental planning.

Let us also take an illustration of a commodity for which the bulk input happens to be labour. An intensive network of trading activity on the part of the government, collecting poultry products from all over the rural areas and bringing them to the urban and other markets, will have an enormous impact on the supplementary earnings of the rural poor. Some initial help by way of advance payment for the poultry product, provision of birds, etc, may also help in the rapid and wide-spread development of this activity.

The oft-quoted 'land augmenting measure' comprises increasing the area under irrigation. Against the background of the analysis in this article, one can confidently say that most of its merit will be lost unless it is accompanied by an institutional set-up to ensure that land is evenly owned by tillers of the soil. There are, however, other land augmenting measures for the areas where the land is not being intensively used largely because of little knowledge about dry farming and similar farm practices. Government could help labourers and tillers to plough such lands jointly in seasons when they are not being used by the owners for cultivation purposes and may allow the net produce (after deducting the seed and other costs incurred by the government except the cost of services rendered by its employees) to be distributed among them. This would not, however, be a feasible proposition in the absence of an institutional set-up wherein land is evenly owned by all those who are tillers of the soil.

In conclusion, we may assert that the existing manufacturing set-up will hardly be capable of generating supplementary income or diverting the population from agriculture to industry with a view to reducing the semi-feudal exploitation. Even if one makes the most optimistic assumption (in view of the past trends and other historical evidence) about the expansion of employment in this sector by about 5 per cent per annum, the impact will hardly be significant. A little mathematical exercise will show that, even after a decade, the share of agriculture in male work force will be more than 66 per cent. The employment base of the manufacturing sector in India is in effect too low to have any significant impact in the near future.

Mortality and Longevity in India, 1901-1961

Kumudini Dandekar

A long-term view of the Indian census life-tables during 1901-1961 indicates:

(a) The health status of the females has been deteriorating vis-a-vis the males.
(b) Mortality for age group 0-4 is less than what is observable elsewhere for the same longevity.
(c) Mortality of age group 0-4 is also relatively less subject to improvement.
(d) Impact of good or bad times in India was seen on the age group 10-29 years.
(e) The pattern of improvement during 1951-61 shakes the earlier pattern of mortality to conform slightly with what one sees elsewhere in the age group 10-29.

One can either accept the above or revise the life-tables on certain plausible hypotheses.

IN the census of 1971, the enumerated population fell short of the population-size expected by the experts. The experts forming a committee for population projections in 1964 had forecast a population of 560 million while the actual population count in 1971 is 547 million for India. The forecast was based on certain assumptions regarding birth and death rates and a decline in them. A smaller population than expected either suggests more decline in birth rate or less decline in death rate than the experts believed since population of India is a closed population. This, of course, on the assumption of the same level of enumeration in the censuses of 1961 and 1971. Skepticism regarding India's capacity to reduce its birth rate leads some quarters to be pessimistic; they believe in less-than-expected decline in death rate as the plausible explanation for the difference in the census count and expected population. The present article sketches the implications of such an explanation after a review of the mortality conditions in India during the twentieth century.

Assessment of mortality conditions in India is based exclusively on the population counted for various age years at the censuses. Thus for the country as a whole the number aged 40 years at a census are regarded as survivors of those aged 30 years at the previous census, conducted a decade ago. Such procedure determines the death rate for various age groups during a decade between the two censuses. Every census has a set of age-specific mortality rates given in a table called the census life-table. The total dependence on the census life-tables for mortality assessment in India is because

(a) Vital registration in India is not dependable.

(b) For any empirical observation regarding mortality, the size of the sample needed for a given level of precision in measurement is large and costly because of variability in conditions with wide range of varying cultures and physical conditions.

(c) There is faith in the near-completeness of enumeration at the census. This is due partly to the vastness of the whole census affair.

(d) Assumption of the same level of under- or over-enumeration at the two consecutive censuses leaves the census life-table comparatively undisturbed.

(e) There is no other go.

The census life-tables commanded faith more for the ingenuity they required for their construction rather than for their reliability. Though highly technical, the construction was based on nothing reliable. The completeness of enumeration was doubted. The uncertainty due to this was often alleviated by the assumption of the same level of underenumeration in the two consecutive censuses. The basis for this was more often ignorance than any sound reasoning. The reported ages have rarely been worthy of reliance. Epidemics and famines upto 1921 always shattered the basis of any respectable guesses. The differential coverage from census to census, if any, could rarely be assessed or corrected for. All these factors resulted in census life-tables with unknown precision. Their assessment needed a long-term as well as a short-term view. The short-term view was provided by the census actuary with his closeness to the census operations. As a technician, he always assured himself of the consistency of the life-tables with other demographic observations. However, a long-term view could hardly be had because of the stagnancy of mortality conditions at a level never observable in modern times for countries with reliable data. A time has perhaps come when a long-term review can be had with great advantage in construction of the life-table. More recently, i e, since 1951, a critical appraisal of the census data from a variety of approaches paved the way for a long-term assessment of mortality and longevity in India.

The census life-tables have a hundred-year history in this country. The decades upto 1921 were intermittently in the grip of famines and epidemics which affected mortality levels and hence the longevity of Indians. In 1881 or 1891 it was about 25 years of life. But in the intervening decades it deteriorated by about 3 or more years. The longevity or expectation of life for a man or woman born in India was as shown in Table A for the various census years.

The mortality conditions for the various census years before 1931 fluctuated erratically due to varying impact of the natural calamities on the two sexes and the various age-groups. The pictures of mortality conditions by the census actuaries constructing life-tables depended as stated before, on their impressions

TABLE A

Census Year	Male Longevity	Female Longevity
1881	23.7	25.6
1891	24.6	25.5
1901	23.6	24.0
1911	22.6	23.3
*1921	19.4	20.9
1931	26.9	26.6
°1941	32.1	31.4
1951	32.5 (33.5)**	31.7 (34.7)**
1961	41.9 (44.2)**	40.6 (45.7)**

° No census life-tables were constructed for these years. K Davis constructed them in his book 'Population of India and Pakistan'.
°° The bracketed figures are estimates by Coale and Hoover.

regarding the well-being of various age-groups in the preceding decade. This was because of the need to correct the age reporting in the censuses. Methods of correction changed from census to census. It is intended to record below the peculiarities of the mortality pattern depicted by the Indian life-tables.

[I] *Greater Longevity of Indian Females than Males before 1931 but Not Later*

The greater longevity of females upto 1921 observed in the above table may be the effect of construction of the life-table on the basis of greater longevity of females observed in other parts of the world for all times and regions. This is not observed for the censuses in India from 1931 on. We may consider two possible hypotheses. One is that the Indian female did have an advantage over the male before 1931. But the conditions deteriorated later in favour of males though they improved the longevity of both. Such a hypothesis upsets our impressions regarding the status of females *vis-a-vis* males.

The other hypothesis is that the earlier life-tables may have to be revised for the proper sex-differentials observed in later censuses on the basis of assumed differential underenumeration in the two sexes. In this revision one has to bear in mind that the sex-ratio for the various census years during the last 70 (or hundred) years shows deteriorating numbers of females compared to males. The trend is so consistent and regular that one believes in it. But its interaction with the two hypotheses stated above leaves one in a perplexing situation. An explanation can be looked for, into (a) differential underenumeration for the two sexes (b) different level of underenumeration from one census to the other. It may be possible to construct relative differences in levels of underenumeration in the censuses on certain plausible assumptions such as:

(a) The health conditions of women relative to men are at least not deteriorating in the successive years.

(b) The levels of enumeration improve with better communications. For the same mortality conditions, this will show better survival for the successive censuses, if communications have improved successively in the later censuses.

(c) The relative levels of enumeration of males and females have differed and these are mainly responsible for the sex-differentials observed in the longevity in the census life-table.

It is not proposed to apply the above criteria and come out with estimates of relative underenumeration in the censuses in the present article. The idea in mentioning the above possibilities is to bear in mind the factor of differential underenumeration, so important in the construction of life-table. When blocks of areas with their population are missed, this administrative inefficiency may affect the enumerations. But it is often for both the sexes. Differential enumeration in sexes is caused by different factors. The reasons behind such underenumeration are likely to be cultural. For instance, the desire to report or not, a male or female. These being deeply embedded in the fabric of the society cannot be easily brought to the surface. A critical appraisal of the kind stated above may help fathoming such factors. The difference in longevity of males and females is about +2 years in the earlier decades and —1 year in the later decades. It may seem small. But the expectation is that the sign also must change. In the present situation one has to decide on two years' difference in longevity of females for only 24 years' of males. This involves the questionability of more than 8 per cent female life. One can clearly see the importance of thrashing out the problem.

[II] *Gain in Longevity in the Successive Censuses*

There was no addition to longevity during the course of 50 years since 1872. If at all, there seemed deterioration of mortality conditions with erratic impact of famines and epidemics. One peculiarity of the census life-tables upto 1921 was that the impact of good or bad times in those days affected most the mortality in the age group 10 to 29 years or so. This will have to be borne in mind especially when one discusses the mortality pattern and change in it in the later censuses.

Compared to past better-year average longevities, there was an addition to them of about 3 years during the decade 1921-31. This was supposedly the first decade in the Indian region completely free of famines or epidemics in the present century. One took for granted this addition to longevity. But the addition of about 5 years during 1931-41 by the life-table (by K Davis) for 1941* cannot be easily explained after a review of life-tables in the successive decades. For instance, the performance in the decade 1941-51 seems unexpectedly dull when compared with 1931-41. This may be the result of judgments in constructing the life-tables for the two decades. One is therefore tempted to leave out either 1941 or 1951 life-table as "not in line with" other census life-tables. One may assume that about 6 years of life was added during 1931-51 and probably there is no disagreement on the point.

During 1951-1961, more than nine years' longevity was added to human life in India. Besides the census estimate of the life-table, other estimates such as those of Coale and Hoover were made not only for 1951 but for later years. Coale and Hoover estimates announced slightly higher longevities than those by the census for 1951 as well as 1961. Besides, they insisted on a higher longevity for females than for males as observed in the rest of the world, implying an underenumeration of females in the Indian censuses relative to males. The discrepancies between the census life-tables and those by Coale and Hoover (or any set of model life-tables such as those by the United Nations or Coale and Demeny) can be discussed by analysing the mortality pattern in India for various age groups. The need for such an analysis arises due to the need for higher precision in mortality measurement stated in the next paragraph.

From 1951 on, there is a special interest in the census life-tables. Besides the interest in the life-tables *per se*, the impact of death-decline on the population growth has to be distinguished from the impact of decline in birth rate. This enhances the desire to measure birth and death rates with precision. Unfortunately one has still to rely on census enumerations to get trustworthy figures for both. The error in one direction or the other throws people into pessimism or optimism and one has to wait for another decade and a census to revise one's impressions with confidence. 1971 census is a good example of the conflict in the pessimistic and optimistic attitudes and it puts to test the capabilities of modern demographers at precision of measurement.

[III] *Lower Mortality in Infancy in India than Elsewhere*

For any given level of longevity the death rate for the age group 0-4 years is smaller in Indian life-tables of all times upto 1961. A comparatively higher death rate for age 5-9 years does not make up for the higher mortality in age group 0-4 years observed in any other life-tables, such as those by Coale and Hoover, Coale and Demeny or the United Nations. The other peculiarity is the higher death rate in the Indian life-tables upto age 30 than elsewhere for the age period, 10-29 years for the same longevity levels. If the Indian situation is to be relied upon, what possibly could be an explanation?

One has to look into the cultural set-up of India for an explanation. One possibility seems to be the long duration of breast-feeding observed in India. With long duration of breast-feeding the Indian babies (male and female) are possibly less exposed to external hygiene and the hazards accompanying low levels of nutrition. Hence the age group 0-4 years may be more secure in India than elsewhere for the same level of longevity. On the other hand, the earlier half of adulthood of women may be more insecure in India for the same reason, i e, constant erosion of calcium through breast-feeding without any help from nutrition. As for adult males, their relatively higher death rate in earlier half of adulthood compared to that found elsewhere (for the same longevity) may be due to low levels of living and nutrition.

In case the above explanation for the observed pattern of mortality is not acceptable, the other alternative is to revise the Indian life-tables to conform to the pattern observed elsewhere. The only part of the life-tables which is not based on actual observations is the earliest age group 0-4 years. If it was to be brought in line with the death rates for later age years, the resulting Indian longevity will have to be revised and it will be reduced appreciably. This will upset the consistency of the life-tables with other demographic set-up of the census with its birth and death rates. The other possibility is to revise smoothing procedure for age group 10-29 years.

[IV] *Change in the Observed Pattern of Mortality during* 1951-61

A comparison of the three sets of life-tables (namely Indian Census life-tables, UN Model life-tables, Coale and Demeny life-tables) consistently brought out the peculiar features of Indian mortality discussed above. However, the census life-table for 1961 seemed to alter the earlier pattern. The age-group-specific mortality rates for the census life-tables were of course lower as usual for age group 0-4. But they were lower for the census also for the age groups upto 30 after which they rose higher. It seemed that the pattern of death rates for the age group 10-29 for India in 1961 was the same as that indicated by Coale and Hoover. But this was for a higher longevity with Coale and Hoover. Thus it is worthwhile comparing the improvements in mortality till 1951 and 1961 to bring out the change in the pattern. This is done below.

Indexes of improvement in mortality in 1951 and 1961 were constructed with 1911 and 1931 as bases. The use of 1911 as base was because the decade 1901-11 was comparatively free of famines and epidemics. The use of 1931 was suggested for the same reason besides its smooth age distribution based on different considerations. These are presented for males and females in

° The 1941 census had no life-table. Hence K Davis constructed it. It does not fit in properly with the life-tables constructed by the census actuaries. It is a typical example of how the construction of life-table is moulded by judgments.

TABLE 1: MORTALITY INDEX, 1911-1961, INDIA

Age Group	Males						Females					
	1911	1921	1931	1941	1951	1961	1911	1921	1931	1941	1951	1961
0- 4	100	109	89	79	67	50	100	102	86	77	74	52

e_0^0=Longevity

Source: "The Demography of Ceylon" by N K Sarkar (1957). The figures from the book were adjusted for comparability with Indian indexes which were based on probabilities of death.

Tables 1 and 2. The Tables show that with 1911 as base year the mortality rate for age-group 0-4 years of males was only 67 per cent in 1951 and 50 per cent respectively upto 1951 and 1961. On the other hand for age group 5-19, the improvement was less than 20 per cent in 1951 but 66 per cent in 1961 as compared to 1911. Similar trend is observable for ages upto 39 for males and upto 29 for females.

With 1931 as base year one observes similar pattern of improvement in 1961 and 1951 as observed above except for the age groups 5-19 for males and 5-9 for females in 1951 when the conditions seemed to deteriorate. The similarity means an exceptional improvement in the age period 10-39 or so in 1961. An explanation for the deterioration of conditions for certain age-groups observed in 1951 has to be sought in the smoothing procedures or underenumerations. Correcting them in one direction or the other may have far-reaching effects. However, while using 1931 as the base, 1941 pattern of improvement does not seem inconsistent and one wonders whether one should accept the 1941 or 1951 pattern.

The effect of the above was that with a specific gain in overall longevity, the addition in longevity due to improvement in mortality of age group 0-4 though higher than in any other age group of similar size, was much smaller compared to additions observed elsewhere. For instance with 15 years added to Indian longevity during 1931-61, only 5 were added by improvement before age 5 and the rest spread over the whole age span. Could it be possible that the relative improvements in mortality in age group 0-4 were also put away because of its being protected with breast-feeding?

The implications of the pattern of improvement in mortality may be interpreted as under:

The Indian pattern of mortality from 1921-1951 perhaps reflects what improvement could occur in a poor, tropical, big country by cessation of epidemics with certain cheap preventive measures and perhaps a little improvement in hygiene. It also reflects the cessation of famines with improved communication facilities. But the mortality improvement in 1951-61 reflects the reactions of the country to modern medical facilities at low levels of living including preventive measures such as the use of DDT, BCG, or the use of curative drugs such as sulpha-drugs, etc. Living conditions in India may not have appreciably changed to effect improvement in the ever-handicapped early working age upto 30 years. But the control of malaria and similiar disabling diseases perhaps helped these ages. To have further improvement above age 30, perhaps a change in the living conditions is necessary. Further, the breast-feeding may protect babies in their infancy at very low levels of longevity. But the same may keep away improvements in it at slightly higher longevities.

The experience of no country in the world seems closer to India than that of Ceylon and still Ceylon had more than 62 years of longevity in 1963. However, it had about 47 years' longevity in 1947. Though the living conditions are different in the two countries, the cultural set-up is very much the same. For various reasons the reliability of vital data for that country is likely to be high. The pattern of improvement in mortality in Ceylon (Table 3) during 1901-1947 can be compared to India during 1911-1941, though India had a smaller longevity. There are two possible patterns of improvement in Indian mortality which may go with the Ceylonese pattern of 1945-47. One is the 1941 pattern and the other the 1951 pattern. One does not know which pattern to choose for India. In any case, both the Indian patterns need a correction and a bigger correction is needed for 1951 than for 1941. But with correction of the pattern, one may have a rough estimate of underenumeration at either of the two Indian censuses.

Analysing the pattern of mortality in India during 1901-1961, one can look at the 1971 census with a 'prepared' eye. The level of improvement in Ceylon of about 1950, is what the experts have assumed for 1971 India in their projections (in 1964). The longevity in 1951 census, if in doubt, was likely to be higher than observed by 1941 standards. In that case the gain observed in 1951-61 is not much and there is much room for improvement in 1961-71, even with the prevalent low levels of living in the country. The increase in medical facilities, the increased coverage in malaria control is expected to bring the backward states in line with the others and the impact of such measures is estimated to be effective in 1961-71 as much as in 1951-61. If not, the health-status in the various states is going to be divergent. This would be a blot on the avowed policy by Indian planners of even distribution of the basic and elementary fruits of planning.

One therefore eagerly awaits the 1971 census life-tables. It is hoped they are not biased by preconceptions regarding less or more longevity (than that estimated by experts committee) added to Indian life during 1961-71.

What the Critics said of

ZULFIKAR ALI BHUTTO's

The Myth of Independence

published in 1969

'This book which is the testament of the author acquires special significance and deserves careful reading.' *Financial Express*

'Through this provocatively informed book he has presented himself as the ardent patriot, fully capable of stirring and arousing people.' *Hindustan Times*

'The real question is: how seriously can one take Mr Bhutto? . . . . There is of course much else in Bhutto's book besides arraignment of India. After all he is also concerned with the future of international relations in general. There is occasionally shrewdness, even wisdom, and often a pitiless logic in his exposition.' *Economic Times*

'His analysis of the changing relationship between the Super Powers, the emergence of non-aligned nations and the causes of the debacle of the Arabs is brilliant . . . but such an impression is shattered when one comes to his tirade against India. . . . It is said that one's writing is a mirror of his own personality. This adage is perhaps very true in the case of Mr Bhutto.' *Tribune*

'This is an important book . . . of special interest to the people of India.' *Indian Express*

'Coldly reasoned. . . . This is a powerful book.' *Times Literary Supplement*

India's Sugar Exports: Re-Assessment of Rationale

Goutam K Sarkar

India first undertook sugar exports in 1957. From the latter half of 1961, government has been sharing the rupee losses on account of sugar exports. Over the years 1961-62 to 1967-68, these subsidies for sugar export amounted to as much as 60 per cent of the foreign exchange earned thereby. And in certain years — 1962-63, 1965-66 and 1966-67 — thesubsidies either equalled or substantially exceeded the exchange earnings from sugar.

The fact is that we clearly do not have a comparative costs advantage in sugar. The cost structure of the industry is far too high to warrant export — without losses being incurred by the industry or without official subsidy. And the extent of reorganisation of cane and sugar production that would be required for Indian sugar to become significantly cheaper puts viable sugar exports beyond the pale of the practically possible. Moreover, the developed countries have in sugar-beet a perfect substitute for sugar-cane which they, therefore, try to protect. Sugar also has a low income elasticity in the affluent sugar-importing countries.

Although all these adverse factors exports of sugar continue to be susidised, reflecting our misplaced investment decisions flowing from the ill-conceived notion that exports have to be promoted at any price.

[The views expressed in this article are author's own.]

I

The Background of Exports

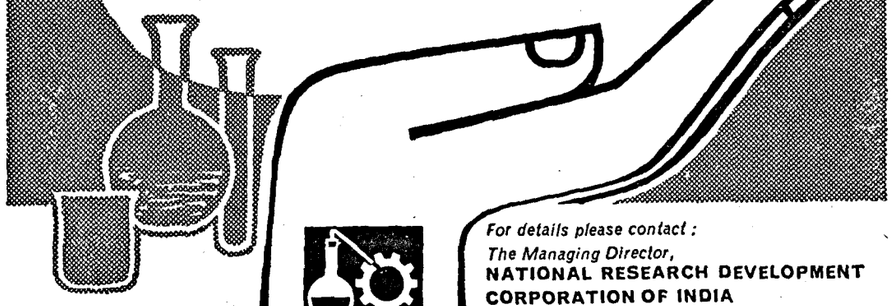
ALTHOUGH the requirements of economic development underline the need to earn foreign exchange, the view that all our exports have to be permanently promoted *at any price* is ill-conceived. India's subsidised sugar exports provide a rather striking example of export planning based on such a view.

When, in 1957, India made an encouraging entry into the world sugar market, exporting sugar to various countries especially in Asia and East Africa, international market prices of the commodity were higher than the cost-price of it in India so that the Indian sugar industry could export without incurring losses. But the buoyancy — which was in any case the result of the Suez crisis and the poor beet crop in Europe — was short-lived. In 1958, the world prices of sugar slumped to unremunerative levels. From 1958, then, up to the middle of 1961, the industry was fully bearing the losses on sugar exports under the Sugar Export Promotion Act of 1958. The Act empowered the government of India to fix export quotas from time to time, and to apportion them to the various factories. The price paid to producers depended on the realisation from the foreign market less the expenses incurred.

From the latter half of 1961 exports were pushed up considerably, with particular emphasis on raw sugar exports to the US and Canada. This step-up was supported by government-adopted schemes for sharing the export losses with the industry. The industry also pleaded its inability to meet its liabilities due to the implementation of the Wage Board Report. Since it was considered inadvisable to raise the consumer price of the commodity, the industry was allowed to supply sugar for export on a no-profit no-loss basis, which meant that it had to bear just a very small burden considering that exports were only a fraction of its national turnover on which the industry earned a profit. Thus the actual losses on exports — equalling the difference between the purchase prices and the f o b realisations (net of expenses) from overseas markets had to be borne by the government in the form of a subsidy.[1] Sugar for export was bought by the government from selected sugar factories on the basis of tenders, and the bulk of it went to the US, Japan Canada, and the UK. Exports to the US were subject to a statutory quota allowed under the United States Sugar Act, while those to the UK and Canada were governed by the Commonwealth Sugar Agreement.

In 1968 and 1969, when sugar exports were restricted to the preferential (negotiated price quota) markets of the US and the UK, the industry agreed to meet the entire losses. In 1970, the industry undertook to bear the losses only on the preferential exports of about one lakh tonnes. The State Trading Corporation decided to export about 50,000 tonnes at substantial losses under barter arrangements and the government agreed to subsidise an additional export of 80,000 tonnes. Tables 1 and 2 give the volume and value of exports of Indian sugar in recent years.

II



Extent of Subsidy

Losses on exports of sugar are quite a common feature among a number of major exporting countries; moreover, the difference between the domestic price the export price of Indian sugar does not compare very unfavourably with the corresponding difference in some of the other sugar-exporting countries. Export subsidies on primary commodities are not uncommon either, and are allowed under GATT. However, most of the leading sugar-exporting countries — e g, Cuba, Hawaii, Puerto Rico, Brazil, Mexico, Philippines, and Mauritius — arrange to ship the bulk of their sugar to the relatively steady preferential markets and channel a much smaller volume to the free markets. Their losses on export are thus relatively small compared with those of India which has to sell very large part of its sugar in free markets abroad, where the prices are much lower than in the preferential markets (Table 3).

The initiation of the International Sugar Agreement since January 1, 1969, has somewhat improved the world sugar situation, and the international prices of sugar have picked up compared with those obtaining in the pre-Agreement years. However, notwithstanding this short-run improvement in world prices, sugar exports from India have to be

made at 'losses' since the cost-price of Indian sugar is much higher than the ruling world prices. Table 4 sets out the values of sugar exports from India and the amounts paid to industry as subsidy.

Over the years 1961-62 to 1967-68, these subsidies amounted to as much as 60 per cent of the foreign exchange earned from sugar exports. Even if the two years, 1968-69 and 1969-70, when no subsidies had to be paid are taken into account, subsidies paid over the decade aggregated 53 per cent of the exchange earned from sugar exports. And in a number of years, e g, 1962-63, 1965-66, and 1966-67, the subsidies either almost equalled or substantially exceeded the exchange-earnings from sugar.

III

Impediment to Viable Exports

The Sugar Enquiry Commission (1965) recorded a rather unqualified support for the subsidies on sugar exports, and recommended that the entire losses on sugar exports should be borne out of the excise duties on sugar. It even suggested a stepping up if necessary of the rate of excise duty for the purpose.[2] The Commission thus happily ignored the undesirable features of the the export subsidy scheme, which should have been used as a temporary expedient. The basic drawback of two-price export subsidy is that it disguises the true cost from the consumer and gives better terms to the generally more affluent foreign buyer. From Table 3 one can gauge the higher domestic prices of sugar in India compared with its export prices in recent years. The suitability of sugar, in particular, for such subsidy must be severely open to question. For, sugar is a commodity in which we clearly do not enjoy comparative costs advantage and of which the export potential is not promising at all.

In fact, sugarcane is unique among tropical crops, in that, a perfect substitute for it can be found in temperate countries: about half of the world's sugar is produced from sugar beet and a number of European countries export sugar. Thus sugar is a commodity which we have to produce in direct competition with developed countries, too, which have naturally sought to protect their domestic producers — though some of them have ensured some preferential price treatment to the exports of developing countries.

Furthermore, sugar has a generally low income-elasticity of demand in the wealthier sugar-importing countries, and this *inter alia* adversely affects its potential for long-run demand expansion. Thus the secular prospects of remunerative international trade in sugar are poor. And, owing to its residual nature, it is quite possible that prices on the 'free market' would remain below most

TABLE 4: VALUE OF, AND SUBSIDIES ON, INDIA'S SUGAR EXPORTS

countries' average production costs so long as surplus sugar from countries with protected sugar industries continues to be dumped.[3] Neither the International Sugar Agreement, nor the bilateral arrangements covering the other half of the world sugar trade, can ensure a better long-term equilibrium in the world sugar economy through a closer balance between world production and consumption.

The basic impediment in the way of exporting sugar from India lies in its high cost of production even as not enough sugar is produced for domestic demand. Along with wages price of cane is the most important component of production costs of sugar. Since a reduction in wages can be ruled out, lower cane prices become imperative. Here it is interesting to note that the support prices of sugarcane in India (exceeding 50 per cent of the total cost of production of sugar) are much higher than the prescribed minimum prices ensured to cane producers in the major sugar-exporting countries. Table 6, which contains data on the producer prices of sugarcane in India and in two other major sugar-exporting countries, partly illustrates this.

However, a reduction in cane prices in India can be ruled out too unless sweeping measures are adopted to step up productivity per unit area, and incomes of cane-growers are thereby safeguarded. Also, there is the need for substantial improvement in quality (percentage recovery per unit) of sugarcane. The main facets of such rationalisation would be intensive sugarcane research, modern, scientific methods of cultivation, water management, utilisation of fertilisers, and selection of improved varieties through efficient cross-breeding, comparable with those evolved for some foodgrains.

Secondly, a *significant* reduction in the cost of production of sugar would also entail a comprehensive improvement in the efficiency of the sugar factories, particularly through modernisation. Although some Indian sugar mills have made considerable progress in adopting superior manufacturing techniques, the milling performance of a large number of factories (which were set up in the period 1930 to 1936) with their worn-out machinery is quite unsatisfactory and leads to low rates of extraction. Lack of uniformity in the standard of the product also adversely affects its acceptance in some foreign markets.

Yet another reason for the high f o b costs of Indian sugar is costly transportation (mainly railway freight) and handling charges. To bring down the high costs involved in transporting sugar to the ports, it would be necessary to set up economic and large-scale sugar units, planned exclusively for export — comparable with those in other leading sugar-exporting countries — preferably situated near the ports in the more productive regions like Maharashtra and and the Southern states. It would also be necessary to develop special handling facilities and adequate storage facilities at the favourably located ports.

IV

No Economic Logic in Export

Financially, and otherwise, measures involving such a radical re-orientation of the cost-structure of the sugar industry is an uphill task. After all, even as it stands, the development of the industry has enjoyed a protected market, and sugar prices have ruled too high by international standards and in relation to the country's low *per capita* income. Since exports are not viable on their own, there is little logic in pursuing them, especially given the very low levels of *per capita* sugar intake in the country (Table 7).

There may be a case, meanwhile, for exploring practical ways of scrapping the uneconomic units. In a study by R K Singh[4] it was pointed out that, toward the beginning of this decade, Indian sugar cost about Rs 25 per maund (ex-factory) against the world price of about Rs 17. Another study[5] relating to the season 1964-65 revealed that the average export price of Indian sugar was around 8.5 cents per lb excluding taxes, which meant that India was in a very difficult position to compete in the world market without excessive subsidy: as seen from Table 3, the export prices of sugar at the Caribbean ports were 5.87 and 2.11 cents per lb in 1964 and 1965, respectively, and even the negotiated prices in the preferential markets were substantially lower. Nothing seems to have happened since then to reduce the price disparity. Rather, a prolonged 'spoon-feeding' may have had an uneconomic influence. One may easily venture the conclusion that the ex-factory prices of sugar now would continue to rule much higher than the world prices. For instance, in recent years, the minimum ex-factory price of sugar (D-29 variety) in India has been around Rs 140 per quintal — equivalent to about 8.5 cents per lb — whereas the export prices at the Caribbean ports have ranged between 2 and 4 cents per lb only.[6]

In the circumstances, a continued drain by way of export subsidies on the government's budget, and the plethora of administrative problems involved in the export scheme, for a commodity whose export standing and prospects are so poor is nothing but a reflection of our misplaced export investment decisions.

Haberler has made a meaningful distinction between *compensatory* export subsidies and *pure* export subsidies. The former are intended to safeguard producers from the competitive disadvantage caused by special domestic fiscal imposts on a commodity. The latter go further than to compensate for this disadvantage in that, they are intended to give definite advantages to exporters *vis-a-vis* their foreign competitors by lowering the export costs of the commodity below what they would be without the fiscal imposts (G P Verbit, "Trade Agreements for Developing Countries", Columbia University Press, 1969, pp 149-159). The subsidies on sugar exported from India can thus be considered as pure subsidies, and it is these rather than the compensatory subsidies which have generally caused complications in international trade.

Multi Service Agency

BANK of Baroda's Multi Service Agency Branch was inaugurated on April 25, 1972. The Multi Service Agency represents an attempt to bring credit within the reach of a vast multitude of social and economic groups. This agency will strive to make credit an instrument of social uplift and of economic welfare of the hitherto neglected sections of society by enabling them to earn reasonable income through self-employment.

As its very name indicates, the Multi Service Agency will provide small borrowers integrated financial assistance as well as a package of technical services such as procurement of raw materials, management of business and marketing of products. The Multi Service Agency is thus primarily a service agency, providing a range of services to a wide spectrum of small borrowers with a view to helping them organise and plan their business more profitably.

The needs of small borrowers and their problems vary considerably. Hence the blanket scheme of credit for all borrowers will not achieve the intended results. The Multi Service Agency will prepare separate schemes for various categories of small borrowers. Instead of waiting for small borrowers to come to the Bank's premises, the Multi Service Agency will go to their very doorsteps. Apart from giving financial and non-financial assistance, the Agency will help them approach various government authorities to solve their problems. Since certain sections of small borrowers to be served are not even literate, the officers of the Multi Service Agency will even help them fill up the application forms etc. The application forms have been simplified and printed in regional languages predominant in Bombay City where the activities of this Agency will be initially confined. Gradually as it gains experience, the services of the Agency will be extended to other important centres such as Delhi, Kanpur, Ahmedabad and districts where the Bank of Baroda has been assigned the 'lead bank' role.

The Multi Service Agency will provide finance at a concessional rate of 4 per cent (2 per cent below Bank rate) to certain 'approved' categories of small borrowers. Apart from the concessional rate of interest, easy repayment schedule will be worked out with due regard to the specific needs of various kinds of small borrowers.

As part of its future plans, the Multi Service Agency proposes to set up a guidance cell, to provide technical advice and consultancy services to small industrialists and other professionals on use of raw materials, registration procedures, and financial, technical and managerial problems.

Indian Aluminium Company Limited

Speech of the Chairman, Mr H V R Iengar

THE following is the speech of the Chairman, Mr H V R Iengar, at the Thirty-fourth Annual General Meeting of Indian Aluminium Company Limited, held on April 26, 1972:

I welcome you to the Thirty-fourth Annual General Meeting of the Company. For reasons of health I could not be with you last year and it therefore gives me particular pleasure to be here again.

Eventful Year

1971 was an eventful year for the country. Memory is still fresh of the vast influx of population from across our eastern border, of the subsequent events leading to a conflict with Pakistan, of our great military victory and of the birth of a new nation: Bangladesh.

While I rejoice at the happy ending of what had started as a sad story, I also wish to draw certain conclusions from the recent events. Perhaps, the most important factor in the success of our military effort was the direction and leadership provided by the Prime Minister and her government. And this I say without in any way discounting the exemplary heroism and the dedication to duty of our Armed Forces. Secondly, the events have shown the inherent capability and maturity of the Indian economy to meet unexpected crisis of vast dimensions.

There may be other conclusions to draw but this is not the occasion to discuss them at any length. Suffice it to say that we should take note of the factors that gave us strength at the time of the national emergency and examine if the same direction and discipline can be used in furthering the objectives of national development.

Commissioning of New Sheet Mill

Insofar as your Company is concerned, the highlight of 1971 was the commissioning of the new sheet mill at Taloja. The Hot and Cold mills were brought into operation in December, and further finishing facilities will be brought into use as they become available during the first half of 1972. Taloja is a very modern and technically sophisticated plant and should prove a most important addition to our facilities. Naturally, to make the best use of this installation, we are anxious to expand it as rapidly as may be practicable.

Semi-fabricated operational capacity is linked by Government to smelter capacity at about 50 per cent level. This calls for a balanced development of both fabricating and smelting capacity. Apart from this, there is the need to expand aluminium production to meet the growing demands of the Indian market. We are therefore actively planning further expansion at Belgaum which should add an additional 20,000 tonnes per annum of smelter capacity there and give us scope for adding 10,000 tonnes per annum of related semi-fabricated capacity.

Exceptionally Well

Our plants performed exceptionally well in 1971. While Belgaum achieved its planned production increase, it is very pleasing to record that our older plants at Muri, Hirakud, Alupuram and Belur broke previously established records of production. Unfortunately, we suffered a two months shut-down of our foil plant at Kalwa due to labour trouble.

Prices continue to be controlled at the levels fixed by Government in May 1971 and the Company has had to absorb further large increases in basic raw material costs. To show reasonably creditable results in spite of this has only been possible by considerable improvements in efficiency at all the plants. But the level of efficiency attained, which can fairly be described as equal to the best international standard, now leaves a very much narrower scope for any further improvement.

Bonus Issue

In my speech last year I had stated that an application had been made to the Controller of Capital Issues for permission to issue bonus shares in the ratio of one to two. I had hoped to announce to you at this meeting that this approval has been received, but at the time of writing this speech it is still awaited. The reason for the delay is that the matter of the bonus issue is linked with a reduction in Alcan's equity in this Company according to the current policy of Government. I am glad to tell you that Alcan have readily indicated to us their willingness to conform to our national policy in respect of gradual reduction of foreign equity participation in an Indian Company. They are, however, concerned that the reduction should not be done in a manner that would be incompatible with sound financing policies and/or the interest of the existing shareholders. These matters are under discussion with Government and your management is optimistic that a satisfactory solution will be found.

Three Budgets

During the past twelve months three budgets have been brought in, which have, or will have, an effect on your Company's results. With the removal of the aluminium industry from the category of a priority industry last year, the company's income tax rate went up from 50.6 per cent to 55 per cent. In the "mini budget" last December a surcharge of 2½ per cent on income tax was levied which was raised to 5 per cent in the recent budget; these have now increased the effective tax rate to 57.75 per cent. In addition, as you all know, the budget speech last year stated that Development Rebate would be withdrawn at the end of May 1974.

Not Averse

Whilst these measures will slow down investment, the budget proposes a substantial increase in Plan outlay. If an increase in monetary outlay is not to lead to higher prices, there must be an adequate growth in real resources to match the faster rate of Plan outlay. Unfortunately, the fiscal proposals do not appear to support a policy which calls for increased saving and investment.

Whilst the Finance Minister has expressed himself as not being averse to fiscal concessions, he has intimated that any new concessions are likely to be for labour intensive industries in the less developed parts of the country. While this is sound enough as a matter of general policy I hope it will not be rigidly observed, particularly in the matter of production of the basic raw materials of growth, which are generally in short supply even at the present levels of activity — for these are highly capital intensive and the direct employment they give to labour is minimal though substantial enough if account is taken of secondary and tertiary employment. Moreover being highly capital intensive, their location has necessarily to be more on the basis of availability of raw material, power supply and markets. We therefore hope that in the interests of increasing the production of scarce metals and in the light of the recent increases in taxation, the decision to do away with the relief that Development Rebate provided for new investment will be restudied. I will not take any more of your time in going into the details of the Company's operations during 1971. These are contained in the report of the Directors which has been with you for sometime.

Before I conclude I should like to give, on your behalf as well as my own, our thanks to the management and all the employees of the Company for the hard and intelligent work that they have done during the past year.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Statement by the Chairman
Shri Mulki Sunder Ram Shetty

at the 40th Annual General Meeting of the Shareholders of the Bank held at Mangalore on April 28, 1972

Ladies and Gentlemen,

It is my privilege today to welcome you to the 40th Annual General Meeting of the Bank. Our performance in the period under review has been creditable as will be seen from the figures before you. I take it that you have already read the Balance Sheet and Profit and Loss Account for the year 1971.

The Economic Scene in 1971

In the year left behind, the political arena in the country was dominant, and replete with events, some of which led the country to the crest of history. Early in the year the setting up of a stable government at the centre, with a thumping majority for the ruling group in the general elections to Parliament was the big event in our political scene. Soon started the refugee problem by the influx of evacuees from East Pakistan culminating in a fourteen day war at the end of the year. While the war with Pakistan left some small dents in our economy it also built up an image for us in the world of nations, created greater confidence in us and a new spirit to meet the emerging challenges. It must also be said to the glory of the nation that all political parties stood solidly behind the government throughout this period of crisis.

There were natural calamities like floods and droughts in different states, including a devastating cyclone. The familiar features of inflation, rising costs, labour unrest and unemployment did however have their natural repercussions. The financial burden on our economy increased so heavily that additional taxation had to be resorted to by the government in the middle of the year. The dollar crisis and the consequent stir in the exchange market were dealt with by our government with an alert awareness of the international monetary situation. Exports were kept up and the foreign exchange reserve was satisfactory during the year. As the year progressed the economy showed distinct signs of slackening, with a pronounced slowdown in industrial production, but as a redeeming feature, the production of food grains was maintained.

It is against this background that we examine the performance of our Bank, a bank in the private sector working in close competition with the other larger banks spread all over the country.

The Banking System

The year 1971 was a fairly successful year of steady growth for all the banks. The average growth of deposits for all the banks in India together was 20.6 per cent as against 16.4 per cent in 1970. The number of branches increased to 12,985 from 11,184 in the last year. On an average 150 new bank offices per month were opened in 1971. The average population served by a branch of the bank declined to 42,000 in December 1971 from 52,000 in December 1970, and 65,000 in June 1969. The banks met their challenge of deposit mobilisation with added vigour to take the total deposits to Rs 6,856 crores at the end of the year 1971. The credit needs of the priority sectors continued to get support from all the banks. The total advances of all banks stood at Rs 4,966 crores at the end of the year. The credit expansion in the banking system was only 11.5 per cent in 1971 as against 23.1 per cent in 1970. Unlike in 1970, deposits did not lag behind credit in 1971. The average credit deposit ratio was as high as 77.4 per cent in 1971 but the bank borrowings from the Reserve Bank to meet credit needs were less than in the previous year.

The report of the Banking Commission set up in 1969 has already been presented to the Parliament. Further developments in the structure and organisation of banking in the country are awaited, depending on the extent of the government's acceptance of the Commission's recommendations.

Our Bank

The deposits of our Bank stood at Rs 43.64 crores on December 31, 1971. The increase in deposits was 58 per cent as against the average growth of 20.6 per cent of all the banks. For us three successive years have been record years. To keep up the momentum was a big challenge. To have kept it was a proud achievement.

It is no small pride for us to give you a flash back. Ten years ago in 1961 our deposits stood at only Rs 1.44 crores. In May 1962 your present Chairman took over as the Honorary Chairman of the Bank. Seven years later, in May 1969 when the Honorary Chairman was appointed as the full-time Chairman and Chief Executive of the Bank, the deposits were below Rs 15 crores. In a few months, by 1969 December, it was Rs 18.71 crores, an increase of 42 per cent over 1968. In 1970 it was Rs 27.52 crores, an increase of 47 per cent over 1969. In 1971 it was Rs 43.64 crores, an increase of over 58 per cent over 1970, probably the highest among banks in the country. I repeat, it was a record for us. Our advances increased by 47 per cent in 1971 and stood at Rs 25.84 crores with

the average credit deposit ratio in 1971 at 63.35 per cent. As you will see from the Balance Sheet, our working results were encouraging. Our gross earnings rose by nearly 53 per cent and our net profit by about 75 per cent to enable us to step up our rate of dividend this year to 12 per cent.

We have opened 15 branches in the year 1971, taking the total number of branches to 141 at the end of the year. 75 per cent of our branches are in the rural and semi-urban areas and 25 per cent in urban and metropolitan areas. Today, we have over 150 branches. Our target for the year is 200 branches. Against 21 branches in 1961, you can imagine the long way that we have travelled these 10 years.

Current Year

The potential for further deposit growth through branch expansion still exists. But banks have now to go slow and be more selective in their approach to branch expansion. Unless a village or a town is a really potential centre, the banks should not venture into such places. Wastage of man-power and other resources has to be eliminated. Nevertheless, the Reserve Bank of India has programmed the opening of 5,000 branches, in the next 3 years which should work out at about 140 branches a month. In the face of this proposed massive expansion, to what extent an individual bank in the private sector can grow in the years ahead is a matter of guess. But from the growth achieved in the last few years I am as optimistic as ever. Let us hope for the best. It was not a mere expansion for us in 1971 but more a consolidation of our position in centres where we had established earlier.

We obtained in the year under report a licence to deal in foreign Exchange. We have opened a Foreign Exchange Department in our Bank to deal in all foreign currencies. Your Chairman went abroad to establish contacts with some of the foreign banks in the month of October 1971. The Bank has now account and agency arrangements with many of the leading banks in other countries. The Bank is at present conducting foreign exchange operations from seven centres — Bangalore, Mangalore, Bombay, Madras, Cochin, Delhi and Hyderabad. More centres will be covered as and when it is deemed necessary.

Personnel

At the end of 1970 we had on our staff 1,462 persons of all categories. At the end of 1971 the strength was just 1,896, an increase of 30 per cent. Our staff deposit ratio stood at 52 per crore of deposits at the beginning of the year. It has declined to 43 per crore at the end of 1971. Our working ratio of salaries and allowances to gross earnings declined from 33½ per cent in 1970 to 29 per cent in 1971.

Our growth is fast and the need for training our staff is engaging our attention. In addition to training them in our own Training Institute, we send some of our officers to courses conducted by the Reserve Bank of India and other training establishments in the country. Our Chief Accountant was at the Administrative Staff College, Hyderabad, for a short course on financial administration. We had sent one of the officers in our agricultural advance cell for a course on Farm Credit Management conducted by the Indian Education Committee, New Delhi. The 23-day course included 18 days tour of Thailand, Philippines, Japan, South Korea and Hong Kong. We propose to depute one of our senior managers to attend the International Banking Summer School in the United States and another officer to Germany for training in foreign exchange. We have plans to train more of them both in and outside India. On the initiative taken by the Reserve Bank of India, a combined staff training college is soon to be set up at Coimbatore for the non-nationalised banks in South India. It will interest ou to know that your Chairman has been elected as the first Chairman of the governing body of the combined staff college.

In a developing institution, no single individual at any level is expected to shoulder the increasing demands for technical competence. What we have yet to do therefore is a further streamlining of our administration in keeping with current management thinking. The pattern of banking has changed. As I said a year or two ago, the old concepts in the management of men, money and material are being pushed out of vogue by the rising tide of social and scientific forces. What is demanded of banks is a high degree of resilience in set up, staff and structure to meet the changing concepts and conditions. The new trends and techniques call for enterprise and expertise at every level. We have to grow our own executive timber. We hope to start a department for management development to develop our own personnel to occupy managerial and executive posts. The purpose behind is to keep well trained men readily available to fill up posts. We must have the right men at the right time in the right place, individuals developed by us with a sense of pride in the organisation and a feeling of growing participation in the progress. We are a bank predominantly youthful in its staff structure with a good spicing of age and maturity at the superstructure. It is only natural for us to grow and grow we must.

Our Thanks

Now let me pay my tributes to our esteemed members of the Board of Directors. My colleagues on the Board gave me their unstinted cooperation. Very sincerely I thank all of them and also the members of the Local Adisory Committees for their unfailing support.

My thanks are due to the Secretary, other Executives, officers and the staff at the Administrative Office of the Bank for their devotion to duty throughout the year. The untiring efforts of group managers, branch managers, other officers and the staff have contributed greatly to our deposit growth. I am deeply appreciative of their dedicated efforts and enthusiasm. I do thank one and all of them.

I take this opportunity to express my gratitude to the Bank's customers and well-wishers for their valuable help, co-operation and understanding at all times.

To you, our shareholders, I am extremely grateful for the confidence reposed in me and my colleagues on the Board.

Thank you.

Note: This does not purport to be the record of the proceedings of the Annual General Meeting.

Dandakaranya

THE resettlement activity at the Dandakaranya Project — started soon after the Partition — made further progress during 1971. As on November 30, 1971, 15,410 families — 14,579 families in agriculture and 831 families in non-agricultural occupations — had been resettled by way of establishing 281 villages.

During the coming year, the main preoccupation of the Department of Rehabilitation would be the migrants who came to India prior to March 25, 1971, from erstwhile East Pakistan, besides repatriates from Burma and Ceylon and Tibetan refugees.

COMPANY MEETING

DUNLOP INDIA LIMITED

Chairman, Mr. R. G. S. Nairn's Review

The following is the address by the Chairman, Mr R G S Nairn, at the 46th Annual General Meeting held on April 21, 1972, at Calcutta.

I have pleasure in welcoming you to the 46th Annual General Meeting of the Company.

As the Directors' Report and Accounts for the year ended 31st December, 1971, have been in your hands for some time, I should like, with your permission, to take them as read.

The Year's Trading

Sales of Dunlop automotive tyres and tubes were higher than in 1970, mainly due to the implementation of the expansion at our Ambattur factory. However, the demand for our products continued to be in excess of manufacturing capacity. Your Company took special steps to ensure equitable distribution of tyres and tubes at the recommended retail prices, and maximised supplies for Defence, State Transport undertakings, and to border areas.

Sales of our industrial products also exceeded those of last year, but, here again, the demand, particularly for conveyor belting, could not be fully met due to limitations in capacity.

Industry Capacity

Production by the Automotive Tyre Industry increased substantially to 4.6 million tyres in 1971 as compared to 4.0 million in 1970, an increase of 14 per cent, but in the important product groups of truck, rear tractor and large earthmover tyres, demand exceeded availability. This was in spite of the implementation of expansions granted by Government to existing manufacturers, including your Company. The position was further aggravated when additional tyres had to be diverted towards the end of the year for Defence needs. During 1972-73 shortages will continue, particularly in the main truck tyre size 9.00-20.

In order to ensure sufficient availability of a vital product, which is essential for the economic development of the country, additional automotive tyre manufacturing capacity should be installed within the next two years. The available capacity of the existing manufacturers, including Letters of Intent, is 5.5 million automotive tyres whereas the total demand in 1973-74 is estimated to be 6.5 million. This gap cannot be filled by the various new tyre projects to whom Letters of Intent have been issued as they do not appear to have made significant progress.

In anticipation of the growing shortage, your Company submitted early last year applications to Government for a composite factory at Goa for the manufacture of automotive tyres and tubes, and industrial products. Government has recently rejected the automotive tyres and tubes application as a licence for a tyre factory at Goa has been given to another existing manufacturer. In view of the immediate need to create additional capacity and the national policy for conserving foreign exchange, we have submitted a new proposal to Government to increase capacity at our Ambattur factory by 200,000 tyres and tubes with the addition of balancing equipment only. It will be possible to implement this expansion within the short period of one year from receipt of the capital goods licence, thus enabling us to meet a part of the shortage in the immediate future. I hope that Government will consider our latest proposals favourably and speedily in order to minimise the need for imports at a substantial foreign exchange cost. The foreign exchange required to import 100,000 truck tyres is approximately Rs 3 crores.

I mentioned earlier that the demand for Dunlop industrial products could not be fully met. In the case of conveyor belting in particular, the market potential has increased well beyond the manufacturing capacity in the country and our capacity is booked for 42 months. Major consumers, mostly Public Sector projects, are therefore having to import their requirements and the position will become progressively worse until additional capacity is installed. Our application for the factory at Goa includes a composite scheme for the manufacture of steel cord and textile reinforced conveyor belting, which is still being considered by Government.

Defence Supplies

Your Company fully played its part in meeting the country's Defence requirements during the year and the output of products such as tyres for army vehicles, including tanks, and for Indian Air Force aircraft, was increased substantially.

Dunlop India is the only manufacturer in the country of aircraft tyres and military tank tyres. During 1971, we commenced production of a special purpose truck tyre for sand operations to meet Defence needs. Our future plans include a scheme for retreading aircraft tyres.

Following the declaration of the national emergency, the employees at the Company's factories worked on Sundays and holidays to maximise production for Defence needs. We had the honour of a visit by Lt-General J S Aurora, GOC-in-C, Eastern Command, to our Sahaganj factory on 21st December, when he expressed his appreciation to your Company and its employees for the important contribution which they had made to the war effort.

Exports

Our consistently good export performance was maintained and another new export record was set in 1971 in the face of severe international competition. Your Company exported to 71 countries earning a total of Rs 3.34 crores, an increase of almost 10 per cent over 1970. This was achieved through well planned export promotion, effective visits by Dunlop export executives to as many as 36 countries to expand existing markets and develop new ones, and the invaluable support from our UK Associates with their international distribution and service organisation. Dunlop India's exports in 1971 were 47 per cent of the total Tyre Industry exports.

A notable achievement of Dunlop India as an Export House was the development of overseas markets for a wide variety of goods made by indigenous small-scale manufacturers.

International trade today is complex, highly competitive and subject to sudden shifts and, in order to be successful in this field, comprehensive and

consistent Government policies are needed. *Unfortunately, this is not always so.* For example, duty drawback rates for automotive tyres and tubes were reduced drastically with very little prior notice in December *1971* with no increase in export cash assistance to compensate for the high raw material *prices in India. Consequently,* exports can now only be made at an even more substantial loss than previously. If we are to win and hold export markets on a long term basis, *it is* essential to have reasonable stability in the net cost of products for export.

Production

Higher production was achieved during 1971 despite production losses at the Sahaganj factory, mainly because of power cuts and high absenteeism, particularly in the first half of the year.

The expansion programme for 250,000 automotive tyres and tubes at Ambattur, for which an industrial licence was received in December, 1969, was completed by the end of the year. The Ambattur factory also started production of bicycle rims, for which a capital goods licence for 1.5 million pieces per annum was received in July, 1969.

An expert team was appointed to investigate the future development of our larger factory at Sahaganj, West Bengal. Plans are being *finalised to* ensure that Sahaganj continues to operate efficiently, and plant and equipment are *modernised* to cater to changing future market requirements.

The range of Metalastik rubber-to-metal bonded products at Sahaganj was enlarged during the year with the introduction of draft gear pads required for the centre buffer couplers of railway wagons.

Product Development

In keeping with the Company's policy to develop new and improved products of advanced *technical design,* a new rayon truck tyre, the Dunlop Highway 105, was introduced in the market after being tested over 80 million kilo*metres on all kinds of roads* throughout India. No other tyre developed in this country has ever been so extensively tested *before commercial introduction.* Your Company also developed and marketed the Dunlop Super Taxi tyre. This is the first tyre produced in India specially designed for the needs of the taxi operator. Another addition to our tyre range was the PG 6, which has been developed for use under very rough "off-the-road" conditions. User reaction to these tyres has been most favourable.

In pursuance of our policy to make the *country self-sufficient* in aircraft *tyres,* we have continued to develop new sizes. During 1971 we added to our range three new sizes for the Indian Air Force and tyres for the Boeing 737 aircraft. One of the most recent projects is the development of the main wheel *tyre for the* Boeing 747 Jumbo *jet.*

Research and Development

Research and development are of the highest importance in a technology-based industry like ours, and backed by the supply of *technology from our* UK Associates, your Company's technical development departments enable us to *introduce* new and better products, and *to improve* on our already excellent achievements in the field of import substitution and exports.

The know-how from our UK Associates is provided *under a Technical* Aid Agreement. At the end of 1969, this Agreement was terminated by Government who requested us to renegotiate a new Agreement. We have submitted our proposals for the new Agreement and Government approval *is awaited.*

It will interest you to know that Dunlop UK's expenditure on research and development exceeds the equivalent of Rs 15 crores per annum, and their recent union with Pirelli, Italy, permits Dunlop India, at no extra cost, to avail of the added benefits of re*search and development by Pirelli,* whose expenditure is also in the region of Rs 15 crores per annum. To remain competitive by international standards, research and development on this huge scale have become essential and, needless to say, a company of the size of *Dunlop India* cannot possibly afford expenditure of this magnitude. It is not only economical but essential for your Company to continue to purchase technical know-how to ensure that we do not fall behind international standards which, I would submit, is a matter of national interest. The advantages are not only in terms of product quality and performance, which are vital to maintain exports, but just as important to ensure that there is the most economic use of scarce raw materials.

However, your Company is keenly aware of the need to reduce reliance on external technical assistance, and, in fact, spent approximately Rs 30 lakhs on local development activities in 1971. The new proposed Technical Aid Agreement reduces the number of products for which technical assistance needs to be continued, thereby minimising foreign exchange outgoings.

The most important products now excluded are cycle tyres and tubes, for which we are establishing a Research and Development Centre at our Ambattur factory. This Centre will not only assume responsibility for exporting know-how to Dunlop Companies all over the world but will also enable us to sell know-how to other manufacturers overseas. Your Company will thus earn additional foreign exchange.

We continue to make every effort to maximise the use of indigenous raw materials and provide all possible assist*ance to local manufacturers* for the development of new indigenous sources of supply. As a result of these efforts, our imported raw materials have been reduced from 11.3 per cent of total requirements in 1966 to 6.2 per cent in 1971.

A similar effort has been made by *us in persuading the major* international equipment manufacturers to commence operations in India and in encouraging the development of indigenous tyre manufacturing equipment. For example, we have played a large part in persuading McNeill's of USA to manufacture *Bag-O-Matic tyre moulding* presses in India. Production is expected to commence in the next year or two and another major step will then have been *taken towards self-reliance.*

Costs

*The inflationary trend in prices of in*digenous raw materials continued during 1971. Apart from higher excise duties, price increases were *particularly high in the case of* synthetic rubber, cotton textiles, and steel. Prices of imported raw materials have also increased following the imposition of higher import duties in December 1971 and March 1972 and the realignment of exchange parities.

The cost of wages, salaries and dearness allowance has also increased considerably over the previous year.

To compensate for the direct cost increases incurred since November 1968, when automotive tyre selling prices were last increased, the Tyre Industry approached Government for an increase in automotive tyre prices early in 1971. *This request has now been referred* to the Bureau of Industrial Costs and Prices for investigation. In the mean*time, we are compelled to absorb these* and any further cost increases.

Taxation

The full impact of the reduced rates of development rebate was felt from 1971. The 1971 Budget introduced fur*ther increase in the incidence of* taxation, the most important being the withdrawal of relief on profits of a number of priority industries, of which your Company was one. *In December* 1971, a surcharge of 2½ per cent on corporation tax was levied as an emergency measure and this has been increased in the 1972 Budget to 5 per cent. These changes will result in a steep increase in the burden of your Company's taxation.

Furthermore, the announcement of the proposed total withdrawal of development rebates from May 1974 is likely to become a disincentive to indus*trial investment, particularly in the case* of capital intensive projects, unless relief in an alternative form is granted to offset the increase in the tax burden.

Profit and Loss Account and Balance Sheet

The main features of the financial results for 1971 have been covered in the Annual Report, but there are several points that I would like to make.

We have always maintained that an important yardstick in considering profits is the percentage of profit, before interest and tax charges, to sales. Since 1969, this ratio has been declining in spite of a steady increase in sales volume, and in 1971 the ratio was 7.4 per cent compared with 9.1 per cent in the previous year. The major reason for this is that selling prices for automotive tyres and tubes have not been increased since November, 1968, although prices of major raw materials, services and also employee costs have risen substantially during this period. The result of these cost increases is that whilst the Company's total income has increased in 1971 by approximately Rs 10 crores, profit before tax has reduced by approximately Rs 1 crore.

Although much has been achieved by way of cost economy, improved operating efficiency and reduced working capital tie-up, a fairly rapid growth in production volume and turnover is essential if selling prices are to be contained and a reasonable level of profits earned.

As you will see from the accounts, *profit before tax amounted to Rs 6.04* crores compared with Rs 7.01 crores in 1970. After providing for taxation and Development Rebate Reserve, the balance of profit amounted to Rs 3.17 crores. The taxation charge for 1971 is actually lower than it was in 1970, due to the commissioning of the new plant and buildings at the Ambattur factory. Preference Share dividends absorbed Rs 4.6 lakhs and your Directors pro*pose to maintain the Ordinary dividend* at Rs 2 per share absorbing Rs 2 crores, the same as for 1970, retaining the balance amounting to Rs 1,12,48,000 by transferring this to General Reserve.

Capital expenditure for the year was Rs 6.03 crores compared with Rs 3.20 crores in 1970. The expenditure during the year includes the implementation of the expansions at the Ambattur factory.

A reappraisal of the effective working life of your Company's fixed assets was carried out during the year. Based on this study, the rates of depreciation applicable to various categories of assets were revised on 1st January, 1971, with retrospective effect. The cumulative adjustment arising out of this revision amounted to Rs 65.95 lakhs and this amount has been transferred from depreciation account to Capital Reserves.

In order to finance the sterling requirements and also the balance of the rupee costs of the company's recent expansion, it was decided with your approval at the last Annual General meeting, to raise approximately Rs 2 crores by way of an issue of 15,00,000 Ordinary Shares at a premium of Rs 4 per Share to members in the ratio of three new Ordinary Shares for every 20 Ordinary Shares held. The proceeds of the proposed issue will be Rs 2.1 crores. The amount payable by Dunlop Holdings Limited, UK is approximately Rs 1.08 crores of which Rs 1.04 crores will be met by set off against the sterling loans made available by them. Government approval to this issue is awaited.

Personnel

It has always been your Company's firm belief that a properly trained and contented labour force is its biggest asset. We have therefore adopted progressive labour relations policies and continuously worked towards improving the conditions of service of all employees.

Consistent with this policy, it has been your Company's practice to negotiate long term agreements, which help to ensure uninterrupted production and industrial peace during the operational period of the agreements. In 1971, we concluded negotiations and signed a new four year agreement covering the personnel at the Head Office as well as the District and Sub-District Offices throughout the country.

Negotiations for a new agreement for the production operatives and staff at the Sahaganj factory are still continuing in an environment of industrial peace.

The agreement covering our employees at the Ambattur factory expired at the end of 1971 and negotiations for a new agreement were started. However, I am sorry to have to report that while negotiations were still continuing at tripartite level, the Union at the Ambattur factory, disregarding the advice of the Government Labour Department, took the law into their own hands thereby disrupting production and creating indiscipline. As a consequence of this, in the interests of security of personnel and plant, the Management was compelled to declare a lock-out until normal working conditions are assured. We are keeping the door open for negotiations and it is to be hoped that the appropriate climate for the resumption of full production will soon be restored.

Your Company's programmes for training and development of personnel at all levels continued to make good progress during 1971. A large number of employees attended Company courses as well as courses organised by outside professional bodies.

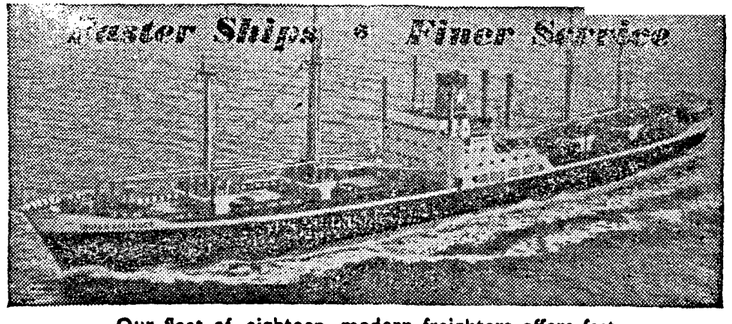
Future Prospects

I have already referred to your Company's plans for expansion and diversification of its manufacturing activities. However, a point that disturbs me is that we continue to be regarded as a dominant undertaking under the Monopolies and Restrictive Trade Practices Act. As you know, a company is deemed to be dominant in any product if its average production of that item over the last three years was one-third or more of the total industry production. Although your Company's share of the total automotive tyre industry output in the last three years has been somewhat in excess of one-third, this is so only because we have implemented licensed expansions quickly and because during this period, our factories have worked peacefully. In fact, your Company's share of total licensed capacity is only

25 per cent which reduces to 16 per cent if all Letters of Intent that are presently valid are included. Your Company, which has produced to full licensed capacity because it has taken energetic steps to implement its expansions quickly, would not be considered dominant if the future position rather than past production were taken into account.

I would like to cite a specific case, directly affecting your Company, where the Monopolies and Restrictive Trade Practices Act could operate against the national interest. Dunlop India is the sole producer in India of aircraft tyres and tubes. Consequently, under the Act, it could be said that your Company is monopolistic for these products. It would be unfortunate if this were the case as our pioneering efforts have resulted in self-sufficiency for these vital products for the country's military and civil aircraft.

I have every confidence that Government will increasingly take a more realistic view of issues such as "dominance" when considering expansion applications and will allow growth to companies such as Dunlop India, which are making significant contributions in vital sectors of the national economy, such as road transport, agriculture, industry, Defence and exports.



In conclusion, I should like to thank all our employees for the efforts they made during 1971 and particularly for the special endeavour during the national emergency.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Committee on Payment of Bills

THE Committee set up by the Reserve Bank to study the problem of payment of bills by large and medium industries to small enterprises and entrepreneurs in respect of supplies made to them and to work out a suitable arrangement so as to ensure speedy settlement of claims, has submitted its report. According to the Committee, the problem of delay in payment of bills of small industries by medium and large industries did exist for more than half the number of small-scale industrial units who supply their products to medium and large industries. The position of small enterprises in regard to receipt of proceeds of their sales to government departments/public sector undertakings was more or less identical with the pattern of their sales to medium and large industries.

The Committee's recommendations for minimising the delay in the receipts from sales of small-scale industries have emanated from the basic need (i) to strengthen the bargaining position of the small-scale units on the one hand and (ii) to inculcate a greater measure of financial discipline on, and to simplify the payment procedures of, the medium and large industries as well as government departments.

Exports from Coca-Cola reach new heights

Over the years, the Coca-Cola organisation has been earning India increasingly more foreign exchange. By generating the export of Coca-Cola concentrate worth Rs. 1.7 crores to countries in Europe, Africa and Asia; cashewnuts to Germany; tea and mango beverage base to the U.S.A., exports from India by the Coca-Cola organisation last year reached a new height of Rs. 2.17 crores. And we expect to do even better. Our special research and development team is continuously working towards developing new products for export and new overseas markets for India.

Things go better with Coca-Cola

Murree Worries

THE talks in Murree and D P Dhar's subsequent meeting with Bhutto have been accompanied by much fanfare on both sides of the border. Yet, despite all the publicity little is known as to the nuances and the subtleties of the discussions, as, for all purposes, the talks were a well-kept secret. And quite understandably.

Pakistan's President, though now in a much more comfortable position after his deft handling of the National Assembly and of the regionalist leaders of the National Awami Party and the Jamiat-ul-Ulema-e-Islam and due to the seeming political somnolence of the army, must still tread very carefully on any path which might suggest weakness in the face of the traditional enemy. India's Prime Minister does not need to be as wary of opinion at home as the Pakistan President, but all the same, any hint of concessions to or compromise with Pakistan, especially after what, within India, is generally considered to be a conclusive and morally well-deserved victory, would cause at least a semblance of a political downdraft for her. But the Government of India must needs be more chary of the opinion of the Government and people of Bangladesh than of any possible domestic uproar. For these reasons it is right and proper that such tight control has been maintained by both the Indian and the Pakistani governments over what went on at the talks. In fact, the strict adherence to a silent approach might be an indication that the two sides are serious about coming to some sort of understanding, if not agreement.

Of course, all the pitfalls remain, including the biggest one, which is whether the officers of the Pakistan army are agreeable to a settlement with India. The flare-up on the border in Kashmir might just be some local difficulty, but it is also remotely possible that a group of Pakistani officers want to increase tension at a time when there are distinct signs of relaxation in the Indo-Pak sphere and so queer the pitch for any understanding. The other issue which must occasion much fervour within the Pakistan army is the question of the return of the prisoners-of-war and the related question of which and how many of them will be detained for war crimes trials in Bangladesh.

From the purely Indian viewpoint this is the least important of the issues in Indo-Pak relations. What makes it assume great significance is the strong and very natural feeling of many in Bangladesh that those who ravaged their land and brethren should not be allowed to go scot-free. Thus, the least important of the issues (from a narrow Indian viewpoint) may prove to be a major roadblock stopping any further advance to the more substantial long-term issues, like a comprehensive border agreement including the recognition of the Kashmir cease-fire line as an international frontier, the fate of the pockets won (mostly by India) during the war, the cold storage of Kashmir as the focal friction point in Indo-Pak relations, the lessening of big power influence in the affairs of the subcontinent.

In fact, it is probably on the last point that two aspiring nationalists like Indira Gandhi and Bhutto are closest to each other in their way of thinking, though neither of them is likely to admit this openly as they would lose their room for manoeuvre in the international context. And in any case both countries are still too closely tied by economic-political-military strings to the big powers to be able to lessen the influence of these powers by joint agreement without making radical changes in the economic-political structure of their respective countries. But all the same, since a mutual but hidden empathy probably does exist on this point, it would be wise if the Indira-Bhutto talks scheduled for June were to begin on this sympathetic note. Perhaps, if this were to be the starting point of the discussions it would be easier for Pakistan to come to terms with Bangladesh, although it is a moot point whether Mujib has the same intuitive wariness of big power interference as Indira Gandhi and Bhutto probably do. Another point on which all three could very fruitfully exchange notes is on how to keep the forces of 'left adventurism' and 'right reaction' at bay while making their painless transitions to their variants of 'socialism'. But airing these issues can do no more than create a congenial mood in which to discuss the more meaty issues, i e, border alignments, Kashmir, prisoners-of-war-cum-trials.

Of course, in the final analysis, the crucial question of whether the next few years will be a period of confrontation or conciliation will depend on how any potential Indo-Pak agreement helps in cementing the power position — within their own countries — of the two leaders. And since Bhutto is much the more insecure of the two, he must be the one who is carefully calculating the likely domestic results of an understanding with India.

Nixon and Vietnam

The Power to Kill

THE American decision to walk out of the Paris talks on Vietnam on Thursday once again underlined that the only negotiated settlement that the United States is interested in is one substantially on its terms. The motions of returning to the talks, which the US itself had earlier broken off, and the elaborately planted rumours of secret contacts between its representatives and those of North Vietnam outside the formal talks were, it is now evident, all intended to prepare the ground for the next phase of America's war on Vietnam. They were also intended to quieten domestic opinion in the US by presenting the picture of a reasonable American president exploring every avenue for resuming the negotiations before being finally thwarted by the intransigence of an arrogant enemy. Yet in the open confrontations at Paris the arrogance was all seen on the US side. Most arrogant of all was the 8-point questionnaire addressed to the Vietnamese side by the chief US delegate which in effect, apart from demanding that the Vietnamese call off their present offensive, also required them to give up the gains of the last few weeks' fighting and, indeed, give an undertaking not to disturb the puppet regime in Saigon — all by way of simply establishing the sincerity of their intent to negotiate and in return for no commitment of any kind from the American side! To judge from the American terms one would have imagined that it was the Vietnamese who had suffered serious setbacks in the recent fighting and not the Americans and their lackeys.

For those who have looked beyond the verbiage churned out by successive American presidents — including, let it be specially emphasised, the late John Kennedy — have long realised that while US tactics in Vietnam may have changed, US objectives have not. These objectives remain, in essence, the creation and consolidation of a Korea-type situation keeping the two halves of the country apart, the crushing of the liberation movement in the South and the propping up of the puppet regime in Saigon. The decision to withdraw US ground forces has not made the slightest difference to these objectives, as the successive peace plans put out by the Americans have made amply clear.

The current Vietnamese offensive has, in the matter of a few weeks, established conclusively that (i) the troops of the puppet regime in Saigon, though beefed up by US assistance many times larger than anything that the Russians and the Chinese give to the other side, are completely incapable of standing up to the liberation forces; (ii) this situation is not substantially altered by massive US air and naval intervention in the fighting in the South; and (iii) the most fierce bombing of military targets in North Vietnam and the supply routes of the liberation forces, for which the most fantastic achievements were being claimed till the other day, have impaired neither the ability nor the will of the liberation forces to carry on their struggle. Given these facts, brought home to him by his own intelligence agencies, Nixon is left with a single option — and by breaking off the Paris talks he has signified his determination to pursue it. This remaining option is simply terror bombing of the North. By progressively stepping up bombing of economic targets like power stations, irrigation dykes and industrial plants as well as population concentrations, Nixon expects to force North Vietnam to get the liberation forces in the South to call off their offensive on pain that otherwise the cost in terms of economic devastation and loss of life would be made intolerable.

The reactions he has had from the two countries most in a position to influence his decision in the matter — the Soviet Union and China — have hardly been such as to persuade Nixon to hesitate over his plans to "bomb North Vietnam back into the stone age" if need be (though he no doubt expects that the North Vietnamese will cry 'halt' well before that point is reached). The Soviet Union has, of course, supplied large quantities of sophisticated arms, especially air defence equipment, to North Vietnam and, what is more, it has recently reiterated its intention to keep up this assistance. On the other hand, however, both the Soviet Union and China have conveyed to the US that they would not allow developments in Vietnam to affect their overall relations with it. During his recent visit to Moscow, Henry Kissinger is said to have been most hospitably received by his Russian hosts and assured by Brezhnev himself that the US president need have no fear that his visit to the Soviet Union would be imperilled by whatever he might do in Vietnam. Kissinger evidently returned to Washington with the impression that the Russian-American *detente* in general would suffer no serious damage nor need there be any setback to specific negotiations such as those over the control of strategic nuclear arms. Relations between China and the United States are, of course, at a more rudimentary stage but Mao Tse-tung — usually so adept at communicating through symbols — did not consider it necessary to recall the Chinese table tennis team now visiting the US even as Nixon proceeded to strengthen enormously his already fearsome air and naval armada against North Vietnam.

Indo-Soviet Trade

Filling the US Aid Gap

THE Foreign Trade Minister L N Mishra is in Moscow to sign a trade protocol with the Soviet Union and to finalise some of the points on which agreement between the two countries could not be reached earlier. The Indo-Soviet trade plan for 1972 has evoked considerable interest because of the likely impact on Indo-USSR trade relations of the suspension of US aid to India. The trade plan would largely follow the broad outlines laid down in the five-year trade agreement signed nearly 18 months ago. The five-year agreement provides for a 15 per cent annual growth in trade between the two countries. In the event of a slower growth of trade during any particular year, the two countries would attempt to achieve at least a 75 per cent increase in trade between 1970 and 1975.

The agreement did make some important departures from the past pattern of Indo-Soviet trade. It reflected the desire of both governments for closer economic relations and a more diversified pattern of trade. New commodities introduced in the Indian export list were excavators and products of Soviet-assisted projects such as electric motors, aluminium cables, garage equipment, wire-ropes, spectacle lenses, machine-made carpets, etc. The agreement also envisages substantial stepping up of exports of readymade garments, woollen knitwear, cotton textiles, automobile batteries and tobacco. Sizeable exports of established items like tea, jute goods, handicrafts, shoes and oilcakes would, of course, continue. On the import side the USSR, for the first time, agreed to supply ships and tankers to India on rupee payment basis. The USSR would also supply copper and increased quantities of non-ferrous metals, platinum, palladium, zinc and nickel. It also agreed to supply 72,000 tonnes of rolled steel for the Bokaro project against 40,000 tonnes offered earlier. But in spite of these prominent features, basically the five-year trade agreement marked an extension of the already evolving pattern of trade relations between the two countries. To that extent the impact of the Indo-USSR treaty of peace and friendship and the Indian Prime Minister's visit to Moscow last year have yet to be seen in terms of any qualitative change in economic relations with the Soviet Union.

The purpose of the Foreign Trade Minister's present trip to Moscow is thus not likely to be limited to signing the trade protocol but may extent to persuading the Soviet Union to fill in some of the gaps that have emerged following the suspension of US aid. Particularly affected has been our capacity to import commodities like fertilisers, cotton and newsprint. Excluding PL 480 assistance, US aid authorisation has averaged Rs 200 crores during the last four years. It is unlikely that the USSR would be able to supply all the commodities obtained by India from the US. For instance, the USSR cannot export cotton and newsprint unless it agrees to purchase these commodities from third countries to supply them to India. But there are such items as copper, zinc, nickel, sun-flower-seed oil, crude oil, rolled steel and mercury which the USSR is in a position to supply without causing undue hardship to itself. India has recently handed over a supplementary list of goods available for export to the USSR. This has been done with a view to persuading the USSR to meet some of our additional requirements, over and above the trade plan provisions.

The USSR has expressed a desire to import from India more non-traditional and traditional products. But as regards the items of particular interest to India, it has so far pleaded that it stood already committed to sell most of these to other countries, especially East European countries that have the closest trade relations with it. The USSR also appears to be unwilling to convert unutilised project aid into non-project aid. As on March 31, 1971 India had drawn upon only about 62 per cent of sanctioned USSR aid and unutilised aid amounted to Rs 351.5 crores. The delay in utilisation of project aid has created a new situation in that the import content of some of the projects has undergone drastic change due to some of the items earlier earmarked for import becoming available domestically. This has been used by India to strengthen its case for converting some of the project aid already committed into non-project aid or for at least switching it to new projects of relevance to the country's changed economic situation.

Past experience suggests that trade negotiations with the USSR invariably turn out to be tough. The ill-fated wagon deal is an example of this. The Russians then quoted prices for wagons which were much lower than those agreed to for similar exports to East Asian and even East European countries. Similarly the Russians have driven a hard bargain in respect of the cotton conversion scheme under which cotton supplied by the USSR is made into textiles for export to the USSR. The prospects of the Foreign Trade Minister's current mission have to be assessed against this background.

Bihar

Hundred Years After

N K Singh writes:

"THE relations of landlords and tenants are those of a high-handed proprietory body on the one hand, habitually disregarding the law, and on the other a tenantry, ignorant, very helpless, and sunk in the very most abject poverty.... Though the rent law gave the ryot certain rights, he was so helpless or so ignorant that he was unable to assert these rights out of court, or to go into court to enforce them." So wrote the Famine Commission in 1880, in a report where they ascribed the miseries of the people in Bihar to the nature of the agrarian system. This year, the one-lakh strong Paharia community — tribals living in the forest hills of Santhal Parganas in south Bihar — are starving. Even a hurried tour of the affected areas is enough to strike home the sharp miseries that have resulted from the failure of two successive crops. In normal times, too, the Paharias suffer from chronic malnutrition. But this year, the situation is alarming, particularly in eight blocks — Littipara, Amarapara, Sundarpahari, Goarijore, Boria, Barahat, Pothana and Taljhiri — inhabited by 65,000 people.

Batches of hungry, ill-nourished Paharias, who seldom leave the hills, have come down to the plains and are seen roaming in search of food. In front of restaurants in Godda, Pakur, Amarapara and Hiranpur towns, squat scores of starving men, women and children, waiting all day long to share the left-overs with the stray dogs of the town.

Paharias live today as they have lived for centuries. Once in a week they come down from their hills to nearby towns to sell the faggots, roots, tubers and fruits that they collect from the jungles, and to buy basic consumer goods for their homes. Their general isolation makes them suspicious not only of the Dikkus (the plains' people) but also of the tribal Santhals. Such cultivation as they practice is of maize and ghanghara, and for this they use the method of shifting cultivation, which demands more time, space and labour and results in unnecessary wastage of much-needed forest resources. But their main food comes from wild fruits like mahua, roots, tubers, etc. No government has ever felt the need to take the trouble to induce them to improve their economy or to join the mainstream of the state's life. In the circumstances, they continue to live a deprived and insecure life. Many are afflicted by TB and leprosy. There is hardly any medical facility worth the name. The few show-piece health-centres are virtually inoperative, and either have no doctors or no proper medicines. Education is practically non-existent. Drinking water is not easily come by in most villages, and some villages fetch water from anywhere like three miles away.

Last year's excessive and untimely rain ruined the Paharias' bhadai crop altogether. Rabi is never grown in the tribal areas of the district. Even mahua, which yields food as well as beverage, was not available on the trees this year. After two such years, the Paharias' plight is far worse than usual.

When the subject was raised in the Bihar Vidhan Sabha, the government claimed that it had already taken up relief measures: Free rations were being distributed, and other relief measures such as loans, subsidies, and manual labour schemes to give the Paharias purchasing power, had been started; fair price shops had been opened on the hills and orders issued to district officials that whatever forest produce the Paharias brought should be officially purchased, again to provide them with purchasing power.

The fact is that the government has sanctioned altogether Rs 50,000 for the one-lakh strong Paharias — i e, approximately 50 paise of 'relief' per head. Such are the circumstances in which the 'self-sufficiency' in foodgrains — which the Agriculture Minister for Bihar claimed Bihar would reach by the end of this year — has to be evaluated.

Temporary relief is no solution, of course, to such famine situations — the roots of which lie deep in the feudal exploitation, known to persist in the villages of the Santhal Parganas. Misery, poverty, unemployment and illiteracy are by-products of the feudal structure headed by the moneylenders in the region. For all practical purposes, that structure is as it was nearly a hundred years ago: Land reform, irrigation, better agricultural practices, have never been heard of in these parts.

Foreign Investment

Making Lollipops

SOME of the established foreign companies in the country have been showing

a tendency to branch into the production of non-essential consumer goods. Prominent among these have been the foreign pharmaceutical companies many of whose expansion plans appear to be mainly in non-pharmaceutical lines. The control of drug prices has clouded their chances of continuing to make super profits out of making medicines. There is also the fear that an essential item like pharmaceuticals will continue to be the object of public and governmental attention from time to time. At the same time, many of these companies have the liquidity and the managerial resources for expansion.

There are a number of factors which lead these companies to diversify into non-essential consumer items. First, production of these items generally does not call for significant imports of equipment or raw materials. This helps to avoid seeking a variety of government clearances. For the same reason the parent companies abroad are prepared, if necessary, to waive royalty payments for use of brand-names, etc, and are satisfied with the larger dividend repatriation out of the profits from the expanded operations in India. Second, in many of these products the foreign companies are the owners of internationally famous brand-names whose use would give them an instantaneous advantage over established indigenous products. Third, such skills as these companies have developed in this country lie not so much in the sphere of manufacture as that of mass marketing. This leaves them ideally placed to go into the making of products like cosmetics, sweets, chewing gum and the like. It is interesting in this context that even a gigantic company like Hindustan Lever has not shown much appetite for expanding into industries like paper or fertiliser but has preferred areas like packaged foods.

While these are undoubtedly very good reasons from the foreign companies' point of view, the question that needs to be asked is what public purpose is served by their going into the production of these consumption goods. The case for permitting foreign private investment in the country rests on the need to acquire advanced product and process knowhow and technological skills unavailable in this country. But there is absolutely no worthwhile transfer of technology in most of the areas that the foreign pharmaceutical companies appear to be going into. On the contrary, what actually results is misallocation of resources in the production of unessential consumption goods. A typical case is that of chewing gum. Within a couple of years of the entry of a foreign company into the field, production of chewing gum in the country is known to have gone up from Rs 50 lakhs to roughly five times that figure. The proliferation of consumer items like chewing gum can hardly be said to make a contribution to any of the country's avowed economic objectives. What is worse this negative achievement is secured at the cost of enlarged profit remittances abroad in free foreign exchange. Currently there are reports of a large pharmaceutical company proposing to start manufacture of confectionery, to be impressively labelled medicated sweets'.

What it all boils down to is that the government appears to have no clear policy towards foreign private investment. Which are the industries where foreign investment will be in the national interest? And where is such investment clearly irrelevant and unwanted? The government is unlikely to get at the right answers to these questions if it decides matters on the basis of whether a proposed new activity by a foreign company calls for import of additional capital equipment or raw materials or whether it will involve payment of royalty fees. Mere absence of imports or of payment of royalty is no merit in itself if the end product of the activity is socially worthless.

Land Ceiling

18 Acres Is Too High

A Correspondent writes:

WHILE the political controversy over it continues to rage, the economic case for lowering the ceiling on agricultural holdings is clear. The country has surplus labour and the ceiling has to be low enough to discourage farm mechanisation to replace labour. There is no evidence to suggest that productivity will suffer as a result. On the contrary, available data show that yields per acre are higher on smaller farms than on bigger farms. Besides, an important aspect which does not receive adequate attention is the gain in productivity which will result from very small holdings becoming viable as a result of the distribution of the surplus land. If the very small holdings are thus enlarged it would be easier to provide them the means of irrigation and enable them to take advantage of new farming techniques. While a strong economic case for a lower ceiling on land can be made out on these grounds, there is a stronger social case for a lower ceiling. So long as the shifting of labour away from agriculture remains a distant goal, the possession and use of land has to be so ordered that there is equity.

The ceiling that is being talked about is to be between 10 and 18 acres of perennially irrigated land (capable of growing two crops in a year) for a family of five members. A lively controversy has developed around the definition of irrigated land to include only land irrigated from government sources of irrigation (see "Land Ceiling: The Irrigation Swindle", April 29, pp 858-9). But even if privately irrigated land holdings are covered, the ceiling of 18 acres would still be too high and would certainly not render enough land surplus to ensure, through redistribution of such land, that a large majority of farmers have holdings of a reasonable size — say, 5-8 standard acres.

As for holdings irrigated through private effort and investment, the Chief Minister of Maharashtra has argued that if a lower ceiling is applied to such holdings, cultivators may prefer to keep their lands dry. While there is no justification for exempting any land from the ceiling, lands brought under irrigation through private investment may have to be shown some marginal concession *vis-a-vis* canal irrigated lands. This point can be taken care of by a proper definition of a standard acre and the controversy is, therefore, basically between those who want a lower ceiling and those who do not want it.

Whatever the practical difficulty in enforcing a lower ceiling on existing holdings, there is no reason why there should be any hesitation in fixing a very low ceiling (say, 3-5 standard acres) for future acquisition of land so that the upper strata of farmers are kept out of the land market. So also, there is a strong case for a heavy tax on all holdings above a certain size (lower than the statutory ceiling) to ensure their intensive cultivation. Alternatively, the heavy tax will force owners to sell that portion of their holdings which attracts the tax — which would be all to the good (see "Crucial Aspects of Agricultural Development" by H B Shivamaggi, September 27, 1969).

Having said all this, it needs to be added that the controversy over land ceiling will not cease unless steps are taken to place a similar ceiling on individual/family income and assets in other sectors. The farm lobby can advance the plausible argument that if the larger cultivators had accumulated property in the urban areas instead of investing in land they would have got away untouched. This argument is bound to become louder in the next few months. The government and the Congress party can, therefore, no longer evade the responsibility of examinig the issue of income and wealth acquisition in all sectors of the economy.

Readymade Garments

Exports to What End?

A Correspondent writes:

THE assurance held out by the Textile Commissioner that help would be given for increasing the export of readymade garments may be just one more instance of the drive to export at any cost. It may incidentally help the industry to utilise its surplus capacity. Yet there are no indications, either in our export performance, or in the existing structure of the industry, or in the market situation abroad, that point to our suitability to export these items on a large scale.

Although exports of woven garments from India increased from Rs 3.56 crores in 1966 to Rs 8.20 crores in 1969 and further to about Rs 16 crores in 1971, India's share in world markets is quite negligible—especially compared to exports of countries like Japan and Hong Kong. Even the current volume of exports would not be possible but for the increasing offtake by Russia which accounts for over 50 per cent of our total exports of woven exports. Exports to the US, the UK and the Common Market countries are regulated by annual quotas. Even these quotas the Indian industry has been unable to anywhere near fully utilise. The prices of Indian fabrics are 30 to 35 per cent higher than those of competing countries. Thus markets for utility items, such as shirts, slacks, pyjamas, etc, for which there is sizeable demand in Western markets are simply beyond the reach of Indian exporters. The international prices of utility wear are more or less established and no minor adjustments by India can help increase exports. Most of India's exports to the West consist of fashion items for which there is a limited market. In fabric blends such as polyester-cotton and polyster-wool Indian prices are about 250 to 300 per cent higher than the ruling international prices. Consequently, though there may be a considerable demand for woven fabrics apparel of different fibre fabrics, such as cotton, wool, natural silk, synthetics and blends (the US alone consumed Rs 33 crores worth of ready-to-wear apparel of different fibre fabrics and blends in 1970, against Rs 22 crores in 1965; and West Europe consumes as much if not more) the Indian industry would have to rely sizeably on raw material imports if it wants to compete for this market. One factor that has helped Hong Kong to increase its exports of garments to about Rs 500 crores per annum is the liberal imports of basic fabrics and other trimmings. South Korea, Taiwan and Singapore too have been permitting liberal imports of basic fabrics for conversion into apparel. Lately, Ceylon and Pakistan have followed suit in an attempt to increase their exports of apparel.

As is to be expected, the Indian Clothing Manufacturers Association has been pressing government for import of polyester-cotton fabrics on the ground that they are needed for the fabrication of garments for export; and, after much hesitation, imports of fabrics of different fibres and blends, including cotton fabrics with specialised finishes, have been permitted for conversion and re-export as apparel. Already, for the apparel-manufacturing machines—especially various types of sewing machines which are constantly undergoing rapid design changes—India relies heavily on imports. Japan's ability to develop sewing machines designed to meet market preferences in apparel has helped it greatly to compete effectively in international markets. It is in fact only when the industry is capable of supporting its exports by such indigenous capabilities that exports of readymade garments would become worthwhile. While the country has developed some base for blends like polyester-viscose, polyester-cotton and polyester-woollen, and for knitted embroidered garments, and while there are Indian prints acceptable in international markets, it has still a very far way to go.

Hong Kong and Singapore have recently arranged tie-ups with well known foreign brands to boost exports of their apparel. Indian garment exporters, comprising well known textile units like Mafatlal, Tata, Bombay Dyeing, and Binny, might want to explore such possibilities. But the fundamental problem of high-cost production would remain. And, apart from liberal raw materials imports, the industry has no alternative to offer. Besides fabrics, even things such as nylon zippers, fusible interlinings, sewing thread, and lining material have to be imported. These are either in short supply indigenously or, when available, do not come up to international standards in quality and cost. There are only two manufacturers of nylon zippers in India; the fusible interlining material manufactured in India, it is claimed, is not suitable for quality garments; the situation is the same regarding local supplies of sewing thread: synthetic sewing thread supplies have not improved in quality and quantity, and the indigenous price of polyester sewing thread is six to seven times higher than that of imported synthetic sewing thread.

In the midst of all this, the readymade garments industry has been pressing Government for a separate Export Promotion Council—useful no doubt, as an officially promoted pressure group constituted of manufacturers, that will proceed to demand various forms of assistance, but of questionable value since the validity of export is itself dubious. (Today the task of export promotion is entrusted to the Garments Panel of Texprocil.) Yet the point seems to be that internal demand for readymade garments has not picked up as anticipated and there exists surplus capacity in the heavy-overhead, modernised, units in the industry—and exports have a use there.

Irrigation

Backwash Effects

A Correspondent writes:

THE Irrigation Commission has rightly drawn pointed attention to the problem of water-logging and consequent rise in soil salinity in different canal irrigated areas in the country. According to the latest estimates, nearly 15 million acres are affected by this problem. This process of lands being rendered barren (the result, paradoxically, of huge investment of scarce resources in irrigation) is operative also in the new irrigation schemes in states like Rajasthan, which indicates the failure on the part of the irrigation authorities to learn any lesson from the past experience of irrigation schemes in Punjab and Sindh.

In areas with impeded drainage, the 'backwash effect' of canal irrigation has taken two forms, as illustrated by the Jawai medium irrigation scheme in Pali district of Rajasthan. After construction of the dam, the well irrigated areas in the lower reaches of the stream (e g, around Ahore) have been rendered dry due to deterioration in the quantity and quality of water in the wells. Some areas (e g, around Takhatgadh) commanded by new canals on the other hand are faced with the problem of water-logging and increased soil salinity.

Incidentally, anticipating such consequences an officer of the Geological Survey of India had warned (in 1921-22) against the construction of a dam on Jawai (which was as a result

postponed for nearly 20 years). As recorded in the settlement report of D Brookman (the then revenue minister of Jodhpur state), the officer went to the extent of suggesting that the small irrigation dams or tanks constructed earlier should also be broken up, because of their harmful consequences. The extent of fertile lands rendered waste (due to rise of salinity) in the command areas of some of those dams was reported (in 1917-18) to be as follows: Sarbar Samand 17 per cent, Kharda 42 per cent, Chopra 19 per cent, Bankali 9 per cent, Sovania 9 per cent and Bhabolai 8 per cent.

Moreover, in some areas of the Pali, Jodhpur and Barmer districts in Rajasthan the constant use of saline well water (without taking due precaution) for irrigating crops like the *Kharchi* variety of wheat has also made irrigable lands unproductive.

LETTERS TO EDITOR

Modern Indian Historiography

M N SRINIVAS states the obvious when he claims to be 'only a social anthropologist/sociologist' (April 8, pp 739-40). But the obvious does not constitute the whole. The distinction between historical sociology and social history is, after all, but slender. "Social Change in Modern India" is basically concerned with historical sociology/social history. And its weakness, to my mind, emerges from the incipience of researches in modern Indian social history. Having utilised the scanty, and by no means very sound, historical literature to provide a conceptual framework to the study of modern Indian social history, Srinivas has initiated, willy-nilly, a trend which practitioners of historical sociology/social history are beginning to follow. Whatever its possible consequences, this development is symptomatic of an enlarging two-way traffic between scholars of historical sociology/social history in India. The one provides the data and the other uses it to theorise; the data and the theorisation interact, and significantly affect the writing of both history and historical sociology. This may be a sad commentary on the conceptual poverty of the Indian historian as also on the methodological ease inducing the Indian sociologist to make a virtue of leaving the original sources to the historian. But this is true.

Srinivas has certainly described contemporary Indian society in terms of vertical and horizontal unities. But his account of social change during the 18th-19th centuries deals almost entirely with caste which happens to form the very pivot of Sanskritisation. I was concerned in my note with Srinivas' portrayal of social change in India in its historical context and not with his sociological/anthropological micro studies.

No academic exception could be taken to my using the term sketchy. Such expressive words have to be salvaged from the unnecessarily pejorative connotation they have acquired. I used this expression because it conveyed the idea that "The Indian Middle Classes" and "Social Change in Modern India", in spite of being important works, barely sketched the outlines of their respective themes.

What I wrote about Risley was that he had described the process which Srinivas designated as Sanskritisation, not that Risley was aware of its ramifications or of its links with Westernisation.

Naxalite-Sarvodaya Syndrome

THE article "Naxalite-Sarvodaya Syndrome" by M R (April 15, pp 793-5) is thought-provoking. This is the first occasion perhaps when the national Press has taken note of the issues that the Andhra Pradesh Naxalite cases have brought to the forefront.

First, I wish to correct a factual error and also complete the picture regarding the judgments by AP High Court. Nagabhushan Patnaik was sentenced to death not for the murder in Srikakulam district across the Orissa-Andhra Pradesh border, as stated in the article, but for a murder in Visakhapatnam district and this case was popularly known as the Visakhapatnam Naxalite case. The observations of the High Court in the Nellore Naxalite case, which have been extensively quoted in the article, were made by Their Lordships Justice Chinnappa Reddy and Justice A D V Reddy. However, in the Visakhapatnam cases, the Division Bench of High Court consisting of Chief Justice K V L Narasimham and Justice V Parthasarathi took a completely different view. The observations of the Court in this latter (and later) case are important, as they had referred to the earlier judgment and expressed their specific disagreement with it. The Court observed:

> "We cannot endorse the view that where a murderer asserts that 'the dictates of his conscience' impelled him to kill another person, a case is *ipso facto* made out for the award of the lesser sentence. Human life can no more be sacrificed at the altar of one's political idols than it can be at the altar of religion. There is as little justification for the one as for the other."

The Andhra Pradesh government has gone in appeal against the earlier decision. The matter is thus before the Supreme Court and perhaps, it would not be appropriate to say anything further on it. But the issue posed is important and does not permit of an agreed answer. The Supreme Court will no doubt give its final finding on the question of law — whether under the Indian Penal Code a deliberate and planned action of this nature was different from a murder committed by any other person. This, in turn, would give rise to a question relating to the value judgment to be adopted by society — should a political murder which has no personal motive be treated on par with other murders? What, in other words, is the distinction between what may be termed as criminal violence and what is considered as political violence? Does an act of violence, premeditated, planned and adopted as a part of a programme for achieving political ends become less of violence?

M R rightly condemns the bankruptcy of the Left intellectuals and their unpreparedness to face basic issues and focus public attention on them. Left intellectuals of today merely romanticise the revolution and prefer theory to practice. They write about history and interpret it, entering into polemics for their own sake; but they forget that they have to make history. Sarvodaya workers have certainly shown greater willingness to turn to action and sacrifice.

A CORRESPONDENT

New Delhi

A Made to Order Election

YOUR West Bengal Correspondent's post-election report (March 25, 1972, p 663) predictably hangs in the air. After having said what he did in his poll-eve despatch (March 11, 1972, pp 574-5) on the "remote prospects" for stability, the Correspondent clearly finds himself in a tighter corner than even the CPI(M). Faced with the fact that the Left Front-FB alliance could win less than 20 seats against his confident expectation of 110 seats, the Correspondent seems to be unsure whether to cry or shout. The tone of his second despatch suggests that he has tried to do both; but finds, because of what he might think to be his conviction, and the courage (wounded pride ?) of that conviction, a lump in his throat. The despatch is a heroic effort to push down that lump.

He talks of the 100 to 300 per cent increase in the Congress(R)-CPI alliance's poll in some of the key contests against CPI(M) stalwarts and sees this as a product of *indrajal* rather than of *Indirajal*. And about the overall results he suggests that anything but a slight edge to the Congress(R) over the CPI (M) would have been unthinkable if not for the "open and bold tampering with the election process." (Of course, he is careful to say that this is the allegation made by the "left press and spokesmen"; but in the two despatches, why, in many more earlier, the Correspondent has been a consistent mouthpiece of these very elements). In the same breath, however, he proclaims that the candidates of the Left alliance have between them polled about one-third of the total valid votes, and resolutely refutes the statement of a CPI leader that the CPI (M) had received a "thoroughgoing trouncing". The CPI(M), he tells us, has bagged 27.14 per cent of the total valid votes polled as against the 47.52 per cent collected by the Congress(R). Why, he even raises the ghost of the proportional representation system to tell us that, had that system been in force (when was it ?) the CPI(M) would have bagged a quarter of the total seats. (Surely, granting their share accordingly to the other parties of the Left alliance, the aggregate would not have reached the figure of 110 that your Correspondent dreamt of?)

There is really no point in going into the voting figures over the years and trying to assess the shift if any in the alignment of the voters. The effective alignments among the various parties, indeed even the very internal structures of certain parties, not excluding the CPI(M) itself, have undergone radical changes over these years so much so that comparisons between the various elections will be meaningless. (Give a trophy, please, to anyone who can draw meaningful conclusions from the table given by your Correspondent on the CPI(M) and Congress(R) votes in some selected constituencies !) Suffice it to say that in the matter of votes polled the Congress(R) has got no more than a "slight edge" over the CPI(M). The rest is a consequence of the realignment of the political forces. What big *indrajal* did *Indirajal* achieve then? If in spite of the advantage of this realignment and of the "national euphoria" (which is more intimate to West Bengal, understandably), the ruling party needed "tampering of the election process" to gain the slight edge it got, S S Ray had better go to the Himalayas.

Your Correspondent has been advocating some such thing already. His complaint is that Ray and his party machine have not been allowing the CPI(M) to continue its acts of intimidation, terror and hooliganism. After all, a party which openly advocates violence can rightly practise violence, and it is none of the business of a party which stands for democracy (indeed non-violence) to use violence even to end this violence ! Indeed it is not enough if the votary of non-violence shows the other cheek when slapped on one; conscientiously he must invite the first slap too. They are philistines, they that believe in an eye for an eye, a tooth for a tooth. Not this for SIDDHARTHA Ray. In fact, the CPI(M) could have managed with less of violence had it been helped into power again. Now if it is forced into more violence Ray must take the blame !

Thus, your Correspondent's wail for stability. But should he weep for a thing which the Bengalees have never seen ever since the CPI(M) raised its head in the state ? Understandably they are prepared to bet on Ray. Let us see.

MOHAN RAO

All Fluff

THIS refers to your editorial "All Fluff" in the issue of April 1. In para 3 of the editorial you observe:

> "The cotton trade puts out its own estimate of the crop mainly with the objective of influencing prices in the direction in which it wants to"

thereby imputing motives to the cotton trade.

The cotton traders prepare estimates of cotton crop primarily for their own use. They are the losers if the estimates go wrong and suffer in prestige.

It is, however, no use imputing motive to the trade. Some arrangement must be made by government to make available in time the vital statistics regarding crop arrivals, ginning and pressing figures and the estimates of crop. If the government is not in a position to take this arduous job let the same be entrusted to some agency like the East India Cotton Association Limited which is recognised by the Government under the Forward Contracts (Regulation) Act to regulate cotton trade and which can for the purpose establish contacts all over India, and to provide it with the funds necessary to carry out that job.

In the absence of vital statistics we are at present groping in the dark and all our efforts to comprehend the cotton situation become an exercise in futility.

May the merciful Lord grant that the next two cotton seasons are normal. This will send the Cotton Corporation of India packing home and on the double. This alone will resurrect the hedge market and eliminate the "violent price fluctuations" you complain about.

The Future Takes Shape

Romesh Thapar

FOR the first time in twenty-five long years the possibility opens for peace—lasting peace—on the subcontinent. Ironically, even as the emissaries talked in Murree and the revanchists on both sides of the Indo-Pak border raised the familiar uncompromising demands and bogeys, it was apparent to the dullest mind that the rise of Bangladesh had made this exciting perspective possible.

History unfolds in the strangest of ways, but we must continue to be vigilant if a genuine peace is to be won. And let's not be unhappy that Bhutto and Tikka Khan are the spokesmen of Pakistan. At least, they cannot be accused of partiality. A double irony...

Of course the Indo-Pak *detente* is only one of many absorbing developments. The debate on "ceilings", for example, is now fully joined. The attack is launched from within the ruling party on the phrasing of the rural ceilings legislation. The "loophole" for evasion is the restriction of ceiling curbs to holdings irrigated by government water systems. This it is alleged helps those who rely on their own tube-wells.

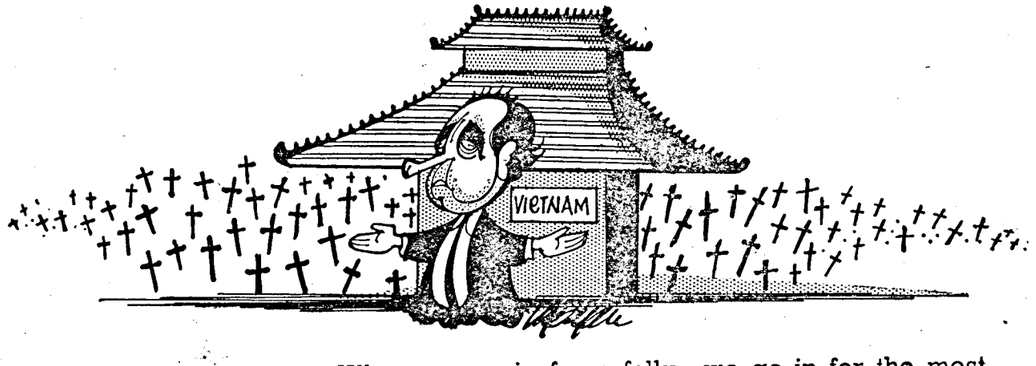
The *kulaks* are mobilising against those who demand a strict implementation of the Congress party manifesto on land ceilings, a paragraph which could be interpreted in many ways. But whatever the result of the uproar, we can bet our last paisa that the legislation in the states will be shot through with "loopholes" not imagined as yet.

A variation on this theme is possible on urban ceilings. All the inner-government exercises on the feasibility of this particular step—to equalise the attack, we are told, between the urban and rural rich—suggest that urban ceilings of an effective kind are just not possible. They will be vulnerable to all manner of corrupt assessments by inspectors and the like during a period of intense inflation, with property values—on paper ! — shooting up.

Those searching for a more practical way out suggest an allotment of fixed "living space" per individual without value assessments. In such a situation, families would tend to live together—and that's not such a bad thing in the insecurity that is India.

Attention is also excited by the prospect of limiting the upper levels of income. This seems a crazy exercise when, from ministers downward, so many perks and black money operations are built into the system. But we are in a crazy period of national evolution. The slogan popularisers are busy as ever, but the thinkers are unable to counter the nonsense that is being peddled. One day—and we hope sooner than later—we should descend to earth with a thud. This will happen when it is found necessary to change the frame of planning to contain the new content of planning.

Meanwhile, we hold our breath as the Public Accounts Committee (PAC) of Parliament tells us what's been going on in the key plants of the public sector. Scandal upon scandal. Crores lost, criminal negligence. Declining productivity. Managerial bankruptcy. Dishonest reporting. Rampant corruption. And not a stir from the slogan-shouters. This is not socialism, it is anarchy. Our politicians can't tell the difference. Their eyes are on the next opportunity for advancement, the next opportunity for a fix.



The PAC, a body of politicians now educated, warns that within a few years we will be called upon to re-finance some of the major projects of the public sector. I hope our leadership understands what that means.

It is against this background that we are beginning to understand the new desire of certain powerful interests in the private sector to urge public sector operations in several areas of industry—for instance, small car production. Apparently the idea is that in the inefficiency of the public sector lies the guaranteed profit of the private sector, for inefficiency means higher prices.

The mixed steel industry is always held out as a revealing example of how the private sector battens on the incompetence of the public sector. It's quite a situation, and doesn't require statistical support. Then there is Heavy Engineering about to establish a Rs 100 crore loss! How to put a ceiling on public sector losses, that is another one of those interesting problems gathering around us.

And, so, the future takes shape...

May 1

"It's a matter of taste. When we go in for a folly, we go in for the most expensive one."

New Conglomerate

Hansavivek

KOTHARI (MADRAS), which has come into being as a result of the merger of three plantation companies (Blue Mountain, Waterfall and Balmadies) and two textile companies (Kothari Textiles and Adoni Spinning) has a licence for the manufacture of diversify its activities. The company has a licence for the manufacture of electronic components, which is intended to be implemented in the near future. It is also proposed to set up a plant for the manufacture of automobile batteries, industrial train lighting cells and nickel cadmium batteries. A letter of intent has been obtained, and a collaboration agreement has been entered into with a German firm. There is also a proposal to go in for the manufacture of various plastic items, namely rigid PVC pipes, films, containers and heavy-duty bags. The company has also plans to go in for the manufacture of calendered plastic materials and printed plastic materials. It is also proposed to participate in a joint-sector company to be promoted by Gujarat government for the manufacture of rubber tyres and tubes. Gujarat Industrial Investment Corporation has a 'letter of intent' for the annual production of four lakh numbers each of tyres and tubes. Kothari (Madras) will have a substantial holding in the equity capital of the new company. The project cost is estimated at around Rs 14 crores, of which Rs 3 crores will be met out of share capital. A collaboration agreement has been entered into with a well known foreign firm. All these projects are proposed to be located at or near Baroda. In addition, the company also intends to establish a watch factory in Tamil Nadu in collaboration with 'Timex' of the US.

At the same time, the modernisation programme of the three textile units is being carried out expeditiously with a view to further improving productivity. The teas manufactured by the company's estates are among the finest produced in South India and fetch the highest prices in Cochin auctions. The coffee is also of the best variety and fetches the maximum points per unit. The total annual turnover of the company is in the region of Rs 16 crores and profit about Rs 90 lakhs. Both turnover and profits are expected to increase gradually when the benefits of the proposed diversification and modernisation of the existing production facilities start flowing in. The company has already declared an interim dividend of 10 per cent. According to H C Kothari, a director, the company should be in a position to pay a final 10 per cent for the year ending August next.

GOKAK MILLS, engaged in the business of cotton spinning for the last 53 years, is adding some new object clauses to its memorandum of association. These include a long list of new businesses of diverse types proposed

to be included among the objects, such as metal founders, smelters, shipbrokers, financial, monetary and commercial agents and advisers, apart from manufacturing of chemical, biochemical and other preparations, dyes, chemicals, acids, alkalies, pigments, paints, engineering and electrical goods, containers, boxes and cartons and even production of copra, cottonseed, castor seed, groundnuts, etc. No indication has been given as to which new businesses are intended to be taken up by the company in the near future. Shareholders are left guessing about the future activities of their company. Another resolution proposed to be placed before the shareholders is to empower the company to amalgamate with any company or companies. It is stated that the proposed alteration is of an enabling nature.

Gokak has drawn up a phased programme for diversification and expansion of production capacity, and an expenditure of about 44 lakhs is envisaged on new machinery and buildings. F H Kemple, chairman, has indicated that various proposals are under consideration for raising fresh finance. Additions to plant and machinery made last year cost the company some Rs 21 lakhs. The mills continued to work seven days in a week and this proved beneficial to the company. The working results showed higher sales and earnings. Apart from maintaining dividend at 15 per cent, the Board has recommended a gift of shares on a one-for-two basis. Kemple frankly admits that the "rather depressing views" about the 1971 results expressed by him at the half-way stage turned out to be incorrect.

BAYER (INDIA) is paying a maiden dividend of 15 per cent, one-half of which is expected to be exempt from tax and is also issuing bonus shares in the proportion 1:5. The company has produced good results for 1971, following bigger contributions from all divisions. With the demand for pesticides growing, the management intends to undertake an expansion programme subject to government approval. Discussions with government in connection with the implementation of a 'letter of intent' for expansion of the rubber chemicals division are also in an advanced stage, and this programme is expected to be implemented in the near future. Last year, the company received a 'letter of intent' for the manufacture of TDI (toluene di-isocyanate), the basic raw material for the production of polyurethane foam. Certain details in connection therewith are under discussion with government. The performance of the pharmaceutical division was satisfactory, both in regard to sales of formulations as well as production of chloroquine phosphate and other basic drugs. The company continued to export substantial quantities of its drugs and formulations to other countries, mainly in South and South-East Asia.

SANDVIK ASIA is seeking government permission to expand capacity from 84 tons to 150 tons of tungsten carbide products. The expansion programme, estimated to cost Rs 90 lakhs, will be financed partly with additional share capital which would be issued "in due course". The latest results, though not strictly comparable with those of the preceding year when the accounting period was changed, show a marked improvement in sales and earnings. Dividend is stepped up by 3 points to 15 per cent. The company is still awaiting government consent for the issue of bonus shares on a one-for-five basis. The company's exports increased from less than Rs 16 lakhs to a new peak of Rs 39 lakhs last year. One of the consignments imported by MMTC for the company has been found to be "outside the company's specifications and as such not usable for the purpose intended". The matter has been taken up with MMTC. Meanwhile, a sum of about Rs 17 lakhs has been written off in the accounts in this respect.

INSTITUTE FOR SOCIAL AND ECONOMIC CHANGE

Bangalore

The Institute for Social and Economic Change or ISEC is an All-India inter-disciplinary institution for research and training in the social sciences, which will start functioning in Bangalore from June-July this year. It will have centres in Economics, Sociology, Demography, Education, Organisation and Administration, Research Methodology and Statistics, and Human Geography and Ecology.

Economics will include agricultural, industrial, quantitative and public sector economics, public finance, credit utilisation, and economic planning and policy. Sociology will deal with the different aspects of the Sociology of Development and include Social Psychology and Social Stratification. Demography will include regional, urban-rural and policy problems. Education will include higher education, vocationalisation, and development. Human Geography and Ecology will include regional planning, resource identification, and changing mass-environment systems. Organisation and Administration will include public administration at the grass roots level, communication and evaluation. Research Methodology will include Econometrics, Statistics and field work techniques.

Applications are invited for the posts of Senior Fellows (corresponding to University Professors), Fellows (corresponding to University Readers) and Research Associates (corresponding to University Lecturers) in all these disciplines. The salary scales for these posts will be the same as those approved by the University Grants Commission for the University of Delhi.

Applicants are requested to send their bio-data in triplicate, giving full details of their age, academic qualifications, research and teaching experience, present position, field of specialisation, list of publications and names of referees and indicate clearly the category of the post for which they would like to be considered.

Applications should be addressed to Dr. V. K. R. V. Rao, Director, Institute for Social and Economic Change, Ratna Vilas Road, Basavangudi, Bangalore-4, and reach him on or before the 31st May 1972.

V. K. R. V. Rao
Director

NEW DELHI

Land Ceiling and the New Farm Entrepreneur

THE issue of land reform, in particular the lowering of the ceiling on land holdings, has come to a head. It is all to the good that, for once, the problem has come to be posed not merely as one of principle, to which everyone readily subscribes, but as one of implementation. The discussion on the question has also brought into focus the emergence of new vested interests in land which have so long managed to remain submerged in the mass of the peasantry and secured special concessions and large economic gains in the name of the poor farmer.

It is not entirely fortuitous that the controversy should have erupted immediately after the conference of Chief Ministers which rejected the report of the Agricultural Prices Commission on rabi prices and sidetracked the issue of lowering the ceiling on land ownership with a vague discussion of the exemptions allowed under existing land ceiling laws. After the Chief Ministers' conference the Prime Minister herself conceded that the state leaders had "scored over" the Centre on the question of the procurement prices for wheat. They could not but go forward from that point to secure further gains for their main constituents, the rich farmers, and tailor the proposals for lowering ceilings to suit their interests.

The Chief Ministers conference also helped to show that the Agriculture Ministry at the Centre was very much in sympathy with the Chief Ministers' position and shared their anxieties. But even then it was not known that the so-called farmers' lobby was so strongly entrenched in the Ministry. This was revealed in the annual report of the Ministry which brought to light the quiet moves within the Ministry to circumvent, if not completely undermine, the proposals for lowering land ceilings. Attention was attracted to that part of the Ministry's report which dealt with the problem of lowering land ceilings in the light of the recommendations of the Central Land Reforms Committee. The CLRC was charged with recommending practical legislative and other measures to carry out the Congress party's commitment to lowering the ceilings in such a manner as would yield substantial surplus land for redistribution among the small farmers and the landless. Chief Ministers had a large weightage in the composition of the Committee which functioned under the aegis of the Union Agriculture Ministry.

The manner in which the CLRC conducted its inquiry and the role of the Union Agriculture Ministry were revealing. A statement was placed before Parliament on August 4, 1971 outlining the recommendations of the CLRC on lowering land ceilings. Recently when discrepancies between the statement as placed before Parliament and the annual report of the Agriculture Ministry were noticed, this was sought to be explained away by the Ministry with the statement that there had in fact been no report by the CLRC at all; the Committee had only reached a 'consensus'. The intentions of the Committee, it was claimed, were more faithfully reflected by the report of the Ministry than by the wording of the statement placed before Parliament.

But the issue is not one of semantics. The recommendation of the CLRC on the lowering of the land ceiling, as presented in the statement to Parliament last August, was as follows: "The ceiling for a family of five members may be fixed within the range of 10 to 18 acres of perennially irrigated land or land capable of growing two crops". As put in the Agriculture Ministry's report, the recommendation was that "The ceiling for a family of five members may be fixed within the range of 10 to 18 acres of perennially irrigated land or land under assured irrigation from government sources capable of growing two crops". The addition of the words "from government sources" is obviously not innocuous. It would mean that lands irrigated from private sources of irrigation, among which tubewells figure prominently, would be exempt from the ceiling. We are thus back playing the exemptions game in a big way — and this after accepting that exemptions have been the principal device to evade existing ceiling laws.

It is estimated that out of a total net crop area of 13.9 crore hectares in the country, the net irrigated area in 1969-70 was only a little over 3 crore hectares or about 22 per cent of the total. The percentage of area sown more than once to net sown area was even less and was only 17.6 per cent of the total. Government canals account for only 37 per cent of the net irrigated area while 29 per cent is irrigated by private canals, tanks and other similar sources. Of the irrigated area 33.7 per cent is served by tubewells and other wells, the majority of them being privately owned. By restricting the application of the ceiling law to only such lands as are irrigated from government sources, the scope of the legislation would automatically be severely limited.

Nor is this the only loophole. The way perennial irrigation is defined has served the same purpose. Perennial, it is suggested, means all the year round or at least ten months in a year. The Gujarat ceiling law of 1970 actually incorporates this condition in respect of perennial irrigation. It is well known that very few canals serve lands for irrigation purposes for as long as ten months in a year. Indeed, this is not even necessary for the optimum irrigation of the command area of a canal.

The Chief Ministers, under pressure from the Central leadership to enact ceiling legislation, have jumped at the Agriculture Ministry's version of the CLRC's recommendation for lowering the ceiling and bills have been drafted or are in the process of being drafted in keeping with this. This has been almost a case of quiet collusion between the farmers' lobby at the Centre and in the states to defeat the move for radical land reform.

The issue first figured in the meeting of the Congress Parliamentary Party where some of the Chief Ministers were criticised for dragging their feet on the land ceiling issue. The party executive, it appears, was at first not even aware of the original version of the CLRC report or of the riders that were added to it in the Agriculture Ministry's report and the directives issued to the state governments on that basis. Subsequently it was found that while the original version of the CLRC report, as laid before Parliament, had been incorporated without change in the Congress election manifesto for the Assembly elections, the Agriculture Ministry and the state governments were acting on a revised version.

The Food and Agriculture Minister attempted to explain away the whole thing with a statement in Parliament but his attempt did not succeed in quietening the critics in his own party. He has now proposed to call the CLRC back into session to clarify what exactly its intentions were. But this too has been questioned as being an attempt to se-

cure *ex post facto* clearance for the revision of the Committee's report by the Agriculture Ministry.

What is significant is that in spite of the sharpness of the controversy, very little of it has found expression on the floors of Parliament. The controversy has remained within the lobbies and committee rooms of different parties. What this suggests is that issues have to be clinched within the various parties first since there does not seem to be a single party, whether of the Right or the Left, which does not have a strong farmers' lobby operating within it. Even the Opposition parties have maintained almost total silence on the issue during the sessions of the two Houses of Parliament though the issue would have provided an excellent opportunity to embarrass the government. This speaks volumes for the real nature of the interests that all parties, including those that sport socialist and communist labels, hold close to their hearts.

In this context it is of interest to note the content of the opposition to land reforms. With the abolition of zamindari the interests which would be touched by further land reform are no longer the narrow social group of feudal landlords without much social or political influence. Land reform would now impinge on the more numerous and the socially and economically influential group of landowners with enterprise and the resources to invest in the modernisation of agriculture. This stratum of rich farmers has been the focal point of the new agricultural strategy and the much advertised green revolution. They have been pampered with incentives and liberal resources and they have taken full advantage of these and have given returns of a kind. With the strengthening of their economic base, their social and political influence has grown. This fact is seen in practically all the political parties. That the opposition to land ceiling should be on the ground that it ought not to extend to lands which are privately irrigated — that is, lands on which most of the investment has been made in recent years and whose owners have displayed a measure of entrepreneurship in modernising agriculture — is indeed revealing.

SOUTH

Kerala Signals

Mohit Sen

THE new turn that has come about in India's political life — the establishment of a Left and democratic coalition to accomplish radical change — was first tried out on a small scale in Kerala as early as the autumn of 1969. It was at that time that a beginning was made in this state to make a break from the previous strategy of going forward along the path of building anti-Congress Left unity. The attempt was made to bring into being a broader unity which would include the progressive sections in the Congress and which would have given an impetus to the process of policy struggle within that party. At that time many considered it a gamble and a leap in the dark. Some went on to say that it would lead to a betrayal of the possibility of revolutionary advance. Now the experiment has spread to other states, above all to that crucial state of West Bengal.

The eventful months that have passed since then have shown the possibilities of this new strategy. They have demonstrated, particularly in connection with the liberation of Bangladesh and the response to the US aggression in Vietnam, that the Left in India can no longer advance by attempting to establish an anti-Congress front. In the present situation this would lead straight to the strategy of fighting "Indira's semi-fascism" in the company of the Jan Sangh!

Recent events have also demonstrated that the Congress, despite the massive electoral victory that it has been winning from 1971 onwards, by itself and on its own cannot accomplish the task of radical democratic renewal. The contrast between the immobility of Andhra and the advance in Kerala is too glaring to be missed. This lesson is further brought home by the fierce controversy that has developed on the question of ceilings within the Congress. Water comes into the ambit of class struggles as does the definition of irrigation! What a far cry this is from the fact that tenancy has virtually ended in this state and that the landlord rentiers have receded into history.

In Kerala now the problem of finally ending the concentration of land ownership is on the agenda. Landlord-tenancy relations are largely a matter of the past. This itself is a vast social change which has not at all received the attention it should have. Building upon this the edge of the Left and democratic forces has now to be turned against the continuing concentration of land ownership. There are some wiseacres who imagine that ceilings on rural land ownership are not a significant issue. They had better go to Kerala's countryside and see what an amount of resistance is being generated by the large landowners to this measure. So much so that action by the government machinery is far from enough. It has to be combined with and even preceded by the action of the masses themselves. But for what purpose? Not to topple the Achutha Menon Ministry nor to embarrass the government to secure the completion of an extremely important task of the democratic revolution in the countryside. The point is to properly combine the vantage point of a government which is favourable to this measure with a powerful mass movement from below. The climate, politically speaking, is extremely favourable for such a pincer movement.

Such a strategy, however, cannot be separated from a proper appreciation of the present coalition that administers Kerala. There are certain specific features about it, such as the inclusion of the Muslim League. The character of this organisation in this state is not quite the same as in other parts of the country. It has accepted a programme of democratic transformation and has till now fully co-operated in its implementation. It joined the national mainstream on the question of Bangladesh. The point of objection as to its communal character is, of course, a valid one and much more so when some of its leaders seek to project this on an all-India scale. This peculiar and even unique aspect is not, however, the most important one. More important by far is the fact that this coalition government includes the Congress. And this Congress has not only fully accepted the programme of democratic transformation but from time to time has suggested radical amendments to it. This is a fact of Kerala's life and it has already had serious all-India repercussions. Surely, the CP(M) cadres, members and followers need to reckon with and ponder upon this fact. How can they build a whole revolutionary strategy without properly assessing this fact? It has been said before and it may as well be reiterated that the CP(M) or the major portion of its cadres and masses have to come into the coalition if it is to acquire the character of a Left and democratic front. What prevents this from happening is "face", prejudice and a clinging to dogma.

An extremely important and revealing event has been the deliberations of and the resolution passed by the conference of the Kerala Pradesh Congress. The lowering of the ceiling, ending the exemption to lands owned by temples and other religious institutions, the nationalisation of all plantations and of private educational institutions — a whole range of radical recommendations are made which no Left party in the state can possibly object to. The evolution of the Left in the Congress in Kerala has proceeded a stage further as a response both to what has already been accomplished in the state as well as to fresh stirrings in the country as a whole. This augurs well for the coming days when a great battle over policy would rage over the entire length and breadth of our country.

All this should not be taken to mean that the coalition in Kerala is all plain sailing. Its proper functioning also depends upon the correct application of the tactical line of unity and struggle. And this application takes place on a different level from that in the rest of the country. But it remains a general guideline even in Kerala. When the masses are in movement, when loyalties are beginning to shift there would naturally be an element of competition among the partners of the coalition as to who would garner the harvest of this change and shift. There is nothing wrong in such competition provided it proceeds along the lines of a competition to best and most swiftly carry out the programme of democratic transformation as well as to win adherence on the basis of the total programme and ideology of the parties concerned. To this competition, too, the CP(M) must respond if it wants at all to be of relevance to Kerala's advance and India's remaking.

NORTH

New Race in Radicalism

PERHAPS in no other state is the race for ultra-radical postures being so frantically run as in Punjab these days. Both the Congress party and its principal rival, the Akali Dal, are outbidding each other. The latest vote-catching gesture was made by Finance Minister Hans Raj Sharma in the state assembly on April 28. Reiterating his government's objective of a social and economic revolution at an early date, he announced that no one would be allowed to accumulate wealth at the cost of the poor. In pursuance of its poll pledges, he said, the government proposed to fix a ceiling on personal incomes and expenditure besides the restrictions on the size of rural and urban property. Truly breathtaking in scope, some of the policy declarations which the Finance Minister and his colleague, Rattan Singh, have been making are designed to steal the thunder from all others. Most Congressmen, Akalis and members of other political groups console themselves with the thought that the radical announcements being made in quick succession are extremely difficult to implement and are hence a part of the image-building drive.

The Akalis have resolved to go one better. While the Congress assembly party on March 21 unanimously passed a resolution favouring a uniform ceiling of Rs 2.5 lakhs on rural and urban property (though later it staged a *volte face*), the Akalis decided on April 28 to sponsor a resolution seeking a Rs 85,000 ceiling on all urban assets, both movable and immovable. Stemming from the Congress move to fix a 17.5-acre ceiling on farm lands (valued at the average rate of Rs 5,000 an acre, amounting to Rs 85,000), the tongue-in-cheek Akali bid is designed to corner the Congress and to beat it with its own stick when the time for electoral reckoning comes five years hence. Ownership of property and vested interests knows no political frontiers, and there are as many propertied persons in the Congress as among the Akalis.

Landlord Lobby Optimistic

Since it is the Punjab Congress which is thoughtlessly making a fetish of radicalism, the Akalis intend to demand that all state legislators, including Ministers, should promptly lay a statement before the House listing all their assets. But to remain on the right side of the landed gentry, Akali opposition leader, J S Brar, stated in an interview that his party would have preferred to maintain the *status quo* in respect of the ceiling (30 standard acres) on farm land and to back the original Congress move for a Rs 2.5 lakh limit on urban property. To what extent the Centre modifies the Punjab ministry's bill on ceilings, now awaiting it approval, remains to be seen. Though the landlord-kulak lobby in both Punjab and Haryana appears to be lying low for the present in view of the Centre's pressure and the socialist winds, it is quite optimistic about the ultimate outcome. While keeping up the appearance of conforming with the all-India ceiling pattern, the parties affected are already getting set for the none-too-difficult task of circumventing the land laws and thus defeating their purpose.

In progressive Haryana, too, the ministry has decided to lower the ceilings and modify the draft ordinance it submitted to the Centre for approval a year ago. It cannot but assure compliance with the Central directive. The pro-landlord lobby has found some half-hearted spokesmen in Congress(O) and the Jan Sangh, though they realise the heavy odds they have to contend with. Ironically, the most vocal advocate of the 30 acre ceiling in Haryana has turned out to be the state's veteran and volatile politician, Hardwari Lal. Though elected on the Congress (O) ticket, he defied the party directive in the Rajya Sabha elections. He has since broken away to form a new group of "Progressive" Independents. Other politicians have chosen to remain silent on the ceilings issue as a measure of expediency. Congress(O), which in the March poll emerged as the largest opposition group, has virtually collapsed, marking another political triumph for Chief Minister Bansi Lal's tactics of winning over opposition legislators by offering them lollypops in varied disguises.

In Himachal Pradesh the past fortnight has been a quiet one, with most politicians away from Simla and hardly any national issue exercising the minds of the people. In this relatively unruffled state, controversial questions somehow get pigeonholed until the next assembly session. The disclosure by the Himachal Pradesh Financial Corporation about having earned the largest profit since its establishment in 1971-72, however, created some interest in knowledgeable circles. The industrial climate the Corporation has sought to promote in the state is in evidence at some places, following its loans to small or medium-sized establishments. The disbursement ratio of about 25 per cent of the allocation during the first three years has gone up to over 80 per cent. More significantly, the record of recovery of loans is highly creditable, over 90 per cent of the loanees having paid instalments regularly — a feat which most other states cannot boast of.

CPI (M) between Moscow and Peking

M R

IN 1964, when the Communist Party of India split vertically, it was hard to place the break-away wing — the Communist Party of India (Marxist), as it came to be known later — in the broad spectrum of the international pro-Chinese tendency resulting from the Sino-Soviet ideological conflict. Closest to the Chinese party were the two other ruling communist parties of Asia (of North Korea and North Vietnam), and one ruling party in Europe (of Albania). Then came a group of Asian communist parties which were wholly with the Chinese party to begin with (of Indonesia, Japan, and Malaysia being the more important ones in this category) and the New Zealand party (the only white party besides the Albanian to support the Chinese positions unreservedly). The CPI(M) which began with a considerable mass base was so variegated in its composition that it was at best an ally of the Chinese party and not its partisan. The breadth of the CPI(M) base at the time of its formation, the strategic importance of the pre-split CPI to the Sino-Soviet ideological dispute, and the Sino-Indian border conflict (which became one of the issues in the Sino-Soviet ideological dispute) vested the CPI split with unique significance. The CPI(M) was a category by itself in the spectrum which had at least three other categories to its right — groups or splinter parties in semi-colonial countries as also in Europe resulting from the main party's alignment with the Soviet party; groups in favour of Chinese positions still continuing in pro-Moscow parties; and nuclei and cadres in revolutionary movements in colonial countries, particularly in Africa, who favoured Chinese positions.

In India, the CPI had already committed itself to pro-Soviet positions in the ideological dispute when the split took place. But the split did not represent a straight Moscow-Peking polarisation in the CPI and the newly formed CPI(M) did not take a stand on the ideological issues dividing the world communist movement until after four years. In 1968, when it came to grips with the ideological issues, the CPI(M) had to split. The Madurai ideological draft of 1967 examined Soviet positions on ideological issues and rejected all except one of them. It did not examine the Chinese ideological positions at all except in one instance only to reject it. The Madurai draft was rejected outright by the Andhra Pradesh and Kashmir plenums but was passed at the all-India plenum at Burdwan in 1968. The CPI(M) rejected the Soviet positions as revisionist but, examined from the Chinese positions, the CPI(M)'s stand itself might look revisionist. In short, the CPI(M) position was one of anti-revisionism sans Maoism. And surprisingly, over the Czechoslovak issue in 1968, the CPI(M) supported the Soviet action while the pro-Moscow CPI found itself divided.

The alignment of parties in the international communist movement has changed since the great schism. The North Vietnamese and North Korean parties which were closest to the Chinese at the time of the schism moved to neutral positions. In Europe, the Rumanian party which was close to the Soviet party also moved to a neutral position. The Cuban party is also neutral between Moscow and Peking. At least, these four ruling parties have asserted their ideological independence of both Moscow and Peking to some degree or other. The emergence of an "independent" bloc of ruling communist parties gave the CPI(M) a chance to establish a bridge with the international communist movement to overcome its isolation. The party's endorsement of the Soviet action in Czechoslovakia was perhaps an attempt at establishing such a bridge through the Soviets but it ended in failure. The CPI(M) hoped that Rumanian intervention could secure for it an invitation to participate in the 1969 world communist conference in Moscow as a "parallel" party from India or at least as an observer. This too failed.

Part of Independent Bloc

Since 1969, the CPI(M) has regarded itself a part of the "independent" bloc of parties but this has not helped it overcome the isolation from the world communist movement. The CPI(M) has been independent of both Moscow and Peking on issues of ideology and is suspect in the eyes of both whereas the ruling communist parties which constitute the independent bloc have been friendly to both Moscow and Peking and are wooed by both. The "independent" bloc is again an ideologically heterogeneous lot. They have not taken agreed positions on issues. Cuba backed Soviet intervention in Czechoslovakia but Rumania did not. North Vietnam and North Korea were neutral. Similar differences were noticeable on isues like Nixon's Peking visit.

The CPI(M) has been maintaining fraternal relations with the ruling parties of the independent bloc — CPI(M) leaders have visited North Korea, Cuba and Rumania — but none of these parties accepted its invitation to its last party congress in Cochin in 1969. Its isolation still continues.

The latest (on April 23) CPI(M) attack on the Soviet and Chinese parties underlines this isolation and failure of its efforts to overcome it. The party's 45-page draft political resolution for its next congress in June denounces the political, ideological and organisational lines of both the "big" parties which are blamed squarely for the weakness of the world revolutionary movement. Such criticism has been made earlier but what lends the latest document significance is the attacks on the attitude of the big parties to the situation in the subcontinent. The CPI(M)'s stand here can be summed up as follows:

> The Soviet party has been openly acclaiming and supporting the "right" party (the CPI) which has been "unashamedly" collaborating with the Congress party and its Central government in suppressing the people's struggles, and in its killings of CPI(M) cadres and leaders. The press in socialist countries has had no word of criticism of the Congress government's "atrocities" on the working classes. "The Soviet Communist party goes on showering encomiums on the Indira Gandhi government as a progressive government."

The Chinese party has been charged with hailing and giving every encouragement to the "so-called Naxalites" who, it is alleged, not only concentrated their disruptive attacks on the CPI(M) and its mass movements but indulged in the assassination of cadres and leaders of the CPI(M).

In effect, the CPI(M)'s contention is that the Congress and the Naxalites have been attacking the CPI(M) and its mass movements, with the backing of the Soviet and Chinese parties, respectively.

On Bangladesh, the CPI(M) is all praise for the Soviet stand and is critical of the Chinese stand. On Kashmir, it endorses Soviet support to India and is critical of Chinese support to the right of self-determination for the Kashmir people.

The CPI(M) in this sense sees more plus points on the Soviet side and fewer on the Chinese side. Nevertheless it tries to equate both in one sense when it says that both the parties have been opportunistic to the extent they have been helping the bourgeois regimes in newly-liberated countries in the belief they are useful. It says the pursuit of "calculated anti-communist, anti-democratic policies at home and the adoption of anti-imperialist position in certain matters of foreign policy" are admirably suited to the class aims of bourgeois regimes in the newly-liberated countries.

"If the leaders of the big socialist states imagine that they have been shrewd in extending them aid and utilising them in the struggle against imperialism and its war machinations, the capitalist regimes of these newly-liberated countries have every reason to gloat over the fact that they have been able to successfully bargain between the opposing camps of socialism and imperialism in the furtherance of their path of capitalist development and simultaneously suppress the democratic movements at home with impunity," the CPI(M) says.

However, one cannot help noticing the contradictions in the CPI(M)'s thesis. The party by implication welcomes Soviet diplomatic support to India and its reservations are limited to Soviet support for India's domestic policies. The Chinese party is attacked for taking what are seen as anti-Indian positions over Bangladesh and Kashmir in contrast to Soviet positions but the CPI(M) fails to note that the Chinese party has been consistently critical of India's domestic policies. The criticism of the Chinese support to the Naxalites pertains to issues of the Indian government's domestic policies. The CPI(M) would be happy if the Soviet party stops backing the CPI and the Chinese party, the Naxalites. In short the CPI(M) wants for itself the role of a "national" communist party, ultimately enjoying the support of both the communist giants. But at the moment it is in an unenviable position. It is in general agreement with the foreign policy interests of the ruling class alliance and collides with its domestic interests.

The CPI(M) provides an interesting example of a non-ruling communist party of consequence caught in the Moscow-Peking cross-fire. Its position is not the same as that of a ruling communist party trying to balance its interests between Moscow and Peking and perhaps get the best of both the communist worlds. The "independent" communist parties are independent either to pursue revisionism or revolutionary aims. The CPI(M) has tried to be anti-Soviet (i e, anti-revisionist) without being pro-Chinese and its objective has been far from clear.

BANGALORE

Co-operation or Subservience?

ONE month is too brief a period to assess the performance of any ministry — let alone a ministry which is strong on ideology and weak in talent. In the context of our underdevelopment, intellectual and material, one cannot complain too loudly about the dearth of talent. And if Urs had gone the whole hog in search of talent, he could not have put together an ideologically homogeneous team. When Nijalingappa ruled the roost, nothing could be done without the patriarch nodding assent. The Syndicate leader, with his strong likes and dislikes, antagonised quite a number of talented and vocal Congressmen. Handicapped by this constraint, his protege, Veerendra Patil, could do little to restore the fast-eroding confidence. The "Indira Wave" swept him out of power, as it did many other politicians in other states.

Devaraj Urs is in no danger of being swept away by any wave. He seems to have, at the moment, strongly established himself as the leader of the party and as Chief Minister. Even so, it is difficult to say, with certainty, that he will stay for a full term. Those who asserted that the victory of the Congress party in Mysore in the March elections meant the swan-song of communalism are having second thoughts. While there is no denying that by carefully shifting the weightage from the major communities, *viz*, Lingayats and Vokkaligas, to the relatively minority castes and groups in the issuance of party tickets, Urs has brought about a swing away from Communalism, as it is understood in Mysore, he has not quite succeeded in eradicating it. He is realistic enough to concede that one has to live with it.

During the brief period of just over one month, Urs has had to face three minor political setbacks. The first related to the election of his adversary, Veerendra Patil, to the Rajya Sabha which would not have been possible but for a fair measure of cross-voting. The second was the defeat of the Congress nominee in the election of the Chairman of the Legislative Council and the third was the passage, in the Council, of an opposition amendment to the Tenancy Bill. The last two setbacks came as no surprise since the party does not enjoy a majority in the Upper House. In the context of these developments, the outcome of the forthcoming by-elections — yet to be scheduled — to enable the entry of Devaraj Urs and S M Krishna, the State Industries Minister, into the lower house, is awaited with unusual interest. Incidentally, Urs did not contest the March elections and Krishna was drafted from the Lok Sabha.

Habits die hard. And Devaraj Urs has still to shake off the habit of slogan-mongering. Even the intellectual Left, which has blessed the radical slant of the new ministry, has grown weary of the shadow-boxing that goes on in the political arena. Urs may be conscious of the popular mandate he enjoys but that is not enough to restore credibility. Credibility is a function of the success of policy measures. There has no doubt been a change in the relations between New Delhi and Bangalore. Those who say that the era of confrontation has given way to an era of co-operation do not seem to have grasped the nuances of Centre-State relationship. Co-operation on the basis of a recognition of mutual obligations under the Constitution needs to be distinguished from subservience practiced for the sake of political expediency. It will not be long before the leaders at the state level realise that Indira Gandhi has no use for leaders who have lost their credibility *vis-a-vis* the people whom they serve. Therefore, Urs will do well not to do anything which erodes the credibility of his government.

Political Horse-Trading

Take for instance, the issue of Tungabhadra waters. If Urs had considered Andhra Pradesh's request for a little bit of Mysore's share of water to tide over the summer months reasonable, he should have magnanimously responded to it instead of saying a "no" in the first instance and later yielding to Indira Gandhi's suggestion. The climb-down was, without doubt, political. Again, subtle pressure is brought to bear on Urs to make him agree to an "out-of-court" settlement of the Krishna-Godavari issue. On principle, the conciliatory approach is unexceptionable but those who warn Urs to watch his step may have a point. It was precisely because nego-

tiations failed — so the argument runs — that the issue was referred to a Tribunal as a last resort. Where is the assurance then that a mutually satisfactory solution could be found through *negotiation? Cynics are already pointing* out that it will be arbitration "by other means". In other words, the emphasis really is not so much on settlement through negotiation but on political horse-trading.

However, the critics of Devaraj Urs are less than fair to him when they accuse him of showing "softness" on the Mysore-Maharashtra border issue. The Centre is genuinely concerned that if the issue is allowed to hang fire indefinitely, it will vitiate the relationship of the states concerned with the Centre. Urs has taken the stand — allowing for the credibility gap — that the Parliament is the final authority to settle the issue. Ultimately, the issue coulld be settled that way but, at the moment, New Delhi is making serious attempts to get the Chief Ministers of Mysore and Maharashtra to agree on essentials. K C Pant, who was here recently to sell the idea, may not have got a *carte blanche* from Urs who is not slow in learning the art of reticence.

BIHAR

Medical Colleges or Teaching Shops?

N K Singh

THE Medical Education Committee which was appointed by the Bihar Government to inquire into and suggest ways to improve the standard of medical education seems to have examined the problem thoroughly. Its recently submitted report states: "The organisers of none of the private medical colleges in the state seem to have made any donation. It is, therefore, clear that there is no element of philanthropy in these enterprises and the organisers have not been motivated by missionary spirit. On the other hand, whatever may have been their intentions, they seem to have created the impression that youngmen's craze for medical education is being exploited under the cloak of missionary spirit."

The Committee has also suggested the promulgation of an ordinance to check immediately the mushroom growth of private medical colleges. Consequently, the Health Department of the state government has sent the draft of such an ordinance to the Law Department where the whole issue is being scrutinised for further action.

In the course of its investigation, the Committee has found that none of the half dozen private medical colleges in Bihar — which admit students after charging a capitation fee ranging from Rs 15,000 to Rs 20,000 per student without having any uniform admission criteria — are adhering to the principles laid down by the Medical Council of India. Most of these colleges are without any buildings of their own, adequate teaching staff, necessary equipment or attached teaching hospital for training. These basic facilities are supposed to be created later on with the help of 'donations' from students.

Expressing concern for the responsibilities of medical personnel, the report points out that by lending their names to these institutions some retired and senior teachers and doctors have definitely caused "serious harm to medical education in the state. . . They have allowed their prestigious position as eminent retired teachers to be misused by organisers of private medical colleges to mislead young men desirous of acquiring medical education." The Committee found that motivated by considerations other than academic, the universities in Bihar have affiliated these colleges without inquiring about their standards of teaching and other matters.

Backing of Important Politicians

But after having said all this, the Committee suggests that "four of the private medical colleges might be allowed to continue . . ." Perhaps the Committee could not do otherwise as any hint of denial of recognition of the said medical colleges would have created serious political trouble in Bihar. It is an open secret that most of these teaching shops have the powerful backing of important politicians. As for the Committee's recommendation that the "opening of private medical colleges in the state should be made a penal offence", it is not difficult to visualise that several powerful political barons will not allow this to happen. The Bihar Government had earlier decided against granting recognition to such colleges but ministers continued to be willing to inaugurate them and support them and eminent doctors were willing to lend their prestige to make these teaching shops look respectable and reliable. In fact, the affair is partly due to government's failure to expand facilities for medical education in the state.

Even in these days of acute unemployment, the administrative, technical, medical fields offer some job prospects. Hence, many students want to take up studies in these fields. There is a scarcity of recognised medical colleges in Bihar. While Maharashtra with a population of 48,000,000 has twelve established medical colleges and Mysore with 28,000,000 has nine, Bihar with 56,000,000 inhabitants has only three reputable medical colleges.

The growing demand for medical education encouraged some persons to start 'private medical colleges'. These clever businessmen — and there is no shortage of them — found good scope for extending their business empire into the academic field. And this could be done without putting in any capital of their own. This 'no capital' business had the backing of a number of influential persons, including ministers, legislators, senior doctors, and some so-called academicians. Taking advantage of the situation, about half a dozen private medical colleges and even a 'medical university' sprang up one after another.

Admission by Donation

The association of these colleges with the names of respectable people helped to encourage the feeling that in time the colleges would be affiliated to different universities (which did happen) and ultimately the Medical Council of India would recognise them (which did not happen). Several hundred students, most of whom had failed to gain admission into the government medical colleges due to lack of merit, were admitted by the private colleges on payment of a lump sum 'donation' of about Rs 20,000, besides the heavy tuition fees. In this way the sponsors were able to collect several crores of rupees — the sole motive behind their 'philanthropic' and 'missionary' spirit.

The skeletons in the cupboards of the private medical colleges began falling out when the sponsors of one of these colleges, the Patliputra Medical College, quarrelled amongst themselves in April, 1971. While the 'Registrar' of the College charged its 'Managing Committee Chairman' — a former Chief Minister of Bihar — and others with defalcation of college funds to the tune of one crore rupees, the 'Secretary' was reported to have threatened the 'Treasurer' with a revolver. A case, known as the Patliputra Medical College Defalcation Case, is pending in the courts and several influential persons, including politicians, are involved in it.

VIETNAM

Crumbling ARVN Abandons Countryside

Harish Chandola

SAIGON: The pivot of the "Vietnamisation of the War" policy, the South Vietnamese Government soldier, does not appear to have the will to fight. This does sound unkind, but this is what I have witnessed on the battlefields in this country during the past fortnight and this is what must by now be the impression of those following the fate of this war in the newspapers.

During the past month of fighting, the Army of the Republic of Vietnam (ARVN) just abandoned its defences along the entire northern front, gave up one base after another in the vital Central Highlands and in the north and northwestern neighbourhood of Saigon, surrendered control over eight district headquarters until the time of writing this, and, what is of greater importance, failed to recuperate and initiate offensive to regain the lost ground. This has happened in spite of the massive US air and naval support to it and the actual leadership of US military advisers in the battlefields. (Almost the entire B-52 bomber strength of the US Air Force is now flying in support of the Saigon troops and dropping on an average about 10,000 bombs a day over the South Vietnamese countryside to prevent the Viet Cong from advancing.)

The Saigon army has almost completely abandoned the countryside and has withdrawn itself into population centres. It is now said that there it will give battle to the advancing Viet Cong forces supported by North Vietnamese artillery and armour. Hopes are now being voiced in Saigon, which in fact is very worried over the situation, that the coming battle over population centres will turn the tide. These hopes lack conviction because no one really believes that the attitude of the South Vietnam Government soldier will change once he establishes himself in positions inside population centres.

Fighting for What?

If you ask a Saigon Government soldier what he is fighting for, he would simply say he does not know, except that he has been drafted to do so for a monthly wage of the equivalent of about Rs 188. If you look at the current high prices of essential commodities in South Vietnam, with that wage the soldier can hardly buy the daily requirements of his family (it would take him nearly two months' wages to buy a full bag of rice). The soldier also sees that not everybody in his country is leading a poor life. In Saigon and other big towns, he sees his prosperous countrymen travelling in air-conditioned cars and paying more than his month's wage for a single meal, not to mention entertainment. And he wonders if his life is being sacrificed to keep these people in luxury and protect them from the war.

And what are the conditions in the field for him like? With all his battalions and fighting units there are US military advisers, always talking tough. But when the Viet Cong attack, the US military advisers are the first to leave. They ask for rescue helicopters over radios and leave the Vietnamese troops behind either to be killed or captured or to manage a retreat on their own to their next base. Life is equally dear to the Vietnamese, and so when the helicopters come to rescue the American advisers, the Vietnamese soldiers too want to get on to them in their bid for safety, often clinging to the skids and causing the danger of accidents, as happened in the Central Highlands a few days ago.

During the current offensive, the Saigon troops had to leave behind their wounded when they retreated. This has caused another setback to the morale of the South Vietnamese soldier. He now thinks that if he is not killed outright in the fighting and is merely wounded, he is going to be left behind to die of his wounds. And so he tries to be careful not to get wounded. In the seige of An Loc, 60 miles northwest of Saigon, hundreds of wounded, perhaps more, were just left behind. And what happens to the wounded who do get evacuated? The army surgeons are so overworked these days that they do not have the time to take proper care of wounds. To save time and take care of as many as they can, they find it quicker to amputate the injured limb, instead of patching it up and taking care of it. Amputation takes less time. In Saigon you can see a number of people whose limbs have been amputated begging on the streets. Many of them wear the uniforms of their former military formations, showing a hollow sleeve or trouser leg, tied and fastened to stop it from flapping. Villages are full of young men hobbling on crutches.

Morale in these conditions cannot be very high and this is reflected in the battlefronts.

No Co-ordination

Two days ago I was following a military convoy got together to open the embattled Highway 13, below Chon Thanh, about 45 miles from Saigon. The Viet Cong had set up an elaborate ambush at a point where the treeline came closest to the road. No sooner did the convoy reach there, the Viet Cong opened fire on it. The Saigon troops quickly moved out and took up positions, but they were pinned down by the Viet Cong fire. There were about five or six armoured personnel carriers (APCs) in our convoy. No sooner did the firing begin than the APCs just stopped in their tracks and stayed there. They saw their men helplessly pinned down by the Viet Cong fire and in danger, but not one of the armoured vehicles moved forward to help them. The men in the APCs were afraid that if they moved forward they would get killed. While they just stood there watching the battle ahead, the Viet Cong fired a rocket which hit the sides of one of the APCs. Five men were taken out of it moaning and bleeding. And then all the APCs moved back together to get out of the range of Viet Cong mortars and rockets! But they took no part in the fighting.

By evening the forward troops were moved back, the treeline held by the Viet Cong was bombed from the air and pounded by artillery, but the battle remained inconclusive and the Highway could not be opened. The whole convoy then returned to Lai Khe, the 5th Division headquarters. There were tank units at Lai Khe, but they too did not come out to help the troops during the day-long battle.

This is an example of the level of co-ordination between the various arms of the South Vietnamese forces. Except those detailed for the battles of the day, nobody else comes out and takes risks.

This enormous army of South Vietnam, of 1.2 million regular soldiers, was raised very quickly, not in accordance with the requirements of the country but in accordance with the US requirement of withdrawing its troops. The South Vietnamese were barely taught the use of arms and war machinery the US troops were using, and while even that had not been completed, they were pushed into the role of defending the Saigon government. All

this was very good for the propaganda regarding "Vietnamisation of the war" and to show that a colossal South Vietnamese army had been created for the purpose, but nobody bothered to find out how the individual soldier forcibly recruited or drafted into this army and pitched into the war felt about the task that had been given to him. Now one can see the result of ignoring the soldier's attitude towards this war in the fighting that is going on. Every time the Saigon troops encounter Viet Cong they call in artillery and air support because that is what the Americans have taught them. But air and artillery support do not capture ground. Troops have to move in to do that.

Three Major Fronts

The situation in South Vietnam is pretty grim. The Viet Cong, with North Vietnam support, are advancing everywhere at the moment. They have opened three major fronts: (1) In the north where they have gained a whole chunk of territory south of the Demilitarised Zone and are now threatening Hue; (2) In the Central Highlands, where their troops have routed the Saigon forces led by US advisers, and where the main Viet Cong forces are now poised to push westwards and link with their guerilla forces in the coastal province of Binh Dinh next door, thus attempting to cut the country into two; (3) In the north and northwest neighbourhood of Saigon, where while fighting for control over Highway 13, leading to Saigon, they are also making flanking movements to send in their forces closer to Saigon by other minor routes in their attempt to surround the capital.

Besides these fronts, the Viet Cong guerillas and irregulars are active everywhere in the country. In the populous and rich Mekong Delta region, they have not merely completely eliminated the Saigon Government administration but have also driven Government forces out of hamlets and villages and into population centres. Soon the population centres will start coming under attack in that region.

May will be a crucial month for this war. Rains will then have set in over half the country, thus making movement difficult for both, but far more difficult for the Saigon troops which cannot receive air support in bad weather, than for the Viet Cong. Again unfounded hopes are being expressed about Viet Cong supplies getting slowed down by the rain. The Viet Cong does use vehicles for moving its supplies, but it is not totally dependent on them. When the vehicles get bogged down in the rain, waves of human beings move the supplies for them. This they have been doing faultlessly right from the time of their war against the French, for about 30 years. Saigon forces cannot do that and therefore the pressure on them is going to continue.

The Americans these days express a negative kind of joy when they say that they are punishing the Viet Cong and the North Vietnamese by killing a large number of them in bombings. They think if they keep on doing that, a point might come when the Viet Cong and the North Vietnamese will not be able to bear the losses and will give up their struggle. This is merely a talking point but in reality this never happens. Even according to the US statistics, which are apt to be exaggerated on this score, in the entire ten-year-old war only 815,780 Viet Cong and North Vietnamese have so far been killed. At this point, let me recall what the North Vietnamese Defence Minister, Vo Nguyen Giap, had said in 1968 on this subject of losses in the battlefields. He had said that in 1945, to suppress the Vietnamese freedom struggle, the French had imposed a famine on Vietnam by stopping the movement of food. In a few months two million of his countrymen had died of hunger. But that did not stop the struggle against the French colonialists. And how many had so far died for the freedom of South Vietnam? he had asked. Not even half a million, he thought. If two million could die of hunger in a few months, half a million deaths for the freedom of the country was not an alarming sacrifice, he had said.

What are the objectives of the Viet Cong offensive? These can only be a total victory in the battlefield, because only that can really free South Vietnam and others around from the bondage of an imperialist power. The war of course can be halted the day the Americans announce that they will completely withdraw from Vietnam and not run the war there by proxy. Besides these, there are not many alternatives.

*

The War Near Saigon

LAI KHE (South Vietnam): The countryside here is so much like that of Assam: lush and green and full of small rivers. Even on Highway 13, which is now alive and flashing with death, when I see the small clusters of wooden houses with thatch roofs, fringed with coconut palms, people breaking clods in small fields or children in their fathers' shirts running along the edge of paddies, I think of Assam and as my hired, moth-eaten old American car rattles along, I sometimes become so forgetful that I think I am about to arrive at Numolighar, between Gauhati and Jorhat, and am going to stop there for a cup of tea on my way to Dimapur!

But beyond Ben Cat, the landscape changes dramatically: the country becomes flat and greenery sparce with an occasional plantation of under-nourished rubber trees. The grey earth looks parched, waiting for rain. The fields are fallow; the roaring traffic from Saigon goes along Highway 1, and at the junction few vehicles turn into Highway 13, the other end of which, from about 15 miles onwards, lies in Viet Cong control. It is along this Highway 13 that the war is approaching dangerously close to the capital of South Vietnam.

The contest for the Highway begins about six miles ahead, from a point little beyond Lai Khe, the sleepy-looking headquarters of the Saigon government's 5th Infantry Division, hiding away in a mangled rubber plantation astride the road. From there onwards the road is cut more often and hastily repaired, or one just goes round the point where it is mined. Before one reaches Lai Khe, one starts running into small bullock-cart convoys of peasants fleeing their homes in the war zone. Inside the carts women hold babies in arms and men sit over piles of rice and household furniture. The rich carry their bicycles tied to the carts.

From Lai Khe to Chon Thanh, about 12 miles away, the road gets closed every other day. And nobody, not even military convoys proceed beyond Chon Thanh to the provincial capital of An Loc, ten miles up, which has been under Viet Cong siege for about a fortnight now, and where nearly two regiments of Saigon troops with the commander of the 5th Division, Gen Huong, remain trapped. Supplying this besieged garrison has become a serious problem as no planes or helicopters are able to land there because of Viet Cong fire. Two giant C-130s of the US Air Force and three planes of the South Vietnam Air Force have been shot down there while trying to airdrop supplies. Neither can the wounded nor the dead who lie there in thousands be taken out.

But both the Americans and the South Vietnamese government are determined to hold on at all costs (and a fairly high cost in lives has already been paid) to Highway 13 from Chon Thanh downwards to Saigon, because abandoning it would only mean allowing the war to reach the Capital. Today (April 25), the government dropped 4,000 paratroopers behind the Viet Cong lines to help break the siege of An Loc.

Last Saturday when I drove along this embattled Highway from Lai Khe to Chon Thanh, at the divisional headquarters I had been told that there was a battalion of South Vietnamese troops at Chon Thanh supported by an artillery unit and that the road was relatively safe. A guard at a checkpoint who waved our car on did say: "Beaucoup VC" (full of Viet Cong), but he said that with such a broad smile on his face that I thought he was just trying to frighten a small Indian from needlessly wandering around in a war-torn area.

From the checkpoint onwards there was not a soul in sight. There were no South Vietnamese troops anywhere. The wooden shacks in Chon Thanh were all shuttered and the town was completely deserted. We looked around for the Saigon battalion which I was told was there but there was no trace of its men. There was not even a stray dog anywhere. It looked like a ghost town. Were the Viet Cong around? I would not know because if they were, they certainly did not open fire on our lone, lost car. Not finding any troops around, I and my driver realised the danger we were in and so we turned around and drove out towards the inhabited Lai Khe as fast as we could.

We drove up on this Highway again today (April 25). Near Lai Khe, at the checkpoint, we were told the road was opened today by the South Vietnamese troops who had made a brisk sweep through sniper fire and sharp, deadly clashes. But my driver did not want to go beyond. So I took a lift in an ambulance going up the road to pick up the injured. Today the road was full of empty shell casings from the 50 calibre machine-guns which the South Vietnamese must have used to fight off attackers ambushing their convoys. The ambulance drove past splintered rubber trees and fires started by searching white phosphorous shells.

A bus blown up by a mine and looking like a trampled toy, which we had passed on Saturday, was still there. So was the body of a Viet Cong soldier, a sniper who, we were told, was burrowed in a hole near the roadside with a load of B-40 rockets, and who was killed with a grenade thrown into his burrow. Nobody had removed the body from the roadside. The remains of three trucks rocketted by the Viet Cong were also there today. There were a few reporters on the Highway today with the troops. And there was a crazy Frenchman; he said he was a teacher; wandering in that war wearing a bright shirt and drawing a lot of Viet Cong fire wherever he crawled. He was desperate, we were told, to obtain a press card from the Saigon authorities.

Troops Listless

The Saigon troops wearing bright red scarfs round their necks appeared listless, as if they had been forced into the fight. They were troops of the 21st Division, freshly brought from the infernally hot Delta region, where they used to hunt guerillas. They were not used to the kind of war they had been pitched into. Truckloads of them went beyond the point where a US military adviser stood by his jeep giving instructions over a radio mike. Some of them moved in a column down the Highway and others entered the thick growth on both sides of the road. The American adviser was asking another American adviser out with the troops in the woods: "Do you want machine-gun fire?" "No", a voice replied on the radio, "I can't see the tracks to control them." That meant that the fight in the woods would have to be rifle to rifle.

At the head of the military convoy were two 105mm howitzers directing their fire forward. Then there was a thump on the roadside and greyish smoke and dirt rose up in a column. The attack was being answered. Artillery then began pounding the spindly woods, full of neglected rubber trees. The South Vietnamese troops fell back slightly and marked their position with greenish smoke, clearing the way for friendly artillery to pound the woods beyond, which the artillery promptly began doing. Medivacs (medical evacuation men) holding stretchers above their shoulders began running around bushes looking for the injured.

There was a little rain then and when it stopped a sharp wind blew. And the few red-scarfed Saigon troops near us began shivering in their wet clothing. Having just come from the hot Delta, they were not used to the cold. But the sun came out immediately and saved them from freezing. Air support was called for and the Phantoms flashed in. A forward air controller asked for cluster bomb units, but the American adviser standing by his jeep said "no" over the radio because that would require the South Vietnamese to move back 500 metres and that he thought was too far to backtrack. The adviser ordered conventional high explosive bombs and nothing else. The Phantoms were promptly challenged by 51 caliber machine-gun fire from the ground. The Viet Cong unit carrying them had to be bigger than a platoon. It could be a company, or even a battalion.

Anything would be out there. It is like that these days along Highway 13.

THE FOURTH ESTATE

Barred from Murree

Nireekshak

WHATEVER the government's motives may have been, it was a "most highhanded decision", as *Hindustan Times* put it, to prevent Indian newsmen from accompanying D P Dhar to cover the Murree talks. As a result, our newspapers had to depend on Radio Pakistan and the international press and wire services to report on the most significant happening of the week. Many newspapers had wanted to post their men in Pakistan for the event. The government, through its Press Information Bureau, dissuaded them saying that arrangements were being made for the two national news agencies, PTI and UNI, and All India Radio to do the job for them in Murree. There were murmurs but the government's decision was accepted in good faith. Then came the let down. The correspondents of PTI, UNI and AIR were all set to leave when they were told that the government had changed its mind. At first an official spokesman tried to pass the buck to Pakistan but this soon boomeranged as it came to be known that an enterprising news agency correspondent had already secured a Pakistani visa for himself through the Swiss Embassy. If Pakistan had any objection to Indian newsmen accompanying Dhar, it could have withheld the visas. But it did not. This made it abundantly clear that it was the Government of India which had debarred Indian newspapermen from re-

porting the Murree talks. In other words, it had indulged in the most blatant form of news management.

News management is nothing new in this country. Some of the news agencies and big newspapers indulge in it all the time. For example, PTI, which specialises in verbatim coverage of Parliamentary proceedings, not many weeks ago failed to mention the allegations made against its management on the floor of the Lok Sabha. Not only this, it blacked out the comments of Nandini Satpathy, Minister of State for Information, on the allegations. All India Radio and the rival news agency UNI, however, made up for PTI's unethical lapse.

Back to the Murree talks. Few newspapers seem to have reacted to the exclusion of Indian mass media from such an important event. That they were all treated on par and that no favouritism or partiality was practised seems to have satisfied them! *Hindustan Times* appears to be have been the only paper which registered a strong protest, editorially, against what it rightly called the "most highhanded decision and a gross interference in the freedom of the Press...". One wonders what the government sought to achieve by keeping Indian newsmen away from Murree. On the face of it, nothing. In the words of *Hindustan Times*, "the government has goofed, and goofed badly. And this, just a day after the Minister of State for Information and Broadcasting told the Lok Sabha of the government's commitment to the freedom of the Press. What is this freedom of the Press that the government is going to defend if it does not even have an elementary understanding of what it is all about?"

Not All Applause

The outcome of the Murree deliberations have by and large been hailed in cautious undertones. *Patriot* and *Motherland* are the exceptions. Though diametrically opposed to each other, the two papers have struck a somewhat similar warning to those who see a silver lining in the Murree talks and the proposed Indira Gandhi-Bhutto meeting. *Motherland* intensely distrusts Bhutto. This is reflected in its various reports, articles and editorials. *Patriot* has the same fears. Prefacing its comments by remarks such as that "a new Muslim consolidation within Pakistan is absolutely necessary for Mr Bhutto, the hedonist, if he is to survive in power and be able to exploit the still-powerful Mullas", *Patriot* goes on to warn that "a Bhutto who has only such assets may not exactly be the person with whom secular India can meaningfully negotiate for a period of stable peace".

The provincial press has also made some interesting and significant comments on the Murree meet. The Pro-Congress Calcutta daily, *Amrita Bazar Patrika* said: "It is all very well to say as Mr Dhar did, that India 'wants to live in eternal friendship, cordiality and amity with the people of Pakistan'. But the people of Pakistan have no voice in the governance of their affairs and President Bhutto, though he has lifted the martial law, has not transferred power to the people." *Searchlight* of Patna said: "No sane person in this country wants Mr Bhutto to come to India on bended knees and offer complete surrender. But he and others who will negotiate on behalf of Pakistan will have to be reasonable and sincerely play their role in ending the tension between the two countries. Any kind of trickery will not pay. Those who are supplying arms to Pakistan, mostly as free gifts, obviously do not like that there should be a permanent and settled border between Indian and Pakistan. They will do everything possible to wreck the talks which are to be started shortly." *Mail* of Madras said: "So far as India is concerned, the issue of prisoners of war is a relatively minor one. India very much wants a final settlement on Kashmir, which has twice been the cause of Pakistani aggression. Without a settlement on Kashmir there cannot be peace in the subcontinent." *Deccan Herald* of Bangalore said: "If Mr Bhutto really desires a turn away from the bitter past he can give evidence of it not by pronouncements which savour of playing to the domestic and international gallery but by demonstrated willingness to hammer out an enduring settlement of all the issues in dispute not only between Pakistan and this country but between Pakistan and Bangladesh." And *Tribune* of Chandigarh said: "Restoration of civilian supremacy in Pakistan was a great achievement for Mr Bhutto. Greater triumph will be his if he leads Pakistan to a reconciliation with India and Bangladesh."

The debate on the government's newsprint policy continues in the columns of newspapers. That *Times of India* has succeeded in increasing the number of its pages through the intervention of the Supreme Court, which issued a stay order on an application challenging the constitutional validity of the government's newsprint allocation policy for 1972-73, has added a new dimension to the discussion. The government and the Indian Federation of Working Journalists have retaliated by exposing the monopoly character of the ownership of big newspapers. Nireekshak has in mind the script broadcast over All India Radio last week in the programme 'Spotlight' and an article "Monopoly Grows" in the latest (April) issue of the *Working Journalist*, which is the official organ of the IFWJ. Meanwhile big business newspapers are trying to focus attention on factors like circulation, readership index, employment potential, quality of editorial services, etc. Some advertising agencies have pitched in with so-called 'surveys' of the effectiveness of various media. According to one such agency, it will be difficult to divert advertising from big newspapers to small and medium size papers for some years to come. Their projections show that even at substantially higher advertising rates, it will be economical and profitable for their clients to use the big newspapers for effective advertising.

Scramble for Top Jobs

There has always been a scramble for top jobs in journalism. The fabulous salaries that go with them provide the additional incentive, if any is needed. The Editor-in-Chief of *Indian Express* is to retire shortly and, it is said, that there are as many as 20 contenders for the post. Among the more serious ones are a High Commissioner due to retire shortly from his diplomatic assignment, a former editor of *Hindustan Times* and two senior journalists at the moment working for *Times of India* and *Statesman*. All of them have made their rounds to the proprietor who is keeping his options open and has made known his amenability to any pressures that may be exercised by the powers-that-be in New Delhi. Who will eventually bag the coveted job is being watched with interest in the profession. Meanwhile, in *Times of India* the succession issue has been shelved for the time being by the present editor being given a two-year extension — much to the disappointment of those among the senior staff who saw their chance of moving up blocked.

Employment by Spending

T S Papola

IN SPITE of the considerable growth of the various sectors of the economy during the last two decades, all available evidence suggests that the magnitude and intensity of the unemployment problem have increased. The government assigned the task of assesssing the extent of unemployment and underemployment and suggesting suitable remedial measures to a Committee in December 1970. The Committee submitted its Interim Report in February 1972. As the sub-title of the Report indicates, the Committee has recommended certain short-term measures for employment. Basic issues likes strategies of development and techniques of production, which are of fundamental importance for a programme of employment generation on a sustained basis, are reported to have come up for consideration before the Committee (as is indicated in the Chairman's letter to the Minister presenting the Report), but they do not find a place in the Interim Report. These and other related issues are now being examined by Working Groups of the Committee. While more detailed information and analysis to evolve a fresh approach to the problem would be available to the Committee only after the Reports of these Working Groups are submitted, the Committee in the meanwhile felt it necessary to submit an Interim Report recommending merely enhancement of expenditure on some of the "labour intensive" programmes of the Fourth Five-Year Plan during the next two years.

Plan Strategy and Employment

The Committee seems to have accepted, at least for the time being, the plan strategy as given. This strategy has been basically directed to the growth of output with special emphasis on the creation of an economic structure which could generate self-sustained growth. Yet the problem of unemployment could not be altogether ignored; its solution was stated as one of the objectives of planning. In the core production sectors of the Plan, however, this objective had to be subjugated to that of a rapid rate of growth. So the employment objective could be met only to the extent it was coterminus with the objective of growth. On the periphery of the plan, there were certain schemes more specifically directed towards the employment objective, but in effect these schemes degenerated into financial allocations and their success tended to be evaluated by the Central and state governments on the basis of the extent to which the funds provided were spent.

It seems that the planners either considered postponement of serious consideration of the unemployment problem harmless or they believed in the notion of a strong complementarity between growth and employment. Experience has, however, belied these assumptions. The Indian economy has grown substantially in both its productive sectors, agriculture and industry. It was the non-agricultural sector, mainly industry, which was supposed to be the main source of employment, but the rate of growth of employment in this sector has lagged behind the growth of output. As a matter of fact, there has been a fall in manufacturing employment in the post-1965 period. Construction activity, which provided about 25 per cent of total additional non-agricultural employment during the Second and Third Plans, also experienced a steep decline after 1966. So the backlog of unemployment has been increasing to which is being added annually over six million new entrants to the labour market.

In the circumstances, therefore, it might seem worthwhile to consider the desirability and feasibility of a plan with employment as its basic objective in which plan outlays and their allocations and also the choice of techniques are determined by the targets of, instead of their determining the estimates of, employment generation. Thus the overall investment pattern of the plan is subjected to the test of employment creation. If activities with greater employment potential have lower growth potential, in order to achieve a high rate of growth the resource requirements would be higher. In view of the overall resource contraint, however, a trade-off point between the two objectives may have to be decided on a socio-political basis. One hopes that the final report of the Committee will throw useful light on this issue. Should the Committee come to the conclusion that a change in plan strategy is warranted, it may be desirable to indicate this before the Fourth Plan, already under formulation, is finalised.

Types and Priorities

The Committee has assigned the task of finding out the extent of unemployment to a panel. Pending its report, the Committee has had to content itself with the general impression that urban unemployment, as indicated by Employment Exchange registrations, has been increasing, and that there exists large-scale underemployment, and some open unemployment as well, in the rural sector. The types of programmes to be suggested have obviously to be based on the nature and extent of the problem, which differ not merely between the urban and rural sectors but also among the various geographical areas. Further, it is not possible to wipe out unemployment at a stroke. Therefore, priorities need to be clarified among the various types of unemployment.

For this purpose the unemployed may be broadly classified into four categories: (i) educated (mainly urban), (ii) urban uneducated, (iii) rural unemployed (mainly agricultural labourers) and (iv) rural underemployed (agricultural labours and small farmers). The first three categories are those of open unemployment and therefore full-time jobs alone would solve their problem while for the last category the solution lies in providing suitable additional work commensurate with the time and skills available. As the Committee reports, there were 44.95 lakh registrants with the employment exchanges in June 1971 of which 20.53 lakhs were educated (including 65,000 engineers) and the remaining 24.42 lakhs were uneducated. Taking a clue from the NSS estimates of under-reporting of the unemployed by the Employment Exchanges, the number of job-seekers may be placed roughly at 70 lakhs. The failure to register being greater on the part of the uneducated than the educated, the figure for uneducated unemployed could be placed at around 40 lakhs and that for educated unemployed at 30 lakhs. These figures give us broadly the extent of categories (i) and (ii) of the unemployed.

No precise and aggregate estimates are available for the rural sector, but some studies in different states indicate that around 30-35 per cent of the total man-days available in rural areas remain unutilised — after taking account of not only farming operations but also allied activities under the given technological

and organisational conditions of work. Of these, the major part consists of man-days belonging to people who have some work at one time or the other during the year. The Green Revolution in certain parts of the country has led to the phenomenon of labour shortage during the peak seasons which means that the number of people unemployed throughout the year — i e, category (iii) — is on the decline. Thus measures providing full time jobs to people are neither desirable nor workable for tackling the problem in the rural areas. Even activities which require more or less the same *number* of people throughout the year may also not be workable in some parts. The activities may have to be such that they come to a standstill for some time so that the agricultural operations do not suffer on account of lack of labour.

Unemployment Is Bad!

There is another and more important dimension of the problem of unemployment, *viz*, its co-existence with poverty. Joblessness without the means of subsistence is certainly a much more serious problem than idleness with sufficient provision for one's needs. The problem of unemployment of the uneducated in the urban areas and the landless labourers in the villages is coterminus with poverty and starvation. The small farmer making both ends meet somehow may enhance his income by working during the period he has no work on his farm; but for an agricultural labourer work is the only means of livelihood. Similarly, the way educational opportunities get distributed in India, it can generally be presumed that a person who has been able to cross the matriculation stage of schooling has one or two earners in his family, whereas an uneducated person is by definition poor and is likely to have hardly anybody to support his family when he is out of work. There is no doubt that unemployment is bad for anyone irrespective of his educational achievements or economic status. But if the resource constraints compel a choice, the decision should obviously go in favour of helping such of the unemployed as face starvation in the absence of a job. It is possible that the most needy may not be the most vocal, but it would be a short-sighted policy to set priorities on the basis of the nuisance value of the different categories of unemployed rather than on their genuine need.

The Committee's main concern in its interim report has been with rural unemployment and underemployment. Here it has considered first the Central programmes for rural employment under the Small Farmers Development Agency, the Marginal Farmers and Agricultural Labourers Agency, the Drought Prone Areas Programme and the Crash Scheme for Rural Employment. The SFDA and MFAL programmes do not seem to have made much headway; during the first two years of the Plan only a small sum of Rs 4.5 crores had been spent out of a total of Rs 115 crores provided under the Plan. The Committee, therefore, did not find it necessary to recommend a larger outlay as it has done in the case of most of the other Plan programmes for rural development. It has instead recommended vitalisation and speeding up of these programmes. It similarly suggests more efficient execution of the Crash Programme and rightly emphasises the need for a concentrated area-approach instead of thinly spreading out and diffusing resources and energies over a large area.

The major thrust of the Committee's recommendations is on an enhancement of outlays to the extent of Rs 740 crores on certain labour-intensive rural programmes which are already a part of the Fourth Plan, *viz*, minor irrigation, rural electrification, road and inland water transport, rural housing, and water supply. On minor irrigation the Committee has recommended an additional expenditure of Rs 100 crores during 1972-74 to be met by the financial institutions. The additional employment generated with this expenditure is estimated at 4 lakh unskilled and 50,000 skilled man-years. The addition of Rs 100 crores takes the total plan outlay under this head for the next two years to Rs 575 crores which is expected to generate employment to the tune of 23 lakh unskilled and 4.5 lakh skilled man-years. The estimates relate only to the construction stage of the minor irrigation works and the Committee expects a substantial increase in employment potential of farming operations with the availability or irrigation potential. The evidence provided in this respect is scanty and only one case, that of sugarcane in Deoria, gives convincing support to the Committee's observation. In any case, the programme is mainly meant for small farmers and an increase in labour use in their case would mean larger use of family labour and would not directly benefit landless agricultural labourers to any significant extent.

A related issue which the Committee has not considered at all is that of mechanisation of farming operations. Sometimes it is observed on the basis of limited evidence that mechanisation has not led to a decline in employment. Whereas it is possible that the use of labour per hectare has not declined, the labour-output ratio must decline if there is any rationality involved in the use of machines. The issue that needs examination is whether an increase in output would have been possible with a more intensive use of labour rather than by mechanising the operations. Is labour a limiting factor in Indian agriculture? How far can the growth of output be attributed to mechanisation and what is its relative role *vis-a-vis* other inputs such as irrigation? An examination of these issues in a long-run perspective is necessary for formulating priorities in input supply and for spreading the use of techniques which increase employment without adversely affecting the rate of growth of output.

Committee's Recommendations

The Committee has similarly recommended an increase in plan outlays under other heads of rural development. On rural electrification an additional expenditure of Rs 235 crores (Rs 100 crores from budgetary resources and Rs 135 crores from financial institutions) for electrifying 37,000 villages and energising 3 lakh additional pump sets/tube wells is recommended. No estimate of employment potential of this programme is given. For the construction of rural roads, an additional outlay of Rs 110 crores has been recommended for the next two years which is expected to generate additional employment to the tune of 5,463 man-years for every crore of rupees spent. For Rural Housing the recommended additional expenditure of Rs 230 crores is expected to generate employment to the tune of 2 lakh man-years in construction activity itself and 3.2 lakh man-years in activities induced by the programme through backward linkages. The resources for the programme are to be mobilised mainly through private investment (Rs 180 crores) and supplemented by budgetary provision (Rs 20 crores) and financial institutions (Rs 30 crores). Similarly, an additional sum of Rs 65 crores is to be spent on rural water supply programmes to be financed through budgetary provisions (Rs 50 crores) and financial institutions (Rs 15 crores). The employment potential of the programme is estimated to be 25,498 man-years.

Unemployment among the urban uneducated is expected to be taken care of by the utilisation of excess capacity in industries. The measure is, in any case, warranted irrespective of the unemployment situation as a more limiting resource, i e, capital, lies unutilised. Utilisation of industrial capacity is, however, a function of several factors and the Committee could not go into the details; nor did it provide any estimates of the employment potential of the programme. Thus the problem of this segment of the unemployed, which warrants priority on the criterion of poverty, did not get serious attention from the Committee. The educated unemployed, however, seem to have attracted greater attention. Their case is better argued and a programme for them is worked in greater detail. A programme of primary education and adult literacy has been suggested which will generate full time jobs for 2.52 lakh persons with matriculation or higher qualifications and part-time jobs for another 30,000 such people during the next two years. Besides, banks have been urged to finance activities for the self-employed by allocating 25 to 30 per cent of their additional resources to this scheme. It is, however, not clear as to how a figure of 30 lakh jobs for the educated during the next five years has been reached. It may be possible to estimate what 25 to 30 per cent of banks' additional resources will amount to, but in the absence of any concrete programmes of activities, how does one know how many jobs this sum will generate?

The Committee has also suggested that unemployed persons should not be charged application fees when applying for jobs. While this may be a desirable measure from the viewpoint of social justice, particularly when the unemployed also happens to be poor, it cannot be a measure for creating additional employment. It may help if the payment of fees is leading to such imperfections in the labour market that a matching of jobs and suitable job-seekers is hindered so that jobs remain vacant and suitable persons also remain unemployed.

So far as the Committee's recommendations about the banks' role are concerned, they seem to be too obvious and general to be of any special significance. The Report of the Thakkar Committee is understood to have been considered by all the commercial banks and suitable programmes have also been initiated in some cases. The "broad and liberal view" which is recommended by the Committee towards disadvantaged borrowers has been, at least in principle, the major plank of banks' credit policy after nationalisation. Every bank has credit schemes for the self-employed and disadvantaged borrowers and preferential terms and conditions are made applicable to them. But, if the banks are expected to make a more direct contribution to the solution of the unemployment problem, it may be necessary to evolve a clear-cut policy of preferential treatment of borrowers on the criterion of employment generation, irrespective of whether the borrower falls within or outside the so-called priority sectors as defined now.

On the whole, the contribution made by the Committee to rethinking on and reorientation of employment policies seems insignificant. There are certain programmes already in operation under the plan or outside it; the Committee has recommended higher outlays on these programmes and their more efficient implementation. One may argue that if resource availability posed no constraint, more could be spent under almost every head and there would be no problem which would need to be considered by a Committee. But the resource constraint is severe and therefore, the real issue is that of allocation both between mainly productive and mainly employment-creating activities and also among alternative activities of the latter type. Raising the scale of spending, as the Committee has recommended, is relatively much simpler than deciding among alternatives within a given scale. Obviously, during the one year of its existence the Committee could not mobilise enough thinking and material to undertake the less simple task and so had to be content with shuffling existing programmes.

The Interim Report is rightly subtitled "on short-term measures for employment". But the Committee would probably like to consider longer-run measures for generating sustained employment rather than temporary jobs flowing from predominantly construction-based programmes. There are some important issues, raised above and recapitulated below, which do not feature in the Interim Report, but cannot be ignored in view of their long-run implications. First, it would be useful if the committee considers the problem of unemployment in relation to the strategy of development. It may be worthwhile in this connection to consider the desirability of reorienting the plan strategy towards the goal of "growth for employment". Secondly, the incidence of unemployment may be examined in relation to poverty, and it may be desirable to give priority to a programme for providing employment for ensuring a minimum level of income for everyone. It may be necessary to decide as to whose labour is to be utilised first, if all labour cannot be utilised immediately.

Thirdly, rural unemployment being mainly in the nature of lack of full utilisation of labour rather than complete idleness, the nature of the problem and the measures provided for solving it would differ significantly among different areas. It may be useful, therefore, to have more detailed area-wise studies and to evolve programmes suited to different areas, rather than suggest programmes for all areas on a uniform basis. Fourthly, it may also be desirable, at least from the long-run viewpoint, to examine the problem of technological choices in agriculture with a view to devising a policy on the use of various inputs to achieve the objectives of increased output and employment. If it is possible to enhance agricultural output with the use of labour-intensive methods without recourse to large-scale mechanisation, a policy of discouraging indiscriminate mechanisation will have to be evolved.

And, lastly, the experience of the working of various programmes suggest that the administrative organisation needs to be suitably tailored according to the requirements of particular schemes. It may just be possible that a replication of a given office-type organisation in the field of operation, which has been the uniform pattern of administration of various schemes so far, needs to be discarded in favour of a more dynamic and flexible form of organisation. Similarly, the system of appraisal and evaluation may also have to be more oriented to the end results rather than merely to the disbursement of allocated funds. It would, therefore, prove very rewarding if the Committee also gave some thought to outlining the organisational set-up for each programme it suggests to ensure its effective implementation.

Notes forming part of the Accounts :—

(1) The actual amount of liability arising from future gratuities payable to staff has not been ascertained but is greater than the amount provided.

(2) As returns in respect of Pakistan Branches have not been received for period after 30th June, 1965, unaudited returns as at that date only have been incorporated in the Bank's Balance Sheet as at 31st December, 1971. As no further information is available, the assets and liabilities in Pakistan have not been shown in the Balance Sheet under the individual heads but only the net book value thereof has been incorporated.

(3) The figures for the previous year have been regrouped where necessary and possible.

(4) Certain old items in branch reconciliations remain to be cleared. The balancing of general ledger with subsidiary ledgers/schedules remains to be completed at a few branches. The schedules supporting general ledger balances and reconciliation statements for accounts with other banks were not ready at a few branches. Necessary steps are being taken in this regard.

(5) Bills of Exchange amounting to DM. 10.5 million reported to have been discounted with some German/Swiss Banks are purported to have been endorsed/guaranteed by the Bank's London Branch and in respect of claims relating to some of these bills amounting to DM. 2.5 million, legal proceedings have been instituted against the Bank. The Bank has repudiated all alleged liabilities in respect of all such bills and claims/disputes arising therefrom.

(6) No interest has been taken into account in respect of doubtful debts where legal action has been initiated.

Auditors' Report to the President of India

1. We have audited the attached Balance Sheet of Central Bank of India as at 31st December, 1971 and also the Profit & Loss Account of the Bank for the year ended on that date annexed thereto, in which are incorporated the returns of 152 Branches audited by us, 308 Branches audited by other auditors, 5 Branches in Pakistan for which unaudited returns as at 30th June, 1965 have been incorporated and the unaudited returns in respect of 545 Branches not visited by us.

2. The Balance Sheet and the Profit and Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule to the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that :-

   (a) In our opinion and to the best of our information and the explanation given to us and as shown by the books of the Bank :-

      (i) the Balance Sheet read with the notes thereon is a full and fair Balance-Sheet containing the necessary particulars and it is property drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1971 and
      (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account;

   (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

   (c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;

   (d) The returns [except for Pakistan Branches—See Note (2)] received from the branches of the Bank have been found adequate for the purposes of our audit.

Studies in Planning Techniques

I—The Planning Horizon

R M Sundrum

A number of circumstances make this an opportune time to reconsider some aspects of Indian planning techniques.

The planning techniques which have been perfected upto now have many achievements to their credit in the past twenty years, but past experience also reveals some directions in which they can be improved.

The need for such improvements has also become more urgent at this time, when there are too many ominous signs of the pace of development slowing down, while expectations continue to rise. This is partly because some of the factors which helped the planning process in the past are no longer fully operative.

A basic reconsideration will also be useful as the renovated Planning Commission takes a look at its future tasks, in which the objectives of economic development have taken on new dimensions of concern with its social aspects.

This series of four studies by the author is concerned with some issues of the techniques of planning, i e, with questions, not so much of what decisions are made in the context of planning, but of how these decisions are made, and with some of the ways in which this decision-making process can be improved in future. The subject of these studies, therefore, overlaps considerably with the question of the machinery of planning, as considered by the Administrative Reforms Commission and its Study Team.

This, the first of the four studies, discusses the problem of the planning horizon.

Indian planning techniques have so far been dominated by the Five-Year Plan approach. In making plan decisions over as long a period as five years at a time, Indian planning has made a very great advance. But this has been achieved at some cost.

There has been a tendency to determine the details of individual projects to suit the financial allocations rather than the other way about. Thus, while there has always been a great deal of discussion of physical targets, Indian planning has often failed to bring the financial targets and the physical targets together.

At the financial level, the planning effort has served the country well upto a point. In spite of the lack of correspondence between financial targets and physical outcomes, financial planning has guided the economic evolution of the country in a direction roughly corresponding to the overall design of development.

But the time has come to build further on this achievement and give greater emphasis to the underlying economic aspects of planning. For this purpose, some modification of the Five-Year Plan approach is necessary.

This paper suggests an alternative model of the planning process. In this model various developmental activities are classified into three categories consisting of (i) those in which the optimum period of advance decision-making is particularly long, say, one or two decades; (ii) those requiring a medium period of advance decision-making of, say, five years; and (iii) those where very little advance decision-making can be done and, therefore, have to be covered by annual plans.

The other three studies in this series will deal, respectively, with the 'development strategy', 'decentralisation of planning' and 'planning the distribution of income'.

The Five-Year Plan Approach

INDIAN PLANNING techniques have so far been dominated by the Five-Year Plan approach. This means that the operational planning horizon in various sectors is taken as five years and that the plans for all sectors are synchronised. Perhaps this approach was originally chosen because the planning period coincided with the normal tenure of each Parliament. More likely, it was based on the previous example of Soviet planning. But this example is a misleading one, for Indian conditions are so different from those of the Soviet Union that as Hanson has warned there is a danger in trying to hit Soviet-type targets with un-Soviet-type methods. The Soviet Union, at least until recently, was essentially a command economy, in which the basic economic decisions were made by a central agency. Moreover, the Soviet Union started with a much clearer picture of its long-term tasks. Hence, the Soviet Plan is best compared with a 'blueprint', which directs and co-ordinates the efforts of a number of workers engaged, say, in constructing a building. In this sense, the 'plan' is just a way of spelling out the tasks falling to the various agents involved out of a clearly formulated grand design. As such, these tasks had to be specified in considerable detail, and could in fact be carried out in that detail, because of the commanding authority of the central planning agency.

In contrast, Indian planning has had to operate under conditions of much greater uncertainty. For one thing, it is concerned with the development of a mixed economy, in which many important economic decisions are left to a large private sector, of whose aspirations, attitudes and modes of behaviour little is known, and over whose actions the planning agencies wield only an indirect and limited influence. Another important circumstance contributing to the uncertainty facing Indian planners is the role of the states, which have increasingly sought to share more actively in the making of development policies and planning decisions. Finally, there is the uncertainty regarding resources, domestic and external, on which Indian planners have had to rely so greatly.

Faced with these uncertainties, Indian planning has made a very great advance, namely in making plan decisions over as long a period as five years at a time. And it is important that this achievement should be fully recognised. But this has been achieved at some cost. Because of the emphasis placed on securing sufficient consensus among the various sections of the people, and the various states of the Union, Indian planning has tended to concentrate rather heavily on the financial aspect of plan decisions. This is not to say that the non-financial aspects, especially the physical aspects, have been neglected. But on the whole, there has been a tendency to determine the details of individual projects to suit the financial allocations rather than the other way about. As a result, estimated costs have often turned out to be way out of line, and the costs and benefits expected from projects have sometimes been doctored to sell a project. Also, because of insufficient specification of projects in advance, various delays in their execution have nullified the timetables laid down initially for their completion. Thus while there is always a great deal of discussion of physical targets, Indian planning has often failed to bring the financial targets and the physical targets together. This has been a heavy price to pay, as the progress of development depends on the physical achievements, rather than on the monies spent.

While the relative failure on the physical side has to be admitted, the planning achievement on the financial side has been a considerable one. Each Plan has estimated the financial resources likely to be available for development, from a variety of sources, for as long a period as five years, and allocated them for a variety of purposes to a multitude of agencies all over the vast country for the same period, in a manner that has had to meet with the concurrence of democratically elected legislatures both at the Centre and in the states. In the process, the amount of resources raised and allocated for plan purposes has been steadily increased over the four Five-Year Plans in a way unrivalled by any other less-developed country. Some idea of the magnitude of this achievement may be gained by comparing this to what the Central Ministry of Finance would have had to do if it made its budgets for five years at a time, instead of annually. While planners at the Planning Commission and elsewhere have worked hard at the non-financial aspects of planning, it is still perhaps true to say that the energies of the most senior members of the Planning Commission and of the Government have been engaged in securing this co-ordination at the financial level.

Up to a point, the planning effort at the financial level has served the country well. In spite of the lack of an exact correspondence between financial targets and physical outcomes, the financial planning has guided the economic evolution of the country in directions roughly corresponding to the overall design of development and has served to raise the magnitude of the country's development effort. Perhaps, the time has come to build further on this achievement and give greater emphasis to the underlying economic aspects. For this purpose, there are indications that some modification of the Five-Year Plan approach is necessary at the present time. As the Study Team on the Machinery of Planning, set up by the Administrative Reforms Commission, says, "there has been overemphasis on the Five Year period in our planning" (p 3).

Planning as Co-ordination

It must be stressed that the present study is rather severely confined to questions of the techniques of planning, i e, to the nature of the decision-making process. From this point of view, we must beware of the common tendency to attribute all the economic progress of the past twenty years to the planning process; it may be argued that much of this progress might have occurred anyway as a result of the increased scale of investments even without the planning approach. One of the ways in which planning has contributed has been to secure greater co-ordination among the various plan decisions. In fact, it may be said that the possibility of such co-ordination has been the principal rationale for the particular type of planning that has been carried out, namely the Five-Year Plan approach. As mentioned before, there has been a real progress in co-ordination at the financial level, especially as the scale of operations has been steadily increased in the face of fearful odds. But there have been real difficulties in co-ordinating at the physical level. The symptoms of this failure are the present shortage of steel all over the country, the shortage of power in parts of the country, the excess in the supply of matriculates and graduates over the demand, the chronic difficulties with foreign exchange, and so on.

This is not to say that these excesses and shortages could have been avoided with any sort of planning. But it does suggest that the systems of planning should not be geared so heavily towards achieving an unattainable degree of co-ordination, at the expense of other ways in which planning can help to make any given level of developmental expenditures more effective in realising their long-term objectives.

Planning as Advance Decision-Making

It is the main thesis of this study that there is another important way in which planning helps the development effort and that the present planning process may be modified in some important ways to exploit this advantage. This aspect of planning may be briefly described as 'advance decision making' It comes out quite clearly in the definition of planning suggested by Dror, namely:[1]

> Planning is the process of preparing a set of decisions for actions in the future directed at achieving goals by optimal means.

In this definition, the points to be noted are that (i) planning is a process, i e, not a one-shot affair; (ii) planning is concerned with a set of decisions, rather than with one decision at a time, to allow for the interactions among the consequences of different decisions, especially decisions for actions at different times; (iii) planning is concerned with actions in the future, rather than with action at the present time, though

The world's latest can making technology now comes to India You can enjoy all its benefits

AMERICAN CAN COMPANY U.S.A.

American Can Company, the world's leading can manufacturer and Poysha, India's most enterprising can maker, enter into technical collaboration to elevate packaging technology in India.

American Can Company, whose annual sales now exceed Rs. 1325 crores

- established the metal container industry's first research laboratory
- developed the pull-tab, easy-open can
- invented the novel Mira-seam process for tin-free steel and aluminium cans
- developed the all-tin easy open can
- developed the drawn and ironed tin can

to name a few.

These advanced can making techniques are the result of Rs. 18 crores spent annually on research and development which are made available to each of the American Can's 25 subsidiaries and 25 associates operating in 33 countries all over the world.

Poysha will assist canners and consumers in India and abroad through improved technology, new materials and new processes. For India, this promises real progress and sophistication in the packaging field.

the decisions to act are taken earlier than the actions themselves; (iv) planning is action towards definite goals, and (v) planning aims at the optimal means to achieve these goals.

This definition takes full account of the need to co-ordinate plan decisions among themselves. But it also stresses the element of advance decision-making. If we like, we may subsume advance decision-making also as a species of co-ordination i e, co-ordination of decisions over time. For clarity of thinking, it may be useful to distinguish the two aspects, reserving the term co-ordination for the relation between decisions at one time but affecting different sectors of the economy — a kind of horizontal or latitudinal balancing, while advance decision-making is some kind of vertical or longitudinal balancing.

From this point of view, the essential question concerning the techniques of planning is whether a country's development efforts are improved or made more effective by the method of advance decision-making. It is all too often assumed that the anwer to this question is in the affirmative, but in fact there is a cost to advance decision-making, and for a complete answer, the benefits of advance decision-making must be weighed against its costs. Further, it is also often assumed that planning is better, the longer the period in the future which it covers. This again is not necessarily true for all sectors. The fact that a five-year plan is better than a two-year plan does not mean that a twenty-year plan is better than a five-year plan or that a fifty-year plan is better than a twenty-year plan. In fact, by considering the costs and benefits of advance decision-making in each case, we might pose our problem as one of determining the optimum period of advance decision-making for various sectors and aspects of policy.

The basic cost of advance decision-making is that we surrender a degree of manoeuvrability in the future. It means making decisions without full knowledge and full analysis of the relevant facts. It means crossing bridges before you come to them or violating the decision-making rule, "Don't shoot till you see the whites of their eyes!". As against this, some clear advantage must be demonstrated for advance decision-making. It is not sufficient to say that development is a long-term affair and therefore needs long-term planning. The arguments must be spelt out more specifically. There are a number of theoretical and practical arguments. One theoretical argument is based on long gestation periods of development projects. If you want something in ten years time and if that something takes ten years to achieve, you have to get started now. This, however, is just sound managerial practice. It does not go to the heart of the case for long-term planning.

The best illustration of the case for long-term planning is in the story of the dog and the master.[2] In this story, a man walks along a straight road and his dog is trying to catch up with him from a point off the road. If the dog runs always pointing in the direction in which it *currently* observes the man, the dog will follow a curved path and eventually catch up with its master, so long as it moves faster. But it can be seen easily that the dog can catch up with the master sooner along a straight line path which brings it to a point on the road at the same time as the master. This story shows how long-term planning can widen the range of our options and enable us to choose a more efficient policy so long as certain conditions are present. These conditions may be listed as (i) a clear idea of the objective; (ii) a good understanding of the working of the system needed for (iii) sufficient predictability of the future motion of the system including the objective; and (iv) a resulting optimum course of action that is significantly different from that of a short-term planning approach. If the optimum solution is the same in both cases, there is no point in making present commitments much in advance of future actions. If the future is not predictable to a sufficient extent, again, the long-term approach has little advantage or may not even be feasible. For example, in some operations such as aerial combat, the short-term approach of constantly moving towards the current position of a violently fluctuating target might be a superior policy.

These are the theoretical advantages. There are also some important practical advantages. The most important is the effect on uncertainty. Uncertainty about the future is the enemy of planning. A good deal of future uncertainty is unavoidable because we simply do not know. But some of the uncertainty may be avoided. If the state, the single most important economic agency in the country, announces certain firm commitments to future actions and policies, this will considerably reduce the uncertainty facing the private sector. In an economy in which the private sector is so large and subject to so much control and regulation by the government, one of the main factors underlying economic uncertainty is the future policy of the government itself. Hence, long-term planning in the government sector will promote long-term planning in the private sector.

Another practical advantage is that the important task of formulating specific development projects will be performed more efficiently, even within the public sector. Such project formulation is the essence of development and has to be carried out continuously; it needs important changes in the organisation of project work and the recruitment and training of technical personnel at all levels. Such changes are not likely to come about if attention is focused so heavily on choosing projects just for the next five-year plan.

There is yet another practical advantage which Arthur Lewis has called the purely political advantage of long-term planning.[3] When various sections of the people put forward projects for inclusion in, say, a five-year plan, the result may well be that the costs of these projects greatly exceed the resources likely to be available in so short a period. Then the planning period may be extended to accommodate all the justifiable projects. In this way, the planning agency will recognise the legitimate needs of all sections of the people. This will be particularly facilitated by the fact that "we can put more than twice as much into a Ten-Year Plan as into a Five-Year Plan". The conflict over whether to undertake a project in region A or in region B gives place to the lesser conflict of whether to construct a project in region A before or after a corresponding project in region B. This is recognised in principle in the Indian plans; for instance, the Third Five-Year Plan says that "certain problems involving conflicts of a regional character in a large and diverse country like India can only be resolved in terms of a long-term plan which fits different regions into a larger design of national development" (p 21).

The first consequence of the above analysis is that there is something like an optimum period of advance decision-making. The second consequence is that this optimum period of advance decision-making may not be the same for all sectors. A third consequence is that, from the point of view of planning as advance decision-making, it is not necessary and may not even be desirable to synchronise the plans for all sectors. These consequences are ultimately due to the conflict between two desiderata of planning techniques that have generally been put forward. Thus, it has been said that planning is better the longer the period it covers in

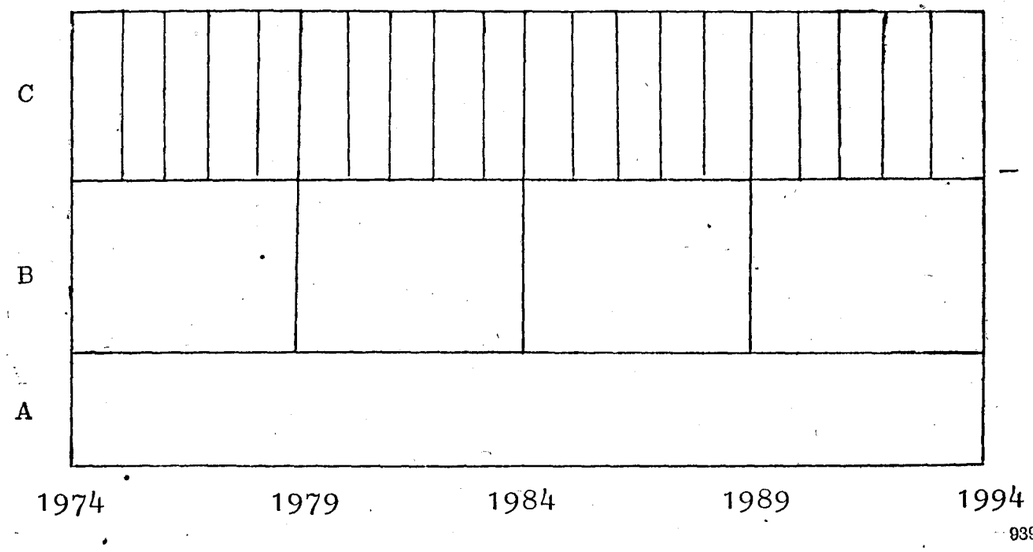
the future and also that planning is better, the more comprehensively it covers all sectors of the economy. But these two criteria are mutually incompatible; the more comprehensive the plan, the less effectively can it cover a long period in the future. Or to put it in other words, there is a conflict between the two aspects of planning, namely intra-temporal co-ordination and advance decision-making. This suggests that it might be useful to consider some departure from the five-year plan approach used at present. This would at the same time avoid some of the fierce burdens imposed on Indian planners quinquennially and make planning a more continuous process.

Alternative Model of Planning Process



To take account of the advantages of advance decision-making as they occur in various sectors of the economy, an alternative model of the planning process may be designed as in the Diagram.

In this model, various developmental activities of the economy are classified into three classes A, B and C. Developmental projects in class A will consist of those in which the optimum period of advance decision-making is particularly long, say one or two decades; these projects will then be covered by long-term plans. The class B projects will consist of those requiring a medium period of advance decision-making, to be covered by medium-term plans of, say, five years. The class C projects will consist of those where very little advance decision-making can be done, and will, therefore, have to be covered by annual plans. Under Indian conditions, it may help to think of class A projects accounting for about 20-30 per cent of development expenditure, class B projects about 50 per cent, and class C projects another 20-30 per cent.

It may be argued that this approach to planning is, in fact, what is being followed by Indian planners in their combination of five-year plans with perspective planning on the one hand and with annual planning on the other. In fact, however, there are important differences. These differences may ultimately be traced to the way in which the term 'planning' is used in the approach suggested here. In our use of the term, planning refers to making a set of decisions, decisions for future actions. Although this is a fairly literal interpretation of the term 'planning', the term has come to be used in so many other ways that it may be useful to dwell on the implications of our interpretation for a while. On this interpretation, planning is much more than projections which merely give the planning agency's best estimate of the most probable future course of events. Projections are certainly needed for making plan decisions, but do not by themselves constitute planning. Similarly, planning is more than just laying down certain targets for the future; it means the consideration of alternative routes to any given target and the deliberate choice of one of these routes based on definite decisions for future actions. Without such a commitment to future actions to attain such targets, the targets will only remain pious hopes. Further, if planning means a set of decisions, then the plan as drawn up by the state can only cover the sector whose activities can be decided by the government. This would seem to contradict the general feeling in most studies of planning that it should cover the entire economy. While the government's plan should certainly take full account of its reverberations in the private sector and in other countries, obviously the government's plan cannot commit itself to firm decisions by the private sector. All that it can do is to make decisions about policies by which the public sector can try to influence the private sector to move in particular desired directions.

Finally, there is one important implication about the objectives of planning for development. It is all too often said that the target of a plan is to raise the total, or per capita, national income, by such and such a percentage in a given planning period. This may well serve as a broad goal of all government policies, whether carried out through planning or not, but it is not good enough as a target for formulating a plan or evaluating its implementation. The basic reason is that the growth of the national income depends on so many fortuitous circumstances and on the decisions of so many individuals and agencies over whom the

Diagram

planner has only a limited influence. Therefore, it is preferable to consider the growth of the national income as the probable consequence of the plan decisions, rather than the specific target. Beyond that, we should also recognise that the process of development is not just the same thing as the current, and continuous, growth of the national income. Development is more concerned with the structural and institutional changes needed for self-sustaining growth; this means, as Arthur Lewis puts it,[4] that the engine of growth must be internalised. It may, therefore, be useful, in an underdeveloped country like India, to distinguish between a 'development phase' for the rest of this century, to be followed by a 'growth phase'. Growth is still the prerequisite of development, because all the structural and institutional changes involved in development are facilitated by growth and frustrated by stagnation. But the central objective of development is to bring about these structural changes. There have been many cases of growth without development either because the growth process did not generate the flow of resources needed to sustain the process or because the growth of demand did not keep step with the production possibilities.

This is a rather strict interpretation of planning, making it consist of a set of quite specific decisions. In addition to these decisions and underlying them, it is useful to have a general idea of the broad direction in which it is intended that the economy should progress. This may be described as the country's development strategy. It differs from the plan, in that it does not consist of specific decisions about actions to be taken by the state according to any time schedule, but rather as an account of what the entire economy is intended to be as a result of development activities and the broad directions along which it moves to get there. The elements of such a strategy may be inferred from the various policy statements of political leaders but there is considerable vagueness in these statements and also a number of gaps on important issues.

On the interpretation of planning suggested above, it follows that what goes under the name of perspective planning is not quite the same thing as long-term planning.[5] In India, perspective planning is essentially concerned with drawing out the implications, of a macro-economic projection for some broad sectors of the entire economy. It aims to cover the entire economy for a period of 15 to 20 years. It does not involve any commitments to future actions over this period. An attempt is made to relate the macro-economic projections to what are called long-term plans in some key sectors, drawn up by various Working Groups. These plans consist initially of certain long-term targets in individual sectors, on the assumption that there would be no financial constraint, and then later cut down to size, according to the indications given by the macro-economic projection. The main object of the perspective plan exercise is essentially to provide a background for formulating the current five year plan. One result is that the perspective plan is revised on the occasion of drawing up each five year plan.

From some points of view, the perspective plan drawn up in the course of formulating each five-year plan may be compared with the concept of development strategy suggested above. But even for this, it has some limitations. This is primarily due to the emphasis given to the growth of the national income in the perspective plan exercise. It is as if the growth of the national income during the planning period was the central objective of such planning, and that the task of planning was merely to anticipate the implications of such growth in various sectors, rather than to promote the structural transformation of the economy to achieve a high rate of self-sustaining growth after the current phase of development planning. Some illustrations of an alternative approach to the concept of development strategy will be given in the next part of the paper, comparing it with the approach implicit in the present perspective plan exercises.

At the other extreme, a great deal of effort is devoted by the planning agency to formulating the annual plans. In current practice, the annual plan is not something additional to the long-term and five-year plans, as in the alternative model of the planning process suggested above, but a way of breaking down the five-year plan in more detail and phasing its implementation. Such annual plans are needed partly because the five-year plan is not specified in sufficient detail. They are also needed to adjust the financing of the annual segments of the five-year plan. This need arises because the five-year plan aims at a comprehensive coverage of the entire economy and hence cannot ensure its financial viability over so long a period. As a result, all the elements of the five-year plan are in annual jeopardy and at the mercy of the annual vicissitudes in financial resources.

Long-Term Plans

Once a fairly comprehensive development strategy has been worked out, the next step in the planning process is to determine those areas in which long-term plans can be drawn up and to formulate such plans for those areas. Before tackling these questions specifically in the Indian context, let us review some of the objections that may be raised against such long-term planning. In this connection, it must be remembered that, for our present discussion at least, a plan means a set of decisions for specific actions in the future, and that a long-term plan is one which covers a period of a decade or more. Further, it is here proposed that the long-term plans be drawn up, not for the entire economy, but only for a few particular sectors.

The first objection to making such long-term plans is that, as these plans cover a period longer than the normal tenure of a Parliament, the present government cannot commit future decision-makers to such specific actions. This objection is, of course, valid in a legalistic sense, but it can easily be exaggerated. Indian planning experience already shows how far it has already succeeded in making advance decisions in the course of developing the five-year plan technique. Also, many economic provisions are already embodied in the Indian Constitution, so that policies resulting from these provisions will be binding on any future government succeeding the present one. And in any case, it is not proposed to commit the actions of future governments over a very wide area. What is needed is to select areas for long-term planning, such that plans drawn up at present will have a good chance of being implemented by whatever government comes into power in the future. To achieve this, the areas chosen for long-term planning must be such that the technical bases for these policies dominate the more political ones. It will be argued below that there are some areas in which these conditions are fulfilled in the Indian situation.

The next objection to long-term planning is the problem of projecting the availability of resources over so long a period in the future. This again is not a serious objection, because such long-term planning is only proposed for a few limited and high priority areas. The resources required for such plans will be a relatively small part of the total resources required for the country's development, so that it should be possible to commit this part of the future resources to implement the long-term plans, even if there is considerable variation in the total resources available.

The third objection, referring to the fact that long-term plans are made only for a few sectors of the economy, is that it will not then be possible to secure full co-ordination between developments in the areas subject to long-term planning with developments in other areas. While true, this again must not be exaggerated. In the first place, given the long-term plans in some areas, every attempt must be made to co-ordinate the medium- and short-term plans in other areas to the long-term plans already adopted. In the second place, we must include, for long-term planning, only those areas which are of high priority, so that there will be less need to modify them to co-ordinate with the plans in other areas, and therefore less deviation from the optimum in pursuing the long-term plans of action. Finally, it must be recognised that, whatever the degree of co-ordination aimed at in our theoretical studies, the amount of co-ordination actually attainable in practice is quite limited, as shown in the past experience with the five-year plan approach. It may even turn out, in practice, that greater co-ordination can be attained by keeping some policies fixed over a reasonably long period and adjusting others to this commitment.

Finally, there is the question of the machinery needed for long-term planning. The theory underlying the present approach is that planning for development is done by the Planning Commission and its counterparts in the states by persons chosen for their technical ability, administrative experience and national stature, so that their decisions on planning will be widely acceptable. This theory has clearly broken down. This is partly because of the extent of ministerial membership in the Planning Commission, which identifies the decisions of the Planning Commission so much with the ruling Government. Also, the conclusions of the Planning Commission are still subject to adoption by the Cabinet and approval by the Parliament. Therefore, planning in the sense of making decisions is still the prerogative of the political leadership, and apart from the extent to which the political leadership operates through the Planning Commission, the work of the Planning Commission is technical and advisory. Perhaps it was originally expected that by virtue of its membership and procedures the views of the Planning Commission would prevail in the political decisions of the government. But this does not necessarily mean that the present set-up is undesirable. It has the advantage of keeping the political leaders in closer touch with the economic and technical considerations involved in policy making, and also the advantage of keeping the technical staff in close touch with the political preferences of the government. But even so, as it operates now, the Planning Commission does not seem to be the best machinery for engaging in long-term planning.

The strength of the Planning Commission derives from the fact that it can constantly keep track of the past and future of the economy as a whole. Consequently, it is unlikely to be able to do sufficiently detailed work in the particular sectors deemed amenable to long-term planning. While the task of formulating the country's long-term development strategy would still be left with the Planning Commission, it may be desirable to set up some other machinery for long-term planning in individual sectors. One device that might be considered is to set up sectoral long-term planning commissions. Such commissions would be composed of the most competent technical persons, fully conversant with the working of the sector concerned and also capable of the vision and imagination to design a long-term plan. It should also include political leaders, both in the government and outside, to ensure that there will be a broad national consensus behind the conclusions of the sectoral planning commission. The inclusion of political leaders outside the government would be essential to give the resulting plan some validity beyond the life of the present government. Whether the long-term plan binding on the present and succeeding governments is actually drawn up by such a sectoral planning commission or whether it is drawn up by the government based on the recommendations of such a commission is a matter to be decided on various political and administrative considerations. But the result should be a credible long-term plan which informs the people about the intentions of the government, and which provides the basis for the more detailed work in implementation to be carried out by the administration concerned.

Short-Term Plans

Given long-term plans for certain sectors, the next step would be to draw up medium-term plans, corresponding to the present Five-Year plans. The projects included in these medium-term plans would be co-ordinated among themselves as fully as possible, and also with such long-term plans as have already been committed to. There would be one important difference between the proposed medium-term plans and the present Five-Year plans. At least in principle, the present plans aim to use up all the resources likely to be available. In the proposed approach, the long-term and the medium-term plans will be drawn up to use a large part, but not the whole, of such resources. The main reason for suggesting this departure from present practice is that there is so much uncertainty in estimating the availability of resources, even over periods of five years at a time. Under these conditions, tight financial planning will generally not be possible. If available resources turn out to be less than estimated, the plans have to be curtailed somehow; the adjustment of plans under crisis conditions will be far from optimal and at the same time, the credibility of planning will be seriously affected. On the other hand, if available resources turn out to be more than estimated, the plans would have turned out to be unnecessarily modest. Therefore, there is an advantage in deliberately planning over the long- and medium-term periods for less than the full amount of resources likely to be available.

On this basis, the task of adjusting development activities to the maximum amount of resources that can be squeezed out of the economy for this purpose will have to be faced in the short-term or even annual plans. Unlike the present procedures in which the annual plans are segments of the five-year plans, under the proposed approach the annual plans will be additional to the long- and medium-term plans. They will be co-ordinated with such plans as have already been drawn up. The annual plans will aim to use available resources as fully as possible. There will therefore be a constant incentive to mobilise the maximum amount of resources. This will be the arena for the policies of demand management, which Cairncross has suggested as being the subject of short-term planning.[6] Hence, this is the area in which the role of the finance ministry and the monetary authorities will be particularly important. In addition, the short-term plan will have to go beyond the usual fiscal exercises of the annual budget to search out for additional short-term questions as being an attempt to se-

development projects which can be financed out of the resources not already committed in the country's long- and short-term plans. To facilitate this, there should be in constant readiness a shelf of projects which have been fully researched and are ready for implementation at short notice.

Has There Been a Decline in Agricultural Tenancy?

S K Sanyal

Was there a decline in agricultural tenancy during the period 1953-54 to 1961-62, coinciding with the two countrywide surveys of landholdings by the National Sample Survey?

This question is examined in this paper on the basis of the distribution of ownership holdings and agricultural holdings separately for three states: West Bengal, Punjab and Uttar Pradesh. The former two states represent regions where tenancy is most pronounced, whereas in UP the incidence of tenancy is less marked.

THE scope of tenancy legislation in the different states after 1953-54 was mainly restricted to providing security of tenure to the cultivating tenant and assuring generous terms to the share-cropper besides securing ownership rights to some tenants. As regards the former objective, it is widely believed that the reforms have not achieved any measurable success; on the contrary, in the name of 'voluntary surrenders' forced evictions have taken place. While some tenantry might have acquired ownership rights over their rented in land, existence of concealed tenancies has also been reported. It is also claimed that the share of cultivated land directly settled with the government has increased. The question remains whether there was a decline in agricultural tenancy during the period 1953-54 to 1961-62, coinciding with the two countrywide surveys of landholdings by the National Sample Survey. The results of these inquiries along with some other evidence have been pooled together by Dharm Narain and P C Joshi[1] to come to the conclusion that there was a real decline in the weight of tenancy at the all-India level during this period, though in some specific regions the weight of tenancy might continue to be high. P K Bardhan[2] is, however, inclined to believe that there was some decline but that a substantial amount of tenancy might have been driven underground. This problem has again been examined in this paper on the basis of the distribution of ownership holdings and agricultural holdings separately for three states — West Bengal, Punjab and Uttar Pradesh, the former two representing regions where tenancy is most pronounced whereas in UP incidence of tenancy is less marked.

Though the limited purpose of this paper is to examine the trends in agricultural tenancy during the period between the two surveys, it would be worthwhile to have a comparative appraisal of the concepts adopted in the two surveys so as to avoid hasty conclusions. As will be observed subsequently, this study takes into account the two concepts of ownership holding and agricultural holding. In the first land holdings inquiry (8th round, 1954-55), the concept of ownership included only land held with the right of permanent and heritable possession but in the second inquiry (17th round, 1961-62) it included, besides 'pure ownership', also land held in ownerlike possession, e g, land held on long-term lease, long tenure, etc. The fact that the proportion of landless households went down appreciably from 23.09 per cent in 1953-54 to 11.68 per cent in 1961-62 has thus to be taken in the light of this important conceptual difference. The actual decline was less than the figures suggest.

The second important concept which needs some elaboration is that of the operational holding. In the eighth round survey, all holdings of the sample holseholds whether put to agricultural use or not were enumerated, while in the 17th round only agricultural holdings were covered. In the reports dealing with the 8th round, estimates of agricultural holdings are provided, having been derived by discounting the non-agricultural ones. For reasons of comparability these estimates have been used in this paper.

Considerable Leasing Out

Some characteristics of rural households, relevant to any discussion of tenancy, are reviewed for the three states against the background of all India estimates (Table 1). Even considering the differences arising out of the concept of ownership holding, it does appear that the proportion of landless households went down for the three states. This was not, however, accompanied by any decline in the proportion of households not operating land; in West Bengal there has been actually an increase in the proportion. Added to this, the high percentage of absentee landlords still persisting in the latter period (Table 1, col 6) confirms the hypothesis that there was considerable leasing out of land. No comparable estimate of the percentage of absentee landlords or pure rentiers is available for the 8th round. Bardhan has compared the percentage of households leasing out their own land fully (2.15 per cent for all India, 8th round) with the percentage of landowning house holds who did not operate their holdings (17.42 per cent, 17th round) to conclude that there was a rise in the percentage of pure rentiers. There might have been a rise, but not to the extent suggested by Bardhan, because the 17th round estimate includes, besides households leasing out fully, those households who owned land solely put to non-agricultural uses or forests or culturable wastes and also those households who had leased out only that part which had been put to agricultural production.

Measure of Tenancy

The NSS surveys sought information on both the 'ownership' holding and the 'operational' holding. While the distribution of ownership holdings, say F(y), includes pure ownership (or proprietary rights) and/or ownerlike possessions, the distribution of agricultural (or operational) holdings, say ϕ (Z), depicts the behaviour of the real farming units composed of the two components (i) owned and operated (ii) leased in and operated. Inasmuch as F(y) takes into account the owned area which might have been leased out, the first component of ϕ (Z) is exclusive of the leased out area. Supposing C denotes the concentration ratio of the ownership holdings and corresponding ly C_z that of the agricultural holdings $C_z < C_y$ to the extent effectiv tenancy has a wholesome effect on th size of the farming units. The inequality holds good because of the incidence of leasing out by large owners and the relatively larger total area leased in by the small holdings. The existence of such an inequality at th

TABLE 1 : PERCENTAGE OF LANDLESS HOUSEHOLDS AND OF HOUSEHOLDS NOT OPERATING LAND

State	Percentage of Landless Households		Percentage of Households not Operating Land		Percentage of Households Owning but Not Operating Land
(1)	8th Round (2)	17th Round (3)	8th Round* (4)	17th Round (5)	17th Round (6)
(1) West Bengal	20.54	12.56	24.30	33.88	22.21
(2) Punjab	35.51	12.33	38.79	39.09	30.51
(3) Uttar Pradesh	9.36	2.78	23.47	20.76	18.49
(4) All India	23.09	11.68	28.21	26.86	17.42

* This column in fact gives the "Percentage of non-agricultural holdings" in the absence of any comparable estimate. In the 17th round, only 1.17 per cent of households reported more than one holding. If, therefore, we assume that each household has only one agricultural holding, the two columns (4) and (5) are more or less comparable.

same time is indicative of the prevalence of tenancy in any region. The distance $d = C_y - C_z$ would be roughly indicative of the incidence of tenancy in a state. The distance between the concentration ratios at time t_1 compared with the distance at time t_2 would reflect the relative changes in the magnitude of effective tenancy between t_1 and t_2.

About the second component, i e, 'leased in and operated', it may be mentioned that theoretically this may comprise any land taken on lease either from the government or from any institution or from urban households, besides from rural households. From what we have seen in the earlier section, a good percentage of rural households are rentier in nature and hence land leased out by such households would form a sizeable proportion of rented in area within the holdings apart from the land leased out by those who own land and migrate to the urban areas for employment. Moreover, households owning more land than they can effectively cultivate also lease out part of their land.

Again, it is true that F(y) includes non-agricultural land and to that extent the distance 'd' may suffer a further reduction if only ownership of agricultural land were considered. But the noticeable feature of the definition of agricultural holdings adopted is that even if a small portion of a holding was put to agricultural production and the remaining portion were non-agricultural, the whole area was termed an agricultural holding. Hence except for slight differences arising out of the lowest landowning classes, the reduction in 'd' may not be substantial.

The concentration ratios of ownership holdings and agricultural holdings for all India and for the three states are given in Table 2. It will be seen that the concentration ratios have been obtained in respect of ownership holdings exclusive of landless households as well as inclusive of them — the former being more relevant for comparison with agricultural holdings and the latter enabling one to have a deeper insight into the behavicur of F(y) seen independently. Considering thus the total rural population including the landless, it is observed that the concentration ratio (C_y) had not perceptibly declined in 1961-62 compared to that in 1953-54 in Punjab and UP and was almost at the same level in West Bengal despite the fact that the proportion of landless households had gone down. Excluding landless households, the distribution of ownership holdings had over this period moved towards increased unevenness in West Bengal and Punjab while being at the same level for UP, thus suggesting a possible subdivision of ownership rights among family members and probably creation of small owners out of the erstwhile tenantry. Comparing the concentration ratios (C_z) of agricultural holdings in the two time periods, it will be observed that for all the three states, the distribution became further smoothened (the evidence being stronger for West Bengal and Punjab, where there is a larger magnitude of tenancy), thereby indicating a movement towards a better size distribution of farms.

TABLE 2 : CONCENTRATION RATIOS OF OWNERSHIP AND AGRICULTURAL HOLDINGS: 8TH AND 17TH ROUNDS, NSS

State	8th Round			17th Round		
	Ownership Holdings (C_y)		Agricultural Holdings (C_z)	Ownership Holdings (C_y)		Agricultural Holdings (C_z)
(1)	Excluding Landless (2)	Including Landless (3)	(4)	Excluding Landless (5)	Including Landless (6)	(7)
(1) West Bengal	0.6562	0.7268	0.5616	0.6941	0.7325	0.4611
(2) Punjab	0.6346	0.7646	0.5368	0.7142	0.7494	0.5013
(3) Uttar Pradesh	0.6136	0.6410	0.5192	0.6108	0.6208	0.5058
(4) All India	0.6772	0.7517	0.6221	0.6834	0.7226	0.5840

CONFLICTING EVIDENCE

Now discounting the landless households in the ownership holdings, if we measure the distance (d_1) between C_y and C_z in the 8th round and if d_2 denotes the corresponding distance for the 17th round, we get the following results:

		d_1	d_2
(1)	West Bengal	0.0946	0.2330
(2)	Punjab	0.0978	0.2129
(3)	Uttar Pradesh	0.0944	0.1050
(4)	All India	0.0551	0.0994

The results above indeed show a larger play of tenancy in the latter period at the all India level relative to the former period. For West Bengal and Punjab, the two states where the share of leased area in the total operated area is quite substantial, d_2 is markedly higher than d_1. In Uttar Pradesh where tenancy is prominent, d_2 is not much different from d_1. It may thus be concluded that there has not been any decline in the magnitude of tenancy in 1961-62 relative to that in 1953-54. Rather, for West Bengal and Punjab, the magnitude of tenancy might well have increased.

Judging from the behaviour of the proportion of operated area leased in, Dharm Narain and P C Joshi have observed a significant decline in the magnitude of agricultural tenancy. If we look at Table 3 we find that not

TABLE 3 : PERCENTAGE OF OWNED AREA LEASED OUT AND OPERATED AREA LEASED IN

State	Percentage of							
	Households Leasing Out		Owned Area Leased Out		Holdings Reporting Leased In Area		Operated Area Leased In	
(1)	8th Round (2)	17th Round (3)	8th Round (4)	17th Round (5)	8th Round (6)	17th Round (7)	8th Round (8)	17th Round (9)
(1) West Bengal	10.41	7.33	15.51	7.22	41.49	29.00	25.43	17.65
(2) Punjab	22.87	11.83	30.82	13.68	53.40	47.69	40.42	35.39
(3) Uttar Pradesh	9.78	7.66	5.84	3.66	27.20	20.98	11.38	8.06
(4) All India	12.03	7.03	11.42	4.43	39.84	23.52	20.34	10.70

only the proportion of operated area leased in but the percentage of owned area leased out has gone down considerably for all India as well as the three selected states. There is all round evidence of a decline in tenancy. On the other hand, the evidence available earlier, i e, of $d_2 > d_1$, shows a more significant role of tenancy in the latter period than in the former. Thus one is apt to question whether the decline in tenancy is genuine.

UNDERREPORTING

That the decline in tenancy observed in the latter period might have been due to an underreporting bias among the informants was examined by Dharm Narain and P C Joshi. According to them, this bias should have led to a relatively sharper decline in the proportion of operated area leased in amongst the smaller holdings than in the large ones but the NSS data at the all India level reveal different results — a sharper decline was observed in the larger holdings. P K Bardhan is not inclined to accept this argument as sufficient to dispel the suspicion that a substantial amount of tenancy might have been driven underground. In partial support of this suspicion he has used the argument that a 65 per cent rise in the number of permanent farm servants per acre of operated area between the two rounds might well have been due to misreporting tenants (particularly sharecroppers) as farm servants. While such misreporting is not to be ruled out, it may be noted that in the first inquiry persons permanently employed by operational holdings were taken to be permanent farm servants but in the second inquiry all those who were more or less in continuous employment and under some contract with the employers during the period of employment were reported as permanent workers. The second inquiry thus permitted the inclusion of workers attached to holdings for relatively short periods. The rise emphasised by Bardhan has to be considered in the light of this conceptual difference.

In selecting "percentage of operated area leased in" in preference to "percentage of owned area leased out" as a more reliable measure of magnitude of agricultural tenancy, Dharm Narain and P C Joshi have correctly pointed out that the latter is more amenable to an underreporting bias than the former. It is expected that tenants will not hesitate to give out the area rented in. In order to investigate the underreporting of tenancy, let us now examine the first component of $\phi(Z)$, i e, the distribution of the 'owned and operated' part of the agricultural holdings, say $\phi(s)$, which excludes the tenancy part, and compare it with the corresponding distribution of ownership holdings excluding leased out area, i e, F(t), t denoting area owned less area leased out. If the concentration ratio of $\phi(s)$ and F(t) be C_s and C_t, $C_s - C_t$. The two may differ only slightly in the latter period because of the reference periods for ownership holdings and operational holdings being somewhat different.

It will be seen from Table 4 that $C_s < C_t$ in West Bengal and Punjab. This smoothening of the distribution of owned area self-operated needs an explanation when we see the actual farming units (or the agricultural holdings) against the ownership holdings. In this context, the limitations of such a study should first be pointed out. C_t has been obtained from the distribution of owned—leased out area by size of ownership holdings and similarly C_s from the distribution of 'owned and operated' area by size of agricultural holdings which also include the second component, i e, leased-in area. Some inaccuracies may thus creep in due to misclassification of some holdings in either case (size classification of owned—leased out area and of owned and operated area, respectively, would have been the correct classifications but, unfortunately, we do not have such data). Nevertheless, on comparing C_t with C_y and C_s with C_z, we can surmise that the inaccuracies are not likely to change the direction of $C_t - C_s$. By and large, $C_t - C$ would indicate the errors of misreporting or the bias of underreporting of the leased in area in the actual farming units or else the bias arising from underreporting of leased out area. Again, if we are prepared to tolerate a difference of $C_t - C_s$ as revealed for the 8th round as being due to inaccuracies resulting from misclassification, we find that the gap became more than three times in the latter period for Punjab and one and a half times for West Bengal. We are thus inclined to believe that there might have been an underreporting of tenancy. The possibility of households reporting tenanted area as owned cannot be ruled out.

Security of Bangladesh

K Subrahmanyam

Bangladesh borders only two countries — India and Burma. Since a conflict with India, even if theoretically possible, would prove unmanageable for Bangladesh, this paper does not examine Bangladesh's security problem in that context. The problems examined here concern the internal security of Bangladesh and the maintenance of a border force, particularly for patrolling the area adjoining the frontier with Burma to prevent minority insurgent elements from moving from one side of the border to the other.

The connected issues of whether Bangladesh should have a standing professional army or a militia and whether Mukti Bahini personnel should be absorbed into the armed forces are also examined.

BANGLADESH shares a long border of more than 3,680 kilometres with India and of 240 kilometres with Burma. As far as one can foresee, except in the case of Bangladesh making a contribution to the overall security of the subcontinent, the new nation is fortunate in not having an external security problem. With India its ties, as has been repeatedly emphasised, are sealed in blood and Burma by itself does not pose a security problem in the conventional sense. Theoretically and hypothetically one may visualise a situation where Bangladesh may develop serious differences with India. If it does, and those differences will have implications for the security of Bangladesh, then the problem for Bangladesh will be unmanageable. There is no need to discuss such an unmanageable type of security problem here. On the other hand, there are some who visualise that Bangladesh may act as a proxy for an external power, just as Pakistan did all along, and develop its armed potential with external assistance. This is an unlikely event. In the fifties when Pakistan entered into military alliances, though they were recognised in India as being directed against this country, not much could be done to counter the threat actively in view of India's weakness. This will not be the case in future. On the other hand, India is likely to be extremely sensitive to the activities of external powers in the subcontinent and take active measures to countervail them at the incipient stage.

Another issue raised is about a maritime threat to Bangladesh and perhaps those raising this issue have in mind Pakistan's continuing claim on Bangladesh and the US Seventh Fleet's activities in support of Pakistan in December 1971. But a threat to Bangladesh will be considered a threat to India, treaty or no treaty. In April 1971, when called upon to do so, the Indian navy threw a protective cordon around Ceylon at short notice. In future any external naval intrusion into the Bay of Bengal will be viewed by India as an unfriendly act. A foreign naval presence in the Arabian Sea which has on its shores Pakistan, Iran, Saudi Arabia, Bahrain and various other nations with treaty relationships with foreign powers cannot be objected to by India. But on the shores of the Bay of Bengal there are only Burma, Bangladesh and India and any foreign naval presence will have to explain itself satisfactorily. The presumption will be that such a presence, unless it is in pursuance of a request from one of the three countries, is an unfriendly act. The main responsibility for ensuring the security of the countries on the shores of the Bay of Bengal from external maritime intervention will be India's.

However, every sovereign nation needs to maintain an armed force and the events in Ceylon last year emphasised the need even for those nations which have no external security problems at all to maintain an effective armed force for internal security purposes. Mujibur Rahman referred to the desirability of discussions between Bangladesh, India and Pakistan to safeguard the peace and security of the subcontinent soon after he had some discussions on the issue with the Indian Prime Minister. Radio Pakistan gave publicity to this statement. The subcontinent is a natural unit in many ways and its defence against external threats should be considered in an integrated way. Mujibur Rahman's statement appears to imply realisation of this fact. This will have an important bearing on the kind and size of security forces Bangladesh will need.

Internal Security

We may start with the internal security requirements of Bangladesh. The new nation is a poor nation, very densely populated, criss-crossed by rivers, with consequent difficulties in mobility. Mobility and communications become even more difficult during the monsoon months when operations even by helicopter and STOL (short take-off and landing) aircraft may not be possible on all days. At present major cantonment facilities are available, apart from Dacca, at Jessore, Khulna, Saidput, Rangpur, Bogra, Sylhet, Comilla and Chittagong. The internal security force could be stationed in these cantonments and be equipped for rapid riverine movement.

The next important issue is whether the borders with India should be patrolled by a para-military force or not. Pakistan maintained around 20,000 personnel for this task. There have been pleas that the border should be open. An open border, apart from having international political implications, also has economic and sociological ones which will have to be considered in great detail by both countries. Bangladesh is, populationwise, a high density area compared to some of the surrounding areas of India. An open border will inevitably mean some spillover from the Bangladesh population into these areas. This will not be readily acceptable to the Indian states bordering Bangladesh and consequently India is likely to keep up the border patrolling. In turn this may lead to Bangladesh also maintaining a border security force. If it is decided to have a Bangladesh para-military force to man the border, what should be its size?

The border with Burma will have to be rigorously patrolled in view of the conditions prevalent in the Burmese areas adjoining Bangladesh. From time to time there have been small-scale insurgencies of semi-communal, Muslim origin in the Akyab region. This may lead to the shifting of insurgent elements from one side of the border to the other. The area adjoining the Chittagong hill tracts has also its periods of turbulence. The emergence of Bangladesh and the granting of statehood within India to Nagaland and Manipur may cause the Burmese Nagas, and other minority groups to persist in their demands for statehood within Burma. This may add to the turbulence in the area and further emphasise the need to patrol the

Bangladesh border with Burma.

Let us now look at the problem from the resources end. Bangladesh's GNP is likely to be of the order of Rs 3,500 crores. Two per cent of this on defence will be about Rs 70 crores which will be a reasonable order of expenditure for a country at the stage of Bangladesh's economic developments and problems. Out of this sum, an army, navy and air force will have to be maintained in addition to a para-military force for border patrolling. Pakistan had a four-brigade division in East Bengal (before February 1971) and 20,000 East Pakistan Rifles personnel. These two elements alone, with overheads, would cost around Rs 50 crores. In addition, a river navy is essential for Bangladesh. There are reports that the coastal area of Bangladesh stretching into the Bay of Bengal may have potential for oil. Coastal patrolling which would also provide minimum protection against smuggling would therefore be needed. Given the riverine terrain, the marshy areas and the Chittagong hill tracts, helicopter and STOL aircraft for the defence forces, apart from a small air force of fighter-bombers, will also have to be planned for.

In view of the recurring devastation caused by cyclones, tidal waves and floods every year, these defence forces should be specially equipped and geared to deal with natural calamities. These considerations again emphasise the need for helicopters, STOL aircraft, power-driven rivercraft, etc.

Militia or Professional Army

In raising an army of its own, the first issue that will come up for consideration is whether Bangladesh should have a small professional army or a comparatively large militia. Militias are most suited to nations which run the risk of being overrun and occupied. To continue resistance after occupation, militias fully rooted in the local population are ideal. But Bangladesh does not have such a security problem. A professional army is suitable for nations which have limited security problems. Militias can be properly organised only in countries where there is a high degree of political indoctrination and a one-party state. Therefore, the raising of a militia will depend upon the political structure Bangladesh is likely to adopt.

A connected issue, which the Bangladesh administration will have to face in the near future, is the absorption of Mukti Bahini personnel. There may be certain demands and suggestions that they should all be absorbed into the armed forces. This suggestion needs to be gone into in great detail. The Mukti Bahini was recruited from among middle class young men most of whom are well educated and motivated. Whether all of them can be satisfactorily fitted into a regular armed force is a major issue. The spirit of association, cohesion, give-and-take in the Mukti Bahini is different from the hierarchical structure in a regular armed force. Is it, therefore, advisable for Bangladesh to convert the Mukti Bahini into a regular armed force?

Bangladesh has been a victim of militarism. All possibilities of the revival of the spirit of militarism should, therefore, be eliminated. Militarism in third world countries very often arises from the 'guardianship' role the armed forces attempt to play and the elitist self-image they have of themselves. In the case of Indonesia, Burma and Algeria, the armed forces played a notable part in the national liberation struggle which brought the new nation into being. Consequently, at a later stage the armed forces claimed for themselves the role of guardians of the state. Nations like Libya, UAR, Syria, Iraq, Sudan and above all, Pakistan, have suffered form the intervention of the armed forces in politics.

The Mukti Bahini today in Bangladesh is a name which conjures up a saga of courage, sacrifice, selflessness and patriotism which will be enshrined in the annals of Bangladesh. These very factors necessitate that the Mukti Bahini at this stage should pass into history and the new armed forces of Bangladesh should not have any continued links with the Mukti Bahini. The Bahini was born to destroy militarism. With that mission accomplished, it must dissolve itself so that in future no one should be able to invoke the aura associated with it for other purposes.

A large number of Mukti Bahini personnel may be recruited into the new armed forces and it is appropriate that they get preference. But in the interests of the future of democracy in Bangladesh the Bahini should not have a continued existence. This is no reflection on the men of the Bahini today. But who knows what may happen in future? An opportunity should not be provided for someone to misuse the Bahini name, and the legitimacy derived from it, for establishing militarism in the future.

Doubts used to be expressed about whether the Bangladesh administration would be able to disarm the Bahinis. The surrender of arms by 16,000 men of 'Tiger' Siddiqui's Bahini at Tangail and the ceremonial surrender of 10,000 weapons in Dacca stadium on January 31, 1971, indicate the loyalty Mujibur Rahman commands among the freedom fighters. The amount of weapons still left unaccounted for is not likely to be significant and disarming of such personnel may not prove a major problem at all.

Militarism

It could be pointed out that the threat of militarism arises only from professional standing armies and not from militias. This is no doubt true. But militias are not of much value for internal security duties in non-ideological states. Even in such states it has been found necessary to employ the regular army against the local militias on occasion. For instance, the Chinese People's Liberation Army had to be employed against the Red Guards to restore order. In any case, Bangladesh is in a situation where a small standing army is inescapable and the issue is how to reduce the risk of militarism while raising and maintaining such a standing army.

Another field in which Bangladesh could take the initiative at this stage, is to have joint facilities for military training with other smaller powers in the subcontinent which will lead to economies and also form the basis of intra-regional co-operation. Bangladesh, Bhutan, Nepal and possibly, Ceylon, may consider having various training academies and institutions on a common basis. For reasons that are obvious, India may be left out of direct participation but may provide staff support.

Bangladesh has an ordnance factory at Joydevpur. The economies of defence production in Bangladesh will depend upon the size of its forces. If the four countries mentioned could standardise their weapons and equipment among themselves and with India, not only could there be an economic basis for defence production in Bangladesh, but there could also be certain purchases by India from Bangladesh and the supply of weapons and equipment not made there, from India. Fortunately, India is even now in a position to buy the products made in the Joydevpur ordnance establishment.

It is obvious from this brief analysis that certain basic decisions concerning Bangladesh's political, social and economic sectors have to be taken by the Bangladesh government before it can decide on the kind and size of the armed forces it needs.

Net Present Value versus Internal Rate of Return

Further Comment

L C Gupta

IN his reply to my comment (February 26, pp M-43-47), Paul Mampilly is right when he states that the evaluation of an investment proposition should be made on the basis of "the net change, increment or decrement, that particular proposition causes to the *total* finances of an investor over a chosen horizon of time", and that account must be taken not only of what he calls 'primary flows' but also of the 'secondary flows' arising from re-investment of the primary flows. Mampilly argues at length that the re-investment rate should be taken into account for the purpose of investment evaluation and uses this argument as his main justification for the contention that the Internal Rate of Return (IRR) method implicitly assumes a re-investment rate equal to the IRR itself. However, to argue that the actual re-investment rate should be taken into account for decision purposes is one thing; to say that a particular re-investment rate is implicit in the IRR method is quite another.

In other words, while he poses the problem of investment appraisal realistically, it is a mistake to think that the assumption of a re-investment rate equal to the IRR takes care of this real-life problem or is analytically superior. No real problems can be solved by assuming them away.

What use can be made of the cash recovered and how profitably it can be re-invested are certainly of great relevance to the evaluation of an investment proposition. This is, however, an open question and, as such, the practical way to deal with it, as with many other quantifiable and non-quantifiable factors, is to give it separate and explicit consideration. In the example of the banker's overdraft, Mampilly himself recognises several different possibilities with regard to the return available from re-investment. Why then assume a re-investment rate necessarily equal to the IRR? He argues:

> "The information, that unrecovered balances yield 6 per cent, is of no use to the investor as it is only partial. He is interested to know the total impact on his finances consequent to a particular investment decision. To say that overdraft yields 6 per cent has, in fact, the potential of misleading the investor, when as in the example, the real return is only 4 per cent."

Does the re-investment assumption bring any more realism into this situation? Does it give the investor any more information and help him to decide better?

To say that IRR implies an assumption of a re-investment rate equal to itself in no way takes away the shortcomings of the IRR method as compared to the NPV method.

The calculation of IRR, or of NPV, is just one step in the investment decision-making process. While the NPV method automatically takes into account the cost of capital of the borrowing rate, in the IRR method the cost of capital has to be considered separately. The IRR procedure is as follows:

(a) Calculate the IRR;
(b) Compare the IRR so calculated with the cost of capital or the borrowing rate;
(c) Accept the proposition if the IRR exceeds the cost of capital and reject it if the IRR is less than the cost of capital.

Now, if we accept Mampilly and Rangarajan's contention that the IRR method implies that "the borrowing rate or the rate at which funds are obtained is the same as the rate at which funds generated during the life of the project can be re-invested" and that the re-investment is made "at the particular value of the IRR", it is clear that the IRR method will make no sense in any practical situation. In order to justify the assumption of a re-investment rate equal to IRR, they had to invent the very unrealistic condition of the borrowing rate also being equal to the IRR itself and conclude that "if the IRR connotes a rate different from the established re-investment rate, it loses its practical significance". How much "practical" significance can be attached to an IRR satisfying all their assumptions?

The assumption of a re-investment rate equal to the IRR is neither realistic nor analytically helpful. It is, of course, not implicit in the calculation of the IRR.

The NPV measures the *absolute* amount of return from investment for the entire life of a project after allowing for cost of capital; on the other hand, the IRR is in terms of an annual *rate* before allowing for cost of capital. Strictly speaking, the two measures are not in comparable terms. In my last comment, I had shown diagrammatically how NPV rankings of different projects may change as the discount rate increases. Mampilly has complained that I forgot my mission of investigating the reason for conflict between IRR and NPV methods. The truth is that the mission was lost on some.

Employment in the Organised Sector

EMPLOYMENT in the organised sector increased during 1971-72, though at a slightly slower rate, it being 2.2 per cent in 1970-71 as against 2.5 per cent in the previous year. In absolute terms, employment increased from 17.1 million at the end of March 1970 to 17.5 million at the end of March 1971, according to the Annual Report regarding employment and training of the Department of Labour and Employment. The employment growth (rate of 3.2 per cent) in the Public Sector attained during 1970-71 was higher than in the preceding year (2.5 per cent). In absolute terms employment increased from 10.37 million in March 1970 to 10.71 in March, 1971.

There were 488 employment exchanges functioning in the country at the end of December, 1971. The total number of employment-seekers on the live register of Employment Exchanges showed a rise of 25.3 per cent from 40.69 lakhs in December, 1970 to 51.00 lakhs in December, 1971. The number of placements effected during April-December, 1971 was 3.99 lakhs, the figure for the corresponding period of the previous year being 3.45 lakhs.

The number of educated applicants (i e Matriculates and above) on the live register of employment exchanges continued to show a rising trend-their number was 22.96 lakhs at the end of December, 1971 as against 18.22 lakhs a year ago — a rise of 26.0 per cent. Of them 12.97 lakhs were Matriculates, 6.05 lakhs were undergraduates and 3.94 lakhs were graduates and post-graduates.

Women work-seekers on the live registers at the end of December, 1971, was 5.83 lakhs as against 4.85 lakhs in December, 1970.

Amar Dye-Chem Limited

Speech of the Chairman, Shri Amritlal Kalidas Doshi

THE following are excerpts of the Speech made by the Chairman, Shri Amritlal Kalidas Doshi, to the Shareholders at the Eighteenth Annual General Meeting of the Company held on May 4, 1972:

It gives me great pleasure to welcome you all this afternoon to the 18th Annual General Meeting of the Company and to place before you the Directors' Report and the Audited Accounts of the Company for the year ended 31st December, 1971.

These have already been circulated and have been with you for some time now. I hope you had an opportunity to go through the Directors' Report and the Accounts. With your permission, I shall take them as read.

Dividend

I am sure you would have been slightly disappointed as the dividend has been reduced from Rs 14/- to Rs 12/-. The Board has been compelled to come to this decision due to factors beyond their control. As you all know, the rate of tax has been increased in the last year by 2½ per cent as a surcharge for Bangladesh refugees and instead of repealing it, due to the emergency being over, it has now been increased to 5 per cent in the last budget. Moreover, the priority industry rebate which was already reduced from 8 per cent to 5 per cent has also been withdrawn. Thus the rate of tax has virtually gone up by approximately 8 per cent. At the same time, the salaries and wages are going up due to the increase in dearness and also the cost of production is increasing due to increase in customs duty, excise duty, octroi, railway freight and many such incidental expenses.

The Board felt that under such circumstances as existing in our country, it is not a wise policy to distribute a larger amount by way of dividend but try to retain as much as possible with the company for future expansion or at best, issue bonus shares. I hope this explanation would prove satisfactory to you.

Company's Operations

The Sales Turnover of the Company was less by slightly over 10 per cent in value as compared to the year 1970, as can be seen from the following figures:

	Year	Value
Sales	1970	Rs 10,10,93,090
	1971	Rs 9,08,48,750

It could be seen that the trading gross profit of your Company for the year under review has decreased substantially from that of 1970. This reduction is the result of various factors, some of the most important being as under:—

1. The crisis in the textile industry, resulting in poor off-take;
2. Reduction in price to meet competition due to production being greater than consumption;
3. The stringent monetary conditions which led to giving longer credits or larger Cash Discount;
4. Substantial increase in salaries and wages, due to increase in Dearness, as the index went up from 813 in December 1970 to 848 in December 1971. We also entered in a 3 years agrement with the union, under which we had to give a rise of Rs 25/- in basic salary from August 1970, but paid during the year under review.

In fact, it is not correct to compare the performance of 1971 against 1970, as it was an exceptionally good year, due to a brisk demand of Textile Industry and high prices owing to shortages. But if we compare the results of 1971 with those of 1969, which would be a fair comparison, the performance should be considered satisfactory.

Performance during the Current Year

The sales turnover for the first four months of the current year is slightly higher than the year under review as could be seen from the following figures:

January to April 1971	Rs 3.07 crores.
January to April 1972	Rs 3.33 crores.

The plant for the manufacture of Phthalocyanine Blue has gone on stream in the beginning of the year. The Company is expected to be self-sufficient with respect to this item.

We have also started manufacture of one Rubber Chemical, namely Antioxidant Phenyl Betanaphthylamine, which should contribute to our sales to some extent. This is besides the normal increase in number of items of Dyestuffs, which we are adding year after year.

Export

In the field of exports, I am glad to inform you that commensurate with the policy of Government and due to slackness of demand in the domestic market, the Company has preferred to increase its exports, as can be seen from the following figures:—

Year	Value
1970	Rs 28.80 lacs.
1971	Rs 55.50 lacs.

We are continuing our efforts to find new export markets and your company's performance is expected to be better in the current year as we have already reached, during the first four months, the figure of Rs 25.77 lacs as against Rs 17.64 lacs during the same period in 1971.

Expansion Programme

We are holding Letters of Intent for manufacturing various items such as Rubber Chemicals, Toluene di Isocyanate (T.D.I.), Hydrogen Peroxide, etc. However, the Government has imposed export obligations varying from 10 per cent to 40 per cent and that makes it very difficult to implement the programme. Even our proposed collaborators for Rubber Chemicals have refused to accept several conditions imposed by the Government. We shall, therefore, have to negotiate with the Government for these projects, before we can undertake implementation of any of them.

Similarly, some of our expansion programmes for Reactive Dyes, Pigments, Optical Brighteners have also been delayed due to the same reasons of heavy export obligation. We are not sure that we shall be able to implement them as we cannot agree to unrealistic export obligation, which the Government chooses to impose in an arbitrary manner, without realising that the conditions in the international market are constantly changing and the consumers of advanced countries are using more and more sophisticated items. Under these circumstances, we consider it hazardous to undertake any long range export obligation.

General

It take this opportunity to express my sincere thanks to my colleagues on your Company's Board of Directors for all their valuable guidance in managing the affairs of the Company as well as to the officers, staff and workers of the Company for their loyalty and willing co-operation that I have received from them during the year under review.

While thanking you all once again, I commend the Report and the Audited Statement of Accounts.

A K Doshi
Chairman

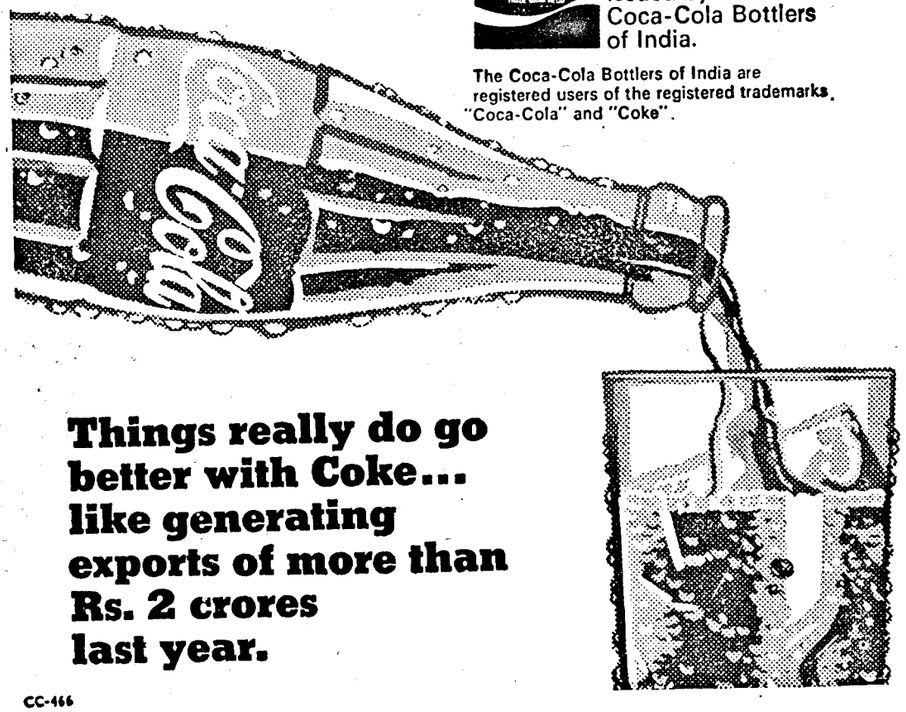
(To be concluded)

In India Coca-Cola goes the Indian way.

By the export of Coca-Cola concentrate to eight overseas countries, mango beverage and tea to the U.S.A., edible gum and cashewnuts to Europe and using the Coca-Cola industry's world-wide distribution network, the Coca-Cola organisation in India last year generated exports of Rs. 2.17 crores.



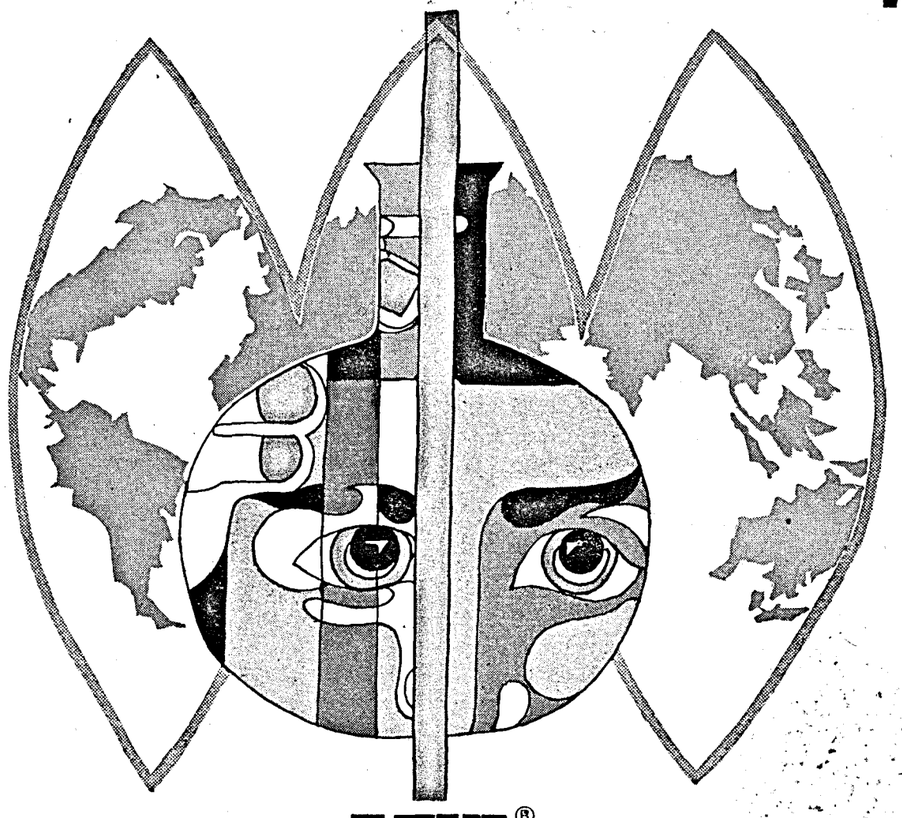
And this is just the beginning. Our special research and development team is continuously working towards developing new products for export and new overseas markets for India.

This is possible because in India, Coca-Cola goes the Indian way. And throughout India, 22 companies—wholly Indian-owned, Indian-managed and Indian-staffed—bottle Coke. This local industry makes an annual contribution of more than Rs. 10 crores to the national economy through taxes. So the more Coke we produce in India, the more the country's economy benefits.

Enjoy Coca-Cola

Issued by the Coca-Cola Bottlers of India.

The Coca-Cola Bottlers of India are registered users of the registered trademarks "Coca-Cola" and "Coke".



Things really do go better with Coke... like generating exports of more than Rs. 2 crores last year.

Not Again

OFFICIAL Russian and Chinese reactions came well after three days of Nixon's announcement of the mining of North Vietnamese and international waters. And these reactions were muted in tone — not reprimanding and almost regretful. Such past epithets as "the glorious struggle of the great and valiant Vietnamese people" were forgotten. The statements same to have been more concerned about the "violation" of legalisms like the UN Charter, International Law and "the generally-recognised principle of freedom of navigation". Of course there was the customary reiteration of support for the Democratic Republic of Vietnam but the spirit to back the words with deeds — not just aid — was missing.

This arouses the suspicion that neither the Russians nor the Chinese were *too happy — assuming, in the first place,* that they had been consulted — about the launching of the North Vietnamese-NLF offensive six weeks ago. At a time when the Soviet Union is about to come to terms with the United States on the limitation of strategic arms and when Peking has seen fit for its own security and diplomatic reasons to cosy up to Washington, the risks involved in an escalation of the Vietnam War were probably considered to be too high to be encouraged by the two big socialist countries.

Kissinger's recent friendly chats with Brezhnev, Moscow's refusal so far to call off the Nixon visit, the near pleading tone when referring to the Soviet Union in Nixon's mine-laying speech: "We do not ask you to sacrifice your principles or your friends but neither should you permit Hanoi's intransigence to blot out the prospects we together have so patiently prepared", might all even suggest that the Russians had tacitly agreed beforehand to the blockade of North Vietnam, so that they could then persuade the North Vietnamese to give up their forthright and risky quest for a quick solution to the American problem in South Vietnam.

The Russians might even be quite willing to persuade the North Vietnamese that Moscow could help gain Hanoi's objectives at the negotiating table if the latter would only allow the Americans to withdraw with honour and the Thieu regime in Saigon to crumble at its own pace. This could very possibly be the Soviet strategy, as it would increase Soviet influence in South-East Asia, provide the Americans with an opportunity to retreat without losing too much face and, perhaps, gain for Hanoi and the NLF their main objective, which as has been repeatedly stressed by Hanoi and the NLF is not an immediate communist government in Saigon, but merely a coalition administration with communists in it.

It is, therefore, not unlikely that the Russians and the Americans and, possibly, even the Chinese, for the sake of their super power interests, are colluding or thinking alike on these lines. The big question remains whether the Vietnamese Workers Party will allow itself once again to be guided to an international conference when a military-political victory is near its grasp in the field. The Vietnamese communists could not have forgotten that in 1954 at the Geneva Conference they were misled into accepting the artificial division of their country into two, after having defeated the French on the battlefield. As now, then also, free and fair elections were promised after a period of peace, but due to the Americans and their cronies in Saigon the promised elections were never held.

So far the signs are that Hanoi is not going to opt for a cease-fire. The fighting around An Loc, near Saigon, continues. Around Hue and Kontum, North Vietnamese forces are regrouping for a concerted attack. To prepare for further American bombing, non-essential personnel and women and children are being evacuated. The recruitment drive for the armed forces has been intensified and eighteen year olds are now going to be drafted. And Hanoi has pledged that it will sweep away the mines.

For these reasons, the resolve of the party of the Vietnamese people "never to step back so long as they have not attained their sacred objectives" can, perhaps, be taken at face value. It is not very likely that now, after a renewed and almost unbelievably heroic struggle against all the odds, those who speak and have the trust of the people of Vietnam will once again fall for the machinations of the 'great' powers. Seldom have a small people defied all the great powers together. But then the Vietnamese people have been known not to succumb to all the might of one great power. It is unlikely that they will succumb to the seductions of the other two great powers.

Power

Areas of Darkness

TILL a few years ago, electric power was considered mainly an input for industrial growth, but with the rapid expansion of minor irrigation agricultural development is also becoming increasingly dependent on adequate and regular supply of power. At the same time, recourse to power-cuts and load-shedding has become frequent in the last two or three years in a large number of states suggesting that, despite the impressive statistics of growth of installed generating capacity and per capita power consumption, the policies and programmes of power development call for review. One would have, therefore, expected to find in the Annual Report of the Union Ministry of Irrigation and Power some discussion of the problems of meeting the rapidly growing industrial and agricultural demand for power — particularly since the Ministry has for long been headed by a technocrat. The Report, however fails to fulfil this expectation; its statistical and descriptive content suggests that the Irrigaion and Power Department is still run as if it were an administrative and not a developmental wing of the government.

As regards policies and programmes of power development, the Report has nothing to offer but a mechanistic presentation of statistics. During the last two decades (1951-1971) installed generating capacity increased by 7 times, from 2.3 to 16.7 mn KW and the all-India per capita power consumption rose by 5 times, from 18 to 90 units. The Fourth Plan aims at expanding generating capacity to 23 mn KW and under the Decade Plan formulated by the Ministry the capacity is to reach 52 mn KW by 1980-81. The shortfall of 2.7 mn KW expected in the Fourth Plan is only casually mentioned. Following from this there is no discussion of the measures the Ministry proposes to take to accelerate the expansion of generating capacity in the remaining years of the Plan so as to minimise the shortfall. Nor does the report worry about how the shortfall in the Fourth Plan target will affect the Ministry's Decade Plan target of 52 mn KW by 1980-81. The Report also says nothing about the continuing imbalance in the regional distribution of generating capacity and per capita availability of power. In the government's industrial policies the objective of development of the backward regions has received considerable emphasis in the last know whether the Union Power Ministry has formulated any plans to match the pattern of power development to this accent in industrial policy.

The Report carefully avoids discussing the reasons for the repeated power crisis in states like Maharashtra and Gujarat. Power development is not just a matter of installation of generating capacity. The reports shows no awareness of the problems of supplying fuel such as coal and RFO to keep going the capacity already created in a state like Gujarat. The Ministry seems to have little say in the settlement of the prolonged disputes between Gujarat government and the Union Ministries of Petroleum and Railways over the supply and price of RFO and the movement of coal from the MP coalfields to the Gujarat power stations.

The Report is full of trivial information on the number of times the Minister and his senior officials were invited abroad for conferences, seminars, etc. But some of the trivial information throws interesting light on the government's thinking on a basic problem like unemployment. For instance, the Report mentions with pride the Ministry's efforts to mitigate unemployment among engineers. These include extension of financial assistance of Rs 3 to Rs 4 crores through the state governments for the study and investigation of flood control, irrigation and power supply programmes. The implication seems to be that investigation of basic resource-use problems is to be undertaken primarily by way of employment-generation schemes. If engineers were not unemployed in such large numbers, the Ministry would not have perhaps thought these problems worth investigating. Similarly, some 2,500 graduate and diploma-holding engineers have been recruited for practical training in power generation techniques at monthly stipends of Rs 250 for graduates and Rs 150 for diploma-holders — that is, at remunerations less than that of even peons in the Ministry!

As for how the power structure in society influences a basic development programme like rural electrification, consider the following matter-of-fact statement from the Report: "It has been observed that street-lighting and public lighting amenities in electrified villages have not been extended to the adjacent Harijan *basties* mainly because of lack of finance." It does not occur to the Ministry to ask why "lack of finances" should affect only the Harijan *basties* even as the upper caste parts of the villages are electrified. Instead it has formulated a *separate* scheme for providing concessional loan assistance of Rs 4.5 crores to State Electricity Boards (through the Rural Electrification Corporation) for the electrification of some 20,000 Harijan *basties*!

Balance of Payments

Errors and Omissions or Leakages ?

THE large figure of errors and omissions for the year 1970-71 in the Reserve Bank's balance of payments data has added fuel to the discussion of leakage of foreign exchange. Upto 1966-67 the figure of errors and omissions was below Rs 30 crores, except in 1951-52, 1963-64 and 1964-65. It, however, spurted to Rs 86 crores in 1967-68 and Rs 114 crores in 1968-69. For equally unexplained reasons, the figure nose-dived to Rs 14 crores in 1969-70, only to go up to Rs 79 crores in 1970-71. For reasons best known to the RBI, balance of payments data from 1966-67 to 1970-71 are still described as 'preliminary' though one may be sure that the size of the errors and omissions entry will not be appreciably different in the 'final' figures as and when the RBI chooses to release them.

From the fact that the errors and omissions entry has been persistently negative the conclusion is sought to be drawn that the country has lost foreign exchange to the tune of Rs 400 crores over the last decade. If only this were the true measure of our foreign exchange losses! Even the official study team on foreign exchange leakages had put the *annual* loss of foreign exchange at around Rs 240 crores. So over the last decade the losses would amount to something like Rs 2,500 crores.

The bulk of the loss of foreign exchange takes place through malpractices such as over-invoicing and under-invoicing. But these cannot affect the balance of payments data and so can have nothing to do with the large errors and omissions figures. Under-invoicing and over-invoicing were as rampant in the early sixties, when the errors and omissions figures were relatively small, as they are now.

The errors and omissions entry arises in the balance of payment data because of the adoption of a double entry system of accounting in which total receipts must match total payments after allowing for changes in official exchange reserves. If they do not, there has to be a balancing entry. The sources of balance of payments data are more accurate and are obtainable without much difficulty for the capital account but are much less precise and reliable for the current account. In the capital account the main entries are those relating to private long-term and short-term receipts and repayments of loans, movement of banking funds, official receipt of loans or amortisation payments and, lastly, variations in official reserves. Information about all these items is obtainable without much difficulty. But in the current account, data relating to imports and exports, involving hundreds of thousands of transactions are more difficult to compile. The RBI's primary source of data are authorised dealers, *viz*, commercial banks dealing in foreign exchange. For data on exports the RBI relies on the duplicates of the GR forms forwarded by the authorised dealers to whom they are submitted by exporters for collection of export receipts.

The GR duplicates do not represent the actual receipt of export earnings and so the RBI's export statistics do not relate to foreign exchange receipts. On the other hand, the import statistics of the RBI are based on information supplied by the authorised dealers in respect of sale of foreign exchange to importers. Theoretically, balance of payments data should refer to actual receipts and payments of foreign exchange but this is not in fact the case. Realisation of export earnings takes 3 to 6 months generally and so the balance of payments figure of exports is likely to under- or over-state actual export receipts, depending on whether exports during a given year are much higher or lower than in the preceding year. By this logic, the errors and omissions figure should be negative only in years when exports are substantially higher than in the previous year. But in fact in the RBI balance of payment data foreign exchange receipts on current account appear to be constantly overstated even when exports have not reflected a consistently growing trend. For instance, the RBI data show that exports during 1970-71 were almost the same as in 1969-70; yet there is an errors and omissions entry of Rs 79 crores in the balance of payments statement for 1970-71. The lag between export shipments and receipt of export proceeds cannot thus satisfactorily explain the phenomenon.

The questions that arise then are: do exporters really bring in all the export receipts due as recorded in the GR duplicates into the country? How careful are the authorised dealers about collecting foreign exchange dues on account of exports? Also, does the RBI systematically match all the GR triplicates (which are sent in by the authorised dealers after the export receipts are realised) with the corresponding GR duplicates?

Education

Not Fit for Democracy ?

A Correspondent writes :

STUDENT POWER is certainly becoming a potent force in Maharashtra. It is true that it does not yet dominate the politics of the state as it does in, say, Kerala. But in educational matters it has often been decisive in the recent past. Thus we saw the students in Marathawada successfully forcing the state government to start a new agricultural university in the region.

Taking their cue from the Marathawada students, the students of Nasik have already launched an agitation for the location in their city of the proposed university for north Maharashtra. The success of their agitation is some-

"The question, Henry, is if we can risk a conventional peace."

what uncertain though, since the other contender city, Jalgaon, is the home base of the state's finance minister, who was also in charge of education for a long time.

But the threat of yet another agitation, in Poona against the vice-chancellor of the local university, has finally persuaded the government to accept his resignation last week (see April 29, p 861). Since there were serious allegations against the vice-chancellor and since his own executive council had expressed its lack of confidence in him, his exit was not unexpected. However, the government has, by an ordinance, not only appointed a new vice-chancellor but also reconstituted the executive council. Recently, it also removed some members from the university court. While holding no brief for the retired council and its cantankerous ways, one would like to note that there were no accusations of malpractices against it, nor had it lost the confidence of the university court, to which it is responsible. Perhaps the government wished to serve notice to the academic community of the state that they are not yet fit for democracy.

Even though the present arrangement is expected to be temporary, two aspects of the new appointments are worthy of notice. First, the government has quietly doubled its representation on the executive council by having both the director of education and a joint director on it *ex-officio*. Secondly, a majority of the new members of the council are past sixty, some of them well into their seventies. The new vice-chancellor himself is seventy-four. By appointing a team of retired people, many of whom (including two ex-ICS officials and a trade unionist) have had no previous connection with the problems of higher education, the government has ensured that, even if the new regime is free from scandals, it will accomplish little or nothing on the campus. Once again the government has shown that it has neither any understanding of the basic problems facing our institutes of higher education, nor any will to tackle them.

Indo-Thailand Trade

The Other Avenue

EFFORTS are under way to explore the scope for more intensive economic and trade relations between India and Thailand. Although there has been a trade agreement between the two countries, little expansion or diversification of trade has taken place.

India's imports from Thailand have consisted mostly of primary products like rice, rubber, copra, kneaf (jute), and tin. Thailand's imports from India have comprised mainly traditional items such as textile yarn and fabrics. During the past three years, trade between India and Thailand has shown no improvement. Thailand's imports from India worth Rs 7.4 crores in 1968-69 were still only Rs 7.5 crores in 1969-70 and 1970-71. Against this, India's imports from Thailand, at Rs 35.1 crores in 1968-69, declined to Rs 15.2 crores in 1969-70 and further to Rs 9.45 crores in 1970-71.

In recent years, India has made a beginning in exporting to Thailand non-traditional items, like machinery and accessories, base metals and manufactures, chemicals, drugs and medicines. But it provides only a very marginal portion of the total import of these items into Thailand which relies mainly on the US, the UK, West Germany and Japan.

The industrial and trade delegation to South East Asian countries, sponsored in 1970 by the All-India Manufacturers' Organisation, saw prospects in Thailand for export of Indian machinery, iron and steel products, steel files, electric household appliances, electric lamps, paper and paper products, radio-receivers, air-conditioners, water-coolers and refrigerators, passenger bus and truck chassis, automobile ancillaries, weighing machines, etc. Thailand is also known to need more railway wagons. It has been pointed out that a major hurdle to such export is that India's ability to supply this range of manufactured goods is simply not known to the Thai market. This capability has, therefore, to be brought to the notice of Thai buyers.

Another lucrative source may be the setting up of joint ventures in Thailand. The industries in which India can undertake turnkey projects, offer knowhow, or supply part machinery for joint ventures in Thailand are: sugar, cement, sulphuric acid, power, industrial boilers, power plant equipment, transformers, diesel engines, textiles, etc. There are even today some joint ventures between India and Thailand in that country, such as Thai India Steel, and Thai India Synthetic. Industries based on local raw materials which can produce for home demand or for export and in which India could help, are: batteries, sheet glass, carpets, canned foods, etc.

Businessmen from Malaysia, Singapore, and Hong Kong, have a record of setting up industrial enterprises in Thailand—either alone or jointly with local entrepreneurs. Thailand is attractive for foreign investors. The terms for transfer of profits and repatriation of capital are favourable, foreign ownership and control is not discriminated against and is given equal treatment with domestic enterprises and freedom from detailed or burdensome regulations. Thailand also offers approved investors facilities such as guarantee against expropriation or nationalisation, guarantee against the setting up of enterprises in competition with 'promoted' industries, income-tax holiday for five years after income or sales commence, remittances of investment capital and profit dividend, exemption from import duty and business taxes on machinery and raw materials, and import of materials needed for setting up factories. Indian entrepreneurs, however, have not seemed so keen to take advantage of these business opportunities and one of the tasks of the sponsored delegations could be to encourage them towards this end.

Investment Priorities

No Beer Famine

EAST Coast Breweries and Distilleries, yet another aspirant for a share in the beer boom in the country, is entering the market with an issue of equity capital of Rs 63.75 lakhs of which Rs 29.50 lakhs are being offered to the public. The project is noteworthy mainly for the munificent support it appears to have received from the Orissa government and the government-owned Industrial Development Corporation of Orissa (IDCO). The company's authorised capital is Rs 75 lakhs of which Rs 11.25 lakhs have been already issued and subscribed to. Of the Rs 11.25 lakhs, Rs 1 lakh has been put in by the Orissa government and Rs 2.75 lakhs by the IDCO. Shares worth Rs 5.08 lakhs have been allotted to the Managing Director and promoter of the Company, N K Mohapatra, and his associates for consideration other than cash. The directors of the company and their associates have subscribed in cash for shares worth Rs 2.42 lakhs which represents their total direct financial stake in the company's issued capital of Rs 75 lakhs. As against this, the government of Orissa is subscribing to shares worth Rs 32 lakhs out of the public issue of Rs 63.75 lakhs and the IDCO to shares worth Rs 2.25 lakhs. Thus out of the total issued capital of Rs 75 lakhs, the Orissa government's and the IDCO's contribution would be Rs 48 lakhs, or 64 per cent. This is no-cost finance for the company till such time as it chooses to declare a dividend. The IDCO is also underwriting shares worth Rs 24 lakhs out of the Rs 29.50 lakhs proposed to be issued to the public. In addition it is likely that the project has received loan assistance from state government agencies. On the whole, this is a good example of the irrational lengths to which state governments are prepared to go supposedly to foster industries within their borders. The Orissa government can hardly claim to be flush with funds. Parts of the state are currently in the grip of a famine and the government has itself complained that famine relief work has suffered for want of money. In the circumstances, how can it justify putting up most of the funds required for the setting up of a brewery?

LETTER TO EDITOR

Who Won in West Bengal?

AS a matter of principle I never reply to personal attacks. But I cannot follow the rule with respect to the one made by A K Dasgupta (April 22, p 822). My regard for him makes me look into his letter for points that are not merely personal comments on my conduct and disposition and which might have wide social validity.

(1) Surely professors as a social category in India are among the most privileged sections of the population. Their earnings ought not to be treated as "wages". The rate of return they enjoy on the social investments made on them during their student days and during their days of active professorship are indeed very high. I shall say more. I shall say most professors in India take from their society much more than they give back to it. As such professors do not deserve to escape the wrath of an armed revolution if indeed one takes place.

(2) A K Dasgupta frowns upon me as one who would "talk about 'armed insurrection' so long as he is sheltered and nourished by the society which he wants others to destroy". This is an insinuation and is based upon a whole lot of presumptions. But what is the ethical basis for this condemnation? If a person is sheltered and nourished by society, as all members of all privileged sections of the society are, does A K Dasgupta's ethics demand that he should for that reason not seek change or destruction of the social order if change or destruction would be his recommendation if he could carry out an impersonal social analysis? Would he not by that token reveal himself as an opportunist, a time-server, a self-seeker, one who supports the social order just because he is nourished and sheltered by it, irrespective of the fact that millions of others are jobless and starving?

(3) I cannot contest A K Dasgupta's feelings about what I feel in my bones. He thinks I feel secure and safe because I do not really believe that there will be an insurrection whereas he warns me that I and my class will have to pay a penalty. But is personal safety endangered only by insurrections? We in West Bengal have passed through and are still passing through some very difficult times. The 'law and order situation', to use the bland phrase of government spokesmen, has been far from good. We who live in West Bengal have to constantly rub shoulders with assassins in various disguises including that of the police. A K Dasgupta thinks that it is a hobby and a private entertainment for persons in my situation to indulge in literary exhortations to armed revolution. But if he knew conditions in West Bengal better, he would know that such a hobby and such entertainment cannot at all be free of dangers. Guerillas of the extreme Left are often notoriously intolerant of differences of opinion and have often been too ready to mistake friends for foes. As to the paramilitary youth organisations of the Congress that are today ensuring "law and order" in different parts of West Bengal, if Dasgupta does not know about their depredations he has only to visit such areas as Baranagar, where after the systematic and organised killing of more than a hundred Naxalites in one single day, CPM supporters and active cadres are being forced to evacuate their areas in hundreds. Living amongst such terrors, intellectual luxury does not consist in holding strong political views of any kind, let alone the view that the social order deserves to be destroyed. Intellectuals are called upon by these circumstances to become non-committal, to lower their criticism of the social order or of the ruling power, to become implicitly if not explicitly supporters of the *status quo* that shelters them and nurtures them.

(4) Why, after all, spend so much valuable EPW printing space by discussing hobbies of any individual professor, whether dangerous or otherwise? Why does A K Dasgupta not pay attention to the basic premise of my arguments? Let him ridicule literary exhortations to revolutions; but what does he say about my premise, namely, that nothing can be done to remove poverty and unemployment in the country in general and in West Bengal in particular through any legislation measures that the Parliament or the Assemblies can adopt? One has heard a lot about poverty and unemployment being finally abolished by the brave and progressive Indira Gandhi; but one has not seen any set of economic calculations that show how and by using what policy instruments or plan strategy this result will be brought about. To be remembered in this connection is that the policy instruments, plan strategy, etc, must be such as to be acceptable to the class interests that are supporting the power structure of Indira Gandhi. The faithful and the professional optimists keep on saying that she must be allowed some more time to consolidate her powers so that she can bring about a major social revolution in the country without a political revolution. But the open eyed non-faithful cannot fail to notice that even after her massive electoral victory the state Chief Ministers did not have any difficulty in scuttling the proposal to lower wheat prices; and that crucial conference was marked by the conspicuous failure of the Prime Minister to show up.

Anyway, this is an empirical matter, and I would claim that I have not sacrificed rational thought processes at the altar of any dogmas. If indeed it can be demonstrated by any economist — A K Dasgupta knows that no such demonstration has been made up till now — that poverty and unemployment can be abolished by the use of some sort of measures which the government can implement, or if Dasgupta can point out to me such measures getting actually implemented, I undertake once for all to give up making literary exhortations for revolution. But if it does not, if Dasgupta cannot show me any blueprint as to what can be done to stop this process of the rich getting richer and the poor getting poorer, or point out to any changes actually taking place that promise a human factor to the millions of this country, what would he, as a liberal intellectual, exhort fellow intellectuals to do?

ASHOK RUDRA

Unemployment in the Fourth Plan

Some Estimates

K L Bagal

THE Fourth Plan, ostensibly on the advice of the Committee of Experts on Unemployment (known as the Dantwala Committee), refrained from giving any estimate of the back-log of unemployment. The Planning Commission's decision to block whatever crude information on unemployment that was so far available through the Plan documents was questionable, even after conceding that the presence of self-employment and under-employment in a predominantly agricultural society does make a simple uni-dimensional definition of unemployment rather difficult. Nevertheless, in the absence of refined data, the cruder unemployment estimates furnished by the Planning Commission were serving a useful purpose of highlighting the magnitude of the unemployment problem.

It is against this background that an attempt is made here to estimate the magnitude of unemployment in the Fourth Plan, on the basis of available official statistics. Sectoral investment-employment ratios, which could have a bearing on policies for alleviating unemployment, are also estimated for the Fourth Plan. The magnitude of unemployment and the estimate of creation of new job opportunities in each of the three Plan periods and during the three annual plans from 1966 to 1969 are available from official statistics and are given in Table 1.

It is of interest to relate the official estimates of unemployment given in Table 1 to the investment effort made in each successive Plan period. The total fixed investment, in the public and private sectors, nearly trebled from Rs 3,100 crores in the First Plan to about Rs 10,400 crores in the Third Plan. Assuming that the proposed investment of Rs 22,635 crores in the Fourth Plan materialises by 1974, the total fixed investment in the economy would increase by about eight times in 1974 as compared to 1951.

Table 2 gives the estimates of investment-employment ratios for the economy and for organised industry and mining in each Plan period. It is evident from the data that the investment required to employ an additional person has risen steeply from Plan to Plan. The investment cost of employing one more person in the economy had gone up in the Third Plan by about 62 per cent as compared to that in the First Plan. One reason for this state of affairs was the general rise in prices which raised the cost of investment in terms of money. Secondly, the deliberate pursuit of a Plan strategy with a bias for heavy industries, requiring larger doses of capital investment, raised the proportion of investment needed for employing an additional person in each Plan.

The proportion of total fixed investment in organised industry and mining — in the public and the private sectors — to total investment in the Five-Year Plans has progressively risen from about 11 per cent in the First Plan to about 25 per cent in the Third Plan. The employment potential of investment in organised industry and mining has, however, remained relatively poor over these years, principally because of the capital-intensive nature of the projects. The total additional employment generated in organised industry and mining aggregates just about 1.94 million in the first three Plans.

In this context, it is argued that the growth of the tertiary sector, comprising such activities as construction, transport, roads and services, depends on the expansion of organised industry and, therefore, employment creation in this sector is partly the result of investment made in organised industry. Data relating to employment generated in the tertiary sector is available only for the Third Plan (for the organised units in this sector). These are presented in Table 3. The data suggest that additional employment to nearly 2.70 million persons was provided by investment in the tertiary sector during the Third Plan, giving an investment-employment ratio 1:19437 for this sector.

Assuming that there would be no significant structural change in the investment in the different sectors, the investment-employment ratio can be assumed to increase by nearly 30 per cent in the Fourth Plan over the Third Plan to allow for the increase in the general price level. Thus, it can be estimated that investment required to employ an additional person would be Rs 9,324 in the Fourth Plan, which is about 110 per cent higher than in the First Plan. Applying this ratio to the total investment in the Fourth Plan, it is possible to estimate the total employment generation in the Fourth Plan,

TABLE 1

(ii) Indian Labour Statistics, 1970, Table 2.14.
(iii) Report of the Study Group on Employment and Training, National Commission on Labour, New Delhi, 1969.

which amounts to roughly 24 million as shown in Table 3. In a similar fashion investment-employment ratios for various sectors could be estimated for the Fourth Plan and thus the likely employment opportunities generated in these sectors. The estimates worked in Table 3 show that the organised units in the secondary and tertiary sectors would generate about 6 million new jobs in the Fourth Plan.

Another way of estimating total employment or unemployment in the Fourth Plan is through projections of the items given in Table 1. Table 4 gives the estimates of employment generation and unemployment in the Fourth Plan by this method. The Expert Committee set up by the Planning Commission for population projections under the chairmanship of the Registrar-General has assumed that the labour force is likely to grow at the rate of 5.5 million per year during 1971-76.

TABLE 4

(in million)

	Fourth Plan (1969-1974)
(1) New entrants to the labour force including back-log	38.2
(2) Additional employment likely to be generated	20.9
(3) Back-log of unemployment at the end of the Plan (1—2)	17.3

Taking this assumption to hold true for the Fourth Plan period, the total labour force seeking employment in the Fourth Plan would amount to nearly 38 million (including 10.6 million back-log of unemployed from the previous three Annual Plans). Assuming again that the pace of generation of new employment opportunities will be the same as that between the First Plan-Second Plan and Second Plan-Third Plan, it is reasonable to expect that fresh employment opportunities of about 21 million will be generated in the Fourth Plan. According to this estimate, at the end of the Fourth Plan as many as 17 million people are likely to remain unemployed.

It is interesting to find a close agreement between the figures of total unemployment and unemployment creation in the Fourth Plan derived by two different methods. It, therefore, appears that employment would increase by about 21-24 million in the Fourth Plan, organised units in the secondary and tertiary sectors contributing only 6 million new jobs. By the end of the Fourth Plan about 14-17 million people are likely to be unemployed. However, our underlying assumption, that the Fourth Plan investment targets will be fulfilled, appears unrealistic from the experience of the first two years of the Plan. It is not unlikely that only about 75 per cent of the planned investment would take place during the Plan. If this comes about, the investment-employment ratio for the Plan gives us a figure of only about 18 million new job opportunities, emphasising the poor employment potential of the Plan.

There is not much scope for re-allocation of investment among various sectors in such a way as to enhance the employment potential of the Fourth Plan. Only if a major chunk of Plan investment is diverted to the primary sector, where it appears that the investment-cost of employing an additional person is relatively low, can enough jobs be created within a five-year period to absorb the work-seeking labour force. Such a Plan, where there is investment only in the primary sector at the cost of investment in the secondary and tertiary sectors, is an unrealistic proposition if along with employment other economic goals are also to be simultaneously achieved.

If the tempo of industrialisation is to maintained, it is obvious that each Plan will have to apportion an increasing segment of total available investible resources to industry. Thus, the proportion of investible resources devoted to organised industry and mining aggregate roughly around 25 per cent of the total investible resources in the Third and the Fourth Plans. Any reduction in the proportion of resources devoted to this sector and the tertiary sector is likely to lead to distortions in industrial progress, with its repercussion in the form of slowing down of the growth of the economy. It is, therefore, reasonable to suggest that in a five-year Plan there is not much scope for re-allocation of resources between the various sectors so as to increase the employment-potential of the overall Plan.

Thus, despite employment being a major objective of planning, the back-log of unemployment at the end of each each Plan had progressively swelled from 5-7 million at the end of the First and Second Plans to around 10 million at the end of the Third. Our estimates for the Fourth Plan once again show that at the end of the Fourth Plan unemployment is likely to increase to a staggering figure of nearly 20 million (assuming that only 75 per cent of the planned investment materialises). This brings into sharp focus the inadequacy of the instrument of short-term development plans for achieving one of the principal objectives of economic development, namely, provision of employment opportunities for all those seeking work. The problem of unemployment can be tackled only through a long-term perspective plan with specific schemes designed to create additional employment opportunities.

CAPITAL VIEW

The Ceiling Is the Sky

Romesh Thapar

THE new *mantra* of the Indian revolution is the word 'ceiling', not nationalisation. Commitments to ceilings is a commitment to all that is pure and enlightened in progressivism. The whole concept began to crystallise with the persistent demand from the affluent for a ceiling on babies. Playing our traditional tit-for-tat games, we have now unleashed a nation-wide scramble for ceilings of all description. By the time we finish the exercise, we'll all be content to do nothing for fear of infringing one ceiling or another.

The young Turks, the old Turks, the soft-headed and the hard-headed, the *badmashes*, the new radicals, the sold-out Left and the violent Left, the revivalists, the Council of Ministers, the puerile planners, the cup-bearers and the Prime Minister herself, surrounded by her experts, are on the brink of a collective achievement which was once thought quite impossible — a contented society, under 'ceilings', with a near-zero rate of growth.

The only way to avoid this rather depressing end-result is to take over the whole system, lock, stock and and barrel, and put everyone on fixed wages — or . . .

But seriously, wherever one goes in the Capital the debate is earnestly joined on ceilings. Surprisingly, there is a fair degree of understanding in middle class circles about the pressures which are building for a more egalitarian way of life. Apart from a few dunderheads who seem to think that the old master-helot relationship could have continued were it not for "that woman", the main thrust of the debate is to understand how in a free-for-all democracy and a very mixed-up economy one should operate, ceilings *et al*.

A total view is needed. We cannot play with the question of land and submit to manipulation from lobbies. The concept of an optimum size farm, personally irrigated or otherwise, increasingly brought under machines specially designed to serve the specific size and specific soil, supported by seed, fertiliser and marketing services, is nowhere near being worked out. Continentally, there will be the inevitable variations, but the yardsticks of measurement have to be settled. At the moment, to cite only one example, we have the spectacle of farms getting smaller and tractors getting bigger — and no tractor stations for servicing. Probably, the optimum is lower than the 10-18 acres envisaged, but the work-out has not been done.

Haphazard or pressurised thinking on land ceilings and procurement prices, which changes from day to day, could create the kind of uncertainties in rural India which might disrupt the agricultural revolution on which so much of our present day political bombast is based. These critical issues are sought to be settled at hurriedly called one-hour meetings of sub-committees of the Cabinet. It's an unnerving thought that we are at the mercy of this sort of insant thinking, particularly at a time when casual or off-the-cuff comments by the Prime Minister become gospel for her team of ministers.

The whole point of the ceilings demand is to get at surplus land for the landless. Judging from the way the debate sways to and fro, we have lost sight of our objective. Bits and pieces of surplus land here and there will become available, but the resettling of this surplus will present massive problems — even though the conviction persists that the loopholes will be many, what with double-cropping hardly practised and village records in utter confusion. The truth is that no one has done a total exercise. As for the old war cry, "Land to the Tiller", it is not heard.

The response of the rural rich to the ceiling threat was to demand a similar ceiling on urban property. Here, too, the same kind of muddled thinking prevails. There is no attempt to differentiate between those who occupy their own living space and those who rent out space. The blanket ceiling concept obsesses, although suitably graded taxes would compel a surrender of property by landlords. Even black-money deals could be curbed by actions to take over properties at registered values. We talk a great deal, but seldom act. It's an old *deshi* custom.

There are so many easier ways to get at the extraordinary profiteering in land values. Because we do not adopt them, suspicion spreads that the ceilings rumpus is a convenient radical cover for a measure which it will be possible to side-track by bribery and corruption. Once again, the honest will suffer and the crooked prosper. This is the fatal hallmark of Congress progressivism during these last 25 years. How long will the people be content with this brand of radicalism.

And now some enthusiastic politicians, with an eye on *gharibi hataoism*, that infallible compass of present-day thinking in the Capital, have decided to push for a ceiling on incomes. Probably, they've been impressed by our ministers, forgetting that they have tiny incomes but elaborate free services. There's nothing wrong in legislating the base and summit of income in an egalitarian society, but the conviction must exist that there are no hidden benefits available to those in power or on the side of those in power. What's more, a clean-up of black-money, and its sources, is a prerequisite.

Anyone viewing the national scene cannot be unaware of the parallel black money economy at every level of society; indeed, it is believed by most economists that in quantum the black money is equal to the white. It is also clear that where black money is active corruption is also assertive. Seldom have we known corruption on the scale at which it flourishes today. Flourishes, did I say? Yes, it flourishes, because it is patronised — and very often by the most powerful in the land, within government and outside. And there is no ceiling on it.

And, by the way, what's going to happen to the prosperous owners of industrial and commercial units? Are we thinking of ceilings for them, too? They might be persuaded. After all ceilings is an easier pill to swallow than nationalisation, particularly if conversion to commercial purposes is permitted. Or is the entire exercise on ceilings, a subtle stratagem to push all resources into uncontrolled commerce and industry, the Monopoly Commission notwithstanding?

The present euphoria which has succeeded in making "ceilings the sky" will have to be disciplined by the Prime Minister herself in her own interest. Irrelevant economics can topple the most stable of the State Governments. Tragically, radical solutions will fail and retreat because those who espoused them refused to do their homework. Lazy louts cannot lead revolutions. And that goes for the Indian revolution.

Indira Gandhi has played her cards without adequate préparation. More thought was called for. The attempt to salvage the play will be complex and costly, but it will have to be made. A mass line is urgently needed. It will have to be sought in a more prepared and thorough manner. We have the expertise, but it has to be mobilised — hopefully at a reorganised Planning Commission, and soon.

May 8

COMPANIES

Multi-Pronged Expansion

Hansavivek

DHARAMSI MORARJI CHEMICAL has secured 'letters of intent' for annual production of 1,750 tonnes of sodium silico fluoride, 1,550 tonnes of aluminium fluoride, 700 tonnes of sodium fluoride, 550 tonnes of activated silica, 16,500 tonnes of stabilised sulphur trioxide and 8,250 tonnes of liquid sulphur dioxide. The proposal to increase capaciity of the alumina sulphate plant at the Kumhari works from 16,764 tonnes to 33,528 tonnes per annum has also been approved by government. Steps are being taken to implement all these projects expeditiously. Industrial licence for the di-ammonium phosphate project was received in August, but much headway could not be made owing to certain objections raised by the City and Industrial Development Corporation of Maharashtra (CIDCO) in regard to its location at Sheva on grounds of the pollution potential of the project. This project is to be implemented under a separate public company. The sulfamic acid plant and the expanded chlorosulphonic acid plant at Ambernath went into commercial production last year.

Last year, DMC produced 2.04 lakh tonnes of fertilisers and 2.15 lakh tonnes of inorganic chemicals against the licensed capacities of 1.75 lakh tonnes and 2.43 lakh tonnes, respectively. Production rose by over 24 per cent to reach a new peak in the company's 52-year career. Turnover advanced by 27 per cent and gross profit by as much as 75 per cent. The cover for the maintained dividend of 20 per cent more than doubled at 3.48 times. DMC is one of the largest exporters of inorganic chemicals in the country. It is now striving to penetrate into the developed countries. Pratapsinh R Morarji, chairman, is confident that the company will be able to make a successful beginning with its sulfamic acid, the quality of which is comparable to international standards. As a result of the studies undertaken by the research and development wing, DMC has been able to work out a recovery system to extract fluorine from the tail gases of its fertiliser plant and convert them into cryolite and aluminium fluoride, both of which are of importance to the aluminium industry. The company has also been issued a 'letter of intent' to manufacture these products on a commercial scale as also sulphur dioxide and stabilised sulphur tri-oxide, for which too processes have been developed. Research facilities have been expanded to cater to assist genuine entrepreneurs in developing new product-lines on a laboratory scale.

With the relaxation in government policy, permitting some 54 industries to step up production to the extent of 100 per cent of their licensed capacities, DMC will be able to increase production in some of its major products. The company has not sought any registration under the MRTP Act as it believes that it does not come within the definition of a 'dominant undertaking'.

CEAT TYRES OF INDIA takes pride in having completed its expansion earlier than all the other tyre manufacturers who were granted 'letters of intent' in 1968. The company had completed expansion of capacity from 4 lakh automobile tyres and tubes each to 6.48 lakh tyres and tubes each by June last and the expanded plant had begun to operate at full capacity by the last quarter of 1971. During 1971 production of automotive tyres and tubes was 7.25 lakhs and 6.23 lakhs against 3.70 lakhs and 3.45 lakhs, respectively, in the previous year when not only was the plant operated at its old capacity but the company had also to contend with a 4-month strike. The company is now seeking a new industrial licence for the manufacture of 4 lakh tyres and tubes each at a new plant intended to be located in an underdeveloped area. Meanwhile, satisfactory progress is being made in implementing the bicycle tyre plant at Nasik, which is expected to go on stream by the last quarter of this year.

The company complains that the renewal of the technical assistance agreement with CEAT International has still not been approved by government, although the matter has been pending since 1969. The collaborators, however, continue to provide the Indian company with the benefits of the latest technological developments in the tyre industry. CEAT's 1971 results show substantial all-round advance over the preceding year. Dividend stepped up 4 points to 15 per cent is covered 2.24 times against 1.21 times. Exports reached a new peak of over Rs 209 lakhs from the previous year's Rs 83 lakhs and the company maintained its position as the second largest exporter in the automotive tyre industry. It has more than fulfilled the export obligation imposed by government at the time of granting the expansion licence.

BHARAT COMMERCE has had a very poor year to December last, when its gross profit was halved though net sales declined by only 2.5 per cent. This outcome is ascribed to shortage of raw materials, particularly staple fibre, slack offtake of blended yarns and increase in cost of production. All the four plants worked below capacity following stoppage of supplies of staple fibre because of the closure of the wood pulp plant of the largest manufacturer on account of a prolonged strike. About half of the spindles of the Rajpura unit were switched to cotton. For the first time in several years, a certain degree of consumer resistance developed for blended fabrics because of its high cost. While the cost of polyester fibre is only about Rs 20 per kg, it has to bear an excise burden ranging from Rs 28 to Rs 34 per kg (depending upon deniers) and furthermore a duty ranging from Rs 8-14 per kg on blended yarns. Last year, excise duty was imposed at 10 per cent *ad valorem* at the stage of processing of blended fabrics, and this year the burden has been increased still further. The company intends to take up aerial spraying work, and is making an application for importing two helicopters and one fixed-wing aircraft. Last year, helicopter operations were limited to patrolling Oil India's Assam pipeline. The agreement with Oil India has been extended for another two years. The engineering establishment at Dumdum airport was shifted to Gauhati. The company's request to shift the registered office from West Bengal to Delhi has been rejected by the Calcutta High

Court. An appeal has been filed and the result is awaited.

INDIAN VEGETABLE PRODUCTS experienced a sharp contraction of margins during the 15 months ended December last owing mainly to "substantial losses" incurred in the vanaspati division as a result of increasing costs of oil and tin containers and processing charges, which could not be recovered under the "unrealistic" price formula fixed by government. The directors complain that representations were made and that although certain recommendations have been made by the tariff commission, government has not taken any decision in the matter. In the meantime, the industry is obliged to continue supply of vanaspati at prices "that do not cover actual costs". In these conditions what has helped the company is the production of chemical and chemical products. It is hoped that in the coming years these divisions will become more firmly established and bring increasing returns. The position in regard to vanaspati has further deteriorated. As a result of the government's policy of de-licensing, a number of new vanaspati factories have come into existence and the overall productive capacity has become "far in excess" of the actual demand. This has created very competitive conditions in the market and rendered price control "unnecessary".

AMAR DYE-CHEM is holding 'letters of intent' for the manufacture of rubber chemicals, toluene di isocyanate (TDI), hydrogen peroxide, etc, but finds it difficult to undertake the projects owing to the imposition of export obligations by government — ranging between 10 and 40 per cent. Some of the company's expansion programmes for reactive dyes, pigments and optical brighteners have also been delayed for the same reason. A K Doshi, chairman, considers it "hazardous" to undertake any long-range export obligations, for, according to him, conditions in the international market are constantly changing and consumers in the advanced countries are using more and more sophisticated items. The company's proposed collaborators for the rubber chemicals project have also refused to accept "several conditions" imposed by government. The company would therefore further negotiate with government before undertaking any of the projects. Owing to slackness of demand in the home market, however, ADC preferred last year to step up exports from Rs 29 lakhs to Rs 56 lakhs.

Documentation Centre

THE Documentation Centre-cum-Reference Library of the Vaikunthbhai Mehta Smarak Trust has been publishing a quarterly Documentation Bulletin since October 1970. The Centre aspires to help existing and potential entrepreneurs, village craftsmen, artisans, small businessmen and industrialists and various organisations and associations all over India, research scholars and students in pursuance of their specialised study of the small-scale industries sector by functioning as a central bureau where factual, economic, commercial, technical and historical information on the decentralised sector would be available. The Documentation Bulletin seeks to bring together information on small-scale industries from a wide range of sources. The latest issue of the Bulletin, that for April 1972, contains information collected from such diverse sources as the Ministry of International Trade and Industry, Japan, the Organisation of Economic Co-operation and Development, Paris, the United Nations International Development Organisation, the Regional Research Laboratory, Jorhat, and the Small Industries Service Institute, Hyderabad. The topics covered range from materials testing, workshop practice and packaging and despatch and a large number of specific industries. For convenience of reference each issue of the Bulletin has an index listing the contents by both title and author.

NEW DELHI

Land Ceiling Talked Out

THE kulak lobby has proved to be stronger and tougher than had been anticipated. It was widely believed, when the meeting of the Central Land Reforms Committee was convened to clarify the position in regard to the application of the ceiling on lands irrigated from private sources, that it would be persuaded to agree to the inclusion of such land within the scope of the ceiling. This was seen as the only way out because of the clear commitment to lowering the land ceiling in the ruling party's election manifesto and the strong objections raised by the radicals in the party to any dilution of this commitment. Indeed, the idea was given currency that the issue had been settled by the central leadership even before the committee had met and that the committee would meet merely to endorse this decision. The absence of the Tamil Nadu Minister from the meeting, on the ground that the Union Government had already taken a decision on the issue before the committee had even met, strengthened this impression. But this was not how things worked out.

Same Party

The two-day meeting of the committee which, in the absence of the Tamil Nadu Minister, was composed entirely of Chief Ministers belonging to the Congress party ended with the decision to refer the controversial question of ceiling on lands irrigated from private sources to a fuller meeting of the Chief Ministers at the time of the National Development Council towards the end of this month. Whatever the upshot of the proposed consideration of the issue at the full meeting of Chief Ministers, it is clear that anything like a radical land reform which will result in a substantial area of land being declared surplus and its acquisition by government and redistribution among the landless and the very small landowners has already been scuttled.

As at the time of consideration of the Agricultural Prices Commission's report on Rabi prices, the Union Agriculture Minister once again let the initiative pass entirely into the hands of the Chief Ministers. His principal anxiety in convening the meeting of the committee appeared to have been to get a certificate from it absolving him and his Ministry of the charge of distorting the committee's recommendations with regard to different categories of irrigated land. He did not seem to be concerned with a decision on any of the substantive issues in dispute. He was readily granted the whitewashing he sought and the Chief Ministers graciously accepted that the consensus among them was in accordance with the wording of the annual report of the Ministry which made a pointed distinction between irrigation from government sources and that from private sources. Having obtained this certificate, he did not ask for more.

That no serious lowering of the ceiling and acquisition of a significant amount of surplus land was in view was clear from the way the issues were posed. Besides the question of the uncalled for distinction between land irrigated from government sources and from private sources, on which much of the controversy had been raging, the other major issue on which the Chief Ministers could give their judgment later this month relates to the date from which the new ceiling law should have retrospective effect. Meanwhile, hints were dropped that prevention of transfers and sales would not be easy and that the question was still a subject of consultation between the Agriculture Ministry and the Law Ministry. In a Press briefing after the meeting of the Committee a spokesman of the Agriculture Ministry emphasised the complexity of the problem of irrigated land and its proper definition. After all, he argued, it would be wrong to say that all the different private sources of irrigation, which include tube-wells, ordinary wells, tanks and lift irrigation, could be treated as uniform. In alluvial soils, irrigation from private sources could raise two crops whereas this was not possible in desert and rocky regions. Thus the definition of perennial irrigation and the stipulation about irrigation capable of growing two crops will leave sufficient room for manoeuvre to get round any set ceiling concept.

Tailpiece: In the midst of the controversy over land ceiling, reports on the Indo-Soviet Trade protocol gave much prominence to the import of 5,000 heavy tractors from the Soviet Union during the current year. For whose benefit are these tractors if a ceiling ranging between 10 and 18 acres is really intended to be imposed?

*

Import Substitution in Reverse

POWERFUL pressures are being built up in support of import of power generating plant and equipment. Coming on the heels of larger imports of steel, because of shortfalls in production, and the recent decision to increase import of petroleum products because of the lags in development of refinery capacity and the increases in the prices of crude imported by the foreign oil companies for their refineries, the demand for liberalising import of plant and equipment for the power programme in the Fifth Plan is significant. If import requirements get pushed up in this manner, the Planning Commission's estimate in the Mid-Term Appraisal of the Fourth Plan that in fact the Plan would need larger foreign aid than was stipulated at the beginning might turn out to have been accurate. It will be recalled that the Planning Commission had come in for strong criticism for what was termed a defeatist attitude to the prospects of self-reliance.

The campaign for import of plant and equipment for power generation has been launched by the Irrigation and Power Ministry's outline of the power development programme for 1972-77 which will more or else coincide with the Fifth Plan. Apart from the Ministry, the main proponents of the plea for import of plant and equipment for implementing the proposed power programme are the State Electricity Boards. The contention put forward is that installed generating capacity had reached only 17.7 mn KW by March 1972 whereas the target for March 1974 set in the Fourth Plan is 23 mn KW. It is estimated that generation capacity actually built in the Fourth Plan will be lower than this target by about 2 mn KW. The proposed five-year programme for 1972-77 envisages expansion of generating capacity to 35 mn KW by 1975 or a net addition of 17.3 mn KW during the five years. This is considered the absolute minimum if a power famine is to be avoided in the coming years.

The present power shortages in several parts of the country are enough to underscore the need for an accele-

rated power generation programme. In this context, doubts have been raised about the capability of indigenous manufacturers, principally HE(I)L and BHEL, to supply the required plant and equipment. Taking their cue from this, State Electricity Boards and other interested parties have begun to argue that quite apart from the inability of the indigenous manufacturers to provide the generators within the stipulated time, their costs were also higher compared to those of imported sets. In any case, it is argued, the foreign exchange outgo will not be very large since the import content of the indigenous sets is insignificant. Further, since there is a buyers' market in plant and equipment for electricity generation, they can be imported on very advantageous price and credit terms. The managements of HE(I)L and BHEL have protested against the proposal to import generators which they are in a position to supply. But how far their objections will prevail it is difficult to say.

An important point in the controversy, which is likely to gather momentum in the coming months, is that at no stage has the power programme shown shortfalls because of shortage of funds or non-availability of plant and equipment, be it indigenous or imported. The shortfalls can be traced primarily to the absence of necessary advance preparation of projects and, following from that, to delays in their execution by the project authorities, mainly the Electricity Boards. To raise a controversy between indigenous and imported generators would thus appear to be misplaced.

MINERALS

Flashes of Enthusiasm

Magnus

LARGE parts of the text of the latest annual report of the Department of Mines are lifted bodily from last year's report, with only the figures changed as required. Nonetheless, the report is not as drearily pedestrian as might be feared. There are flashes of enthusiasm, an awareness (in words, if not in action) of the importance of minerals and metals to the national economy, and even some pieces of good news. The introduction discloses that the contribution of the mineral sector to national income increased from Rs 470 crores in the first Plan to Rs 969 crores in the Third. This is probably an underestimate.

The Department's main preoccupations are coal and iron ore. Coal has been the despair of our industrial scene for many years. It represents, as it were, both the cause and the effect of the poor performance in many other areas. During 1971-72 coal output declined for the second successive year, from 74 to 68 mn tonnes. Poor wagon availability is blamed for this. The National Coal Development Corporation produced 14 mn tonnes (against a target of 16.3 mn tonnes) and suffered a loss. Its collieries have probably the longest gestation periods ever heard of in the mining industry: for Sudamdih and Monidih, completion dates are still a comfortable 5 to 7 years ahead, and the Corporation has not even bothered to change its achievement percentage figures from last year. At Silewara, in the Kamptee coalfield, production is expected in 1976-77 and the Maharashtra State Electricity Board is known to be worried because its new thermal plants will be ready much earlier. NCDC's coal washeries at Gidi, Kathara and Swang can only be described as misconceived, for while the last two work at 25 per cent capacity, the first had to discontinue even its trial runs because there is no market for the washed product. Surely some thought was given to marketing before building all this (3.8 mm tonnes) capacity, and surely it is not too late to find markets for a perfectly usable commodity?

Iron ore exports and the NMDC are not doing too badly. Due to delays in commissioning Bokaro, all mining at Kiriburu was suspended in December 1971, because it had completed its export commitments. It is hoped that Kiriburu, as well as the other major projects, will reach full production in the next few months. A good deal of attention seems at last to be given to pelletising plants in various areas to utilise ore-fines which are otherwise lost permanently.

Brave Words

Copper and aluminium in the public sector continue their slow creep towards production. Bharat Aluminium's progress is in very sharp contrast to that of the private sector companies; if the practice of cancelling industrial licences for insufficient progress in a given number of years were to apply to the public sector, Bharat Aluminium and Hindustan Copper would have been dead long ago. A peculiar point about the Khetri project is that, according to figures given in the Departmen's report, the two main shafts are further away from completion than they were last year! Khetri's financial estimates have gone up from Rs 94 crores to Rs 120 crores, including a foreign exchange component equivalent of Rs 24 crores. Hindustan Copper has been entrusted with the management of the recently-acquired Indian Copper Corporation. In identical paragraphs in two parts of the report, this is hailed as "very significant step (which) will enable step up of production on a priority basis". Brave words.

The Kolar Gold Mines were transferred from the Ministry of Finance to the Ministry of Steel and Mines in 1971 and have been registered as Bharat Gold Mines. Apart from the gratuitous change of a time-hallowed name, it is doubtful if much can be changed in these mines in their final few years. Pyrites, Phosphates and Chemicals Ltd was transferred from this Ministry to the Ministry of Petroleum and Chemicals. Since the company produced only a little pyrites, no phosphates and no chemicals, this, again, makes little difference. The recent change in its top management may have some effect, however.

Hindustan Zinc and Manganese Ore India are two companies which show a refreshing contrast from others in their reports. Instead of giving a long list of excuses, they show a positive, action-oriented attitude. Both have sensible expansion schemes in hand and are performing much better in 1972 than in previous years. Hindustan Zinc recently announced that it would stop import of zinc concentrates from September, while Manganese Ore has sold all its production forward till June 1973. Both, incidentally were nationalised in the 1960s.

While the Geological Survey and Indian Bureau of Mines occupy several pages of the report with routine matters, there is strangely no mention of the proposed Mineral Exploration Corporation, which caused such excitement in geological circles last year. This body is to undertake all ore exploration from this year on a commercial basis, and its Chief, as well as its structure, were decided upon some time ago. The report is also silent on the significant expansion of rock-phosphate production, which has been saving considerable foreign exchange from 1971.

A noticeable change in the report is the reticence in giving financial results. It would not be out of place to give summarised annual accounts for each public corporation, but at least some figures should be mentioned in the Ministry's annual report. Reading between the lines one gathers that Neyveli, Singareni, NCDC and Hindustan Zinc made substantial losses, while MOIL made a profit. But one would like to know, for example, how the NMDC fared after it started charging ex-mine prices instead of f o b, what happened to NCDC's scandalously large stores inventories, and why Bharat Coking Coal made losses in 6 months when the same mines had showed a profit during the previous 6 months, as indicated in Parliament a week ago.

A matter which government should look into is that of public sector bodies blaming each other for their failures. Thus NCDC blames the railways for poor offtake, and Bharat Earth Movers and MAMC for delays in supply of equipment. (It also blames the market and the rains.) NMDC blames the railways, Heavy Engineering Corporation, National Projects Contruction Corporation and National Industrial Development Corporation. No doubt inter-departmental committees are set up frequently to go into these matters, but what it really amounts to is bad coordination.

A pronounced 'socialist' bias is discernible in the introduction to the report, as well as in the utterances and actions of the new Minister, Kumaramangalam. Strong links with Poland are likely to be forged in the mineral sector during the coming few months. Until performance in at least some public undertakings improves, however, it will be difficult to avoid scepticism. For an easy start, the Fuel Policy Committee could be bestirred to give its report which is already eight months overdue and which will, hopefully, decide the coal industry's future prospects.

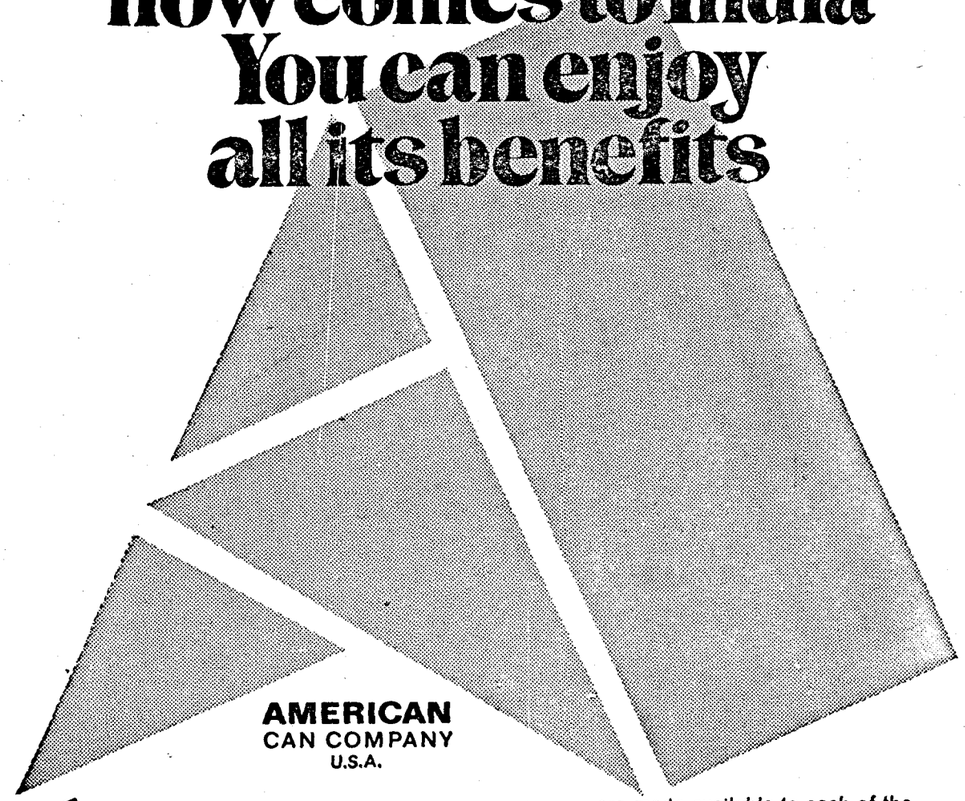
DEFENCE

The More the Merrier

(From a Correspondent)

AN imaginatively written report on the Ministry's working should have added to the quality of this year's Lok Sabha debate on the Defence budget. Far from that, the debate produced little beyond the usual cliche thinking on the need for a higher R and D outlay and the need to keep the nuclear options open. And of course the platitudes about the "brave jawans" which like "India's teeming millions" is part of the debased political coinage.

Amidst the jingoistic rhetoric becoming only of big power chauvinism, it would have been low, if not high, treason to question the postulates of the defence budget which has steadily grown from Rs 280.94 crores in 1960-61 to Rs 1,408.36 crores in 1971-72 (revised estimates). There is so much new folk-lore being popularised by a powerful lobby in New Delhi which wants the rate of growth in defence expenditure to be not only kept up but increased so that by the end of this decade it touches the Rs 2,000-crore mark. It is even argued that the December 1971 war did not really cost the nation anything because the 1971-72 outlay of Rs 1,241.66 crores was decided upon when the Bangladesh crisis was not foreseen and the increase of Rs 169.31 crores in this year's budget represents a negligble rise in the capital account and is almost entirely in the revenue budget. The total cost of the operations in December last is computed at Rs 120-150 crores which, it is pointed out, is only a fraction of what we might have had to spend on the refugees had there been no war.



By all accounts, the framers of the Defence budget would like the nation to believe that a truncated Pakistan and the emergence of Bangladesh have not diminished the threat to India's security. Those who advocated a short and swift war to liberate Bangladesh last year were arguing, as late as October 1971, that once this was done a big part of the defence burden would be taken off India because a truncated Pakistan cannot be rearmed to its old military strength. With just China to confront, it was argued, India needed to spend much less because elimination of Pakistan as a military threat would act as a constraint on China. Since 1962 Indian defence and foreign policies proceeded on the assumption that a Sino-Pakistani collusion was a reality and the twin-threat to India was also real. China's enmity towards India was taken as an axiomatic truth though the *status quo* on the border has remained unchanged. (It would be well to remember here that while Pakistan has been in illegal occupation of 31,000 square miles since 1947, the area under Chinese occupation, according to Swaran Singh was 12,000 square miles before the 1962 war and another 2,500 square miles after that.) When the Indo-Soviet treaty was signed in August 1971, it was argued in some quarters that it would underwrite peace and stability in this subcontinent and to that extent relieve India of a good part of the defence burden.

But new-fangled theories are now advanced by the military establishment outside the government to justify a growing defence expenditure. The success of India's political model is supposed to pose an ideological challenge to countries in the neighbourhood especially in South and South-East Asia and therefore two major powers — United States and China, to wit — may try to operate against our national interests. It is also argued that the security problems of the countries around us are likely to interact with our own problems of national security. Intervention of these countries in countries within India's perimeter would pose a theat to India's security, to extend this argument.

All this assumes that India is already a big power and its defence perimeter lies one country deep beyond India's own national boundaries. The disclosure that India has begun selling arms to friendly neighbours and the implications of the Indo-Soviet treaty and the India-Bangladesh treaty makes the "big power" consciousness of the ruling elite rather obvious. The India-Bangladesh treaty, it has transpired, not only underwrites the security of Bangladesh against external threats but underwrites its internal stability, as demonstrated by the joint military operation against the Mizo and other tribal insurgents in the Chittagong Hill Tracts. The new threat perception is indeed revealing. Any threat to the left-of-centre politics of the Mujib regime or the Sirimavo Bandaranaike regime would interact with our own problems of national security. The proposal for a peace treaty with Nepal in the place of the one that lapsed in the 1960s has been revived in New Delhi as if to demonstrate that the Indo-Soviet treaty has not really aroused suspicions about India's intentions among smaller nations.

With the new threat perception has come new theories which advocate

The world's latest can making technology now comes to India You can enjoy all its benefits

AMERICAN CAN COMPANY U.S.A.

American Can Company, the world's leading can manufacturer and Poysha, India's most enterprising can maker, enter into technical collaboration to elevate packaging technology in India.

American Can Company, whose annual sales now exceed Rs. 1325 crores

- established the metal container industry's first research laboratory
- developed the pull-tab, easy-open can
- invented the novel Mira-seam process for tin-free steel and aluminium cans
- developed the all-tin easy open can
- developed the drawn and ironed tin can

to name a few.

These advanced can making techniques are the result of Rs.18 crores spent annually on research and development which are made available to each of the American Can's 25 subsidiaries and 25 associates operating in 33 countries all over the world.

Poysha will assist canners and consumers in India and abroad through improved technology, new materials and new processes. For India, this promises real progress and sophistication in the packaging field.

POYSHA

CMPI-53-243

everything short of exporting India's left-of-centre model with which the Soviet ideologues have been enchanted for a long time. Together with India's advocacy of an Asian peace plan which would include Soviet Union, claimed to be an Asian country, one of the super powers would enter the Asian peace system. All this plus India's high-profile defence posture would indeed arouse apprehensions among the neighbours. India was quick to respond to Ceylon's request for military aid and after that a Military Adviser has been permanently posted in the Ceylon High Commission in New Delhi. Nevertheless, Ceylon has felt it necessary to reappraise its stand on keeping the Indian Ocean a peace zone following the Indo-Soviet treaty and the Indo-Pakistan war.

In the next few years, the accent will shift from a quantitative expansion of the armed forces to sophistication, better mobility and better equipment. Already interested countries are busy putting across plans for the sale of submarines and for the manufacture of a strike aircraft for the 1980s. Meantime, the bogey of a joint Sino-Pakistani adventure, and of super-powers remilitarising Pakistan have to be kept alive to justify the huge defence budget which accounts for about a third of the total Central budget.

ASSAM

Historical Dispute

NAGALAND's claims to certain border forest reserves of Assam are currently being looked into by a senior Union Home Ministry official. The official is due to submit his recommendations this month. Till then, the *status quo* along the border is likely to be maintained. Presently, the official is engaged in studying the memoranda submitted by the governments of Assam and Nagaland. Both sides are awaiting his recommendations, probably hoping for the best. He is reported to be examining the issue from all angles — historical, constitutional, demographic and geopolitical. It is a difficult and delicate mission. Compromise is difficult too, especially as the Assam Government considers the Naga claims absurd. Sinha, Assam's Chief Minister, has openly declared that he will fight to the last for Assam's rights. The Union Home Ministry, however, has wide powers and, strengthened by the constitutional and political developments of the last few years, the Centre can impose its decision, if it so wishes.

The Centre intervened after serious clashes between Assam and Nagaland police including one in the Geleki reserve, where the Nagaland government had constructed a road and started preliminary work on a paper and pulp project. The Assam government initially lodged protests as it considered the reserve to be within the Sibsagar district of Assam. But the protests proved ineffective, and the Assam government ordered its police to resist Nagaland's encroachments. This led to a clash in which several policemen were injured and one Assam policeman lost his life. The Home Ministry's intervention eased the confrontation by persuading the two police forces to withdraw to safer distances on either side of the border.

Efforts to settle the problem on a bilateral basis between the Assam and Nagaland governments were made, some of them at the instance of their common Governor, B K Nehru. The Assam government feels that these efforts failed entirely due to Nagaland's uncompromising stand. But the Nagas say that about 5,000 square miles of the territory of Assam (which totals 47,094 square miles) should really belong to them. This demand was first put forth by the Naga People's Convention prior to the passing of the Nagaland State Act. In support of its claim, Nagaland puts forward the following arguments. At the time of constituting the district of Naga Hills (Kohima subdivision) in 1866, the valley of Dhansiri and the Mikir Hills were included in it. Later on when the Hukokchung sub-division was added to the district of Naga Hills in 1889, Mikir Hills and Dhansiri were given away to the districts of Sibsagar and Nowgong. Since the Mikir Hills and Dhansiri were once part of the Naga Hills district, the Nagas claim that they are a part of Nagaland. To reinforce its claims the Nagaland government has not acknowledged the present border and, according to the Assam government, 20,000 acres of Assamese land have been encroached upon and 16 'illegal' posts have been established. Further, various measures like setting up new villages, harvesting wet lands, levying taxes, felling trees and starting building activities, have been resorted to.

Assam's position is that both Ahom and British records clearly show that Assam at no time ceded any territory to the Nagas. The Dhansiri valley, and other territories claimed by the Nagas were Ahom territory. The British also conceded that these were non-Naga areas. The Mikir and North Cachar Hills too belonged to the Mikirs and the Cacharis.

A review of the history of annexation of the Angami, Sema, Ao and other Naga areas during the period between 1839-1905 shows that prior to that period the Nagas lived in either isolated units or villages. The Ahoms controlled the frontier trade gates, punished offenders and raiders and allowed some of the friendly Nagas to enjoy rights over some *Khats* or lands, but never ceded territorial rights. The British continued this policy between 1839 and 1846. From 1847 to 1850, they tried to control the tribal raiders by establishing outposts inside the Naga Hills. From 1850 to 1866 the policy of non-interference advocated by Lord Dalhousie was followed. But vexed by the raids, the then Lieutenant-Governor opined that "were this policy generally adopted, then Assam would soon be divided amongst the Bhutias, Adis, Nagas, Garos, Mishimis and other wild tribes with which it is surrounded which would quickly take advantage of any signs of weakness in the Central Government."

Further, the 1905 Survey of India map shows all the disputed forest reserves to be within the Sibsagar and Nowgong districts. The 1905 District Gazetteer mentions that the Naga Hills have no forest reserves at all except one, but that too "to all intents and purposes" belongs to the Sibsagar District. The Naga Hills district in 1905 "contained one town, if town it can be called, and 202 villages". None of these villages were within Assam or even in the foothills. The northern boundary was hilly with a range of average 2,000 to 3,000 feet height. The Naga peasants were not, and still are not, used to wet cultivation. Therefore it is impossible to think that they had any interests in plains lands. The 1925 notification finally settled the boundary of the district after a survey. In fact, the Naga Hills district was entirely a British creation. Before this the Nagas were not united on one territory.

The Assam Government therefore considers Nagaland's claims to be chauvinistic and politically motivated. Neither leasing out nor the further whittling away of Assam's territory will be to the liking of the people of Assam. It is also felt that this could encourage Meghalaya and Arunachal to follow in Nagaland's footsteps.

BONN

High Drama in Parliament

Aswini K Ray

JUST as the East German chief, Honecker, was announcing a series of new benefits for workers and a fresh new deal for the socially handicapped, people across the border were witness to one of those periodic spectacles of parliamentary democracy which goaded Nietzsche into making the jibe that the system has "a mania for counting human noses". It surely was a coincidence, but one that helped to highlight the varying social values that divide the German people in spite of their language.

The curtain to Bonn's drama was raised with the defeat of the Free Democrats (FDP) in the Baden-Wurttemberg state elections. The defeat of the liberal Free Democrats was not really unexpected; a political party based on nineteenth century liberal values is a luxury in the sharply polarising politics of modern West Germany. Paradoxically, the swansong of liberalism was sung in the Necker Valley — once the 'home of the liberals'.

Political Horse-trading

In the elections to the Stuttgart *Landtag* (the local legislature), the liberal Free Democrats crashed down from 14.4 per cent support in the 1968 elections to 8.9 per cent, thereby barely managing to scrape through the 5 per cent minimum vote required for representation in the legislature. The Social Democrats (SDP), hitching their wagon to the declining fortunes of the liberals, and campaigning on the basis of their *Ostpolitik*, improved upon their 1968 performance of 29 per cent, going up to 37.5 per cent. But the poor showing of the FDP, neither enabled the extension of the national coalition to the state nor was it possible to retain the remnant of the 'Grand Coalition' of the earlier era. Shortly before election day, the neo-fascist National Democrats (NPD), with 9.8 per cent backing in the last election, withdrew all their candidates in favour of the Christian Democrats (CDU), which ultimately proved to be decisive. The stigma of fascist support was an ethical liability for the CDU all right, but it also proved to be an electoral asset, which is what counts in parliamentary democracy. The CDU improved its position from 44 per cent to 53 per cent, an improvement just about equivalent to the NPD strength in the last legislature. Though Chief Minister Filbinger lost his home constituency to his SPD rival (that does not prevent him from continuing as Chief Minister), the Christian Democrats obtained the necessary absolute majority in the state assembly and also an increased majority in the *Bundesrat*, the upper house of the federal legislature.

At this first sign of distress, the FDP quietly shed off its cloak of respectability. A chain-reaction of horse-trading and the phenomenon of *aya Rams gaya Rams*, so familiar to Indian politics, followed. Helms, the farmer from north Germany, who disagreed with the government's economic politics, found the time opportune to announce his resignation from the FDP. Two other millionaire members of the party also quoted their price, and fairly soon, a chain-store owner reportedly offered six million deutschmarks to make the drift away from liberalism and respectability profitable. With many such new catalytic agents brightening up opposition leader Barzel's succession prospects, it was time for the opposition to implement its threatened "constructive" vote of no-confidence — "constructive", as, according to the opposition, it enabled the government to assess its strength before initiating the debate on the *Ostvertrage* (the treaties with the Eastern powers).

Even the most friendly pollsters had given a very low rating to the chances of the opposition in a national election on the issue of the *Ostpolitik*, and lower still when the practical benefits of the Brandt government's foreign policy were fully reaped by the West Germans. So, the timing for the no-confidence debate was scheduled for a week before the debate on the treaties. Party satrap, Helmut Kohl, smarting under his defeat by Barzel in the contest for Christian Democrat chairmanship, and Christian Social Union (CSU) leader Strauss ill-reconciled to his number-two position in the shadow cabinet, also played their role in the opposition's decisions. They succeeded in luring Barzel to expose his ambitions. More than that, they tested his strength a little sooner than it suited him. Strauss, the big leader of the small party, was conspicuous by his eloquent silence throughout the entire proceedings of the debate preceding the voting — a silence, that went neither unnoticed nor uncommented on by the Social Democratic Party tactician Herbert Wehner.

The fate of the Chancellor and of the pretender to the succession was being decided upon under the veneer of 'high falutin' principles. Chancellor Brandt quoted from the philosopher Kant, and Foreign Minister Scheel, after accusing the opposition of undermining the credibility of the government by publishing secret official documents, in a long peroration, went on to recall the glorious heritage of the FDP. The opposition demanded a quick division in the true tradition of parliamentary democracy. Underneath the veneer of principles the arithmetic of parliamentary politics was being sorted out by both the groups. The ruling coalition was filibustering to gain time to assess its strength before facing the hard reality. The opposition, having struck their deals, were keen on a quick division before the floor-crossers were bought back. Meanwhile the trade unions were busy organising "spontaneous" working class solidarity with the socialist government and other groups were demonstrating against Barzel and Strauss for trying to "repeat 1933". And almost the whole nation was glued to their TV sets. They had never before seen so many legislators on crutches and wheelchairs!

The fact that the opposition lost the division by only two short of the required 249 votes and gave a close shave to the government, left little room for complacency by either side. But in any case, the government's paper-thin majority was never in doubt. The opposition's tactics were based on its hope of doing away with this small majority. The opposition failed in this primary objective, and along with it, sank Barzel's hopes and public image. In fact the no-confidence debate boomeranged on the opposition. Hardly, if ever, has there been such a wave of public sympathy for a West German Chancellor, both at home and abroad.

Party Solidarity Compromised

But the survival of the Brandt government cost the country two casualties. One, a high principle, and the other, a hard reality — the latter following from the former. The simple principle of party solidarity — fundamental to parliamentary government — was the first casualty. Brandt appealed for "a Roy Jenkins" in the opposition; the opposition in turn, appealed to the conscience of the FDP. Some FDP members responded, but the opposition failed to retain all its own support; the sly Strauss managed to withhold just enough support to prevent Barzel from becoming the Chancellor.

On voting day in Bonn, no one trusted the other. The opposition banked

heavily upon the secrecy of the ballot as an effective agent to stir the conscience of the ruling coalition members, but this proved to be its undoing. The Social Democrats turned the secret ballot into an open one: the party whip asked members not to cast their votes and remain seated in full view of the TV cameras. This meant that even if some SDP members wanted to help overthrow the government, they could not. One cannot reconcile party government with mere appeals to conscience!

Having failed in parliament, Barzel, who had been claiming that the Chancellor did not have a majority in the legislature, corrected himself and added "neither I nor the Chancellor". The result is that backdoor consultations to evolve some sort of joint foreign policy declaration have now begun in the committees representing the various political parties. Meanwhile the Bahr-Kohl negotiations for a long-term regulation of Berlin traffic have reportedly reached their final stage. But, according to the East Germans, these regulations can only be implemented after the ratification of Bonn's treaties with Moscow and Warsaw. But *ad hoc* arrangements, similar to those during Easter, for West Germans and West Berliners to visit East Germany are being made for the coming Whitsuntide holiday — another demonstration by the East Germans of the practical benefits of Brandt's foreign policy.

The Russians have meanwhile told the West Germans that there can be no question of any revision of their treaty with Bonn. A Soviet aversion for any negotiations with a future non-socialist West German government, though to be taken with a pinch of salt, has also been hinted at. The Soviet Union has also made it quite clear that the final four-power agreement on Berlin will depend upon the ratification of the treaties. But at the same time, Soviet Ambassador Fallin has informed the West German Chancellor about the Russian acceptance of one of the major opposition demands — the acceptance, as part of the treaty, of a *Bundestag* resolution endorsing the ideal of German unification.

While negotiations with the opposition are on, the government is playing down its *Ostpolitik* and diverting public attention to its complement, *Westpolitik*. While the expert committees work out the agreed joint declaration on foreign policy, the *Bundestag* is kept occupied with debating, rather endorsing, the enlargement of the Common Market. Brandt's recent visit to Britain was a success. In London, the Chancellor announced that the two countries had no points of disagreement between them. They even agreed upon the location of the European Secretariat in Brussels, and not in Paris, as Pompidou would have it. Unlike on other similar occasions, this time Pompidou did not come out with any unsolicited, but useful, support for the West German *Ostpolitik* while the Chancellor was in distress. However, it is now clear that West German foreign policy is on the brink of realising the major policy objectives of the Brandt-Scheel government, which is to make West Germany the fulcrum of an East-West *detente* and to help the process of multi-polarisation in politics.

Narrowed Choices

At this juncture, time is a crucial factor for the government as well as for the opposition. In the resultant conflict it is least likely that any quarter will be asked for or granted by either of the groups. But it must be said that after the failure of its no-confidence motion, the opposition's choices have narrowed down further. It has little chance of winning a national election on the issue of *Ostpolitik*. It can prevent the dissolution of parliament, but with the determined support of the Western and the Eastern powers for the Chancellor's *Weltpolitik*, it cannot for long continue to deprive the West Germans, and the West Berliners, of the practical benefits of the new foreign policies. On the other hand, if its obduracy facilitates further Soviet concessions, the credit for these will merely go to the ruling coalition in next year's elections. Already, the damage to Barzel's prestige due to the no-confidence vote has rekindled ambitions inside his party and in its sister party. In a prolonged crisis situation no one can really be taken for granted, particularly with fewer crumbs to pass around in the opposition ranks. The ruling coalition has little scope for complacency either. Till now, in terms of concrete achievements, it has very little to show. It may not be in its best interests to face the West German electorate for the second successive occasion only with great promises.

INSTITUTE FOR SOCIAL AND ECONOMIC CHANGE

Bangalore

The Institute for Social and Economic Change or ISEC is an All-India inter-disciplinary institution for research and training in the social sciences, which will start functioning in Bangalore from June-July this year. It will have centres in Economics, Sociology, Demography, Education, Organisation and Administration, Research Methodology and Statistics, and Human Geography and Ecology.

Economics will include agricultural, industrial, quantitative and public sector economics, public finance, credit utilisation, and economic planning and policy. Sociology will deal with the different aspects of the Sociology of Development and include Social Psychology and Social Stratification. Demography will include regional, urban-rural and policy problems. Education will include higher education, vocationalisation, and development. Human Geography and Ecology will include regional planning, resource identification, and changing mass-environment systems. Organisation and Administration will include public administration at the grass roots level, communication and evaluation. Research Methodology will include Econometrics, Statistics and field work techniques.

Applications are invited for the posts of Senior Fellows (corresponding to University Professors), Fellows (corresponding to University Readers) and Research Associates (corresponding to University Lecturers) in all these disciplines. The salary scales for these posts will be the same as those approved by the University Grants Commission for the University of Delhi.

Applicants are requested to send their bio-data in triplicate, giving full details of their age, academic qualifications, research and teaching experience, present position, field of specialisation, list of publications and names of referees and indicate clearly the category of the post for which they would like to be considered.

Applications should be addressed to Dr. V. K. R. V. Rao, Director, Institute for Social and Economic Change, Ratna Vilas Road, Basavangudi, Bangalore-4, and reach him on or before the 31st May 1972.

V. K. R. V. Rao
Director

RHODESIA

Total Dependence on Monopolies

Africanist

"I WAS in the East End of London (a working class quarter) yesterday and attended a meeting of the unemployed. I listened to the wild speeches, which were just a cry for 'bread! bread!' and on my way home I pondered over the scene and I became more than ever convinced of the importance of imperialism... My cherished solution for the social problem, that, in order to save 40 million inhabitants of the United Kingdom from a bloody civil war, we colonial statesmen must acquire new lands to settle the surplus population, to provide new markets for the goods produced in the factory and the mines. The Empire, as I have always said, is a bread and butter question. If you want to avoid civil war, you must become imperialists." Thus did Cecil Rhodes (Lenin described Rhodes as a social chauvinist) set about to colonise the territories which came to be called Rhodesia, after his name.

Traditional African society based its existence on certain modes of agricultural production. Based on these modes, definite land and property relations and specific forms of social arrangement formed the fabric of the socio-economic setting. This pattern of life was destroyed by colonisation. As a first step towards creating a freely exploitable class, the imperialists seized control of the most arable land and created a large dispossessed peasantry which they herded into semi-arid areas officially called 'reserves'. These reserves were intended to sustain only a small part of the landless peasantry; the rest were to live as squatters and labour tenants on newly created white farms.

In Rhodesia, Rhodes' British Chartered Company expropriated land and encouraged the dispossessed African peasantry to remain as tenants, their rent being commuted for labour performed for the rising white rural bourgeoisie already in possession of the most fertile land. The entire process of dispossessing the African peasantry and giving the white farmers complete control over the land and the large black rural proletariat was further stabilised by the Land Apportionment Acts of 1936 and 1941.

By these Acts, some 50,000 square miles of unclassified, wanton wasteland was allotted to 2,630,000 Africans, whilst 75,000 square miles of fertile land, which included all mining and industrial regions and areas served by railroads and major roads, was gifted to 215,000 white settlers. What the Acts accomplished were definite limits to land Africans could occupy for permanent settlement, grazing and tilling. Concentrating millions of peasants on mostly uncultivable land ensured the rapid degeneration of the land and decreased productivity; expecting a multiplying peasantry to engage in production to meet its needs on lands which could not support even the existing numbers was murderous. The desired effect of this policy was an overall decreased productivity which could not sustain the peasants, thus forcing them into European farms. So occurred the rural proletarianisation of the African peasantry.

White Compradors

At the present time, the whites who constitute a mere six per cent of the population, control 50 per cent of the most fertile areas. Africans, 94 per cent of the population, are settled on the remaining 50 per cent of soil-eroded land allocated in the reserve areas. Of the whites who control the land, the white rural comprador bourgeoisie is in firm control of the agricultural sector and holds most of the 'white' land. Constituting just 24 per cent of the total white settler population, the white rural comprador bourgeoisie, 57,000 in number, is a powerful section of the white ruling classes.

Together with the white compradors in the industrial sector, it is the 'real' power behind the eco-political structure of the country. The two groups together serve foreign economic interests and have close connections with foreign capital. Through their activities, they help transfer the surplus from the semi-colony to the imperialists. They constitute the class that the imperialists rely on to develop the country's economy along lines complimentary to imperialist needs. Between them and their imperialist masters there is a vicious cycle binding one to the other. The imperialists give them a free hand to regulate the techniques, methods and forms that are suitable to their area, i e, they are allowed to control the relations of production best suited to imperialist exploitation. Their existence in turn depends on the continuance of imperialist exploitation. They are at once the watchdogs, the agents, the trusted servants of imperialism.

Thus, when British imperialism handed the reins of 'political power' to the white settlers, it singled out classes whose interests lay in the perpetuation of the existing relations of production. These were the white commercial compradors and the white comprador rural class. Together, these white classes acted as the agents of British imperialism's economic territory — a territory that was economically, financially and militarily dependent on the United Kingdom. Thus did Britain ensure its position in Rhodesia.

Britain's operations in Rhodesia are broadly in three categories. Firstly, through direct operations of British monopolies (Rhokana Corporation and Exchange Copper); secondly, through its South African subsidiaries (Imperial Chemical Industries of South Africa Ltd, the British South Africa Company); thirdly, through shares, holdings or equities that the British have in other companies (African Explosives, Anglo-American Corporation); and finally, through joint (collaboration) ventures (London and Rhodesia Mining and Land, Rhodesia Iron and Steel).

Together, these monopolies control every aspect of Rhodesian industry and agriculture. They have inextricable interlocked shares, holdings and equities in each other — all this ensures them complete control of Rhodesian industry. For instance, take the London and Rhodesia Mining and Land Company. This monopoly, which comes under Oppenheimer's Anglo-American Corporation, has close interlocking financial interests with many of the major monopolies of Britain and the USA and close coalescence with the major banking interests of the capitalist world. It has acquired 90 per cent of Consolidated Holdings (Pvt) Ltd, 100 per cent of Mashaba Gold Mines (Pvt) Ltd, 36 per cent of Kanyemba Gold Mines, and 51 per cent of Associated Overland Pipelines of Rhodesia (Pvt) Ltd. Again, take the British South Africa Company, one of the largest monopolies in Southern Africa. Its principal company, Cecil Holdings, was formed primarily to acquire the whole share capital of British South Africa's subsidiaries. Another formation, British South Africa Invest-

ments Ltd, acquired the greater part of the parent company's investments in 1958. Other British South Africa (SA) company's subsidiaries include: British SA Company Managment Services Ltd, British SA Citrus Products Ltd, British SA Company Holdings Ltd, Charter Properties (Pvt) Ltd, Indaba Investments (Pvt) Ltd, Beit Holdings (Pvt) Ltd, Jameson Development Holdings (Pvt) Ltd and so on.

British SA is also in close association with Oppenheimer's Anglo-American Corporation. In Rhodesia, this association is to be drawn tighter by means of a proposed share deal between them by which 1.2 million ordinary shares (ten shilling shares) of Anglo-American will be exchanged for £ 2.5 million in £ 1 shares ("the £ 1 share is the basis of British imperialism") of New Rhodesia Investments Ltd, a public company registered in Rhodesia and equally owned by Oppenheimer's Brenthurst Investment Trust (Pvt) Ltd, and British SA's tributary, Cecil Holdings.

New Rhodesia's shares in Consolidated Mines Selection Trust Ltd will be increased as a result of the current financial arrangement with Anglo-American. Further, New Rhodesia's buyings in the Diamond Corporation, Johannesburg Consolidated Investment Company Ltd and Rhodesia Anglo-American, tie up closely with Anglo-American's activities in Rhodesia and in the Congo and Portuguese territories. Johannesburg Consolidated subsidiaries include Barnato Brothers Ltd, Barnato Holdings Ltd and African Asbestos-Cement Corporation Ltd.

Large Shareholdings

Rhodesian Anglo-American, the Rhodesian version of Anglo-American's all pervading interests, has large shareholdings in the leading copper mines of Rhodesia. It is further interlocked with principal British monopolies like Rhokana Corporation Ltd in which it has 52 per cent interest. This interest in Rhokana gives it an added interest (17 per cent), in another British monopoly, Nchanga Consolidated Copper Mines Ltd in which its direct participation is 21 per cent. Further, through Rhokana it has an interest in Chibuluma Mines Ltd. It obliquely participates in Mufulira Copper Mines Ltd, has shares, stock units and holdings in Rhodes Alloys (Pvt) Ltd, (involved in the ferrochrome mining industry), Broken Hill Development Company Ltd, Bancroft Mines Ltd, Kalindini Exploration Ltd, and Kasempa Minerals Ltd. It also controls 31 per cent of the shares of Anglo-American Prospecting (Rhodesia) Ltd and a large number of the shares of Chartered Exploration Ltd.

What all this in effect means is that monopoly capitalism has complete control of the natural resources of Rhodesia. And, as can be observed, the few giant monopolies have virtual control over the smaller exploiters. "The head of the concern controls the principal company; the latter reigns over the subsidiary companies which in their turn control still other subsidiaries and so on. In this way it is possible with a comparatively small capital to dominate immense spheres of production". Thus, a few monopolies have control over the entire mineral wealth of Rhodesia. Gold, iron, steel, coal, diamonds, copper, phosphates, asbestos — all the wealth from the exploitation of these mineral resources goes to the coffers of the imperialists.

It has already been observed that London and Rhodesia Mining and Land which comes under the Oppenheimer group — which is itself a giant US-UK-South African monopoly and which has intimate connections with international banking interests — has nearly complete control over the gold mining industry. Anglo-American, together with the British South Africa Company, is a major shareholder in New Rhodesia Investments Ltd which has the greatest amount of its capital invested in mining (45.9 per cent). Rhodesia Anglo-American, as has already been observed, is involved in mining to a very large extent and has interests in all the major mining companies. Iron, steel and coal also come within its range. Lubimbi Coal Areas Ltd, which holds prospecting rights for coal over an area of approximately 130 square miles in the district of Bulawayo, also represents Rhodesia Anglo-American's interests. Rhodesian Iron and Steel Company Ltd also has close connections with Rhodesian Anglo-American. Stewards and Lloyds (UK) has a 13 per cent holding in Rhodesian Iron and Steel.

In June 1971, Johannesburg Consolidated Investment Company, in which New Rhodesia has major buyings, started a 20 million Rhodesian dollar nickel and copper mine at Shangani near Bulawayo. Production from this mine will be worth 10 million Rhodesian dollars per year. It will be the fourth biggest nickel mine in Rhodesia. African Explosives and Chemicals, with its share capital controlled by De Beers Consolidated and by Anglo-American and the South African branch of Imperial Chemical Industries Ltd, announced a $ R 3 million expansion programme, last November for Dorowa Phospate Mine and the super phosphate factory at Msasa near Salisbury. This Dorowa expansion programme pushes the total capital investment in the mine and the super phosphate factory to $ R 13.5 million.

Asbestos, of which Rhodesia is the world's largest producer, is principally under the control of Turner and Newall, a British Company. It controls 90 per cent of Rhodesia's asbestos output. Anglo-American Corporation, together with its various subsidiaries and particularly Roan Selection Trust, controls iron and steel. The group also virtually dominates coal and iron pyrites mining, the ferrochrome and cement industries.

The Linkages

"The final word in the development of banking is monopoly. As regards the close connection between the banks and industry, it is precisely in this sphere that the new role of the banks is, perhaps, most strikingly felt". Lenin continues; "At the same time a personal link-up, so to speak, is established between the banks and the biggest industrial and commercial enterprises, the merging of one with another through the acquisition of shares, through the appointment of bank directors to the Supervisory Boards (or board of directors) of industrial and commercial enterprises and vice versa. The 'personal link-up' between the banks and industry is supplemented by the 'personal link-up' between both of them and the government. The British South Africa Company, which has such an all pervading control of Rhodesian resources, had at its head (i e, the Chairman of its Board), P V Amrys-Evans. He was also a director of the Anglo-American Corporation as well as Director of Barclays Bank. He was also on the Board of Rhodesian Railways Trust Ltd — a subsidiary of British South Africa — as well as on the London Committee of Rand Selection Trust. Hanover Bank (US) is also involved with the Anglo-American Corporation. So are the Rockefellers. Hanover is also linked by financial interchanges with the American Fore Group of New York, a principal fire and casualty insurance company. Finally, the US Government gives loans at 4 per cent interest to the Anglo-American Corportation in the US which in turn loans this capital to its overseas affiliates at 6½ per cent. "This is only a single short strand of the tangled web that relates predominant banking interests in Europe and America to the industrial undertakings in Africa" (Nkrumah).

This is not the full story of imperialist monopoly control over the entire spectrum of Rhodesian resources. Anglo-American's major investments includes citrus and sugar estates, forests, clay products and financial houses. Lonrho has vast interests in the cattle industry; it also owns a pipeline. Forestal Land, Timber and Railways, one of the world's largest producers of tanning extracts, through the Rhodesian Wattle Company, owns nearly all of the wattle acreage. The British South Africa Company owns forests, agricultural estates and real estate in Rhodesia; its subsidiary, British SA Citrus Products Ltd has control over the fruit industry.

All this shows the extent of imperialist control over Rhodesian industry and agriculture. It is only within this context that Ian Smith's Unilateral Declaration of Independence can be understood. Without imperialist support, Smith and his clan would have found it impossible to declare and maintain Rhodesia's 'independence'.

THE FOURTH ESTATE

No Eye for Pictures

Nireekshak

A GOOD photograph is worth a thousand words. So goes the saying in the profession. Yet, newspapers in our country do not seem to be paying the kind of attention which this vital aspect of journalism deserves. There have been instances where a provincial newspaper — whose finances are supposed to be meagre — has agreed to subscribe to two wire services but has declined to subscribe to even one photo agency.

The reason for this apathy is often made out to be financial. To the price of photographs has to be added the cost of block-making, so would run the argument of many a small and medium newspaper editor to emphasise the high cost of photo journalism. Professionally speaking, this is not true. A photograph — good in composition, sharp in detail and time-wise topical — invariably has a greater impact than many hundred words which, incidentally, also cost money.

Poor Display

The real reason for the neglect or poor development of photo journalism in this country lies elsewhere — in the non-availability of good photo journalists, in the lack of technical knowledge about photography among our deskmen, in the distasteful picture page layouts and in bad photo editing. Layout and picture editing are considered highly technical jobs in the big newspapers of the developed countries. But not so in our country where the news editor or the chief sub-editor is supposed to do both the jobs in addition to subbing news copy. The result is evident from the poor display which some good photographs get in even our big newspapers. Not surprisingly, therefore, enterprising young photo journalists often decide to seek their fortunes abroad. A case in point is Kishore Parikh who left *Hindustan Times* some years ago to join a professionally more satisfying journal in Hong Kong.

Statesman's Raghu Rai, *Hindu*'s T S Satyan, *Panasia*'s V M Saluja and freelancer P N Sharma are among the better photo journalists this country has in terms of experience, skill and talent. They have won acclaim here and abroad. In fact it is when their work appears in well edited foreign publications that one realises how much good picture editing and layout can improve the visual impact of a photograph. Among our newspapers, *Statesman* has an eye for photographs. Its Delhi edition had two excellent photographs recently on the front page. One, published on May 1, was of buffaloes cooling themselves in the Jamuna water against the background of yachts taking part in the Northern India Yacht Regatta. The other, published the next day, was a very unusual photograph of a May Day rally in the capital. The Calcutta edition of *Statesman* too had a very good picture on its front page on May 3 showing storm clouds over the metropolis the previous evening. *Hindustan Standard* carried a similar picture but it was ruined by the inferior newsprint used by the paper.

Few provincial newspapers employ their own photographers. By and large, they depend on photographs supplied free either by the Press Information Bureau or the state governments' Directorates of Publicity. But on some special occasions they do hire a freelance photographer for an exclusive job. The fire that broke out in the UP Council House recently provided one such occasion to Lucknow newspapers. *Pioneer* carried three photographs of the fire-fighting operations on its front page the next day. So did its rival, *National Herald*, the quality of whose pictures was slightly better. *Amrita Bazar Patrika* of Calcutta has a good photographer in Panna Sen whose study "summer hits countryside" was featured on the front page of the newspaper of May 5. The photo showed a large tract of parched field in Bankura district, a village girl trekking in search of water and vultures on a tree-top eyeing the carcass of a cow that had apparently died of thirst. In its issue of May 2 *Tribune* of Chandigarh carried a gruesome photograph, released by some foreign photo agency. It showed two polar bears attacking the head and arm of an unidentified man who had fallen into the bear pit of the zoo in Perth, Australia. According to the caption, "the man was dead by the time rescuers, using ignited gasoline-soaked rags, distracted the bears and pulled him out of the pit".

Oh, for the Bomb!

The Pakistani offensive in the Tithwal area of Kashmir produced sharp comments in our newspapers, which tried to explore the motives behind the action. Was it a local aberration or a planned move? Was it a deliberate attempt to induct third parties into the situation? According to *Hindustan Times*, none of these questions were relevant. "Which leaves only the possibility of someone in Pakistan being intent on queering the pitch for the proposed [Indo-Pak] talks: the military, at least some sections of it, in Pakistan is mentioned in some circles in this connection. If this were so, then Mr Bhutto must assert himself quickly and effectively so that his own capacity to speak for Pakistan is not thrown into doubt."

However, according to *Hindustan Standard*, "it will be scarcely prudent to dismiss the episode as a local breach of the peace caused by the rashness of some overzealous minor

fry . . . Islamabad can scarcely be given a clean bill in the affair. It is rather unlikely that a day long bitter engagement involving a full battalion would take place without the approval of the highest military command and the knowledge of the civilian chief . . . Apparently Mr Bhutto is attempting to blow hot and cold at the same time. He is keeping his diplomatic options open by opening up a channel of communication with Mrs Indira Gandhi. He however has not abandoned his other option. If he can grab some territory by force in the border area in Kashmir he is not averse to such a course . . . ".

Defence Minister Jagjivan Ram's announcement in the Lok Sabha on May 2 that the Atomic Energy Commission was studying the technology of underground nuclear explosions was commented upon editorially by most newspapers. Some hailed it, others found the announcement rather intriguing, while still others felt that it had come 15 years too late — had the decision come in the late fifties, they felt, there would have been no Chinese aggression in 1962. The most sensible and informative editorial on the Defence Minister's statement came from *Statesman* which patted the government for rightly "resisting ill-considered pressure for a change in India's nuclear policy" and went on to explain what was behind the AEC's studies on nuclear explosions. All that had happened, *Statesman* said, was that with the setting up of a plutonium plant at Trombay, "a relatively small-scale facility had been created for separating plutonium from used reactor fuel. Plutonium is fissible material and, given a sufficient amount, it may indeed be more difficult to prevent an explosion than to cause one." All that AEC was proposing to do was to check this "uncontrolled explosion" by a device that would explode "in a predetermined manner . . . to fulfil a predetermined purpose".

As for making the nuclear bomb, *Statesman* pointed out, India just would not do it for the simple reason that our "plutonium-yielding reactors have been built with foreign assistance with specific safeguards against use of the plant and its products for any military purpose". Americans have assisted us in building the Tarapur plant; Rana Pratap Sagar plant is being set up with Canadian help as also the isotope-producing reactor at Trombay. According to *Statesman*, "India will have an independent plutonium source only when the Kalpakkam nuclear power station is completed, provided of course the plant is built without such foreign assistance as is likely to attract safeguards". And "until this is done, all talk about a bomb programme is largely academic", said *Statesman*, adding: "but New Delhi apparently prefers not to explain this when rejecting demands for an immediate nuclear weapons programme."

Indira Gandhi's newspaper, *National Herald*, made a significant comment in this regard while generally welcoming the government of India's "no change" nuclear policy. It said: "Admittedly, nuclear energy is a product of science and technology. There are areas of nuclear development which are common to civil and military use. These areas can be and are being explored to the farthest limits within the ambit of our policy." *Hindustan Standard* and Jan Sangh's *Motherland* were the strongest protagonists of India making the nuclear bomb. *Hindustan Standard* said: "The self-imposed nuclear abstinence India is practising does not make much sense in a world where possession of nuclear arms grants the super power status to a nation." And *Motherland*: "A nuclear arsenal, howsoever modest, is of utmost importance for India from every point of view. It will make a qualitative change in our defence capability and deter all our enemies, present and prospective, for good. It will provide jobs for all our educated unemployed. It will lay the foundation for a billion dollar business in nuclear materials in the twentyfirst century. And it will elevate us to the status of one of the Big Four powers of the world."

Twelve years ago, Dr Joseph, a young scientist at the Indian Agricultural Research Institute, had been driven to suicide by professional frustration. The tragedy had sparked off inquiries and reforms were supposed to have been initiated at the Institute to set things right. But the recent death by suicide of Vinod H Shah, an agronomist at the IARI, has revealed that at the Institute things stand where they were 12 years ago. Newspapers in all parts of the country highlighted the causes that led the young scientist to commit suicide and focused attention on the prevailing frustration among our brilliant scientists. They demanded a thorough probe into the hierarchically structured system of our research establishments which have become breeding grounds of frustration among the talented and have encouraged mediocre sycophants. Two very good editorials on the subject appeared in *Hindustan Standard* and *Hindustan Times*.

The impact of government's newsprint policy is gradually being felt in the profession. New recruitment in the big newspapers has come almost to a standstill, annual increments to existing staff are being delayed and those reaching retirement age are being hastily sent away. *Statesman's* managing director, C R Irani, has said that if the 22 per cent cut in his paper's newsprint allocation continued, his newspaper may suffer a loss of about Rs 96 lakhs. The *Times of India* management has also unleashed similar propaganda, claiming that the paper may be in the red as a result of loss of revenue of Rs 1 crore.

Some of the big newspapers are also thinking in terms of getting themselves reclassified into lower categories. According to the recommendations of the Wage Board for Working Journalists, newspapers are classified into seven categories on the basis of their advertising revenue and circulation. The higher the category of the newspaper, the higher are the employees' wage and dearness allowance scales. Reclassification into lower categories may not affect the existing wage scales of employees but might block future increments, etc. Reclassification will also have a side effect on the news agencies. Their revenue from big newspapers will fall as they will pay for agency services at the rates prescribed for the lower category of newspapers. As a way out, the representatives of some big newspapers, who sit on the boards of both the national news agencies, PTI and UNI, have suggested merger of the two wire services. If this happens, it will be unfortunate for competition between the two agencies is at present one of the safeguards against news management.

Hindustan Lever

HINDUSTAN LEVER's sales increased from Rs 119 crores in 1970 to Rs 134 crores in 1971. Distributable profits, which had suffered a setback in 1970 owing to substantial increases in raw material costs, recovered from Rs 2.39 crores to Rs 2.75 crores after tax, capital expenditure on scientific research and net transfer to development rebate reserve. According to the company, results for the current year will depend significantly upon the outcome of discussions with government in regard to prices of products which are subject to price control. The company's exports rose by Rs 74 lakhs to Rs 5.52 crores. Included in these are increased exports of synthetic detergents to the USSR.

Black Is Not Beautiful

Contributed

Direct Taxes Enquiry Committee, Final Report, Ministry of Finance, Government of India, December 1971; pp ix + 314.

THE Final Report of the Direct Taxes Enquiry Committee traverses ground extending from estimates of "black" money to tax policy to the departmental working of tax administration. The departmental representation in its composition made it certain that the Committee would be concerned with the trivia of tax administration rather than with principles of tax policy. The terms of reference are, moreover, taken *seriatum* so that the Report undulates between policy and administrative matters.

The Report can be divided into four parts: estimates of black income, tax policy, dealings with tax-payers and internal organisation of tax administration. These matters are covered at different points, but their organised examination helps to bring out the full flavour of the Report.

Estimate of Black Money

The existence of black money has a profound impact on the economic and social policies of government. Almost all government measures — ranging from price control and exercise of administrative discretion in matters such as issue of various permits and licences, to fiscal and social policy measures aimed at achieving equity in income distribution — apply to the formal economic system. Not only do these measures not reach the parallel black money economy but the parallel economy, by forcing policy changes, tends to pervert the impact of these measures, For example, the whole direct tax structure has little relevance to equity when people have unequal access to black market resources.

In a controlled economy — and India has had one since 1939 — official discretion becomes a purchasable commodity, or a price mechanism for official favours emerges. Price controls lead to dealings involving both official and unofficial money. High taxes lead to payments outside the tax system, concealment of income and false cost information. Agriculture is today a means of legalising black income; when the income-tax system is extended to agriculture, it will become one more source of generating black money. Thus the parallel economy extends to the bureaucracy, to trade and manufacture, and to professionals. The Committee is excessively coy about tax evasion in the medical and legal professions and the role that the legal profession plays in facilitating black transactions. How can one accept that in the early sixties there were only 9 doctors in the country earning more than Rs 1 lakh per year (much of even this declared income, incidentally, came out of other sources like property and the 'medical income' element was smaller)?

By its nature it is difficult to make estimates of black money. It is not only a stock but a flow as well; moreover, it enters and goes out of the official system at various times and points. Yet the estimates given by the Committee, let alone those given in the Minute of Dissent, are staggering. The Committee, following the Kaldor method, estimates a generation of Rs 1,400 crores of black money in 1968-69 (Ch 2.17); D K Rangnekar estimates the amount at almost double the figure.

The Committee recommends the setting up of another committee to find out what controls need be maintained (Ch 2.58); it also suggests removal of rent control on non-residential premises (Ch 2.205). It considers political donations as an element in the tax evasion system, and suggests government financing of political parties, exemption of individual donations to political parties and audit of accounts of political parties (Ch 2.60, 2.61).

The generation of black money and the distribution of spoils are distinct problems. Black money is generated through transactions (selling of goods at higher than controlled prices) or tax evasion (as in the case of receivers of black money or non-declared incomes of professionals). Such black money gets divided in various ways, as through bribes for import licences (which get paid ultimately out of transactions in the commodities produced with the help of imported goods). All estimates of the loading of black money in transactions or through tax evasion must remain notional. What is damaging to the social fabric is the pervasiveness of such deals, its manifestation in conspicuous living, the acceptance of its existence as a normal part of individual or business behaviour, and the feeling of unequal treatment it generates among people outside the parallel economic system.

Tax Policy Measures

Of the recommendations of the Committee, those which have attracted the most attention relate to direct tax measures. The Committee attributes tax evasion to high tax rates, and recommends a lowering of the personal tax rates to a maximum of 75 per cent. The Committee's arguments for reducing tax rates (Ch 2.44 to 2.55) are the oddest one has heard — including one like "the country has to leave some tax potential in reserve for an emergency" (Ch 2.51) or that whatever the level of income a tax-payer must be left with 25 per cent of income. The Committee suggests that lowering the tax rates would boost the economy, as it is supposed to have done in Japan, West Germany and the United States (Ch 2.53) — an unthinking reiteration of N A Palkhivala's argument which has little economic meaning or logic.

As regards corporate taxation, the Committee recommends the abolition of priority status for some activities (Ch 5.43) and the removal of the "closely-held" company distinction (Ch 5.85 to 5.87). The Committee recommends more generous treatment of companies in respect of entertainment allowances and guest houses (Ch 2.69, 2.70). On the other hand, it favours a tax on the capital of companies (Ch 5.89).

The Committee recommends rebate on tax payable by labour-oriented industrial units (Ch 5.75), an investment reserve scheme for economic stabilisation through a Reconstruction and Stabilisation Reserve Fund (Ch 5.78), and a tax rebate for higher capacity utilisation (Ch 5.80) — proposals which are vague or not relevant to the economic conditions of the country.

The Committee does not favour treating a family (husband, wife and minor children) as a unit of assessment (Ch 3.34), though it makes provision for clubbing incomes where the division of income is of a tax-avoidance nature (Ch 3.39). Nor does the Committee accept the suggestion regarding treatment of a Hindu Undivided Family as a firm or a company (Ch 3.29). It suggests that where a member of a Hindu Undivided Family has independent income, the Hindu Undivided Family should be

taxed at special rates (Ch 3.30). Given its bias in favour of professionals, the Committee recommends removal of the tax on professional firms (Ch 3.43), though one fails to see how this is relevant to the Committee's terms of reference.

The Committee recommends levy and collection of agricultural tax by the Centre, with an additional exemption limit of Rs 5,000, making a total exemption of Rs 10,000 (Ch 2.129, 2.127). It, however, shows poor economic logic in measuring the impact of the present tax system on the agricultural sector (Ch 2.123). The Committee also recommends levy of excise duty in lieu of sales tax (Ch 2.134).

The Committee does not recommend revival of the expenditure tax (Ch 2.186), though it argues that the requirement of an expenditure statement (Ch 2.184) would "be quite effective in checking evasion" (Ch 2.186). It is against the issue of bearer bonds or numbered accounts (Ch 2.36, 2.37).

The Committee, looking at the system partially, could hardly have arrived at sensible conclusions. What is the extent of disclosure or non-evasion that is expected when the maximum tax rate is reduced to 75 per cent — particularly given the fact that the Committee's own estimates of the tax-rate on tax-evaded income is low? And would those who earn black incomes through transactions (official favours, deals at above-controlled prices) disclose these incomes because the tax rates are lower? Where income is hidden, as in the professions and trade, lower tax rates might have some relevance. But where transactions are illegal, the incomes arising out of them are insensitive to tax rates. Clearly these areas form part of the total economic system, and the Committee's recommendations hardly touch the system as such.

Moreover, the Committee makes recommendations which detract from the economic objectives of the tax system — without in any way reducing tax evasion. For instance, the existence of priority status for some industries hardly leads to much tax evasion through transfers, but it does help to provide an incentive to invest in the priority industries.

Yet in the fiscal field itself, there are ways of dealing with the problem. Firstly, given the propensity to evade taxes, it is desirable to have lower rates on a wider tax base — instead of the present system of high tax rates on a narrow base. Thus tax should be imposed on all forms of income and transactions — on interest paid no less than on profits earned, on capital no less than on income. Secondly, an automatic surcharge must be levied on discretionary income — that is, incomes other than salaries, interest, dividend and rent as also incomes which are professional or trading incomes. Thirdly, given the size of the tertiary sector, there is a strong case for replacing the sales tax by a value added tax, purely as a device to bring all transactions to book and to prevent tax evasion. Unfortunately, none of these ideas figure in the 468 paragraphs of observations and recommendations of the Committee.

Dealings with Taxpayers

The description of the office-keeping practices of the Department given by the Committee must cause despair not only to those who work in the Department but also to those who deal with the Department. There is not enough office space (Ch 6.91) or filing space (Ch 6.107); files get regularly lost; office equipment (such as desk calculators) is not provided to the required extent; facilities for checking tax evasion (for example, transport, *vide* Ch 4.21) are not adequate.

The Committee opposes further "voluntary disclosure" schemes (Ch 2.31) and in the process exposes the corruptness of the present regime: "Much of the income disclosed . . . had been . . . earlier already detected . . ." (Ch 2.28). Those who wonder how income "already detected" becomes a "voluntary disclosure" might consult some of the better known film actresses for the knowhow!

The Committee is "not in favour of introducing a comprehensive return form" (Ch 2.183), though an integrated return, prescribed also by Kaldor, would be an important administrative reform to curb evasion. The Committee recommends payments through bank bills of exchange (Ch 219), and suggests that banks report unusual or suspicious transactions to the Reserve Bank (Ch 2.181). The Committee makes various recommendations on blank transfers (Ch 2.229), denial of credit facilities to tax evaders (Ch 2.232), tax treaties with other countries for exchange of information (Ch 2.213), tightening the provisions of the Stamp Act, checking under-valuation of immovable property, and rousing of public conscience against tax evaders. The Committee suggests that the valuation of immovable properties, once adopted, should be maintained for five years (Ch 3.71).

The Committee recommends that minors should not be admitted to the benefits of partnerships (Ch 3.40), and that *benamidar* partnerships should not be recognised (Ch 3.42). All trusts seeking tax exemption are required to register themselves with the tax authorities (Ch 3.52). The Committee also recommends tightening of the tax law on exemptions for trust income. A gift by mere book entry (without transfer of actual cash) should not be recognised (Ch 3.75). The Committee also recommends aggregation of gifts (Ch 3.75). It recommends compulsory maintenance of accounts by professionals and businessmen with income about Rs 25,000 a year (Ch 2.140) and compulsory audit of accounts above specified limits (Ch 2.148).

The Committee recommends that the intelligence and investigation work of the Department is strengthened (Ch 2.97 onwards). It recommends greater use of powers of search and seizure (Ch 2.40). In many cases (for example, where property is found on search), the Committee makes suggestions for changes in law so as to place the onus of proof on the tax-payers or to widen the powers of tax officers. Given the extent to which tax-payers have tried to use legal machinery to avoid taxes or to frustrate tax collection, these changes are justified. The Committee makes many suggestions regarding prosecution of tax cases (Ch 2.93 onwards) and regarding penalties for concealment of income (Ch 2.71 onwards).

It is, however, difficult to appreciate the Committee's sensitivities: while most searches made were successful (Ch 2.39), the Committee refers to complaints of "arbitrary and high-handed manner" (Ch 2.41) in which searches are conducted. The Supreme Court has even ruled that "penalty for concealment of income cannot be imposed merely because the explanation given by an assessee is found to be false" (Ch 2.76). One fails to understand the reason for this sympathy for tax-dodgers which, reflecting a class bias, leads to treatment of tax-doging as a different (and more respectable) category of offence.

Ultimately the efficiency of administrative practices and the sophistication of the office aids available to the Department must keep up with the practices of the tax-payers and with modern times. To some extent, inadequate office aids generate slovenly office habits; the Committee refers to cases where files of assessees, called for interview, are not traceable when they call on officers ("papers get misplaced, and and are often not available when the tax-payer appears . . . ", *vide* Ch 6.107). If the tax system is to serve a social

purpose, it has to be organised efficiently to perform its functions. This is one area where the Committee's recommendations deserve clear support.

The Greatest Boondoggle

The Committee reports in detail on the administrative structure of the Department and the requirements for its efficient organisation, even though it admits that "procedures are incidental to the primary terms of reference" (Ch 6.1). To an outsider the organisation of the Department makes strange reading. At the highest level, the Central Board of Direct Taxes has almost no corporate existence or decision-making powers and acts only through its individual members. The charges under the Commissioners are very large, ranging upto 100 income-tax officers (Ch 6.36). The jurisdiction of income-tax officers is not clearly defined. Targets and workloads are set arbitrarily ("output quotas have been arbitrarily stretched", *vide* Ch 6.32 also "work norms have been fixed, and performance standards laid down, without any scientific study of the workload or the manpower requirements", *vide* Ch 6.49).

The demands raised in the month of March are almost three times those raised in February (Ch 4.78). It is not surprising that taxes in arrears more than doubled in four years from Rs 381.83 crores at March-end 1966 to Rs 840.70 crores at March-end 1970 (Ch 4.2) — though the Finance Minister has recently stated that arrears have been brought down by Rs 250 crores. One of the arguments advanced by the Committee for this state of affairs is that "unrealistic assessments have led to large accumulations of arrears of tax for which the Department is frequently blamed" (Ch 4.7). The question is: who else can be blamed for it? The Department also does not close irrecoverable accounts (Ch 4.28), thus keeping arrears high. Apparently also taxes paid are not credited (Ch 4.38), again inflating arrears!

As regards work distribution, the Committee mentions that "as on 1.4.1971 [there were] 104 officers attending to collection as against 963 officers on assessment duty" (Ch 4.17), and the Department generally conducts work in the form of special drives. Gradation and promotion have an arbitrary element in them. The whole set-up must appear as a nightmare to any efficiency expert.

Given its composition, the Committee opts for two major changes: organisation of the Department as a Board on the ground it will give the Department greater financial autonomy; the present Central Board of Direct Taxes "does not have the same independent status as the Railway or the P & T Board has" (Ch 6.7). Secondly, an equivalence in gradation and pay-scales with the administrative service.

The recommendation regarding an independent Board — despite examples of practices in other countries cited by the Committee and despite recent moves in the UK in the same direction — raises various issues. The Committee refers to political interference in the Department's work (Ch 6.12), but independence comes out of service conditions and character: a person, amenable to corruption (financial or political) is hardly likely to be different when forming part of a Board. The Department does need to think out its problems more clearly.

This is all the more necessary since one notices running through the Report the deep commitment of the Department to improving the salary conditions of its officers. The devices through which this is sought to be achieved boggles one's imagination — by revising scales, by creating junior and senior categories within the same scale (Ch 6.45 and Ch 6.59), by grant of special allowances (Ch 6.69) or additional perquisites (Ch 6.96), by upgrading various categories (Ch 6.71 to 6.74) and by creating new categories (Ch 6.67). The Department does not miss the chance to ask for an increase in car allowance to take advantage of the tax exemption (Ch 5.26). There is also an attempt to help officers of the Department in other respects (for example, the demand for extension to all civil servants of exemption from estate duty granted to the Border Security Force in case of death in action, *vide* Ch 5.60; or for deputation of Department staff to public sector units, *vide* Ch 6.75, though this is against government policy).

At the same time, the Department is particularly keen to maintain its own private preserve and comes out clearly against recruitment of outsiders to high posts and in favour of denying promotions to outsiders above specific positions (Ch 6.51). Apparently, the Committee's emphasis on "merit and merit alone [as] the criterion for appointment to higher posts" (Ch 6.56) is to apply within its inbred hierarchy.

Given these mores of the administration, one can only wonder about its standards of integrity. Significantly, the Committee refers to the existence of a few black sheep, but is coy about the role of retired Department men who, in the guise of tax "consultants", operate as contact men and help to subvert the morale and integrity of the Department. The Committee only indirectly refers to the role of tax advisers in assisting tax-dodging (Ch 2.20) but, given its departmental bias, unabashedly recommends (incidentally, in a section entitled "Assessee's Representatives") that the bar on retired tax officials practising tax consultancy for two years after retirement or resignation should be removed, on the ground that it is "an unreasonable restriction on the exercise of a profession" (Ch 6.161). So also the proposal to allow fees paid to authorised representatives as a deductible item (Ch 5.35) is intended to benefit retired tax officers.

It is unfortunate that the Department should devote so much energy to improving its own working conditions and that the Committee should have allowed itself to be used as a vehicle for ventilating departmental demands. In essence these are matters internal to the governmental organisation and could have been covered by general recommendations with a detailed internal note. This is particularly relevant as evidently the Department has been pleading the same briefs to various bodies (e g, the Direct Taxes Administration Enquiry Committee and the Administrative Reforms Commission) and is building up a case for improvement in emoluments and status through endorsement by these bodies. Whatever the shortcomings of the Department in its organisation and administrative practices, it seems to have been its full-time activity in the sixties to seek an improvement in its working conditions and emoluments.

Summing Up

There are five minutes of dissent covering various points, particularly the Committee's recommendations on expenditure tax and on treating the family as the unit of assessment. Some of the Committee's recommendations, like those for giving a permanent account number (Ch 2.154), for deduction from payments to contractors (Ch 4.51), and taxation of casual income (Ch 3.15) have already been accepted.

The Committee's recommendations bristle with inconsistencies. The Committee is against allowing film artistes to spread income over years (Ch 2.215), though it endorses the suggestion that an artiste is taxed only on the annuity if an irrevocable annuity policy is taken

out in his name (Ch 2.216) — the only difference between the two being the intervention of the LIC. The Committee, on the one hand, wants dividends to be distributed (Ch 5.82) to let the market determine where such funds should be invested, and, at the same time, recommends tax exemption for corporate savings (Ch 5.78). So also, while it wants investments in the National Development Fund to be blocked and made not withdrawable for seven years (Ch 5.64), in the very next paragraph it suggests credit facilities against such deposits (Ch 5.65). And while at one point the Committee asserts that "the scope for tax evasion or avoidance exists irrespective of the source of income" (Ch 6.109), it later states that "a well-defined class of assessment work involving definitely lower responsibilities... has emerged" (Ch 6.111) and that "we have... rejected the notion that all assessment work is identical" (Ch 6.112).

The whole Report lacks draftmanship. At an early stage, the Committee makes a profound literary statement: "... black is a colour generally associated with evil" (Ch 2.1); later: "... a person lives for many years but dies only once ..." (Ch 3.76). Much later, arguing for an independent Board status for the Department, the Committee brings in colonialism as a cause of the Department's present status and states: "the supremacy of the administrative services in our country is a hangover of the old colonial and imperialistic days . . . economic development should now have priority over general administration" (Ch 6.50) — a thought and phrase with which it falls so much in love that it is repeated verbatim later (Ch 6.67).

It is significant that the interim Report presented by the Committee (by which it still stands, *vide* Ch 2.26) has not been released. Judging from the Final Report, it appears that the Committee has failed to deal with the substantive problems involved in its terms of reference, and has been content to get itself lost in the trivia of departmental organisation and conditions of work.

REVIEW

Bureaucracy and Politics

V A Pai Panandikar

Bureaucracy and Politics in India by C P Bhambri; Vikas Publications, 1971; pp 349; Rs 36.

THE relationship between the bureaucracy and politics has always been recognised for its cruciality both by students and practitioners of government. In recent years, this relationship, especially the role of bureaucracy, has evoked widespread political interest in India. In the Bombay session of the AICC in 1969, after the split in the Congress party, Jagjivan Ram, then President of the Congress, raised questions regarding the suitability of the concept of neutrality of the civil servants and asked whether it was an appropriate concept in a developing economy.

C P Bhambri of Jaipur University has focused his attention on investigating the interaction between bureaucracy and politics, especially at the national level. He provides in the first three chapters a descriptive background of the political and the administrative system as it exists in India. In the next five chapters, Bhambri takes up five case studies from real life situations in which the relationship between the bureaucracy and politics, specially with political leaders, became national issues. In the last chapter he presents his conclusions.

Bhambri takes the theoretical standpoint that in a developing society an informal institutional set-up is not enough to control the bureaucracy. He feels that "unless political parties have established their legitimacy and hegemony over the bureaucracy, the latter tends to arrogate to itself more authority than it is permitted under a democratic political system".

Obviously, the book was written between the split in the Congress party in 1969 and the 1971 parliamentary elections which changed the political scenario in India. Aptly the book reflects the political uncertainties and anxieties as well as the failures of the Indian bureaucracy to respond to the changes due. Nonetheless, Bhambri has attempted valiantly to keep to his theme. He offers us a good understanding of the party structures in India, especially that of the Congress party, the manner in which it operated from time to time, and the changes in its character and position since the 1967 elections. Bhambri almost decries the dangers of coalition politics which could, according to him, put Indian politics back under bureaucratic hegemony. We also get from the book a useful commentary on the organisation of the bureaucracy, the forms of institutional control and several episodes on the minister-civil service relationship at the Centre, going back to the Mundhra Case involving the LIC's investments.

Too Impressionistic

While the book is a useful addition to the literature in the area, Bhambri has not been able to develop an effective theoretical framework or to answer the critical questions pertaining to bureaucracy and politics. From both these points of view, it would have been particularly important to examine the nature and processes of the interaction between bureaucracy and politics. The criticisms about bureaucratic hegemony are too impressionistic and represent popular images. The relationship between the bureaucracy and the political system has certainly evolved a great deal since independence. No doubt incidents like the Mundhra case have influenced the relationships, or at least the images, a great deal. But whatever may have been the policy domination of the bureaucrats in 1947, the situation has changed vastly since. Indeed several ministers have held policy positions much longer than the civil servants and have become virtually "technocrat-administrators" themselves.

Besides crucial policies whether regarding planning or development programmes, or in socio-economic areas like land reforms, nationalisation of banks, abolition of privy purses, etc, have emerged not from the bureaucracy but from the political institutions and personalities.

This is not to deny that the bureaucracy plays an important role in subsidiary policy-making or even a critical role in policy execution during which the basic policy gets altered, modified or sometimes even subverted.

Bhambri regrettably does not go sufficiently into these areas. Because of a lack of a rigorous framework of analysis, sometimes the book appears journalistic, weak in analysis and unduly impressionistic. However, he has served a useful purpose in focusing academic attention on a critical area and in taking the first step towards researching this important field.

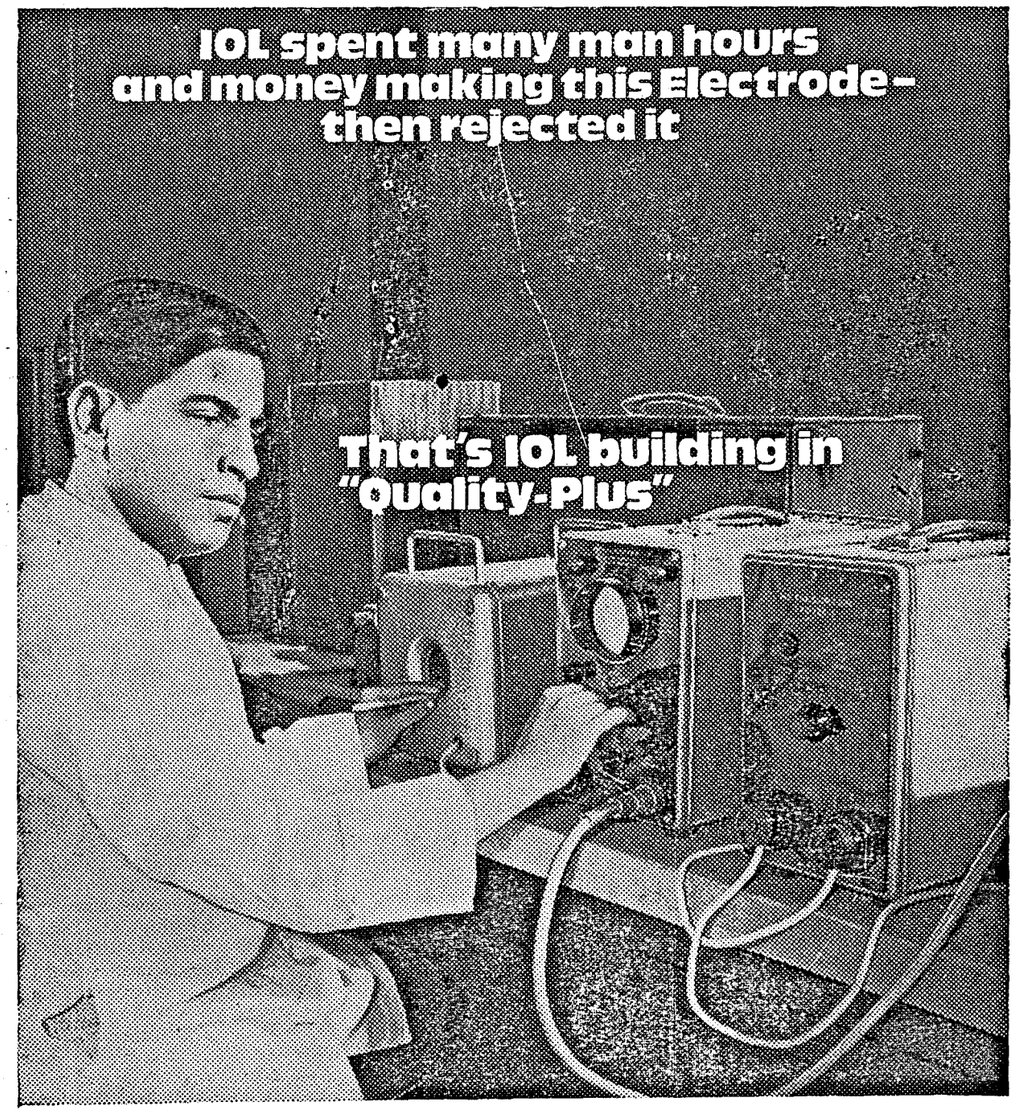
Studies in Planning Techniques

II—The Development Strategy

R M Sundrum

In the first part of these studies, published last week, it was argued that the planning process would be greatly facilitated by the deliberate choice of a development strategy to indicate the broad directions in which it is proposed that the economy should move over a fairly long period. The present part is concerned with a definition of this concept in more detail. In particular, the strategy concept will be distinguished from the sort of perspective planning that is now carried on in India.

The concept of development strategy cannot be laid down in terms of specific decisions, but it can be formulated in terms of decision-making rules, which can then be applied to make the actual decisions as new data become available. This approach will then help to ensure that a long-term point of view is taken into account in dealing with practical decisions, so that they are not overwhelmed by narrower short-term considerations.



Only a few broad aspects of a development strategy have been discussed above to illustrate the contrast between the real issues and the numerical exercises we tend to indulge in. In particular, an attempt has been made to distinguish areas of planning where the optimum period of advance decision-making is long from those where it is short.

IN the first part of these studies, published last week, it was argued that the planning process would be greatly facilitated by the deliberate choice of a development strategy to indicate the broad directions in which it is proposed that the economy should move over a fairly long period. The present part is concerned with a definition of this concept in more detail. In particular, the strategy concept will be distinguished from the sort of perspective planning that is now carried on in India.

Let us first consider why we need such a concept. If, for instance, we had a sufficiently reliable idea of the working of the economy, and of the external circumstances influencing its development, then we could lay down a long-term plan for the entire economy, in the sense of firm decisions according to a definite time schedule. But we do not have this knowledge. External factors fluctuate far too much and we do not know enough about how the large private sector of the economy behaves, particularly in response to the policies of the government. It is because of this lack of reliable knowledge that the alternative approach suggested in the earlier part restricts long-term planning to a few sectors only. But even if we do not have the knowledge to specify a long-term programme of action, we have some ideas of the problem, of future possibilities in meeting the problem, and of our preferences in choosing among these possibilities. These ideas in fact, constitute our diagnosis of underdevelopment and our general approach to dealing with it. It is an attempt to view the development problem in its totality. Such a concept of development cannot be laid down in terms of specific decisions, but it can be formulated in terms of decision-making rules, which can then be applied to make the actual decisions as new data become available. This approach will then help to ensure that a long-term point of view is taken into account in dealing with practical decisions, so that they are not overwhelmed by narrower short-term considerations.

The first task in defining a development strategy is to lay down its ultimate objective. The definitions discussed in the literature can be classified under two headings, which may be broadly described as Growth and Development respectively. Both concepts are concerned with raising the standard of living of the people, but there are significant differences. The basic distinction has been stated by Kindleberger thus: "Economic growth means more output and economic development implies both more output and changes in the technical and institutional arrangements by which it is produced."[1] In fact, it is useful to think of growth as the process, characteristic of the developed countries, by which the national product is continuously increased by investment and technological progress. For this to occur on a continuous basis, the engine of growth has to be internalised, in the words of Arthur Lewis. This requires a certain type of institutional and technological structure of the economy, essentially based on modern science and technology, which has already been established in the developed countries over a long period of time. In contrast, development is the process by which this institutional and technological framework is built up in a less developed country, where the prevailing institutions and techniques of production are based on a different, and older, technology.

For the less developed country, there may therefore be an important advantage in distinguishing between a development phase and a growth phase. During the development phase, the emphasis is on the structural transformation of the economy; growth is not neglected in this phase, but it is not the principal criterion for judging performance. Once this phase is completed, the economy will enter the phase of self-sustaining growth, characteristic of the developed countries. This, in turn, does not mean that the maximisation of the growth rate is the principal object of policy in the growth phase; it only means that the economy has become capable of sustained growth, and particularly that the actual rate of growth becomes amenable to policy, especially in the short term. The way the two phases have been distinguished has a close analogy with Rostow's theory of the take-off, but the analogy is not a complete one. Unlike Rostow's stages of growth approach, it is not here assumed

The leadership that IOL electrodes have had and always will have is the result of many hours of specialised hard work. Hard work in choosing very carefully at the raw materials stage. Hard work at each and every manufacturing stage, where IOL puts added emphasis on quality. And hard work at the checking stage where the electrodes are given hours of attention by specialised IOL technologists who are far ahead of their times.
All this, coupled with the world-wide expertise and latest know-how and processes, build into each IOL electrode the well-known IOL "Quality-Plus". A coupling of the finest materials built into the finest products with the help of the most advanced welding technology which others can't beat !

IOL builds in "Quality-Plus" others can't beat.

IOL
INDIAN OXYGEN LIMITED

IOC-203

that there is any innate tendency for one stage to lead to the next; economies can persist in a pre-take-off state for long periods of time in the manner studied in theories of the low-level equilibrium trap. Further, Rostow lays great emphasis on an acceleration of the growth rate and achievement of a high rate of investment as factors leading to a take-off, whereas in our approach, greater emphasis is placed on a structural transformation. The process of economic growth, as it occurs in the developed countries, has been the subject of intensive study, but we do not yet have a complete theory of development as it occurs under present conditions. Therefore, many aspects of development policy have to be determined on the basis of political judgments. This is specially true of the social aspects of the development process, such as income distribution.

The broad distinction between the growth objective and the development objective is quite familiar to Indian economists, but it is surprising that the planning techniques generally used are related so much to the growth objective, i e, to the current and continuous growth of such aggregates as the national income. This is well illustrated by the techniques of perspective planning in India.[2] Three basic features of the procedure used may be noted: (1) The perspective plan gives only one line of development of the economy over periods of fifteen years, rather than a number of alternatives; (2) During this period, the structure of the economy is projected by extrapolation of the trends observed in the Indian economy in the past; and (3) The projection is largely based on a target for the growth of the national product.

The 1964 exercise in perspective planning starts off with the objective of assuring by 1976 a minimum monthly consumption of Rs 20 per capita (in 1960-61 prices). From this, it is deduced that the national income in 1975-76 should be of the order of Rs 370 billions; this gives an annual average private consumption in that year of Rs 480 per capita. Assuming that the pattern of inequality of consumption remained constant, according to which minimum consumption was about half the average, this would ensure reaching the minimum standard. This approach is again explicitly used in the 1970 exercise (p 34).

Having thus established a national income figure as the target of the perspective plan, the study then goes on to phase the growth of the national income at annual rates of 5 per cent in 1960-65; 7.7 per cent in 1965-70; and 7.5 per cent in 1970-75. As the study was finished in 1964, the growth rate of 5 per cent in the first five years was mostly past history by then; from this, it is pure arithmetic to deduce the rate of growth required in the remaining period to achieve the final target. The study proposes a slightly lower rate of growth in 1970-75 than in 1965-70, based on a rate of capital formation rising sharply from 16 per cent in 1965-66 to 21 per cent in 1970-71 and remaining constant thereafter. There is no explanation for this particular sequence of events; the only basis seems to be a desire to promise a growth rate of per capita consumption at 5 per cent in the period 1970-75 to compensate for growth at only 4 per cent in 1965-70. The slackening in the growth of investment after 1970-71 may also be due to a desire to be independent of foreign aid by 1975-76.

Table 1: Annual Rates of Growth of Output, Productivity and Employment: 1960/61-1975/76

(per cent)

Sector	1960/61-1970/71			1970/71-1975/76		
	Output	Productivity	Employment	Output	Productivity	Employment
A	3.6	2.5	1.1	4.3	3.5	0.8
B	10.4	3.6	6.6	9.7	4.2	5.3
C	6.7	2.6	4.0	8.4	4.1	4.1
Total	6.3	3.8	2.4	7.4	5.0	2.3

Starting with this projection of the national income, the programme then lays down increases in production of various goods on the basis of the demand arising from planned investment, the growth of population, and of per capita consumption on the basis of expenditure elasticities observed in the past. Some targets were based on social norms; enrolment in primary education was to reach 100 per cent of the corresponding age group in 1976, and 90 per cent at lower secondary level. In later studies, the enrolments at higher levels were based on an estimate of manpower requirements, themselves based on the targeted growth rates of national income and its principal components.

It was also expected that the economy would reach a full employment state by 1975-76. The rates of growth of employment were derived for three broad sectors, agriculture (A); organised mining, manufacturing and transport sectors (B); and other sectors, such as small enterprises, construction, commerce and the professions (C). The results are summarised in Table 1. The assumed growth of employment was based on the growth of net output and the increase of productivity. On this basis, it was expected that, of a projected increase in the labour force of 70 million, 50 million would be absorbed in the non-agricultural sector. To the extent that productivity increases more slowly than expected, employment growth will be faster, but if productivity does not increase as fast, the growth of output may also be slower.

The stock of capital is expected to increase by Rs 665 billion from Rs 322 billion in 1960/61 to Rs 987 billion in 1975/76. Of the addition to the capital stock 46.5 per cent is to be in the mining, manufacturing and transport (MMT) sectors, raising the proportion of the capital employed there from 26 per cent to 40 per cent. Also 65 per cent of the additional capital is to be in the public sector, raising its share of the capital stock from 26 per cent to 52 per cent. Thus, the allocation of the new investment will be such as to strengthen the MMT sectors and also the public sector. The high level of investment in the public sector is expected to be financed by current surpluses of the government sector, deficit financing, external resources (for part of the period), and absorption of private savings, as shown in Table 2. The assumptions about financing are rather optimistic; the revenue surplus increasing at 23 per cent annually; the surpluses of public enterprises at 26 per cent, and domestic borrowing at 10 per cent. Further, the proportion of private savings to be

Table 2: Financing of Public Sector Investments

(Mn Rs)

Source	1960/61	1975/76
Revenue surpluses	850	19,100
Surpluses of public enterprises	500	16,300
External resources	4,900	—
Deficit financing	—1,100	3,250
Domestic borrowing	3,050	13,350
Total	8,200	52,000

borrowed for public sector investments is expected to double from 20 per cent in 1960-61 to 40 per cent from 1965-66 onwards.

It will thus be seen that the perspective plan depends crucially on the projection of the national income and the possibility of financing the plan. The assumptions about future growth represent a sharp break from past trends, and cannot be fulfilled without extensive policy changes designed to bring about a greater momentum of development. But the work done in perspective planning does not indicate the nature of the required policy changes. To that extent, this sort of exercise does not provide much strategic guidance. Instead, it is heavily based on estimating levels of investment and its allocation to various sectors required to achieve the target rate of growth. In addition to this, the perspective plan derives estimates of required capacity in various sectors and industries in considerable detail, but as these are in turn based on the target rate of growth, their value for detailed planning is doubtful. In all, it seems as if the perspective plan does the same basic calculations for a fifteen year period that the medium term operational plans do for five years at a time; the difference is that it is not expected that the perspective plan will be implemented as drawn up, but will be modified as time goes on. Under these conditions, the perspective plan is of little use in formulating the medium-term plan or in focusing attention on the basic issues of longer-term development policy. The point may be seen more clearly by discussing some of the issues that might be considered in an alternative formulation of development strategy.

(1) The Relative Roles of Capital and Labour

In spite of all the arguments that have been waged in the last twenty years, there can be no question that the development phase of a less developed country is one of investment in capital on a major and, for these countries, an unprecedented, scale. These countries cannot afford to slacken their efforts to provide for capital accumulation by every means in their power. This is partly because they begin their development phase with such a low level of capital. It is also because many of the institutional and even social changes that they aspire to are facilitated by the process of investment on a large scale. The rest of development policy is only concerned with making such investment possible. The real issues concern the problem of making the best use of the maximum amount of investment they can undertake. Some of the disenchantment with the key role assigned to capital is really due to the manner in which new investments have been allocated and utilised in the past. To this extent, the primary concern with the appropriate *level* of investment in some of the earlier theoretical and in even recent planning discussions is misplaced and tends to bypass the real issues of development.

Even if the less developed countries achieve investment at the maximum rate possible, capital will remain scarce relative to labour for a long time to come. It follows, therefore, and is widely agreed that during this period we should adopt a labour-intensive strategy. This means that, wherever possible, the economy should be moved to use labour-intensive goods in preference to capital-intensive goods, and labour-intensive techniques in preference to capital-intensive techniques. In turn, all obstacles to such a strategy, such as labour indiscipline, wage demands, cheap imports of capital goods, etc, should be watched and overcome, consistent with other policies. However, this needs some important qualifications. First, this does not mean that a labour-using technique is to be preferred at all costs. The idea of a labour-intensive approach is to get a higher return from our scarce capital. Hence, when a labour-using technique actually gives a lower return to capital also, the capital-intensive technique may have to be chosen. For example, Dhar and Lydall have raised some doubts about the advantages of some small-scale industries from this point of view.[3] Also, public administration is very labour-intensive but it is not to be expanded on that account, for already its labour-intensity may be a factor leading to serious inefficiency. The second qualification to note is that the present labour-surplus condition will not last forever. The very process of development will lead to increasing labour-scarcity in a long, but finite, period of time. This should also be taken into account in planning.

Once it is accepted that our development strategy should be biased towards a labour-intensive approach, how is this strategy to be incorporated in our planning? This requires intensive study about the factors which affect the substitution of capital for labour in the economy and the influence of the various instruments of public policy on these factors. Planning cannot wait for the results of a full study; while such a study is going on, various policy measures can be tried in an experimental way, thereby influencing current developments on the one hand, and also providing additional data for a fuller understanding of the process, on the other. For example, measures can be taken straightaway to raise the prices of capital-intensive goods so as to shift demand towards labour-intensive goods. Also the use of capital-intensive techniques can be discouraged, and that of labour-intensive techniques encouraged, by suitable taxes on capital, and tax reliefs or subsidies on the employment of labour. In doing this, an effort must be made to ensure that the discouragement of the use of capital must not be carried so far as to underutilise our existing capacity in capital-goods industries or to reduce the output of the using industries either. The fiscal measures to influence choice of industries and of techniques can be supported by other measures, such as industrial licensing, import entitlements, credit policy, industrial location policy, etc. The supply of capital can also be influenced by policies; a great deal of the capacity in capital-goods industries is in the public sector; therefore, the supply of capital-goods industries can be regulated by investment decisions in the public sector itself. An important question is the extent to which the government and entrepreneurs have any degree of freedom in the choice of techniques. They may be restricted to such techniques as they can borrow from the capital-abundant labour-scarce countries. A large domestic capital-goods industry can therefore play a part in extending these options, and some weight must be given to this consideration in making decisions about the industry.

A major factor influencing the relative roles of capital and labour is the level and rate of increase in wages. This is an area where governmental regulation is likely to be weak, but the government sector itself is a large employer of labour, and it should use all its influence in restraining the growth of wages in the public sector, to prevent a sympathetic rise in wages in the rest of the economy. Even so, it may not achieve a perceptible effect on wage levels; further, the policy towards actual wages may have to take account of other social and political considerations. But even if actual wages cannot be adjusted sufficiently, an attempt must be made to see that investment decisions, definitely in the public sector,

and as far as possible, in the private sector, are not based on the actual wage rates, but on some shadow wage rates and shadow interest rates designed to move the economy towards the chosen strategy. Such shadow prices cannot be derived in the text-book manner from optimising exercises, because we do not have enough information to build such models; they have to be chosen by the exercise of informed judgment. In fact, the shadow prices of factors determined in this way may be taken as the parameters of an overall strategy.

(2) Relative Roles of Physical and Human Capital

Investment in both physical and human capital is needed to promote economic development; both types of investment involve costs at present, while yielding their benefits at a later time. This leads to the question of the relative emphasis to be placed on each. Present conditions and the nature of her future development justify placing considerable emphasis on investment in human capital in India. One reason is that India has a long way to go in incorporating modern science and technology in her productive process, and this requires strengthening of the human factor. Another reason is that human capital may be cheaper than physical capital in India, because education is one of the most labour-intensive industries. In fact, it may be said that Indian strategy should aim to substitute human capital for physical capital, wherever possible. The scope for such substitution is quite large, as shown by recent developments in the developed countries themselves.

In fact, great emphasis has been placed on educational development in India, especially at the higher levels. There may be a variety of factors, some of them social and political, which underlie this emphasis, but insofar as this is based on economic considerations, such development must be planned much more carefully than seems to be done at present. One objective of such planning should be concerned with the quality of education. There is abundant evidence that the great quantitative expansion of education that occurred in the past, has been at the expense of quality, especially at the higher levels. Mark Blaug has argued that this is inevitable, that under Indian conditions "more means worse".[4] A K Sen has suggested that this has been due to the failure of academic salaries to rise sufficiently to attract the required number of adequately qualified persons to the teaching profession.[5] These are matters to be studied in detail, and the further expansion of education should be planned so that a high quality is maintained.

A second important consideration is that educational development can assist the process of overall development only to the extent that the graduates are employed in the production process. Even in the developed countries, a large proportion of the more educated workers is employed in the public sector, but in the typical underdeveloped country, the proportion is very high, apart from some self-employed professional people. Various factors have tended to inhibit the employment of educated workers in the private sector, such as the small scale of most enterprises, the high salary expectations of educated workers, the quality of education in schools and universities, etc. These factors have to be studied and modified as far as possible to raise the employment of the increasing supply of educated workers, to promote the greater use of modern science and technology in production.

Then we come to the question of the magnitude of educational expansion to aim at. The two considerations mentioned above, the improvement of quality and the absorption of educated workers, impose an upper limit to the rate of expansion. Apart from this, there are two dominant approaches to the quantitative planning of education — namely the manpower requirements approach and the rate of return approach. The manpower requirements approach has been adopted by the Education Commission for planning the higher levels of education. Under this approach, the national income is projected over a decade or two; from this, the growth of various sectors is derived by various elasticities observed in the country or in international comparisons; this is then translated to occupational categories by using a matrix of co-efficients and finally into a projection of requirements of workers at various educational levels, again on the basis of another set of co-efficients. Although this method, developed in the OECD Mediterranean Regional Project, is widely used in practice, the method has serious shortcomings, essentially due to the assumptions that the various co-efficients observed in the past will remain constant in the future. The estimates derived by this method also depend on the degree of optimism with which the national income is projected. Further, the method suffers from its almost complete neglect of the economic factors of the costs and benefits of education.

In contrast, the alternative approach in terms of the rate of return is dominated by economic considerations. In this approach, the costs and benefits are calculated explicitly and expressed as a rate of return on investment in education. Typically, the benefits to the individual over his lifetime are estimated from the observed earnings differentials of workers of different educational attainments at various ages. For certain countries, such as the United States, it has been shown that such calculations do explain the nature of the private demand for education. In fact, on the basis of such data as are available, Blaug *et al* have shown that such private rates of return do provide the rationale of the behaviour of private individuals in India, such as the great demand for higher education and the continuing demand for a general and academic education. However, to be useful for public policy, the relevant rates of return have to be adjusted for a social point of view. Here the rate of return approach is on much weaker ground. It relies heavily on observed income differentials, which may not quite represent differences in social benefits. It assumes that these differentials will persist over the lifetime of persons making their educational decisions at present, and therefore does not take account of changes in these differentials that may occur in the future, or even the changes likely to result from the process of expansion itself. Finally, the rule that education at various levels should be extended to equalise the rates of return among themselves and with the return to be expected from other types of investment, does not give guidance to the extent of expansion needed in any period, or the ultimate goal to which the procedure would lead.

There is a lively controversy going on between proponents of the two approaches, especially as they often get divergent policy conclusions — the manpower requirements approach favouring large expansion at the higher levels, and the rate of return approach favouring expansion at the lower level. But in a sense, both approaches are similar in that educational expansion is obtained as a derived demand, a demand derived from the actual or projected growth of the rest of the system. Although both approaches, and especially the manpower requirements approach, are applied over a long period of time, their basic assumptions, such as constancy of observed co-

AIYARS-S-272

efficients and income differentials, limit their applicability to a rather short period, quite inadequate for the planning of educational development. These approaches leave out of account the role that educational development can play in influencing the rate and pattern of overall development. If it is at all expected that educational development will be a factor in influencing a break from past trends in economic development, then we have to start with a prior determination of educational goals, and persevere with policies to ensure that the rest of the economy derives the maximum benefit from progressing towards these educational goals. Thus, instead of starting with certain sectors which are likely to expand or to be developed, and then calculating the manpower requirements, new industries have to be developed to utilise the availability of new skills in the labour force. Instead of deriving the directions of educational expansion from rates of return based on present income differentials, these differentials have to be adjusted to promote the full utilisation of a growing output of graduates. It is along these lines that Arthur Lewis has argued that "one ought to produce more educated people than can be absorbed at current prices, because the alteration in current prices which this forces is a necessary part of the process of economic development. On the other hand, this adjustment is painful and fraught with political dangers".[6] The role of planning is to minimise these dangers. This approach depends on setting the long-term goals of educational expansion. Ultimately, these goals have to be fixed on the basis of the requirements for a modern, growing economy. Here, the analogy with the present developed, industrial, countries becomes more applicable. Once the long-term goals are held down, then economic criteria based on current developments may be used to choose from among alternative routes to these goals.

On the approach suggested here, educational development becomes a subject for long-term planning, not just in the sense of a broad strategy for dealing with changing circumstances as they arise or in the sense of perspective planning to provide the background for current decisions itself being periodically revised, but in the sense of firm decisions on a definite long-term time schedule. It would then have all the advantages claimed for long-term planning in the first part of these studies — reduction of uncertainty for the private sector, more systematic project planning, more effective balancing over different regions, and clearer definition of supporting policies. In particular, it would help in maintaining the quality of education in a period of expansion, and lay the basis for salary reforms in the public and private sectors.

Once it is decided to apply long-term planning to education, the task of formulating such a plan may be done by a National Educational Planning Commission. This would be preferable to doing it in the present Planning Commission. An Educational Planning Commission would include India's leaders in the educational field and would be able to delve deeper into the educational aspects and spend more time at it, than the Planning Commission with its preoccupation with five-year plans. Such an Educational Planning Commission would also function differently from the Education Commission of the type which met in 1964; for one thing, the Educational Planning Commission would aim to arrive at firm commitments to action rather than be confined to analysis and broad policy recommendations. But more importantly, the Educational Planning Commission would investigate deeply the interaction between educational development and the progress of the rest of the economy. Such an Educational Planning Commission does not have to be a permanent body; after having formulated a long-term plan, the further planning tasks may be left to the present planning agencies and the educational authorities.

(3) Investment in Infrastructure

The strength of the infrastructure in India, as in other less-developed countries, is very inadequate for the functioning of a modern economy, and for the integration of all parts of the country. This has, of course, been recognised in Indian planning and a considerable portion of investment has gone into infrastructure. As the most urgent needs get filled, it becomes necessary to approach future policy in this field with a more deliberate choice of a suitable strategy.

Two possible approaches may be distinguished. One approach, which may be loosely described as the World Bank approach is to make an investment when the demand for it can be foreseen clearly enough to yield a rate of return above some estimate of the cost of capital. The other approach is that of building infrastructure ahead of demand — in fact, to stimulate the demand. The case for building infrastructure ahead of demand in the less developed countries has been forcefully argued by the late Ragnar Nurkse,[7] who, in other respects, was a balanced growth theorist. The distinction has been described in relation to transportation by Wilfred Owen thus: "Traffic projections are too often based on what may be expected to happen rather than what can be made to happen. The first approach is guessing the future, while the second is planning it."[8] It would help the planning process to make a clear choice between these two approaches, at least as a broad principle. There are indications that Indian planning seems to have taken the first approach in principle but to have followed the second in practice. One result of this is that, for capital already invested, the whole burden of securing an adequate rate of return falls on the prices charged to consumers. It would be better to determine these prices on the basis of what the traffic will bear, and in the interests of resource mobilisation, consistent with other development policies.

The divergence between the two approaches is similar to that noticed in the alternative approaches to educational development, which may itself be considered as an element of social infrastructure. There is, however, the difference that educated workers are much more versatile and also more mobile than physical infrastructure. Hence, educational development can be determined on a more aggregative basis, and therefore, is more amenable to long-term planning than most physical infrastructure. Scale and location decisions are likely to be more important for physical infrastructure, and have to be considered more closely in relation to the development prospects to be served by each investment.

A strategy for infrastructural investment may be drawn up by first specifying certain long-term targets in rather broad terms such as energy output, ton-mile capacity, etc, without advance choice of the specific means — hydro, diesel or thermal, road, rail or water, etc. These long-term goals may also be broken up into regional goals — to ensure some sort of regional balance and fair distribution. The second element of a strategy would be the continuous search for feasible projects. This may also be undertaken as a long-term assignment, so that suitable expertise and organisation can be built up all over the country. Then, a shelf of fully researched projects will always be available. This will avoid the danger that, when infrastructural investment is to be stepped up for any

reason, the number of technically sound projects available will be inadequate. This may be one of the problems facing the rural works programme, whose expansion was recently attempted as a measure to deal with rural unemployment and underemployment problems.

Given these long-run preparations, actual investments may be decided in the medium term on a variety of considerations. An investment may be made as soon as it becomes clear that a shortage has occurred or is likely to occur. Faced with such a need, a decision can be made about the particular type of investment to meet the shortage of infrastructural facility, i e, the choice of hydro or thermal source of power, or road or rail means of transport. Such a choice can be made on strictly economic grounds. It will be easier to make these choices if there is a shelf of projects to choose from.

Apart from the cases where shortages are clearly foreseen, other investment decisions may also be made in order to stimulate economic activity. While every effort should be made to see that there are good chances that economic activity will, in fact, be stimulated, some speculative element will enter in some cases. To deal with such cases, an economic choice may be made on the basis of a projected rate of return, but a lower cut-off point may be used. In other cases, the infrastructural investments may be directed towards specific economic activities to be stimulated, as e g, in the construction of industrial estates.

One of the most important possibilities opened up by using infrastructural investment to stimulate particular directions of economic activity is the application to deliberate urbanisation. For example, the proportion of urban population living in small towns has been steadily falling in India. Infrastructural investment may be directed to promote the growth of small towns, in contrast to concentration in the bigger towns and cities. The development of smaller towns would prevent an excessive rate of migration from rural areas to the big cities, creating problems of congestion in those cities, calling in turn for more infrastructural investment. At the same time, the small towns might more directly serve the urban needs of their rural hinterland, and thus promote its agricultural development as well.

(4) Agricultural Development

Some of the uncertainties regarding long-term planning facing other sectors of the economy are absent in the case of agriculture. There is a general consensus that the country should be self-sufficient with regard to most of its agricultural requirements. There is also widespread agreement that this is technically feasible. On this basis, the perspective plan exercise done for the Fourth Plan has derived a target of a 5 per cent rate of growth of agricultural production up to 1985-86. The problem of achieving this growth has also been studied intensively, and the broad lines of solution are clear. The gross irrigated area has to increase from about 31 million hectares in 1964-65 to about 67 million hectares in 1985-86. The intensity of fertiliser use has to increase fivefold from about 10 kg per hectare in 1968-69 to about 50 kg per hectare in 1985-86. This has to be combined with efficient water management and improved cultivation practices. All this has to be supported by continuous research effort in the search for new varieties and the adaptation of varieties, water management, fertiliser use and other agricultural practices to suit local areas.

While these technical aspects of agricultural development have been studied and by now are well known, at the national level, there is still a great deal of work to be done at the local level. In this connection, there has been great concern about agricultural planning as it is done at present. Among the factors which need to be re-examined is the question whether the essentially long-term tasks involved here have suffered from the five-year planning approach followed so far, with its heavy emphasis on the financial aspects of planning. Another is the question whether the present distribution of the planning function between the centre and the states has weakened the implementation of agreed programmes, a role now largely assigned to the states. A third factor is the question whether the economic policies of the government have been adequately adjusted to the predominant role that the private sector plays in this field.

A satisfactory solution of these problems requires a long-term horizon. It involves essentially the long-term process of building up new organisations and institutions to serve the agricultural sector. It also requires a considerable expansion of the research effort spread all over the country to improve our knowledge of the conditions prevailing in local areas, in addition to the basic research in search of new varieties, more suitable to local conditions of soil, water availabilities, of disease, and of demand peculiarities and needs. The extension service has to be greatly expanded to provide a two-way communication of research results to producers and of local problems to research agencies and policy makers. An appropriate institutional basis has to be built up to exploit fully the opportunities opened up by nationalised banking to meet the credit needs of agricultural development. A long-term approach to agricultural policy has to be evolved to balance the competing aims of providing an adequate incentive to producers on the one hand and of keeping down the cost of living of the weaker sections of consumers. A basic decision is also needed in connection with agricultural mechanisation to ensure that agriculture provides maximum opportunities for employment, as output and productivity are increased. Above all, an approach to land reform should be defined over the long term.

The fact that the long-term goal of agricultural development is fairly clear and the fact that the principal means of achieving this goal involve so many long-term processes suggest that this is another area which is eminently suitable for long-term planning. The essential prerequisite for this is a decision to pre-empt a certain part of furture development expenditures for the agricultural sector. This does not mean that all expenditures for agriculture have to be pre-empted in this way but only the part that corresponds to clearly foreseeable needs. Once such a decision is made, then the task of planning on this basis can be entrusted to a National Agricultural Planning Commission, on the same principles as that proposed for education. In practice, this might be done by a suitable re-definition of the terms of reference of the present Agricultural Commission. When so re-defined, the Commission could take full account of the needs within agriculture itself, and at the same time, take full account of the interrelations between agriculture and the rest of the economy. It could consider not only the questions of financial allocation for various purposes, but also the question of the policies to promote these objectives.

(5) Industrial Development

From the beginning, the main route to economic development was assigned to industrialisation, i e, the steady increase in the labour force employed in, and the national product originating from, the industrial sector. Within this broad objective, there have also been some basic decisions about the pattern of industrialisation. From the Second Plan onwards, greater emphasis was

given to capital-goods industries. In other industries, a certain role was reserved for small-scale enterprises. Regarding the ownership and control of industry, the basic policy was enunciated in the Industrial Policy Resolutions of 1948 and 1956. The public sector was to play the major role in the organised sector; further, the private sector was to be closely regulated by a system of licensing and other controls to guide industrial development according to detailed targets laid down by planners, and with a view to preventing excessive concentration. Subject to licensing, private sector industry was to be promoted by a number of financial agencies and by various programmes of technical assistance.

After two decades of planned industrial development, Indian industry is facing serious problems. While there has been an emphasis on the capital-goods sector to lay the foundations for long-term growth, following the Mahalanobis model, there has been less emphasis on corresponding action to match savings to this shift towards investment goods on the physical side. As a result, there are indications that inadequate savings in the economy has led to underutilisation of capacity in the capital goods sector, and a demand for consumer goods beyond the existing capacity, leading to inflation of consumer-goods prices, simultaneously with signs of industrial recession.[9] At the same time, as a number of recent investigations have shown, the system of licensing and related controls has not had any systematic economic basis, and has failed to achieve some of its major objectives, such as prevention of concentration. While the machinery of controls could be relied on to choke off excessive demand for investment resources, the corresponding machinery of financial institutions and technical assistance has failed to raise the demand when it fell too low, as shown by the protracted industrial recession of the past few years.

In the light light of this experience, the planning of industrial development needs a basic reconsideration. Essentially the present weakness of industrial planning may be traced to our ignorance about the factors affecting the private sector of Indian industry, and hence, to the lack of an adequate theoretical basis on which to plan industrial development. This can be seen from the variety of theories that have been advanced to explain the industrial recession. A part of the industrial recession has been attributed to the slackening of public sector investment; on this explanation, industrial expansion has not yet been sufficiently geared to the rest of the economy. To meet this difficulty, a greater part of industry must be re-oriented to serve the private sector demand, and at the same time, more resources must be mobilised to maintain a high level of public sector investment. According to another line of explanation, an excessive capacity has been built up in the capital goods sector, beyond the increase in the rate of savings generated in the economy. If a large capital goods sector is desired in the interests of long-term growth, this again requires more action on the savings front. Yet another explanation is based on the shortage of essential inputs, such as the shortage of steel and the shortfall in raw cotton; in the case of such short-term and temporary difficulties, speedy action is needed to import the materials in short supply. An interesting line of explanation relates the industrial situation to agricultural conditions. It has been argued that a bad agricultural season, by raising food prices, reduces demand for industrial goods, because a higher proportion of disposable incomes is spent on food. On the other hand, it has also been argued that high agricultural prices only inflate the incomes of traders and money lenders, whose demand for industrial goods rises to a smaller extent. It has also been argued that the expansion of Indian industry was so largely based on import substitution of relatively luxury goods, and that this demand having been sated, the industrial expansion has proved to be a once-over affair, incapable of continuous expansion, in the absence of a significant change in income distribution. Finally, it has also been argued that the promotional efforts of the government in the field of industry have been too weak to stimulate industrial investments, especially in the small-scale sector and that the various financial institutions have only acted passively to serve existing demand, rather than to promote new demand. This requires a more active policy on the part of the financial institutions, and a more active use of credit planning.

All this shows that our knowledge of the mainsprings of industrial expansion is quite meagre. One of the first tasks is to undertake intensive research on these issues. Our present approach is heavily based on rather over-simplified macro-economic models. They need to be greatly elaborated and supplemented by micro-economic studies. While this research gets under way, some tentative conclusions may be drawn about the directions of future progress. Over the long term, the pattern of industrialisation has to be related to the progressive changes in the distribution of income. Also, the success of the government in guiding industrial development depends not only on the negative aspects of regulation by licensing and controls but also by the positive aspects of active promotion by programmes of financial and technical assistance. At the same time, industry must be guided towards the absorption of the growing labour force at the maximum possible rate, and to this end, all instruments at the control of government, including price policies, have to be actively used. Apart from these essentially long-term measures, the actual rate of industrial expansion in the short run has to be related to the maximum resources that can be mobilised for investment in this sector.

In the past, industrial investments in the private sector were subject to detailed "planning" in the sense that certain capacity targets were laid down and the system of licensing and controls operated to ensure that these targets were not exceeded. In view of the many uncertainties involved in our understanding of this sector, the economic basis of laying down such targets has become suspect. Further, the control mechanism has failed to ensure that these targets are attained and also to promote its other objectives. At the same time, the government has to exercise some influence over the rate and direction of industrial investment. It has also to allocate some essential scarce materials and scarce foreign exchange among various industries and various applicants. To do this, a more flexible system of planning over a short term has to be used, and its operation modified on the basis of continuous monitoring. For this purpose, the French system of indicative planning provides a useful model. In this system, the instrument of credit planning can be used with greater effect. There will, of course, be some basic industries of high priority for which future requirements can be forecast more reliably; in these cases, a strict type of planning over the long term can be applied.

(6) Resource Mobilisation

In spite of the great progress that has been achieved in the past twenty years, there is still need for further increases in the rate of resource mobilisation for development. As the needs for investment over the long run in infrastructure, education and various economic sectors become better defined in terms of pro-

jects, the need for more resources will outstrip the present rate of resource mobilisation. This will be specially true of the public sector which bears a special responsibility for the development effort. Therefore, the strategy for resource mobilisation has to be re-examined in order to step up the pace of development.

So far the size of the plan has been debated on the issue of the amount of resources that can be mobilised, leaving the question of the use of these resources for secondary consideration. This procedure threatens to slow down the possible rate of progress. Instead, the first task is the spelling out of the tasks to be performed, for which the technical, administrative and institutional preparations have been made. A basic principle of resource mobilisation should be that financial resources should not be a constraint on the development process in these critical years. To adopt such a principle, of course, the projects to be undertaken must be of the highest priority for development. This principle has in fact been stated in Indian planning documents. For example, a memorandum of the Perspective Planning Division states that "the right approach is to investigate closely the nature of the problem to be tackled, the nature of solution to be sought, the concrete tasks to be carried out, the physical resources, skills and organisational effort to be mobilised for the purpose. If these appear to be operationally feasible, it should be possible to devise policies by which the finance can be found to facilitate the process of mobilisation of the real resources."[10]

While it is desirable that the pace of development should be limited only by the extent to which the practical tasks are defined and judged to be most conducive to development, rather than by a prior judgment about the financial constraints, the pace of development can be accelerated only when adequate financial resources are, in fact, raised. This means that, for following this approach, the whole apparatus of resource mobilisation must be streamlined so that the resources will be forthcoming as they are needed. There are, first, the obvious lines in which past efforts must be expanded. The tax administration must be strengthened to control the present high rates of evasion or the tax system must be revised to make its administration more effective. The tax system must be extended to mobilise more resources out of the rising agricultural incomes. As already stated in the Second Plan, "there should be discriminating, but prompt, use of the instrument of taxation to prevent excessive increases in consumption in certain lines and to mop up the excess profits or windfall gains that deficit financing tends to generate" (p 86).

Out of its revenues, the government must exercise the utmost economy in the cost of the general administration. After having complained bitterly of the cost of the administration in the old British days, the country has been landed with an expensive administration of its own, mainly because of the hangover of so many administrative ideas from those days. The poor financial performance of the public sector enterprises has been held as an argument against having these enterprises in the public sector at all. Their management has to be improved so that they begin to contribute towards the development effort.

Break from Past Trends

Two important elements that enter into the decision about the size of a plan are the expected volume of savings and the permissible amount of deficit financing. Elaborate calculations are made about these magnitudes. In the case of private savings, these are essentially based on the past experience with the marginal rate of savings. In the perspective plan exercise of the Fourth Plan, for example, this is held constant at 12 per cent. However, an effective policy of resource mobilisation requires a break from past trends. This requires an intensive study of the incentives to private savings, especially the effect of the present rate of inflation on the real rate of interest earned by savers. A basic problem in the projection of savings from past data is that these data only reflect *ex post* savings, while what is needed is to attain the highest level to which *ex ante* savings can be pushed. Another important question is the extent to which these savings are available to the public sector. Under present conditions, the hopes included in the perspective plan of doubling the proportion of private savings that can be borrowed by the government seem over-optimistic. Given the relatively slow growth in private savings, the prospect of raising sufficient resources for the proposed perspective plan rest mainly on a great increase in public savings. While this is essential to any argument, it requires basic long-term changes in fiscal policy, which have not been spelt out.

The approach to deficit financing appears to be based on a sort of quantity theory of money. The Third Plan "proposed to limit deficit financing ... to the minimum warranted by the genuine monetary needs of the economy, ... in view of the rise in prices that has occurred during the Second Plan period" (p 99). The estimate for the Fourth Plan was based on the required expansion of the money supply corresponding to the planned growth in real income, but it is also said that "the annual amount of deficit financing will have to be determined in the light of emerging trends" (p 83). The policy towards deficit financing has thus been based on a presumed close-connection between the amount of deficit financing and the danger of inflation. In fact, we do not know enough about this connection in Indian conditions. In spite of the planners' concern with deficit financing, price inflation has gone on steadily in the past. Much more research needs to be done on the role of other variables, such as food supply and wage rises.[11] Further, the hopes of maintaining monetary stability during a period of development are too optimistic. As Joan Robinson says, "If there is to be development, there must be a stage when investment increases relatively to consumption. There must be an increase in effective demand and a tendency towards inflation. The problem is how to keep it within bounds."[12] It is all too easy to let inflationary forces get out of control, as the experiences of so many less-developed countries have shown; however, the goal of monetary stability may involve too high a cost in terms of growth and may, even then, be unattainable. The objective should be to squeeze as much investment as possible out of the economy, consistent with retaining control of the monetary situation. This requires a combination of long-term and short-term measures. We need a much better idea of the working of the monetary system and of price trends. We need a great strengthening of financial institutions to mobilise resources from all sources. Given this long-term preparation, the actual amounts to be raised by various sources can be kept flexible, and determined on short term, or even annual bases. To the extent that inflation is inevitable, its most undesirable consequences should be contained by a return to the approach stated in the Second Plan of what may be called 'selective inflation' (p 86).

The specification of a development strategy involves many other factors. Only a few broad aspects have been discussed above to illustrate the contrast between the real issues and the numerical exercises we tend to indulge in. In particular, an attempt has been made to distinguish areas of planning where the optimum period of advance decision-making is long from those where it is short.

Rent Control and Low Income Housing

Abhijit Datta

This note seeks to bring out the irrelevance of rent control to solving the housing problem of the poor and advocates a positive policy on the part of the government in this direction.

Such a policy would consist of increasing the subsidised housing programmes in a substantial manner and adopting a more general income guarantee scheme for the poor. Only by attacking on both these fronts we can tackle the problem of housing the poor.

ONE of the prevailing myths about rent controls in our urban areas is that these benefit low-income tenants in the face of rising house rents. Any suggestion for relaxing the rigidities of rent control, let alone its abolition, is viewed with suspicion by well-meaning public leaders. Here we propose to examine the efficacy of rent control as an instrument of affecting income distribution and the alternative means to achieve the same goal more efficiently. An attempt will be made to indicate the broad lines of public policy towards low income housing.

Mechanics of Distribution

Any redistribution scheme, in order to be equitable, must ensure that the two tests of capacity and needs are taken care of. The most widely accepted index of capacity is income, while needs may be measured in terms of family characteristics. Both these factors must be weighed in order to determine the eligibility conditions of redistribution. Rent control measures, although assumed to be redistributive in nature, fail to apply these basic tests of eligibility and, therefore, tend to distort the distributive pattern in a most haphazard way. We shall illustrate this in terms of both vertical and horizontal redistribution or equity.

Vertical equity : Since there is no means test applied either to the tenants or the landlords before rents are frozen, it is not clear who benefits or loses because of rent control. It is quite conceivable that a landlord may be poorer than the tenant. Even if he is not, it is not clear why a poor tenant should be subsidised by his landlord, instead of by the state. If it is the intention of the government to make the rich pay for the upkeep of the poor, why should only landlords be picked for this noble role?

Horizontal equity : Among the tenants who benefit also there is no classification in terms of relative needs based on the number of family members, age and sex composition of families, occupational needs, etc, so that single-member family units are treated exactly in the same way as multi-member families. The occupational needs are simply ignored.

Rent control, therefore, violates the basic norms of distributional equity either in vertical or in horizontal terms. The only way rent control distinguishes tenancies or properties is in terms of (a) date of tenancy, or (b) date of completion of the property. Both these can be extremely inequitable. First, old settlers are protected at the cost of recent migrants, newly married couples and mobile tenants. Second, insofar as old buildings are discriminated against, the problem of maintenance of existing property is ignored and such property is made obsolescent sooner than necessary.

Distortion of Consumer Budget

From the point of view of the beneficiaries of rent control, the tying-in of the subsidy with the existing housing space distorts the consumption choice of the tenants so protected. It is quite conceivable that the relative preference of many of the protected tenants might lie away from housing space and in favour of some other needed commodity or service. But rent control compels the tenant to have more of housing than he would have if he had the choice to spend the subsidy as he wished. Therefore, the marginal utility of the rental subsidy to the tenants is less than that of an equivalent cash subsidy. There is thus a strong built-in incentive for the tenant in a rent controlled property to misuse the allotted house space through sub-letting, non-residential use, etc, or in extreme cases to sell off his occupancy rights to the landlord in return for a compensation.

A partial redistributive device, such as rent control where the subsidy is tied to the consumption of a specific commodity — housing space —, is always less efficient in welfare terms. Either such a subsidy scheme has to be operated in close concert with similar subsidy schemes for other essential

commodities, such as food, clothing, etc, or the subsidy must be worked out in terms of the income of the recipients, i e, a maintenance allowance.

Alternative Distribution Methods

If we reject rent control as a means of enabling the low-income population to enjoy housing at 'normal' rents, we must examine the alternative methods of doing so and see which of these alternatives should be pursued by the government. In this context, we would define the low-income group to mean the non-amortisable group of the population whose housing needs are to be met, either partially or wholly, from public funds. We discuss the various subsidy arrangements broadly under two categories (i) subsidised housing, and (ii) subsidised income.

Subsidised housing: Public subsidy schemes for housing low-income groups have tended to take the form of capital or cost subsidy rather than subsidised rental in the urban areas, with the result that fewer families are benefited each year from the plan programmes. Administratively, this is a simpler operation, but it is also a slow method of making an impact on the housing situation. On the other hand, public house construction and a matching subsidy take care of both the supply and demand aspects of low-income housing. Perhaps a better method would be to utilise the subsidy to reduce the annual debt charges of the construction agency, as suggested by Ford Foundation experts.*

The second disquieting feature of subsidised public housing schemes is that only a small proportion of the total public investment in housing is really subsidised — during the Third Plan period this was only about a quarter. It might be preferable to induce the organised financial institutions to supply the loan funds for housing, while government funds could be devoted exclusively to the subsidised programmes. In this context, the revolving fund approach of the public housing agencies may be questioned. Why should these agencies invest funds to cater to the needs of the affluent, rather than devoting their energies exclusively to the needs of the poor? If at all, financial institutions could try the revolving fund approach and not public development agencies.

The third criticism of the subsidised programmes would be the government's approach to solving the slum problem. It would be better to concentrate on improving the environmental facilities of existing slums than to try to pull these down. Where it is necessary to clear the slums, the approach should be first the rehabilitation of slum dwellers and only secondarily to put the vacant land to more efficient use. The vacant land may well be converted into open recreational area, in view of the lack of open spaces in our major urban centres.

In order to make any worthwhile impact on the existing housing shortage, it is imperative that a massive shelter programme is undertaken by the government. Without such a determined effort on the part of the state to solve the problem of low-income housing, it is not possible to fight poverty on the housing front.

Subsidised income: An income subsidy to ease the housing problem of the low-income groups may be thought of in either *specific* or *general* terms. A specific subsidy would include a rental subsidy upto a ceiling of the rent actually paid. So far this has been tried out with public employees and also some of those in organised private employment. Unless the low-income groups are made the exclusive beneficiaries of this type of specific subsidy, the relative income distribution pattern would not be affected. Moreover, organised employment being smaller compared to that in the unorganised and self-employed sectors, this would cover only a fraction of the low-income families.

A general income subsidy to the low-income group in the form of a comprehensive social security programme is perhaps an ideal, but presently an impossible, solution. This would respect consumer choice and tie up all the basic necessities of life in an integrated manner. But obviously this has to be thought of in terms of the country as a whole, covering both urban and rural areas. Even a token effort in this direction would perhaps go a long way in our fight against poverty, which is really the main evil — and not its consequence in poor housing conditions.

Conclusions

We have tried above to indicate the irrelevance of rent control in solving the housing problem of the poor and advocated a positive policy on the part of the government in this direction. Through increasing the subsidised housing programmes in a substantial manner and adopting a more general income guarantee scheme for the poor. Only by attacking on both the fronts — housing construction as well as income of the dweller — can we tackle the problem of housing the poor.

FRANK KITSON

Low Intensity Operations

Subversion, Insurgency and Peacekeeping

In recent years the British Army has been largely occupied with peacekeeping operations and with the countering of subversion and insurgency; and it seems likely that it will continue to be occupied in this way for the foreseeable future. The purpose of Brigadier Kitson's book is to provide a clear and authoritative outline of the steps that should be taken to improve military efficiency in this role of peacekeeping. It concentrates on co-ordination between military commanders on all levels and police and civil leaders.

With service in Kenya, Malaya, Muscat and Oman, Cyprus and Northern Ireland behind him, Brigadier Kitson is eminently qualified to tackle the subject. *Faber* £3.00

Farm Mechanisation in a Labour-Abundant Economy

A Comment

A S Kahlon

S S Grewal

INDIAN AGRICULTURE, which was caught in a vicious circle of low productivity and low investment, has shown some resilience since the mid-sixties. The recent technological change was fostered through the introduction of high-yielding crop varieties and intensive use of non-conventional inputs such as fertilisers, pesticides and mechanisation in various forms.

Mechanisation of irrigation was necessitated by the high-yielding varieties programme, which demanded timely irrigation as a prerequisite for its profitable adoption. Electric motors and oil engines provided assured irrigation to meet this need.

Even after irrigation was mechanised, farmers realised that they could not efficiently manage their lands and further increase cropping intensity, without adding substantially to the energy input through the introduction of tractors and allied farm machinery. To meet this pressing need, Punjab farmers purchased tractors from all over the country and in most cases at exorbitant black market prices, with the result that the number of tractors in the state expanded to about 25,000 in 1970,[1] the highest for any state in the country.

Factors Affecting Mechanisation

Rapid growth of use of tractors and other farm machinery in a labour-abundant economy seems to be paradoxical. It was argued by C H Hanumantha Rao[2] that this would happen in a developing economy where the biological sources of energy, *viz*, human and bullock labour became costlier relative to machinery, thereby necessitating the use of mechanical energy. Bullock prices, wage rates and foodgrain prices were reported to have risen proportionately more than the rise in the prices of tractors. The latter were stated to have been made artificially cheap through a liberal import policy and through extension of institutional credit for the purchase of tractors. A closer examination of the problem will, however, show that this line of argument does not explain the way the situation has developed in Punjab.

The rise in prices of tractors and bullocks over time is shown in the Table. The figures show that during the period 1961-68, bullock prices more than doubled, while the increase in tractor prices (Eischer 27 HP and Massey Ferguson 35 HP) was about 50 per cent. But it is not just the relative increase in the price of machinery *vis-a-vis* other factors (as argued by Rao), which clinched the issue in the favour of farmers buying tractors. The absolute increase in prices could not be ignored. Between 1961-1968, the price per bullock increased by about Rs 600, but the increase in tractor prices during the same period for Massey Ferguson 35 HP and Eischer 27 HP tractor was of the order of Rs 7,000 and Rs 5,500, respectively. The difference in absolute increase was widened when tractor prices were raised in the beginning of 1971. For example, the prices of International 35 HP and Hindustan 35 HP tractors showed an increase of Rs 10,670 and Rs 14,500 over their respective cost during 1965.

Again, it is not just the fixed cost (as overemphasised by Rao) but total operational cost which becomes relevant for decision making by the farmers. If the farmers' decision to switch over to tractors resulted from higher cost of bullocks (as argued by Rao), then the farmers who took up tractor cultivation should have dispensed with bullocks altogether. A recent study[3] conducted in Punjab showed that whereas the actual utilisation of bullocks on tractor farms decreased by 85 per cent compared to bullock farms, the presence of bullocks on tractor farms decreased by only 39.7 per cent.

Reasons for Mechanisation

Thus, the compelling reasons for mechanisation seem to be varied and different. The recent technological change and positive interaction of food prices have motivated the farmers to expand their production programme. The high-yielding seed varieties have required more water, fertilisers, pesticides and intensive methods of cultivation. There has been a rapid increase in irrigated area as well as overall cropped area. Land shaping and grading have become major operations in areas brought under tube-well irrigation. Because of their power requirement, these operations have to be done entirely with machines. Timeliness[4] in operations has gained added importance in the context of the new agricultural strategy. This has placed a heavy demand on human and bullock labour.

Table : Bullock and Tractor Prices

Year	Bullock Prices (I Grade Bullocks) Rupees/Bullock	Tractor Prices (Rs)				
		Eischer 27 HP	Escort 37 HP	Hindustan 35 HP	International 35 HP	Massey Ferguson 35 HP
1961	515	11900	—	—	—	—
1962	650	—	—	—	—	14450
1963	750	—	—	—	—	—
1964	850	—	—	—	—	—
1965	875	—	—	12500	16830	—
1966	875	—	15400	—	—	—
1967	900	—	—	—	—	—
1968	1135	17480	17910	15710	19570	21140
1969	1335	—	—	—	—	—
1970	—	—	—	—	—	—
1971	—	19460	19930	17470	—	—
1971	(Actual prices in the market)	—	—	27000	27500	35000

Note : Tractor prices are listed against :
(a) the year in which the production of particular tractor was started,
(b) the year 1968 which denotes the prices fixed in the middle of 1968.
(c) the year 1971, which denotes the prices fixed in early 1971.
(d) the year 1971 which denotes the prices at which tractors were available in black market. This is based on survey data.

Source : (i) Government of India, Report on the Fixation of Prices of Agricultural Tractors, Manager, Government of India Publications, Delhi, 1970.
(ii) Patiala Commission, New Delhi.

The biological sources of energy, especially bullocks, could not cope with the requirements of the changed situation during the critical periods of workload. Therefore, the farmers, particularly the large ones, were compelled to switch over to the use of tractors. Here the cost of maintaining bullocks also weighs with the farmers. The large farmers have to choose between keeping a certain number of bullock pairs and a tractor. And it is the overall benefit of cultivation with bullocks versus tractors, rather than their relative prices, which is more meaningful from the standpoint of the farmers.

Again, tractor-operated farms have higher land and labour productivity. This is reflected in higher net income on tractor farms. A study[5] relating to Punjab showed that net income per hectare in canal irrigated areas was Rs 458.95 on bullock farms but as high as Rs 922.56 on tractor farms.

Impact on Employment

It is bullock and not human labour which has been affected the most owing to the introduction of tractors. This is understandable, because tractors were introduced mostly to meet the expanded energy input requirements, which the bullocks could not meet. The average reduction in bullock labour utilisation on tractor farms compared to bullock farms was about 85 per cent.

In the case of human labour, it was replaced by tractors only to the extent of 4.25[6] man-days per acre per year. This loss, if one chooses to call it a loss, should be judged against the gain of the much higher productivity of land on tractor operated holdings and off-farm employment generated in agro-industries. The additional income per acre on tractor operated farms compared to bullock farms was Rs 388. It is due to this and several other gains and not just the relative price of human labour and tractor as suggested by Rao, that the introduction of tractors has become a necessity in Punjab agriculture.

PROBLEM:
Money for industry
SOLUTION:
Mahabank

BANK OF MAHARASHTRA
Head office: 1177 Budhwar Peth, Poona-2

BANK OF MAHARASHTRA has Schemes to aid the Small Scale Industrialist—the person with ideas awaiting financial backing.

He comes to MAHABANK; feasibility of the Scheme is studied; plans come alive...another step is taken to progress. Ideas turn into concrete products.

Interested in financial aid for a small industry?

For further details contact our nearest branch.

Indian Overseas Bank

Directors' Report: 1971

1. The performance of the banking system during the year 1971 was characterised by accelerated growth in deposits, a slowing down in credit extension and a continued active phase of branch expansion. New deposit accretion crossed the Rs. 1000 crore mark, for the first time in the history of Indian banking, and the rate of deposit growth at 18.6% bettered the previous year's 16.6%. Credit outstandings rose by 9.3%. This was reflected in a drop in the credit-deposit ratio from 78.6% in 1970 to 72.4% in 1971. The year saw commercial banks opening as many as 1805 new branches, of which 1073 were in hitherto unbanked centres. The spectacular programme of branch expansion executed by the banks since nationalisation has brought down the average size of population served per bank office from 65,000 in June 1969 to 42,000 in December 1971.

2. IOB's progress during the year was satisfactory. Profits after tax, but before provision for bonus to staff amounted to Rs. 39.42 lacs in 1971 as against Rs. 37.44 lacs in the previous year. The profits for 1971, together with a sum of Rs. 2.75 lacs transferred from Development Rebate Reserve, have been appropriated as follows :

	Rs lacs
Transfer to reserve fund	8.00
Provision for bonus to staff	25.72
Transfer to Government of India	8.45

3. The Bank's deposits and other accounts in India and abroad stood at Rs. 131.60 crores at the end of 1971, recording an increase of Rs. 23.37 crores or 21.6% during the year. For purposes of comparison, it would be more appropriate to look at the trend in the Bank's deposits in India exclusive of inter-bank deposits, sundry creditors and margins—termed as 'aggregate deposits' in official statistics. The rate of growth in aggregate deposits of the Bank in India was as high as 25.4% during 1971 which compares favourably with that of the banking system at 18.6% and the Bank's own previous year's performance (23.1%).

4. Success on the deposit front was the result of a multi-faced strategy. The Bank initiated what could be described as 'a total marketing concept'—a cohesive integrated employment of all available marketing tools for business promotion with particular reference to mobilisation of deposits. The new strategy was reflected in the introduction of new customer satisfying schemes, reorientation in the approach to publicity, adoption of direct marketing techniques and implementation of a programme to secure effective staff participation in business growth.

5. The Bank's overall advances were up by Rs. 10.23 crores (or 15.7%) touching Rs. 75.25 crores at the end of December 1971. Investments rose by Rs. 13.71 crores (or 47.5%) to reach a level of Rs. 42.58 crores at the end of the year.

6. In India, the Bank's credit portfolio recorded an increase of 20% exceeding Rs. 67 crores at the end of the year. The priority sectors comprising agriculture, small-scale industry, road transport operators and special categories like retail traders, artisans and self-employed persons, continued to claim a sizeable share of the advances. As of end-December 1971, IOB's involvement in the priority sectors was around 38% of its total advances in India.

7. Agriculture absorbed 13% of the Bank's lendings in India. A noteworthy feature is the predominance of small farmers. The Bank had 53,282 farmer-loan accounts on its books at the close of 1971. Approximately 85% of these accounts related to farmers with holdings of 5 acres or less. The total number of such accounts increased by over 12,600 or 31.3% during 1971. The greater emphasis placed on meeting the small farmers' requirements is reflected in the average size of farm loan (outstandings) which dropped from Rs. 1300 in 1970 to Rs. 1100 in 1971.

8. The machinery for appraisal, sanctioning and post-advance supervision in respect of agricultural credit has been further strengthened. Regional workshops and training programmes organised in various districts for the benefit of rural branch agents have helped build up expertise in farm financing. The field staff—there are over 60 qualified agricultural graduates on our rolls—keep in close touch with the farming community, study their problems, evaluate their financial needs, provide guidance, supervise loan utilisation and assist in recovery operations

9. Credit to small-scale industrial units, including road transport operators, rose by 33% to Rs. 12.73 crores during 1971. This sector accounts for about 20% of the Bank's total lendings in India. The number of small industrial borrowing accounts exceed 4000. About one-fifth of credit to small industrial units is absorbed by cashew industry. Units producing engineering goods make up a sixth and chemical products one-twelfth. Manufacture of fire-works, cotton textiles, silk and synthetic textiles, rubber goods, plastic goods, leather and leather products, coir yarn and goods, paper and paper products, printing and publishing industries are other principal beneficiaries in the small industrial sector.

10. A credit scheme was introduced early last year for qualified engineers who have viable propositions for—setting up small-scale units. Finance is extended to them on very concessionary terms. 54 technocrats came forward with concrete proposals and the Bank sanctioned loans to all of them totalling Rs. 154 lacs.

11. The Bank has actively involved itself in providing finance for self-employment (including retail trade). In the context of heavy incidence of unemployment in India this sector offers immense scope for generation of employment opportunities. We have been endeavouring to give adequate support to the viable productive needs of the self-employed sector both in rural and urban areas. As at the end of 1971 the Bank had over 7000 borrowing accounts of persons belonging to the self-employed sector with total outstandings at Rs. 267 lacs.

12. Export finance continued to receive a measure of preference in IOB's credit programming. As of end-1971, total advances to the export sector in India amounted to Rs. 786 lacs. At the height of the busy season, export lendings touched a peak of Rs. 1000 lacs.

13. Thirty-two new branches were opened during the year—18 in Tamil Nadu, 4 in Mysore, 2 each in Delhi, Pondicherry, Kerala and Orissa and one each in Uttar Pradesh and Chandigarh. Since nationalisation upto end-1971, 90 new branches have been opened—58 in rural areas, 12 in semi-urban centres and 20 in urban and metropolitan locations. 61 of the 90 new branches were in hitherto unbanked centres. The Table below illustrates the distribution by population size of the Bank's 285 branches in India at the end of December, 1971 :

Population-Size	*No of Centres*	*No of Branches*
Upto 10,000	83	83
Over 10,000 and upto 25,000	50	50
Over 25,000 and upto 50,000	15	16
Over 50,000 and upto 1 lac	17	17
Over 1 lac but less than 10 lacs	40	59
10 lacs and over	7	60
	212	285

Apart from full-fledged branches, 'extension counters' were set up in four educational institutions (one during 1971 and three subsequently) to inculcate saving habit in the younger generation. Extension counters handle purely deposit transactions.

14. The Bank has taken positive steps to fulfil its role in the lead districts allotted to it. A Development Office has been set up at Madurai for effectively administering the Lead Bank Scheme in the districts of Kanyakumari, Ramanathapuram and Tirunelveli. We have plans to initiate an action-oriented programme for the total development of the lead districts. This would mean identification of credit gaps and formulation of specific developmental projects. A beginning is being made in Ramanathapuram district—the most backward of the lead districts allotted to us—where we have, with the co-operation of the Agricultural Finance Corporation, identified specific projects for the development of agriculture and fisheries.

15. The Bank is devoting attention to the streamlining and simplification of procedures and forms and in taking all steps towards improving customer service. We have a nucleus of an Organisation & Methods Department which is being strengthened.

16. In conclusion, the Directors wish to thank the members of the staff at all levels for their sincere and devoted service to the Bank.

For and on behalf of the Board of Directors

Madras, 18th April, 1972.

R. N. CHETTUR

Guest Keen Williams Limited

Statement by the Chairman, Mr K C Maitra

THE following is the Statement by the Chairman, Mr K C Maitra, on the occasion of the forty-second annual general meeting of Guest Keen Williams Limited held in Calcutta on May 5, 1972:

It is my pleasant task to welcome you to this 42nd Annual General Meeting of your Company. The Annual Accounts and Directors' Report have been circulated and with your permission I shall take them as read.

Board of Directors

Mr A H Sethna who joined the Board on 12th June, 1964 has resigned from it on 30th December, 1971 on his retirement. I must add, however, that his association with the Sankey Electrical Stampings part of the Company is longer, going back to April 1961. Throughout this time, his knowledge and experience of the Steel Industry were of great assistance to the Board, and on your behalf and mine I would like to place on record our great appreciation of the services rendered by him during his long association with us.

I have also to report to you the resignation of Sir Henry Wilson Smith, KCB, KBE, Deputy Chairman of our associated company in UK — Guest Keen & Nettlefolds Ltd. Although Sir Henry only joined our Board in June 1970, his interest in our affairs has been continuous throughout his service with GKN, and we have greatly benefited from his mature counsel and experience. Again on your behalf and mine I would like to place on record our great appreciation.

It gives me pleasure to welcome to our Board Mr S K Nanavati, whose appointment as a Director from 4th February, 1972 is noted in the Directors' Report. I am also glad to tell you that Mr H S Killick, MC, TD, one of the Executive Vice-Chairmen of Guest Keen & Nettlefolds Ltd, joined the Board of Directors from 30th March, 1972. Your Company is indeed fortunate in obtaining the services of men of this calibre and distinction.

Operations during 1971

The Directors' Report circulated to you has already covered the salient features of the 1971 results, and I need not repeat them here. But I cannot let the achievement, for the first time, of Rs 50 crores turnover pass without a special mention. I shall at the end of my statement, as is customary, thank the members of the GKW team at all levels for its contribution during the year; but I think you would wish me to make special reference to this landmark — such figures are only achieved when the whole of our strength is pulling in the same direction. As it happens, achievement of Rs 50 crores comes almost exactly 50 years after Henry Williams (India) Ltd set up its first manufacturing activity in Calcutta in 1922. This Private Company later grew and became associated with Guest Keen & Nettlefolds Ltd, UK in 1934 leading eventually to the public company of Guest Keen Williams Ltd, in 1956. The contribution to the Indian economy, to employment, and to indigenous availability of needed materials and products, brought about by this combination of private enterprise and association with one of the world's great international companies, is obvious. It is our earnest hope that it can long continue to thrive and to grow.

The area where we are most disappointed with our performance is export. I am glad to be able to tell you that we have booked some good orders already in 1972, although price competition in export markets is, if anything, fiercer than last year. We should be able to hold our position, but we have much further work to do in order to get our exports back on to a growth track.

I would also like to comment on the apparently high liquid resources we are maintaining. I do not think it is sufficiently realised how the combination of inflation, high tax rates, and growing volume of business, place heavy demands on resources. For example, the book value of our stocks at 1st January, 1972 was Rs 14.26 crores. If this year we hold merely unchanged volume, but suffer 5 per cent inflation, the value of stocks will rise by Rs 71 lakhs. To finance this from internally-generated resources requires a pre-tax profit of about Rs 2.1 crores. If one couples this purely inflationary impact, with the need to achieve expansion in real volume and re-equipment of our fixed capital base, the pressure on funds is obvious.

Bonus Issue

Before I begin to speak on 1972 and the future, I must give the shareholders a piece of disconcerting news. You will recall that, at an Extraordinary General Meeting held in November 1971, it was decided that an application should be made to government to permit a 1 for 2 issue of Bonus Shares by capitalising the entire amount standing to the credit of the Share Premium Account, and some of the General Reserve. By an Order received shortly after the Directors had signed their Report, the government has turned down the request for bonus issue on the ground that Rs 1.11 crores of total Share Premium Account was "created by consideration other than cash", which they do not permit to be capitalised. This policy of government raises important points which affect both our Company and yourselves as shareholders, for it effectively freezes a part of our Share Premium Account for many years to come. We are carefully examining the matter and, for the moment, I would request you to bear with us till we come to some definite conclusions. I couple this with an assurance that it is still our wish to effect a bonus issue on the best basis we can devise consistent with government policy.

Current Prospects

Looking back, the recession of 1966-67 affected all industry. Your Company had to go out of the dividend lists in respect of its operations in 1967 and 1968: although we traded at a profit, it was all wiped out by the heavy interest charges on borrowings at that time. In 1969 and 1970 we came back into profitability, coupled with rigid control on assets to restore the healthy liquid position I have already referred to. Last year we moved forward again and we were able to support the higher activity levels with internally-generated funds.

In 1972, we expect further turnover increase (and indeed, sales in the first four months ahead of the equivalent period of last year although not as much as we would have liked). But costs are also rising; in particular, in the Emergency Budget last December increases in excise duties and regulatory duties were announced. In view of the general economic situation, and the gov-

ernment's wish to maintain the price line, we decided to absorb these extra costs at that time. The main budget in March further increased the same duties, and whilst on certain products we have been obliged to raise our prices, we are still absorbing a substantial portion of the combined impact.

Meanwhile, it is common knowledge that the rate of growth in industrial production has markedly slowed down over the last 12 months, although one must hope that the increased Plan expenditure also included in the Central Budget will help to stimulate a faster rate. If we are to make a contribution to holding the price line against inflationary cost pressures, an expanding economy is vital — particularly in a company like ours, supplying materials and components to the manufacturing industry. Equally vital is the need to ensure that expansion is not disrupted by industrial strife — certain of our major customers are currently suffering from this canker, and it has materially affected our sales to date.

Against this background, the problem of 1972 may be summarised by saying that we have to run quite fast just to stay where we are, and maintain the 1971 profit figures. I believe this to be possible; but to achieve further profit improvement we need very substantial increase in our turnover, and that in turn would require a marked surge forward in the economy as a whole.

The Economic Climate

At this point, I would like to make some of the more general observations which Chairmen are customarily permitted on these occasions. They tend to display a certain sameness, one to another, and to repeat the words of leader-writers, politicians, and other pundits. This year, more than ever, it is difficult to avoid this repetition. National events in the last twelve months have been so total in their impact upon the life of the country, so demanding of effort from its people and its institutions, and have wrought such a drastic change both in our present situation and our possible future, that comment on other matters runs the risk of triviality by comparison.

When I last addressed you, the most massive popular vote in a free democracy had installed a Central Government with overwhelming strength in the Lok Sabha. Within days of its installation it was faced with a crisis on our Eastern border which, although external in its source, was immediately internal in its impact through one of the greatest refugee movements ever seen. For nearly nine months we vainly sought the peaceful solution we would have so much preferred: but circumstances imposed on us military action, carried out by our armed forces with surgical precision. A new nation was born, essentially out of its own strength — particularly strength of national purpose, and therefore looking to us not as a parent but more as a godfather. We gladly accept the role, cherishing and supporting the independence of Bangladesh by giving political, moral and economic support insofar as that country itself determines what it would wish to have. Finally, in March the electorate gave a further mandate in the States to the leadership which has seen us through such a difficult year.

These are great events in the life of a nation. They have given rise to a sense of unity and purpose which, if constructively put to work in the national interest, can yield a rich harvest within the framework of a stable government. The ways in which we seek to use this new-found strength in pursuit of our national objectives, are commonly expressed in certain slogans which, by constant repetition, attain the status of inviolable truth. But the danger of adopting a slogan as an inviolable truth is that we cease to think. It is always easier to repeat a cliche, parrot fashion, than it is to think about problems more fundamentally; this easy road is a luxury which no nation, and particularly its leaders, can afford. As Bernard Shaw said "The golden rule is that there are no golden rules". Moreover, there is also a tendency that, where a rule has been devised in pursuance of a particular policy objective, it becomes sacred even though in a particular application the rule may achieve results quite opposite to the policy it was intended to support. This is a characteristic of bureaucracy everywhere — it "works to rule" in a quite literal sense, for this is the way the elected political authority seeks to exercise its political will through the administrative machine.

Let us examine for a moment one of the most popular ideas of the day, namely the need for self-reliance. As a target to be set in front of the country, it is in many ways eminently desirable. There is no reason why we should depend on others for what can be achieved by our own material and human resources. We must resist the tendency to rush for outside help at the slightest provocation and to ignore or condemn whatever can be done indigenously. However, it would be wise to remember that in this century technological developments have been taking place (and still continue to take place) at such a rapid pace that no country, however advanced, is or will ever be completely self-reliant in the absolute sense. Even countries like America, Great Britain and France have all in the last five years had balance of payments crises leading to devaluation: in our struggle to raise our exports and control our imports, we keep company with the most developed of countries.

Thus self-reliance is not an absolute goal, it is relative to the standards of living which we wish to secure for our people. We could be self-reliant today: there is no absolutely essential requirement — essential, that is, for supporting life for our people — which is not either already indigenously produced or obtainable within the limits of our existing foreign exchange earnings. But a self-reliant India on this basis would also be a poorer India — self-reliance under these terms means quite simply "cutting our coat according to our cloth". Surely, we should aim higher than this!

I believe it would be particularly misleading to take self-reliance as an overriding objective in the sphere of fixed capital formation. The capital needs of India are probably greater than those of any other nation in the world. It has been said that if we achieve 6 per cent per annum compound economic growth rate, allowing for the expected growth in population, it will take us 20 years to double the per capita income of our people. Twenty years from now, that will still condemn many to grinding poverty by any standards, and many more to poverty by the standards which will then exist in most of the rest of the world.

The cure does not lie wholly within our borders. To what extent can we honestly ask millions of people, who have so little, nevertheless to save — to forgo marginal improvement in their current condition in return for future benefit? Yet if the State generates revenue surplus to fund State Capital Investment, this is financed by savings of the people; even if private industry generates its own surplus, it comes ultimately from the prices paid for its products, paid by the people as ultimate users of the goods they make. India currently has a low rate of capital formation as a percentage of Gross National Product, and although politicians and economists are fond of saying it should be raised they rarely draw attention to the consequence of such a policy — that we should spend less on current consumption!

This is indeed a cruel dilemma — more investment we must have to achieve 'Garibi Hatao' in the future, but if the cost is less consumption now, that is 'Garibi Bachao'. Surely, one solution — in this context, a good socialist solution — would be to attract to this country capital from those people and nations that have far higher margins between current wealth and current need; who have, therefore, both a greater propensity and a greater ability to save and invest. The rich nations of the world have a huge capital market, India has a huge capital need. Surely our policy should be such as to encourage world capital to invest in India.

Assistance from the outside world can take two forms. The first is official aid from governments and from institutions such as the World Bank. Here, the cliche is "aid without strings", which carries the implicit assumption that no aid carries no strings. In practice, no aid would carry the string of unabated poverty. But all means we should reject strings which defeat our national objectives, debilitate our attitude to hard work, or violate our international conscience; on the other hand why should not we continue to welcome, as we have done in the past, development assistance the fruits of which have been so obviously not to our detriment.

The aid contribution from official sources is comparatively well known. It is perhaps less well known that the flow of funds from private sources in the developed countries to the developing is almost as great as the total official aid. In 1970, according to provisional World Bank figures, the net flow of private funds was $6.4 bn compared to the official flow of $8.3 bn. This huge source of wealth is one from which India should seek at least her fair share. It is sad that by a combination of tax structure, specific restrictions, and interminable procedures making a mountain of every molehill, India presents to the world capital market one of the least attractive investment propositions.

Finally, let me make one comment on the ideal of distributive justice. I use the world ideal deliberately, because I genuinely believe that we must aim for it. It is taken to mean *inter alia* that the proportion of total production resources held in the State Sector, or in the Small-Scale Sector, should grow as compared to the proportion held by established companies like ourselves. If we are allowed to grow at the maximum rate which we can achieve, in support of the objectives of increased employment and attack on poverty, and if the State Sector and the Small-Scale Sector grow faster, we would wholeheartedly applaud. But if the rate of growth in the State and Small-Scale Sectors is inadequate, and re-distribution is achieved by holding down companies like us to a still more inadequate rate of growth, this will merely re-distribute stagnation! The percentages may look better on paper, but will the people really benefit?

All our social objectives, however well meant they may be and however appalling are the problems they are designed to cure, fail if there are not economic resources to carry them out. I am well aware that there are problems and difficulties in the course I have been advocating, particularly the need to ensure that we do not leave to future generations a burden of debts which they cannot support. But I believe most sincerely that alternative policies to those currently in favour must be constantly reviewed, otherwise they go by default. More than anything else, what I am pleading for is a result-oriented pragmatic approach to our economy, and a rejection of unthinking adherence to cliches or slogans. In such a result-oriented pragmatic approach, we would eagerly wish to join; for we believe that in the future, as in the past, we can echo the proud words of Othello — "We have done the State some service, and they know it".

Our Associates

A highlight of the year to date has been the visit in February of Sir Raymond P Brookes, Group Chairman, and Mr J F Insch, Deputy Chairman of Guest Keen & Nettlefolds Ltd, UK. This visit gave concrete evidence of the importance which our associates attach to our affairs, and their presence with their charming ladies was a great pleasure to us. We are currently fortunate in having in our midst Mr H S Killick, whose appointment to our Board I have already referred to. In the opposite direction, GKN continue to receive our people for training in their Works in UK, as well as rendering valuable technological assistance.

Conclusion

It remains for me to thank our employees for their continued co-operation. All of them have had to work under somewhat difficult conditions, particularly during the last war with Pakistan. It is to their efforts that we owe the improved working of the company already achieved, and I am quite sure we will not be lacking in their support for our plans to move ahead in the years to come.

Note : This does not purport to be a record of the proceedings of the Annual General Meeting.

Family Planning

THE birth rate in Kerala, Tamil Nadu and Maharashtra has fallen below 32 per thousand, the target of the Fourth Plan. According to the Report of the Ministry of Health and Family Planning for 1971-72, it is also declining steadily in Mysore, Punjab, Andhra Pradesh and Orissa, and, if present trend continues, it should reach the Fourth Plan target next year. Over 12.4 million couples, out of 98 million couples, in the reproductive age group have been protected against unwanted children. 8.6 million people have preferred sterilisation, 1.5 million have had IUCDs inserted and 2.2 million have preferred conventional contraceptives. Had it not been for the family planning programme, there would have been 9.4 million more mouths to feed in the country.

Mass vasectomy campaigns are the most conspicuous feature in the last year's family planning activities. Following the successful vasectomy campaign in Ernakulam District in November last year, 25 vasectomy camps have been held in the country.

The Central Drug Research Institute has been perfecting an oral contraceptive "Cent Chrome" which showed a hundred per cent contraceptive effect in animals, when fed to females within 4 days of coitus. Clinical trials are now being carried out. The Institute also developed an intra-vaginal contraceptive device "Cent Square". The Central Council of Medical Research for Indian Medicine and homoeopathy have taken up three Ayurvedic and Unani contraceptive recipes for evaluation. Chemical and pharmaceutical screening of single drugs used in selective recipes is in progress.

Over 41 lakh IUCD Insertions have been done since the inception of the programme. The IUCD programme revived in 1970-71 (.47 million) after a period of slump. A total of 15,62,136 sterilisations have been done between April and December 71 adding up to a cumulative total of 10,221,213 and a coverage of 18.7 per thousand of population.

In India Coca-Cola goes the Indian way.

Throughout India 22 companies — wholly Indian-owned, Indian-managed and Indian-staffed — bottle Coca-Cola, India's favourite soft drink — a local business, the way it is in more than 130 other countries. Providing direct employment for 10,000 people and an important source of livelihood for 200,000 more — most of them shopkeepers.

Things really do go better with Coke... like helping to provide a living for more than 200,000 Indian people.

By making it a local business, the Coca-Cola organisation helps to develop other Indian ancillary industries, from bottle and case makers to refrigerator and machinery manufacturers, with annual purchases of their products and services worth more than Rs. 13 crores.

The Indian Coca-Cola bottling industry is established with over Rs. 10 crores of investment from Indian entrepreneurs who produce a world-class soft drink of the quality you can trust anywhere, any time.

Enjoy Coca-Cola

Issued by the Coca-Cola Bottlers of India.

The Coca-Cola Bottlers of India are registered users of the registered trademarks "Coca-Cola" and "Coke".

Printed by Krishna Raj at States' People Press, Janmabhoomi Bhavan, Ghoga Street, Fort, Bombay-1, and published by him for Sameeksha Trust from Skylark, 284 Frere Road, Bombay-1.

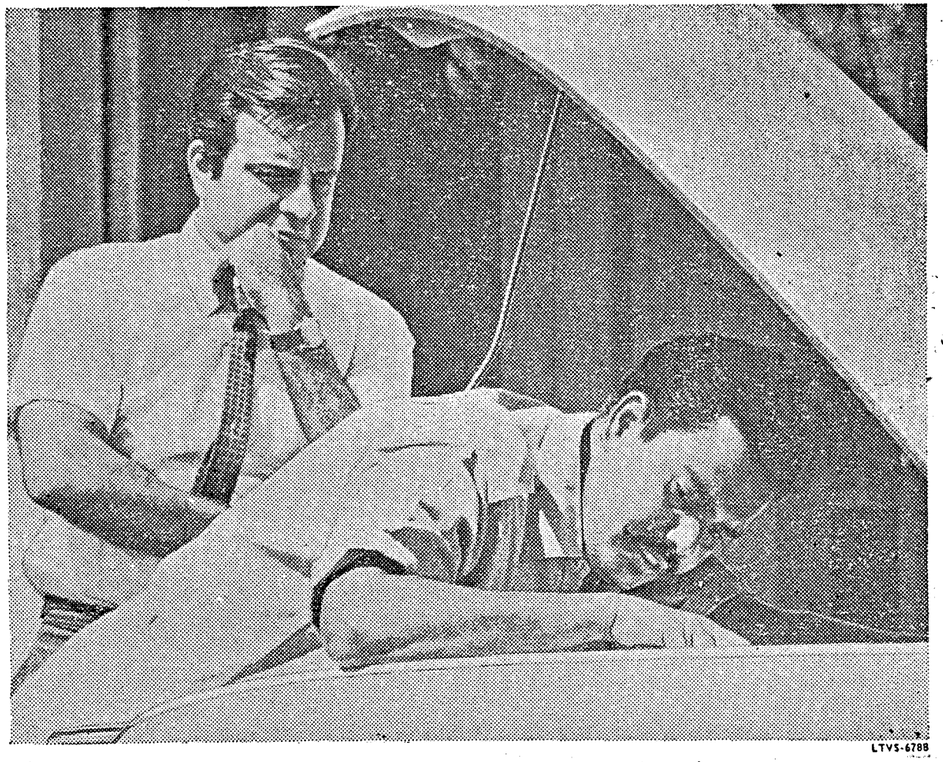
You spend more on your precisely integrated Lucas-TVS electrical system only when you let unauthorised "specialists" tamper with it, when clever fakes, let loose in the market, are used for replacements of worn-out Lucas-TVS parts. You spend endlessly. We get a bad name.

Avoid all this. Make sure you trust a Lucas-TVS electrical system only to an authorised dealer or service outlet. Your automobile electrical system is checked by trained technicians and worn-out parts are replaced with genuine spares.

Sold and serviced by — Lucas Indian Service Limited Madras, Bombay, Calcutta, Delhi, Bangalore and TVS & Sons (Private) Limited, Madurai and all its branches.

THE LUCAS-TVS RANGE

STARTERS-DYNAMOS-ALTERNATORS-REGULATORS - IGNITION COILS - DISTRIBUTORS - HEADLAMPS - HORNS - SWITCHES - FLASHERS - WINDSCREEN WIPERS



LUCAS-TVS

The name that's your guarantee to reliability in auto-electrical equipment!

The Show Goes On

SO the chickens are coming home to roost and, one after the other, the Congress party's radical pretensions are getting exposed. When, last month, the Chief Ministers of Punjab, Haryana and UP managed to have their way on the question of the procurement price of wheat, it was still possible to suggest that the Central Government had given in without a fight for tactical reasons. Procurement prices affect all farmers — large, medium and small — with foodgrains to sell, whereas the ceiling on land holdings or a tax on agricultural income and wealth would touch only the larger farmers. By choosing to tackle the latter two issues before returning to the first, the Central Government was seeking to isolate the larger farmers from the mass of cultivators in dealing with them. The argument may have been plausible a month ago. But it is no longer so after last weekend's palavers on land ceilings among Congress party big-wigs.

The confabulations were notable, among other things, for the reported statement of the Prime Minister, calling upon her partymen to stop the competition in radicalism and to appreciate the "tremendous difficulties" that the Chief Ministers would have to face in implementing the ceiling laws. Indeed, it is time that Congressmen called off their sham radical talk and came clean; but unfortunately the Prime Minister's advice on this point went abegging. For, the very next day at the same conference the party leaders resolved in all seriousness to provide house sites for the *entire* rural population by August 15, 1973, the Planning Minister held out the assurance that the problem of rural unemployed would be solved by the end of the Fifth Plan, and the Education Minister promised to wipe out illiteracy among the 16-25 age group by 1980! The Prime Minister herself — even as she ruled out-of-court any talk of drastic reduction in the land ceiling on the ground of the difficulties that the Chief Ministers would face — continued to speak of the proposed changes in the ceiling laws benefiting 90 per cent of the rural population.

More important, it surely deserves some notice that the Prime Minister should have sought to emphasise the "tremendous difficulties" in the way of lowering the land ceiling and not the problems that may be created by *not* lowering the ceiling. While this is, no doubt, a curious position for the leader of the *garibi hatao* party to take, it is nevertheless a very sensible one in the given political situation. After all, who are the proponents of land reform and land redistribution among the landless? In the Congress party itself, it is a small group of people who count for little politically and a number of whom, besides, espouse radical causes mainly to further their own personal political fortunes. This is not a political force that either the Prime Minister or the Chief Ministers have to worry overmuch about. And do any pressures exist for radical policies and programmes outside the Congress party? True, the two communist parties and, of course, the SSP are capable of generating a certain amount of heat and commotion in the two houses of parliament and in some of the state assemblies. But nowhere else. Otherwise how can one explain the fact that the government in Punjab — where, according to data collected by the National Sample Survey, 62 per cent of the rural households had either no land or had less than 2.5 acres — has been able with no fuss or pother to introduce a new bill under which for the bulk of the landowning families in the state the new ceiling will work out to 35 acres — or almost double what the Congress party's election manifesto had promised? There are no reports of the landless and the small peasants holding mass demonstrations or marching to the state assembly to protest against this. And, of course, the CPI(M), the CPI, and all the rest of them, are nowhere on the scene.

No apologies need be offered for viewing the land ceiling issue in such crass political terms. The politics is all that is material; the finer economic points are irrelevant. For, as long as land reform and other radical programmes merely remain the subject of passing excitement in the halls of legislatures or a matter of playing to the gallery at party conferences, the shadow-boxing in the ruling party between the radicals and the conservatives, between the Young Turks and the Chief Ministers, can go on and on like some Gilbert and Sullivan show.

possible default in repayment of principal also. The news caused a flutter in Dalal Street. Reports have it that the Reserve Bank was under pressure to direct the bankers to the newspaper group to relent and extend some accommodation to it — such as against advertisement dues from government. The Reserve Bank did not concede. However, the newspaper group seems to have managed to get fresh funds from non-banking sources — mainly trusts — to tide over its 'temporary' difficulties.

The newspaper group's borrowings from the public were said to be worth about Rs eight crores. Of course, the precise amount is not known — not even to the Reserve Bank which is supposed to have its finger on the pulse of such financial flows. In any case, the statistics on public deposits with companies available at the Reserve Bank are at least three years old. And this, after deposits from the public have been consciously sought to be brought under the purview of the Reserve Bank.

Until the sixties there was no restriction on companies obtaining deposits from the public. Companies in fact borrowed to the hilt from the banks and then went on to obtain deposits from the public. Then the Reserve Bank intervened to prevent 'over-acceptance' of public deposits. Companies which had borrowed in excess of the permissible limit were given time to repay that amount. To evade the rules on 'deposits', companies began to 'borrow' from the public against the signatures of the directors of borrowing companies. The loophole has now been plugged, and the companies given time to settle the borrowings.

Clearly, however, no amount of 'regulations' are enough without the will and the energy to enforce them with the public interest in view. How alert is the Reserve Bank to the financial goings-on of companies — at least the more obvious ones? The newspaper group referred to — or rather its controlling interest — is known to have burnt its fingers speculating in steel shares and is still saddled with steel shares of the face value of at least Rs three crores which are unsellable except at a considerable loss. It is also widely known that the group spent a sizeable amount on the recent state elections in Madhya Pradesh. Finally, like any major holder of wealth, it has large tax commitments.

Yet, in spite of all these obvious factors meriting its attention, the Reserve Bank was caught unawares as it has no system for keeping track of and adequately regulating company deposits. It does not have any clear idea of the number of companies with excess deposits (and borrowings). Nor does it have selective statistics of the large companies with excess deposit borrowings. Even more beyond its pale, in the circumstances, will be the complicated problem that will now arise with the newspaper group's fresh borrowings from non-banking sources to tide over its existing debt servicing difficulties. Having allowed additional borrowings when even the existing debt is in excess of the permissible limit, how will the fresh borrowing be fitted into the regulations concerning the repayment schedule for excess deposits-borrowings?

It is high time the RBI accepted responsibility for a stricter and more systematic regulation of the unsecured deposits or borrowings from the public at attractive rates of interest. This is by no means the first case when the absence of its control has become apparent. Only a few months ago a reputed city family concern which had accepted deposits worth approximately Rs five crores was reported to have failed to honour its interest and repayment liability to the public.

Gold

Rush

GOLD prices seem to be on the way up and at an unprecedented rate. At the end of 1970, they were around US $ 38 an ounce, a level which was officially accepted a year later in the Smithsonian agreement. However, by then international uncertainties, economic as well as political, had sent prices soaring upto around $ 43, a 15 per cent premium on the new official price — a premium rate which was normal in the sixties. Since then prices have risen another 25 per cent during the last five months, taking gold to an unheard of $ 54.55. And prices are still going up.

The gold market is subject to peculiar forces. Gold production in the non-communist countries remains steady, but supply fluctuates with the amounts of gold that the Russians choose to put into the international market. In recent years, Russia (in shrewd capitalist style) has been cashing in on rising prices. Gold demand emanates from industry and from speculators and hoarders and is, therefore, highly volatile. Demand from industry accounts for more than half of the non-communist countries' output of gold and has been rising steadily. Some studies made in London, which is both a major entrepot for gold and the headquarters of many gold mining companies, indicate that within a decade industrial demand for gold will exceed current output. However, industrial demand is a stable, derived demand, and is hardly responsible for the present instability in prices, which arises out of the speculative and hoarding demand.

Apart from gold, hoarders' needs are equally well met by numbered accounts in Swiss banks. The Arab oil states and tax evaders all over the world are major users of these accounts. Such bank liquidity leads to a speculative demand for currencies, moving from weak currencies (sterling, US dollars) towards strong currencies (D-marks, yen). In recent times such speculative movements have led to foreign exchange curbs and currency revaluations. It was expected that the December accord would lead to a period of foreign exchange stability. However, the accord was doomed to failure from the beginning. It became obvious almost immediately that the par values would not hold for long. Talk about yen revaluation, for instance, has persisted even after the December accord. The economic forces making for price and currency instability during the last five years have hardly changed at all. Except perhaps in the US, in most other countries prices and wages are on their hound-and-hare round again. And the gold speculators continue to make many a fast buck. But this bubble could easily burst. An end to the Vietnam War could remove a major element in US financial difficulties and dollar weakness and, along with the increasing integration of EEC currencies and a revaluation of the yen, could severely lessen speculative opportunities.

However, since the international situation is still quite uncertain, a second revaluation of gold is on the cards. Such a revaluation would benefit gold producers (mostly, South Africa and the Soviet Union) and gold holders (most of the advanced countries). In the past when a price rise in gold was not considered feasible, South Africa had offered to share with the developing countries a part of the gains it would make on a gold price rise. But now that a price rise is a distinct possibility, there is less talk of such sharing.

A Ceiling on Ceilings

Romesh Thapar

YES, somewhat reluctantly, it's been decided to put a ceiling on ceilings talk, at least until the "thinkers" of the Congress party get their many confusions sorted out. A wise decision. Indeed, even the most radical agitator would come to this conclusion after following the proceedings of the two-day brainstorming on ceilings organised under the all-powerful chairmanship of the Prime Minister herself. Seldom has a demonstration of political-economic confusion been more powerfully and vividly presented.

There's little point in recapitulating the viewpoints of the various lobbyists. Suffice it to say that one intervention cancelled out the other. The total impact was of an essentially leaderless mass, trying desperately to link with the promises pledged to the people but unable to find the unifying *mantra*. Simple solutions were scorned, not even considered. The tortuous, self-deluding, meanderings of the essentially Hindu mind of the ruling party succeeded in befuddling even the apparently clear — and here I am not referring to those who attempted a competition in radicalism with the Prime Minister, from Subramaniam to Chandrasekhar.

The fundamental flaw in the reasoning of the Congress leadership is the attempt to tie up the concept of ceilings with dispossession. The two objectives are different and should be sought at different levels. To attempt a single formula to serve two objectives — or to kill two birds with one stone! — is not possible in the mixed-up muddle that is the Congress party. The tackling of one objective is impossible enough in democratic conditions, but no one seems to think so.

The opportunism which parades as radicalism in the shadow of the Prime Minister will have to be disciplined by the detailing of certain principles which should underpin economic activity in our democratic society. Let us define afresh what we understand by self-cultivation in rural areas. Let us sketch for the first time our understanding of self-occupation in urban areas. Then, let us ask ourselves whether we are going to allow rural and urban landlordism — and, if so, to what extent.

The surplus land and building should be sold in the open market during the financial year with government retaining the right to take over agricultural land and urban property at registered values against special six or seven per cent bonds. The wider and gaping loopholes of allowing commercial and industrial assets to escape ceilings will come under attack. It will have to be blocked in much the same way or else there will be a howl from those already under ceilings.

I have deliberately stated the case for ceilings in these cold terms, because the logic is precisely that willy-nilly one ceiling will follow another. The way the debate is proceeding at the moment convinces even the enthusiasts that the whole business of ceilings is shot through with contradictions. Even the ceilings that are being imposed — in the Punjab, for example — are so generous as not to make any impact. It is not unlikely that when ceilings are finally enforced, they will be of a kind which do not really disturb property-owners in rural and urban areas — and that would be as bad as the present confusion.

Something of the uncertainty should be cleared by the time the AICC meets in the first week of June. Until then, we can only keep our fingers crossed and hope that those entrusted with the job of preparing background papers and policy statements do their work thoroughly and without an opportunist eye on the competition in irrelevant radicalism which is infecting all and sundry, even Jan Sangh leader Vajpayee. Under the slogans of radicalism a host of urban and rural vested interests are hiding, determined to destroy a genuine radical thrust. Only a bold and realistic exercise on ceilings, related to the objectives of a new economic policy, can now save the ruling party from plunging along a path strewn with evasion, corruption, double-cross, frustration and bitterness.

Messy operations have never served egalitarian ends. Surely, our khadi-clad gentry have digested this basic lesson of 25 years of freedom. If not, they had better start chewing on the facts before it is too late.

May 15

LETTER TO EDITOR

Mode of Production in Indian Agriculture

ANDRE BETEILLE, while charging me with distorting his views (April 22, p 822) has, in fact, himself distorted them.

In his original paper he discusses the question of applicability of the concept of class in an "agrarian society" "of the Indian kind". But in the letter he refers to the question of the applicability of the same concept to the study of "rural India". I doubt that Beteille is so naive as to think that the study of India as an "agrarian society" and the study of "rural India" are equivalent.

In his original paper, again, Beteille makes two crucial statements: (a) "the nature of social divisions is *different* in agrarian as *opposed* to industrial societies" (our emphasis), and (b) the concept of class "was formulated, shaped and refined in the context of *industrial* society" (our emphasis). Assuming the validity of these statements does it not follow that such a concept of class is unworkable in agrarian societies including those "of the Indian kind"? How, indeed, could I have distorted his position?

Let me add a more important point. "Agrarian society" and "industrial society" are categories that have been brandished by some bourgeois social scientists in order to hide the reality of classes and class struggles in the contemporary world. Acceptance of these categories as valid implies the rejection of Marxism, whatever be the verbal jugglery (through words like "difficulties", "caution", etc) to cover up this truth.

I am grateful to Beteille for drawing my attention to K N Raj's "extensive writings on the Marxist approach" but I am sorry I cannot oblige him by entering into a polemic with Raj at this point. Serious controversies preclude surrogate functions.

In fine, concerning Beteille's *argumentum ad hominem* against me, I, in my turn, understand perfectly that, given the contemporary political reality of India, people like Beteille do gain *materially* by projecting a 'left' image of themselves while peddling, in fact, ideas alien to Marxism in Marxist fancy dress.

PARESH CHATTOPADHYAY

Calcutta

A Better Cover, For All That

Hansavivek

HINDUSTAN LEVER had the advantage last year of a record crop of oilseeds and higher imports of oils. It now apprehends a scarcity of soap-making oils if the imports of oils and fats are reduced following the cut in foreign aid. The company continues to encourage production and use of forest crop oils, rice bran oil, etc, as indigenous alternatives, but it warns that margins will fall and production suffer "unless the industry is permitted to recover at least the increased cost resulting from the shortage of imported oils". HL hopes that adequate reliefs will be provided under the informal price control system following the study by the Costs and Prices Bureau, to meet the considerable inflation in manufacturing and distribution cost of soap. The company also complains that Government has not yet announced its decision on the Tariff Commission's report and that, in the meantime, margins on vanaspati have deteriorated. It says the current pricing formula does not allow for the sharp rise in the cost of processing and distributing vanaspati that has taken place over several years. Margins on baby food have also been steadily eroded, as the "small increase" in price allowed by government has not sufficiently compensated for "rapidly rising costs". Sales of convenience foods have continued to fall "below expectations".

However, HL experienced further growth in sales of poultry and cattle-feed. It introduced special feeds for small animals and dispersed production facilities to service the expanding market economically. Production of nickel catalyst for hydrogenating vegetable oils was increased further. The fine chemicals unit at Andheri used processes developed by the research unit to produce chemicals hitherto imported. The major emphasis in the factories was also on import substitution and cost reduction. The management is still discussing with government the proposals for expanding production facilities in some of its existing businesses and the feasibility of a project in the 'core' industry referred to by the chairman last year. The company has produced better results with increases in turnover and margins. Dividend, stepped up by a point to 15 per cent, finds a better cover than last year's.

ATUL PRODUCTS has obtained a 'letter of intent' for manufacture of betanaphthol, but government has imposed certain conditions on which discussions are going on. The company has also applied for licences to expand capacities of the caustic soda/chlorine plant and of some intermediates, but its application for undertaking manufacture of nylon filament yarn has not been granted, because the government has decided on a regionwise distribution of such plants. Last year, Atul increased exports by Rs 5 lakhs to Rs 56 lakhs in spite of some restrictions imposed by government towards the year-end. The company is now exporting dyes and intermediates to a large number of countries, and is well on its way to setting up a "reasonably strong" export base. Despite the slackness in the textiles industry, general credit squeeze and unsettled conditions towards the year-end on account of war, Atul was able to increase its sales modestly. Owing to a "substantial loss" incurred on sale of dyes purchased from Atic Industries, coupled with the lower quantam of dividend from Atic (Rs 17 lakhs against the normal payment of Rs 28 lakhs), and the increase in manufacturing costs, however, profit was lower compared to in the preceding year. Some of the plants could not be utilised fully, and the fast colour bases and sulphur black plants had to be closed temporarily because of unfavourable market conditions. The intermediates plant also could not be run to full capacity. Lower sales from the production of these plants, however, were compensated by higher sales of chemicals and pharmaceuticals. The phosgene plant has now started production. Plans are afoot for making some of the phosgene-based materials. A new situation has arisen in regard to benzidine which is one of the main raw materials for direct dyes, an important group of dyes made by Atul. Most of the countries in the world have stopped production of benzidine, because it is considered carcinogonic. Atul is making research and development effort to substitute benzidine as a raw material and has succeeded to some extent. As the market for vast dyes is now steadily improving and prospects for reactive dyes also appear to be "much better". Atic Industries is expected to run its plants satisfactorily this year. Cibatual made a profit of Rs 57 lakhs and wiped out all the past accumulated losses. The scheme to manufacture formaldehyde is being implemented; the plant is likely to be commissioned next year. Cibatual has also obtained a licence for the manufacture of pyrazole base, and this plant is expected to go on stream by the end of this year.

PFIZER stepped up its net sales by 20.9 per cent, but its gross profit could rise by only 16 per cent during the year to November last. The ratio of gross profit to sales thus declined from 28.1 per cent to 27.15 per cent, but that of net profit to capital employed increased from 14.89 per cent to 15.46 per cent. Commenting on the controversy as to whether the return for the pharmaceutical industry should be based on its sales turnover or capital employed. S V Pillai, charman and managing director, advocates that the objective should be more intensive utilisation of the limited resources and maximum growth in production. This, he says, will encourage increased production and sales with minimum additional investment. In fact, Pillai deprecates the reported move of fresh amendments to the Drugs (Prices Control) Order, aimed at affecting the present pattern of pricing and profit ratio in the pharmaceutical industry. The new prices came into operation only from mid-January 1971. The first year after the introduction of a "drastic measure", according to him, will be a period of readjustment to the new operating pattern and a period of stability will be reached only in the second year. He is of the view that the quantum of return should be determined only after proper evaluation of factors such as the "peculiar character of the industry, the future national role to be played by it and the financial needs dictated on the basis of these". The decline in Pfizer's profitability is attributed to the "drastic" price reductions and the "continually rising manufacturing costs". Last year, the company had the advantage of inventory of imported raw materials held by it prior to the enforcement of the Pooled Prices Scheme, procured at comparatively lower prices. This was a temporary benefit, and the full effect of the high pooled prices will be, it is stated, felt in the current year. Also, it is feared that the impact of the Drugs (Prices Control) Order will become more pronounced in the current year. During 1970-71, Pfizer's exports aggregated around Rs 62 lakhs. The company had applied in 1969 for permission to increase the licensed capacity for the manufacture of 'chlorpropamide'. Government approval is expected this year.

BARODA RAYON has secured 'letters of intent' for stepping up capacity for rayon from 3,000 to 6,380 tonnes per annum and for a plant to manufacture soda ash with an annual capacity of 1,44,000 tonnes. It also expects to receive 'letters of intent' for establishing plants to produce cellophane paper and nylon tyre cord. But the directors appear to be in two minds and say that all these schemes will be examined "in their proper perspective before arriving at a final decision about the schemes to be implemented". During its 13th year ended December last, BRC increased its sales and gross profit. Net profit, however, turned out to be lower because of increased tax liability. And dividend, stepped up 4 points to 12 per cent including 2 per cent by way of additional payment, is not fully covered by earnings. The allocation of foreign exchange for the import of wood pulp, being made through STC, has recently been reduced. But production is expected to be maintained by using indigenous pulp. The directors point out that profit margins are continually being eroded by higher costs. In accordance with a fresh agreement between weavers and spinners, BRC would have to supply 57.62 per cent of its production (against 50 per cent upto the end of December last) at a concessional price. In addition, 10 per cent of the production will have to be continued to be supplied at a "highly concessional rate" as before against export of art silk fabrics.

EAST COAST BREWERIES AND DISTILLERIES is setting up a project at Paradeep in Orissa for the annual production of 50,000 hecto litres of beer with technical knowhow from Desmet (India) whose offer includes installation and commissioning of the brewery under supervision of Anton Steineckers of West Germany. The plant is expected to start production in the first quarter of 1973, and the directors hope that the company will be able to pay a maiden dividend of 12 per cent for 1974. At present there is only one unit producing beer in the Eastern India region where shortage of beer is often experienced. Demand, moreover, is likely to grow fast. Being located at a port head, ECBD will have the advantage of competing in the export market too. The project, estimated to cost Rs 1.5 crores, is proposed to be financed with equity capital and borrowings in equal proportion. Of the present subscribed capital of Rs 11.25 lakhs, Orissa government has put in Rs one lakh and Industrial Development Corporation of Orissa Rs 2.75 lakhs. Equity shares worth Rs 32 lakhs have been reserved for subscription by the state government and Rs 2.25 lakhs for IDCO. The public is being offered the balance equity capital of Rs 29.50 lakhs. The subscription list will open on May 22 and close on June 1 or earlier, but not before May 25. The entire public issue is fully underwritten — Rs 24 lakhs by IDCO and Rs 5.50 lakhs by a Calcutta firm of stockbrokers. N K Mohapatra is the managing director of the company. Other directors include Maharaj Prithviraj of Jaipur, K K Dutt and F R Bhesania.

FROM OUR CORRESPONDENTS

NEW DELHI

Granting the Politics

THE two-day conference of the leaders of the ruling party convened by Indira Gandhi last week, ostensibly with a view to working out an action programme to carry out commitments made to the people and implement the party's election manifesto, has on the contrary highlighted some of the characteristics and constraints of the Congress in its newly re-established hegemony. So long as radical slogans were serving the immediate electoral purposes of the party, they were voiced in unison. But their implemention now required of the Congress party is quite another thing, and has brought to the fore differences in outlook and approach and precipitated an indirect acknowledgement of the party's limitations by the high command. The two-day conference provided occasion for this in the wake of the controversy on land ceilings. Interesting to watch was the role the Prime Minister played and the Centrist positions she was obliged to adopt in the clash between what are now called the 'ultra-radicals' in the party and the more 'cautious' sections in charge of government administration.

Almost the entire time of the conference was taken up by the ceiling question. It was inevitable that the issue of agricultural land ceiling should figure in the deliberations. Those who demure on this issue had prepared their counterblast in the form of an insistence on a corresponding urban ceiling. The discussions failed to lead to any firm decisions on either the urban or the rural ceiling proposals. A nine-man committee was appointed instead to deal with the problem of agricultural land ceiling, which was to present its report within a day so that final decisions could be taken by the conference; but it did not do so. It is now expected that the committee will present its report for the coming sessions of the National Development Council in the last two days of this month and of the AICC early next month. The problem of urban ceiling and a uniform all-India policy on it was also referred to a 10-member committee.

The Crux of Land Ceilings

It was rather disconcerting for some of the radicals in the party to see Planning Minister C Subramaniam emerge as the spokesman of the ultra-radical trend. He spoke strongly and with his usual ability about the need for imposing a ceiling on land at a level that would give enough surplus for purposes of restriction. This is, after all, the heart of the matter; and not whether the ceiling should be between 10 to 18 standard acres, or how exactly the standard acre should be defined, or whether irrigation facilities to be taken into account are from government sources or privately owned — though controversy has raged on these subjects over the past few weeks. If the lowering of ceilings by legislation fails to provide any substantial surplus for redistribution — as is likely under the laws being enacted by the state governments — the essential aim of the proposed radical reforms obviously cannot be realised. That the author of the new agricultural strategy had taken up this position was a matter of considerable surprise and people wondered whether Subramaniam would have upheld his present views if he were still in charge of the Food and Agriculture Ministry instead of being Planning Minister.

Ultra-Radicals

However, the ultra-radicals do not appear to have reckoned with the possibility of Indira Gandhi snubbing them as sharply as she did at the conference. Claiming that she was the best judge of what the people really wanted — and there is no contesting that claim within the Congress party at present — she squarely joined issue with the ultra-radical pleas. In reply to the demand that, land reform being essentially a political issue, it was for the top political leadership to give a lead in the matter, she sided with the state Chief Ministers and made it quite clear that their difficulties in carrying out such measures as land reforms would have to be given due consideration. The difficulties she had in mind were quite understandably political. "Where is the organisational structure and the administrative set-up to implement a more radical policy", she pointedly asked. Chiding the ultra-radicals for vying with each other to advocate radical measures, she commended a practical approach — suggesting, by implication, that radical slogan-mongering had no further useful purpose to serve.

Coming Clean

A similar problem arose during the discussion on the ceiling on urban property. Once again, C Subramaniam spoke proposing that the purpose of the urban ceiling should be to take over urban property, regardless of its value, if it had been constructed by private owners with the purpose of renting out to others. The cautious element, which predominates in the party was more articulate and questioned the 'practicality' of such proposals. Again, a remark revealing of the thinking of the Prime Minister came later in the course of the discussions when she said that the intention should not be to expropriate the rich: all that was necessary was that the poor should be helped by the government. She also clarified that the burden of taxation should fall on the rich and that the Centre and the states should ensure that there was no additional burden on the middle classes. These remarks hardly square with the earlier professions of an impending frontal attack on poverty, encompassing redistribution of wealth and incomes and distinct from the publicly discredited philosophy of a trickling down of the benefits of growth as part of the process of general economic development.

It would appear that the manner in which the controversy on land reforms has developed and sharpened in recent weeks has alerted the Prime Minister to the risks of radical rhetoric and posturing, and that she is now moving to impose a measure of curb on these tendencies. She must realise that, unless this is done, there is every possibility of the prevailing balance of social and political forces within the country getting disturbed with far-reaching consequences for her. The change in the political landscape of the country, which has come about between the 1969 Congress split and the 1972 electoral victory with which the Congress party under Indira Gandhi re-established its complete hegemony, is the resultant of many factors. A major factor has been the resentment against the urban big business which was charged with having cornered all the fruits of the first phase of economic development in the fifties and early sixties. The sentiment was most forcefully articulated by the middle classes, the educated unemployed, and the people with fixed incomes, who suffered the most during the prolonged stagnation of the mid and late sixties. Indira Gandhi fully exploited this sentiment and reaped rich political dividends from it. Clearly she has no intention of moving further away from this position.

No Damage to Supports

Meanwhile, the only growth point in the economy has been the rich farmer who responded to the new agricultural strategy and enormously increased his economic and political power over the last five years. Indira Gandhi very well realises that the setback suffered by the Congress at the 1967 elections was in large part due to the frustration of the urban middle classes and the defection to Opposition parties of its rich farmer base in the rural areas. Blunting the edge of discontent of the middle classes in the urban areas and active assistance to the rich farmer in the countryside helped her to regain the lost ground and won her the impressive electoral victories of 1971 and 1972. She can have no use for the ultra-radicals and their slogans now, which may erode the Congress electoral base. She is quite willing to place curbs on the small group of big business which enjoys little social influence. But she cannot possibly alienate the middle classes by implementing urban property ceilings, nor contend with the rich peasant by carrying out the land reforms however necessary they may be on other grounds.

A Nice Balance

BY simultaneously introducing the Punjab Land Reforms Bill and the Urban Property (Ceiling) Bill in the state Assembly on May 12, Chief Minister Zail Singh was countering criticism about 'discrimination' between the rural and urban sectors. At the same time, the large landowners have been pacified, as several of the provisions of the Land Reforms Bill have left room for evasion.

A ceiling of 7 hectares (17.5 acres) is proposed for land under assured irrigation from a government source enabling at least two crops annually. For 'barani' (unirrigated) land, the ceiling is to be 18 hectares (45 acres). For land of intermediate classes, the area will be determined by the intensity of irrigation from any government source and by the productivity — subject to a ceiling of 11 hectares. One hectare of additional land is to be allowed for each member of a family exceeding five, but not for more than three such members. The holdings are to be further increased by two hectares for each adult son or daughter who does not own any land. For orchards, an additional area of two hectares will be allowed.

The principles for determining compensation are liberal enough: 75 per cent of the market value for the first seven hectares, 50 per cent for the next 7 hectares, and 25 per cent for the remainder. Retrospective effect is sought to be given to this legislation through the provision that all deals and transfers made after September 26, 1970, will not be considered. Though other exemptions have been withdrawn, landowners are greatly relieved to find that numerous loopholes are available, particularly in the case of lands irrigated by tubewells. Moreover, it is the amendments proposed to be introduced later that will determine the character of the land reform. In Punjab, 51 per cent of the net area is irrigated by wells, tubewells, and pumping sets. Not all of it would be covered by this ceiling law. In fact, on present calculations, the net surplus area available for redistribution will be quite small.

The ceiling on urban property is along expected lines too. In the case of an individual and a family of not more than five members, the ceiling, in terms of value, is to be Rs 2.5 lakhs. An increase of Rs 50,000 will be allowed for every member in excess of five, the total not exceeding Rs 4 lakhs. Three years after the commencement of this Act, the government may acquire **the excess urban** property with a view to utilising it for a public purpose. The compensation for such excess property is to be determined by agreement or according to specified principles. These provide for 75 per cent of the market value in the case of property worth Rs 2.5 lakhs or less. For property above Rs 2.5 lakhs, the scale is 75 per cent for the first Rs 2.5-lakh slab and 60 per cent for the remainder. The compensation is to be paid through 12-year bonds carrying interest at 5.75 per cent.

When the Time Comes

Haryana, too, is determined to lower land ceilings and the Chief Minister has declared that he will implement the Congress policy in letter and spirit. Of course, positive action has been deferred until Central directives are clearly made known.

In a bid to take full advantage of the governments' dithering on the issue of ceilings, several landowners in Punjab and Haryana have effected fake deals and transfers in recent weeks. Such break-up of the large holdings had started even earlier, in the last quarter of 1970, in order to evade the wealth tax. In fact, many landlords in undivided Punjab had already split up their holdings in the fifties, when ceilings were imposed for the first time. As a result of the manoeuvres comprising transfers and 'sales' most of the landowners had managed to retain their possessions. They were helped along in this by the many loopholes and exemptions in the Land Ceilings Act. Consequently, newcomers in the field and others who had not arranged transfers on the earlier occasion became alert this year when in March the Congress — coming to power after years of Akali rule — announced its intention to lower the ceilings.

The more popular method of transfer has been the filing of suits for possession of land (or their 'share' of it) by sons or other legal heirs of the elderly heads of families. Through allegations of extravagance, moral turpitude, and malicious intentions (all, of course, in complicity) against the owners, the 'heirs' have secured their 'rightful' share of the land. Since this was done through court orders in uncontested cases, the village patwari was quite helpless. Bribes were common enough. At many centres, the fee was said to be about Rs 250 for the lawyer, a comparable amount to other court dignitaries; and a 'good tip' to the patwari, for speedy execution of the orders for splitting land.

•

Of the many recommendations of the Punjab Taxation Enquiry and Resources Committee to augment the state's revenues and to effect economy, perhaps the most interesting concerns Ministers' salaries. In a 514-page report, which was presented to the Assembly on May 4, the Committee indicated that the Ministers actually cost the state five times their salary. On an average, government spends about Rs 5,200 per month on each Minister by way of salary, TA, DA, etc — the expenditure being much greater on the Chief Minister. At present, Ministers draw Rs 1,000 as salary, but get rather more by way of perquisites such as free furnished house, electricity, and water, etc. The Committee has recommended a consolidated salary — Rs 3,500 to the Chief Minister and Rs 3,000 to his colleagues; and all charges, including income-tax, house rent, and electricity, water, and telephone bills, to be paid by the Ministers themselves. The Committee has also recommended a ceiling on the size of the state ministry at one-tenth of the total membership of the legislature.

If its recommendations are implemented, the Committee expects about Rs 18 crores to be set free for other purposes. However, the Committee is opposed to an agricultural income-tax because of the 'practical difficulties' involved. On the other hand, it has recommended complete nationalisation of bus transport within a period of five years, increase in electricity duty, increase in school and college fees, levy of a commercial crop cess, and increase in stamp duty. The Committee has urged exemption from additional taxes for the people living in the border areas.

•

Meanwhile, an Industrial Development Bank team, which recently surveyed Himachal Pradesh, has stated that the principal factors responsible for the state being one of the least industrialised in the country are its topography, inadequate transport facilities, and lack of entrepreneurial skill. For tapping the state's rich industrial potential — including its forests and minerals — the team has made several proposals, in particular an integrated pulp-cum-paper project with a capacity of 100 tonnes per day, certain electronic industries, and a fertiliser unit.

MIZORAM

Harbingers of Change

Dipak B R Chaudhuri

MIZORAM, which recently became a Union Territory, has a population of about 325,000 — the majority being Christians — and covers an area of 21,000 square kilometres. In the elections held only a short while back the Mizo Union won most of the seats in the local assembly. The Union seems to consist of stable elements with a consistent and honest leadership. Mizoram's sole representative in the Lok Sabha, former headmaster of the Aijal Government School, is also from the Mizo Union. The Mizo Labour Party, which includes a number of former Mizo National Front (MNF) secessionists, is likely to serve as a useful opposition pressure group of young people to keep the new ministry and leaders on their toes.

The Congress did badly in the elections and has only a few seats in the assembly. Its unpopularity is party due to its line of encouraging the Laldenga-led faction of the MNF to harass the Mizo Union in order to win support for itself. This policy of short-sighted opportunism has backfired and the Congress has paid a heavy price for its manoeuvrings.

De-grouping the Centres

Among its first few measures, the new ministry has announced its intention to 'de-group' the 102 're-grouped' centres as a first step to normalcy. These centres were set up by the army during the MNF insurrection to prevent MNF fighters from seeking supplies or recruits from Mizo villages and also in order to offer protection to 'loyal' Mizos. De-grouping will now be made easier as Mizoram has secured the services of several dedicated development administrators. If these administrators and the politicians in the new Union Territory work in harmony and trust with each other, much could be achieved to accelerate the economic development of this fertile region of valleys and hills. Economic development would also be the best adhesive for integrating Mizoram with the rest of India.

Another feature which is likely to be of advantage to Mizoram is the establishment of Bangladesh. Chittagong is the natural port for Mizoram and could be used to advantage. The Kaptai dam on the Karnafuli river is close to the Mizoram border with Bangladesh and Dacca has already agreed to provide hydro-electric power to Mizoram as well as Tripura.

The first priority in Mizoram's economic development will have to be the setting up of several pilot projects in the rural areas. These projects would serve as focal points for modernising agricultural practices and encouraging agro-based industries like fruit processing and pulp making. The tradition of *hnathlang* or voluntary labour for community service could be usefully mobilised so that Mizo villagers could develop their own economy. Some other traditional Mizo practices, like *jhum* or shifting cultivation, will have to be discouraged. This practice has eroded much land and is not conducive to increasing crop production. Grants have been disbursed for terracing of fields, but the money, it seems, has been used for other purposes. Only paddy and chillies have been traditionally grown in the Mizo hills, but now it is planned to diversify agriculture and to branch out into pineapple and ginger cultivation.

Popular State Farm

In this field of encouraging new forms of agricultural development and diversification, the farms run by the (Central) State Farms Corporation are doing pioneering work. The state farm at Lokichera, which I visited, is very popular among the local population. Apart from being an agricultural showpiece it supplies electricity to the village of Lokichera and serves other useful functions. (It may be of some significance that one of the six successful Congress candidates to the assembly of 30 members is from this area.) The state farms have had a visible — and audible — effect on the lives and way of thinking of the people around. The local folks have composed a song, which looses its rhythm in translation, but its content is "... the bulldozer is the most important member of the Central State Farm. Without the help of the bulldozer there can be no neat and clean road to travel on! Without the help of Pathaua the mechanic no tractor or motorcar can run!"

One of the side benefits of Lokichera is a film projector. On the evening I was there, I saw a propaganda film called "Mizo Memoirs" produced by Pramod Pati of the Films Division. The film purported to show the Mizo people that they were a part of India and that places like Bombay and Calcutta were also theirs. The dialogue and commentary were in Lushai (the local language) and the film was about 17 Mizo citizens of India, of different ages and backgrounds, who do a 'Bharat Darshan' tour of the country. For all its technical flaws and poor planning, the film seems to have made an impact in Mizoram.

Unpopular Army Protection

I saw the film again the next night at 'V', an army-protected settlement. A large crowd turned up to see the film at the community centre hall and the showing had to be given up half-way due to overcrowding. In contrast to Lokichera, re-grouped centres like 'V' do not seem to have inspired much enthusiasm. Farmers find it difficult to carry on cultivation under these 'protected' conditions and there has not been much attempt at discouraging wasteful practices like burning of natural vegetation to clear the land and random sowing of seeds. It would be wrong to describe the re-grouped villages or centres as slums, but it would not be inaccurate to say that this form of habitation is less than popular.

It is particularly unpopular among the educated young. And it must be stressed that Mizoram has a high literacy rate of 50 per cent. This has created the problem of Mizoram having a high proportion of white-collar job-seekers. In a situation where there is no population pressure on land and where plenty of cultivable land is available, young people still insist on seeking jobs in towns. This is one of the problems the new ministry will have to deal with tactfully to prevent the sort of discontent that led to the formation of the Mizo National Front and its quest for independence in 1966. The signs are that the Mizo Union with the help of the group of development administrators will be able to tackle Mizoram's problems — which are minor when compared to those in some other states of India — and bring about an era in which the 1966 insurrection will only be a faded memory.

Co-operatives as Employers

K K Taimni

BOTH the trade union movement and the co-operative movement began as movements of dissent and protest against a system which enables capital to exploit labour. However, while the trade union movement over the years has consolidated its position and been generally instrumental in protecting and promoting the interests of the workers, the same cannot be said of the co-operative movement in this country — especially after the emergence of the sugar co-operatives.

Although the co-operative idea was formulated with a view to breaking the hold of capital over industry and labour, co-operatives have never quite worked that way. The distinctive characteristics of the co-operative organisation are that co-operatives are essentially associations of human beings and that the power of capital can be eliminated by limiting the return on capital to the minimum. The co-operatives were even expected to bring about a highly satisfied community of individuals.

Uneasy Equilibrium

Co-operatives were started in India by the British with the limited purpose of providing agricultural credit to cultivators. After Independence, there was a perceptible shift, with the State providing massive assistance under various developmental plans to build a strong and viable co-operative sector, particularly in the rural areas. Many successful co-operatives did emerge; but these emerged under a particular kind of leadership which perceived co-operative organisations as instruments for strengthening their hold on the community and as potential vote banks. There has thus resulted an uneasy equilibrium in the relationship between the co-operative leadership and the workers. Exploitation of labour and industrial unrest are consequently not unusual in co-operative organisations.

It is against this backdrop that the Vaikunth Mehta National Institute of Co-operative Management, Poona, recently organised a two-day national seminar to assess and to focus attention on the current state of industrial relations in the co-operative sector.

In his inaugural address, P B Gajendragadkar, Chairman of the National Commission on Labour, stressed the participative character of the movement which "arose as a protest against capitalist enterprise which exploited labour". The co-operative movement "gives to the social structure and national economy a direction, a purpose, and a sense of reality". He, therefore, deprecated the feudalistic attitude of the co-operative leadership towards the employees. "Paternalism has no scope in co-operative movement, it is utterly untrue of the basic philosophy of the co-operative movement", he said. Industrial harmony meant non-paternalistic, brotherly, and participative management of the industrial sector. The co-operative movement was intended to be a shield for the weak but "it has become a sword of the strong".

Appropriate Start

The discussions started appropriately with the 'Place of an Employee in a Co-operative Organisation'. Not many participants saw any special place for employees in a co-operative organisation different from under any other form of economic organisation. Exploitation of labour, poor working conditions, and feudalistic attitude of the managements towards employees, were rampant among the larger co-operatives in the country. N G Goray, an MP, actually questioned the relevance of the topic under discussion. The relationship between the co-operative management and the worker was purely economic, he said, and so long as workers were denied their legitimate rights, it hardly mattered whether it was done by the capitalist, the State, or the co-operative leadership. Given the pattern of co-operative leadership, the social background of the managerial personnel, and the prevailing socio-cultural conditions, how could one hope that a special place would be accorded to an employee in the co-operative organisation?

Prabhakar Kunte bemoaned the shifting nature of the centres of authority in the co-operative organisations. "It has always been difficult to negotiate with the co-operative employers and even more to unmask them." Co-operatives, according to him, are the worst exploiters of labour.

Bawa, of the Union Ministry of Co-operation, stressed the need for making a distinction between the elected co-operative leaders, the senior managerial personnel, and the workers, if the true impact of the power structure in co-operative organisations on industrial relations was to be evaluated. The relationship between the elected leaders and the senior managerial personnel held the key; and so long as these relationships were not evolved on healthy lines, the whole climate of industrial relations would continue to be disturbed.

Thus, although historically an employee in a co-operative organisation enjoyed a different status by virtue of his position as a co-operator and a member, prevailing socio-economic environments in the country do not give an employee in a co-operative organisation any status or privilege different from what employees elsewhere obtain.

That such indeed was the case, was confirmed during the discussion on 'Personnel Management Practices in the Co-operative Sector'. Field studies were quoted to emphasise the point that labour had been as much exploited by the co-operative as by any other capitalist enterprise. Indeed, Ogale, who is connected with several trade unions of the sugar co-operative employees, commented that since the co-operatives did not even have the enlightened self-interest of the capitalists they were by far the worst employers. He pointed out that, in spite of lip-service to the principles of democracy and co-operation, the entire leadership of the sugar co-operatives came from the richest segment of the rural society which did not look kindly on the workers. Their outlook was exceedingly feudal.

More Human Approach

Ironically, the consensus that emerged was that, if industrial relations were to be improved, management personnel would also have to display a more human approach while dealing with workers and their grievances. Stress was also laid on the need to develop better communication systems in place of the present ones where memoranda are used by the managements to communicate.

It is interesting that personnel management practices are found to be better in co-operatives located in the urban areas than those located in the rural areas. Evidently, unionisation and exposure to the labour movement had induced the urban co-operative worker to fight for his rights.

The oft-quoted scheme of creating 'staff cadres' for co-operatives was written off at the seminar. It was felt that these would merely lead to proliferation of the bureaucracy.

Although the co-operative leadership were, by and large, chary of the trade union movement and had always discouraged its formation, the few management representatives at the seminar seemed to appreciate the need for trade unions in modern economic organisations. The trade union leadership, however, had no illusions: "The trade union is considered by the co-operative leadership a nuisance, not even a necessary evil".

It was hardly surprising, then, that there was a sharp divergence of opinion on workers' participation in co-operative management. Arun Joshi of the Shri Ram Centre for Industrial Relations, felt that the term 'participative management' was unclear and needed elaboration, especially in the prevailing socio-economic environment in the country. Whereas some felt that, it was the inherent right of the worker to become a member of the co-operative and thus participate in the process of management, others felt that this was not desirable. In fact, a few diehards questioned the relevance of a worker joining a sugar co-operative as a member and influencing the decision-making process, especially when he had little or no stake in the co-operative, whereas the cultivators had contributed "millions of rupees". To this, a leading trade union leader angrily retorted: "Why do you want State assistance? Why do you call yourself 'co-operative'? Why do you seek State protection? Whom are you deceiving? Call yourself co-operative capitalists and give hell to the workers."

The majority, however, favoured workers' representation on the Board, a built-in mechanism for consultation with the workers, and their participation in the process of decision-making especially in areas immediately affecting them. By and large, the right of an employee to become a member of a co-operative was favoured — though it was suggested this right should lead to some positive results for workers —; or else disenchantment and dissatisfaction would soon follow among them.

It was generally acknowledged that industrial relations in the co-operative sector were taut and uneasy. Such equilibrium as there was had been achieved largely at the cost of the workers, who were weak in terms of resources and organisational strength.

R K Khadilkar, in his valedictory address, stated: To expect employer-employee relations in these co-operative organisations would somehow be qualitatively different from those in private industry would be wishful, unless some special efforts are made to bring about such a happy development". The seminar was one such effort, for, it was for the first time that the subject had been discussed in its entirety at a meeting of this nature.

LUCKNOW

Fifty Years to be Answered For

THE Golden Jubilee year of Lucknow University was recently inaugurated by the President of India. It has been a peaceful year for the university — both in the conduct of examinations and for teaching. Only the floods caused some havoc. The atmosphere of peace in the university is generally attributed to the new Vice-Chancellor.

The 50 years of the university have to be reviewed in the context of the social, cultural and political aspirations of its people, and an outline has to be given of the university's future programme of development.

Towards this end, the university has set up an editorial committee to prepare a volume called "Fifty Years of Lucknow University". The committee is collecting data to test the hypotheses that: (1) University education has no relevance either to national needs or to requirements of students; (2) The university's development has been an unplanned one and to the detriment of excellence; (3) The university is a place for distribution of social opportunities, and only incidentally prepares one for a job; (4) Dissemination of knowledge, rather than its advancement, has been the main function of the university; (5) The university is a repository of tradition, and consequently opposed to innovation; (6) Development of the university has been inhibited by the paucity of funds; (7) University autonomy has never existed, and whatever there was of it has been eroded in the post-War era.

Documents are being examined which demonstrate that the successive amendments to the Lucknow University Act since the fifties have been in the interests of the politician-academician. They have consequently led to the following negative results: (1) a unitary, teaching university has degenerated into an affiliating one — extending its jurisdiction as far as Kanpur; (2) the residential university has been converted into a day-scholars university with scant residential facilities; (3) the government has enlarged its powers — too frequently — for framing statutes, ordinances and regulations; appointing teachers, officers and authorities of the university; controlling finances; and constituting academic bodies, visitations and inquiries; (4) decreasing participation and control by teachers has been accompanied by increasing growth of non-academic and political control over decision-making at the university. In short, an educational zamindari has been sought to be created and perpetuated. It is against this background that the growth of the campus, its facilities, libraries, sports, and staff and students and their organisations, have to be evaluated. Also, a perspective for the future has to be presented.

In preparing a blue-print for its future development, the university is making efforts to include an institute of technology and engineering that will concentrate on courses and training for self-employment in small-scale industries, an institute of management, a Hindi institute of scientific works, an institute of agricultural economics, an institute of industrial relations and economic development, a school of fine arts and music, a reorganisation of the faculty of Arts to create a faculty of Social Sciences, an institute of Eugenics, and new subjects like geography, library science, and journalism. To meet the problem of physical accommodation, the programme envisages that 500 acres of new campus area would be needed. Also required would be a new administrative block, five hostels for boys and three for girls, residential facilities for 250 teachers and 250 non-teachers, an auditorium, a swimming tank and a day-scholars' home, an alumni home, a guest house, a staff club, and a post-graduate library. Slum clearance, improvement of amenities, and beautification of existing buildings, are also part of the programme. For this purpose, schemes have been prepared to collect over Rs one crore. The university is banking on the good offices of its ex-students, members of staff, and members of Parliament and of the planning bodies of the state and Central government, to help it in its programme.

All these programmes of expansion, however, leave two fundamental ques-

tions, which still need to be answered satisfactorily: what has the university done to promote the various academic disciplines during the past 50 years? and what does it propose to do to solve contemporary problems?

CEYLON

At the Cross-Roads

Urmila Phadnis

WITH a great deal of justification, historians have considered India to be both the curse and the salvation of Ceylon. For instance, the Trotskyites, who were the first organised party in the island to agitate on a mass basis for freedom, were convinced that the socialist revolution in Ceylon could not take place without a similar one in India and some of the Trotskyite leaders presently in government spent part of their political lives participating in the Indian nationalist movement.

More recently, it was immediate and effective Indian assistance which enabled Ceylon's Prime Minister, Sirimavo Bandaranaike, to survive the challenge to authority posed by the so-called 'Che Guevarist' insurgency movement. By the same token, the Ceylon government feels itself compelled to be gratified by Indira Gandhi's recent assurances that India has no designs on Ceylon. This gratification reflects relief from a fear of India's emergence as a domineering unit in the South Asian power structure. More than that, the Ceylon government's anxieties stem from the troubled internal situation in the island.

Perhaps at no time in the quarter century of Ceylon's independence has its democratic parliamentary system been confronted with so many simultaneous and cumulative crises as today. An influential segment of its million-strong Ceylon Tamil community in the north is threatening to rise in revolt against 'Sinhalese chauvinism' and there is much talk of an independent 'Yala Desh' (Country of Tamils) in the Jaffna peninsula. In the plantation sector (in central and southern Ceylon), which is the mainstay of the island's economy, a general strike for better wages and employment facilities by the estate labourers, most of whom are Tamils, seems to be imminent.

The law and order situation is far from satisfactory. Tourists are still 'advised' to drop many' sites from their itinerary. In the last few months, there has been a spurt in cases of robbery and arson. It is alleged that these are the doings of the young insurgents and there is fear in the atmosphere of a sudden outburst of armed activity by the People's Liberation Front (known in common parlance as the JVP or the Che Guevarists).

The government's fears of renewed insurgent activity are evident from the army's movements. Security measures have been tightened, army leave cancelled, volunteers recruited last year called back to service. Strategic points are heavily guarded and the houses of important political dignitaries are barricaded.

The attitudes of the various partners of the United Front (UF) government —the Sri Lanka Freedom Party (SLFP), the Trotskyite Lanka Sama Samaj Party (LSSP) and the Moscow-oriented Community Party (CP) — towards the insurgency and to the subsequent army actions, indicate that all is not well with Sirimavo Bandaranaike's government. To begin with, there is a viewpoint cutting across party lines which believes that the rightist segment of the army and the police is making use of some sporadic insurgent activity to further entrench itself in the power structure and to make the political leadership more and more subservient to it. They also maintain that if this is allowed to continue, it is bound to be at the cost of democratic values and norms.

On the economic front, Ceylon continues to live a ship-to-mouth existence. Its foreign exchange gap rose to Rs 1,433 million in the 1971-72 budget, with the grim prospect of lower foreign exchange earnings because of a fall in international prices of the commodities exported by Ceylon, increased debt repayment liabilities and a rising import bill necessitated partly by the abnormal security conditions and partly by shortfalls in the domestic availability of, and growing demand for, some commodities.

The budget left a deficit of Rs 1,925 million which was sought to be partly covered by reducing the subsidy on food. The government's commitment to provide subsidised rice costs the exchequer Rs 430 million or roughly 10 per cent of recurrent revenue expenditure. In addition, the government subsidises the paddy producers which, together with the rice subsidy, adds up to Rs 807 million.

These budgetary constraints compelled the government to dilute the welfare part of the budget which accounts for nearly 45 per cent of expenditure. As it happened, while cuts were proposed on welfare subsidies (these were ultimately restored under the pressure of coalition backbenchers), the government did not apply itself with equal vigour to its socialist objectives of a ceiling on ownership of land and houses, higher taxes on upper income groups and nationalisation of key sectors of the economy.

The 1971-72 budget thus brought in higher prices of flour and sugar, but did not propose any specific measures on land and house ceilings. Further, the government fixed an upper limit for salaries, but exempted ministers' perquisites like entertainment allowance. In the explosive situation this stood out as far more inequitous than it would have been under normal circumstances. Even worse for public morals was the behaviour of the left political elites which continued to live in an affluent style while exhorting the public to live austerely.

It is noteworthy that while the conspicuous consumption pattern of the Ceylonese elites is of a much lower order than, say, in India, where the consumption gap between the rich and the poor is phenomenal, the credibility gap between the masses and the left establishment in Ceylon is much wider. In Ceylon, the crisis of the left is not merely due to its limited success in translating policy into performance but also because of its tarnished image in a situation where its 'left' moorings were seriously and dramatically challenged by the insurgents.

The detention without trial of about 15,000 young, alleged insurgents in the 15 to 30 age group (including girls and Buddhist monks) during the past year is a continual reminder to most people that the government has yet to win the battle against the JVP. The JVP struggle's intensity may be gauged from the fact that every home or two lost a young man or has one under detention in 'Her Majesty's Boarding Houses', as the detention camps are grimly referred to. There is demonstrable evidence of widespread public sympathy for the detained insurrectionaries. *Trastavada* (Sinhala for insurrectionary) has become a common term. Children play games, with *Trastavada* outwitting the police. Angry mothers call their children *Trastavada*.

In this situation, the comment of a Ceylonese left leader is very apt: "When a movement becomes unsuccessful, it is called terrorism. When it succeeds, it becomes a liberation movement, a revolution." The only paper which has succeeded in pushing such statements through at times has been *Attha* (Truth) published by the Communist Party, which is one of the constituent partners of the UF. The paper entitles itself "the daily of the United Front' but manages to maintain more than a critical stance towards the UF government's performance. This has earned it the approval of the 'radicals' of the CP, while the 'power elite' of the party considers its views to be too 'far-fetched'.

The parliamentary vote on the occasion of the Criminal Justice Commissions Bill on April 6 (which gives sweeping powers to the Commission to try the detailed insurgents), brought intra-CP differences into the open Notwithstanding the directive of the central committee of the party asking its parliamentary group to vote against the Bill, B Y Tudawe, a junior minister for education, supported the Bill, while two other CP members abstained. Tudawe was promptly relieved of his membership of the central committee of the party and as things stand, a showdown within the party may lead to its breakup, with MPs like S A Wickramasinghe, the founding father of the CP, and the youthful Sarath Muttetuwagama either walking out or being forced out of the UF.

In such a situation, a new pattern of alignment might emerge with the CP attempting ot secure the leadership of the 'insurgent' elements. This new alignment might also evoke a favourable response from the unemployed, disgruntled and restive Tamil youth who seem to be losing faith in the ageing Tamil leadership.

In this context, a pertinent question may be asked. If there is an uprising again, with a section of the Communist Party (Soviet-wing) aspiring for its leadership, will Indira Gandhi come to Sirimavo Bandaranaike's aid once more? If such a situation does arise, it is bound to have international repercussions. With a Peking-Washington axis becoming more than obvious in the region and with India's close relationship with Moscow becoming more pronounced, any Indian decision concerning an 'insurrectional' or revolutionary situation in Ceylon will have to reckon with the regional realities as much as the fast changing patterns of global alignments. But in view of the necessity for 'stability' in the region and with the possibility of a section of the Moscow-oriented Communist Party remaining in the ruling Front, Indira Gandhi may not be averse to staging a 'rescue' operation in Ceylon once again.

A more significant question, therefore, is whether Sirimavo Bandaranaike will seek Indian assistance in such an eventuality or will prefer to choose another power to come to her rescue? It needs to be recalled that during the crisis, last April, she sought diversified military assistance which worked like a model of 'collective security'. Following the same trend, she has currently had talks not only with the US Pacific Ocean Naval Commander, Admiral John McCain, but also with a Soviet Admiral, Nicolai Smirnov. Sirimavo Bandaranaike, it would thus seem, is averse to military dependence on Ceylon's colossus neighbour and would prefer assistance from diverse sources.

THE FOURTH ESTATE

Little Investigation, Loud Comment

Nireekshak

A NEWSPAPER's function is not only to record — but to reveal. Those which shirk this social duty become merely a record-sheet of arranged happenings, parliamentary and court proceedings, formal functions and handouts and rarely make interesting reading. On the other hand, newspapers alive to their social responsibility and role as public watchdogs, investigate happenings to uncover unknown facts and probe beneath the surface to reveal what someone may have liked to conceal — in professional jargon known as 'investigative reporting'.

Fear of dirty washing coming out, "don't-let's-cause-a-scandal" attitude and more often simple sloth comes in the way of our newspapers making use of this effective technique to expose nepotism, graft, inefficiency and the many *effete* systems prevalent in our society. Small newspapers regard investigative reporting as very risky and time consuming because they seldom have the required trained staff at their disposal. Big newspapers, out of self-imposed restraint, discourage such investigation of the sensitive spheres of public life.

A case in point is last year's Rs 60 lakh State Bank of India fraud case, also known as the Nagarwala case. Few newspapers conducted their own investigation of the case, while the general pattern was to report what was stated by the police, said by MPs on the floor of parliament and, of course, the court proceedings. *Motherland* of New Delhi was an outstanding exception. Its exposures were in many ways responsible in getting the case reopened after sentence had been passed on the main accused involved in the fraud. It was the newspaper's misfortune that the chief accused died of a heart attack just about the time the retrial proceedings were to commence and, perhaps, confirm what it had been reporting for weeks.

The recent death by suicide of Vinod H Shah, a senior agronomist at the Indian Agricultural Research Institute (IARI), provided another opportunity to newspapers to investigate, but few seized it. There were editorials galore on the subject as also lengthy parliamentary proceedings but few reports revealing more than what met the eye. *Motherland* again scored. It exposed the nepotism and malpractices rampant at the IARI. Shah had committed suicide because he was superseded in his job by a less competent person. Now *Motherland* has revealed that M S Swaminathan, "himself has superseded more experienced men in becoming the Director of the IARI in 1966 and Director-General of Indian Council of Agricultural Research in January this year."

Easy Promotions

According to *Motherland*, "he [Swaminathan] shot above Dr A B Joshi who, till 1966, had been officiating. He [Joshi] was by all standards the obvious choice for the very posts Dr Swaminathan now holds. The reason for the latter's meteoric rise to the top-most rung in the national ladder of agriculture, and his subsequent stranglehold on the post, is put down to the fact that he has had (and still has) the backing of Shri S Boothalingam, former Finance Secretary, and Planning Minister C Subramaniam. (Shri Subramaniam was the Food and Agriculture Minister in 1966 when he backed him for the directorship of IARI.) Dr Swaminathan is the son-in-law of Shri

Boothalingam!" What goes on at other levels has also been revealed by *Motherland*'s staff reporter. "Dr H K Das, though a Pool Officer drawing only Rs 400 a month, was inexplicably selected as a senior bio-chemist in the scale of Rs 1,100 to 1,400, superseding some much more experienced men who were in higher categories in the Pool, and drawing higher salaries. Similarly, Dr S L Mehta was selected as a senior bio-chemist (Rs 1,100 to 1,400) though he had only 2½ years experience in the institute. The rules very specifically lay down that 10 years experience is required. Dr Y P Gupta, a bio-chemist with 21 years experience at the institute, has been superseded thrice — first by Dr N S Naik, then by Dr H K Das and lately by Dr S L Mehta. Dr Naik, in fact, went from Rs 350 to head of the bio-chemistry division within three years and is now in the Rs 1,300-1,600 grade."

Nixon's Blunders

The American blockade of North Vietnam ports was a subject of editorial comment in most newspapers. Centrist *Hindu* of Madras thought: "Mr Nixon's calculation is that if this supply route is shut off, it would at least blunt the communist drive and save what is left of South Vietnam being run over militarily". Leftist *Patriot* of New Delhi ruefully said: "...at least those Americans who are not permanently afflicted with hallucination of affluence should be asking themselves where the international gangsters in the White House are taking them". And Rightist *Motherland* conceded: "The irony is that while Shri Nixon pushes the world towards Armageddon, his intransigence is not likely to secure his objectives in Vietnam".

Among the other newspapers, *Mail* of Madras and *National Herald* of Lucknow stand out in making the most caustic comments on the Vietnam situation. *Mail*: "All the Americans who have died there will have died in vain, and all the billion dollars poured into that country to prop up a corrupt regime will have flowed down the drain." *National Herald*: "Little does President Nixon realise that his actions can lead to a world war, obliterating not only Vietnam but even the mighty United States. He has taken a mad course, mainly because the United States and South Vietnam are losing the war."

The last word on land reforms is yet to be said but disillusionment has begun to set in among those who had radical hopes. The pro-Congress Calcutta daily, *Amrita Bazar Patrika*, commented on the situation thus. "The Central Land Reforms Committee has clearly shirked its responsibility and almost proved its uselessness by referring back the controversy over its own recommendations to the State Chief Ministers who are constantly under pressure of the farm lobby... its failure to specify whether its definition of 'perennially irrigated land' also includes 'privately irrigated land' leaves a big loophole, the exploitation of which by vested interests — who, as things stand, also exercise considerable influence over Chief Ministers — might make a mockery of land reforms." *National Herald* dubbed the CLRC's decision of passing the buck to the Chief Ministers as a "subtle exercise in evasion" and indicated that "at this rate it appears that the Kulak lobby will have its way."

Candour on Steel

Union Steel Minister Mohan Kumaramangalam's announcement in the Lok Sabha that "a fairly serious loss" was expected in Hindustan Steel Limited (HSL) this year did not come as a surprise to parliament or the press. It was more or less anticipated as HSL year after year has been known to be losing heavily. This year's loss was estimated to be about Rs 20 crores but the cumulative losses since the inception of HSL in 1954 to March last year were more than Rs 178 crores. The Minister explained that 65 per cent of the losses were due to the poor performance of Durgapur, where labour troubles and maintenance problems were rampant, and the remaining 35 per cent of the losses were due to technological mistakes and incompetent management. These problems were being gradually overcome but it would take some time before things took a turn for the better, said Kumaramangalam, whose interventions in the steel debate, *Hindustan Times* conceded, "had at least the virtue of well-calculated candour." *Tribune* of Chandigarh was nearer the truth in its editorial comment when it said that "the crisis in HSL is essentially a crisis of management, and no measures and guidelines in government memoranda can be of much help unless this basic factor is recognised." *National Herald* generally approved of the government's measures to set things right in the HSL and tried to equate the problems of the public sector with the private sector — "poor industrial relations, sub-standard management, over-staffing." *Deccan Herald* of Bangalore, however, felt that "until the men incharge of the steel plants change their attitude from being merely officers entitled to privileges to those of facing the responsibility of making a success of the factories entrusted to their care, it will be impossible to present a favourable image of the sector to the public."

Trade Union Talks

The unity talks between the three major trade unions of the country, INTUC, AITUC and HMS, got wide coverage in the press all over the country. Their failure to come together earned editorial comments like, "...once again the Prime Minister's diagnosis of the malady stands vindicated that the trade union movement in India has been suffering from competitive militancy among rival unions for earning cheap popularity" (*Amrita Bazar Patrika*). "Disruptive political parties masquerading under trade union garb cannot be allowed to imperil national survival" (*Hindu*), and "The implicit refusal of the labour leaders to put the national interests above their own is indeed a pity" (*Tribune*). More than anything else the fear of INTUC's ultimate domination over the other two trade unions was responsible for the breakdown of unity talks. With this the ball has been passed into the court of the Union Labour Minister who has been urged by many newspapers to order a thorough review of the Trade Union Act to ensure industrial peace in the country.

The so-called press ownership diffusion bill is not likely to be introduced in the current session of Parliament. Though the panel of ministers, which examined all the aspects of diffusion of newspaper ownership, has completed its work, the recommendations are yet to be discussed by the Union Cabinet. The Prime Minister's non-committal attitude on the Bill has perplexed the Indian Federation of Working Journalists which has once again intensified its lobbying in Delhi. A victim of their campaign has been H Y Sharda Prasad, Director of Information in the Prime Minister's Secretariat, who, it is said, is against the diffusion of press ownership and has so advised the Prime Minister. When this allegation was repeated in the Rajya Sabha recently, all that the Prime Minister said was: "There is a rule in this House that we do not mention names of officials, who are unable to answer for themselves here". That she did not contradict the allegation — even when she was provided the opportunity — has made many newspaper trade unionists sit up and think.

Socialism at the Grassroots

M L Dantwala

THE hot wind of radicalism which is blowing this summer is almost unprecedented in India's political history. Hardly a day passes without a fresh round of radical salvoes being let off, all from the arsenal of the Congress election manifesto. The Prime Minister's belated attempt to counsel moderation is not likely to be of much avail. Only when the whirlwind blows over will the dust settle down and clear the vision.

Only Pertinent Issue
