* IASM is a non-profit organization connected to the CASSA PER IL MEZZOGIORNO and provides free advisory services to businessmen willing to establish industrial or tourism ventures in Southern Italy.

When the growing had to stop

No one can be so persuasively pessimistic about Italy as an Italian. And in the elaborate tapestry of doom he weaves all is blended together—riots, strikes, bank robberies, the absence of a government, the flight of money abroad, the failure of nerve of the small businessman, the decline in industrial production. . . . And so it goes on. To talk about the Italian miracle to an Italian is an affront to national dignity. What miracle, the industrialists ask, searching their memories for the time when Italy had the fastest growth rate in Europe ? The question they put to themselves now is not whether the rapid expansion of the past can be resumed quickly, but whether chaos can be avoided.

In fact it is impossible to discuss the important economic questions facing Italy without talking about politics, not in the sense of who is going to get how many votes in the forthcoming elections but about the chances of the Italian political system ever becoming an effective vehicle for change. If the governments of Italy continue to be unable to provide the right amount of houses, schools, hospitals and jobs for the poorer regions, the social and political unrest which puts Italy at the top of the league for strikes will get worse. Labour troubles on the scale that Italy has been experiencing damage confidence, and that depresses investment and encourages a flow of capital abroad. The result is low growth and the one thing that a society in transition like Italy's cannot afford is low growth. For this in turn limits the government's capacity for easing the pain of mass migration and for bringing the south into Europe, in substance as well as form.

Low growth makes the political situation more unstable and the polarisation of society between the right and the left more likely. The men in the middle become increasingly nervous and start to cultivate foreigners as a long term insurance for the future, while Italian industrialists put yet more of their plans in cold storage for fear that the skeleton may jump out of the political cupboard.

The difficulty is to assess whether confidence and attitudes towards investment are entirely the result of labour troubles or whether they have not also been affected by the economic mismanagement of the administration. If this is so, the right economic treatment might enable the patient at least partially to recover and growth to take place again after two years of stagnation. And then Italy's entrepreneurs might come to terms with the fact that life will never again be as it was in the 1950s and most of the 1960s.

What has happened in the past three years is that a new centre of power has arisen alongside the three groups which in the past have dominated the post-war recovery of Italy, the church, the communists and the great industrial corporations. The unions have suddenly emerged as a group which can influence events, political as well as economic. For many people this makes the future unpredictable. There is also a ground swell of disorder and violence which puts the small businessman on the right and beyond, lured by the madness of neo-fascism. This makes the left jumpy. There is a general sense of unease in Italy which has both a direct and an indirect effect on the economy.

The direct effect is that a grumbling war of attrition is taking place between unions and employers. This puts a constraint on output both through the impact of strikes and the increase in absenteeism. Much more important is the indirect effect on private industrial investment. Ignoring the massive state holding companies, investment declined sharply last year and only recently has it shown tentative signs of picking up. The government cannot do much about it, for though funds are allocated so as to push extra purchasing power into the economy, the task of persuading the bureaucracy to turn votes into money spent and buildings on the ground becomes increasingly difficult. And the government, in its turn, becomes even more discredited in the eyes of those who know that for Italy's future health,

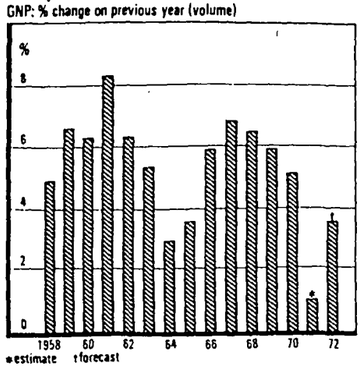
the money must be spent.

But the trouble with this kind of political analysis, of which the Italians are so fond, is that it does not add up to a complete explanation of what has been happening, and what is likely to happen over the next 12 months, whatever the results of the May elections. There are a variety of factors which prevented the economy from growing last year. Even if most of them have had some kind of political origin, they can also be treated as economic events per se, which can respond to a coherent economic policy.

Since the hot autumn of 1969, when the unions first showed their new militancy in bargaining over the national three year wage contracts, the extraordinary dynamism which the Italian economy has shown since the war has faltered and virtually disappeared. The union campaign itself knocked about 1 per cent off Italy's growth in 1969, cutting it back to around 6 per cent. Initially in 1970 there was a rapid recovery, but by March other factors began to force the economic authorities, notably the Bank of Italy, into restriction. Alarmingly, prices rose by more than 6 per cent ; the balance of payments moved into a worrying deficit ; and there was a serious political crisis in the middle of the year, which led to an outflow of capital of avalanche proportions. As a result the Bank of Italy had to impose a credit squeeze, which together with the 15 per cent rise in wage rates in 1970, created a severe cash problem for a lot of Italian companies. On top of this, Signor Colombo's government, when it was formed in the middle of 1970, brought in an emergency package which was supposed to cut consumption in a full year by L600 billion (£450m), with the aim of cutting back imports and shifting resources to investment. The idea was that by moderating the pressures of the wage increases granted at the end of 1969, the economy would be on course to surge forward on its normal growth path in the course of 1971.

The failure of the Colombo government to achieve this goal was largely responsible for its demise early this year. Signor Colombo had, after all, been for years Italy's internationally respected finance minister in successive centre-left governments. Without a well-entrenched power base in the Christian Democrat party, it was essential for the survival of his government that he should at least succeed at the game at which he was meant to be pre-eminent. In fact 1971 was the worst year for the Italian economy since the grim days of early postwar reconstruction, despite predictions to the contrary by most outside observers, including the Organisation for Economic Co-operation and Development (OECD) and the Bank of Italy itself.

Behind the stagnation



What went wrong ? Apologists for Signor Colombo say that the key factors were : continued labour unrest and strikes ; the trials and tribulations with which the Colombo plan for reforming and expanding low-cost housing went through in parliament ; and the sickness of the textile industry. Certainly the continued aggression of the unions did not make the government's job any easier. But this was largely predictable and, in any case, was partly the result, not the cause, of the economy's sluggishness. The textile industry, increasingly hit by competition from lower cost producers in Asia, is one of those problem children with which any economy has to cope. The argument about Signor Colombo's housing reform is more interesting in the sense that what happens in the building industry directly affects about 26 industrial sectors, such as cement, steel, glass and so on. The building industry was, of course, affected by the pervasive stagnation of investment. More important, housing has been in a disastrous decline since 1969 for a complex series of reasons.

What matters here is that the private sector was in serious difficulties owing to a number of laws which restricted its ability to buy land and to build. The basic objective of the Colombo housing reform programme, on which he staked a good deal of his government's time and prestige, was to enlarge the public sector, give it more money and short-circuit the hopeless administrative confusion in which the housing question had long been stuck. What eventually emerged was in the typical way of Italian politics a very different animal from what was originally proposed, and it may only modestly enlarge the capacity of the public housing sector. Meanwhile what has mattered is the private sector, since public housing still represents only 5 per cent of the total, and it was this that the Colombo government felt unable to help while its reforms were dribbling through parliament.

The result of the private sector's troubles was a continued decline in building activity which sent ripples throughout the whole economy. House building was 10 per cent down on 1970, which already had shown a considerable fall on the high point of 1969. This statistic and its effects on related industries the forecasters had failed to include in their equations. At the same time, stagnation had a cumulative effect in pushing down stocks throughout industry to astonishingly low levels. And on the international front, exports, while rising by what seems in British eyes a highly satisfactory 8 per cent in

Dr URBANO ALETTI
President of Milan Stock Exchange

MILAN STOCK EXCHANGE

The Managing Committee of Stockbrokers of the Milan Stock Exchange send their greetings and thanks to the delegates who attended the 1st International Convention on Stock Exchanges, March 14th-16th 1972, in Milan.

A brief report on the proceedings follows :—

GOOD HOPES FOR THE FUTURE

If it is true that Italy is "the Sick Man of Europe", and if it is still possible to speak of the Italian Stock Exchange as an economic thermometer, the present state of this institution should surprise no-one.

The phenomenon cannot, however be explained in such simple terms. In reality, the crisis of the Italian Stock Exchange has deep and complex roots : the vitality of the Market depends also on the inter-connections (in Italy, yet to be clarified) between the Stock Exchange and the model of economic development decided on by the authorities.

It was, hence, in Italy, that the Stockbrokers Management Committee in Milan, a city of traditionally international bent, organised the 1st International Convention on Stock Exchanges which was attended by highly qualified experts in financial and Stock Market matters from all over the world. The theme of the Convention—organised by CISMEC (Centro informazioni e studi sulla Comunità Europea) the scientific sessions being run by Prof. G. Pivato of the Bocconi University of Milan—was "The Stock Exchange : an instrument of socio-economic progress in Europe and the world". The success was really remarkable. Dr. U. Aletti, President of Milan Stock Exchange said that the contributions from foreign speakers had been most important. Not only had the conditions of the world's principal bourses been discussed, but experiences had been exchanged and it had become apparent that the Stock Exchange can develop its functions with efficiency; above all the foundations were laid for an international collaboration which the Italians, for their part, would promote to the utmost.

The Italian's contribution to the Convention, although voluntarily limited in its length, was brilliant in its quality.

However the most keenly awaited speakers—whom the Milan Stock Exchange wish to thank most warmly—were those from the United Kingdom, France, Germany, the United States and Japan, in a word, from all the leading industrialised countries. Also of considerable importance were the various institutions of the EEC, effectively represented by Mr. Raymond Barre. The delegations from Latin America and from Israel were equally well-armed. Also memorable was the keen interest in exchange matters demonstrated by Yugoslavia. Since it is impossible to record here every single one of the very valuable speakers, the principal points may be drawn from Prof. Pivato's summary which was agreed by most of those present.

The internationalisation of the capital markets is destined to become a reality and the Stock Exchanges must conform their policy to it (see the speeches of W. J. Carey, Chairman of the SEC, of J. E. Ammermann and of W. C. Cates of the U.S. Department of Treasury; of Raymond Barre, commissioner of the EEC; of H. Feith of the Deutsche Bank).

To attain this objective a higher concentration and efficiency of different domestic markets are first necessary (see the speeches of J. G. Torrò, Barcelona Stock Exchange; of S. Aihara, Tokyo Stock Exchange; of D. Petit and Y. Meunier, Paris Stock Exchange; of G. Tagi, Milan; of U. J. N. De Graaf, Amsterdam Stock Exchange; of N. Goodison, London Stock Exchange).

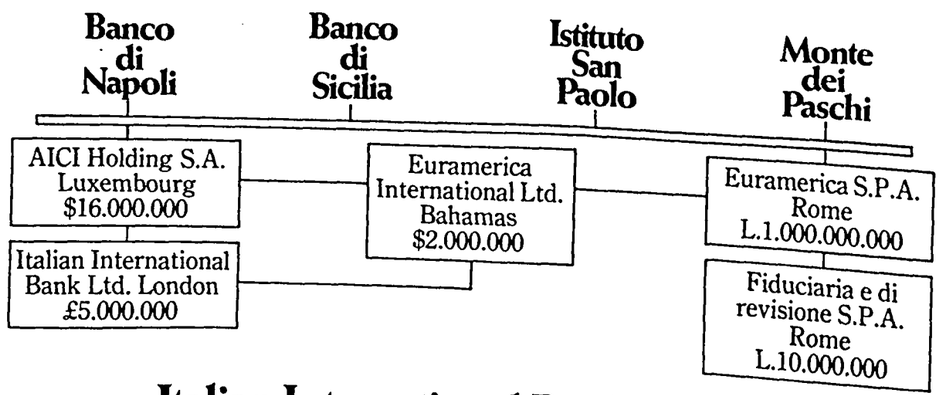
The self-regulation powers of the Institution and of its members appeared as a rapid and efficient instrument for modernising Stock Exchanges (see the speeches of R. W. Haack, New York Stock Exchange ; of J. R. Knight, London Stock Exchange ;

Milan Stock Exchange

of G. Rendu and J. Sellato, C.O.B. Paris ; of M. F. Cohen, Washington ; of A. Rossi, Zurich Stock Exchange).

There were unanimous and pressing demands for a stricter harmonization of regulatory systems and for a closer collaboration on an organisational level.

It is exactly in this direction that the Milan Stock Exchange intends to act in the future, decisively and with conviction, without waiting any longer for miraculous interventions by State bodies which have too often shown themselves to be short-sighted. A presence on an international level—European first of all—requires a suitable internal organisation : the large computer of Milan Stock Exchange may soon become the nerve centre of the Italian securities market, connecting up the data and operation systems of all the Italian Exchanges. This will produce benefits in concentrating the market, without adversely affecting the widespread system of collecting orders through provincial brokers.



The Italian broker must however acquire a multi-national habit and mentality, which alone will allow an increase in this role. The experience of the important British and American securities firms shows countries such as France, Belgium, Spain and Italy the path to be followed : multi-national broking firms not only in securities but also on commodities—will be the logical outcome of internationalising negotiations.

The governing bodies of the Milan Stock Exchange are aware that this is the moment to act firmly on the proposals for harmonizing the main European exchanges. On this, President Aletti said : "We are ready to collaborate actively on every problem within our competence. The executives of the Milan Stock Exchange are ready to exchange views and make study visits to London, Paris or Madrid. But there is no time to lose." He proposed to the London Stock Exchange, as a first step, to formulate a common general exchange index and, for example, to unify the dealing hours of European Stock Exchanges. If it is true that "nothing succeeds like success" the 1st International Convention on Stock Exchanges gives good hope for the future.

For further information write to the Milan Stock Exchange, Piazza Affari 6, Milan.

Banking through five centuries and throughout the world

An agreement between four of the oldest banks in Italy creates a new international banking venture.
The services of the four banks are available, not only through a network of 1560 branches in Italy, but also through 'Euramerica' in Rome and the Bahamas, and the newly formed Italian International Bank, London.
These will provide a complete international merchant banking service including medium and long-term loans.

Italian International Bank Limited
P & O Building, Leadenhall Street, London EC3V 4PT.

volume, were less than brilliant by Italian standards, partly because of the slowdown in international trade and partly because of supply problems at home, so that Fiat dealers abroad, for instance, were—and still are—howling for more cars which Turin cannot supply.

Consumer demand did not make up for the crisis in housing and investment. Wages were still rising fast, by rather over 10 per cent, thanks to the 1969 contracts and the widespread custom of indexing wages to the cost of living. But over half the increase was taken up by the continued rise in prices, and the uncertainty which most sections of the population felt about the future was revealed in an increase in the rate of savings. At the same time there was a fall of at least 300,000 in the numbers employed and a substantial increase in short-time working. The actual number of hours worked dropped by 5-6 per cent over the year.

Worries about the way the economy was going were pronounced enough by the middle of 1971 for the government to attempt some reflation in July, and by that time the Bank of Italy was pursuing a monetary policy which was compatible with a nominal growth in gnp of more than 10 per cent. The everlasting problem was that the government machine is not well geared to use public spending as a counter-cyclical device. It could and did take over from business some of the burden of social security payments. But the government's main effort last year was to announce that some L1,500 billion (£1 billion) of public investment would be "accelerated." The problems, however, of ensuring that public money, other than the salaries of the overnumerous bureaucracy, is spent are enormous. And so far the effect has been negligible.

On the knife edge

As a result the economic scene during the run-up to the elections has been gloomy. Nevertheless, some highly optimistic figures have been bandied around. The budget minister of the outgoing government, Signor Giolitti, produced a planning document in February which suggested that growth this year could be around 5 per cent. The employers' confederation, Confindustria, presented a paper to the unions which forecast the same thing. In the case of Signor Giolitti's annual plan the proviso was that the L1,500 billion of public investment would actually be made. For Confindustria

Italy needs more people like them

the quid pro quo was that workers would behave themselves: if only there were industrial peace, all would be well is their highly politicised but partially justified message.

For ISCO, the government-backed economic forecasting institute, and the Bank of Italy, which are both thinking in terms of what is likely rather than what is desirable, the forecast is a growth rate of 3.2 to 3.5 per cent, concentrated largely in the second half of the year. This time the forecasts are unusually important since even if the elections provide a decisive mandate for a new government—and the odds on that cannot be very high—the likelihood of a further reflationary package having much impact on the economy before the end of the year is not great.

If Italy experiences another year of stagnation, there is a persuasive school of thought which suggests that the effect on the economy and the political equilibrium will be powerful, long-lasting and bad. The argument goes something like this. The Italian economy should be growing at something like 6 per cent a year. Instead it has now been effectively operating below capacity for three years, and the situation has been getting worse year by year. Another bad year will be enough to cause a sea change in the way the economy operates. It will then be difficult, if not impossible, to return to the habits and assumptions which induced rapid growth in the 1950s and 1960s. Italian industry—or at least that large sector of it that has been so successful in foreign trade—will cease to have one of the best investment records and hence some of the most up-to-date and competitive capacities in the world. Instead it will have one of the worst.

This will have a profound effect on its propensities to export and import, which may take some savage tinkering with the exchange rate to get right again. As a result Italian industry may shift from the virtuous circle of export- and investment-led growth to the vicious circle that Britain knows so well—under-investment, sluggish exports and imports which are only too quick to roar up as soon as domestic demand revives. At the same time Italy has, and has always had, a very special structural problem which requires rapid growth as an essential precondition of its solution. This is the old balance between the north and the south, which in relative terms is as bad as it has ever been, even if in absolute terms southern Italy is enormously more prosperous than it was at the end of the war.

Will it be 3 per cent?

On this analysis a 3 per cent plus growth rate is probably the minimum which will enable Italy to re-enter its traditional growth path next year. So the forecasts are worth looking at in some detail, bearing in mind that there has rarely been a more difficult time to make them. The key assumptions are that the fall in housing activity will start to level off, perhaps ending up with a drop of 5 per cent this year, but that private investment will still

This survey was written by Jonathan Radice

show an absolute fall. But this, the forecasters then assume, will be more than made up by a strong rise in the investment of the great public holding companies. At the same time there should be a big turnround in stockbuilding, if inventories return to anything like their normal levels. Public consumption tends to grow steadily at around 3 per cent a year. But ISCO for one is making a rather optimistic assessment of what will happen to private consumption which it expects to rise by 6 per cent in real terms. As no one can envisage a growth in employment and as prices are likely to eat up all but 3 per cent of the growth in wages, ISCO must be assuming that people will be cutting into their savings. Where it is less optimistic, however, is over exports which it thinks will only increase by 4½ per cent in real terms.

No one expects any real revival in either building or private investment. On the trade side, as exports last year rose while imports remained virtually static in real terms, it is thought likely that this year the trade balance will be neutral in terms of its effects on growth. Stockbuilding should be some help. But the main onus is on public investment and private consumption. The accelerated spending of L1,500 billion is still in theory taking place, and some of it should limp through into reality from the shadow world of government budgeting. But a great deal still depends on a reasonable increase in private spending. And this in turn depends too much on expectations to be forecast with any confidence.

Umbrella for the unemployed

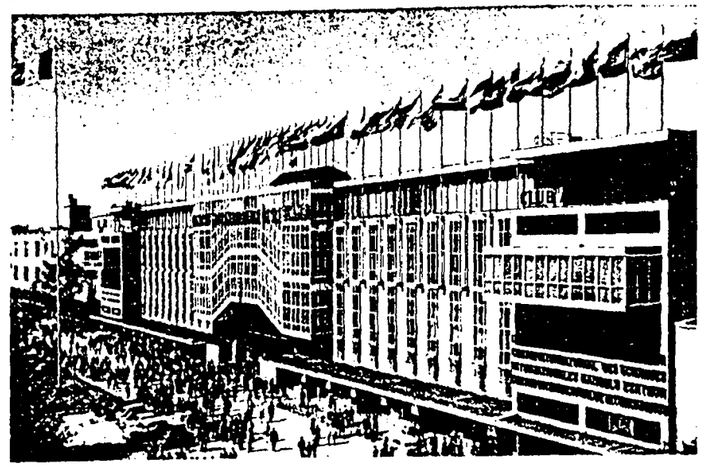
It also depends on the employment situation. In Italy this is never easy to decipher. Essentially Italy's policy is to do the opposite of what has been happening in Britian, where labour has been shed in line with the underlying growth in productivity. With an even worse growth record, a similar increase in the level of wage rates and a propensity for productivity to increase even faster, Italy has seen a big fall in employment but virtually no increase in the recorded figures for unemployment. This mystery is partly explained by the fact that the unemployment statistics, which show that 650,000 people are without jobs, do not mean very much at the best of times. But there has also been one of those once-and-for-all changes in the activity rate. This has happened because of a rise in the numbers of children staying at school ; an increase in the number of people of pensionable status ; and a decline in the number of working hours. So although there are less jobs available, there are also relatively less people to do them.

But there is also another factor : it is much more difficult and expensive to lay off workers in Italy than it is in Britain. The closing of factories, for instance, causes such enormous hostility that they are frequently occupied by the redundant workers who then have to be bought off. It can be assumed that most firms are carrying workers whom they could do without. This tendency is encouraged by the existence of a curiously Italian institution, the Cassa di Integrazione, which makes up wages for those on short time. In 1971 it increased payments to the equivalent of 200m hours. As a short term palliative this is as efficient a means of paying out benefits as any. But there is a limit to the extent to which it can conceal the true state of unemployment.

In the last recession, which was at its worst in 1963, employment did not pick up again until late 1967. It is hard to see anything different happening this time. So the outlook for private consumption, at least until the autumn round of wage negotiations, is not very encouraging. In short, it is quite possible to envisage the economy growing very little again this year, and certainly under the 3.5 per cent envisaged by even the more cautious forecasters.

This analysis has been in terms of the components of real demand. But monetarists, even if one hears less from them nowadays, would argue that the large increase in the money supply which took place in 1971 must at some point have its effect. Base money, which the Italians find the most useful pointer as it governs the future expansion of deposits (consisting of currency, monetary liabilities of the Bank of Italy, and treasury bills) expanded by 18 per cent in 1971, compared to less than 10 per cent in the previous two years—in each of which real gnp rose by over 5 per cent. At the same time the leading banks report that they increased total lending by around 20 per cent last year. So, if there is a lag between the increase in the money base and an increase in gnp of 18 months to two years, all one has to do is to wait. The trouble is that this kind of relationship depends a great deal on expectations and these at the moment are unpredictable. It would seem that a relatively small number of changes would be enough to shift the Italian economy back on course. It is, as always, all a matter of 1 or 2 per cent.

The necessary insulin



But this is not to advocate complacency. There are a lot of things seriously wrong with Italian society, which require a shift in the allocation of resources and in the method of doing things. But it is much easier to redeploy resources when they are growing. Much more interesting than the present impasse is what will happen to Italy in the next 10 years. In a rather critical form it exemplifies the most acute problems both of northern European societies and of the peripheral countries to the south. In Turin the unions are posing sophisticated if unanswerable questions about the meaning of work, while in Palermo there are still stories about women having to sell their children for the rest of the family to survive.

If two things are done quickly, Italy has a sufficient combination of dynamism and sophistication to cope better than most. First, the incoming government in May will have to get the economy moving again ; and, second, it needs to use the crisis to push through a bold programme of social spending. Fortunately the two are compatible. Unfortunately—and this is why the "if" is a big one—no one at the moment can foresee the emergence of a government capable of doing anything. One can only hope that the general pessimism is unjustified. Optimism is not in the Italians' character. As Luigi Barzini has put it : "There are many things they do not see for being too clear sighted." Italy has come far, fast. But it needs the constant stimulus of economic growth as much as a diabetic needs insulin.

Dr Colombo did not provide the insulin

FIFTY TRADE FAIRS A MILAN ANNIVERSARY

The Milan International Trade Fair was held for the first time in 1920. It was closed for three years during the war and will therefore be celebrating its fiftieth anniversary this Spring.
In the half century since the Fair was founded Milan has firmly established itself as one of the cross-roads of world trade. Two main factors lie behind this city's rapid growth as a vital centre of commerce.
The industrial and agricultural potential of northern Italy backed by the commercial spirit of its people is one. Abundant energy, hard work and devotion to the job in hand is the other. Taken together, they are the secret of Lombard prosperity.
But there is a third ingredient to the formula: yeast. And the yeast that has kept production rising in Italy is Milan Trade Fair. No one could have guessed what a leavening effect this Fair would have when it was opened fifty years ago.
The wooden pavilions of the 1920 Fair exist no longer. They had been used to accommodate refugees from Caporetto and were already the worse for wear when the first Organizing Committee re-erected them beside the city walls at Porta Venezia. In 1920 there were 1233 exhibitors, 265 of them from abroad.
Britain was represented officially and by private exhibitors. The United States had a number of firms there. All countries now belonging to EEC were showing. German firms alone booked thirty display stands.
The bastions at Porta Venezia and the gardens of the old Villa Reale soon proved inadequate. Another location, where lasting premises could be built, had to be found. For the fourth Trade Fair an army parade ground, at that time on the outskirts of the city, was taken over from the State, and a first group of pavilions was erected on what is now the permanent home of this Fair.
The economic autarky of pre-war days did not check the increasing attraction of this trade event. By the mid-thirties the number of stand bookings had settled at around 4500, of which perhaps 1000 were from foreign exhibitors. Daily attendance was in excess of 100 000. It took a war to halt its progress. That was in the Spring of 1943.
After re-opening in 1946 a major plan was drawn up to restore the Fair quarter. Its buildings had been razed to the ground, and while the work of clearance and temporary reconstruction was still going on a scheme was adopted to lay out the new premises in self-contained sectors designed to operate independently of one another. Several exhibitions could then be presented at the same time.
The immediate post-war phase was followed by a period when, in addition to thorough re-structuring, provision had to be made for the many specialized trade shows which, with the April Fair, now form what is known as the « Great Fair »: an integrated cycle of trade events spaced out round the year so that in effect the gates are never closed.
To take the most recent complete cycle, between May 1970 and April 1971 42 specialized trade shows lasting 251 days were held in the Fair quarter. Add to that the annual Trade Fair - 14 to 25 April - and the number of days on which business visitors were admitted was 263.
In that year the total display area available to the Fair was 598,580 square metres. Overall, the sequence of specialized trade shows took up 899,387 square metres. Exhibitors at the 1971 Trade Fair numbered 11,916, of whom 9135 were Italian and 2781 from abroad. Specialized trade show exhibitors were up to a record 14,400, of whom 10,617 were Italian and 3783 from abroad. Seen as a whole, the 1970-71 cycle shows the following results: trade shows, including the April Fair, 43; working days 263; total area of display sites utilized 1,498,237 square metres; exhibitors 26,316, of whom 19,752 were Italian and 6564 of other nations.
The international importance that this trade exhibition centre has acquired is best shown by the returns for last year's April Fair. That single event booked stands to nearly 12,000 exhibitors, one-quarter of them from outside Italy. Of the 3.5 million visitors 120,000 were foreign businessmen from 130 countries. Participation by private firms came from 90 countries, 72 being officially represented.
Official representation is through CIS, the International Trade Centre located in the Palace of the Nations at the heart of the Fair quarter. This « business citadel » contains a series of well-equipped offices that offer maximum privacy and comfort to foreign delegations and organizations that come here to meet exhibitors and businessmen from all over the world. Developed in the early 'sixties, CIS is the instrument through which Milan Fair helps to bridge the gaps between areas with different economies.
In the first instance the Fair did this by setting up as a bridgehead between western countries and the socialist states of eastern Europe. More recently it has done so by providing a rallying-point for bringing industrially advanced countries into closer contact with the Third World in the belief that it is there that consumption levels are most likely to rise.
But the value of this Fair does not lie in trade promotion alone. For many years Milan Fair has been a centre for conferences and congresses on social, technical and scientific subjects of wide interest to environmental and ecological progress. It has set itself targets in this field which fifty years ago were unheard of.
With half a century of experience behind it the Fair Organization is in a position to make even greater efforts in co-operation with countries and private firms that avail themselves of the many services and opportunities it offers.
Its second half century begins with the expansion of EEC to include Britain, Denmark, Norway and Eire. Milan Trade Fair welcomes the wider prospects they will bring to the economic and technological development of Europe and the world.

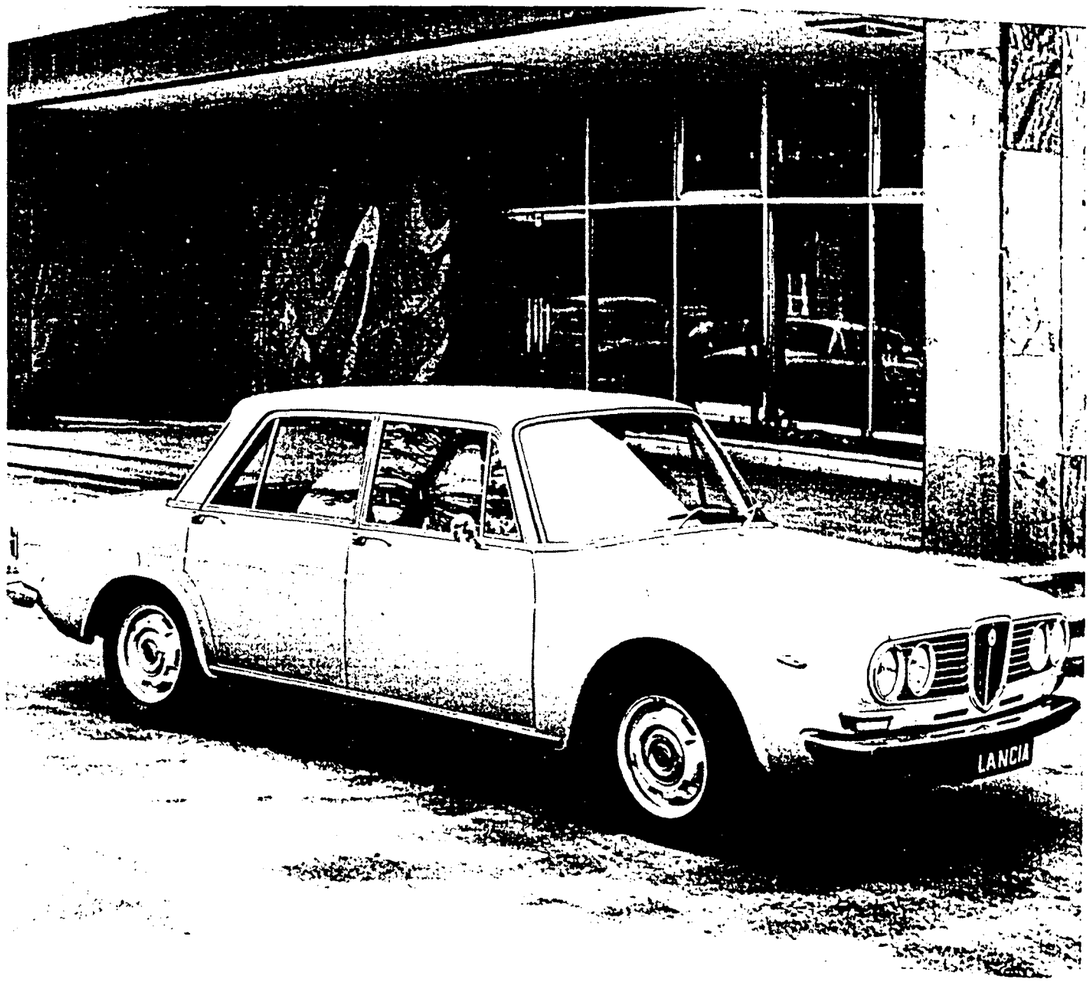
Delegation in London: Dr. Vittorio Schiazzano, 20 Savile Row, London W1X 2DQ ☎ 01-734 2411

Lancia. One of the great Europeans

Winning the Monte Carlo Rally was a triumph that says a lot for the supreme safety and performance of a Lancia.

But you'll never know all the advantages of a Lancia until you've seen and driven one yourself.



Then you'll notice the comfort and elegance. The finger-tip control, instant acceleration, silent power and perfect road-holding. Even features you would expect to be extra are standard on Lancia.

The Lancia 2000 Sedan (above) and the Coupé are standard with power steering and heated rear window and are available with electronic fuel injection.

Just two of the Lancia models that leave Turin constantly for distributors all over Europe.

Drive one. You'll discover what made Lancia one of the great Europeans.

Lancia (England) Limited, Ealing Road, Alperton, Middlesex. Telephone: 01-998 5353.
Lancia & C. Fabbrica Automobili. Torino. Spa.

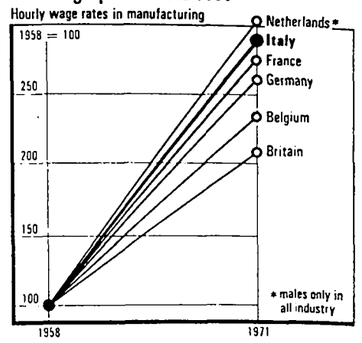
A sense of perspective

The starting point for any discussion about the Italian question must be the end of the second world war, if only to provide a sense of perspective and to show the remarkable development which has taken place since then. By the end of 1945 national income was less than half what it had been in 1938, when in any case it was relatively low by European standards—being just over a quarter of that of Britain, for instance. Industrial production was down by 75 per cent. And just like its defeated ally, Germany, Italy was experiencing a period of very rapid inflation (with prices having risen during the war years 40 times). Again like Germany, after two years when the main problem was to ward off starvation, it discovered a monetary policy to ward off inflation and launched itself into 14 years of uninterrupted growth combined with remarkably stable prices.

But if the story of recovery shows some similarities with that of Germany, the structural background was very different. Germany had, after all, been for nearly half a century the great industrial power in Europe, while Italy's industrialisation started very late in the 19th century. It was hampered, of course, by the fact that it became politically one country only in the 1860s. And even unification could not make up for its lack of raw materials like coal and iron ore.

The first world war gave a tremendous impetus to industrialisation, but it was pushed through at any cost, so that by the war's end, when it was facing a critical shortage of foreign exchange with exports only covering 20 per cent of imports, Italy had too big a production base for the home market, and industrial costs were so high as to prevent its industries penetrating export markets. Italy then suffered from 20 years of Mussolini. The tragedy was that in the 1920s, when a realistic exchange rate might have fertilised Italy's still young industrial sector, Mussolini saw a strong lira as a breastplate rather than a leaden suit. "I shall defend the Italian lira to my last breath," he said. As a result Italian industry remained short of wind until the 1950s.

So when the De Gasperi government had to decide what to do about the combination of mass unemployment and hyper-inflation in 1947, it was not just a question of stabilising the lira and getting the factories going again. There were not all that many factories. The problem facing Italy was similar to that of a developing country, with a low industrial base and inadequate savings. But there was one important difference : Italy, though industrially backward, was a culturally advanced country. A potentially highly skilled labour force was there, ready and waiting to be used.



The solution devised by De Gasperi and his very able finance minister, Signor Einaudi, the ex-governor of the Bank of Italy, was to avoid the autarchic mistakes of the past and to go for a liberal economic policy based largely on the manipulation of credit. But it was a liberal policy with a difference. A massive use of state funds was needed, first for reconstruction and then to develop the south. But the essence of the policy was to mobilise private savings within a free market economy. It was therefore incompatible with a coalition which included the communists, as the first postwar government did. A coherent policy required firm political direction, which it fortunately got from De Gasperi's dominance in the Christian Democrat party.

The key technique used was to slow down the growth of credit very substantially, but not to halt it absolutely. The aim was to change expectations about inflation without bringing industrial recovery to a complete stop. To do this new weapons were needed to allow the Bank of Italy to control credit in a continuous and flexible way. They were provided by a package of reforms which enabled the Bank to impose reserve requirements on the banks, and generally to maintain a close surveillance over them and to oversee the bond market and new issues.

By 1949 Italy's industrial output was back to prewar levels. And then with skilful guidance from the Bank of Italy, it moved forward very fast, rising by 62 per cent in the seven years to 1953, and by 96 per cent in the seven years after. So successful, in fact, was the use of monetary policy in the postwar years, that allied with the frequent political weakness of coalition governments, it has enabled the Bank of Italy to dominate economic policy-making ever since.

But a skilful use of credit was not, of course, enough given Italy's plight. Italy depended, as did other European countries, on large injections of dollars to provide it with foreign exchange. It obtained an essential $\$3\frac{1}{2}$ billion in American aid, via UNRRA and then the Marshall aid programme. Italy for some time also needed high tariff walls. It had to build up its exports before it could afford to let in more than the bare essentials in imports. And even in 1953 Italian tariffs were still higher than those of any other nation in what was then the OEEC.

Catching up with the rest

The Italian economic miracle was not just caused, however, by a good monetary policy and some cash from the United States, although they were the essential preconditions. What mattered was the quality, supply and price of its labour, combined with a very high level of capital formation. Cumulatively they explain a great deal. What one cannot say is quite how much they do explain in detail. The economic evidence for why countries grow, and why growth rates differ, is not conclusive for the simple reason that no one has yet come up with a satisfactory growth model. And while correlations between aggregates can do much, the causal direction—whether X influences Y or vice versa—is never completely clear.

One of the most comprehensive attempts to discover why growth rates differ was made by Mr Edward F. Denison for the Brooking Institution. Taking the period 1950 to 1962 he suggested that about 40 per cent of Italian growth was caused by either the increase in available labour or the movement of people from low productivity areas (mainly agriculture) to high productivity ones. Another 12 per cent was due to the increase in capital and a further 20 per cent to economies of scale as the Italian market and exports expanded (which effectively amounted to growth feeding on itself). These percentages should not be taken too seriously except as indications, but they provide a good clue to the factors behind the Italian miracle.

Labour moves mountains

Italy's problem for a long time was that it had a population growth roughly comparable to that of Britain, without the same rate of industrialisation to provide employment. The classic remedy was emigration. In the first decade of the century, for instance, at least 500,000 people a year left Italy's shores, not just to the United States, which houses the most famous and notorious community of the Italian diaspora, but to other places as well. Quite a lot went to France, for instance, and across the southern Atlantic to Brazil and Argentina.

This kept unemployment down, not just in the south and the islands, but in the centre of Italy and the north east in the Veneto area. And eventually the little sums which the emigrants sent back to their villages developed into an important contribution to the balance of payments. But the process had its costs. The money which was coming back was often used to pay for the passage out of Italy of other members of the family. And the social and psychological costs were heavy. The communities in the south lost their most energetic sons. Today, this is still a potent factor in explaining the apathy and defeatism of those who were left behind.

The fascists attempted to remove the effects, while doing little about the causes. Mussolini disapproved strongly of emigration, since this hardly tallied with his vision of a strong, dynamic and conquering state, and he managed to reduce the outflow. At the same time he brought in laws which made it difficult for people to move within Italy and bound them in principle to the area where they were born.

So by the end of the second world war there was a huge sector of the population which, even ignoring the dislocations of war, had no means of employment. Emigration from Italy started to rise again. But recipient countries in the post-war world had very different views about immigration. And the outflow settled down to a steady 250,000 people a year, which in gross terms is rather under that from Britain. Internally the laws restricting people to the area where they were born, although in practice largely abandoned, were not in fact repealed until 1961.

Italy, therefore, had a gigantic unemployment problem on which its governments only began to make any real impact towards the end of the 1950s. It was compounded of suppressed emigration and an economic structure totally unsuitable for a population of 50m on a land area about the same as Britain's (116,000 square miles), of which only half is remotely suitable for farming. In 1951 42 per cent of the population was still employed in agriculture, if employment is the right word when four out of five farms amounted to less than two hectares. By contrast, industry in all its forms employed only about 35 per cent of the working population.

The movement off the land is always thought of as a shift of people from south to north. But it was not just that. Agriculturally depressed areas ran right up through the centre of Italy, through areas like Umbria and Tuscany to the Veneto and the mountainous areas of the north. And there was a long tradition even in the north of smallholders leaving their farms to work in factories when times were good and going back to the land when times were bad.

But the shift from the land was not just a simple question of Rocco and his brothers jumping a train to the north and arriving at the gates of Fiat's Mirafiore works in Turin. First of all there was a substantial shift from the country to the towns within the south. Then there has been an enormous movement of people to Rome itself, which has trebled its population in the past 20 years. In any case a southern Italian farm labourer was not likely to move straight into manufacturing industry, but to swell the ranks of those eking out a living in the service industries. Fortunately, Italians became very ingenious at inventing services after the war, and the enormous, if seasonal, tourist trade helped. Building provided another large outlet. There was all the reconstruction work which needed to be done after the war, financed in large part by the counterpart funds from American aid. And not only did Italy have one of Europe's worst housing problems to overcome, made doubly bad by migration, but it also embarked on an ambitious programme of road building and public works.

The total impact of manufacturing industry on employment, once it got moving again after the war, was rather small, at least until the late 1950s. The reason for this was that labour productivity in manufacturing rose very fast, by about 10 per cent a year consistently throughout the 1950s, and nearly in line with its output. So that although by 1960 industry contributed over 46 per cent of national income, its share of employment had not risen at the same rate.

Nevertheless, manufacturing did add to its labour force. It is a common factor of all fast growing economies that they all need extra labour at the margin. What Italy's large pool of unemployed labour did was to enable the fastest growing sectors of the economy to add without any difficulty to their labour force when they wanted to, right up to the end of the 1960s, and without waiting for declining industries to release their surplus manpower. In other words, firms could largely ignore, until recently, the considerable rigidities in the economy.

Even more important for Italy's

The immigrants

ENI – 1971

SMART MANAGEMENT TRIUMPHS IN A CRITICAL YEAR

Italy and the ENI group were unable to escape repercussions from the numerous discouraging economic factors characteristic of 1971. Rising costs, weakening demand, labour agitation, renewed foreign nationalistic pressures particularly directed at the international oil industry, world monetary troubles, all combined to make good business harder to realize.

Nevertheless, as consequence of a broad background of perennial preparation for business flexibility in times of stress plus the long pursued international policy directed at winning friends throughout the world, ENI and its group of national and foreign based operating companies were able to chalk up in 1971 a 16.5% increase over 1970 in consolidated gross sales, for a total of 1,865.2 thousand million lire (equivalent to $3,189.5 million at the new rate of exchange). This is the highest figure yet reached in the 18 years of ENI existence. At the same time, during 1971 the group invested the largest annual amount ever, 472,400 million lire, which is indicative of the intense effort of ENI management to continue the expansion and qualitative upgrading of key industrial sectors to safely affront critical periods in national and international economies.

This effort in 1971 was an effective factor in the ability of the group to maintain the continuous upward trend in sales. It also indicates the built-in potential created by wise management whereby ENI has been able to maintain its position among the largest energy enterprises of the world while at the same time carrying out its statutory charges to serve as one of the important mediums of the Italian government for executing strategies pertinent to national economic planning.

While as an energy company the majority of group investments are in the petroleum sector, which accounted for 82.1% of group business in 1971 (1,531.2 thousand million lire), ENI's interests also lie in two integrated sectors, chemicals and textiles, which national economic planners consider crucial. Consequently of the planned investments of some 3,020,000 million lire in the next 5 years (1971-75), 32.5% of the outlays are earmarked for the chemical and textile sectors. In the chemical sector, in addition to broadening and strengthening the group position in heavy and basic chemicals, plans in the making are for initiatives which will tend to stimulate diversification toward production of more of the finer chemicals such as intermediates and additives. In the textile field the group for some years has been carrying on a programme for reorganizing, rationalizing and rejuvenating the sector.

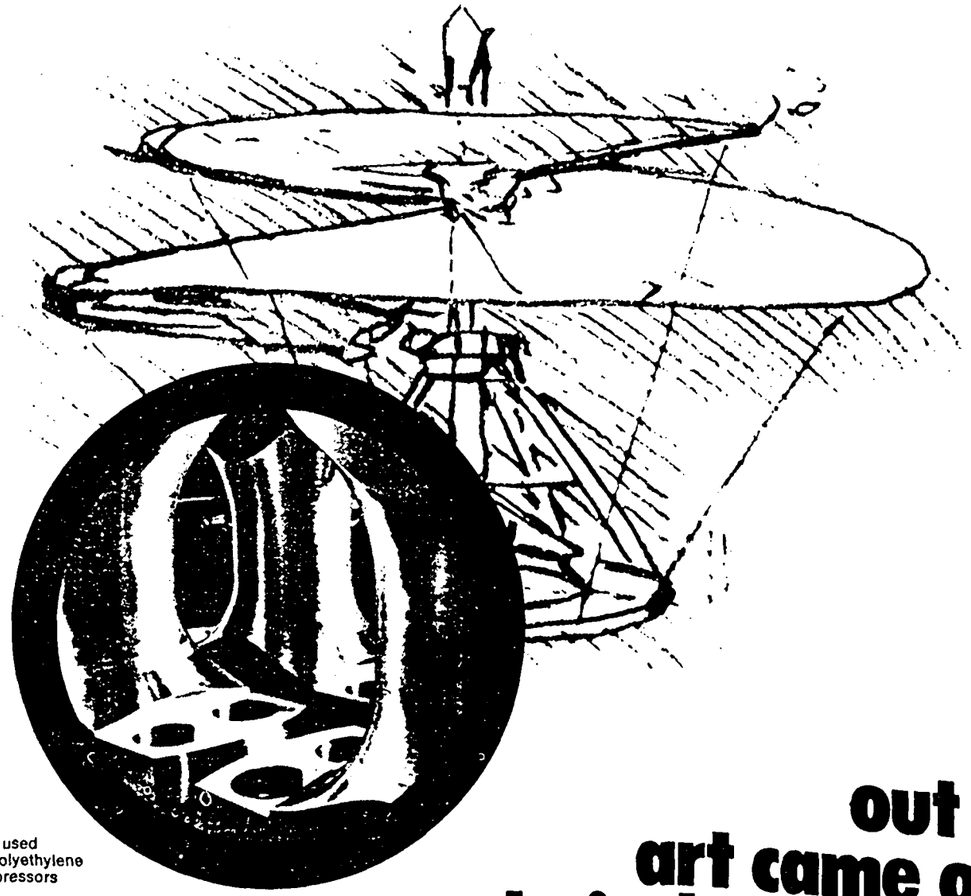
During 1971 the results of group petroleum exploration and production were very satisfactory. New production began making available to the group crude oil from fields in Nigeria, from the Nowrouz field in Iran and from the North Sea, adding 33.2% to the previous year's foreign production. As a consequence total foreign and domestic crude production amounted to 11,700,000 metric tons (average 230,000 b/d). Natural gas production in Italy amounted to 12,399 million cubic meters (437,871 million cu ft), with new discoveries during the year adding 16,000 million cubic meters to domestic reserves.

Although demand for both petroleum products and natural gas in Italy was somewhat restricted because of the economic status which affected practically every sector of industry in 1971, the ENI group continued programming and implementing expansions for meeting future needs. The ENI natural gas transmission system reached a total length of 9,714 km (6,023 miles) by the end of the year, an increase of around 1,000 km more than in 1970. Preparations evolved rapidly for construction of the new transmission lines to bring gas from the USSR and Holland. The importation of LNG from Libya was initiated.

The engineering, construction and well drilling service companies of the group, backed by the farsighted trading and financial policies practiced internationally by ENI, were able to show consolidated sales 18.5% higher than in 1970. Among a large backlog of work at year-end the ENI engineer-constructor sector was building a new group refinery in Zambia.

The mechanical manufacturing sector, despite considerable buyer reluctancy in Italy, was able to show a 12% increase in sales of heavy equipment for the refining, chemical and petrochemical trade. Half of these results came from export business.

Returning to the marketing of petroleum products and connected activities, as in other sectors ENI has continued reinforcement of facilities. At year-end there were 6,773 roadside outlets operating in Italy and 2,015 abroad in 23 countries plus 7 stations functioning in Hungary under the combined AGIP-AFOR banners. In Italy product distribution rose only 3.8% over 1970. Elsewhere in Europe the increase in all product sales rose 12.8% while in Africa the gain in such sales was 21.3%. In Italy 2 new motels were opened and 629 "Big Bon" convenience stores were operating in connection with service stations at year-end.



In the nuclear field, fuel element manufacture continued for supplying the reactor at Latina (near Rome) and a contract was signed for future supply of UF_6 to ENEL. Uranium prospecting continued on leaseholds of the group in various countries and discoveries considered potentially promising were made in Wyoming (USA), Zambia and Australia.

Environmental protection is a field the importance of which has long been stressed by ENI management. To better co-ordinate group efforts and needs in this sector and for studying problems concerning ecology, systems for its protection and for abatement of pollution, a new subsidiary was created under the name of TECNECO with the objective of commercially designing, engineering and supplying such systems.

ENI (Ente Nazionale Idrocarburi) is a corporation wholly owned by the Republic of Italy, created under and by virtue of Law No. 136 of 10 February, 1953. This Law, with subsequent legislative modifications, endowed ENI with corporate powers to operate with the flexibility of a private enterprise in carrying out functions of promoting and actuating initiatives of national interest in the fundamental fields of petroleum, natural vapours, chemicals and nuclear fuels. Where applicable, these include exploration, production, processing, reprocessing, marketing and activities in other sectors connected with operations in the fundamental fields, where such operations are instrumental, accessory or complementary thereto.

Although the Republic of Italy owns other agencies endowed with special statutes, the peculiar combination of functions endowed upon ENI posed managerial responsibility of a nature formerly unprecedented in Italy. While free to operate with the flexibility of a private enterprise ENI has the obligation to account to the Government and Parliament for all its activities.

ENI operates as a holding company, parent to a large group of subsidiary corporations which are private operating companies and which depend upon ENI for assistance in primary strategy formulation and decision making, long-term investment policy and advance planning, financing and negotiating of fundamental business affairs, and for consolidation of programmes to conform with group strategy on both the national and international scenes. With constitution in 1967 of CIPE (Interministerial Committee for Economic Planning) ENI began co-ordinating all programming to conform with recommendations by that body.

out of art came our technical perfection

Machines as technology, machines as art, is the life of Nuovo Pignone, a company in the vanguard of industrial progress, founded on the Florentine tradition. Out of this artistic inheritance, the setting for the achievements of Leonardo da Vinci and Benvenuto Cellini, was born 128 years ago in the ancient district of Pignone the forerunner of the present company. This was a general iron foundry and mechanical engineering works. Today, Nuovo Pignone with its six plants and the experience of thousands of skilled craftsmen is synonymous with technical perfection in the modern world. Today Nuovo Pignone manufactures : compressors, gas engines, turbines, pumps, valves, vessels, and all elements at the heart of the largest refineries and petrochemical plants the world over.

NUOVO PIGNONE

manufacturing boom was the impact the army of unemployed had on wage rates, working conditions and the general docility of the unions. It is only now when social and working conditions have improved so visibly that so much fuss is being made about them. In other words, when it was clearly a privilege to have a job, someone who only two years before was facing destitution in his southern hovel was not going to argue about long hours or a lunch break which lasted only 15 minutes. Wage rates rose at much the same speed as they did in other European countries, albeit from a far lower base. But as far as manufacturing was concerned, they consistently rose only about half as fast as productivity. So between 1950 and 1961 there was a steady fall in wage costs per unit of output.

This, in turn, made its impact on the rate of savings and capital formation. The crucial point here is that in mature industrialised countries high unemployment generally means a lot of surplus capacity too. So, normally, it is not combined with a high rate of capital formation. In Italy during the 1950s, this was not the case. High unemployment made it easy for firms to get hold of labour when they wanted it. It made it easy for them to generate savings because, thanks to the weakness of the unions and the fast rate of growth in production, the workers' share of the cake was falling. It had nothing to do with whether Italian industry was operating at full capacity or not. In fact, since the basic problem of Italian industry was that there was not enough industrial capacity, this background was ideal for the generation of new capital with which to expand it.

Italian industrialists were able to hold their prices steady. And with a reasonable exchange rate (for, like the currencies of all the defeated nations, the lira undervalued rather than overvalued Italy's productive potential) and the tremendous backlog of domestic demand, they had no problem in selling what they produced. They then picked up the profits and ploughed them back into further capacity. This process was aided by two additional advantages. First the tax system in Italy was so easy to evade that no self-respecting firm ever paid anything like what it should have done on its profits. Second, Italy has, since the war, developed a whole variety of ways in which loans for investment are subsidised (the main example is loans for the south, but there are many others).

Other factors which helped to make the Italian take-off possible were the discovery of natural gas in the Po valley, which considerably broadened the base of low cost energy, and the shift in the world oil distribution system, which encouraged the building of refineries close to consumer markets rather than alongside the oil fields themselves. Italy was a natural site for oil coming from the Middle East and has for a long time been a major exporter of refined products, which helps to lower the cost for itself. By the mid-1950s what had been previously for Italy a crippling disadvantage, its own lack of coal, had turned into a major advantage in that it could buy from the cheapest possible sources of fuel on the world markets (including coal from the United States and oil from Russia).

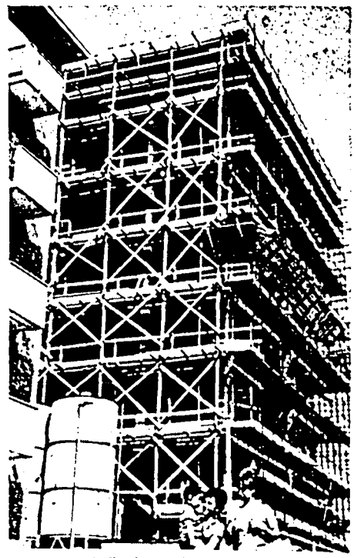
On the distribution side, transport costs began to fall as Italy set to work enlarging its autostrada system. During the 1950s Italy was building more new motor roads than any other country in Europe. And although most of the publicity was lavished on the Autostrada del Sole down to Naples, most of the actual building took place in the north where industry was, with the new roads radiating from Milan.

With costs going down rather than up, Italian industrialists benefited from a further change in their environment, —the lowering of tariff barriers. From being the most highly protected economy in Europe, Italy had to move towards and then undergo the process of becoming part of the EEC. Much of Italian industry was terrified by the prospect, just as French industry was. But for the larger and more dynamic companies it was self evident that the Italian market was uncomfortably narrow if they wanted to be anything like on a par with their European, not to speak of American or Japanese, rivals. Fiat, for example, was thinking in European terms well before the EEC took effect. On the supply side the controlled reduction of tariffs which took place during the 1950s and most of the 1960s once again had a significant impact on the prices of bought-in materials.

For a number of reasons, therefore, Italian industry had a great deal going for it during the prolonged boom of the 1950s. But it also exploited them with considerable flair. This was not just the work of a few large firms. What the boom provided was the opportunity for the highly skilled artisans in which Italy abounded — in part because it had missed out on so much of the industrial revolution previously —to combine with the latent entrepreneurial skills which Italians always had in abundance but rarely before had a chance of revealing. The men who did so well in the boom were the small businessmen in the Veneto area and the Lombardy plain. These men had enormous freedom to do what they wanted, hardly bothered by tax men, union officials or pollution inspectors. Milan became and is still the free enterprise capital of Europe in the old American sense of the word.

Running out of steam

The first serious check to this process of growth feeding on growth came in the early 1960s. By the end of 1961 industrial production was running at double its level in 1953. Then a change started to take place. As boom year succeeded boom year, unemployment started to fall much more rapidly than before ; net emigration began to decline ; and for the first time shortages of certain types of skilled labour started to appear. Internal migration to the industrial centres started to increase rapidly as the word got around that there were plenty of jobs to be had in the factories.



Although there was plenty of unemployment and above all under-employment left in Italy, particularly in the south, the fact that in the first three years of the 1960s employment in industry had grown by nearly 1m workers and that this had been over a decade when a large section of society had experienced steadily rising incomes caused a shift in priorities and expectations. As the American economist, Mr Charles Kindleberger has put it: "Full employment is the most important structural reform. When this is satisfied it is time to move to the next items on the list." And the next items were glaringly obvious. Put it another way, labour unit costs revealed in the Italian ministry of labour statistics, covering about half manufacturing industry, fell between 1953 and 1960 by 22 per cent. And the surplus was fed not to the consumer but to investment and the owners of capital. In the next three years, as the labour market in the north began to tighten and the unions began to feel the first stirrings of power, labour unit costs began to

rise at an increasingly rapid rate, until the increase reached 10 per cent in 1963. Industrial wages, it is worth remembering now in 1972, rose by 16 per cent in two successive years, and, moreover, differentials, between regions and between men and women, started to narrow.

The whole basis of the Italian miracle, in fact, was being called into question. And greater prosperity brought the economic and social inequalities more sharply into focus. Poverty remained deeply ingrained in the south. The dusty mummy which went by the name of Italian bureaucracy remained largely unreformed. A fairly large investment effort by the De Gasperi government in the early 1950s in agriculture had little impact. And the enormous social costs of migration, which might have seemed bearable when all around was lying in ruins, were now a startling contrast to the Alfa Romeos flashing by.

The change in the economic balance in the early 1960s, which included a shift into deficit on the balance of trade and a consumer-led, instead of export- and investment-led boom, was paralleled by a political change which led in 1963 to the first of the centre-left coalitions. The most interesting period of the Italian miracle, and the most instructive for the present time, is that from the 1963-64 recession until the hot autumn of 1969. There are both economic and political parallels. The opening to the left had been preceded by a shift to the right, the recession by a wage explosion, and in both cases some of the most important demands by the unions were political.

As so often it was the Bank of Italy which engineered the decisive shift in policy. As the current account plunged into a $1 billion deficit in 1963, so capital started to take flight, literally, across the Swiss border. The authorities had to repurchase $1.5 billion in bank notes. As a result of the combined pressures they started to tighten the monetary screws towards the end of 1963, by which time, as so frequently happens, the boom had already passed its peak. The net result of the credit squeeze, combined with a package of deflationary fiscal measures early in 1964 and the downturn already taking place in business expectations, was that industrial production fell appreciably, for the first time, in the middle six months of 1964. All this was accompanied by a decline of nearly 200,000 people in industrial employment. But then, as now, the unemployment statistics did not reflect this, or the continued rapid shift from the land. This

Not enough flesh on the skeleton

happened because, first, a lot of women left the labour force and second because 300,000 people went back to the service industries, easing the aches and pains of Italian urban life for others more fortunate than themselves.

In 1964, as in 1971, the surplus on current account helped to limit the recession. Then, the gloom continued until the middle of 1965, by which time an export boom had developed to pull the economy out of its malaise, although employment continued to fall and unemployment to grow until well into 1966. The surge in exports was followed by a recovery of investment, and in those simple days the revival of production was not hampered by "irresponsible groups of left wing extremists" in the factories. Gross national product recovered its pre-recession momentum with a sharp rise in industrial production. Profits rose. Prices remained stable. And life bloomed like a rose in the industrial centres of Milan and Turin. Over the three years 1966-68 real output rose by 6 per cent on average.

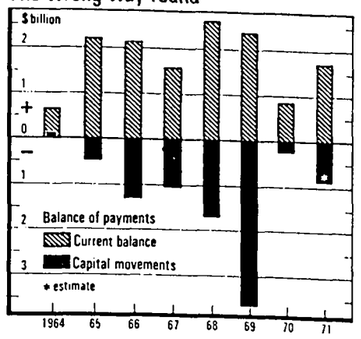
But there were several mildly disturbing points. First, factories were not hitting the capacity levels at which they had been running in the early stages of the miracle. Second, investment did not represent the same share of gnp it used to have (19 per cent, against 24-25 per cent in the old days), and although employment in industry was rising again, it was not enough to cope with the movement off the land. Third, a great deal of the expansion in final demand depended on Italy continuing to run a very large surplus on its current balance of payments.

Meanwhile the impact of public spending had actually tended to be deflationary, at least until 1968. And when expansionary it tended to be channelled through the salaries of the growing number of civil servants, not into the badly needed hardware on the ground. Allocations of many billions of lire for schools, houses, hospitals, sewage systems and the like tended to remain figures in some dusty ledger. This gave heart to the budding extra-parliamentary left.

Differing strategies

What was emerging was a new coalition against the status quo, if only in the sense that that was all most of the "antis" had in common. There were those who had suffered directly from the massive transformation which Italian society had undergone, the city immigrants. There were those who had suffered indirectly, through the pressure on inadequate social resources. There were the articulate members of the left who wanted to stoke the fires into a revolutionary bonfire. There were alarmed leaders of the union confederations who found that within their own organisations things were not what they used to be. And there were the politicians who, for two different sets of cogent reasons, were against the status quo.

One set was most eloquently put forward by the Republican party, which had been pulled back from the brink of extinction by Signor Ugo La Malfa who attracted what a few years ago would have been called the technocrats, decent university men and the younger and often American-educated business managers. What people like these hated above all was incompetence. On the one hand, there were over 9,000 state agencies which had been set up over the years to cope with one sort of problem or another and which not only did little or nothing but actually prevented any reforms taking place. On the other, state activity largely took the form of allocating funds for some specific and laudable purpose—and then not spending them.



There was a famous example of this in 1969. Children, despite the loving attention devoted to them—and no one is more beautifully dressed than an Italian baby out with its parents for the evening air—are one of the most underprivileged groups in Italy. In the north the number of schoolrooms and teachers has not kept pace with the rise in population. In the south the word school is often a joke for the badly equipped shack into which children are herded. So the government set aside $1.1 billion for a schoolbuilding programme. Two years later only 10 school rooms had been built.

The problem to which middle-of-the-road critics addressed themselves, was how funds like these, allocated but not spent, could actually be used without causing chaos in the fiscal management of the country. By the end of last year the infamous residui passivi amounted to $12.8 billion. It is normal for the Italian public sector, central and local government, to run a substantial deficit. Only too often the sums allocated but not spent for capital investment turn up in the form of an increase in current spending, either in higher transfer payments or in higher salaries.

The Republican programme, therefore, would mean that some Caesar of the budget would have to bring in some pretty drastic administrative reforms. And this raises rather profound questions for Italian society as a whole. In Rome and places south the bureaucracy is one of the main sources of employment. And patronage over jobs is a key source of political power. To be made doorman in a regional office in Palermo is a political transaction. To reform the civil service is therefore a hard job indeed for any government—particularly one dominated by the Christian Demoorats, who have so much of their power-base in the south.

Related to the absolute size of current spending is not just the question of the bureaucracy but also the increasing degree to which the government has been handing out subsidies, for lowering the cost of credit, for baling out para-state institutions and so on. One of the most frequent complaints about government activity is strangely reminiscent of the "lame duck" controversy in Britain. It is that if cash from the state is used to shore up all the most feeble parts of the economy, the whole concept of financial responsibility and of individually accountable profit centres is blurred.

The wrong way round

And that this is likely to have profound and disastrous effects on the efficiency of the Italian economy.

By 1969 another attack was being launched by men of the traditional left, which had much more to do with one of the important parts of the structure of the economy. Put in the words of an OECD report it was this: "Economic expansion has continued to depend significantly on a sizeable current external surplus, entailing a transfer of real resources abroad, largely to advanced industrial countries with considerably higher levels of income per head than Italy."

Checking the outflow

The normal balance of payments structure of a country which is trying to catch up through fast growth with the rest of the industrialised world is that it runs a deficit on current account which is financed by a steady inflow on capital account. In other words it needs to have real resources moving in its direction, not away, in order to obtain extra growth.

Initially in the Italian miracle the United States acted as the rich uncle. But over the past decade it is Italy which has been lending not borrowing. It has been running a surplus on current account of around $1 billion, because the capital account has almost always been in the red over the past decade and deteriorating rapidly at that. The basic reason why the capital account is bad is that Italians do not like to invest in their own country. Many Italian companies are owned at least in part by a holding company in Switzerland or Luxemburg. More extraordinary still is the habit of Italians who are less than millionaires of driving north with large quantities of lire in their car boots. In 1969 this trade reached L2.25 billion (£150m).

It is related not so much to the underlying strength of the lira, which in many ways should have been one of Europe's strongest currencies over the past decade, as to the political barometer.

The left-wing parties have argued, with some plausibility, that the rich should not be allowed to penalise the fortunes of the poor in this way. Controls they say, should be imposed so that the capital account would reveal more clearly the steady net inflow of foreign capital and so that Italy could benefit from the enormous earnings of the tourist trade, which despite the growing number of Italians who spend their holidays abroad, brings at least $1 billion net a year on a conservative estimate. What needs to be done, according to this argument, is to bring about a structural shift in the trade account so that Italy moves from running what has become a rather regular trade surplus to a regular deficit.

The problem with this policy is that it is much easier to say that it should be done than to say how it should be done. One thing the Italian government is notoriously bad at is organising controls so that they are not systematically flouted. Most people from the centre rightwards would argue that the causes, not the effects, have to be tackled, and that the average Italian capitalist has to acquire a sense of confidence in his country, which the unions and the left are not doing anything to foster.

But even if controls were imposed—which arguably they could be—a further problem remains. How could the extra resources be shifted towards badly needed capital investment and not towards extra consumption? A more expansionary money supply would not itself distinguish between the two sectors. So one comes back to the question of administration.

A shift of real resources towards schools would inevitably have, for instance, an impact on the balance of payments, since in one form or another capital would tend to be shifted from the laying-down of another assembly-line for export towards building schools, which would not come into the balance of payments (except in terms of their import component). But, of course, the real resources available for any purpose will depend not just on the distribution of the gnp but its size and its rate of growth. A very hinder not help the shift of resources to social investment.

The unions flex their muscles

These kinds of arguments were what the hot autumn, at its most rational, was all about. The immediate reason for a large scale confrontation between unions and employers was that wage contracts in Italy for large sections of industry are renegotiated every three years, and in 1969, as this year, they had to be renewed for certain key sectors such as metal working. Industrial trouble had been building up since the early summer, particularly at the Fiat factories in Turin. It soon became clear that there was a new mood on the shop floor—a much more political attitude to disputes, to which employers were not accustomed. The demand for higher wages were certainly part of it.

But there were also two other important questions being raised for the first time. First came questions about the conditions of work. The "inhuman slavery of the production line" was the kind of phrase being bandied about. One of the reasons for this was that in terms of things like lunch-breaks and the length of the working-week Italians were feeling they had not caught up with northern Europe. They had some justice on their side, although practice in the larger international companies was as good as anything elsewhere.

A second important reason was the increasing proportion of the labour force at factories like Fiat's Mirafiore works that had emigrated from the south. First generation industrial workers would arrive in the north, get a job perhaps in building or construction, and then drift into assembly-line work because the wages were higher. But after a year or so many of them would begin to find the monotony and the discipline of working on the assembly-line intolerable. It was among these workers, who were often separated from their families and living in bad housing conditions, that the ultra-left groups, like Lotta Continua, found their working class recruits. The unions also found in regional differentials in wages ammunition to fire at the industrialists.

The other set of questions which the unions were raising were national political ones. As a result during the closing months of 1969 the unions were addressing themselves half to the employers across the table, half to the politicians. The main tactical needs were to win concessions across the board, to convince their workers that the unions were still relevant and to enable them to exert some leverage on the government in Rome. By using short but repeated strikes as a bargaining weapon, they were highly successful. Regional differentials were abolished; wage increases, together with cost of living adjustments, pushed up earnings in 1970 by over 20 per cent; and a whole package of measures to shorten the working week, reduce overtime and generally improve working conditions were agreed upon.

The immediate costs were nearly 38m working days directly lost in strikes, and rather over 1 per cent of gnp (over £330m). But in contrast to France, where the economic recovery from the events of May, 1968, was remarkably quick, the continued side-effects echoed heavily through 1970 and 1971. For one thing, there was a dramatic fall in the growth of productivity, down from nearly 10 per cent in 1969 to under 2 per cent in 1970. This was not only due to the once-and-for-all shift caused by shorter and more tolerable working hours. It also had something to do with the new labour laws passed in 1969, which in many ways tilted the balance in favour of employees against employers. For instance the rules applying to sick leave were changed so that it became easy for workers to take selective and awkwardly timed holidays.

At the same time work-stoppages, though not on the scale of the hot autumn, became endemic. There were further national contracts to be bargained over. And the implementation of the 1969 agreements at plant level led to a good deal of continued bitterness and strife. There were a good many complaints that employers were constantly trying to go back on what they had agreed. But the central point was that unions had to maintain the pressure they had built up in 1969, partly to reinforce their own control at factory level and partly to boost their political importance. Indeed political strikes becames increasingly frequent, even though these usually lasted only four hours or a day.

Disruptive tactics

One of the problems that the personnel officers of the main companies faced was that the disruptive tactics of their workers were subtle and it was not always easy to identify who was responsible. The unions have never been rich, for in contrast to other countries money has tended to move in

They were not just fighting Pirelli

Italy from the political parties towards the unions, where there are close political affiliations, and not the other way round. Nor do workers in Italy obtain much in the way of family benefits. So, with their usual ingenuity, Italians have worked out methods of selectively not working, like failing to work on every tenth car.

All this has suggested to the ambitious union leaders that they can force the government to do things in a way which no other pressure group can. They had a notable success in 1969, for instance, when they forced the Rumor government to take some hasty action on its pensions bill. Part of their political ambition is the move towards the unification of the three main confederations, CGIL, the largest, linked with the communist party and possessing around 3m members, CISL, at one time linked to the Christian Democrat party with 2m members, and UIL, which is roughly social democrat, with 800,000 members.

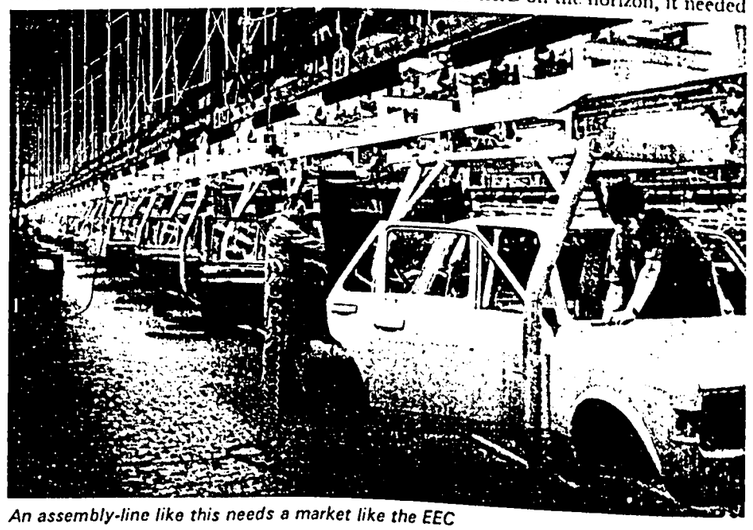
Talks have been going on since the unions found they could work together in 1969, and the first important joint initiative was in May last year when the metal working unions joined together in a new attack on Fiat. This time the basic theme was a change in the nature of work, highly philosophic in tone but with a practical side-dressing of shorter working hours and new manning procedures. Although the unions did not get very far in getting the traditional assembly-line changed, they built up enough enthusiasm for a joint congress held at Florence in November to decide that the confederations should merge. The theory was

that a joint union would be more effective and attract more members, perhaps a total of 6m-7m. The problem has always been that the confederations have very different political affiliations. But it was hoped that three years of militancy would have swept the differences away.

In practice, the likelihood of a new single confederation being set up on schedule next February gets slimmer each day. The original decision was pushed through by two leaders, Signor Luciano Lama of CGIL and Signor Storti of CISL. Signor Vanni of UIL and his men were always lukewarm, as was a big minority of the CISL hierarchy. The basic objection, strenuously denied by Signor Lama and Signor Storti, is that the new union will become the instrument of the communist party. In defence of unification, all senior members of the new union will have to give up their political affiliations. And in the united body the communists (who do not have an absolute majority in the CGIL) would be easily outvoted as a block. But the election and the question of the referendum on divorce (which would split catholics and communists) have aroused old antagonisms. The communists, after all, are by far the best organised political group. And no one quite trusts them.

When the new contracts come to be renegotiated in the autumn, therefore, the unions will not be as strong as they would like to be. Two years of stagnation, for which they have been partly responsible, is not a good position from which to bargain. And there is an increasingly powerful school of thought within Confindustria for standing up to the unions wherever they challenge.

This is coupled with a feeling that in the past the employers' organisation has been too dominated by the big industrial groups which find it easier than others to absorb steeply rising wages. This does not mean a return to the paternalist, sometimes contemptuous, attitude which employers used to have before 1969, but it shows a desire for less rhetoric and more hard bargaining. The employers, for example, held talks with the unions in February on the deteriorating economic situation. This suggests that there is still some willingness for a dialogue on both sides. How the bargaining in the autumn will turn out depends upon the tactics of the union leaders, still divided against each other. But it is hard to be optimistic about the chances of both sides of industry coming to a sensible compromise.



Wider frontiers

If the unions have seen their own involvement in politics as the solution to Italian problems, a good many Italians among the older establishment of industrialists and politicians have seen Italy as an insoluble logical puzzle which could only be resolved by altering the frame of reference for the broader one of Europe. By pressing for economic and political integration within the European community (and the larger it becomes the better) they believed that Italy by a process of osmosis would become like other nations in the north where things work better (the civilised virtues which Italian life possesses being always taken for granted).

What has the EEC done for Italy? The short answer is a good deal, despite the fact that Italy had previously been the country with the highest tariffs. There is no space here to go through the involved ritual of working out exactly what can be attributed to the formation of the EEC per se and what would have happened anyway. But one can affirm that Italy's is an example of export-led growth, that its sales of goods to the other members rose very rapidly, both absolutely and in terms of its share of total intra-community exports, and that its success within the community was paralleled in external markets. During the first 12 years of the community's life, Italy's share of intra-EEC trade in manufactures nearly doubled to around 15 per cent and outside the community it achieved a similar success, with its share rising from just over 3 per cent to 6 per cent.

But a cautionary note needs to be sounded here. While the increases have been dramatic, Italy's initial take-off point was very low. In 1958 Germany exported five times as many products within the EEC as Italy did, and France twice as many. What Italy has basically been doing, therefore, is moving nearer what its share should naturally be, given its size and population. A lot of Italy's economic development can be explained if one assumes that capital and know-how are quickly transmitted, and that given a roughly similar level of skills and culture, there is no reason why one country should be much richer or poorer than another. In other words, Italy has been catching up on its delayed development potential. The EEC hastened this process. There is no doubt in the minds of the leading manufacturers that Italy did not provide them with a large enough market for them to achieve parity with their European rivals. The EEC helped to provide this.

A perfect example is Fiat. Although even by European standards it was a relatively small producer until the mid-1950s, it has always had a policy of exporting at least 30 per cent of its production, on the basis that the Italian market, where Fiat was completely dominant, was too narrow. By the mid-1950s the Italian market was starting to grow rapidly, but Fiat still produced only around 250,000 cars. With the EEC on the horizon, it needed

Fiat 127: the European

903 c.c., 47 b.h.p. (DIN), 87 m.p.h., 5 seats

This is the considered judgment of over 100 motoring writers from 18 European countries who have chosen the Fiat 127 "car of the year".

The completely international character of the panels of judges organized by the three magazines STERN (Germany), AUTOVISIE (Holland), TECHNICKÉ NOVINY (Czechoslovakia) and the Danish daily MORGENPOSTEN show that the 127 is the complete answer to today's huge traffic problems, while at the same time meeting the apparently contradictory requirements of European motorists:

- *more comfort, more room, but smaller external dimensions;*
- *high performance, but a small capacity engine to reduce exhaust fumes;*
- *competitive price, but high standard of engineering, especially for safety.*

To all these problems the Fiat 12 provides a European answer.

FIAT

IFI

a highly diversified italian holding company with large investments in a great variety of industries

Investments are held in the following areas:
automotive, beverage, cement,
refractory, ball and roller bearings,
components and equipment
for the automotive industry,
printing and publishing, insurance,
finance, retailing, real estate, hotels

IFI Istituto Finanziario Industriale

a public company with more
than 12.000 shareholders on record:
its preferred shares are listed
in the main European exchanges

to obtain much bigger economies of scale if it was to withstand competition. Leaving the Fiat 500 aside since it is largely produced for the home market, about 50 per cent of Fiat's total output is now exported, four-fifths of it to Europe. It now produces about twice as many cars as the Italian market, which has been virtually static since 1966, can take. Its share of the European market, over 20 per cent, is nearly twice as large as that of its nearest rival, Volkswagen.

Fiat's international presence is in fact even more pervasive than these figures suggest. It accepted early on, with a good deal of political realism, that a large number of less developed countries would want to save imports and industrialise by making or assembling their own cars. In over 20 countries now, from Korea to Argentina, the local car of this sort is a Fiat. But the most interesting area where Fiat is involved is eastern Europe. There is the famous plant in Togliattigrad in Russia, scheduled to turn out 600,000 modified 124s. Some of the old 600s and 1300s are built in Jugoslavia, 124s in Bulgaria, tractors in Rumania, and there is now going to be a big expansion in the Polish plant for 125s. Fiat sees eastern Europe now much in the way it saw western Europe in the 1950s. In the short run there are considerable side benefits in being well entrenched in the east, particularly in terms of follow-up orders and other contracts (Fiat for example is helping to establish service organisations there).

But clearly Fiat hopes that the eastern European market will become increasingly integrated with that of western Europe. Some of the old east European hands think that this is being ridiculously optimistic. They argue that communist governments will either ignore the growing demand for cars rather than devote increasing resources to them, or—and this is the crucial question for Fiat—they will not be prepared to engage in a vigorous two-way trade. But, at least, Fiat in the east has a useful alternative source of supply for filling up its dealers' showrooms when they cannot get enough cars from Italy.

Fiat now has a large minority holding in Citroën, and the medium term plan is to dovetail all operations from research to production and sales, making the deal a full operating merger. Fiat's internationalism has made it the object of the accusation that it has been buying itself out of its labour troubles at home. This, with justice, it would strenuously deny, for easily its largest investment outside Turin in the past few years has been in southern Italy. But it is certainly acquiring the flexibility inherent in being a world-league company and this makes the union leaders uneasy.

The assembly line takes over

Nor is it the only one. Pirelli, the rubber and tyre group, merged two years ago with the British Dunlop, for reasons that are not completely clear but which seem primarily to have been defensive, to cope with the American giants and the fearsome technological record of Michelin in France. Olivetti has carried the worldwide rationalisation of its plants perhaps further than any other international company, producing for instance all its portable typewriters in Spain. Eni, the national oil concern, has pioneered joint production companies with the host country in several areas.

This flexibility works both ways. Italy is no Japan when it comes to letting in foreign investment, although one or two large deals have come unstuck (for the Italian way of business has its own conventions which can seem appallingly foreign to the Anglo-Saxon). Fiat for example sold out its ball-bearing company, RIV, to the Swedish SKF in 1965. The big companies, Zanussi and Ignis, in the highly successful domestic appliance industry have either close ties with or are owned by foreign companies. And recently there has been increasing foreign involvement in the Italian car component industry, notably by Lucas and International Telephone and Telegraph.

The big four

The Italian attitude towards foreign investment is in fact a key to understanding how its industry works. It is part of conventional wisdom in Italy to say that industry is basically run by four groups: Iri, Eni, Fiat and Montedison. In terms of their direct contribution to the country's added value, this is not strictly true (although between them they must contribute close to 10 per cent of the gnp). As was noted earlier, Italy is still very largely a country of small to medium sized firms. But the leverage the big firms possess is very large. They are giants among minnows. There are only six Italian firms among Fortune's top 200 outside the United States. (Iri as a unique type of holding company is not included, but Finsider which forms a major part of it, is.) Apart from the big four, the other two are Pirelli and Olivetti. The ramifications of these giants are almost endless. Between them they have a major part to play in almost all sectors of the economy.

Iri controls the three major commercial banks. It builds nearly half the autostrade and runs Alitalia and a good deal of the merchant shipping fleet. It has practically all the shipbuilding capacity, runs virtually all the telephone system and owns half the steel-making capacity. It is also important in cement, food products, cars (Alfa Romeo), and plays a key role in aeronautics and electronics. Eni, besides being an integrated petroleum company, dominates petro-chemicals through Anic, has got into textiles and runs some extraordinarily successful engineering and construction consortia (like Snam Progetti).

Montedison was the product of a merger in the middle of the 1960s between Montecatini, which before Anic was set up completely dominated the chemical industry and an ex-electricity company, Edison. Montedison then threatened to become a shambles, and the Italian chemical industry with it. With the Italian balance of trade on chemicals sliding into the red, Eni three years ago, with Iri, tried to take it over. For two years there was a vicious battle that involved most of the household names in the Italian industrial establishment, including Fiat and Pirelli. They were worried that with the inclusion of Montedison the state would become too dominant in industry. In the end a stalemate was called while everyone decided what to do next and the government drew up a plan for the chemical industry's future.

Between them they can get most things done . . . Fiat's Agnelli, Iri's Petrilli, Eni's Girotti, Montedison's Cefis

The dilemma was resolved in classic Italian style, not by altering the balance of shareholder power but by making the man who had been president of Eni since 1966, Signor Eugenio Cefis, head of Montedison. Cefis is not a man for personal publicity. But in many ways he is the most interesting industrialist on the Italian scene. In the year he has been at Montedison hardly a week has gone by without the company making a takeover bid or selling off a subsidiary. The biggest coup so far was Cefis's successful bid for Snia Viscosa, Italy's largest textile company. The effect was rather as if ICI in Britain had managed to buy up Courtaulds, and it has meant a battle with Eni, which also wanted to become the key textile producer to round off its petrochemical-synthetics interests.

Finally there is Fiat, the fief of the Agnelli family (which controls it through its financial holding company Ifi). Its power, political as well as industrial, has increased over the past decade in line with its extraordinary and highly profitable growth. Fiat, thanks to the historical lack of ancillary industries, probably buys in less and makes more of its end-products than any other European car maker. Apart from all kinds of vehicles, engines and a certain amount of vertically integrated activities like steel making, it owns part of the aircraft consortium and is in nuclear engineering.

Between them, the big four can put together almost any kind of deal that needs to be made and in the past few years there has been increasing cooperation between them to plug the gaps in Italy's industrial capacity. The fact is that, despite its dynamism, Italy's industrial structure is still rather thin compared with that of its main industrial neighbours, both in its range and in its management and technological capability. In aeronautics, electronics and in nuclear power it lags behind its main European neighbours. And it is painfully aware of its rather minor role in the various European consortia set up in these fields, although it is in the multi role combat aircraft and in the European airbus. As a result it has insisted very strictly on the principle of *juste retour*—in any multinational project you take out exactly what you put in—which has been a major barrier to the development of European technology.

The big gaps

In general Italy comes low on the research and development ratings. This makes some of the key people in its more advanced industries nervous about the future. Entwined with the theme of the technological gap is that of the management gap. Italian industry used to be run until a few years ago by a lot of old men with only a few young exceptions. By and large the 70- or 80-year-olds have been replaced by men in their 40s and 50s, and some younger ones like Umberto Agnelli. (On the other side of the glass door the leaders of the engineering unions are in their 30s, suave, articulate and indistinguishable from some of their brighter, opposite numbers in management.) But the roots of Italian industry are still the small family owned firms, run sometimes by an entrepreneur who knows how to make something but gets into trouble as soon as his firm grows beyond a certain size.

The pool of management is relatively small, especially since people do not move around much to gain experience. The movement tends to be at the top rather than in middle management. There is still rather the tendency to say once an Olivetti man always an Olivetti man. Iri, with its enormous diversity and a policy of letting the local man get on with it, is one of the best training grounds in Europe. And Iri men are sometimes loaned out when a company gets into trouble and has to be rescued by the usual consortia of the establishment. But they cannot cover the whole of the economy.

Despite two decades of growth there is therefore a lingering sense of insecurity and inferiority among Italians (although not, one feels, at the Bank of Italy) which reinforces the tendency to operate in alliances, industrially as well as politically, and to make sure that none of the key spokes in the wheel suffer disaster. The bankruptcy of Rolls-Royce and the loss in prestige which it caused would never have been allowed to happen in Italy. Some years ago a similar fate threatened Olivetti. It was rescued by a consortium which included the state medium term financing institute, Imi, Fiat, Pirelli, and one of the most interesting institutions in Italy, Mediobanca. This is a medium term credit institute set up by three of Iri's commercial banks to get round the fact that under the 1936 banking laws they are meant to be concerned with short term money only. In practice it has become the crucial arbitrator in any takeover deal which involves two or more powerful interests. It has, for instance, a 2 per cent stake

MONTEDISON:

STRUCTURE OF A GROUP

The Montedison Group was created in 1966 through the merger of two of the largest Italian industrial organisations, MONTECATINI and EDISON. The two groups, while working mainly in the field of large-scale chemicals (basic products, fertilizers, petrochemicals, plastics, and artificial and synthetic textile fibres) had widely diversified production structures and activities that gave them positions of considerable importance in other sectors, such as aluminium, department store and supermarket sales, the engineering industry, electronics, textiles etc.

At present, activities in the aluminium, chemical and petrochemical sectors are carried on directly by MONTEDISON, a minor role being played by a few important associate companies. Other sectors (fibres, textiles, department stores, food products, engineering, electronics) are operated exclusively by companies in which MONTEDISON SPA has shareholdings of varying size. Between 1971 and early 1972, two major events have occurred to strengthen the Group and shift the emphasis within it: firstly, Montedison has acquired a controlling share in a major pharmaceutical company, Carlo Erba; secondly, the Group has decisively increased its participation in the key textile group Snia Viscosa.

Thus, Montedison's textile side, already dominant, is further enhanced, while the pharmaceutical interest, hitherto relatively minor, now looms large.

Because of its size, its many associate companies, and the wide diversification of the products involved, the MONTEDISON Group is organised into divisions, which combine, as far as possible, all related activities, irrespective of whether they are carried out directly by MONTEDISON or by the associate companies.

The divisions, which are largely autonomous within the overall policy framework of the Group, are:

1) **The Petrochemical Division**, which operates in the field of basic chemicals (basic products, intermediate products, and plastics) and manages the petrol refineries. 2) **The Agricultural Products Division**, which is concerned mainly with fertilizers. 3) **The Industrial Products Division**, which supervises the production of basic inorganic chemicals, and production relating to the secondary chemicals industry (paint, explosives). 4) **The Minerals and Metals Division**, which is concerned with extracting operations and metallurgy. 5) **The Engineering Division**, which designs and manufactures plant both for the Group and for customers, and is responsible for associate companies in the electronics field. 6) **The Industrial Services Division**, which controls production installations and the distribution of electrical energy for the Group, and supervises the production and distribution of gas in Milan. 7) **The Miscellaneous Division**, which is concerned with the activity of a large number of associated companies, operating in a variety of fields, the chief ones being mechanical engineering and building construction. 8) **The Research and Patents Division**. The other main activities, carried out by the Group, but not supervised by single Montedison Divisions, are the following: 9) **Pharmaceutical industry**, in which operate two Groups, Farmitalia and Carlo Erba. 10) **Fibres and textiles**, which is concerned with the manufacture of chemical fibres and textiles 11) **Retailing trade**, in which an associate company, the STANDA, works in the field of department store and supermarket sales. 12) **Food production**, in which the Group operates almost totally through a single associate company.

The Group employs about 175,000 people, 164,000 of whom are employees of the Holding Company and associate companies working in Italy, and 11,000 of overseas associate companies.

About 70% of personnel in Italy work in the north, about 12% in Central Italy and 18% in the South, where most of the jobs have been created in the past twenty years as part of the policy to combat unemployment in that part of the country.

The industrial side of the MONTEDISON Group works through 193 factories, of which 170 are in Italy, and 23 abroad. The numerical distribution of these factories, by production sector, is: 73 in chemicals and petrochemicals; 19 in fibres; 28 in textiles (transformation) and clothing; 15 in minerals and metallurgy; 17 in food products; 41 in other miscellaneous sectors.

The production units of the Group are distributed throughout practically all the Italian Regions, with particular concentration in Veneto, especially in the Porto Marghera (Venice) area, in Lombardy, Piedmont, and in Sicily.

Industrial activity abroad is mostly in the chemical, petrochemical, and synthetic fibre sectors. There are production units in the Netherlands, France, Spain, Malta, the United States, Mexico and Brazil.

Montedison's activities have profound ramifications throughout the Italian economy. The Group sells basic and semi-finished materials to many other companies, as well as other products direct to the consumer.

These activities lack a uniform pattern. Yet, the priorities and choices established in defining the Group's growth strategy have to match Montedison's human, technical and financial resources, and productivity and profitability must achieve high levels while bearing in mind the Group's responsibilities to the community.

Moreover, to achieve these aims, major decisions need to be taken regarding the restructuring of the organisation.

Some of the most important sectors in Montedison's activities, such as chemicals and fibres, can compare for size with major international concerns. Other, more recent ones, such as retailing trade and food, have already attained significant proportions.

Others again, such as mining and electricity generation, make an important contribution to ensuring the steady growth of the chemical side of Montedison's operations, while certain small-scale sectors, including iron and steel, mechanical engineering, electrical engineering, the electronic and the building industries, were inherited through the diversification policies of the original Montecatini and Edison companies before they merged to form the Group.

Analysis of the Group's different areas of activity shows that a predominant role is played by chemicals and synthetic fibres, which together account for fixed assets worth 2,830 billion lire, or 92% of the Group total, and sales of 1,330 billion lire, or 65% of Group turnover. These sectors also employ 122,500 people, i.e., 70% of Montedison's total labour force.

These, therefore, are the Group's major activities. They are backed by a massive body of human resources, expertise and a vast technical and marketing organization.

The Group's large-scale retailing trade operations make up an area of primary interest too. Montedison owns Italy's largest department store and supermarket chain, whose turnover accounts for around 40% of the total national sales in this sector. Apart from purely profit-making considerations, the growth of this business has important social implications for the modernization of the Italian retailing system. It also effectively promotes the Group, since many Montedison products are sold at its outlets. At the same time, the retail division is in a position to make a direct assessment of the market on which to plan a production policy for the Group's manufacturing and base chemical operations.

In the food industry, Montedison is now engaged in a substantial reorganization with a view to achieving increased profitability.

Finally, the Group is in process of gradually withdrawing from other sectors such as the iron and steel engineering, mechanical and construction, electrical apparatus, electronic equipment and other industries, which are outside the scope of the main growth guidelines previously indicated. Despite traditional links with these industries, Montedison has to envisage the possibility of reducing its commitments in these areas to raise the funds required for major investments in chemicals and synthetic fibres.

The brief outline of the Group's activities and future strategy illustrates the importance of its role in the chemical industry in particular, and the Italian economy in general.

With its organisation, traditions and research potential, Montedison is the only Italian company in a position to compete with major international chemical and synthetic fibre groups on an equal footing. Yet, if it is to play this part to the full, considerable investments will be needed.

According to provisional figures, the Group's capital expenditure on new plant and equipment amounted to around 370 billions lire in 1971. Between 1972 and 1975, Montedison plans to spend around 500 billion lire to complete projects now in progress, and, in addition, there is a programme to expand the Group still further. An outlay of about 1,400 billion lire is likely to be needed for these projects between 1972 and 1975, and their completion during the subsequent three-year period will call for further investments of about 750 billion lire.

Over the four-year period from 1972 to 1975, the Group will therefore need to invest 1,950 billion lire in new plant and equipment to complete various projects in progress and initiate others now at the planning stage.

On this overall capital expenditure, 72% will represent investment in chemicals, 18% in fibres, 8% in retail distribution and the remaining 2% in other activities.

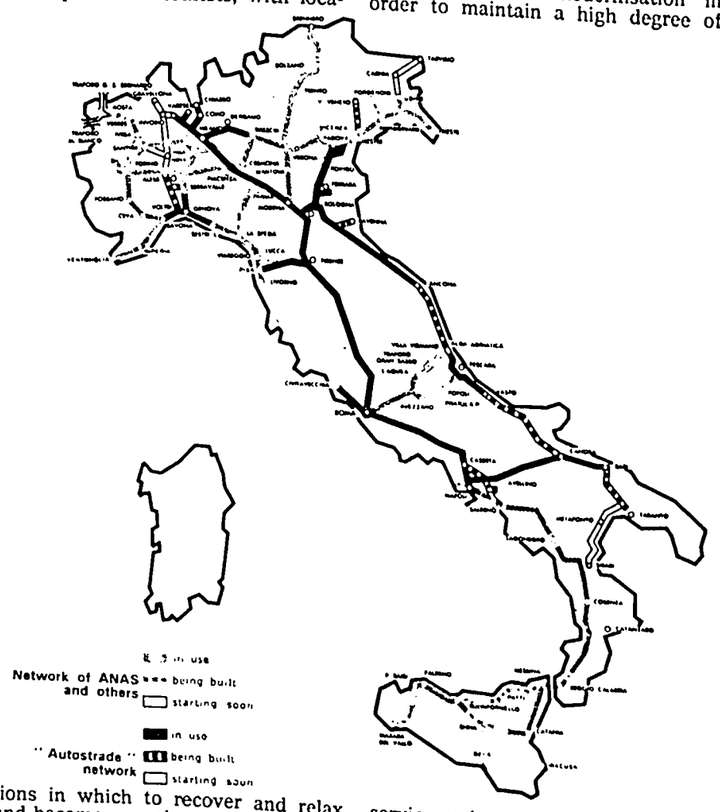
autostrade spa (gruppo IRI)

At the end of 1971 the Italian motorway network totalled 4,300 km with a further 1,100 km in course of construction and 1,300 at the planning stage, totalling 6,700 km.

When this plan is finalised the Italian motorway system will be virtually completed. The main North/South highways (such as the Autostrada "del Sole" from Milan to Reggio Calabria and the Autostrada "Adriatica" from Bologna to Bari) will effectively bring the Mezzogiorno (Southern Italy) closer to the North of the country as well as to Northern Europe.

With the Italo/Swiss motorway link-up at Chiasso visitors and goods originating from Northern Europe will be able to reach the South/the East and West of Italy without leaving the motorway. From the Brenner Pass foreign visitors will be able to reach—by using the "Sole" and "Adriatica" interchange—the Southern tip of Italy (Ionian Coast) without leaving the motorway.

50% of this network is entrusted to the company "Autostrade" a wholly owned subsidiary of the public group I.R.I. Among the entrusted companies "Autostrade" is the only organisation operating an extensive North/South network stretching to 2,000 km at present, which will total 3,000 km when the plan is completed.



The plan put into operation by "Autostrade" has two fundamental objectives:

1. An improved link-up between the Italian motorway network and the surrounding European highway system by the construction of the Voltri-Alessandria-Sempione, the Udine-Tarvisio, and the Mestre-Vittorio Veneto motorways.

2. The completion of the motorway network for the South of the country by the construction of the Caserta-Salerno motorway (for a quicker link-up between the Autostrada "del Sole," Napoli-Bari and Salerno-Reggio Calabria) and the Bari-Taranto-Sibari which will be the extension of the "Adriatica" motorway along the Ionian Coast.

The availability of 4,300 km of motorways will offer the user not only the advantage of being able to travel from point A to point B with speed and safety, but will provide additional services not necessarily linked with transport. New needs arise for the motorway user such as fuel requirements, technical and sanitary facilities as well as rest centres; in addition, for tourists in particular, Information Offices as well as stopping places offering pleasant and interesting locations within the motorway complex.

A number of special projects are being studied by "Autostrade," including new service centres along the motorway providing travellers, and in particular tourists, with locations in which to recover and relax and become acquainted with the local characteristics of the region. These new centres will be built first in those areas which are considered of particular interest to tourists and in the initial stages primarily in the Mezzogiorno.

The Italian motorway network which consists of two parallel axes (the "Sole" motorway in the centre and the "Adriatica" along the coast) will help towards a shift of tourist migration to the South of the country. It represents an invitation extended by "Autostrade" to foreign tourists to discover the Mezzogiorno, especially for the 1973 holidays when the entire stretch of the "Adriatica" motorway will be open to the public. Our invitation to tourists should be even more attractive to visitors from other countries since cars bearing foreign number plates will pay the minimum motorway toll, regardless of engine size. This represents a reduction of 50% on the normal tariff.

Among the main priorities of the "Autostrade" company is also the improvement of older motorways so as to meet the increasing density of traffic. It is the company's responsibility to ensure an adequate rate of development and modernisation in order to maintain a high degree of service and guarantee a high level of safety. This is of particular importance as regards the motorways in the North of the country where the problems of an increase in the traffic density has developed at a rate far in excess of any provisions or forecasts. For the same reasons a study has been undertaken to modernise the extreme points of the Autostrada "del Sole" and in particular the stretch between Milan and Bologna where further motorways will be linked. The widening of the existing Milano-Bergamo motorway to six lanes as well as the improvement in certain steep parts of the Bologna-Firenze motorway are taking place now.

Other kinds of foreigners are welcome, too

in Olivetti. And thus it helps the different sectors of the establishment to work together.

But the policy of alliance does not just include domestic groups. Italy has some obvious parallels with Japan. But it does not possess the same insularity that has enabled Japan to keep out foreign capital while absorbing foreign technology. Iri, for instance, is quite prepared to yield control over a company to an outsider as the price for obtaining management and technological skills. It has for instance 50 per cent or less in Walworth Alloyco (which makes valves), Armco Finsider (structural steel) and Siemens Data (computer software) which are all controlled or run by foreign companies. And this process is likely to develop further. But the external connection is not going to remain just one way. It will not be surprising if Iri, as well as—or because of—its role as developer of the south and of advanced technology, becomes a European power as well. To paraphrase some recent remarks of Signor Petrilli, head of Iri, the industrial problems of Italy cannot be solved in Italy alone.

It is these kinds of weaknesses, as well as political ones, which have driven the Italians to espousing Europe as the solution to their problems. In some respects this is right. Brussels has a less favourable climate for southern politicians than Rome. And more southern workers are earning their pay packet outside Italy than in Milan and Turin. The prime customer for a European regional policy would be the Mezzogiorno. Italian fruit and vegetables have flooded Europe. And being on the right side of the common external tariff is a comfort for those who foresee Italy running into a second generation structural problem before it has finished solving the first.

This is that the kinds of industries which created the Italian miracle were based on artisan skills or rather simple assembly-line work which other southern Mediterranean countries and several in the developing world are rapidly acquiring. At the same time the Italians recognise that they do not have the big guns in advanced technology. A case in point is Olivetti, which is having its market in mechanical calculators eroded by cheap Japanese electronic ones, while it has failed to gain more than a fingerhold in computers. To some extent this is a problem for all European countries, but Italy is a particularly acute example. Once again the solution is European. But at the root of its industrial and economic difficulties lies its social and political failure. And only Italy can heal itself. What this means is first that Italy's entrepreneurs have to accept the trade unions as a new fourth estate here to stay, and second the government must outflank the unions' political demands by reforming itself.

Levers of power

For too long the Italian entrepreneur has been living in a capitalist's dream. The resources have been shifted towards those accumulating capital. They have had almost complete freedom to do what they want with it. This does not mean that there are few rules and regulations in Italian society. On the contrary, there are an enormous number. But equally for every rule there is a way of getting around it. In railway carriages, for example, there is a notice in non-smokers boldly telling people it is forbidden to smoke. Immediately below it there is always a large well-used ashtray.

The adventures of the trade unions have left a feeling of profound unease among the entrepreneurial class, an unease which is not exactly justified by the amount of damage which union activity has actually caused. There has been no equivalent, for instance, of the recent coal miners' strike, in Britain, or the long and bitter strike at the Girling brake factory a couple of years ago which brought virtually the whole of Britain's motor industry to a halt. And it is noticeable, in the north at least, that many of the people jumping onto the neo-fascist bandwagon are small entrepreneurs who cannot understand what is happening now and wish things were back as they used to be.

The big companies are more realistic, but even they are schizophrenic. They would like to encourage a single powerful union in the sense that they would then know who they were dealing with, and once they struck a bargain they could have some confidence in it being kept. On the other hand, even they find it difficult to resist a return to their sly old ways. In Turin at the moment, a number of senior Fiat managers have been brought to trial, accused of paying police officers and the local Carabinieri for helping Fiat against strikers and for keeping troublemakers under surveillance. And union leaders complain bitterly that even large companies do not keep faith with the small print of agreements. But the unions are also schizophrenic, divided between their industrial and political goals. They too, for political reasons, cannot help giving managers one in the eye. At the same time their aspirations cannot be met unless the industrialists and the employers have an equal political identity and force. It is noticeable that Confindustria nowadays bandies the same remarks about the need for social spending as the unions do.

What is really needed is a new concordat between employers and unions,

Bank of Italy's Caesar, Guido Carli

Union leaders: CGIL's Lama, VIL's Vanni, CISL's Storti (standing)

a commitment to a certain growth programme over the next few years which would leave room for both higher wages and higher social spending. The underlying potential for further gains in productivity in the Italian economy is still enormous, provided economic growth starts again soon. And it is only possible to have an ordered transfer of resources from exports, domestic consumption and, to a certain extent, from industrial investment towards social investment provided firms can use their existing equipment to maximum effect.

What the unions are also doing, curiously, is to set up a bias in the economy in favour of the large company. The larger companies are more likely to be in a semi-monopoly position in which they can pass on the higher cost of wages. They also have far greater internal resources with which to finance their future investment and are therefore far less affected by any monetary cycle, while the medium- to small-sized companies have to go to banks for much of their investment funds.

So a situation emerges in which these smaller companies are hit twice by a sharp increase in wages, first by the effect of the higher labour costs themselves and second by the credit squeeze which the Bank of Italy puts on when it thinks that wages are moving ahead too fast. And Italy is still a country of small businesses. Three-quarters of workers are in plants with a labour force of less than 500. More remarkable, over a third of them work in firms with less than 20 people on their staff.

If, as the average Italian entrepreneur believes, the workers are mainly to blame for the present depression, the Bank of Italy must share some of the responsibility too. Early in 1970, it started operating a restrictive monetary policy as a counter-weight to the 1969 wage contract. By the end of 1970, the need was for expansion and the Bank of Italy allowed a rise in the monetary base compatible with a 10-11 per cent increase in the national income. By the end of 1971, the monetary base had increased by L3,450 billion (£230m) compared with an increase of L2,000 billion (£133m) in 1970. And the banks were flush with liquidity. But for many credit was still hard to come by at the right price. This is because banks naturally prefer to lend to the surefire risks, the stateholding companies and the big international corporations. When it comes to a dynamic but less well known entrepreneur, the banks tend to take a rather jaundiced view about economic prospects and about the borrower's ability to repay, and insist on collateral which it might be difficult for the entrepreneur to provide.

Among the many special funds which provide subsidised credit for Italian industry, there is one for the small firm. But like the others it has limited cash, and it is not in the power of the banks to shift funds from one source to another. One answer suggested to this problem of Italy's Macmillan gap is for a national guarantee fund to be set up, held by the central institute for medium-term lending, Mediobanca. In fact, under an existing law, it is possible for the state to guarantee medium-term lending operations. But as usual in Italian life, the procedure for obtaining this guarantee is so complex, long-winded and exhausting that institutes have tended to shy away from operations where this kind of help would be necessary.

Boss bank

One thing that the heavy dependence of the medium and small sized firms on bank credit does is to make life a lot easier for the Bank of Italy. A credit squeeze in Italy, as in Japan or Germany, really bites hard. The Bank of Italy exercises control over the monetary system in three main ways: through its rediscount facilities; through compulsory reserve requirements; and through open market operations. The rediscount facility which enables banks to increase their liquidity and therefore their potential loan base, by discounting certain types of paper with the Bank of Italy, can be a useful way of restricting credit, both in terms of the type of paper which the Bank of Italy will accept and in terms of the rate of interest which it charges. But generally it is the least powerful of the three weapons. The system of requiring commercial banks to hold reserves in relation to their total outstanding deposits with the Bank of Italy was one of the key reforms brought in by the De Gasperi/Einaudi regime. At key moments an increase in the reserve requirement, or indeed a decrease, can have a powerful effect on the total liquidity available to the monetary system. But, in practice, by far the most useful and flexible weapon is the open market operation. The two large variables with which the Bank of Italy

TUSCANY – A LITTLE MIRACLE

Florence, Chief Town of the Region

Tuscany is one of the more outstanding of the twenty Italian regions which have had a legislative assembly and a government of their own since 1970. It is almost as big as Belgium and has a population close to that of Denmark. Its capital is Florence, a city which has emerged with difficulty from the destruction wrought by the great flood of 1966.

There are none of the big industrial complexes in Tuscany which are so characteristic of Northern Italy and a large portion of the industrialised part of Europe. Industry is small or medium-sized, and is very widely disseminated throughout the Region, with special concentrations in the valley of the Arno, Tuscany's biggest river.

The production of Tuscan companies is generally in the field of high quality goods, which have a variety and are kept up-to-date in a way that would be impossible in larger, highly mechanised plants. Tuscan products thus manage to maintain a personal note and close links with typical local traditions. There is the production of articles made from straw around Florence, for instance, and of goods made of hides and leather as well as furniture, furnishings and glass in the Arno valley; jewellery is made in Arezzo, alabaster ware in the ancient Etruscan city of Volterra, and marble goods in the mountains that separate Tuscany from Liguria. Finally there is wine-making, with an output topping all other regions of Italy and a product held internationally in the highest esteem (Chianti).

INDUSTRY AND TRADITION

This kind of production is largely intended for export, with an annual total of $800 m as against imports of $350 m. Only Lombardy, with its major industrial centres at Milan, does better than Tuscany.

The products peculiar to Tuscany have very frequently been the Region's messengers throughout the world, and have in certain cases given rise to a fresh influx of tourists.

Side by side with this business there is a flourishing precision engineering sector (the Galileo factory and the Nuovo Pignone works in Florence) and an advanced technology industry (the O.T.E. plant in Florence).

Particular importance attaches to the production of steel (Acciaierie di Piombino, one of Italy's biggest plants with an annual output of 1,379,300 tons) and motorcycles (the Piaggio company of Pontedera, the largest in its field in Italy).

In Tuscany, a region unique in Italy for its monuments, its cultural tradition and its natural beauty, the tourist industry is more important than almost anywhere else in Italy.

But if we really want to understand the Tuscany of today, we must remember that in these last ten years the Region has experienced a kind of little miracle on the Japanese pattern. There has been considerable industrial progress at the expense of agriculture (dropping from 50 per cent to 15 per cent of the labour force) as a result of a process which, taking advantage of low labour costs, gave a fresh impetus to a movement towards extensive industrialisation mainly geared to foreign markets. It follows that the repercussions of economic difficulties on a national plane were felt in Tuscany only at a time when foreign trade began to fall off and international demand dropped.

The Regional Government's main task at this moment is to maintain in being Tuscany's productive apparatus in order to overcome current economic difficulties.

President Lelio Lagorio

The Region of Tuscany in Figures

Area: 8,875 sq. miles (2,299,113 ha)

Population: 3,479,585 (1970)
Capital: Florence: Inh 460,944 (1970)

Working population: 1,303,000
Agriculture: labour force 184,000
Industry: labour force 638,000
Services etc. (tourism, handicrafts, commerce): labour force 481,000

Agriculture
Cultivated area: 426,278 acres (1,053,332 ha)
Production: cereals 685,800 tons (6,858,000 q.)
olives 76,200 tons (762,000 q.)
grapes 583,130 tons (5,831,300 q.)
fruit 57,890 tons (578,900 q.)
Agricultural machines: 80,781

Forests
Area: 351,487 acres (868,525 ha)

Hunting
Close area: 171,210 acres (423,059 ha)

Tourism
Hotel undertakings: 3,451; beds: 115,032

Hospitals
159; beds: 42,659

Education
Elementary schools: 3,122
Secondary schools: 541
Higher schools: 369
Universities: 3 (Florence, Pisa, Siena)

President of the Regional Government: LELIO LAGORIO (Socialist)

Monte dei Paschi di Siena, one of the main banks in Italy and, indeed, in Europe, in 1972 completes 500 years since its foundation.

"Monte dei Paschi" occupies 60th. place in the world ranking of banks, with a total of funds handled close to Lit. 3,000 m.

Monte dei Paschi di Siena has branches in the main regions of Italy, but it has a particularly extensive network of offices in Tuscany.

"Monte dei Paschi" also has interests in major international financial institutions, including the Italian International Bank, London.

has to operate are the balance of payments effects and the treasury's financing requirement which results from government deficits. The impact of the treasury financing requirement depends to quite a large extent on who takes up treasury paper—the Bank of Italy itself, the commercial banks and other credit institutions or the public at large. So the central bank, which can neither predict nor control the absolute level of the government's deficit, has had at several crucial points to manipulate the balance of payments through borrowing or lending in the Eurodollar market.

Blunted weapons

These dry technical details are important. For there are few countries in the world where monetary policy is so important, simply because for several reasons the Italian government's budgeting is an intolerably clumsy weapon of economic control. First because with financial responsibility divided between three ministries, there is no economic supremo as there is in Britain or Germany. Although Signor Colombo achieved a certain pre-eminence during his long stint at the treasury he lacked the formal power or the apparatus to do the job properly (and it is significant that when the Andreotti government was being formed at the end of February he would only accept his old job on condition that he was effectively given control over the ministry of the economy as well). Second, owing to the incompetence of the bureaucratic machine the fact that money is allocated for a specific purpose does not mean that it is spent.

Third, Italy suffers from one of the most inefficient tax systems in Europe (as a result of which the government is permanently in deficit whether it likes it or *not*). And the central government has very inadequate control over the spending of local government, which is so up to its eyes in debt that the Bank of Italy in its last annual report sternly demanded a complete reform. Although tax receipts do have some counter-cyclical effect, going up when the economy is buoyant and down when it is in recession, the inadequacy of the tax base has often been a prime excuse in putting off urgently needed social spending. In principle Italy is about to undergo a sweeping tax reform, master-minded by the former finance minister, the tenacious Social Democrat, Signor Luigi Preti. It is hoped that the tax

The church came first

system will then have a larger, more equitable and more buoyant base, although the sceptics claim with some plausibility that the Italian nature is *too* incorrigible for it to work properly.

Up to now Italian taxation has been based on two principles, both baffling to Anglo-Saxons. The first, which the reform hopes to abolish, is the independent power of local authorities to assess income. Until now it has been possible for an Italian to have his income assessed by the state at one figure and by the local authorities at another, because they looked at his standard of living not his actual earnings (and the colour of his politics could make a significant difference too). Now only the state will tax, on the basis of earnings. And the method of assessing on the tax official's hunches —he does not have to prove that the taxpayer's declaration is wrong—is to go altogether. This has meant that the taxpayer declares a ludicrously small figure, knowing that it will be increased by the official, and then appeals against his assessment. With one third of taxpayers going to appeal, the drag on revenue is so desperate that an amnesty has to be granted and a compromise is made out of court.

Fighting the tax officials has become a national sport and the number of outright evaders is put as high as 8m people. The new deal is that the state will stick to what the taxpayer declares and a highly elaborate computerised tax register is to be introduced. Rates have been revised and there should be an important shift in the fiscal burden from the lower-middle to the upper-middle income groups. The American economist, Mr Franco Modigliani, has persuasively argued, however, that things will remain the same. Large capital incomes are taxed at such high rates, he says, that money will still be smuggled out of the country and the rich will continue to transfer their assets to some Swiss-based company to escape personal taxation. And since the officials will still be left with discretionary powers, tax will still be a matter of "bustarelle," the polite euphemism for civil service corruption.

The other main reform is that Italy will bring in a value added tax (Vat) instead of its current turnover tax. Under EEC rules it should have done so in 1971, but yet once again there has recently been a postponement. The problem is that with the turnover tax there has been widespread evasion by small firms and shopkeepers who often have secret stores of goods which they have not invoiced. Under Vat, also computer backed, they will find it hard to conceal their previous evasions and the cost of living is likely to be jolted upwards.

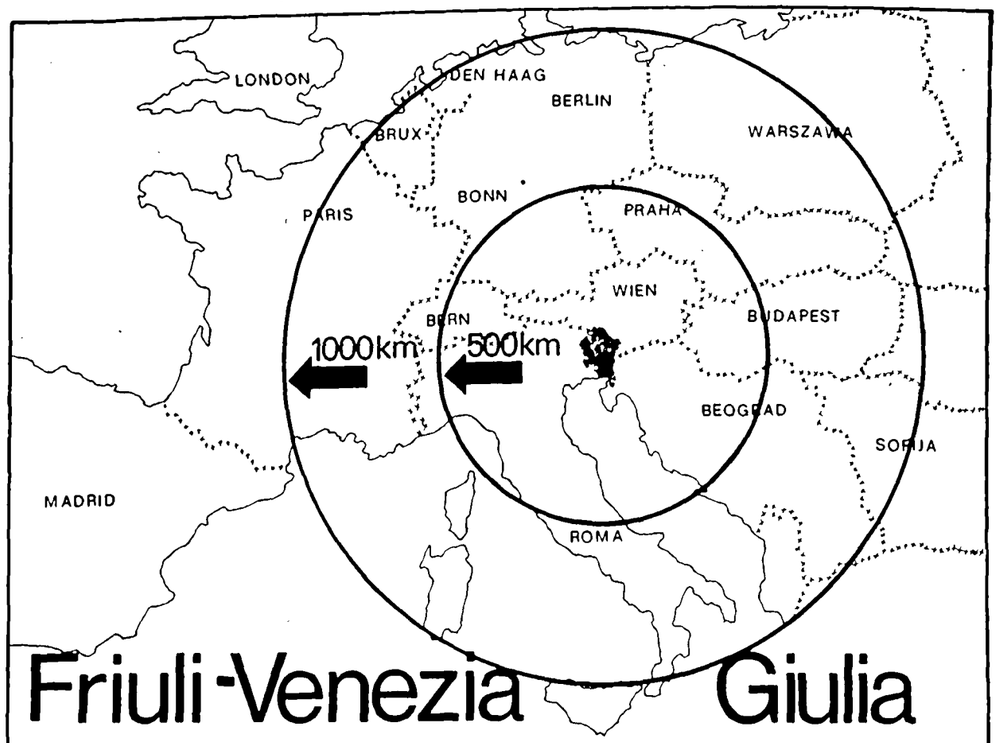
But the real problem is the organisation of the tax offices, a paradigm example of Italian bureaucracy. Most offices are short of adding-machines and it is normal for high level officials to have to do their typing and filing themselves. Most of their registers are, in fact, still handwritten. Typically, too, co-operation between tax offices at provincial or regional level is slight, which makes life a lot easier for the evader. Like all Italian reforms, it is hard to believe in Signor Preti's brain child until it is actually at work.

Sottogoverno

One compensating factor in terms of economic management is the huge state industrial sector. Around 55 per cent of the Italian economy is state controlled in one form or another. The long term investment programmes of the railways, Enel, the electricity company, Iri, Eni and so on do have some counter-cyclical effect. For instance, Iri's investment budget in bad years accounts for as much as 11 per cent of industrial investment, while in good years for the economy this falls to about 7 per cent. But even in these repositories of the Italian miracle the ways of the Roman system of government have their pervasive influence.

Way down south

Political power is used less to control the overall size of public funds than the use to which they are put. Jobs for the boys, the plums of large government contracts, licences, grants and subsidies, these are the things which take up political energy. The unification of Italy has not meant an outright victory for the north. Economic power may reside there, but increasingly political and bureaucratic power is in the hands of central and southern Italy. No one is more contemptuous of Rome than the straight-backed Piedmontese. What does the Roman do, they ask, but "intrallazza"—intrigue for personal gain? Nevertheless it is the northerners who have accepted the game which the "terroni"—anyone who comes from south of the Po valley—play with such passion.



The game is Sottogoverno. It basically consists of the manipulation of patronage on a vast scale to provide money, jobs and votes for political parties and their allies. Parties and politicians need money (for under Italy's proportional representation system they have to field a lot of candidates). And with nine significant political parties, each split into rival factions, the fight for the powers of Sottogoverno is fierce. Political leaders, to retain power and the allegience of their best men, need access to a "Stanza dei Bottoni," a room where you can push the right buttons. And payment is their support for whatever measure or reform the unfortunate government of the day is trying to push through parliament. The best players are the Christian Democrats who have managed to pack most of the important posts. But the struggle when one of the posts comes up is always acute.

Recently there was a bonanza of vacant jobs, including the presidencies of Eni, Imi (the medium term credit institute), the Banco di Napoli, the Istituto Bancario San Paolo di Torino, the Banco di Sicilia and Rai, the state controlled radio and television service. Rai is one of the eldorados of the patronage system, employing thousands of unnecessary people, including over 20,000 "special contributors." A recent article in La Stampa described the head of Rai, Signor Barnabei, as an eastern potentate, surrounded whenever he goes to the house of parliament by a horde of supplicant MPs, asking him to employ their protégés.

At the regional and local level the system is much the same. As a result, the obstacles in the way of cutting down some of the useless bureaucracy and its agencies are enormous. Questions about economic management, the role of the unions, the banking system and the public sector are common to all modern industrial societies. And 20 years of rapid growth have made the bare statistics of the average Italian's life reasonably comparable with those of Europeans to the north. But in certain key ways life in Italy is still profoundly different. Talking to a wide range of Italians one still has the impression that society is still going through a traumatic shock, which in one way can be called the product of rapid development, but it is less the product of growth as the fact that Italy has been through an enormous structural change and still needs to go through another.

That agriculture now employs less than 20 per cent of the working population, compared to over 40 per cent in the early 1950s, has meant that over 6m people have moved from the land to the cities. This has happened throughout Italy and, indeed, the regional shift, from south to north, has not been all that enormous. The net shift of people from south to north after the war rose from less than 100,000 to just over 200,000 a year and it has since dropped again to between 50,000 and 150,000 a year. Thus over the past 20 years the total number of people leaving the south has been around 2½m. This, and the general move from the land common to all Italian regions, has been enough to cause acute problems in the northern cities. But it has not been enough to change the age-old imbalance between south and north.

This is the key problem in Italian society. The backwardness of the Mezzogiorno reaches far back into its history. And it has not been helped by the fact that so much of it is mountainous and unsuitable for anything but forestry or grazing. By the time of unification in 1861 the south was already behind the vigorous Piedmont and the north according to most indicators. It had a much higher illiteracy rate; only a small part of the railway system (which according to Cavour was going to sew up the Italian boot); and only a few commercial firms. But, at least, during the preceding years the Bourbon rulers of the Kingdom of the Two Sicilies had begun to do something. The first steamship in the Mediterranean was built in Naples in 1818. And at the Florence exhibition of 1861 the south showed that it had a stake in papermaking, marine and railway engines, shipbuilding, leather goods and textiles. But what it had laboriously built up was largely thrown away by open competition with the north, and although it initially received more than its fair share of public works, economic conditions generally became worse, aggravated by a high tariff commercial policy, which ruined its export trade while forcing it to take high cost import substitutes from the north.

Friuli-Venezia Giulia

A bridge-region between the European Common Market, the Mediterranean basin and the markets of Central and Eastern Europe

A traditional cross-road for trade relations and traffic between the Overseas and the Danube Countries

Twelve Industrial Development Areas, with special facilities away from congested regions;
a good net-work of transport and communications (railways, highways, airport);
Trieste - a port connecting Africa, Asia and Central and Eastern Europe, with its duty-free zones;
availability of fuel and power, including methane gas;
availability of manpower;
several State and Regional incentives for industrial investments;
tax exemptions and reductions;
medium-term loans at attractive rates;
grants for investments in mountain areas;
minority share capital for joint-ventures by FRIULIA, the Regional Financial Company;
lease of small factories and machinery by FRIULIA-LIS S.p.A.

BRITAIN into EUROPE

Britain no longer has to choose between the continent of Europe and the open sea. It needs both. And the continent of Europe needs Britain and the open seas it will bring into Europe with it.

The Economist has prepared a 52-page booklet on the detailed and broad implications of British entry. It does not hide the many doubts; it answers them. This booklet is based on updated versions of the dozen widely read briefs published in The Economist between 24 April and 10 July 1971.

Rates for reprints from The Economist
Inland and surface mail 30p, airmail 45p (US$1).
Postage is included.

BRIEF BOOKS

This background series of 28-page briefs, illustrated with maps, charts and photographs, looks at some current world problems and isolates the real issues.

Rates for Brief Books

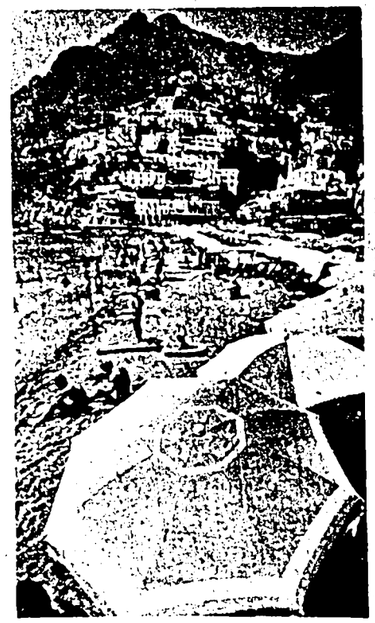
Signs of inequality

The gap between north and south continued to widen under the fascists, who at least managed to drain 60,000 hectares of marshland in lower Lazio. The south was predominantly agricultural, in the worst possible way with either large and under-exploited or tiny landholdings. It lacked markets, it lacked capital, and it was forced to concentrate on the extensive production of high-cost grains. Between 1861 and 1936 the number of jobs available in industry and transport in the south actually declined by 100,000, while its total population rose by 5·7m. The gap in real incomes steadily widened in the decades before the introduction of the Cassa per il Mezzogiorno in 1950. Then, the south had 37 per cent of the population but less than 22 per cent of the national income. If one takes the poorest areas of the south, Calabria and Basilicata, and compares them with the richest areas of the north the contrast is far more startling. Real income per head was less than a third in these regions of what it was in Lombardy, Piedmont and Liguria.

In other words the south was similar in many respects to one of the better-off developing countries today, with the disadvantage that it was unable to manipulate its terms of trade with the rest of the world through a separate exchange rate. Much of it was also in the 19th century as far as communications were concerned. So was its social environment, often still feudal in tone. The Cassa was the first large scale attempt to redress the balance. It was set up at a time when development economics was still in a primitive state and when the success of the Marshall Plan tended to make people think that all that was needed to get an economy going was an injection of funds. Fortunately there were no such illusions about the south, and the Cassa was endowed both with what at the time seemed a very large amount of money and a long-term commitment that would continue whatever happened politically or economically in the rest of the country.

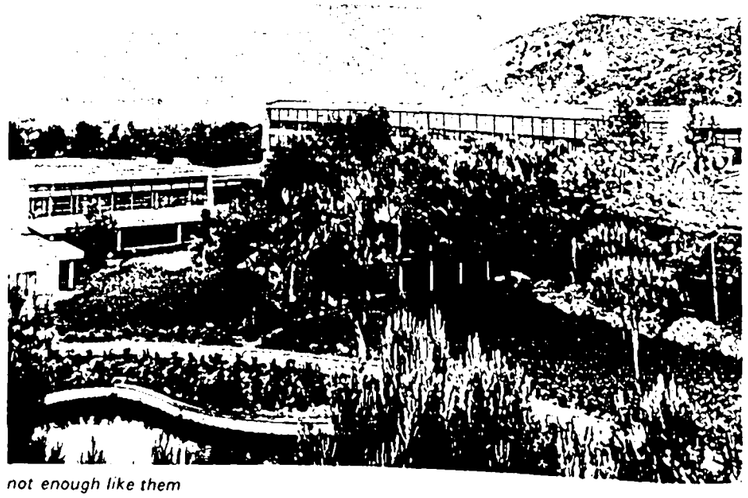


The first priority of the Cassa was rightly to provide a modern infrastructure and to try to do something about the south's largest employer, agriculture. The south was short of everything —roads, electricity, water. Out of the L.1,640 billion (£1.1 billion) spent in the first 10 years, half went on agriculture, a little less than a quarter on infrastructure and the rest mainly on subsidising industry. In the next decade, between 1961 and 1970 when the sums made available more than doubled, over two thirds of the money was used for industry. The attention of the Cassa had switched to jobs. Meanwhile Iri and other agencies were building up the road network, connecting the west side down to Reggio di Calabria with Rome and the north, and radically improving east-west communications with a motorway from Naples to Bari.

As the programme developed it revolved essentially round three prongs: making the south accessible to the rest of Italy and providing an adequate background for new industry; twisting the arm of state enterprises so that they pushed more and more of their new investment to the south; and providing a variety of incentives for private industry to set up new factories, of which the most important have been a tax free holiday and subsidised rates of interest for loans. Initially, it was hard to attract any sizeable private investment. The northern industrialists were quite happy where they were in the plain of Lombardy and although wage rates were initially lower in the south, there was still the problem of training workers and finding skilled men and management who often had to be brought down from the north. So too did the vast bulk of raw materials and semi-finished products. Basically the south was too underdeveloped to attract prosperous northerners. Foreign firms often grumbled too that when they came to set up a factory the services promised to them by local authorities, like roads, electricity and water supply, were just not there.

Cathedrals in the desert

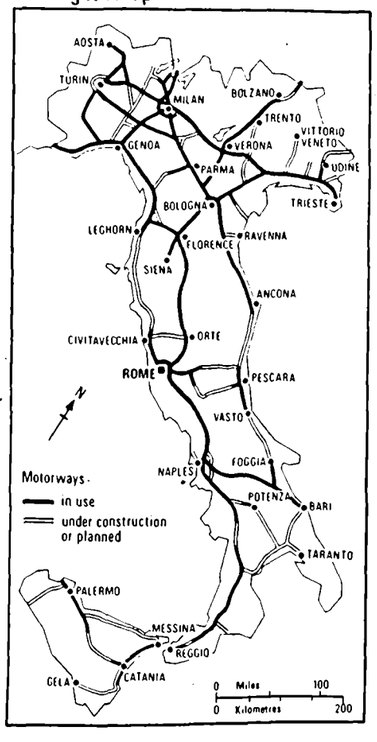
In these circumstances, it was far easier and more spectacular to twist the arm of a state-owned enterprise into building some giant project which it was going to have to put up anyway. Sicily made sense for refineries since it was a short tanker ride from the Suez canal and other outlets for Middle East oil. But refineries provide few jobs. Their main attraction apart from the labour needed to build them is the downstream activity which might one day get tacked on. The largest single investment until recently has been the Finsider steel works at Taranto (part of the Iri group). The hope was that around the Finsider works would develop a host of factories using steel products. But nothing happened, largely because Taranto produced finished steel and none of the consumers of finished steel like the car assemblers were in the least anxious to end up at Taranto.



So the first decade or so of the Cassa became known for those cathedrals in the desert which look very good in the statistics but provide very few jobs. Much more important in practice was the pressure on state holding companies like Iri and the large private empires like Montecatini not to close down the industries they already had in the south. Thus Iri was landed with an expensive load of loss-making shipyards around Naples. And firms which

The south needs more than sunshine

Too many like him . . .



not enough like them

have accepted the generous incentives of the state find that they carry some heavy political obligations. Indeed, for this very reason, some foreign firms when they go south prefer not to accept state subsidies at all.

During the 1960s there was increasing criticism of the Cassa's management of its funds. First it appeared to be quite indescriminate in the way it encouraged little pockets of industry all round the south, thereby diluting the chances of any one place achieving self-sustained growth. Second, it was accused of replacing rather than supplementing the work of local and provincial authorities. Given the nature of southern politics, this was hardly surprising. Third, although there was an enormous improvement in the income per head of southerners from 1950 to 1970—it rose from $320 to $800—their relative position as compared with the northerners remained roughly the same.

In itself this was no mean achievement, since it required a remarkable rate of growth for the south to keep in step with the north at all. And the south was initially cursed with a far greater dependence on agriculture. But many respectable economists have argued that less money should be spent in the south not more, since the only realistic way of solving its problems is by encouraging a mass exodus of people. The fact is that despite the L7,770 billion (£5.2 billion) poured in by the Cassa, despite an increase in investment by state holding companies of nearly 600 per cent in the past decade, and despite the appearance of scores of foreign firms, the actual number of jobs available in the south has gone down. There are now only 1.8m people employed on the land, compared to double that number in 1951. But since 1960 a fourfold increase in industrial investment has added less than 160,000 extra jobs. Essentially it is the old leaky bucket problem. Too many industrial jobs in the south depend on declining industries.

Sewing it all up

Pouring money in

Despite the emigration of 5m people either abroad or to the north in the past 20 years, unemployment in the south remains just as intractable a problem as ever. Around Naples there are 100,000 unemployed out of a total population of 1.7m, and 15,000 jobs at least need to be provided each year just to keep that figure unchanged. It is little wonder that Italy's planning system is now virtually concerned only with the southern problem. Recently a series of measures has been passed to increase the rate of spending in the south.

The Cassa will have almost as much money in the next 10 years as it has had in the past 20, and the state holding companies which are responsible for around half Italy's industrial investment have now in principle at least to locate four-fifths of their new projects in the south. The level of incentives has been raised so that really big investments of over $8m (£3.3m) do not get such good terms as smaller projects (for which grants of up to 45 per cent will be available). In general, the incentive system has been made more flexible so that the government can give more money to the projects they really want and an attempt is being made to subsidise labour-intensive as much as capital-intensive schemes.

But more important than the extra money is the fact that very belatedly some of the big northern industrialists have got round to doing what Olivetti pioneered nearly 20 years ago, in locating part of their investment in the south as a matter of principle. And here southerners have the strikes and disturbances of the hot autumn to be

IMI

ISTITUTO MOBILIARE ITALIANO

(Established in 1931)

VIALE DELL'ARTE, 25—ROME, ITALY

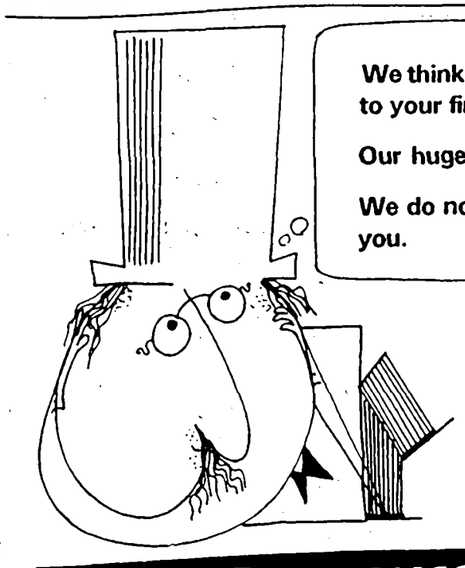
Subscribed capital and reserves Lit. 257,834m

A CREDIT INSTITUTE SPECIALISED IN EXTENDING MEDIUM AND LONG TERM FINANCING TO INDUSTRY AND TO PUBLIC UTILITIES

Main figures as of December 31, 1971

Loans outstanding	Lit. 3,861,541m. =	£2,574m.
Bonds	Lit. 2,662,334m. =	£1,775m.
Foreign borrowings	Lit. 469,643m. =	£ 313m.

IMI operates through:



—the extension of loans and other credit transactions, including the financing of investments assisted by Government incentives and interest contributions both for medium and small enterprises and for new ventures in the South of Italy and other development areas,
—the financing of industrial research and development,
—equity participations,
—maritime credit,
—the terms financing of export of capital goods,
—trusteeships.

IMI raises funds on the Italian and foreign capital markets, principally by floating bonds which are widely popular with investors and savers,

IMI's experience and credit facilities are available to foreign concerns willing to make productive investments in Italy.

Representative Offices in Washington, London, Zurich, Brussels, Mexico City.

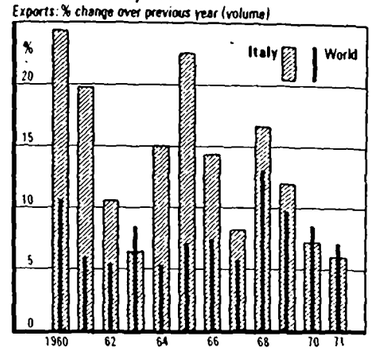
thankful for, since it was apparently only then that companies like Fiat realised how much they had contributed to the social upheaval by concentrating their growth on one place. In the 1970-72 period Fiat will be spending over $300m in the south and in future will spend at least 50 per cent of its investment funds there.

Alfa Romeo is building a giant car plant outside Naples for its new Alfa Sud models. But this was a highly political act since the plant will more than double total output and no one knows whether the firm can sell the new cars. The hope was that the Alfa Sud factory, with the expanded Fiat investment in it, would act as the growth centre for a car component industry. Although over 20 component firms will eventually set up plants, the total scale is disappointing. The fact is that the big guns are still in the north and it will take a further large shift in the centre of gravity before it is worthwhile for a manufacturer to move so far from his traditional market.

But the south should not despair yet. Although the amount of jobs available will continue to be wholly inadequate for another decade, the combination of emigration, government money and pressure and the largest pool of surplus labour in Europe must eventually prove decisive. How quickly depends on the speed with which southerners themselves can shake off the apathy towards the blows that fate deals them, just as much as the amount of help which comes from outside.

Pessimism is never enough

Politically Italy has been one country for over 100 years. It will take another generation before it is one country economically. But at last it is on the road there. In every year since the war but the last, one out of every 100 Italian families leaves the land. By the end of the decade the 1 in 10 who remain will hopefully, primed with money from Brussels, be running more or less viable farms. For those who leave, the future is still in the balance. Whatever government is in power, there will be a deep commitment to see that the south gets more than its fair share of resources. But how soon will it be able to hold on to its sons, and not export most of them to the north and abroad ? And what will they find waiting for them when they do go ? The answers depend first on the vitality and dynamism of Europe as a whole and second on the ability of the men in Rome and Milan to resuscitate the miracle.



After passing through its most severe depression since the war, Italy today is a country full of pessimists. It is also a country where everyone appears to be in conflict with everyone else and where the capacity for compromise appears to be waning. There are economic forces working for a revival. The indicators which have been going down must at some point start moving up again and world trade should start growing faster again, too. But people are going to take some persuading that things can get better again. So there is going to be an ugly period of waiting for the next nine months or so.

There are two great hurdles to be overcome : the general elections and the formation of a new government after them ; and the renegotiation of long-term wage contracts in the autumn. The tone of the second will be set by the first. But there is certainly one possible scenario which does not lead to disaster. No government will survive which merely puts industrial peace at the top of its list. But, to put it bluntly, the new rulers will have to buy their way out of trouble. With a reasonable balance of payments and a stagnant economy, this is no time for financial masochism. Money must be spent, and be seen to be spent, first on housing, because that has the greatest economic impact and because there at least half a reform is already in being. Second, the government must actually start a dialogue going with the unions when it works out its programme of reforms. In other words the government must try to separate the political side from the economic side of the next hot autumn.

Third, and most daringly, Rome must recognise that its record in administration over the past 100 years has just not been good enough and abdicate some of its powers. What is potentially one of the most important reforms since the war has just come into operation. Italy now has, formally at least, a system of regional government. In principle at least many of the powers of Rome to conduct domestic affairs have now been delegated to the regional level. If Rome cannot get houses built, well perhaps the men in Bologna, Turin or Milan can. But they need money and the main financial powers will remain firmly with the central government, as they should. This means, however that if Rome wants

Not what they were

Exports: % change over previous year (volume)

Old style mayor, Darida of Rome

New style head of Emilia-Romagna, Fanti

to be obstructionist it can make a farce of regional government by not authorising the cash needed to activate laws at the regional level.

This would be a tragedy. It will also be a tragedy if some of the ministries in Rome are not now dismantled and their staff sent packing to the provinces or given large golden handshakes. The new regional authorities, in other words, offer a chance to alter the way in which Italy is ruled—and it is a chance which ought not to be missed.

Of course some regional governments will prove to be worse than the old system. Sicily has had regional status for years and Sicily, as everyone knows, is a mess of corruption and exploitation. Rome itself is one of the worst managed cities in the world. But at least regional devolution would give the north a chance to digest its immigrant load. The towns as they are now have the responsibility for what goes wrong—the houses which are not built, the schools which are overcrowded—but lack adequate powers to put them right. Now in principle their regional governments will.

The worst solution will be if Rome hangs on to what powers it already has and if the regions become just another arena for mixing delay, confusion and political manoeuvring together. Italy has always been a country of cities and their regions with a national bureaucracy imposed upon them. The bureaucracy has never worked. Now is the time to cut it down to size.

How is Italy likely to develop in face of all the problems which afflict it? One suspects that over the next 20 years it may have some striking advantages. It has large industries, but it also depends greatly on small ones. During the 1960s, when size seemed to be the main industrial virtue, this looked a disadvantage. But now there is a considerable disenchantment with the huge corporations. Italy's relatively immature industrial structure may lead it to some form of organisation more suited to the 1970s and 1980s. In the economy of the future, the south may have more advantages than appear now. Economic operations—not just industrial ones, which in any case will become relatively less important—will be more footloose as electronic communications really make their impact. The south has a great deal of easily accessible, relatively empty and very beautiful real estate. It might even become the last refuge for suburban European man towards the end of the century. If Venice is sinking, some 21st century equivalent may rise south of Eboli.

And this in turn leads to another question. Should Italy see itself as the southern leg of a united Europe as its place in the EEC suggests, or should it equally consider itself the focal point of the Mediterranean? The enlarged community is a creature of two seas and it would be natural for it to have two centres of gravity, not one. The special arrangements the EEC has already forged with the countries lining the southern shore of the Mediterranean and the commercial relations which Fiat and Eni have been so keen to pursue there could be the first strands in a system which is likely to become ever more interdependent. The essence of Italian life is to ensure that no commitment is so deep that it excludes other options. Italy's fortune as a country is that looking beyond the present impasse the options are still there.

The sons of the church still have their say

. . . but those with the duty of forming governments

. . . must also pay heed to the sons of revolution

The Treaty of Rome; and the case for British entry into 59 Gresham Street.

We don't want to appear patronising towards Brussels, Paris or Bonn; but don't let's forget that Rome is where the European community actually began (some thousands of years before the Treaty of that name). Or that around the oldest capital in Europe are to be found some of the most rewarding investment opportunities in Europe today. Which is why, as an outward-looking British businessman, you may find it profitable to seek admission (in fact the doors are wide open) to the **Banca Nazionale del Lavoro** here in 59 Gresham Street. This is, of course, the London office of the leading bank in Rome, and for that matter Italy. You'll find we're well geared to help you bring about the closer ties you may be wishing to create between yourself and our country. We're a mine of information about trade and industrial opportunities in Italy; and for your further information we keep a finger on the pulse of the economies of our European trading partners. Surprising as it may seem, your first significant step into Europe could be just down the road to 59 Gresham Street.

STET

SOCIETÀ FINANZIARIA TELEFONICA p.A.

STET—Società Finanziaria Telefonica p.A. is one of the holding companies belonging to IRI—Istituto per la Ricostruzione Industriale—and operates in the field of telecommunications and electronics. The activity of the IRI group on the whole is delineated in three different stages: at the lowest level there are the operating companies which produce goods or services: these companies are gathered in groups of similar activities and depend on the Financial agencies that are controlled by IRI.

Amongst the branches of activity of the STET group, which are more direotly conneoted with telecommunications, there is SIP—Società Italiana per l'Esercizio Telefonico p.A.—which assumes exclusively and by state grant the whole national territory and partially the extra-urban telephone service. One of the main goals reached by SIP is the extension of teleselection by user over all of the national territory which was completed in October, 1970; an achievement that very few countries in the world are able to boast. On December 31, 1971 the number of subscribers exceeded 900,000, while the telephone density has increased from seven (7) telephones per hundred (100) inhabitants in ten years to almost nineteen (19); the number of individual telephones in service has more than surpassed ten million (10,000,000).

Moreover SIP has the responsibility of supervising the relationship with the users and providing with its own means and the means of other firms of the telecommunication system to the extent to which it is necessary for the service of data transmission.

Besides SIP, there is another grantee for telecommunication service, the ITALCABLE—Servizi Cablografici Radiotelegrafici Radioelettrici S.p.A.—which assumes the intercontinental telephone services by means of very modern cablephonic and radioelectric plants among which can be found one of the most recent and important accomplishments in the field of world telecommunications: the underwater cablephonic system TAT 5/MAT 1 which crosses the Atlantic and directly connects the Mediterranean area to North America. It is the fifth transatlantic cable and the first Atlantic-Mediterranean cable.

Dialling the number "170" the Italian user can easily communicate from anywhere in the nation with the Intercontinental Telephone Center Italcable of Rome, where automatic apparatus carries the telephone traffic to all the world along the communication lines which the company uses. In the international field the company also manages telegraph service and telex service utilizing for its communications connections by satellite provided by the associate TELESPAZIO—Società per Azioni per le Comunicazioni Spaziali, which is a grantee for the plants and services in Italy of the systems which utilize artificial satellites. This company, using the earth station of Fucino "Piero Fanti" has acquired in a short period fame and prestige throughout the world of telecommunications via satellite. Its very modern equipment allows direct connections with almost all the nations of the world. The TELESPAZIO station of Fucino is the only one in Europe which is able to offer with its antennae and equipment the telemetric and telecommand services and the control of all the satellites in orbit on the Atlantic Ocean and Indian Ocean for INTELSAT—Consorzio Internazionale per le Telecomunicazioni via Satellite. The completion of the Antenna "C" of Fucino, which consists of an antenna 29.56 meters in diameter, has been undertaken by another division of the STET group, the STS—S.p.A. Consorzio per Sistemi di Telecommunicazioni via Satelliti, which also installed the earth stations of Balcarce (Argentina) and Tanum (Sweden).

In the area of telecommunication production and research the Società Italiana Telecomunicazioni SIEMENS S.p.A. is particularly conspicuous; it is the main manufacturing firm of the group and the most important one for telecommunications and electronics in Italy with over 16,000 people employed in the production of telephonic, telegraphic stations, transmission installations, radio bridges, systems for satellites, installations for radio-television studies.

SIT SIEMENS is particularly active in the south of Italy, where in its installations in Aquila and Santa Maria Capu Vetere, more than one-third (1/3) of the active force is installed and where the new productive units which are being built demonstrate how the programme for the south is continually developing.

SIRTI—Società Italiana Reti Telefoniche Interurbane S.p.A.—which is engaged in the study, projection, installation, and maintenance of systems of telecommunications by using underground and above ground cables, satellite communication systems, radio bridges, underwater telegraph cables, and electric lines is the company which operates specifically in Italy, Spain and Brazil, and is today in Italy the main company for installations and one of the most important in Europe in the field of telecommunications.

The production and research activity in the field of electronic components is being borne not only by ATES Componenti elettronici S.p.A.—which is connected with "Ates Electronics Ltd." of London which co-ordinates the distribution of the products on the English market, but also by the SGS Società Generale Semiconduttori S.p.A. which was recently acquired and is established in Italy, Great Britain (Falkirk), France and Singapore.

SELENIA—Industrie Elettroniche Associate S.p.A.—operates in wide fields of activity which include everything from radar and missiles to aeronautics, from the advanced systems of telecommunication and space activities to data elaboration and automation. The notable development of the company is testified to by the numerous affirmations obtained by Selenia in the international field; above all in the space field: telecommand and telemetric equipment for the satellites ESRO IV and SIRIO, telecommunication antennae for INTELSAT IV satellite, visual apparatus for the European aerial defence system NADGE. The company is also active in the field of engineering systems through its associate Vitroselenia.

Elettronica San Giorgio—ELSAG S.p.A. carries on its own activity in the field of armament direction systems, postal systems, service systems, and systems for control of implement machinery.

The activity of research and development, given over to specialized sectors of numerous firms of the group, is considerable inasmuch as the major part of the material is produced by various sectors "to specification" for the client.

SEAT—Società Elenchi Ufficiali degli Abbonati al Telefono p.a.—operates in the field of auxiliary and complementary activities of telecommunication and among other things cares for editing of telephone books which are printed by means of the most modern electronic and photocopying techniques by ILTE—Industria Libreria Tipografica Editrice S.p.S.—besides telephone book printing, is active in the graphic arts and produces for outside customers, using the most up to date typograhpic techniques, the finest printing work available anywhere.

The personnel of STET had exceeded 94,000 by December 31, 1971; the initiatives connected with professional training and preparation of workers are numerous and important; other initiatives are continually promoted in the social, recreational and cultural field.

In 1971 the investments of the group amounted to over 350 billion Lire, of which a large part was invested in Southern Italy following the line which the group had undertaken years ago to promote and integrate the constructive effort of the Mezzogiorno of Italy.

OFFICIAL CALENDAR FOR APRIL-DECEMBER, 1972 OF THE INTERNATIONAL FAIRS AND EXHIBITIONS IN ITALY

Approved by the Minister for Industry, Trade and Handicrafts

Exhibitions organised by Public Fair Societies

International General Trade Samples Fairs

BARI	XXXVI Levante Fair	8–19 September
BOLOGNA	XXXVI Bologna Fair	24 May–4 June
BOLZANO	XXV Bolzano Fair	16–25 September
MESSINA	XXXIII Messina Fair	5–20 August
MILANO	L Milan Fair	14–25 April
PADOVA	L Padua Fair	25 May–5 June
PALERMO	XXVII Mediterranean Fair	27 May–11 June
TRIESTE	XXIV Trieste Fair	17–29 June

International Specialised Fairs and Exhibitions

ANCONA	XXXII Ancona Fair—International Trade Mart of Fishery, Nautical Sports and related activities	24 June–2 July
BARI	II EXPORT LEVANTE—International Trade Fair of Sports and Hobbies	30 April–8 May
BARI	IV MOBIL-LEVANTE. International Furniture and Home Furnishing Fair	31 May–5 June
BOLOGNA	V International Show of Perfumery and Cosmetics	28 April–2 May
BOLOGNA	XV International Foodstuffs Exhibition—SIA	24 May–4 June
BOLOGNA	VIII SAIE International Show of Industrialisation in Building Techniques	7–15 October
CREMONA	XXVII International Fair of Milk-Cows	8–17 September
FIRENZE	XXXVI International Handicrafts Trade Mart	22 April–7 May
FOGGIA	XXIII International Agricultural and Zootechnics Fair	30 April–7 May
GENOVA	IX TECNHOTEL. International Hotel and Tourist Equipment Exhibition	28 October–5 November
NAPOLI	V SIR International Gift Show	31 May–5 June
NAPOLI	XV Housing, Building, Home Furnishing, Clothing and Food Supply Fair	21 June–2 July
PADOVA	IV International Exhibition of public services "SEP '72"	3–7 May

THE GREAT OIL ROADWAY
IN THE HEART OF THE MEDITERRANEAN

There is a spot in the Mediterranean where, in 1971, over 12 million tons of crude oil were refined, creating an absolute record in Italy. This happened at the Saras Refinery, located in Sarroch (near Cagliari in Sardinia) where every day oil tankers from all over the world unload crude oil of every type, and load finished and semi-finished products. For the still young industry of Sardinia, this is a promising success soundly based on modern business principles and on technical efficiency in all steps of production processes, from the arrival of the crude tankers in port to the shipping of finished product. At Sarroch, the tankers are welcomed at Porto Foxi, and are berthed at the marine terminal, which consists of a jetty and a steel platform, the so called "crude oil island". The complex has been designed so that loading and unloading operations are carried out in the least possible time. Saras' productive capacity consisting of two atmospheric distillation units (160,000 and 200,000 BPSD, equal to 18,000,000 tons per annum), nine further process units, and a tank farm with a total capacity of approximately 3,000,000 cubic meters, makes this refinery one of the most important in the Mediterranean. This explains why this young Sardinian industrial centre succeeded to reach, in such a short time, a leading position both nationally and internationally. Such a position can but commit and stimulate to strive for further improvement in the service of the Italian oil industry of tomorrow.

billi

FOR TECHNICAL EXCELLENCE

Billi S.p.A. Costruzione Macchine Tessili Firenze Italia

There are stocking manufacturers working all over the world.
And working with them is Billi, perhaps the most famous name in stocking machinery.
Billi machines have revolutionized the stocking industry.
We hold more patents for technical advances in the field of hosiery machinery than any other company.
And Billi engineers have planned, designed and built complete stocking plants all over the world.
If you're in the business of making stockings,
make it your business to talk to Billi.

Books

The Un-Americans

THIRTY YEARS OF TREASON
Edited by Eric Bentley.
Thames and Hudson. 1019 pages. £5.

The Un-American Activities Committee of the House of Representatives is not dead. Under a less tarnished name, the Internal Security Committee, it continues to hunt out Americans whose actions and thoughts seem subversive to its preponderantly conservative members ; it still receives a great deal of money, over half a million dollars in the present financial year. But when a Republican President holds out the hand of friendship to Peking and China a communist-hunting committee must feel itself in a sort of limbo.

Mr Bentley is concerned with the committee's heyday. The record which he presents is far from complete (for it to be complete would take several dozen volumes of this giant size) and he omits the Hiss case, the panel's most sensational and satisfying hour, concentrating instead on artists and writers. But the hearings which Mr Bentley does give he gives virtually in full. Almost every page is compulsively readable, whether it is Mrs Hallie Flanagan giving as good as she got as she defended the Federal Theatre project in 1938 (skating with poker-faced dexterity over the nature of some of the plays which it sponsored) or the pitiful Mr Larry Parks struggling not to become the Judas of the Hollywood scene in 1951. At that time the cold war was going full blast and many people who had been sucked into the communist fold during the great depression of the 1930s and the era of good feeling towards Russia during the war wanted desperately to conceal their past.

Most readers would probably benefit from more guidance through the hearings than Mr Bentley vouchsafes, while excerpts from the hearings into communist influence in the trade unions would give a fairer picture of the committee's work. But a most striking lesson emerges from the comparison between earlier witnesses, who played into the committee's hands by refusing to answer its questions, and the representatives of today's radical youth who are only too happy to monopolise the floor and to tell the committee everything it wants to hear and a great deal that it does not. The Hollywood 10 went to jail for contempt of Congress (the only punishment which the committee can inflict) but their real suffering was inflicted by Hollywood's blacklist, which blasted many promising careers and even led to some suicides. Today's radicals have nothing material to lose and, faced with them, it was the committee which backed down, declaring, in an extraordinary reversal, that it would try henceforth to avoid publicity.

In his interesting afterword Mr Bentley considers some questions of conscience (not all the silent witnesses were simply bent on saving their own skins) and also the discreditable part played by the relatively few hard-core members of the communist party. Even where they are concerned Mr Bentley does not subscribe to Mr Richard Rovere's verdict : "The investigators and the investigated seem to have deserved each other." But, as a radical himself, Mr Bentley is revolted by the communists' passion for intrigue and secrecy, their lack of candour, the way they hoodwinked well-meaning liberals about the nature of stalinism and tried to blur the distinctions on the political left to their own advantage. In his eyes the communists betrayed their own revolution and discredited the whole radical movement ; this was their real sin Incidentally, he does not subscribe to the popular idea that the committee was a ridiculous side-show : "HUAC was usually the reverse of stupid. . . . These men had their ears closer to the ground than any of your bland, clever, literate liberals."

Earlier tragedies

PASSAGE TO AMERICA
By Terry Coleman.
Hutchinson. 317 pages. £3.90.

Think of a typical immigrant to America. Andrew Carnegie ? Julie Andrews ? John Kennedy's ancestors ? And think of the Statue of Liberty. Does it not invite "the huddled masses" of tired Europe to American shores ? This moving book by Mr Terry

Reception committee, New York style

Coleman reveals our lamentable dependence on myth rather than history for knowledge of the past. While the United States did turn out to be the promised land for many newcomers, it did so particularly for those who arrived with some cash and physical strength and who came after the advent of the steamship which cut the length of the journey to less than a fortnight after 1850.

Most of the Irish exodus in the wake of the potato famine lacked these advantages. Mr Coleman has chosen to concentrate his attention on the years from 1846 to 1855 and on the emigration to America from Ireland and Great Britain. The conditions under which the steerage passengers made the journey were no better than those of a concentration camp, and with typhus, malnutrition and the Atlantic itself there was no need of gas chambers. The passengers were beaten by the crew, starved by the captain and then if they survived—as many did not—to reach New York, Boston or Philadelphia, they were robbed of money, luggage and even their children by the porters, travel agents and bureaucrats who were waiting for them to leave their ship. The length of the journey itself doomed many of the weak and aged; the old brigs and sailing packets took more than a month to cross the ocean, hardly less time than it took Columbus.

This is a worthy, readable book that misses being a major one. The author has failed to encompass his subject and to set the heart-rending stories, meticulously dredged out of the documents of the period, into a solid historical

CAMBRIDGE UNIVERSITY PRESS

matrix. The conditions described by Mr Coleman were so harrowing that one wonders how any emigrants at all managed to survive. What percentage did make the grade and what kinds of jobs saw them through? How did paupers scrape up the few pounds needed for steerage passage? And what ever did happen to wretched John Williams who, broke, jobless and foodless for five days, had no money even to return to England and was advised by a sympathetic immigration clerk to commit suicide? The author leaves him weeping.

In spite of the weight of anecdote, however, three general facts stand out. One is that the horrors of the potato famine must include the deaths of thousands of Irish who were forced to emigrate when in no physical condition to survive the voyage. Another is that many of the supposedly new problems of American port cities were just as recognisable a century ago—the seediness of Boston and the corruption of New York City's police, for example. But what is most overwhelming of all is the steadfastness of the American governmental establishment in holding to the country's traditional philosophy of welcoming all immigrants who chose to come, even though that meant accepting infirm paupers of a religion which at that time seemed alien to American tradition.

Anatomy of wartime collaboration

THE PATRIOTIC TRAITORS
By David Littlejohn.
Heinemann. 406 pages. £3.90.

"Hitler's war," pronounced the Cardinal Archbishop of Paris on July 30, 1941, "is a noble undertaking in defence of European culture." He really meant it. Cardinal Baudrillart let it be known that he kept on his desk a facsimile in miniature of the banner of the *Légion des volontaires français contre le Bolchévisme*; and he commended the volunteers serving with the Wehrmacht in Russia as "the finest sons of France." As prime minister, Pierre Laval—whether or not he really meant it—disgusted most of his compatriots by declaring flatly on June 22, 1942, "I hope for a German victory," and subsequently urging French workers to respond to Gauleiter Sauckel's demand for 350,000 Frenchmen to replace Germans conscripted from factories. Cardinal Baudrillart had the good fortune to die naturally before the liberation. In October, 1945, M. Laval, half dead from self-administered poison, "was able to stand on his feet to face the firing squad. He met his end with courage and dignity."

Mr Littlejohn notes that after the humiliations of occupation the mass of the French people itched with vengeance, not so much against the foreign enemy as against those in their own country who had helped him. The "purge" lasted from 1944 to the end of 1949. In the courts 2,071 persons were sentenced to death, excluding some 4,400 who had been tried in absentia. Of the 2,071 capital sentences only 768 were carried out. But in the heady free-for-all of the first days of liberation summary executions disposed of at least 10,000 collaborators. In addition 1,325 executions (according to restrained official sources) were carried out by ad hoc tribunals composed of members of the resistance. (During the occupation over 5,000 collaborators had already been assassinated.) In the armed forces 3,035 officers were discharged with dishonour and 2,635 involuntarily retired. About 5,000 civil servants, including 18 magistrates, were dismissed. In all some 39,000 prison sentences were imposed for various acts of collaboration. Mr Littlejohn remarks that the French purge does not seem to be excessively severe when compared with similar proceedings in Belgium and Holland, each of which brought some 50,000 collaborators to trial, although their combined population was less than half that of France.

Who were they all? And why on earth were they ready to ally themselves with Hitler's tyranny? Mr Littlejohn writes objectively, compassionately and always interestingly of the muddled yet not always wholly despicable individuals and political groups that developed more or less willy-nilly into the wartime collaborators of Norway, Denmark, Holland, Belgium, France and the Soviet Union. His longest chapter is devoted to France. There, he points out, "collaboration" had two meanings. To the majority of collaborators it signified only the minimum of co-operation with the occupying power deemed necessary to secure for France a tolerable place in the nazis' projected new order. To a small minority it meant working actively, and even soldiering, for a German victory.

Roughly the same distinction applied elsewhere in Europe. Mr Littlejohn deals with each country in turn and the character and fate of its salient collaborators. Of the notorious only Léon Degrelle of Belgium escaped the harsh end of such "patriotic traitors" as Laval, Quisling, Mussert, and Vlasov. Mr Littlejohn's book breaks new ground to good effect.

Work, work, work

MUNBY, MAN OF TWO WORLDS
Edited by Derek Hudson.
John Murray. 471 pages. £5.

Why does one feel such gloom, even repugnance, in the face of a character who obviously had good brains, good manners and, after his own peculiar fashion, a good heart? It is not that the life and diaries of A. J. Munby are uninteresting—far from it. He could well become one of the most famous diarists of the nineteenth century; it is excellent that his papers have been unearthed and published. And the high level of Mr Hudson's industry and intelligence is everywhere in evidence. But one is overwhelmed, at the end, by feelings of helplessness and hopelessness. Part of the reason is the curious unreality of it all—it is as though Mr Pooter and Gladstone had agreed to play out an elaborate charade, only Munby's obsession was not with "unfortunates." In his eyes, the only unfortunates were those females bidden by misguided politicians and trade unions to absent themselves from the felicity of hard manual labour in the coal mines.

Munby, the friend of such diverse men as F. D. Maurice, Millais, Thackeray and Rossetti, a barrister, a minor poet and a social figure somewhat on the edge of things, was simultaneously and secretly living out another life, below—very much below—stairs, in pursuit of his ideal female. To suit his peculiar tastes, she had not merely to be a servant, but one blackened with coal-dust and with coarse, red hands eloquent of endless slavery in kitchen and scullery. Not that domestic servants really lived up to his conception of feminine perfection. They did not wield shovels or go about in clogs. Wigan was his spiritual home, and to that paradise, and others like it, he would constantly repair to interview, sketch, photograph and question iron-muscled women, dirty all over for preference, and engaged in work arduous and unremitting enough to make any member of the women's liberation movement foam at the mouth.

And yet the fantastic paradox was that Munby would regard himself as a fully paid-up member of the movement; his idea of liberation would be to allow women to put in a 14-hour day of hard, physical toil. The trouble was that this paradox intruded into his private life. He found in Hannah Cullwick a woman who, to a great extent, shared his views on the virtues of physical work. For many years she was his servant, content to blacken his grate and his boots, and then, although not without hesitation, misgivings and much secrecy, he married her. She continued to clean and polish on her hands and knees, but the major paradox bred a number of minor ones and Munby, to his own consternation, would occasionally find himself wishing that Hannah had pale hands that could hover above the drawing room tea-table, instead of ones grimy from the coal-hole. Hannah shows herself to have been sensible, equable and intelligent in her letters—her education at Munby's hands was considerable—which are happily included, and Mr Hudson's comments endorse this impression. But even she felt the strain of their unnatural relationship, and the marriage, although it never entirely broke down, came perilously close to it.

It is not Mr Hudson's fault that his admirable book is enough to put anyone off the Victorian age. In its own way, it does so even more effectively than Mayhew, though Munby was in some lights a philanthropic character, and can be acquitted of some of the nauseating hypocrisy of his time. Rather, in his curious neurosis or perversion, he was its victim.

Munby's feminine ideal

HODDER & STOUGHTON

Remote control

THE CONTROLLED ECONOMY: VOLUME 3
By J. E. Meade.
Allen and Unwin. 382 pages. £7 cloth, £2.95 paperbound.

This is the third in Professor Meade's series of volumes on the principles of political economy in which he is engaged in setting out his own version of recent advances in economic theory. He is, of course, too creative to do no more than synthesise and simplify the work of other authors, but that is nonetheless his central purpose. Here he is concerned with dynamic macro-economics and uncertainty. With his customary clarity he has explained parts of control theory without recourse to elaborate mathematics. Some readers will share his enjoyment in the resulting intellectual edifice, but others will feel that he has helped them to see how useless it all still is. What he calls "governmental control planning" can "theoretically" be optimised. The prerequisites are merely a complete econometric model of the economy; both a description and a probability of each of all possible future combinations of outward circumstances; and, on top of all that, some principle for measuring the social welfare arising under all possible states of the economy.

Part one of this book is a brilliantly simple introduction to period analysis of the Stockholm school type. Part two shows, in effect, that we cannot actually apply such analysis. Part three is about the ideal removal of uncertainty by contingent forward markets or by an all-embracing indicative plan. Part four deals with the governmental control planning mentioned above and part five brings in a residual uncertainty explanation of the demand for money. It ends with Professor Meade's proposals for an incomes policy.

In the preface, Professor Meade notes that it was impossible to acknowledge the sources of all the ideas in the book. He mentions the names of a dozen or so friends with whom he has discussed things. This is apparently his excuse for refraining from acknowledging any sources whatever in the body of the book, a feature which seriously detracts from its value.

BUTTERWORTHS BUDGET TAX TABLES 1972
Now available.
Edited by J. Jeffrey-Cook, F.C.A., F.T.I.I., and George Whillans, F.I.B., F.T.I.I., F.R.Econ.S.
Published annually within three days of the Budget. these Tables are essential to all who need immediate and precise information on the way in which the Chancellor's proposals will affect their work.
All the Budget proposals are dealt with in *Butterworths Budget Tax Tables,* classified under logical headings with the effective date of commencement of each change clearly indicated.

Short list

An Insight into Management Accounting by John Sizer (Penguin, 40p). The gap which Dr Batty's book "Accountancy for Managers" was intended to fill no longer exists. Mr Sizer covers the field of accountancy for management in a much more comprehensive and integrated fashion. He deals with both financial and cost accountancy and integrates these areas with the total corporate planning process. Its coverage is superior and its price advantage significant.

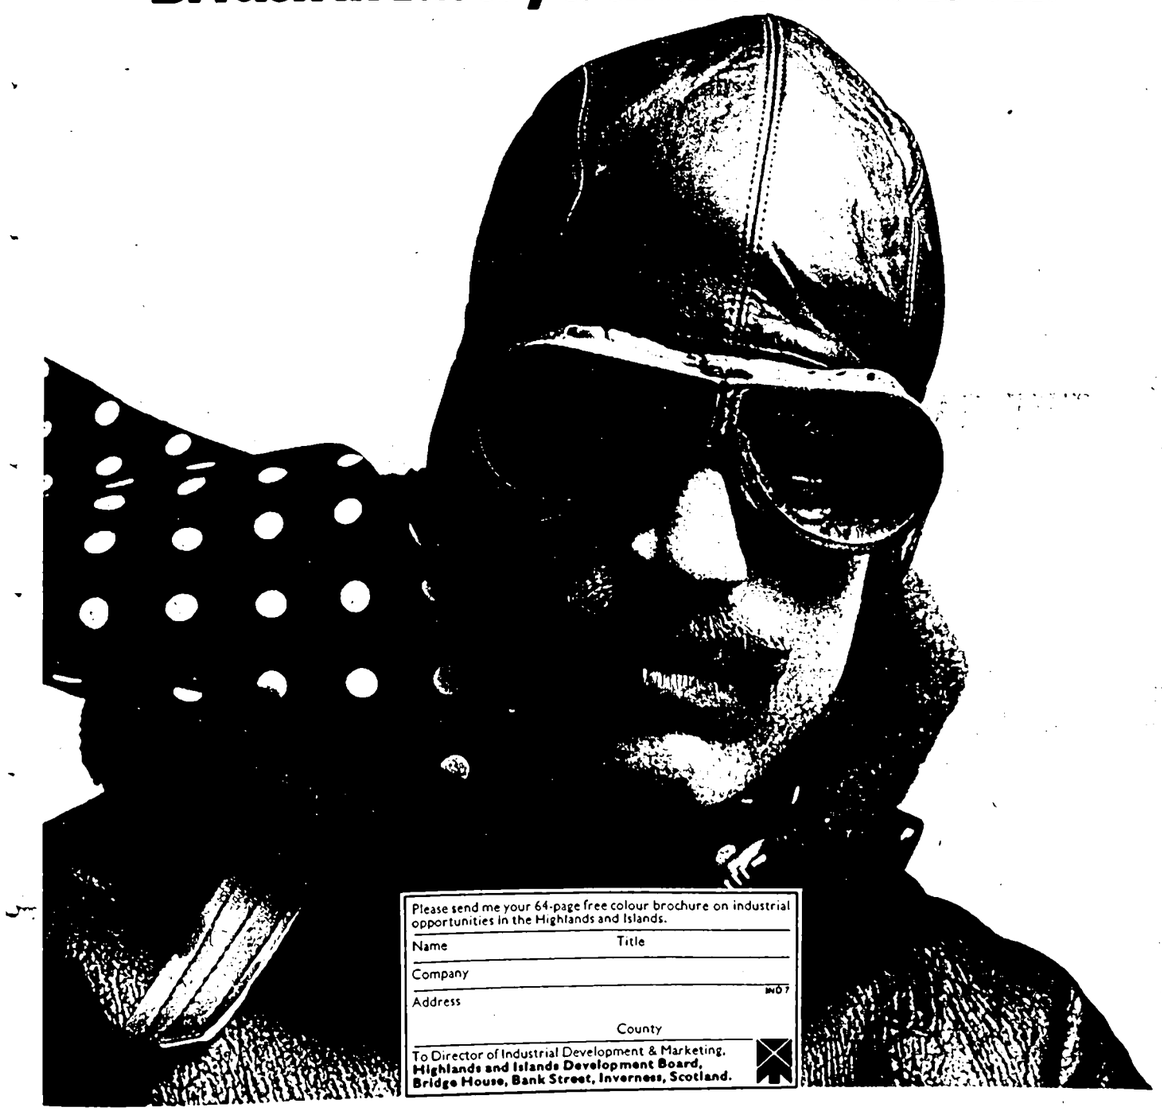
Trade Unions edited by W. E. J. McCarthy (Penguin, 60p). This is a collection of 22 essays on this and that about unions. Nearly all of them have been published elsewhere before—three being straight out of the evidence and report of the Donovan commission. There are a few good ones on democracy and the lack of it in unions, and the economic conditions for union growth. But it would be a hardy reader who got from cover to cover.

Payment Systems edited by Tom Lupton (Penguin, 60p). If you are a harried personnel manager, beset by strikes, low productivity and constant labour disputes, what you may need is a new payment system, such as measured daywork. This book is a series of essays about this and other new pay systems, including profit sharing. Sadly, most are a little too academic and rather out of date. But this is a useful primer on the subject.

The Scottish Highlands and Islands. The biggest development area in the whole of the British Isles. A place with bigger opportunities and perhaps a different philosophy from any other locations you could choose.

We're out to create. To build industry from scratch. To shape an environment which is as economically attractive as it is beautiful.

This means we need worthwhile ideas and projects which we can combine with our experience and the resources we have available. Together we can give British industry and the British economy, a much needed lift.



So we're looking for two types of people. Those who have a going concern which they wish to expand and those who have an idea which needs turning into reality.

We can offer quite a bit in the way of resources: manpower, space, water and power—not to mention get-off-the-ground financial support. And by plane we are only two hours from London and little more from other main centres in Britain.

But first take time off to read our new industrial brochure. It tells of the sort of conditions you can expect, the type of projects we've already worked on, the kind of assistance and backing you could receive.

There's a copy for anyone with the will to be a high flier.

We're offering British industry a chance to take off.

Please send me your 64-page free colour brochure on industrial opportunities in the Highlands and Islands.

Business Brief

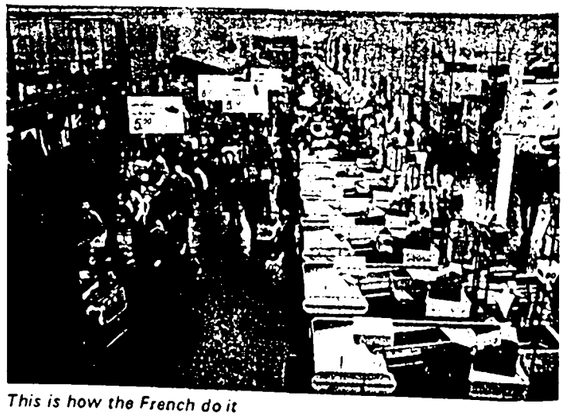
Shopping goes out-of-town

There were 368 hypermarkets in west Germany by the middle of last year; France had 128 and even Belgium had 34. Britain had none, less from an innate preference for the corner shop than from the exceptional stickiness of British planning authorities about permission to develop out-of-town shopping sites. A report* on these "superstores, published on Tuesday, argues that Britain ought to have some of its own because the consumer would benefit from the competition.

A hypermarket, on the most common definition, is a store with at least 25,000 sq ft of selling area, often a good deal more (a good-sized supermarket would have around 10,000 sq ft). It is likely to be on the edge of a town, if not farther out, because sites of this size rarely exist in town centres, or not at an economic price. A hypermarket also needs extra car parks probably equal to at least three times its selling area, so that customers can conveniently (and without charge) part next to the store.

Hypermarkets sell a good selection of food at prices probably lower than in the town centre, and a fairly large range of other goods as well. They are always self-service, and, in contrast to department stores, the selling area is usually on one level.

On the face of it, Britain now looks ripe for the introduction of hypermarkets. The British do spend a smaller proportion of their income on food and drink than the French or the Germans, but this reflects lower food prices rather than more frugal tastes, and the differences are marginal. Car ownership is essential and here Britain is slightly ahead of Germany, although a bit behind France. Proportions of households owning one or more cars in 1969 were, respectively, 58%, 55% and 63%.



*Superstores in the 70s. By Jennifer Tanburn. *Lintas, London*. £3.

Working against hypermarkets is the present state of British retailing. Britain took to supermarkets earlier than most, helped along by a number of large and effective multiples. Supermarkets developed here at a cracking pace throughout the 1960s. France, meanwhile, remained stuck at the corner shop stage. When pressures for innovation finally built up, France went straight for the more radical option of hypermarkets, uninhibited by any feelings about protecting past supermarket investments.

In Britain, however, inhibitions have been at work from the planning stage downwards. Where local authorities have recently spent heavily on town shopping centres, there is understandably little enthusiasm for putting this business in jeopardy. The Department of the Environment sits on the fence. It issued draft guidelines last May which said that

> development of out-of-town shopping sites may be encouraged if they are sites which offer good access, which are appropriate for the full range of commercial and social provision of a district centre, and which are open to no major objection on amenity or other grounds.

This more or less left the way open for every planning authority to draw up its own rules. The final, definitive guidelines, eventually published in February, added only one new factor: that Mr Peter Walker, Secretary of State for the Environment, will have to be notified of all planning applications for out-of-town shopping developments of more than 50,000 sq ft. If neighbouring local authorities cannot agree, he may make the decision himself.

This is how the French do it

Advantages

The three-pronged argument for hypermarkets depends on lower prices, more convenience and relief of town centre congestion. **Prices** can be kept down because site costs are lower out of town, and the size of the operation allows a fairly low staff-to-customer ratio. Hypermarket Holdings, a subsidiary of Wheatsheaf Distribution and Trading in which the French hypermarket pioneer, Carrefour, has a stake, reckons that its gross margin on food will average 12½% when it opens its first British hypermarket in the autumn. The late Prices and Incomes Board, in its 1971 report on food distribution margins, worked out an average margin of just over 19% for its sample of grocers.

On the non-food side, the picture is more varied. Wheatsheaf/Carrefour will work on 21%; multiples generally work on a little over 23% and department stores on 28%-33%. All in all, the hypermarket should be about 8%-9% cheaper, but French experience suggests that other stores in the neighbourhood are likely to drop their prices by 1%-2% once a hypermarket opens. Anti-hypermarketeers claim that although operators start by cutting prices, these creep up once the store has become established.

For **convenience**, hypermarkets have the edge over High Street shops that were never built with the motor car in mind Sainsbury reckons that a customer averages 40lb of shopping a week, which only a fairly sturdy lady could carry in one go. A hypermarket shopper has this transferred straight from trolley to car.

Cars are used for a minority of all shopping trips in Britain but only because many housewives are still in the habit of daily shopping; the average is two to four shopping trips a week. But this is declining all the time. The little Neddy for the distributive trades, in a study on the future pattern of shopping, thought that the weekly shopping trip would be the norm in future. As the proportion of married women at work rises—it is now 37% and going up by 2%-3% a year—there will be extra pressure for more convenient and efficient shopping.

Easing **congestion in town centres** is a double-edged sword. Traders argue that they could cope with all the demand if shoppers would only spread the peak. The Department of the Environment's policy note is particularly anxious about the effect of out-of-town shopping on historic towns, where the loss of income available to maintain the historic buildings could outweigh the advantages of reduced congestion.

Drawbacks

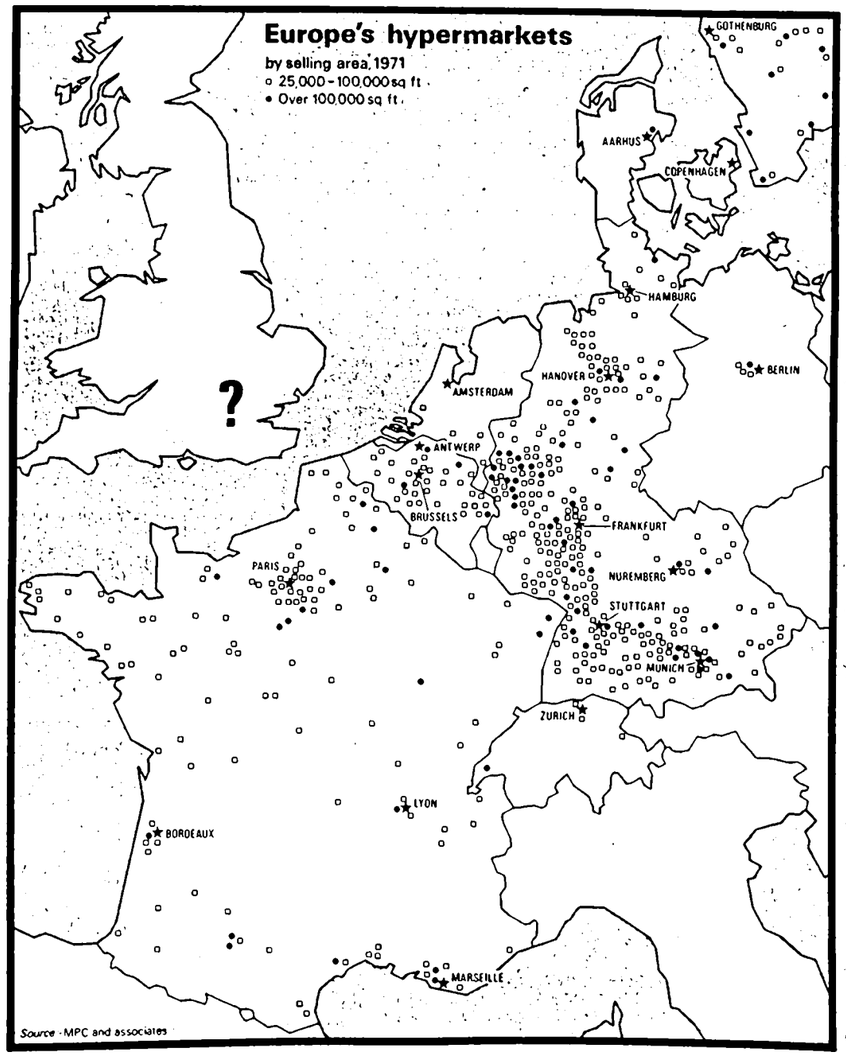
The main drawbacks, as the anti-hypermarketeers see them, are the threat to trade in existing centres, the prospect of traffic problems on approach roads to out-of-town shops, and the look of the thing. There is much talk about eroding green belts and creating eyesores in otherwise unspoilt countryside. Much of this is directed against plans for greenfield sites away from existing towns, drawing customers from a wide radius. But greenfield sites are, in the words of one retail executive, a bit of a red herring.

Most of the sites are at the edge of towns, on derelict or semi-industrial land, or even near existing suburban centres.

Traffic problems on access roads to hypermarkets could be a nuisance, but can be solved by proper planning, and

operators will usually offer to contribute to the cost of what they call "off-site works"—road improvements and the like. If American experience is anything to go by, the sheer size of the car parks creates its own major drainage problems.

By far the most serious objection to hypermarket development is the potential loss of trade to existing centres. Such trade losses are extremely difficult to quantify. French studies suggest that the effect of a new hypermarket on town centre trading can range from a 5% gain to a 30% loss. An inquiry by Manchester University in 1964 into a proposed shopping centre at Haydock, between Manchester and Liverpool, put the long-run loss of trade for these two towns at 12%. But Wigan would lose 41% and Warrington as much as 46%. Accordingly, the application was refused. Sunderland Corporation commissioned two studies last year on the potential effect of a proposed 100,000 sq ft shopping centre at Doxford Park, at the edge of the town, which found that the effect of this on trade in the central areas would be negligible. Even so planning permission was eventually refused.



Traders like to believe that the extra business for out-of-town shopping developments could come entirely from the natural growth in consumer spending, even though, in real terms, the volume of trade in shops has risen only by 5% in the past five years. But even if town centre trading suffers a bit, there is now a strong feeling that the out-of-town bandwagon must not be missed. The Co-op, which still has plenty of town shops that it ought to close, is pushing strongly for a number of "superstores" of between 25,000 and 50,00 sq ft away from town centres. One, at Cardiff, is already in operation.

If all big off-centre shopping developments are included, almost every major retailing group in Britain is trying to diversify away from the High Street. Tesco has already looked at more than a dozen possible hypermarket sites, though it has had no encouragement at all from the planning authorities as yet. Associated Dairies and Fine Fare have some superstores going. Sainsbury is opening a 25,000 sq ft supermarket (hypermarket?) at the edge of Peterborough later this month. Wheatsheaf/Carrefour has finally got planning permission for two hypermarkets, at Telford new town and at Caerphilly; the Caerphilly one will open later this year. Appeals for several other applications are pending.

Groups like the John Lewis partnership and British Home Stores are getting interested. John Lewis is hoping to open a store in the new Brent Cross development in North London, Britain's first regional shopping centre. After endless delays work is expected to start in the autumn. Woolworth has five "Woolco" stores—a kind of free-standing out-of-town department store—which now seem to be picking up business after a slow start. Marks and Spencer, however, leans more towards improving existing High Street locations than starting from scratch on a new site.

Pressure from retailers for out-of-town planning permission is bound to mount. But will Britain be overrun with hypermarkets a decade or two from now? Wheatsheaf/Carrefour forecasts 37 hypermarkets in Britain by 1978, turning over £200m a year—still a minute proportion of what is estimated will be a total retail turnover of £15 billion. More pessimistic forecasters say that Britain cannot comfortably support more than 20 hypermarkets without serious damage to existing shopping facilities.

This would be fewer than a country as small as Belgium has now, but, if it should be true, then planning decisions should not be left to individual local authorities to take according to their own priorities. The Government would do well to follow the industry's little Neddy's suggestion for a strategic plan drawn up on a regional basis; but there is nothing to suggest that the Department of the Environment is thinking that way.

INDUSTRY'S NEED FOR HIGHER MARGINS TO MEET FURTHER ENERGY DEMAND

Alaska and North Sea Forties Field

"...during the 'seventies the extent of our success will depend substantially on the progress of these two major ventures. We are confident that in both of them we shall achieve our objectives..." Sir Eric Drake, Chairman

The Chairman's Statement circulated with the Report and Accounts for 1971 is as follows:—

I deeply regret to record the death in May 1971, of Mr R P Smith. Mr Smith served on the Board of this Company for 15 years and he is greatly missed. Marshal of the Royal Air Force Sir Charles Elworthy, formerly Chief of the Defence Staff, was nominated a Director early in May, 1971. Mr D W K. Barker, who joined the the Company in 1929, is retiring as a Managing Director on 31 March 1972 and I must express my thanks for all he has done for the Company over the past 43 years. To fill the vacancy caused by Mr Barker's retirement it is intended to appoint Mr M.M Pennell a Managing Director from 1 April next. Mr Pennell, who is 55 years of age, has been with the Company since 1946 and has been engaged mainly in exploration and production.

Importance of Forties Field

You know how much importance we attach to our activities in Alaska and in North America. In 1971 it became clear that we had another development of outstanding importance in our North Sea Forties field, and during the 'seventies the extent of our success will depend substantially on the progress of these two major ventures. We are confident that in both of them we shall achieve our objectives, although it is discouraging that another year has passed without a permit to proceed with the Alaska pipeline. With regard to the Forties field, this discovery and its development are likely to be of the utmost importance for the British economy and we are doing everything possible to speed this development consistent with a sensible approach to technical and environmental problems.

The expense of developing these two fields is very large. The cost of Alaska falls, in the first instance, not on BP but on our partners, Sohio. That of developing the Forties field will be a direct charge on BP, and the cost of the first phase, designed to produce oil by 1974, is likely to be of the order of £175 million. It is accordingly satisfactory to record the success of our rights issue of last September, realising some £120 million of new money. In this operation we were able to pass on directly to the stockholders of The Burmah Oil Company the rights in BP in which they were beneficially interested, and thus acquired some 50,000 new stockholders. We warmly welcome these new stockholders, and are grateful to them for the confidence they have shown in us by deciding to invest directly in BP, and also to Burmah for their help, without which these arrangements would not have been possible.

Current Results Disappointing

Since the autumn of last year mild European weather, coupled with a trading recession in Western Europe, has resulted in a worsening in our trading results. The third and fourth quarters were increasingly disappointing and the present prospects for 1972 are extremely discouraging.

Despite the disappointing results of the last months of 1971, the net income of £148·6 million could, if looked at alone, have justified an increase in the distribution to ordinary stockholders, but the trading conditions and the need to conserve our resources for capital expenditure requirements make it inadvisable to recommend any increase at this time.

Need for Higher Margins

I cannot believe that margins will remain for long at such a low level if the industry is to play its part in meeting the increasing energy demand in the years ahead. Our experience in Alaska and the North Sea shows the high costs, considerable risks, and frustrating delays that can be associated with new production schemes. Development of other major energy sources appears to be no less costly.

Demands by OPEC Countries

In the second half of 1971 fresh demands on the oil industry were made by OPEC. The first of these was for the adjustment of the US dollar value of oil revenues of OPEC countries to reflect the decline in value of the dollar. After the general realignment of currency exchange rates in December the industry agreed to negotiate an adjustment, and a settlement was reached in January which increased the dollar posted price of Middle Eastern crude oils by 8·49 per cent, with the result that their oil revenues remained approximately unchanged in sterling terms. The second demand was for "participation" by OPEC governments in the existing major concessions in their countries. Talks on this question have not yet been concluded but at this stage three things can be said: first, that the price that OPEC countries are suggesting they pay to acquire their interest does not remotely approach the true commercial value of these concessions; second, that anything which effectively increases the financial burden must also increase the future costs of Middle East oil and, therefore, its price; and third, that substantial new investment will be required to maintain and increase the oil revenues of the Middle East and elsewhere, and anything which raises doubts in the minds of those expected to find the money would, in the long run, be contrary to the best interests of the producing countries.

Libya

An additional complication has been the action of the Government of Libya in purporting to nationalise our interest in Concession 65 – our principal investment in Libya. This measure was admitted by the Libyan Government to be a purely political action and unconnected with the normal considerations governing relations between an oil company and a host government. The Company's reaction to the Libyan measures has been, and will continue to be, prompt and vigorous. We immediately called for arbitration under the Concession and will press forward with this. We have made it clear to the Libyan Government and the oil industry generally that we regard the Libyan measures as a breach of international law and as being without international validity. We shall therefore sue any person who purchases from the Libyan authorities any oil derived from our concession areas. We have already commenced one action in Italy and, if occasion requires, we will not hesitate to commence others.

Protection of Environment

We have taken important steps to ensure that the environment suffers as little as possible from our operations. This is something we all feel strongly about. The oil industry already invests large sums on the protection of the environment and we hope we may be regarded as an important part of the environmental movement itself.

The Staff

During the year our staff throughout the world have responded well to the very heavy demands made on them and I cannot do better than to conclude by expressing my thanks for the excellent work they have done.

FIVE YEAR SUMMARY

	1967	1968	1969	1970	1971
Group sales in millions of tons	128	142	162	190	207
Gross income—£ million	1,727	2,124	2,287	2,659	3,194
Overseas tax as a percentage of income before tax	73%	70%	73%	79%	78%
Net income—£ million	64	101	97	91	149
Distribution per ordinary stock unit—gross	18·43p	19·85p	21·27p	20·64p	20·64p
Return, being income after tax but before interest on average capital employed	5·9%	7·8%	7·2%	6·7%	9·0%
Middle East, Libya and Nigeria taxation and royalties—£ million	244	330	363	465	727
Capital expenditure—£ million	211	213	244	322	375
Cash flow—£ million	184	227	229	247	275

The following are extracts from the Report of the Directors.

Trading Conditions

The year 1971 has seen the substantial initial impact of the increased taxation and royalties paid to the governments of producing countries under the five-year agreements signed during the first half of the year. In regard to crude oil sales the higher amounts paid were offset almost entirely by the co-operation and goodwill of our crude oil customers who accepted increases in contract prices. Product prices showed some increase in the early months of the year, these being offset by the higher taxation and royalties which increased progressively during the year. The full effect of the higher taxation and royalties did not therefore occur in the first six months during which a net income of £86·2 million was achieved, over half of which was in the first quarter.

The continuation of a reasonable income level based on estimated sales quantities appeared likely but from September onwards oil demand, particularly in Europe, reduced unexpectedly because of the slow-down in the rate of industrial expansion and an unusually mild spell of weather in the northern hemisphere. Sales were therefore lower than expected and there was a weakening of prices in certain products, particularly fuel oil. As a result the net income for the second half of the year at £62·4 million was less than it had seemed reasonable to expect when the first half-year's figures were issued to stockholders in September.

Capital Expenditure and Finance

Capital expenditure by group companies in 1971 amounted to £255·7 million and the group's proportion of capital expenditure by associated companies was £118·8 million, a total of £374·5 million (£322·4 million in 1970). Cash flow including investment grants was £275·6 million (£247·1 million in 1970).

Group borrowing outside the US amounted to £122·4 million, most of which was short-term and acceptances in respect of oil movements.

Standby facilities, currently unused, amount to approximately £100 million. These have a duration of more than 12 months and are renewable.

Progress is being made with arrangements to finance the substantial capital expenditure in respect of the development of the Forties field in the North Sea.

Receipts from Iranian Consortium Members

£6·4 million was received in 1971 and represents the final amount due from the Iranian consortium members under the terms of the 1954 agreement. This amount has been credited direct to reserve by the parent company.

Contribution to UK Balance of Payments

The group's UK exports consisted of approximately 9 million tons of oil products, the value of which was £97·5 million. The value of chemical exports was £20·0 million.

Over 90 per cent of the group's trade of 207·4 million tons was carried on overseas and the majority of the crude oil and products was neither imported into nor exported from the UK. The oil export figure given above is therefore not indicative of the group's contribution from oil activities to the UK balance of payments which for 1971 is estimated at £170 million.

£140 million of this contribution arises from overseas trade (including sales of quantities exported from the UK) less capital investment abroad, to which is added £30 million representing the estimated saving to the country by reason of the group importing oil to the UK for consumption as compared with the foreign exchange cost of buying the same quantity from a foreign based oil company.

Developments in the USA

Development of the Prudhoe Bay leases continued during the year, although permits for the construction of the trans-Alaska pipeline have still not been issued.

On the marketing side, economies were achieved during 1971 by combining Sohio and BP Oil Corporation activities and reorganising BP's marketing operations. BP Oil's profitability is expected to improve still further by concentrating market development in those areas where prospects are promising and by withdrawing from others.

In February this year Northern Natural Gas Company of Omaha agreed to commit US $20 million to an exploration programme to be conducted by BP Alaska in east coast US and Alaska offshore areas and to make a prepayment of US $30 million against the supply of 1·5 trillion cubic feet of BP Alaska's North Slope Alaskan gas when it becomes available. In return, Northern will have the first option to purchase any gas discovered and the right to participate in all BP Alaska's lease acquisitions in the areas of interest. BP Alaska will retain the right to any oil found.

Group Sales

Sales by the group of crude oil, refined products and chemicals rose by 9·3 per cent to a total of 207·4 million tons.

In 1971 sales of crude oil topped 100 million tons for the first time. Sixty-seven customers were supplied with a total of 104·6 million tons, which represents a 24·8 per cent increase on 1970.

Mainly because of substantially reduced industrial activity both in Europe and Japan, product sales including those to associated chemical companies were 2·9 per cent below the level achieved in 1970. Natural gas sales amounted to 125,511 million cubic feet, compared with 91,690 million cubic feet in 1970.

Marketing

BP continues to up-date its filling station network, especially in Europe. We are introducing Autocenters, large sites with comprehensive modern facilities for the motorist. There are now more than 5,000 Autoshops which offer customers a widening range of items.

BP Canada (now BP Canadian Holdings) acquired a controlling interest in Supertest Petroleum (renamed BP Canada) in a merger which added 1,400 retail outlets to BP's network in Ontario and Quebec.

Since the announcement last year that the marketing of BP and Shell products in the UK would be progressively developed in separate brand organisations over the next four to five years, we have been studying how this can best be done with minimum disturbance to our customers and normal business. It is expected that the first stages of implementation will begin very shortly.

Production and Exploration

In 1971 the group lifted 208 million tons from its resources of crude oil, an increase of 11·8 per cent over the 1970 total of 186 million tons. The Middle East provided 170 million tons, African countries 36 million tons, and 2 million tons came from other areas. The group stopped lifting its Libyan crude oil on 7 December 1971.

In the UK appraisal drilling has confirmed the Forties oil discovery 110 miles off Aberdeen as a major field. Plans are well advanced to bring the field into production by the end of 1974. Surveys were carried out in several other offshore areas and additional licences were obtained. Onshore, surveys and drilling proceeded.

Sea Transport

At the end of 1971 BP's fleet and those of its subsidiary and associated companies totalled 130 ships of 5·6 million deadweight tons (dwt) compared with 127 of 4·5 million dwt at the end of 1970. During the year, six vessels totalling 1·2 million dwt came into service and three totalling 69,000 dwt were sold. We also had long-term charters amounting to 13·3 million dwt, with other vessels on short-term charter.

Refining

During 1971 the crude oil processed on our account in our wholly and partly-owned refineries was 100 million tons. A further nine million tons were processed for us by other refiners. The total of 109 million tons compares with 113 million tons in 1970.

Outside the US the group has 14 wholly-owned refineries, a majority holding in six refineries with 100 per cent processing availability, and part ownership of 21 refineries. In the US, four refineries are operated by Sohio.

Chemicals

The group's main consolidated investments in chemicals are in the UK where demand was more disappointing and cost inflation greater than in most other parts of Europe. Various remedial measures to improve the company's position were taken in 1971. The benefit from these measures and from new plant coming on stream will become progressively more significant as trading conditions improve.

BP Chemicals International was honoured to receive The Queen's Award To Industry in April 1971 for its development of a process for producing chloroprene from butadiene.

Proteins

Work has continued on the commissioning of our protein demonstration unit at Grangemouth which has a capacity to manufacture 4,000 tons a year of high-protein yeast, and the first sale from this plant was made at the end of the year.

Research and Engineering

Since 1964, BP has operated a process to isolate normal paraffins, which constitute important raw materials for the chemical industry and in protein manufacture. During 1971 an improved version of this process was brought into operation in our Dinslaken refinery.

The first plant licensed in the US for the operation of the BP isomerisation process was successfully put on stream by Atlantic Richfield in 1971.

In the continued search for more economic bulk storage of oil, we have completed a programme of development of the use of high strength steels which will permit an increase in the maximum size of tanks and reduce their construction costs.

Environmental Control Centre

Protection of the environment continues to play an important role in our operations and accounts for a growing proportion of our expenditure on refinery plant and facilities. Our Environmental Control Centre, created in 1970, and a high level Environmental Policy committee, set up in 1971, co-ordinate these activities throughout the group.

Copies of the Annual Report and Accounts for 1971 may be obtained from the Secretary, The British Petroleum Company Limited, Britannic House, Moor Lane, London, EC2Y 9BU

Your entry to a Great Country

Through The Commercial Bank of Australia

We are the open door to your investment problems in this country.

We can advise you where to invest. Whether you are opening a subsidiary operation or seeking local associates.

We're The Commercial Bank of Australia. With over 800 offices throughout Australia and New Zealand offering full banking facilities. We also have a representative office in Tokyo thereby providing a springboard to rich South East Asian Markets.

We know the markets, we know the investment potential, we know we can help you. By arranging trade introductions. Import/Export advice. Acting as your nominee for portfolio investments. We'll even make your travelling arrangements. So contact us, and discuss your investment prospects.

The 121mph BMW 2500 'executive express'

For those who like power, all sorts of power, the BMW 2500 reflects unbeatable performance with an individuality of style. Its perfectly balanced 170 bhp overhead camshaft engine is complemented by the hand-finished coachwork.

A car for the forward looking company with an international approach. For the man who can really appreciate the true meaning of performance. Like 0 – 50 in a mere 7 seconds. 26 miles to the gallon when touring.

Twin servo braking system combined with 'anti-dive' all independent suspension to make doubly sure you stop when you want to, and take the cornering out of cornering.

Plus the option of power steering and special ZF Sports Automatic Transmission to cut out the leg-work without losing performance. And a sumptuously upholstered interior with heated rear screen.

Alternatively, you may consider the 127 mph BMW 3.0S with 0–50 mph acceleration in 6.2 secs, and even higher specifications including built-in headrests and ventilated disc brakes as standard equipment.

Take a test drive today and rediscover the kind of driving pleasure you thought had ceased to exist. And remember there's *no waiting* for delivery.

Prices of the BMW range: 102mph (Autocar test report) BMW 1602: £1799 · 113mph (Autosport) BMW 2002: £1949 · 108mph (Safer Motoring) BMW 2000: £2125 106mph (Motor) BMW 2000 Touring: £2173 · 119mph (Autosport) BMW 2002 tii: £2349 · 121mph (Autocar) BMW 2500: £2999 · 127mph (Autocar) BMW 3.0S: £3750 132mph (Autocar) BMW 3.0Si: £3999 · 131mph (Autocar) BMW 3.0CS: £5450. ZF Sports Automatic Transmission optional on the BMW 2000 and 2002 models at £199 and the BMW 2500, 3.0S and 3.0CS models at £249. Prices shown are recommended retail prices including P.T.

Unbeatable BMW present a range of Sports Saloons starting at £1799

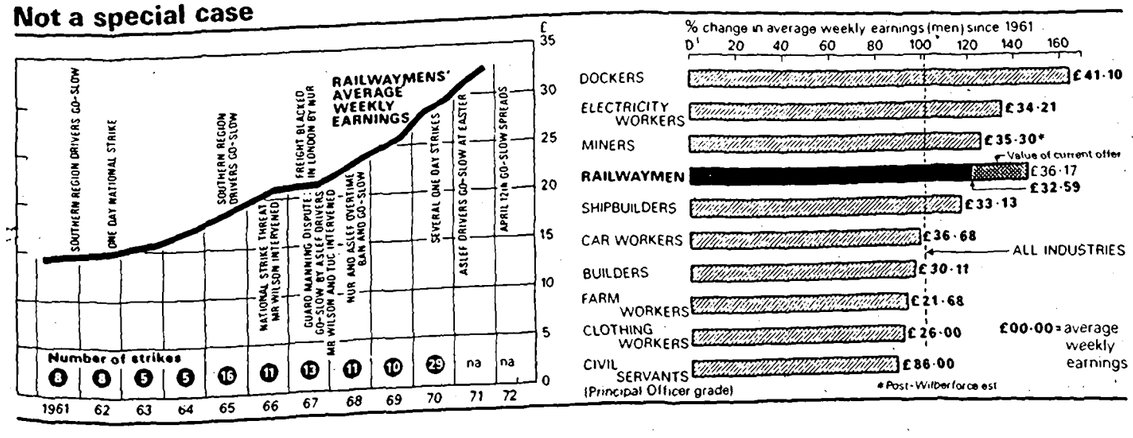
BUSINESS

They're not special

Railway workers are not underpaid; British Rail's 11 per cent offer is more than generous

The pressure is now on the railway unions to take their claim for an extra 16 per cent to arbitration, which on all past evidence is as good as a guarantee of an offer larger than anything that British Rail is voluntarily prepared to put up. The ritual comings and goings began at the Department of Employment on Thursday afternoon, the day after the unions had voted to start an official go-slow from Sunday. Although the men left Mr Maurice Macmillan, who was having his first taste of the bed-of-nails side of his new job, reporting that they had been offered no more money, the normally militant train drivers' Mr Ray Buckton was still saying that the gap was "not wide." The unions were not expected to say before Friday whether they would accept arbitration ; nonetheless, Mr Macmillan had the chairman of British Rail round immediately afterwards.



The Government should not feel that it has to conciliate the railwaymen. Mr Buckton himself was worried enough about public reaction to trouble on the trains to have asked the militant southern region train drivers to call off their unofficial work to rule until the starting date for the official, country-wide one. He failed, of course. But it showed his awareness of the need to have the public on his side if the necessary pressure was to be put on the Government to increase what Mr Heath had called a generous wage offer. And the way to make the public love you is not by leaving it fuming at Charing Cross in the Thursday rush-hour home, while local drivers go off to hold a meeting.

The railwaymen claim that, like the miners, they are a special case. The Associated Society of Locomotive Engineers and Firemen which is the only one to put this on paper, argues that :

- Other workers have got bigger rises,
- The railwaymen have co-operated to reduce BR's labour force,
- Productivity has risen sharply,
- Modernisation has made the work tougher,
- Prices have risen fast and will go on doing so.

The first point is simply not true. Although the Guillebaud committee back in 1960 could report that railwaymen were paid 10 per cent less than most comparable jobs, their wages since have improved faster than most. Their earnings have gone up by 122 per cent in the past decade, or a fifth more than the average for all industries. Were the latest offer accepted, earnings would have risen by 146 per cent since 1961. The miners' earnings rose by 81 per cent in the same period, although if the Wilberforce award is included the increase has been 126 per cent.

Not a special case

Even in the past few years the railwaymen have done pretty well. In 1970 they got 13 per cent and in 1971 11 per cent, both about the going rate at the time. Where the militant Aslef train drivers are right is in claiming that the differential between their pay and that of porters, signalmen and other grades has narrowed. Drivers' pay in the past decade has risen by 101 per cent, almost the average for all industries.

Against this, the drivers work shorter hours than most railwaymen, usually a 44-hour week, including overtime. Most railwaymen work nearly 50 hours a week, around 10 hours of which is at overtime rates. Signalmen put in nearly 52 hours, and their average pay packet is worth £36.60, compared with the drivers' averae of £35.57. Porters and other manual workers take home about £28.

The pay structure is complicated by a muddled system of productivity bonuses, which BR is trying to end. The main bonus is related to miles driven by drivers. The aim is to reward those who do a lot of work in a short space of time, so that a driver, working on what is called a "long link," may collect £60 in a week, but not many do. A driver who takes a train from Euston to Edinburgh, and thence to Manchester and down to Penzance, will collect a hefty bonus. But since the timetable is not up to the driver, there are not that many options open for high bonus-earnings. And although there are complex adjustments for drivers on suburban services, they do not do as well as the drivers of the fast Inter-City trains. This is partly the reason why BR proposed consolidating bonus payments into basic pay, a move that would have made the 11 per cent offer worth, for some men, 15 per cent.

Claims to have co-operated willingly with BR's labour-slimming plans do not bear too close inspection. Railwaymen have fought redundancy at every stage and the industrial relations record of the railways is poor. Other than occasional one-day affairs, there has been no national strike since 1955, and the union leadership has never shown much stomach for one. But there has been no end of go-slows and unofficial strikes up and down the country which effectively disrupt the transport system without obliging the unions to give strike pay.

Of course productivity has improved, but, given the scale of new investment in the railways, it would have been remarkable if it had not. Passenger journeys per man employed have gone up by 61 per cent in a decade, but where this cannot be explained by the introduction of faster trains on newly-electrified lines, it is likely to be the result of the steady axing of branch lines. Both BR and the unions still boast of the productivity deal struck in 1968 at Penzance, which introduced, among other things, more single manning of trains, but no one has yet succeeded in quantifying any of the benefits claimed for it. As for working conditions, better signalling systems have offset any strain in driving the faster trains, and railway work cannot now be called dangerous.

The railwaymen are, in short, a slightly-above-average bunch of men. Until the miners got their extra 25 per cent, wages on the railways were rising faster than in the pits; they would outstrip them substantially again if the present offer was accepted. And there is nothing in a railwayman's working environment to tug at the public's heart strings in the way that the miners did.

The trouble that the Government has created both for itself and for British Rail is that it is now subsidising the nationalised industries so much that, although the unions might not dispute Mr Richard Marsh's contention that there are limits to how big a wage increase he can pass on in prices to rail users, they see no reason why the Government should not toss in the few million pounds that would bridge the gap for him. The Government has, after all, done this for the coal board in face of the obvious impossibility of passing on the whole of the miners' increase to consumers. But if the railwaymen then get the sort of inflationary settlement that radically alters their place in the wages league table all those other industries with wages under negotiation are going to have something to say about it.

How not to depreciate

The Finance Bill provides that all investment this year will be depreciated at 40 per cent, while the profit from it will be taxed at 50 per cent. This could mean a bad setback to investment in 1972-73. And that's not all

The Government's hopes of stimulating that lifeblood surge of industrial investment this year will be badly jeopardised if clause 65 of the Finance Bill is allowed to go through. This clause provides that there shall be 100 per cent first-year depreciation (for tax purposes) of all plant and machinery bought after March 21, 1972. When we discussed the problem last week (April 8th, page 72), we did not actually believe that the Government would go for this form of depreciation. Now that it has, we must say again how damaging the consequences could be.

The effect of the proposal is that, in the year before the new corporation tax system is introduced in April, 1973, when the rate of corporation tax will go up from 40 per cent to 50 per cent, the depreciation of new assets will occur at the 40 per cent rate of tax, while the taxable profit deriving from them in later years, both for amortisation and actual profit, will be taxable at 50 per cent. But for investments after next April both depreciation and profit will have the same 50 per cent rate applied. The incentive to delay is obvious.

It is true that it is not absolutely necessary to take 100 per cent in the first year: the bill provides for the right to do so to be waived. But it will then only be possible to depreciate 25 per cent of the reducing (undepreciated) balance of the expenditure in each successive year, start-

Atlas Copco.

Group's profit up 6%.

Sales

The year 1971 was characterised by a receding market trend in most industrial countries. Anti-inflationary measures initiated during the latter part of 1970 were accentuated by an increasing imbalance on the international foreign exchange market. As a result falling mineral prices and, in consequence, sharply reduced demand for industrial products was experienced in many sectors. These factors influenced Atlas Copco Group sales.

In many countries, price control measures, combined with increased competition, made it more difficult for the Group to recover continued increases in costs of production and distribution.

For 1971, the Atlas Copco Group reports total invoicing of Sw. Kr. 1,696 million (1970: 1,542). Group sales were Sw. Kr. 1,704 million (1970: 1,566).

90% (89%) of the Group sales went to foreign markets. Sweden remained the largest individual market.

Among overseas markets, sales were particularly satisfactory in Argentina, Australia, Brazil and India. A gradually more expansive economic policy was pursued in the U.S. and Canada. Nevertheless, the Group's sales on these markets were slightly below those of 1970.

Sales of heavy rock drilling equipment showed a marked improvement. Deliveries were primarily made to civil engineering underground operations, and several orders were received in connection with large international projects. Crawler drills for contractors also enjoyed a reassuring increase in sales.

The low activity of the contracting industry in a number of areas in 1971 resulted in a decreasing market for portable compressors. However, a slight upward trend was noted towards the end of the year.

Stationary compressor sales remained high during the first half of the year, but fell during the second half. The prevailing monetary situation is considered to have influenced larger investments. Nevertheless, the order book for large capacity compressors remains at a substantial level.

Increases were recorded in pneumatic components, which have now been introduced onto all European markets.

For industrial tools there was a marked increase in competition on price, particularly for impact wrenches. The multiple nut runners introduced during the year were well received on the market.

Investments

Investments in production equipment remained at the same high level as during the two previous years. The utilisation of the total production capacity was reasonably good.

The biggest investment for production facilities, both in buildings and machinery, was made at the Arpic works in Belgium. In Sweden the Avos Workshop is being extended. The new forging shop at Smedjebacken was put into operation.

New sales centres are under construction in the U.K., Denmark and New Zealand. In Brazil a new office was completed. New branch offices were established in a number of markets.

The building work for the first stage of the research institute CERAC in Switzerland was completed.

The number of employees in the Group at the end of 1971 was 13,706 (13,764).

Results

Group invoiced sales increased during 1971 by Sw. Kr. 155 million or US $32.0 million, and exceeded the 1970 figure by 10%. The operating profit for 1971 of Sw. Kr. 252 million, or US $51.9 million, showed an increase of slightly more than 8% over the previous year. Profits on sales were reduced from 15.1% in 1970 to 14.8%. Considerable rises in wages and salaries, together with currency exchange losses of some Sw. Kr. 8 million were the main causes of this reduction.

Group profits before appropriations and taxes rose to Sw. Kr. 171 (161) million, or US $35.2 million, an increase of approximately 6%.

The consolidated balance sheet shows an unappropriated profit of Sw. Kr. 220.8 million, or US $45.5 million.

The Board proposes a dividend of Sw. Kr. 5 per share, including shares from last year's new issue.

The Annual General Meeting of Atlas Copco AB was held on April 12th, 1972.

Atlas Copco

ing with the second year. Even this could be better (although not necessarily so) than taking 100 per cent in the first year at 40 per cent. Whether it is or not, investment in 1972-73 will still be at a great disadvantage compared with investment in April, 1973, and after. Indeed, that is putting it mildly. There will be no reason to expect British investment in plant and machinery between next October and next April other than that essential for the preservation of a business or that which promises vast, quick returns. And this as Britain moves into the common market.

We had thought the Government would probably adopt the free depreciation that exists for ships, whereby the 100 per cent allowance can be taken at the owner's convenience. Had it done so, businesses that invested in 1972-73 would generally have done without any depreciation this year and taken their full 100 per cent in the second year, at the 50 per cent tax rate. Even if the Government changes its mind and does go for this kind of depreciation, investment in 1972-73 would still be hampered, but it would be a mild disincentive compared with the one proposed.

There are at least two amendments the Government could make to rectify the situation (apart from suddenly deciding to bring in the new corporation tax this year instead of next). One is to allow free depreciation and accelerate all capital allowances for 1972-73 expenditure by a year. Thus businesses would take their depreciation for 1972-73 expenditure in the second year, at 50 per cent, but would get the cash flow as if they had taken it in the first. The other scheme would be to allow businesses to depreciate more than 100 per cent of their 1972-73 spending on plant and machinery. The first scheme is conceptually nearly perfect, but could be administratively tricky. The second scheme would be easy to administer. The investment allowance needed would be 25 per cent, making a total depreciation of 125 per cent allowed on 1972-73 spending. In fact, this would introduce a slight bias in favour of investment done well before April next, but there is no harm in that, since the more investment the sooner, the better.

Also new in the Finance Bill are the rules for share incentive and stock option schemes. *The Economist* explained on January 15th why it is unnecessary to introduce statutory restrictions for share schemes : our fears of meddling were all too justified. Schemes that do not conform to the rules will have all the benefit from them taxed to income tax and surtax (rather than capital gains tax), thus killing them off.

The first rule, that shares issued under schemes must mature fully into ordinary shares of the class in question within 10 years, is reasonable. But to stipulate that only full-time directors or employees may participate is not. Part-timers, often working, say, three days a week, ought to be included. A further bad rule says that the shares issued under a scheme should be a minority of issued shares of that class. This apparently rules out schemes of the Cunard type, under which participants buy incentive shares that entitle them to scrip issues of ordinary shares, in proportion to their holding of incentive shares, when profits exceed a certain level : in the Cunard scheme itself, 5 per cent of the excess profit was so distributable as scrip issue. Unfortunately, such incentive shares are only held by the participants, thus putting them in the majority. Another rule also destroys the Cunard-type scheme : it says that shares issued outside the scheme to participants must bear the same restrictions. So, if a participant owned other ordinary shares in the company, he could not benefit from scrip issues to holders of the ordinary shares. The Cunard scheme was one of the best, because benefit was linked to higher profits.

It is reasonable to limit, as the bill does, any particular person's involvement in shares to a value not greater than 40 per cent of his salary. This makes anybody who wants a large participation spread it out over the years —and, therefore, also maintains the incentive. But the limit over the years is to shares of a value not exceeding twice his salary. This is unreasonable, because above about £15,000 a year salaries cease to be a reliable guide to a man's worth. An adequate limit to the amount of shares that may be issued under schemes is provided by the fact that not more than 5 per cent of the ordinary share capital may be issued in the aggregate of such schemes in a company.

No incentive shares under a scheme may be priced at less than 80 per cent of the shares they mature into. This is bad because there are a few, fierce schemes under which such maturity occurs only after the fulfilment of difficult conditions, usually involving profit targets. Such conditions genuinely depress the value of incentive shares by more than 20 per cent. These schemes are in many ways the best kind, because they balance a maximum of stick with a maximum of carrot. The Inland Revenue has been quite capable in the past of preventing schemes that involved too much discount in relation to the conditions on the incentive shares. That should be sufficient.

By contrast with all this, the new rules for stock options may over-encourage them. This is because the exercise price of the option has to be only 100 per cent of the share price at the time of issue for it to escape income tax and surtax. An option will be exercised if the share price goes up, and not if it goes down, so the owner of it should always be made to pay for it, as he is if he buys it in the market. The only companies that will prefer the more bracing atmosphere of a share-incentive scheme are those that want a high-risk situation, or those that have shareholders who insist on it. The former are probably not all that common, and the vigilance of shareholders is likely to be small, now that the Government has taken over the job of regulating schemes.

There is a major break with tradition under clause 116 to provide for the Customs and Excise and the Inland Revenue to exchange information with one another. But there is no hint that this co-operation will reduce duplication in the demands of the separate departments for the same information on different tax forms. However, confidentiality towards other departments will, happily, continue : there was one case of a betting shop allowed to count as an expense (wholly and exclusively incurred) the bribes paid to named police officers. The Home Office never got to know. Presumably, the officers had to be named so that income tax could be collected.

"As air traffic at airports becomes even more dense, fast accurate communications can help ensure the comfort of passengers. In my painting I have symbolised the precise interrelationship between air travel and reliable, intelligent communications."

–ROBERT SCHOOLCRAFT, AMERICAN ARTIST

If you need a worldwide telecommunications network, come to ITT. Trans World Airlines did, for a computerised store-and-forward message switching system with a potential capacity to handle–on a priority basis– more than 200,000 incoming and 400,000 outgoing messages a day.

In the USA and 126 other countries, ITT provides products and services ranging from computer-based electronic telephone systems to home television sets. What shall we do with Concorde . . .

Another of those meetings at which ministers routinely discuss the rising cost of Concorde, and whether they will authorise the necessary design changes that will put the cost up another few million (they always do), took place at Bristol on Thursday with Mr John Davies batting for Britain and M. Jean Chamant for France. But cost is no longer a material issue; governments are not concerned with whether the bill now stands at £900m or at £1 billion, compared with the £170m estimate put forward 11 years ago when the project was launched. Their immediate worry is with which airlines will buy it, and in what numbers. They have now authorised the building of 16 aircraft; 10 were already on the stocks and a further 6 were approved at the meeting.

They can safely assume that, provided Air France and the British Overseas Airways Corporation put Concorde into service—a matter that the governments can settle between them—some other airlines will do the same. But it is impossible at this stage to deduce how many; published order lists are meaningless because they do not commit the airlines. The usual assumption is that a Concorde service cannot be efficiently operated with fewer than six aircraft, which suggests immediate sales of 30-40 aircraft.

But it is also argued that individual airlines could get by with as few as two, which could bring the order book down to 10-12. It would be even smaller if American airlines were allowed by their Administration to join a pooled, North Atlantic Concorde fleet. Studies done for the British Government show that such a fleet, operating about six aircraft, could pay its own way although it would play havoc with the economics of some of the other services. The Americans are not, at the moment, allowed to join. But the only way of testing these figures is to see what a last, officially backed sales drive will produce in orders that are signed and sealed with money down. The drive starts this summer.

Granting a certificate of airworthiness for Concorde has not become a serious issue yet, but Americans are waiting with some interest to see the standards the British and French will prescribe for it. Many Americans assume that Concorde, with its present handling properties, could not get a British certificate unless new rules are laid down for supersonic airliners that are less stringent than those applied to ordinary jets. But as the Americans consider British requirements are unnecessarily strict, they are not scandalised by the thought that this might happen. Under the existing American licensing rules, Concorde would have less difficulty getting by.

. . . now we've settled RB 211?

The British Government may have thought that at least one incubus was off its hands when Rolls-Royce began delivering production jets to Lockheed, and Lockheed turned the first completed Tristars over to the first customer, Eastern Airlines, which intends, very cautiously, to start flying the aircraft next month. Other customers are going slower and postponing the introduction of their Tristars until the middle of the summer, but at least the worst looks over, and all those sharp-toothed arguments with the airlines are no longer over whether the engine will work, but over the old routine doubts about whether Rolls-

Tinkering gets expensive

Royce can put some more of its old, bad habits behind it and provide airlines with the technical back-up of spares and servicing that they regard as theirs by right.

But you do not get shot of so enormous a crack-up as Rolls-Royce's quite so easily. Back to London after Easter came Mr Dan Haughton with a request that the British Government help him out yet again. Mr Haughton wants a bigger RB 211 so that he can develop a longer range Tristar that will compete with the long-range DC 10 that McDonnell Douglas is already selling (both jets started as short- to medium-range aircraft but are being talked of for flights from London to Los Angeles). The engine can be built, but it could cost the British Government at least £20m and possibly a good deal more. There is some tinkering that can be done to the existing RB 211 which will put its power up to close on 45,000lb of thrust; this tinkering has to be done anyway in order to get it up to to its original, promised performance under all weather conditions. Beyond that, the work and the sums get bigger.

Rolls-Royce could make the RB 211 into an engine that gave close on

50,000lb under ideal (ie, not very hot weather) conditions, and around 46,000lb-47,000lb in all weathers, if the basic engine remained much the same, but the fans that shift the air through it are enlarged at the front. This would mean a bigger diameter engine, hung from the aircraft on bigger diameter pods. It is a large engineering job but not a complicated one. The Government will almost certainly put up the money.

There remains the problem of who will buy the bigger Tristar, and here Mr Haughton is looking yet again for British help in the form of an order from either or both British air corporations. British European Airways is the obvious customer, but BEA does not want to commit itself to ordering anything for another 12 to 18 months. Mr Haughton wants his order now, in order to impress other customers and make it easier to raise the $75m he needs to develop his end of the long-range Tristar. The British Government shows signs of thinking that in salvaging the RB 211 for him it has done all that conscience required. It probably has.

Steel

New broom, new plan?

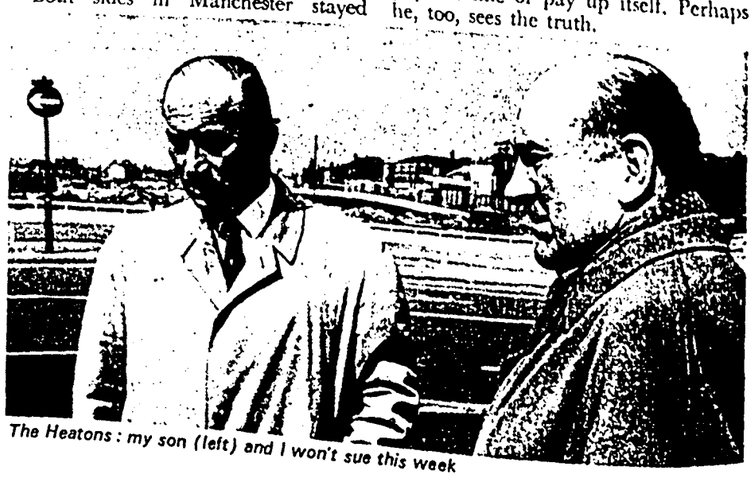
One victim of the Government reshuffle is the master plan for the steel industry which was to have been announced this week but which has now been put off until the new Minister for Industry, Mr Tom Boardman, has had time to learn his brief. This is the fourth plan for the industry's long-term reconstruction that has been prepared since steel was renationalised and it has already gone through several drafts. The British Steel Corporation probably welcomes this opportunity to put it through at least one more draft because with each round the corporation is convinced that it manages to extract a little more autonomy, and the civil service gives a little more ground. And when the chairman of a nationalised industry is as subject to day-to-day intervention from Whitehall as Lord Melchett even the littlest helps.

Not all the recent interference can be laid at the door of the departing Minister for Industry, Sir John Eden, although the corporation cannot be sorry to see him go. Any hope that the Government would authorise the construction of a green-field, deep-water, showplace of a steel site has been given up long ago, but this still leaves a huge area over which the corporation thinks it should have more autonomy and a large section of Whitehall does not. The two biggest points of controversy are over Whitehall's suspicions that the corporation is abusing its monopoly powers—this explains some recent Government decisions about steel prices—and issues that involve the closing down of uneconomic plants. At the present rate of unemployment, the Government is unlikely to allow any closures for the next 18 months, for a start. And at the same time Whitehall's attitude to foreign investment is notably friendly. Local reports have it that the Norwegian Christiania Stiververk company, which was first refused permission to put a mini-mill in the west Midlands, now has the go-ahead.

Strikes

In the hot seat

The unions gave the new Secretary of State for Employment, Mr Maurice Macmillan, a right royal welcome in his first week of office. While the railwaymen were deciding how best to disrupt the railways, engineers in Manchester continued their three-week-old campaign of strikes and sit-ins, dockers in Liverpool decided to ignore the National Industrial Relations Court order to stop blacking lorries, and the first major confrontation under the new Industrial Relations Act was only temporarily shelved by a studied display of moderation by the Heaton haulage company, which decided to hold up its action against the transport workers for £400 damages by at least a week. The British European Airways pilots continued their go-slow, to very little, if any, effect.



Both sides in Manchester stayed poker-faced this week, although there were a few signs of restlessness. The local employers began privately asking the national Engineering Employers' Federation to try to get national talks going again. But the EEF wants the unions to sweat it out.

At the last count there were 19 sit-ins, six lockouts and two strikes. Over 90 per cent of firms are still unaffected. But the sit-ins are gaining momentum. British Leyland workers at Cowley thought it might be fun to give the sit-in a try when 2,850 of them were sent home because they were disrupting production to push a claim.

At Liverpool's docks, the men voted to go on blacking lorries, as part of a campaign to save their jobs, although the local Transport and General Workers' official had advised them to stop the blacking. Had the TGWU swallowed its pride and sent a spokesman to the NIRC, it could have argued that because it had tried to stop the blacking it was not responsible for the men refusing to obey the court order. If so, the court could even have thought again about the £5,000 fine.

On Wednesday the court confirmed the fine. If it is not paid within three weeks, the fun will really begin. The NIRC is legally bound to issue a writ of sequestration, which will confiscate everything that the TGWU owns right down to Mr Jones's desk. The commissioners of sequestration, which would be appointed by the court, then decide what to do with it all. Most of it would be only temporarily confiscated, but it would show that the law has teeth.

Mr Jones decided on the same day to seek advice from the Trades Union Congress. It looks as if he hopes that the TUC will accept that Mersey is a special issue and either allow him to pay the fine or pay up itself. Perhaps he, too, sees the truth.

In his Statement to the Shareholders of National and Grindlays Bank Limited the Chairman, Lord Aldington, said:

Progress in 1971

The principal reason for the sharp increase in the trading profit between the two years was the steady improvement in management efficiency, which enabled us better to respond to market conditions and so to secure better margins in most areas of the Group's banking business.

The return after tax on shareholders' funds has now increased to 10.8% compared with 7.7% last year. The overall rate of taxation paid on the Group's trading profit remained around 52%.

As our business has expanded, and the type of facility granted within the Group has been extended from those traditional to the old exchange banks, so the risks have altered. By increasing the geographic area of our operations, we have tended to broaden our base and to reduce the threat to our profits from a disturbance, whether economic or political or both, in any one country. But some aspects of the various types of business introduced into the Group in recent years have increased our risk—and more so than we had anticipated when we established the basic provision for bad and doubtful debts on the adoption of the principles of disclosure for the 1970 accounts. The Profit and Loss Account for 1971 has borne substantially larger charges for bad and doubtful debts than either 1970 or any of the previous years. These charges were calculated on the average of the experience in the current year and the preceding four years.

Last year I indicated that the amount of advances as shown in our Consolidated Balance Sheet was the total of our advances reduced by an amount which we thought adequate on the basis of past experience to provide for bad and doubtful debts. This general provision was established out of formerly undisclosed reserves. After a further careful review we have decided to increase that provision by £2.5 million. This now requires a transfer from our disclosed reserves which, together with other charges to our reserves is recorded in our Consolidated Profit and Loss Account statement in accordance with modern practice. With this significant topping-up the general provision will cater for the steady increase in advances and other risk assets for which we plan. Measures are in hand better to control the risk. The uncertainties which are bound to attach to any bank whether national or international following upheavals such as have been experienced in Bangladesh are well covered by the earlier provisions and the Bank's reserves.

Asia
The Bank's business in India and with India has been well maintained and well run
Our branches in Pakistan continue to be managed efficiently and I am glad to report that there has been some increase in our business
The Merchant Banking Division started operating in Karachi in May 1971.
I expect to be able to include in my statement for 1972 an encouraging report on the progress of the Bank's business in Bangladesh

Africa
Both Kenya Commercial Bank and Grindlays Bank International (Kenya) had good results to show in their first year.
Grindlays Bank (Uganda) is now again a subsidiary of the Bank, with 51% of its shares owned by us and 49% by the Government of Uganda. Grindlays Bank International (Uganda) has just started in business
Grindlays Bank International (Zambia) Ltd was incorporated towards the end of 1971.
In Nigeria we watched with special interest the success of Nigerian Acceptances Ltd., which is now part of Financial Holdings (Nigeria) Ltd
We have 30% of the shares of the National Finance and Merchant Bank Limited in Ghana

Middle East
1971 was a year of considerable consolidation within our organisation throughout the Gulf.
Our associate, the Bank of Bahrain, had a satisfactory year and another associate, the National Bank of Dubai, is building up a strong banking position
Our associated bank in the Lebanon, the Société Nouvelle de la Banque de Syrie et du Liban, continues to occupy a predominant place in a very large banking community

The Far East
Dao Heng Bank, in Hong Kong, has had a splendid year.
We received permission in the latter part of 1971 to establish a Representative Office in Tokyo. I expect this office to be opened shortly

Europe
Banque Grindlay Ottomane S.A. has a good base for expanding business

United Kingdom
The sterling lending business in London has been able to grow healthily. Our Eurocurrency operations continued at a high level.
In merchant banking, both the Company Finance Department and the Industrial Department increased their activity
Good work has been done in reorganising Cox & Kings Limited and rationalising the travel business of the Group

Our Principal Asset—Men
We have in the Group, a variety of skills, attitudes, temperaments and experiences. We are now tackling the problem of how best to prepare the right men for the many different new jobs which we know we shall have to fill in the next few years
We seek to give a professional banking service to countless customers in 27 countries. Our management is going to be as professional

NEW ZEALAND

We are where the action is

It was gold that helped New Zealand in its early days. And now New Zealand's other mineral resources are exciting close interest.

Minerals already discovered include lead, silver, zinc, sulphur, titanium, silica and bentonite; all have considerable export potential. And in their wake, the prospect of a succession of second generation industries.

Beckoning fingers to the British investor and exporter. And we are there—right where the action is—well placed to help you as and when you need.

Meanwhile, why not study a copy of the latest edition of our 'Review of the Economic Situation in New Zealand' or our booklet 'Investing in New Zealand'? They are yours for the asking.

Over 200 branches and agencies throughout New Zealand.

Electronics

Indoor sports

Philips and Motorola may give the British video cassette market the jolt needed to get it off the ground this year. Launched initially by the Columbia Broadcasting System in 1967 as electronic video recording, the cassette system has been a near-flop even in industrial and educational markets, and a total flop in home entertainment.

The CBS announcement was followed fairly quickly by claims from other companies that they were developing similar but more advanced systems. Some of these announcements were overhasty, and technical problems led to many proposed launch dates being passed, with customers still waiting in the wings. Most manufacturers had high hopes of a vast consumer market, but fate decided otherwise. The original EVR system is based on an instrument which can play back specially prepared cassettes on an ordinary television set, but cannot record material itself. The cost of the teleplayer, at nearly £400, has kept it well outside the mass consumer bracket.

In America Motorola was granted an exclusive licence to manufacture the CBS equipment and started delivering sets in the middle of last year. To date it has invested about $50m and delivered about 1,800 systems, nearly half of them exported.

The original British licensee, Rank Bush Murphy, only started delivering in January of this year and so far has sold only about 100 sets. Production is running at about 20 a week and the company cannot even guess when its planned 200 a week will be reached. Meanwhile the Motorola system will be in British shops by August.

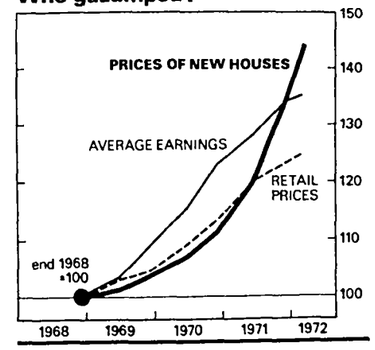
Competition may well bring prices down, especially as Japanese manufacturers are expected in Europe soon. But the problems of EVR do not end with the price of the teleplayer. Last December, CBS decided to close its programme-making facility at Rockleigh, New Jersey. From next July the only place in the world recording programmes will be at Basildon, a partnership between Imperial Chemical Industries and CIBA-Geigy. CBS's decision did nothing to boost confidence in the future of the EVR system.

At this point, a do-it-yourself cassette system is being put on the market next month by Philips. The main advantage claimed against the EVR system is that it makes its own direct recordings from a television set on to ½-hour, ¾-hour or 1-hour magnetic tapes, with playback in colour or monochrome. Agreement has been reached with the major television set manufacturers throughout Europe to incorporate plugs for it in their sets.

This Philips package consists of the recording mechanism, a tuner and a clock for robot recording. Since it was announced, the price has gone up, but at £298 it is still in the consumer bracket. The three cassettes cost £11, £14 and £17, but the tapes can be reused for up to 500 programmes. At least for the present, Philips appears to have the best prospects of getting the market to take off.

House prices

How much higher?



New planning procedures were announced on Wednesday that will speed up the release of building land, the price of which is being blamed for the rocketing prices of houses. These rose by 7 per cent in the first three months of this year, according to the latest figures from the Nationwide building society, a further acceleration after the 6 per cent increases in the two previous quarters and nearly twice as much as in the early part of last year. In some areas, reality is much more depressing than the Nationwide figures suggest. In London and the south-east, the average new house now costs over £10,000. Late in 1970, it could still be had for just over £6,500.

What has risen sky-high is the cost of land. The site value of that same imaginary average London and south-east house late in 1970 was 28 per cent of the total price; by early this year the proportion had risen to a full third.

How much longer can prices keep shooting up at this rate? One theory is that house prices took their time to react to the large increases in earnings of the past couple of years, and are now catching up with a vengeance. They will not be able to run ahead of earnings indefinitely, and so should eventually level out again. This assumes a fairly rigid relationship between earnings and the amount of mortgage credit a housebuyer can raise. But for the past year or so such credit has been very easy to get, and remarkably flexible.

But there are now warning signals that building societies may become less generous. First returns for the January-March quarter suggest that, although investors' money is still rolling in at a fairly heavy rate, withdrawals are sharply rising, too, so that net receipts are well down. Although the societies continue to lend at record levels and carry heavy forward commitments, they will clearly have to cut back soon.

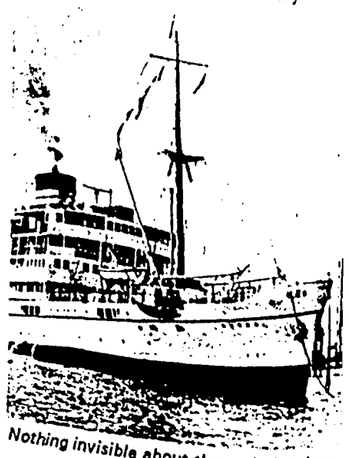
BUSINESS *International*

Currencies, SDRs and all that under a Chilean sky

Santiago's hotels and much else besides are bursting unceremoniously at the seams. For Chile's capital has been invaded by battalions of delegates from 135 countries, United Nations officials and countless hangers-on—perhaps 3,000 all told—settling in for the five-week United Nations Conference on Trade and Development which started on Thursday.

What can this assembly hope to achieve ? It is true that Unctad offers the less-developed world its best opportunity of presenting a united front to the rich countries, see *The Economist*, March 18th (Business Brief, page 72). But the 2 billion people who live in the 96 developing countries represented in Santiago this week do not speak with one voice. The poorest among them are sharing only to a very limited extent in economic growth and, although a score of countries are doing relatively quite well, their own poorest parts are not. If the have-nots are now divided among themselves, on the other side even the International Development Association, the World Bank's soft-loan agency, could be in danger of letting the least-developed down ; deplorably, the United States has not yet ratified its key contributions to the new replenishment of funds: $320m out of the proposed total of $813m a year.

The developing countries do seem agreed to a man on one grievance: that whenever the world's money system gets rejigged they get hurt. Their reserves were hit by last December's dollar devaluation and they are hugely suspicious of the wider band adopted for currencies, which requires, they say, an expertise in foreign exchange dealing which they lack. They are clamouring, therefore, for a say in the promised long-term reforms of the system. More down to earth, they will press at Santiago for a link between the International Monetary Fund's special drawing rights (SDRs) and development finance, and nothing short of a formalised link, which would require changes in the IMF's articles of agreement, seems to their taste.



It is ironic that the developing countries are now pushing for the International Monetary Fund, long thought of as the rich countries' club. But everything in this life is relative ; the Group of Ten industrial countries dominates the world's financial system and it is this select club that the developing world wants to get at by building up again the IMF's much-diminished authority. Equally ironically, the developing countries seem to have an ally in the Americans, in at least wanting to enlarge the Group of Ten (although not to build up the IMF) ; for since the British changed their spots the Group of Ten is dominated by the Europeans.

Undismayed by all this jockeying, the Group of Ten expects to go on as before. A meeting of the deputies seems likely in June, in Paris. Its first priority will be to agree on the next allocation of SDRs, due on January 1, 1973. This allocation will probably be no more than a token one, perhaps $750m a year ; at the same time, some way *might* be found of shelling out these SDRs to the benefit of the less-developed, perhaps giving them proportionately more than average, or perhaps even the lot. As to longer-term reforms, maybe even these officials feel that it is not their lengthy deliberations that will secure them, but the breakdown of the December 18th agreement in the market place. Although currencies have quietened under the yoke of exchange controls, the yen, for one, was 2 per cent above its central rate this week.

In the meantime, in the midst of the Santiago meeting, the common market countries will introduce, on April 24th, the narrower band for their currencies against one another, the "snake within the tunnel." To the outside world, looking beyond the technicalities, it will be seen as a move towards a European regional system, for it is quite likely that other continental countries will eventually join in. The less-developed world can only feel more out in the cold.

Battle at sea

Much will be heard, among other things, about those two old favourites of Unctad—shipping and insurance—and the active head of its invisibles division, Mr W. R. Malinowski. Unctad discussions about insurance have progressed a good way from the fantasy world in which they were originally conducted, with many developing countries complaining that it represented a huge and unnecessary outflow of funds, and the rich countries (and Britain and America in particular) insisting that everything their insurers did was in the best interests of the developing world, so that they must

enjoy total freedom of action there—although insurers have anything but freedom in developed countries.

The developing countries now recognise that their best bet is to develop their own local insurance markets and set up their own reinsurance companies to exchange business among themselves and eventually to cover risks in rich countries. For this they need technical help, which they are getting from or via the Unctad secretariat. Argument still rages on small points of ludicrous obscurity, but on the big issues Unctad has produced something of a consensus.

Yet shipping looks like being the subject of a quite needless confrontation. Controversy has centred on the liner trades, where crucial decisions on freight rates and the sharing of business are taken within the conference system, which is dominated by the lines of the traditional maritime countries. Developing countries have complained loudly that the structure of freight rates discriminates against their exports, that they are not consulted when changes are made or, indeed, regarded as having a right to be consulted, and above all that their lines are shut out of much of the trade by the conference system, leaving them about 8 per cent of world seaborne trade in their ships (excluding Liberia and Panama), even though 40 per cent of it involves them.

Since the early 1960s, when these charges were first levelled, the conference system has been reformed considerably, thanks mainly to the pressure exerted by the American Federal Maritime Commission. Governments are now consulted over freight rates, less is heard of charges of discrimination against exports, and the national lines of the developing countries now belong to most conferences. Nevertheless considerable discontent remains. Admission to conferences is still often refused on grounds that may be justified, but may not. Within conferences a developing country's line may be allowed to share in the trade to and from its own ports but not the cross-trade between other countries covered by that conference. Above all, the conferences still insist that their affairs are their own, that disputes over admission, sharing the trade, and over freight rates should be settled in cosy discussions with "leading" shippers (ie, those in industrialised countries). It is this philosophy that is enshrined in the code of practice for conferences, belatedly drawn up by the Committee of European Shipowners' Associations, and officially endorsed last winter.

Irish power strike

Black Wednesday

Dublin

The Irish government is now giving a lesson to London and other places on the right way to handle a power strike. An unofficial strike of 650 key generating station workers is causing the worst power crisis since the state electricity supply board was set up in 1927. The 820,000 electricity consumers have been rationed to 10 per cent of normal requirements and power is available for only 3 hours out of every 24. By the end of the first day it was estimated that 95 per cent of industry had closed down and tens of thousands of workers were sent home. Thousands of telephones were cut off, city traffic was jammed as traffic lights went out, highrise flat-dwellers had to walk up stairs.

The electricity supply board is feeding available supplies to key services and then to each area of the country on a rotating pattern. The country has been divided into 36 districts and, so far as possible, advance warning of cuts is given on special radio bulletins.

The strike is organised by the unofficial shiftworkers' association, whose members look after the boilers and turbines in the republic's 28 generating stations. The men also belong to five different unions, all of which officially oppose the strike. The strikers are seeking status increases of £3-£4 a week and the replacement of the present weekly wage by an incremental salary scale. The claim has failed at all levels of negotiation, the industrial council for the industry having proposed that incremental scales for the electricity board's 12,000 workers be introduced on April 1st next year.

The ESB has a poor history of industrial relations, but many improvements were introduced after a committee of inquiry's recommendations last year. The strike is in breach of a domestic agreement within the ESB and also of the national wage agreement. Coming on top of the present tourist debacle and a rapidly worsening economic situation, a protracted strike would cause very severe damage to the economy. But the government cannot afford to capitulate without the whole concept of the national wage agreement being discredited. It is therefore not likely to intervene as a peacemaker. It fears that such action would inevitably blow up all future disputes to the point at which they would all refuse to settle without government action. What it may do is to bring in the army to operate the boilers and turbines, although the British view has always been that the damage to power stations and soldiers alike would be worse than the blackout. The Irish TUC may, however, have saved the government the trouble since it instructed trade unionists on Thursday afternoon to be ready to go in and run the generators if the strikers had not gone back to work by 4 pm. No one took a blind bit of notice, neither the strikers nor the other engineers, but Ireland is not a country where this sort of thing is likely to be done in a hurry.

A Japanese broker's report chose this, of all weeks, to say that it was the best Western country to invest in.

Computers

What hurts IBM

The day that customers throw out equipment supplied by American International Business Machines and replace it with plant manufactured by relatively small independent suppliers is not quite as rare as it was. A big London computer installation has discarded £1m worth of ancillary IBM equipment and replaced it with technically more advanced (and probably cheaper) plant from an

Key indicators: world commodity prices

Sugar

The world price of raw sugar on the London market has tumbled to £65 a ton from £90 only 5 weeks ago. Speculative buying which, together with large block deals with Russia and China, had helped to push the price earlier to dizzy heights, has largely died away. Brokers are now cautious: the price could settle at an even lower level.

independent manufacturer, the biggest throw-out of its kind to take place in Britain. The growing power of these independent equipment makers, who do not manufacture computers but specialise in the peripheral equipment that works with them, is beginning to worry the big manufacturers, and IBM is feeling the results first because it is the biggest.

When they were really small and lived mainly by undercutting IBM with equipment that was a replica of the standard IBM design, the independents only made inroads that could be shrugged off. But they have proved a tough breed, and many of them are now technically ahead of IBM in their chosen fields. Some, like Potter Data Systems, have successfully sued IBM for infringing their patents, while others are beginning to tamper with the roots of the whole IBM marketing structure.

All IBM's computers have limits to the amount of work they can do, and these limits are fixed in such a way that, once beyond a certain point, the whole installation has to be replaced by the next up the scale. If, by adding on attachments here and there, customers can get one or two years of extra work out of an installation, the effects on IBM's cash flow would be dramatic. And the development of add-on memories by a number of independent manufacturers is threatening to do just this. IBM had threatened to boycott customers who buy these extra memories by refusing to service their equipment, until legal action made it think again. But the computer business is looking less rigidly monolithic and monopolistic than it did.

Australia
Papua New Guinea

Chronic inflation and industrial unrest are promoting the Australian government's unpopularity. With a November election probable, the Labor party is optimistic. Can Mr. McMahon win back favour?

An analysis of the Australian situation and Papua New Guinea's political tangle and sudden drop in traditional exports is given in the EIU's latest QER.

Every quarter the EIU publishes 70 reviews covering 150 countries. An annual subscription to one review (4 issues and an Annual Supplement) is £15 (US$40). Airmail postage £2 (US$5). Single copies £4.50 (US$12) (payment with order please). Details from the Subscription Department

Luxemburg

Steel's tough

The slump in steel profits is not confined to Germany. Arbed (Aciéries Réunies de Burbach-Eich-Dudelange), which accounts for 45 per cent of Luxemburg's total industrial output, 25 per cent of the gnp, 65 per cent of exports, and employs close on half the total labour force, is expected to report a drop in profits of 75 per cent or so in a few days.

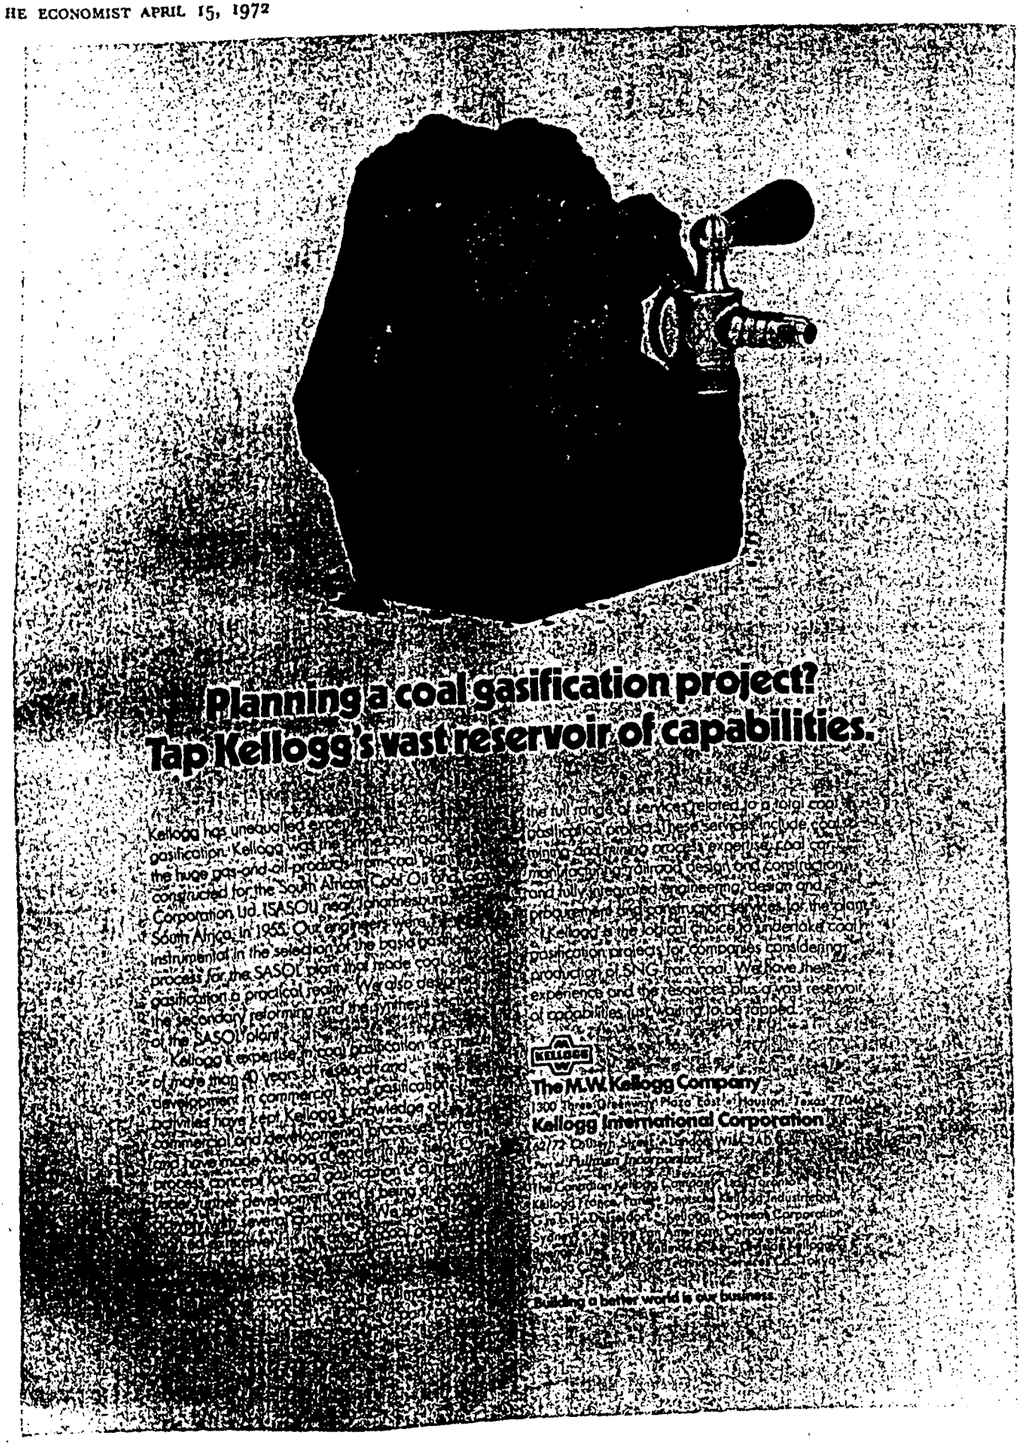
In Germany, Hoesch has now reported a 75 per cent drop in profits to £6.8m, coming on the heels of August Thyssen-Hutte's drop of 70 per cent (to £7.6m) and Klockner Werke's of 71 per cent (to £2.4m). When Estal, Hoesch's new joint company with (Dutch) Hoogovens, comes into being, it will displace Arbed as Europe's third largest producer after Thyssen and British Steel, assuming always that the Hoesch shareholders approve the merger in May. Meanwhile, Dr Hans-Günther Sohl, Thyssen's managing director, forecasts that German steel output in the current steel year (which runs to September) is expected to be down another 6 per cent, following the 7 per cent drop in 1970-71.

None of this makes happy news for Luxemburg. Far from the coast and using coal from the Ruhr and ore from Lorraine, Arbed is not well placed to cope with a serious glut. Any drive to raise productivity and cut labour costs would be less easy to absorb in Luxemburg than the Ruhr. Luxemburg has already been campaigning for new foreign investment and alternative work for some years. So far it has netted a fair string of American firms, with Goodyear (about to double its output of motor tyres and triple that of aircraft ones) the most conspicuous but including Du Pont, Monsanto, Uniroyal, General Motors and Canada Dry. Not everybody in the capital of the Grand Duchy is happy about so large a concentration of industrial power, and American industrialists were not pleased when Luxemburg unions starting making noises about co-ownership. Hence the switch of emphasis towards wooing European firms and British ones (now supposedly poised to invest all over Europe).

To this end Luxemburg offers the predictable package of grants and other incentives: cash grants up to 15 per cent, exemption from 25 per cent of corporate taxes for eight years on new investments, loan guarantees, subsidies for the interest on money borrowed for investment, research and development and training, and further tax credits on top of normal depreciation allowances. Unlike the extensive Belgian incentives, however, this package has not been criticised as over-generous by the Brussels commission. The employment it has generated has been relatively small so far.

Glassmakers

Fragile



Paris

Glaverbel, the largest Belgian glassmaker, which has the unpleasant task of telling shareholders that there will be no dividend because its 1971 net income dropped by 41 per cent, has also let it be known that it needs money. The two largest shareholders are Belgian holding companies, but leaving aside the possibility of a purely Belgian rescue operation, which at the moment seems unlikely, there is a strong possibility that one of two rival French glassmakers which are also shareholders in the company will have to cough up some cash to finance Glaverbel's ambitious investment.

The two are St-Gobain-Pont-à-Mousson, which owns, through a Belgian subsidiary, 17 per cent, and Boussois-Souchon-Neuvessel (BSN), which owns 25 per cent. In 1970 St Gobain, one of the largest French companies, bitterly fought off a take-over bid by BSN, a smaller glassmaker, only to be pushed into a merger with Pont-à-Mousson by the Suez group, a major stockholder in both.

The merger was an excellent one as St-Gobain, despite its size, was not doing well. In 1970 it lost £460,000; in 1971, after the merger, profits came to about £3½m. The combined company has eggs in a fair number of baskets (glass is still 40 per cent of its business), but it has been steadily divesting itself of marginal or unprofitable activities, has pushed further into new fields like fibreglass insulation, and has regained the confidence of the bourse. Since the beginning of the year, shares have risen from a low of Fr128 to approximately Fr180.

Although Glaverbel is talking with both companies, the most likely tie-up, in French eyes, is with St-Gobain's Belgian subsidiary because St-Gobain, rather than BSN, is already deeply involved in produoing float-glass, both in Belgium and Germany, and Glaverbel, for the moment, has only one small float-glass plant.

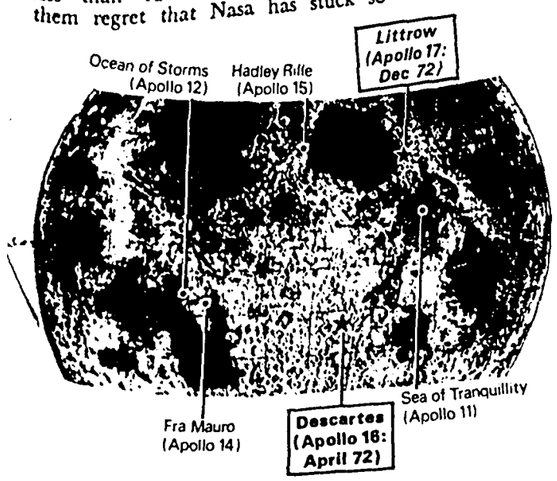
Apollo 16's counting down

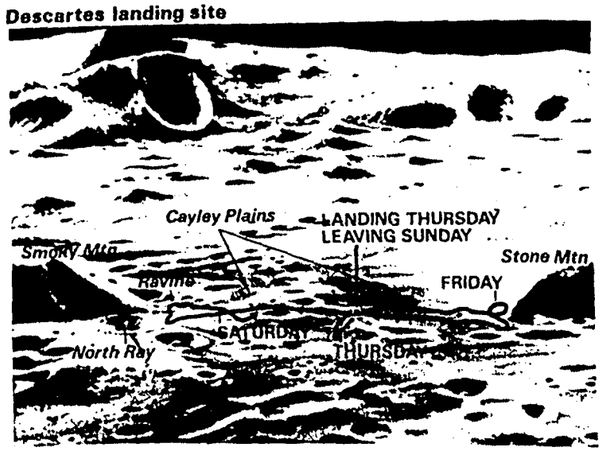
It took engineers three days to get the better of a leak in one of Apollo 16's pressure tanks that threatened, at one point in the week, to cause yet another month's postponement of a flight to the moon that had already been put back one month by a rash of minor technical troubles; the Apollo rockets have been in store a long time and are showing their age. But late on Thursday the launch still looked set for Sunday. The timetable is a tight one; there is a slot of barely three hours during which a rocket launched then from Cape Kennedy has any chance of landing in the moon's Descartes highlands, and another suitable three-hour slot does not come round for another month.

Unless the Descartes area is full of surprises, it will not be an epoch-making flight. The National Aeronautics and Space Administration can be a painfully bureaucratic organisation and it chose the Descartes highlands for this Apollo mission at least two years ago, when scientific priorities on the moon were quite different. It has steadfastly refused to change its plans, on the grounds that it takes a long time to prepare and map a moon mission, and plans cannot be altered at short notice. Scientists have noted, nevertheless, that the flight of Apollo 17, planned for December (and the last that the Americans will make to the moon for perhaps 20 years), is being set up in less than 12 months. This makes them regret that Nasa has stuck so rigidly to its choice of the Descartes area, which they do not expect to be so very different from the two highland sites already visited.



Available photographs of the landing site are of such poor quality that there may yet be more to Descartes than meets the eye; there is certainly more than the astronauts, Captain John Young and Lieut-Commander Charles Duke, are aware of now, because the pictures they possess of the place where they are expected to bring down Orion reveal nothing less than 200ft across. One of the cameras that had been intended to map the site for them went out of operation during Apollo 15's flight, as the camera did on Apollo 14.

They are due to stay longer on the moon than any of the previous missions, for a total of 73 hours, which will allow them 21 hours actually working on the surface, split up into three missions. The business of motoring around collecting rock samples is getting steadily more methodical and so are the drilling and sampling tools, but since Nasa now has a relatively huge stockpile of moon rock on earth already, only a fraction of which has been allocated to research, the bringing back of rock is not the vital function it was. Much more important, on the second last mission, is the setting up of another small, scientific station which should go on working for years after the astronauts have left.

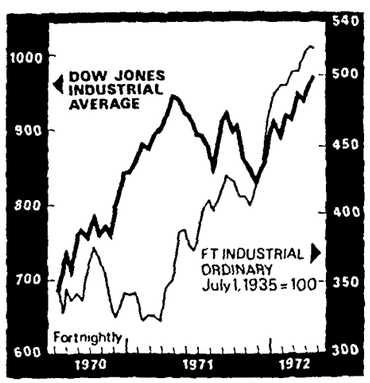


There are automatic stations working now on the Apollo 12, 14 and 15 sites, but the Apollo 12 complex is almost at the end of its life and the triangle these form is very narrow. An assembly left behind on the Cayley plains will give much better triangulation and, with the Apollo 14 and 15 sets, should work for about four years.

The Apollo 17 mission is, by contrast, one that scientists are desperately anxious to see completed, although the mission controllers take a more jaundiced view of it. In the Littrow-Taurus area, photographs have been taken of what look like relatively new craters, with black cinder rims that suggest volcanoes. It is also a site of vast landslides where entire mountain tops have slipped down the sides. Landing there would not only satisfy curiosity about the craters, it would allow scientists to collect what they knew without shadow of doubt to be original moon bedrock from the mountain tips without the ifs and buts always associated with previous old rock. The pictures of the Apollo 17 site are exceptionally clear, showing objects down to 3ft in size, and because they are so good the astronauts have been able to override the mission controllers' considerable misgivings about landing in a narrow valley between two 7,000ft peaks.

Assuming the pessimists are right about the relative unimportance of the Descartes area—although it does represent the kind of formation that makes up 15 per cent of the moon—the most important scientific work may be done by Lieut-Colonel Ken Mattingly, orbiting along above the moon in Caspar and making jokes about friendly ghosts (the original cartoon Caspar is beside the title). Motorised astronauts on the moon's surface cover at best only a few square miles, but the man in orbit above covers the entire moon and not only maps it photographically, he can get a fairly accurate chemical picture of the materials that make up the moon. It was Major Al Worden, alone in orbit, who discovered the cinder-covered craters that have decisively shifted the whole emphasis of research.

Descartes landing site



BUSINESS — *Investment*

To market, to market, to buy a fine share

New York

Hordes of investors have now joined Merrill Lynch, Pierce, Fenner and Smith in proclaiming their bullishness. But while the giant brokerage house launched its widely-quoted television expressions of confidence in Wall Street when business activity was at a low ebb last summer, the new disciples are responding to sharply improved first quarter company earnings and clear signs of a strengthening economy. Retail sales were a record in March, while the latest quarterly poll from the University of Michigan shows consumers markedly more optimistic about economic prospects.

Whatever the cause, Wall Street's rally in the past few days has been surprisingly vigorous in the face of renewed fighting in Vietnam. On Wednesday, the Dow Jones average of 30 blue chips advanced 4.36 points to close at nearly 967, up 12.5 points from the week before, and at its highest in nearly three years. The volume of trading, too, has been remarkably strong, exceeding 24m shares on the Big Board on Wednesday, following two sessions of almost 20m shares each. But on each of the three days trading in large blocks was relatively light.

Besides rediscovering ordinary shares, the non-professionals have been making considerable use of credit to finance their purchases, giving rise to speculative undercurrents. Since early last December, when the Federal Reserve Board cut minimum down-payments on stock purchases to 55%, from 65%, customers' debt to member firms of the New York Stock Exchange has soared by $1.27 billion, to a total outstanding of $6.18 billion, a near record, even by the end of February. Bank loans to investors (other than brokers) to finance stock purchases also bounded up, and by the end of March stood at over $6 billion as well, up nearly $2 billion, or 50%, in a year. Much as brokers ordinarily welcome relaxed credit for securities, some think that perhaps the market has now been visited by too much of a good thing. Since the monetary authorities have been moderating their former policy of aggressive monetary expansion, a complementary action by the Fed in the same vein could conceivably bring a new moderate increase in stock margins.

Not surprisingly, investors have concentrated their attention on companies that have just reported hefty quarterly profit gains or seem likely to do so. Thus, when **Columbia Broadcasting System** reported an 89% year-to-year profit gain for the March quarter, its shares rose nearly $3 to $58 on Wednesday. By the same token, **United Aircraft** registered gains of $6½ to $39½, after it estimated substantially higher earnings for the March quarter.

In contrast to such dazzling moves by ordinary shares, prices for longer-term bonds in recent weeks have continued on the downswing. This would not be unusual in a strengthening economy since better business ordinarily leads to greater capital demands by corporations, pressing downward on bond prices and upward on yields. Complicating the present situation, however, are the massive Federal budgetary deficits in prospect for both fiscal 1972, which ends in June, and fiscal 1973, and recently renewed inflationary worries. As a consequence, yields on quality corporate bonds have edged up to the 7.50%-7.60% range, the level of last August when inflationary fears were rampant. Some bond men expect that yields may move up to 8% and perhaps a bit beyond that in coming weeks and months. Some believe, too, that an 8% rate may prove to be more than the Administration will tolerate, especially if it threatens to rub off on yields on home mortgages, and could prompt the imposition of ceiling controls to keep the long-term rate from going any higher.

London market

The property bank

London has been holding steady around the 518 mark, as measured by the Financial Times industrial ordinary index, despite the threat of a rail go-slow. More attention than usual is being paid to European and American investment, and so it is rather surprising that the investment dollar premium has fallen from 30% to 20% in the past few weeks. The answer seems to be that investors are funding their overseas equities with overseas loans, and selling their investment dollars.

The most interesting development on the domestic front is the proposed merger between a fast-growing merchant bank group, **Keyser Ullmann Holdings**, and a property company with which it has long-standing links, **Central and District Properties**—a striking example of the way financial institutions are changing their spots. The price being paid seems a high one. The cash alternative values the property company at 290p per share, but the highest value that some experts

are putting on the net property assets —which will presumably be revalued for the offer document—is a maximum of 250p, and the price of Keyser Ullmann shares shed 12p to 363p on Thursday after the announcement.

Since this merger has the blessing of the **Prudential Assurance Company** the natural reaction will be for the market to play Heather Jenner between all kinds of property companies and insurance companies.

Pergamon: another chapter

The affairs of Mr Robert Maxwell's Pergamon Press are taking the Department of Trade and Industry's two inspectors longer to clear up than they had expected, although the final report is in its last stages. They published a second interim report* on Tuesday, describing how Mr Maxwell first got into the encyclopaedia business in the years before he entered a joint company in partnership with the British Printing Corporation. It was that venture which was involved with the row with the American Leasco company that led to the DTI investigation.

A critical interim report on that joint venture was published last July; in strictly chronological order, it was really chapter two in the Pergamon business, and this week's report is chapter one. As before, Mr Maxwell's solicitors, Lewis Silkin and Partners, immediately instituted proceedings to have "this further tainted document set aside" and declared invalid. And, as before, the DTI has declared that its publication is "in the public interest."

Pergamon bought the Subscription Books Division of George Newnes at the end of 1965 for £1m, and 19 months later transferred it to International Learning Systems Corporation, the company jointly set up with BPC, at a valuation of just over £2m. By Pergamon's reckoning, the division made a profit of £757,000 over that period, but the inspectors are critical of the way these figures were arrived at. "Some kind of argument," they say, "can be advanced to justify what was done with each of the figures . . . but we find it surprising that any officer of Pergamon, who had anything to do with the accounts, should have carried self-deception to the length of believing that a true and fair view of the trading profit of Pergamon resulted."

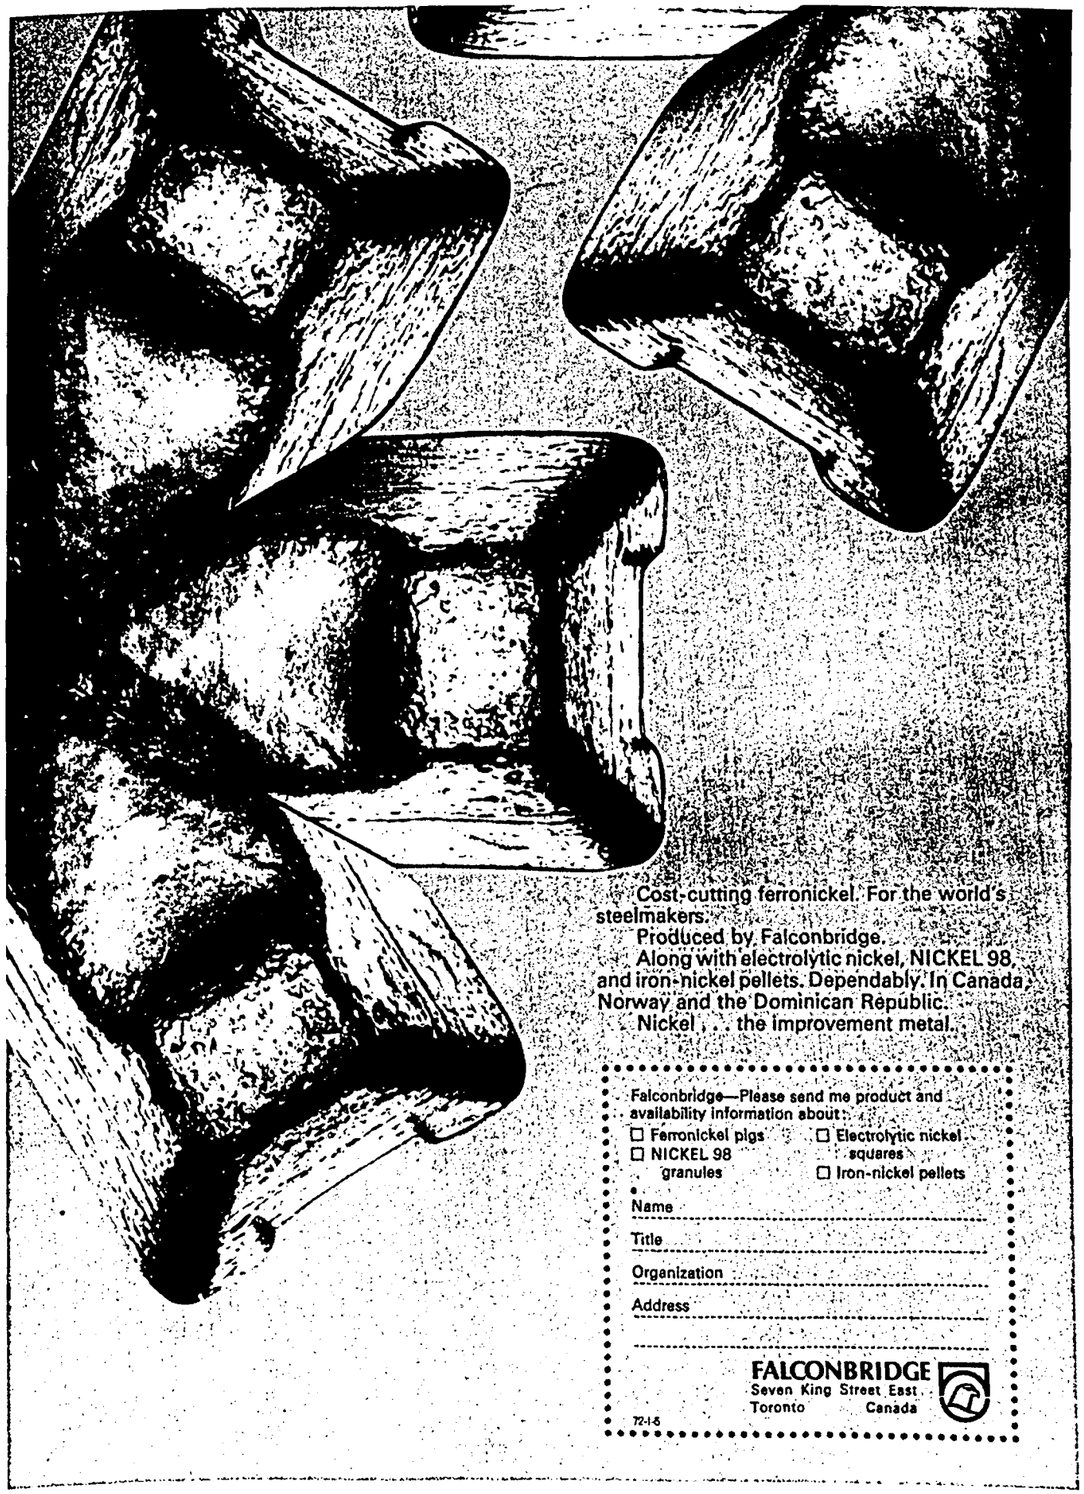
They say normal trading profits of the business—of which Chambers's Encyclopaedia was the main product—were overstated and the sales proposals exaggerated, and "both must have had a material effect on the value of Pergamon's shares on the stock market; both must have had far reaching effects on BPC and its shareholders and both must have played a significant part in bringing the shareholders of Pergamon to their present unenviable plight."

Mr Maxwell was bullish about his acquisition, and forecast a satisfactory return on the £1m purchase price. He felt it had more potential than the International Publishing Corporation had been able to exploit, for the sales and trading profits of what was originally the Newnes SBD (subscription books department, or, in common English, door-to-door encyclopaedia business) and of its foreign subsidiaries had been going down. Mr Cecil King, who was IPC's chairman at that time, told the inspectors that he did not consider the business could be run profitably unless it used selling methods that he did not regard as ethical. Pergamon's accountants, Messrs Chalmers Impey, advised against buying and so did Ansbacher, at that time Pergamon's financial advisers. But, said Ansbacher's Mr Bruce Ormrod, "we were more or less told that Maxwell was the organ grinder and knew what he was doing."

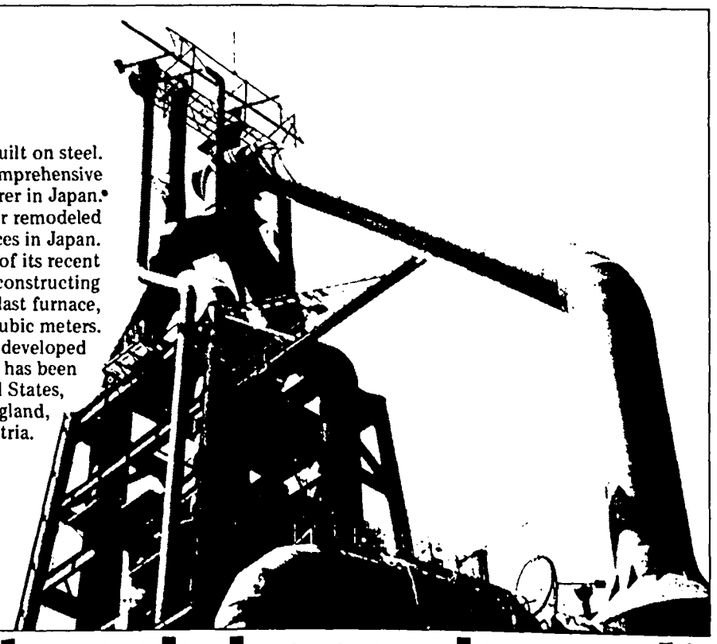
The profits that Pergamon reaped from the business arose from such things as the release of £150,000 of bad debt provisions (accountants tend to take a poor view of the chances of recovering instalments on encyclopaedias once customers fall behind), £100,000 of stock revaluation, sales that should arguably not have been counted in until the books ordered had actually been delivered, and some simple bookkeeping errors. There were lengthy exchanges between the inspectors and the auditors, who had originally recommended hefty provisions against bad debts but later agreed to the release of part of the bad debt provision. "I must say quite genuinely," said the partner in charge of the audit, "that at the time it was a broad brush provision," although he agreed with the inspectors that it was a "material figure in relation to the profits of the period which was being discussed."

One justification for considering that the provision could be reduced was a number of non-recurring expenses inherited from Newnes, such as undertakings to keep on all staff for six months after the takeover. The inspectors only partly accept this argument and add: "In our opinion, Chalmers Impey did not have sufficient information to satisfy themselves that the remaining debtor provisions in respect of these debts were sufficient."

The inspectors also asked about two sales invoices, for a total of £115,000 and dated the day before the 1966 year-end, which came from two Maxwell family subsidiaries (the family company aspect should be explained in the final report), one based in America and the other in France. It was put to the then sales director: "There is only one reason for these two invoices, and you know it as well as I do, don't you?" When he asked what it was, the reply was: "To bring the profit from these sales into the year 1966 . . . what other explanation is there?"



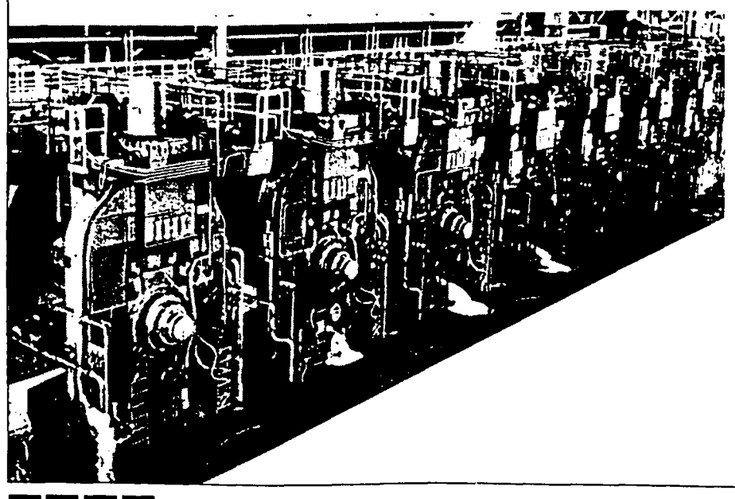
The explanation was that, although —as Chalmers Impey's own files showed —there were not enough bound copies of Chambers's Encyclopaedia in stock to meet the orders, it was not unusual in this sort of business to wait until invoices came in before going to the expense of binding sets. Mr Maxwell was sure that, in this sense, the orders were backed up by stock and could therefore be taken into sales. The auditors accepted his assurance that the transactions were genuine.



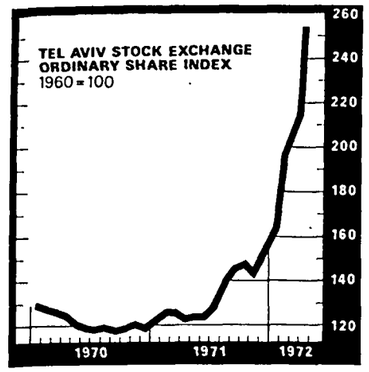
As it happened, the books were never delivered because the negotiations to merge the business with BPC then intervened. But the profits of the Pergamon encyclopaedia business were used to work out the transfer price of rather more than £2m to the new joint company, which then proceeded to make losses on such a scale that Pergamon's share of them exceeded £2m. "In contrast," say the inspectors, "from the date of Pergamon's acquisition of Newnes SBD up to the transfer date to ILSC, Pergamon included in its accounts normal trading profits of £757,000 and capital profits (less expenses) of £512,000, a total surplus of £1,269,000."

A few months before the ILSC deal, Mr Maxwell went on a world sales tour, his plan being to capture 5 per cent of a world market for encyclopaedias that was estimated to be around £200m. He came back claiming to have sold 7,000 sets, which the inspectors say was "exaggerated" and that Mr Maxwell knew it, "a serious instance of a director of a publicly quoted company falling below that standard which we consider should be observed when commenting on the affairs of his company to the press."

The inspectors "do not criticise Mr Maxwell for an unfortunate commercial decision," which is what they consider the initial purchase of Newnes to have been. "We are, however, critical of the manner in which the trading results of Pergamon SBD (which Newnes became) were computed and reported, and of the profits, supposedly from the normal trading of Pergamon SBD, which were incorporated into the accounts of Pergamon."



*Further interim report on the affairs of Pergamon Press Limited. *HMSO*. £2.25.



The modern world is built on steel.
And IHI is the most comprehensive iron and steel plant manufacturer in Japan.*
IHI has either made or remodeled more than half of the blast furnaces in Japan.
And as a typical example of its recent assignments, IHI is now constructing the world's largest blast furnace, with an inner volume of 4,000 cubic meters.
Also, the technology of the IHI-developed blast furnace top-charging system has been exported to the United States, West Germany, England, South Africa and Austria.

The Earth. Whatever helps people span it, develop it, live on it, IHI is involved in it.

The land gives us metals.
And IHI breathes life into them.
By constructing various rolling mills.
Slabbing mills, blooming mills, hot and cold strip mills. And others.
IHI's hydraulic mill is especially commanding keen interest.
One of its notable completions is a 4-high, 5-stand full-continuous tandem cold mill for the NKK's Fukuyama Works.
All the way. For top manufacturer of rolling mills worldwide, it's IHI.

Israeli stock exchange

Spectacular speculating

Jerusalem

The Tel-Aviv stock market has gone up 20% in the past month and 120% in the past year. Daily turnover in equities is up tenfold on the average of a year ago, to £300,000.

The boom has been set off by a splurge of private buying and optimism about the strength of the economy, fuelled by buckets of money that flowed in after the devaluation of the Israeli pound. Industrial output went up by 12% in 1971 ; there is full employment ; investment is up ; and even the balance of payments is showing some improvement. But all of this has little to do with a stock exchange which has not been encouraged to play much of a role in economic development. Although investment reached unprecedented levels in recent years there were almost no new share offerings. Most of it was financed privately and backed by extensive loans from the government and official development banks. Most of the considerable private savings are channelled to the government's own coffers through pension funds, savings associations and insurance companies which hold bonds issued directly or indirectly by the government.

The interest rate and capital values of these bonds are linked to a cost-of-living index, and they have been the main constituent of people's savings portfolio. But now the man on the beach is discovering the joys of equities and the market has all the attributes of an amateur's playground. However, most analysts do not think prices excessive ; **Union Bank**, for example, has doubled to £I250 but is still on a moderate p/e of 7. Since foreign investors can repatriate dividends and capital at current exchange rates, it might still be worth looking for a few bargains. But there might be other risks.

Norwegian companies

Norsk Sea oil

Over the past year, the share price of **Norsk Hydro** has almost doubled, while that of **Borregaard** has fallen by 20%. The difference between these two leading Norwegian companies is that Norsk Hydro has extended its traditional water-energy activities into the deeper and richer waters of the North Sea, while Borregaard has found no such easy route out of the woods. Its profits for 1971 slumped disastrously from £1.6m to £0.3m, as both paper-making and copper-mining had a terrible year.

This week Norsk Hydro is introduced to the London stock market, where the North Sea has already oiled several share prices well up. But on a p/e in the 40s, a great deal is already discounted—especially as the latest six-monthly accounts show a drop in profit from £2.7m to £600,000, and the outlook will be unpromising for the rest of this year. The nitrogen and fertiliser sales, over half total sales, have been hit by rising costs and falling prices. Over the next few years, the company will have to raise another £50m-odd for capital expenditure and exploration, and the need to tap the international capital market explains the timing of the London quotation. There will no doubt be a Eurobond issue soon, and, by the look of the balance sheets, more rights issues too. But for the long run, the recovery in the traditional activities, the success of its participations in Ekofisk and the gas finds in Frigg, make it an interesting speculation at £60 (or £73 including the premium).

Eurobonds

Respectable sterling

The first real sterling Eurobond has made its entrance, borne on the shoulders of Morgan & Cie International and Morgan Grenfell. There have been previous bonds with a sterling-DM option, but this is the only one designed to appeal to non-resident holders of sterling so far. The £10m being raised by **Standard Oil Company (Indiana)** is for the benefit of Amoco (UK) to spend in Britain.

The bond will be an external security for British exchange control purposes so that the company can count it as a foreign borrowing for the purposes of the rule that British subsidiaries of foreign parents must derive a certain proportion (about 70%) of capital requirements abroad. Yet as a sterling loan it enables assets to be matched with liabilities in the same currency, negating possible currency change losses. For the investor (provided that he is not resident) external security status means that interest can be paid free of tax.

The coupon of 8% compares with 7¾% for Eurobonds denominated in dollars, 7½% in francs and 6½% in D-marks. The narrowness of the gap demonstrates sterling's new-found favour with international holders of bonds, but is wide enough to make this sterling Eurobond a useful diversification for a portfolio of Eurobonds.

The British loan market is virtually undeveloped between 5- and 20-year maturities, and it is a moot point whether British companies will be able to take advantage of this bit of the external loan market.

Key indicators: world bourses

Wall Street climbed in heavy trading. London steady despite rail dispute. But Japan and Hongkong star performers this week.

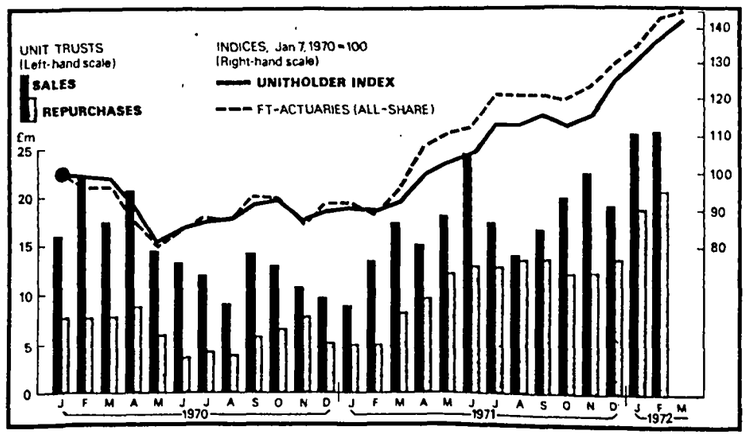
Unit trusts

The new deal



The new deal on unit trusts' capital gains tax is particularly timely. Their pre-budget liability to a 30% tax on realised gains would have become an increasing deterrent to performance as the current bull market progressed and more and more gains were realised. And the new 15% arrangements provide an entirely new incentive to investing through a unit (or investment) trust—and an eminently advertisable one. There can be no better marketing angle for a financial service than that of saving a bit of tax.

Trusts can do with a new sales plank. Mounting doubts are being expressed about the validity of their main selling point, that unit trust managers can make a better job of investing than the man in the street. The Americans seem to be forever producing statistical evidence that their mutual fund managers might just as well pick their stocks with a pin for all they achieve, once performance is adjusted for the volatility associated with degrees of risk. Britain is less numerate but it is still pretty plain from figures like those in the chart that the average unit trust performs more or less in line with the market average most of the time.

This has never been an argument for unit trusts going out of business, however, since the archetypal small man cannot sensibly invest in shares by any other means. The costs are too high, the eggs-in-one-basket risks are too great, and so on. But those unit trusts which regard the small man as a bit of a burden can now rejoice over the tax incentive to woo their larger customers.

As normally happens with tax changes, it is the rich that gets the gravy. The poor (in this context, unitholders who would normally escape the gains tax net altogether if they sell under £500 worth of securities) do not get any, but at least they get less blame than before. They will still be paying some tax, via the trust, on gains realised by the trust, but at least this will now be at 15% rather than 30%. For other unitholders the extent of their bonus depends on the amount by which gains they make when they sell their units exceed gains actually realised by the trust on which the trust has paid tax at 15%. On the profit, those who next year will be liable to a 15% tax rate (half the standard rate of income tax) on capital gains (19.375% at the moment) will not have to pay any tax (4.375% for the rest of this financial year). Those unitholders who are liable for the 30% rate will now have to pay only 15% on their realised unit trust gains—and realisation day is at choice.

It is fair to assume that tax-saving will be sizeable. It will naturally be less the more active the trust is in turning over its portfolio. But it would be absurd for unitholders to select inactive trusts for this reason. The wisest course is to select trusts which look like performing well irrespective of how actively they pursue their objectives. An investor who switches out of a portfolio of ordinary shares in order to save tax has still got to find the right trust.

The top performers in our lists have been showing creditable results for longer than just the past three months, though some of them over that short period have achieved some particularly spectacular results. **Scotexempt Growth** (second in our three years, three months list), for example, is up 34.4%.

Hambro Smaller Companies, at £7m or so, is a fair size middleweight to put up the sort of sky-rocketing performance it has done in the past three months. Its specialisation in small companies has stood it in good stead over this bull market. The trust has also been on the back of the building boom (where there are a lot of small companies), as have quite a lot of the best current performers, including Scotexempt Growth and the specialists **Jessel Property and General** and **Ebor Property and Building.**

The good results of late do not mean that all trusts are out of the net redemption problems. As sales rose during the first two months of the year to reach a 22-month high of £26.4m at the end of February, redemptions rose in train to reach an all-time high of £20.3m in that month. By all accounts much the same pattern was repeated last month. But a lot of the sales growth will have been directed to just a few trusts: the new savings darlings, managed funds, which invest both in unit trusts and property funds. **Hambro Life's Managed Investment Bonds** has pulled in £17m so far this year and most of it has gone into the Allied Hambro unit trusts. Save and Prosper has directed a large proportion of the £5m or so flowing into its **Balanced Fund** into the Save and Prosper **General Fund.**

Many funds might suffer redemptions for some time to come. **Target Consumer Fund** has, in the past few months, been priced nearer a bid basis and this has contributed to the decline of a star performer of last year into one of the worst performers of 1972 so far.

Over the past three months the unit trust industry has distinguished itself by performing a little better than the market as measured by the Financial Times-Actuaries all-share index. The Unitholder index rose 14.3% compared with 13.4% by the all-share (with income reinvested). This is unusual in bull markets. An important contributory factor will undoubtedly have been once-for-all boosts to a lot of trusts moving back on to the "offer price" basis of price calculation now sales appear to be picking up. During the sales doldrums of 1970 and 1971 many trusts were forced to price their units on the minimum bid price allowed for a given fund value, pulling the offer price down below the allowed maximum so the gap between the two prices would not look unnaturally large. A move back to maximum offer prices means quite a few percentage points in performance terms which owe nothing to investment prowess.

Our table this time includes the exempt trusts available only to charities and pension funds, to see just how well trusts do when they are free of gains tax worries. The answer seems to be pretty well, particularly if they are in the Save and Prosper empire and in that part of it managed by Edinburgh-based fund managers Ivory and Sime. They manage S and P's Scotbits range, including **Scotexempt Growth, Scotexempt Yield** and **Scotlaps,** and some of the Ebor funds, though not the **Pension Fund,** which is managed by Robert Fleming. Including the exempt trusts, Ivory and Sime have six trusts in the top tables.

Most of the other exempt funds are too new to have established much of a track record but M and G's longer established **Charifund** and **Pension Exempt Trusts** are not far out of our charts and **Schroder Recovery Fund** is a star of the 15-month list. One exception is **Tyndall Exempt Trust,** managed by Warburg, which has risen only 34% over the past three years. It has suffered in relative terms, like the once splendid **Tyndall Capital** and **Tyndall Income Funds,** from having a fair chunk in the United States while the home market has been booming. But their time may well come again this year. What the Warburg team can do when the markets are with them is demonstrated by their **Ulster Fund,** whose consistently successful performance since it got going just over two year ago seems to be one of the few bonuses of being an Ulster resident. There are some estate duty advantages. The investments are, however, made elsewhere.

The laggards in both shorter- and longer-term tables continue to be those whose overseas commitments have kept them out of buoyant Britain during the past year. It might still reasonably be asked why they did not get more mileage out of equally buoyant Japan (Save and Prosper's **Japan Growth Fund** is one of the best performers over 15 months) and why **Target Growth,** among the worst performers over the 3-year-plus period, got into this position at all. The international funds can, and vociferously do, complain that the premium currency rules inhibit their freedom of action, although more and more are getting round the problem by raising funds abroad.

Best and worst growth records among unit trusts on an offered price basis to March 30, 1972, net-of-tax income reinvested. No account taken of capital gains tax paid.

CHAIRMEN'S STATEMENTS

New World & General Investments Limited

Sir Denys Lowson on Argentine Conditions

The 88th Annual General Meeting of the Company was held at Estates House, London, E.C.2., on April 6th. Sir Denys Lowson Bt., the Chairman, presiding stated that the Revenue for the year to 31st October, 1971, amounted to £82,825. After charging expenses and taxation totalling £22,336 against £22,361 in the previous year, there was a net profit of £60,489. An interim dividend (in lieu of a final) of 9 per cent less income tax which was at the same rate as in the previous year, absorbing £63,000 gross, was paid on 16th March and left a balance of £22,626 to be carried forward.

The value of the Argentine peso declined sharply during the year, the rate of exchange at the date of the accounts being 19.19 pesos to the £, as compared with 9.566 pesos to the £ a year earlier. As a result of this depreciation, an exchange loss of £6,799 has been debited to the provision for diminution in value, which compared with a loss of £3,575 in the previous year.

For the past two years there has been a considerable measure of stability in the Argentine under the military Government's regime; where a strenuous attempt was made to control prices and wages in the same way as we are anxious to do in this country.

However, as in previous cases, both in the Argentine and in other parts of the world, this attempt appears to have failed. The dam has now broken so that there have been a considerable number of strikes and other work interruptions with demands for very substantial wage increases, unmatched by increased productivity.

As Shareholders are aware, we naturally only have a very small proportion of our assets in that country, but it still has wonderful natural resources and a great potential for the future. However, in common with so many other countries in these days, it appears impossible to control inflation, and even stable government is impracticable without some form of arbitrary or military control.

The geographical distribution of the Company's investments, based on the market valuation at 31st October last, was as follows: Great Britain 68.32 per cent; North America 16.19 per cent; the Commonwealth (excluding Canada) 2.88 per cent; elsewhere 12.61 per cent; while as regards categories 94.81 per cent were in equity stocks and shares and 5.19 per cent in fixed interest securities. During the year under review the net asset value of the 25p ordinary stock units increased by 19.3 per cent to 69½p compared with a rise of 14.4 per cent in the Financial Times Ordinary Share Index; and for the first time since the Company was formed the valuation of the investments exceeded £2 million. Since the Company's year end October 31, share prices have appreciated considerably and the valuation at 31st March last was in the neighbourhood of £2,400,000, giving an estimated amount of 87p per share. We hope that barring unforeseen circumstances, we will be able to at least maintain the same rate of dividend in the current year.

The Report and Accounts were unanimously adopted and the proceedings terminated with a warm vote of thanks to the Chairman Sir Denys Lowson, Directors and Staff.

Richards & Wallington Industries Ltd

W. R. Richards, A.I.O.B., Chairman & Managing Director, reports—

	1971 £'000	1970 £'000
Group Turnover	12,018	10,460
Profit before tax	1,277	1,002
Profit after tax	866	662
Earnings per share	10.1p	7.7p
Ordinary dividends paid and proposed	50%	45%

- The record results achieved are an increase of 28%.
- A one for ten bonus issue is being recommended.
- Although the Earthmoving company moved into profit during 1971, its activities are being terminated during the current year when present contracts are completed.
- Whilst our expansion will always be geared to hard common sense, our determination to expand is undiminished.
- This year has started well and current levels of utilization are higher than this time last year. We can look forward to another substantial increase in profits during 1972.

THE NATION'S LEADING CRANE & PLANT HIRE GROUP

Copies of the Report and Accounts may be obtained from the Secretary, Wharf Road, Birmingham B11 2DY.

APPOINTMENTS

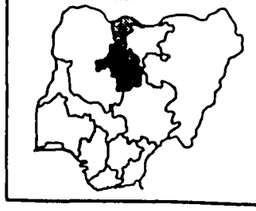
Government of the North-Central State of Nigeria

RURAL DEVELOPMENT BUREAU

Applications are invited from suitably qualified candidates for the following post:

PLANNING OFFICER

Qualifications: B.Sc. (Economics) and experience in Rural Economy.



Duties: Planning of Rural Development.

Salary: Scale AY £N1,548-£N1,764.

Note: £N1=£1.17 sterling. Income tax is at Nigerian rates and these are substantially lower than those prevailing in the United Kingdom.

Fringe Benefits: Children's allowance payable for up to three children under the age of eighteen years; contract gratuity at the rate of £N25 or £N37.10/- for each completed 3 months of residential service; inducement allowance of between £N180 and £N300 per annum; provision is made for car loan and an allowance payable for maintenance; free passages to and fro on first appointment and on leave; baggage allowance; quarters will be provided at a nominal rent not exceeding £N12.10/- per month.

In addition, a tax free supplementation may be paid to UK citizens.

Further information and application forms are obtainable quoting reference NCS/5/72, from:

The Recruitment Attache, NIGERIA HIGH COMMISSION, 9 Northumberland Avenue, London, WC2N 5BX

APPOINTMENTS

University of Exeter

Department of Economic History

Applications are invited for the post of Lecturer in the Department of Economic History. Candidates should have an interest in the economic history of the nineteenth and twentieth centuries. Preference will be given to those with special competence in quantitative methods of historical analysis or in a foreign language.

Salary will be on the Lecturers' scale with initial placement to be within the first four points of this scale, £1641-£2,316 per annum. The appointment will be subject to a probationary period not exceeding three years with prospects of permanency thereafter.

Further particulars may be obtained from the Secretary of the University, Northcote House, The Queen's Drive, Exeter, EX4 4QJ, to whom applications (eight copies: overseas candidates one copy) should be sent by 2nd May 1972. Quote reference no. 1/33/3042.

University of Melbourne

Sidney Myer Chair of Commerce and Business Administration

The University wishes to fill the Sidney Myer Chair of Commerce and Business Administration which is vacant following the resignation of Professor P. J. Willett on his appointment as first Vice-Chancellor of the Griffith University in Queensland.

The prime responsibilities of the Professor of Commerce and Business Administration will be to carry on and to develop Management Education in the University.

SALARY: $A15,264 per annum.

Further information, including details of application procedure, superannuation, travel and removal expenses, housing assistance and conditions of appointment, is available from the Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF (Tel: 01-387 8572).

Applications close on 19 May 1972.

INTERIM STATEMENT

MC GROUP Mitchell Cotts Group Limited

Unaudited Interim Results for the Six Months ended 31st December 1971

	Six Months to 31 12 71	Six Months to 31/12/70	Year ended 30/6/71
	£'000	£'000	£'000
Group profit before interest and taxation	2,717	1,962	5,305
Interest	650	543	1,236
Group profit before taxation	2,067	1,409	4,069
Taxation	975	623	1,749
Group profit after taxation	1,092	786	2,320
Outside shareholders' interests	208	90	352
Profit after taxation attributable to Mitchell Cotts Group shareholders	884	696	1,968
Ordinary Dividends: Cost	363	353	1,413
Gross rate	3.75%	3.75%	15%
Per Share	0.94p	0.94p	3.75p

Group Profit before Taxation for the six months ended 31st December 1971 has increased by 47% when compared to the first half of last year. Profits would have improved still further but for the realignment of world currencies which had the effect of reducing the Group Profit before Taxation by some £100,000.

Nearly all sectors of the Group contributed to the better profit performance, which is wholly attributable to interests which existed in both six months' periods and no part is due to the acquisition of new interests.

The profit of Tendaho Plantations Share Company has been included in the Interim Results for the first time and the comparative figures have been adjusted accordingly.

Negotiations are continuing on the amount of compensation receivable for the nationalisation of the Sudanese interests and no provision has been made for any revenue that may be paid subsequently to the Group for the periods covered in this Statement.

An Interim Dividend of 3.75% (1971 – 3.75%) has been declared on the Ordinary Shares and will be paid on 2nd June 1972.

CIVIL SERVICE COMMISSION (NORTHERN IRELAND)

DEPUTY ECONOMISTS (2)

Applications are invited for pensionable posts as Deputy Economists in

(1) Labour Affairs Statistics Branch of the Ministry of Health and Social Services.

(2) Economic Section of the Ministry of Finance.

QUALIFICATIONS

Candidates must have a First or Second Class Honours degree in Economics, including statistics, together with at least three years' practical experience in economics or statistics.

DUTIES

(1) **Labour Affairs Statistics Branch**
To examine the operation of new statistical procedures, such as the new Census of Employment and the proposal to computerise unemployment statistics. The work will also involve reporting and advising on various other aspects of the work of the Ministry's Labour Affairs Department.

(2) **Economic Section**
Economic and statistical analysis of major aspects of regional economic development, with special reference to the EEC, and the monitoring of the Northern Ireland Development Programme, including output budgeting.

SALARY SCALE

£2,798-£3,873. Entry point will be related to experience and qualifications. Application forms and further particulars obtainable from the Secretary, Civil Service Commission, Clarendon House, Adelaide Street, Belfast, BT2 8ND. Tel: Belfast 44300 Ext 29. Completed application forms should be returned by May 3, 1972. Please quote SB66/72/60.

APPOINTMENTS

Transport Economics (Aviation & Shipping)

Much of the work in this post is to do with the evaluation and analysis of the policies and programmes of the aviation and shipping industries. It involves the application of project appraisal techniques and cost/benefit analysis, and requires an understanding of corporate planning methods.

Overseas Commercial Policy

The work will particularly concern questions of trade liberalisation, our relations with international bodies, international monetary problems, and other such topics raised by our membership of EEC.

R. & D. Harwell

Here the economic and social effects of R & D projects are evaluated through the application of cost/benefit analysis and other appraisal techniques. The person appointed will be the senior economist in the Unit, reporting to the Director.

Other appointments are to be made, concerning work on the development and analysis of industrial policies.

The work involves research on current problems of vital importance with access to a wide range of unpublished material. The problems, embracing several disciplines, require fundamental analysis. There are good opportunities to publish your findings and you are encouraged to keep in contact with universities.

Economists to work on problems of industrial development and international trade

QUALIFICATIONS You will normally need to be at least 27 with a first or second class honours or higher degree in economics or a closely related subject. Substantial relevant experience is essential. Appointment can be on a permanent or contract basis.

SALARY (Inner London) Starting salary can be above the minimum of the scale £3653—£4883 and promotion can lead to salaries of £6475 and above.

There are also vacancies in the Civil Service College, Foreign and Commonwealth Office, Ministry of Defence, the Department of Health and Social Security and the Ministry of Posts and Telecommunications.

Send for full details and for an application form (to be returned by 5th May). A visit to the department of your choice can be arranged if you are short-listed. Write to the Civil Service Commission, Alencon Link, Basingstoke, Hants. Or telephone Basingstoke 29222 ext. 500, or London 01-839 1696 (24 hour 'Ansafone' service), quoting reference A/622/10.

Department of Trade & Industry

ASCO

ECONOMIST/PLANNER

ZAMBIA

U.S. $1,400

2 years contract. Free passage to and from Lusaka extended to the family. Free housing and medical benefits. 35-45 years of age. English mother language. To work in collaboration with our Town Planning and Civil Engineering section on Regional and Town Planning and/or Transportation studies.

Interested candidates should write, giving full details of qualifications, age, experience, nationality and marital status, to :

ASCO ZAMBIA, P.O. BOX 1340, LUSAKA, ZAMBIA, OR C.C.
(ITALASCO VIALE REGINA MARGHERITA 279 00198 ROMA).

Portfolio Manager

The Airways Corporations Joint Pension Scheme, situated on the Great West Road, Hounslow, Middlesex, needs a Portfolio Manager to undertake the responsibility of approximately one half of the UK equity portfolio. Dealing is involved, together with the organisation and supervision of the work of two or more research analysts. Contribution to the formulation of policy is an integral part of the job.

The position will suit someone who has a University degree or professional qualification and is in the region of 30 years of age. The appointed person will have had at least two or three years experience as a research analyst, preferably in the Capital Goods Sector of the stock market, and have had some experience of company visiting, dealing in the stock market, underwriting and similar work.

Starting salary will be £3,193 per annum, rising to £3,948 per annum including London Weighting allowance.

Additional benefits include membership of the contributory pension scheme and opportunities for holiday air travel.

Postcard requests quoting E197 for an application form to :

BEA BOAC

Hounslow TW6 2JA

APPOINTMENTS

Export Marketing Manager c. £6,000

Career Opportunity in Australian Steel Industry

Location—Sydney

This post will interest a man with substantial experience in international marketing and sales achievement. The appointee will be responsible to General Manager, Export, for the development and sales execution of Export Marketing plans requiring dynamic leadership of an experienced export sales team with technical support services.

Preference will be given to applicants with employment background in steel mills engaged in export or merchant organisations and who have been responsible for sheet steel sales to international markets.

A knowledge of languages will be an advantage.

Remuneration: This is a senior managerial appointment which will attract a person capable of earning around £E6,000 per annum. Fringe benefits including a car pertain to the position.

Free transport to Sydney, together with usual household effects, will be available to appointee and family.

Applications, including summary of personal details, education, qualifications and experience, should be addressed to: The Chief General Manager, Service & Sales Division, c/o John Lysaght (Australia) Limited, London Office, 14-16 Cockspur Street, London, S.W.1. They will be treated in the strictest confidence, and will be forwarded to Australia for consideration.

John Lysaght Australia Limited

Lysaghts is now embarked on an expansion programme of major proportions which will continue into the 1980's. You have a unique career opportunity to join an historic Australian development.

John Lysaght (Australia) Limited, an independently managed company (jointly owned by The Broken Hill Proprietary Company Limited and Guest Keen & Nettlefolds Limited of the U.K.) with a present turnover of $A200 million in steel sheet and coil from its own mills, plans to spend up to $A1,000 million on expansion of production facilities at Western-port, Victoria. The company is already based in all States of the Commonwealth and has overseas subsidiaries. The product range currently marketed is very wide. Operations will become progressively more international as a major export plan is implemented.

APPOINTMENTS

POPULATION STUDIES—INTELLIGENCE UNIT

Head of Section

£4230–£4878

An experienced social statistician required to head a section undertaking research into the inter-related demographic, social and economic characteristics of Greater London's population.

The work is concerned with the prediction of future developments and changes which will affect the context in which local government authorities in London operate and the services they will need to provide. The section also obtains and disseminates vital statistics and census data for GLC departments and the London boroughs.

The person appointed will direct the work of a specialist staff of statisticians and mathematicians. The post calls for management ability and a keen interest in applying statistics to London's problems.

Experience in designing and supervising an extensive research programme is essential. Publication of research findings is encouraged and the section head must be able to assess their policy implications over the whole field of local and regional government operations in order to advise senior officers throughout the Greater London Council and the London Boroughs.

Further details and application forms returnable by 28 April, from the Joint Director, Department of Planning and Transportation (AO/784/C), County Hall, S.E.1 7PB.

GLC GREATER LONDON COUNCIL
Department of Planning and Transportation.

Assistant General Secretary

work may include union negotiation, research, tuition, editing and administration. Scale maximum exceeds £4,500: starting pay negotiable. Non contrib. pension, 6 weeks' holiday. Applications in confidence to **General Secretary, APOE, 345 Upper Richmond Road West, London SW14 8QN** marked 'AGS', by 1 May 1972.

CIIR Overseas Volunteers

41 HOLLAND PARK,
LONDON, W11.
01-727 3195.

THREE VOLUNTEER CO-ORDINATORS

are needed to act as the overseas arm of CIIR's operations within the British Volunteer Programme. Two will be based in Central America, the third in the Yemen Arab Republic. They will be responsible for the welfare and administration of CIIR volunteers, and the encouragement and assessment of local development projects which might benefit from volunteer participation. Terms include a personal allowance, board and lodging, all expenses, a Land-Rover, annual return air-fare to UK and a final resettlement grant. The posts are for a minimum of two years, starting in September 1972.

Male economics or social science graduates with language ability, overseas experience and a capacity for administration are most likely to succeed, but applications from any suitably qualified or experienced candidate will be considered. Write for application form to R. Church.

A VACANCY OF INTEREST TO

ECONOMETRICIANS

Due to expansion, a vacancy offering unusual opportunities in the field of Econometrics has occurred in the Research Department of a leading City firm.

The firm is noted for its progressive attitude to investment and economic research and has included amongst its projects the building of a macro model of the UK economy. It is envisaged that the further development of this work will include an analysis of the Monetary Sector, the use of input/output techniques, and the adaptation of the system to a real time computer terminal network giving facilities for operating in interactive mode.

Much of the work that is planned is of a particularly sophisticated and advanced nature, and for the successful applicant there will be the opportunity to participate in and contribute to these new developments.

Applicants should have a very good degree and preferably have done postgraduate work in Econometrics or Monetary Theory. Age range is 22-25.

Salary will be generous and progressive.

Please reply to Box No 2436.

Share in the riches of Britain's gas

ECONOMIST
£2390-£2890

An Economist is needed in the Economic Planning Division of the Gas Council in London, to analyse and advise on a variety of purchasing problems of a non-repetitive nature.
Considerable latitude will be given to allow work to be done with the minimum of supervision. Knowledge of the energy market is desirable. The ability to digest complex problems quickly and provide sound yet lucid assessments is fundamental. Additionally, you should be educated to degree standard in Economics and have had at least three years' experience in a large company or management consultancy.
Application forms can be obtained from the Personnel Manager, The Gas Council, 59 Bryanston Street, London W1A 2AZ, quoting reference EP/161/202/2/E.
Closing date for applications is 2nd May 1972.

GAS COUNCIL

APPOINTMENTS

La Trobe University
MELBOURNE, AUSTRALIA

Technical Teachers' College, Compton Road West, WOLVERHAMPTON.
College of Education (Technical), Holly Bank Road, HUDDERSFIELD.
Garnett College, Downshire House, Roehampton Lane, LONDON SW15.
College of Education (Technical), Chadwick Street, BOLTON.

{Travel is so broadening.}
Rallying cry of the culture vultures.

As any Far East expert can testify, such magnificent sunsets occur only at Manila. And even there only in the evening.

THERE IS nothing to beat Far East experts. If you find yourself sitting peaceably in your luxurious Swissair armchair on the non-stop flight from Geneva to Bombay, and your neighbour suddenly explains the physical and topographical reasons why the plane can only land crosswise at Hong Kong, you may take a small bet it's one of these characters. (Never fear, the landing is perfectly normal.)

The stories our hostesses have to listen to in the way of expert opinion while on the 230 weekly connections between, to, and from Karachi, Bombay, Bangkok, Hong Kong, Manila, Tokyo, and Singapore not only deserve an advertisement all to themselves, but would fill a book:

That the girls in Colombo are much prettier than in Singapore.

That you can see the Himalaya on the Swissair flight from Bangkok to Manila. (If you can at all, possibly on the non-stop flight from Athens to Bangkok.)

That silk is cheaper in Singapore than anywhere.

That there's a tailor in Hong Kong who will make a suit to measure in three hours.

And the true distinction between a sari and a sarong.

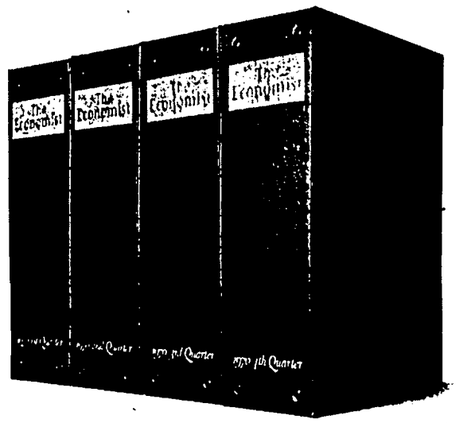
Not to mention the differences in preparing Japan, India, and Ceylon tea.

Our hostesses and pursers say nothing to betray their amazement. One doesn't teach lessons to experts. But if you should be flying with us the first time, please ask us any question you feel like.

On long runs we have plenty of time, and people like our crews who move around professionally in the Far East have a pretty good idea of what goes on between Tokyo and Karachi, what you can buy, and what you'd better not do.

But as to the wild assertions that the Far East has the world's biggest city, the world's highest mountains, the world's fastest industrial growth, the world's most remarkable buildings, and the world's speediest railway, they're all perfectly true.

And any IATA travel agency can confirm that Swissair has tempting, completely individual, yet reasonable package tours out that way.



The business about sunset at Manila is true too; the Swissair advertising manager himself says so. He knows all 79 destinations that Swissair flies to. And when conversation turns to the Far East, he puts on an odd expression; probably he considers himself an expert.

It's a shame he can't take better pictures of sunsets, though.

SWISSAIR

The Economist

Binding cases

Binding cases for The Economist are available from Easibind Ltd. The binders (see illustration) are covered in strong black leather cloth with a black leatherette lining. The spine, which is specially reinforced, is embossed in gold and red. Each binder holds 13 issues of the main edition or 18 issues of the air edition, with quarterly indices. The cost per binder, post free throughout the world, is £1·25 (US $3·50). Orders, stating clearly which edition, the years required and enclosing payment, should be sent, NOT to The Economist, but to:

EASIBIND LIMITED (Dept. E) Eardley House, 4 Uxbridge Street, Kensington, London W8 *Telephone:* 01-727 0686 (3 lines).

Copies of the quarterly indices (£2·50 pa) are available only from The Economist, 25 St. James's Street, London SW1A 1HG.

Lancaster Carpets & Engineering Limited

Dividend up from 15% to 25%

Points from the Report and Accounts and the Review by the Chairman, Mr. E. S. Hammett, C.Eng., F.I.Mech.E., F.I.Prod.E., for the 52 weeks ended 2nd January, 1972.

	1971	1970
Turnover	£12,973,787	£10,919,944
Pre-Tax Profit	1,737,551	1,303,989
Taxation	699,092	559,459
Ordinary dividend	25%	15%*

*Adjusted for Capital issue

- Further growth. Sales 19% higher and profits up by 33%.
- Previous capital expenditure a major influence in the further advance by Lancaster Carpets Limited. Planned expansion over next two years should lead to 40% increase in output and a further increase in profit.
- Priest (Lindley) Limited, producers of high quality synthetic yarns, again contributed to Group profits.
- The Motor Gear & Engineering Co. Ltd. increased its sales and profits in a depressing period for manufacturers of capital equipment.
- Further increase in profits expected in 1972.

The Economist

Here they come again

In the Trident cockpit alone, there are 164 checks to be m

"All checks completed; commencing take-off."

Taking off. Landing. And, in between, keeping the plane on an even course. That, you might think, more or less sums up a captain's job.

Not by a long way.

Even before boarding, the Captain is responsible for some 40 exterior checks. Once in the cockpit, another 164.

Meanwhile, each member of the cabin crew has been going through a checklist. When they've all finished – they report to the Captain.

The Engineer presents his report. Everything that's been done to the plane since touch-down, in full technical detail.

Only now, when every single aspect of the plane has had the Captain's personal approval, can he commence take-off.

Our Captains are perfectionists. We wouldn't have them any other way. Nor, we believe, would our passengers.

BEA

Your Captain wishes you a pleasant flight.

Here they come again

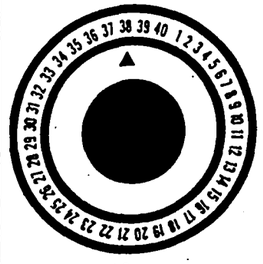
North Vietnam's Easter invasion is a mark of how the war has become a straight struggle between the two Vietnams. How the battle could go, page 15. The first week's fighting, page 35. North Vietnam's calculations, and the balance of armed power, page 36.

A term to violence

Liberal opinion has made a great mistake in not emphasising the total disreputability of violence in any modern society, especially as more fearful weapons are coming along, page 19. Intimidatory street demos have led on to the awfulness that happened at Easter in Turkey (see page 43) and is still happening in Ulster (see pages 23 and 39).

Papal fallibility

Is Pope Paul starting to think twice about the Vatican's policy towards Russia?, page 22.



Spring books

A special look at what's best in the spring book lists, after page 52.

McGovern

The new challenger

Senator McGovern took the Wisconsin primary very handily, which delighted his young followers but naturally spread despondency among the Democratic old guard, page 53.

On the cable

What cable television can do for a wired world, and the full opportunity that may be missed, page 65.

Wounded party

Labour MPs are beginning to despair at the number of times Mr Wilson expects them to stand on their heads. But will the Jenkinsites have to do so again on the referendum issue?, page 17.

Ireland

SIR—When peoples of differing racial characteristics, religion and culture cannot live together, separation is the only remedy. In Northern Ireland the Protestants regard themselves as British and their province as part of the United Kingdom. The Catholics regard themselves as Irish and the ancient province of Ulster as part of Ireland. Both communities consider right is on their side. This surely is the nub of the problem.

Both communities could be satisfied if the province were divided, the overwhelmingly Catholic counties of Fermanagh and Tyrone being ceded to the republic. The city of Londonderry, together with parts of the county of that name, and the town of Newry, together with parts of the county of Armagh, would also have to be ceded to the republic. The remainder of the province would be fully integrated with the United Kingdom on the Scottish model.

The border resulting from such a division would be much shorter and more easily supervised. Some thousands of people would inevitably be stranded on the "wrong" side of the new border. For these, financial assistance to move home and employment would be necessary. The scale of such assistance would be considerable and it should be supervised by a joint United Kingdom-Irish commission. In the long run, the costs of such population transfers would be insignificant compared with the present cost of keeping the two communities from each others' throats.
—Yours faithfully, D. W. MOUNTAIN
Carshalton, Surrey

SIR—There seems to be a devious, basically unfair thinking involved in the suggestion by Professor David O'Mahoney (Letters, March 4th) that the British Government give in to "the Irish-orientated minority" in Northern Ireland and set up some sort of "joint-trusteeship or dual sovereignty, which will accommodate the different allegiances of the communities."

It is a matter of record that Ireland has already been divided once for religious-political reasons. At that time, the Catholic Irish took over most of the island, and the small corner in the north-east was left as the sanctuary of the Protestants of Irish, Scots-Irish and English descent who wanted no part of a separate Irish government.

Professor O'Mahoney suggests that this safe haven of the Protestants now be divided again. His statement that "there can be no lasting peace" unless a division of the Protestants' territory is made along the lines he suggested implies a continuation of the present terrorism as its only alternative. On this point Professor O'Mahoney, and that part of the Catholic minority who are disloyal, might misreckon sorely. Given the continued hostile activity and guerrilla warfare conducted by this disloyal minority, this nightmare promises resolution only through far-reaching action.

When the Irish Republic became self-governing, all who had been loyal to Britain were driven out with great deliberation. That is a sword with two edges. But, then, who am I to point a finger in this instance? America did the same thing after gaining its independence. In fact, every other land has followed this pattern, with very rare exceptions. The reason is clear. In political life no house can stand divided.

Therefore, the fatal mistake perpetrated on the Northern Ireland loyalists was to force them to tolerate an avowed enemy in their midst. Much bloodshed and sorrow has resulted, and much more is on the horizon as a result of leaving this situation unsettled. It does not seem unreasonable to expect that anyone given political freedom in Northern Ireland accept full political responsibility, and pledge his allegiance to the existing government. This is standard procedure throughout the world. The penalty for refusing such allegiance is loss of civil rights, imprisonment or expulsion. Britain should stand fast in this situation and not bow to terrorism. The present IRA, with its international socialist leanings, had national socialistic leanings during the second world war, when it sought military help from nazi Germany. It is an undesirable group to let determine the future of those who were our comrades fighting the nazis.

If the Westminster Parliament should lose its will in this situation, and be prepared to change Northern Ireland's constitutional status to suit the terrorists, it must understand it has placed the loyalists in an isolated corner. The loyalists must then either strike their enemies effectively enough to neutralise them, or face the eventual fate of Protestants in the Irish Republic. Such a compromise with their enemies will then clearly mean to the loyalists: "Defend your rights now, and alone, or be destroyed through legalised attrition."—Yours faithfully,
Alburtis, Pennsylvania WILLIAM SIMPSON

SIR—Further to Professor O'Mahoney's letter (March 4th), I would suggest that he is living in an ivory tower in Cork's University College when he talks of "joint-trusteeship or dual sovereignty" for Northern Ireland's citizens. The reality is that the majority of the population would reject such a ridiculous proposition.

I would refer him to Matthew, Chapter 6, verse 24: "No man can serve two masters: for either he will hate the one, and love the other; or else he will hold to the one, and despise the other. . . ."—Yours faithfully, E. W. MCCARTNEY
Belfast

Taxing small companies

SIR—Your article (March 25th) regarding the shortfall on private companies is well put, and at last it is recognised that the problems created by shortfall for private companies are out of all proportion to the revenue received. Those companies with profits below £15,000 receive at present shortfall abatement. From next year private companies with profits above this figure will suffer increased corporation tax if their distributions are low. This means, in effect, therefore, that low distributions will be penalised in any case, irrespective of whether or not there is a shortfall problem. If this extra corporation tax is coupled with the fact that plough-back profits increase the future liability to capital gains, then there seems little point in continuing shortfall at all.

You mention that something like 350,000 small companies may be relieved of the increase in corporation tax. It is a sobering thought that if each of the small companies in this country could employ one extra man the problem of unemployment would be nearly halved.

Had it not been for the discriminatory legislation introduced by Mr Callaghan in 1965 against private companies, we might well not now be faced with the serious unemployment that we have today. Without doubt, the close company legislation which includes shortfall did much to hamper and set back the prosperity of this country.

There is now virtually no reason at all why the whole of close company legislation should not be scrapped. Indeed, one might even go further and scrap the necessity to file accounts of private companies, which also causes considerable extra professional costs and seems to achieve none of the arguments which were advanced in favour of filing.—Yours faithfully, J. E. CRITCHLEY
London, EC1

Value-added tax

SIR—I agree with you when you deplore the zero-rating of food for Vat (March 25th).

Admittedly, a single rate of 10 per cent makes fiddling Vat less tempting, but because such a large part of consumer purchases is zero-rated it will be exceedingly difficult for the customs to know with any degree of reliability their net Vat liability.

As retail pharmacists, I and my medical colleagues are intrigued by the decision to zero-rate all goods supplied by a pharmacist on the prescription of a doctor (Schedule 4, group 13). We do not anticipate that whisky or cameras will become prescribable under the NHS, but are pleased with the incentive to private medical care provided by the white paper.

As a keen gardener, who also retails seeds, I am puzzled by the discrimination between those propagating foodstuffs for animals providing human food and those not in this happy, or unfortunate, position

SECOND CLASS POSTAGE FOR *THE ECONOMIST* PAID AT NEW YORK, N.Y

MANAGEMENT APPOINTMENTS £7000 PA AND OVER

THE LONDON GRADUATE SCHOOL OF BUSINESS STUDIES

Principal

The Governing Body of the London Business School invite applications for the office of Principal of the School. The post will become vacant from July 1, 1972 when the incumbent and first Principal of the School will be resigning in order to resume his business career. It is hoped that the person appointed will be able to take up the appointment by September 30, although this is not an essential condition.

The School has a student body averaging about 375 and offers Masters and Ph.D. programmes and a range of executive programmes of from one or two weeks to ten months duration. In addition, the School conducts widespread research activities in the management field. The work of the Principal involves leading a team of teachers, researchers and administrative staff totalling about 165, and the overall supervision of the academic work, the finance and administration of the institution.

The ideal candidate will have a background of substantial managerial or administrative responsibility and a knowledge of relevant academic disciplines and/or academic administration.

The remuneration will be at Vice-Chancellor level and a house is provided. Membership of the Universities' Superannuation and Life Assurance Scheme is required.

Applications accompanied by a curriculum vitae should be submitted to The Secretary, London Business School, Sussex Place, Regent's Park, London, NW1 4SA and marked, "Confidential". The closing date for applications is April 30, 1972.

Financial Controller

• THIS is an opportunity to join a dynamic business in the City, a leader in its field, with an outstanding record of profitable growth and strong international connections.

• THE ROLE is twofold: to control a major reorganisation within the finance division, and to work increasingly with the Financial Director on broad aspects of the company's international development. The job offers considerable scope for personal advancement.

• A CHARTERED ACCOUNTANT is required with a proven record in financial control at senior level. Equally important is the ability and temperament to contribute in an intellectually demanding environment. Experience in the City is a strong advantage.

• AGE early thirties. Salary will attract men already earning £7,000.

Write in complete confidence to G. W. Elms as adviser to the company.

JOHN TYZACK & PARTNERS LIMITED

10 HALLAM STREET • LONDON W1N 6DJ

(Schedule 4, general item 3). I appreciate that we should do all we can to provide small wild birds for the Italian diet and can see that I must view the depredations of visiting or resident pheasants and wood pigeons with a different concern than has been my wont in the past.

Altogether this is a most interesting white paper which I trust our sovereign Parliament will transform into law with as little delay as possible and that it will not feel its responsibilities lessened by the thought that later this decade our system is likely to be "harmonised" and that we will in all probability, together with the rest of the EEC, have a system similar to that now obtaining in Denmark.—Yours faithfully, C. J. FELL
Newport, Essex

Inflation

SIR—The repetition of the hoary myth—that Hitler put Germany on a "sound financial footing" under Dr Schacht—would by this stage in our knowledge of nazi economics be merely a flat joke, if it were not also dangerously irresponsible.

Let Major John North (*Letters*, March 25th) read Schacht's own book, "The Magic of Money," and learn how the nazis cured unemployment by preparing for war, how they reduced foreign trade, jeopardised the supply of raw materials and soaked rich Jewish families for ransom money. Let him consider the gigantic spoils of military conquest, and how the catastrophic decision to finance the war by printing money led to a new inflation. In Schacht's own words: "Hitler conducted his economic autarchy . . . in complete disregard of the practical consequences."

No, the real period of economic growth and stability has been, of course, and surely not by coincidence, since strong trade unions became integrated with the other relevant institutions, after 1945.—Yours faithfully, J. R. HOPKINS
Halesowen, Worcs.

SIR—I should like to commend two suggestions for curing inflation which have appeared in your correspondence columns recently. One was to liquidate trade unions and the other to nationalise them.—Yours faithfully, R. S. MUSGRAVE
Ghyll Head, Windermere

American medicine

SIR—Your review of my book "Health or Health Service?" seems to have roused distinguished economists in the United States and Great Britain to protest that the American medical system had not failed. I quite agree. In many aspects it is far ahead of ours; in others it reflects all the advantages and disadvantages of a free and liberal society.

No serious author complains of receiving a review in your respected journal but perhaps he is entitled to ask if the reviewer really read the book or wrote of his previous misconceptions? For I did not advocate the use of the American system—why should I? We are two very different countries and economies. I did advocate a reform of our contribution scheme through private enterprise insurance. I also showed the dangers of a state monopoly in health care.

I also gave a political explanation of why would-be popular demagogues, from Bismarck to Senator Edward Kennedy, have sought to use medical care as a political power base. My own short spell in the House of Commons (which I hope will be shortly extended) showed me how essential the maintenance of the most socialistic medical scheme in the world (not even barring Soviet Russia) is to the political power base of the Labour party. This issue arouses them like none other. Unfortunately, some of their myths and distortions come to be believed by Conservatives. Most people working within the NHS know better. That is why I wrote the book.—Yours faithfully,
Poole, Dorset WYNDHAM DAVIES

Tunisia

SIR—I found Michael Wall's Maghreb survey (March 11th) an excellent interpretation of current events in the three North African countries, which I know fairly well from about five years of residence as an economist with the United Nations, Ford Foundation and Swedish International Development Authority during the 1960s and early 1970s. I entirely agree with his picture of the development in Tunisia, the Maghreb country I know best. The forced collectivist approach to the development policy of this country, which came to an abrupt close with the arrest of Mr Ahmed Ben Salah in 1969, was, no doubt, a major political mistake.

The 1969 crisis was, as is well known, triggered by a World Bank report, in which the failures of the co-operative efforts and the public initiatives in the industrial sector were disclosed—in such an open way that the regime lost face and decided to punish the initiator of this policy, Mr Ben Salah. He was, as Mr Wall rightly points out, "exceptionally able," and I would like to add, on the basis of several years of acquaintance, exceptionally honest and hardworking.

Against this background, I would like to question Mr Wall's statement about Tunisia as a still-favoured recipient of foreign aid. The seriousness of the development effort directed by Mr Ben Salah and, as Mr Wall points out, unhesitatingly backed by President Bourguiba and his whole government, did at the time attract massive development assistance, even from such countries of a liberal orientation as the United States, France and Germany. But today, as a result of a political sentence altogether contrary to the basic principles of the UN charter, Tunisia has, no doubt, lost a considerable part of the international prestige it had attained during the earlier part of Mr Bourguiba's leadership.

Mr Ben Salah has recently been adopted by Amnesty International as one of the victims of dictatorial regimes. In several western countries, as well as in the leading international organisations, there has been, ever since the end of 1969, an awareness of the imprisonment of Mr Ben Salah as an unacceptable act of revenge for a purely political mistake, an awareness which certainly is doing great damage to the image of a progressive Tunisia.—Yours faithfully, TORSTEN GÅRDLUND
University of Lund, Sweden

On the West Bank

SIR—Your article on the West Bank (March 18th) gives the impression that the Israelis there were engaged in all sorts of insidious activities.

You write: "Mr Dayan has said that wherever Israelis settle they mean to stay." Do farmers anywhere consider themselves transients? Why are Jewish settlements in an Arab environment such an intolerable idea if the West Bank were to return to Arab domination? Wouldn't such an attitude imply that the much-vaunted Islamic tolerance is in exceedingly short supply in Jordan and other local Arab states?

If, as you mention, the Arab farmer on the West Bank is in such bad shape, why has he quadrupled his purchase of fertiliser and tractors since 1967?—Yours faithfully, LUDWIG M. TANNENWALD
Palo Alto, California

From east to west

SIR—Commenting on the illiberal nature of east European governments (March 11th), you say: "The number of people allowed to travel to the west last year from Hungary and Poland—the two most liberal of Russia's allies—may actually have been slightly smaller than it was in 1970." I wonder if you realise the obstacles which western governments sometimes place before aspiring east European travellers.

Last summer I invited a Polish girl to spend a month in Britain. A friend of mine invited her boy-friend. For the sake of the story, let us call them Mary and Jack. Both are studying English literature at Warsaw university and think highly of Britain and everything British. We have known Jack for several years and he was extremely hospitable when I visited Poland two years ago, so both my friend and I in London were quite willing to sign statements saying that we would assume responsibility for their maintenance while they were in Britain, and to save up in order to be in a position to do so.

Neither Mary nor Jack had any trouble in getting passports and other travel documents from the Polish authorities, beyond the standard delay which seems the hallmark of any bureaucracy, and Jack eventually visited Britain. Mary was not so lucky. Her application for a visa appears to have been held up for several weeks at the British embassy in Warsaw. She had planned to come on Sunday, August 22nd; it was not until August 19th that a pair of policewomen visited me, apparently to investigate her visa application. I do not know what their report stated, but Mary

There's no shortage of good ideas in British industry. It just sometimes looks that way. Worthwhile projects exist aplenty. So do the men of vision who can conceive them.

But too often, myopia wins over and the suggestion box is a funnel to the wastepaper basket.

So we're looking for people who are not content to let the status stay quo. People with plans in their heads and fire in their bellies.

At the Highlands and Islands Development Board, we have a mandate to turn ideas into reality. To get projects off the ground.

The resources are here for you to do it—manpower (and womanpower too!), water, land, buildings, power, transport and financial support from the Board.

And by plane we're only a couple of hours from London and little more from the main centres in Britain. So if you've got a good idea, we really would like to hear it. It can be electronics, oil, food processing, light engineering . . . whatever you like, we're willing to give you a chance to follow it.

But first find out what we've already done, the sort of operating conditions you can expect, the type of assistance and backing you could receive. They're all in our new industrial brochure.

There's a copy for anyone who knows a good idea when he sees one.

Will the ideas men please come out of hiding?

Please send me your 64-page free colour brochure on industrial opportunities in the Highlands and Islands.

did not hear of the British embassy's refusal to give her a visa until well after her proposed date of travel. As far as I can gather, no reason was given for this refusal.

It is difficult to save up for a trip of this sort. It is unpleasant to have one's summer vacation ruined by uncertainty and delay. This may have been an exceptional incident, and in any case Her Majesty's Government has the right to grant or refuse visas as it sees fit. But a case of this sort does nothing to exploit the potential goodwill which Britain has among the young in east Europe, and it makes a mockery of your self-righteous liberal indignation at how few east Europeans are "allowed" to visit the west.

I have no political axe to grind, but I feel it my duty, as a supporter of that "extreme centre" which you usually so fairly represent, to bring this case to your notice in the hope that you will realise a painful truth: there are faults on both sides.—Yours faithfully, M. Huq
London, WC1

Ecology

Sir—Your article, "Limits to misconception" (March 11th), was a sad example of your propensity to seek to ridicule arguments to which you yourselves plainly have no satisfactory answer.

You seemed to be arguing that because technology has always found an answer to the problems and shortages which it has created, it will necessarily do so in the future. You admitted "the germ of common sense" in the suspicion that today's pace of exponential growth in gross world product must run into inelasticities of supply (shortages) in some particular things some time, but seemed unprepared to draw the obvious conclusions from your own later stated concern with the problem of swelling population. It is the interaction of too many people with a spreading, profligate life-style which creates precisely the problem which you recognise in principle but seem incapable of thinking through.

It really is too glib and parochial to pretend that, because London's air is cleaner and London's fish have begun to return to the waters of the Thames, we have no serious pollution problems to combat. You have only to consider the damage done to human health by the lead content in petrol or the serious threat to health from some industrial plant—such as the smelter at Avonmouth—to realise that there is still much to guard against and to bring under legislative control.

Your seeming faith in computer-assisted learning programmes as the answer to the problems of education in the underdeveloped countries is tragically wide of the mark and, even if partially realised, very likely to be counter-productive. What these countries need is our help in developing systems of education which they can afford and utilise to best effect, not technological aids which merely serve to compound their frustration by leading them down the path to a life-style which is already increasingly discredited in the minds of thinking people in the so-called advanced societies.

You admitted that there is still reason to be worried about the supply of decent urban living systems, but offered no evidence at all to support your assertion that the signs are better than they were. You recognised the breakdown of various social patterns and constraints, but seemed unable to grasp the simple fact that this process of social disintegration is part and parcel of the urban crisis to which you referred. The significant rise in crime and all kinds of mental disturbance is a direct reflection of the de-humanising effect of so many aspects of modern urban life.

The warnings contained in the Club of Rome's study have little to do with semantics and a lot to do with hard economic and political choices. However you define "food," it is true to say that more than half the world is now undernourished and that millions die from malnutrition and starvation every year. However you define "arable," it is true to say that the area of food-producing land is diminishing every year as modern methods of agriculture hasten soil erosion and exhaustion and as modern technological man covers more and more of the earth's land area with muck, concrete and tarmac.

Your seemingly touching faith in the forces of market innovation lies at the very core of your misunderstanding of the problems involved. You seem to suggest that the invention of new plants in pods, the harnessing of solar power for agriculture and the substitution of sea farming for fish-hunting are examples of the way in which technology will once again come to our rescue. However, you make no mention of the enormous costs involved—costs which your sacred market forces may not be prepared to bear—nor of the unknown ecological consequences of such new technological ventures. You cite the example of the discovery of extensive oil reserves in the North Sea as justification for your claim that in reality it is much more likely that we will for a time exponentially increase raw material reserves in line with exponentially rising demand. But even if you are right about this in the time scale of the next 15 or 20 years, you should stop to consider what you plan to do when the economic and ecological costs of harnessing new sources of energy become impossible to bear, even in our myopic and technology-obsessed society. And it cannot be sufficiently stressed—though it was ignored in your treatment of the problem—that it is the urgent responsibility of this generation to seek to limit its families to no more than two children, if those same children are to inherit a world worth living in.

Such a stable society—if it were ever to be brought about—would be the result of conscious choices made today, while we still have the possibility of free choice. It would be founded upon an almost revolutionary awareness of the need to extend both the time-scale and the scope of the value-judgments which form the basis of our political choices. It would constitute a statement of faith in the future and evidence of our determination to take our destiny into our own hands.—Yours faithfully, F. N. Forman
Brighton, Sussex

Sir—I should like to send you an appreciation of your article "Limits to misconception" (March 11th).

I recollect an address to the Royal Society in the early years of this century forecasting world famine in a generation. Being involved commercially in the international wheat trade, I took careful note of this as about 1933 would be the critical period. On or about that year wheat futures in Chicago and Winnipeg were standing at a level disastrous not to the starving consumers but to the starving wheat producers.

Did not Masefield say quite truly: "Trained men's brains are spread so thin they let all kinds of darkness in"?—Yours faithfully, W. R. Law
Helensburgh, Dunbartonshire

Service isn't slavery

Sir—The idea expressed in your paper (January 22nd) that tourism is resented by the population of the host country inasmuch as it constitutes a service industry is best answered by the recognition that courtesy is not the synonym for servility, but for decency.

This is proven, for example, by Switzerland, the classic tourist country. I have still to find a Swiss whose character is affected by servilism.—Yours faithfully,
Buenos Aires Martin Ruppel

Iran

Iran should reach its 20 per cent growth target in 1972, unpinned by expanding oil revenues and an excellent credit rating. The latest QER analyses how this feat may be achieved.

Pan Am introduce the first-ever First Class dining room

The China Clipper was a Martin M130 with a cruising speed of 130 mph; she was one of three owned by Pan Am. She could seat 32 passengers—only 15 to 20 on long journeys. With a range of 2,400 miles, she was Pan Am's first long-distance aircraft.

In 1936, when 'Gone with the Wind' first hit the bookstalls like a hurricane and William Powell starred in the glassy, glittering 'Great Ziegfeld,' the Pan Am China Clipper flew with the first-ever flying dining room.

Pan Am first served food on board in 1929. In 1935, galleys were installed and the first hot meals served. A dining room came next.

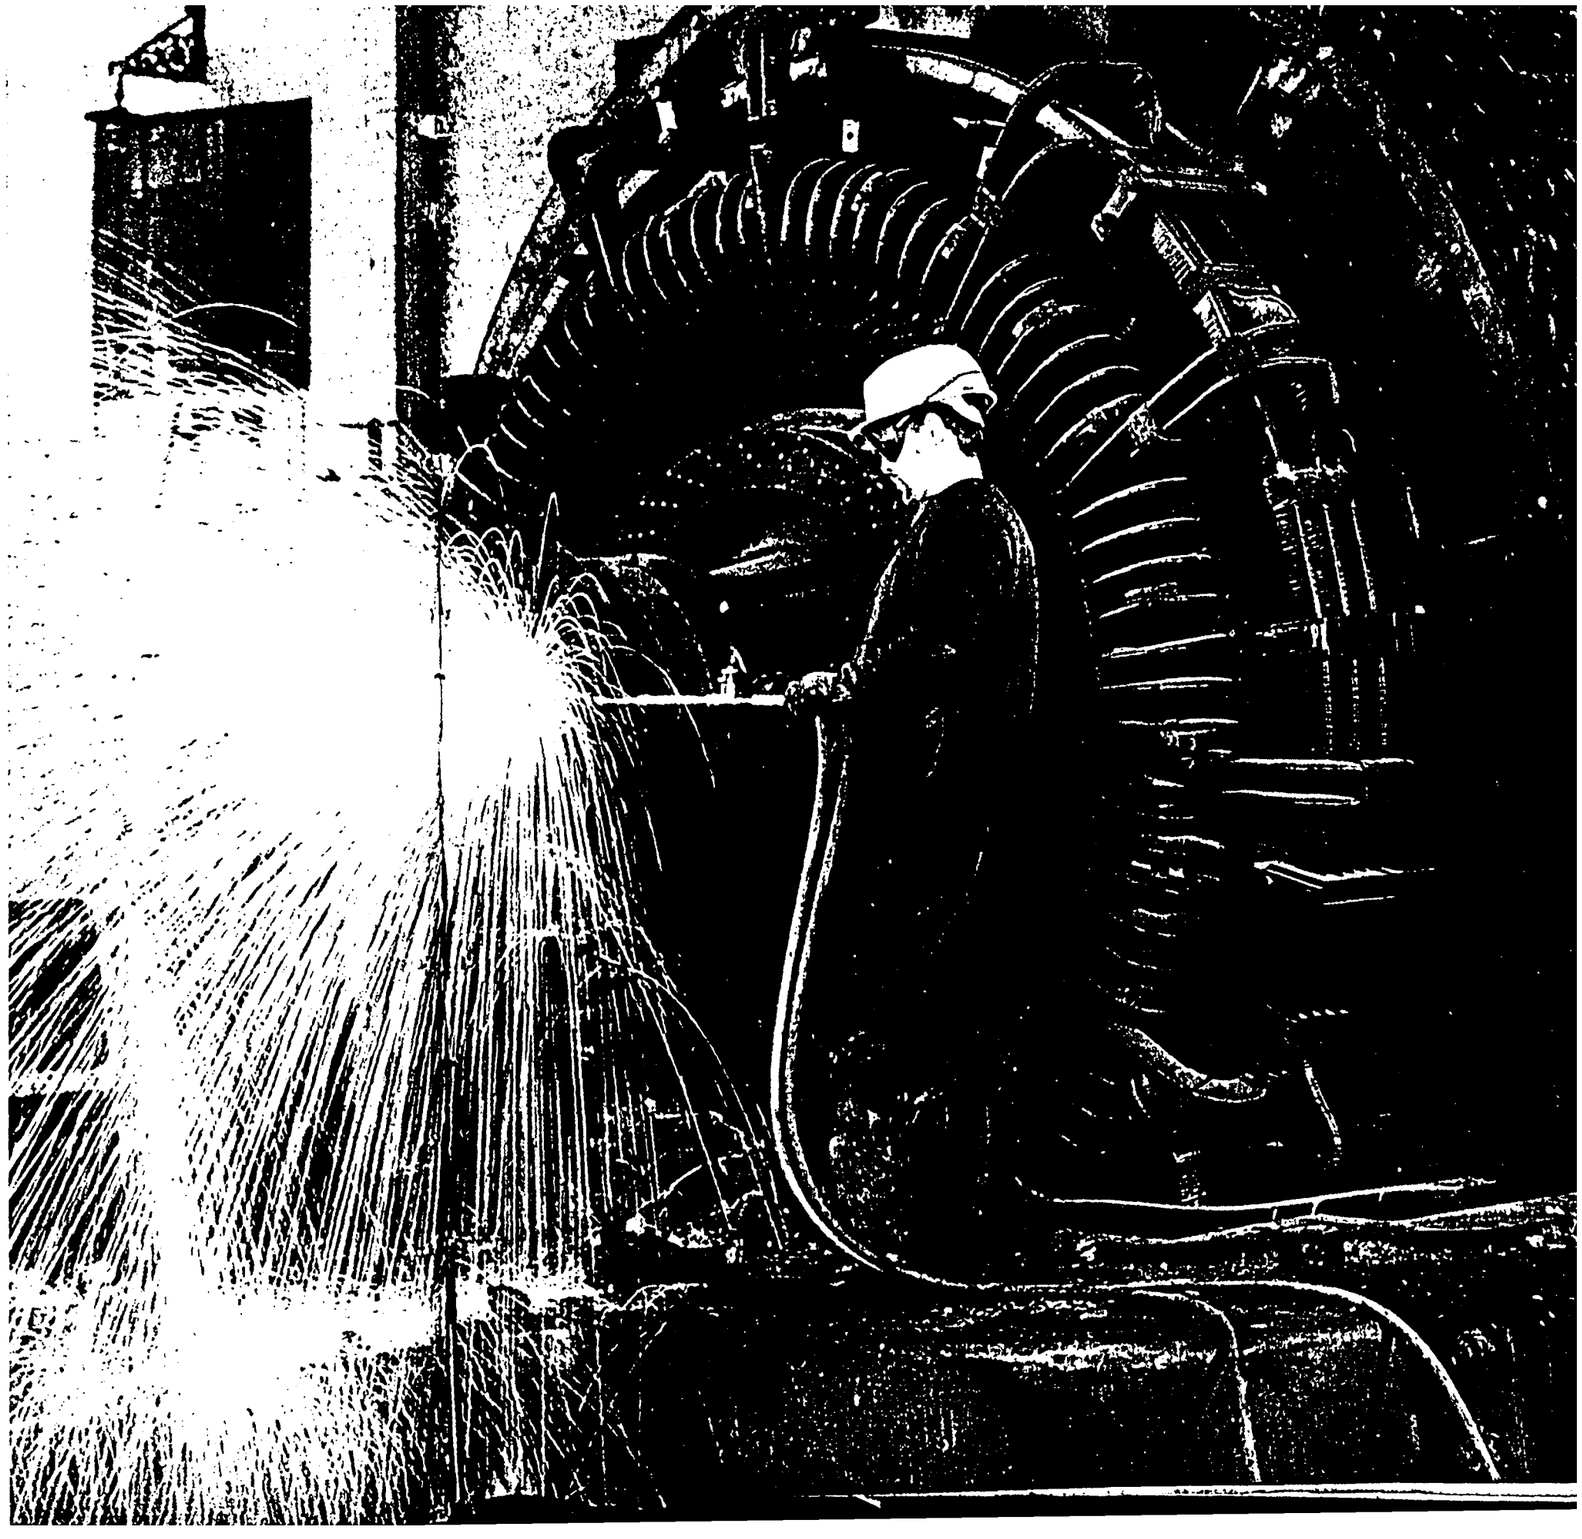
It was small but well appointed, like a lift in the Waldorf Astoria, and it seated fifteen diners very comfortably while still leaving the lone steward room to manoeuvre.

...again.

After 35 years Pan Am have another aircraft big enough to carry a dining room again.

The 747 travels at 625 mph with a range of 6,700 miles. Unfortunately there cannot be a dining room on board to accommodate all the thirty-eight First Class passengers. Just ten can use the dining room, so far.

Perhaps it should all be one big dining room, but till that day, should you decide that you want to be a pioneer too, please remember to book your table early.



Suddenly, you're (dining) somewhere else.

There's no end to it

Something old for something new. In the expert hands of The Ward Group dismantling means new life. Obsolete factories, plant, equipment, ships are skilfully broken down by Ward, cut and graded into the precious scrap metal that's vital for the production of today's new steel products. Ward's dismantling division and 21 scrap works and 4 ship-breaking yards are equipped to make the break-up a fast, efficient operation, and have long experience in meeting exacting furnace and metallurgical specifications. Today Ward is one of the leading suppliers of this essential raw material. There's no end to the use of iron and steel — and no end to Ward capabilities, in this and other industrial fields. The list of services, products and materials offered by Ward covers pretty well every need of every industry.

Works dismantling — another thing Ward does well

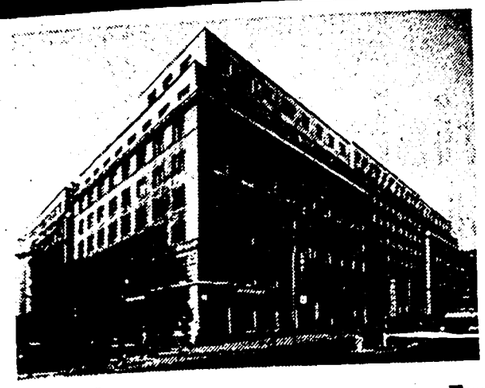
TWW THE WARD GROUP

In the capital-for-expansion game, Charterhouse can help you get a better deal.

The brighter your company, the more you need capital to finance your expansion, but also the more people seem to want a fantastic slice of your action in return. In fact, it sometimes seems that private companies have to give most of the business away just to keep going.

One of the functions of Charterhouse Finance Corporation is to make all this unnecessary. As part of the Charterhouse Group we have access to some very special City financial and management skills. And since another part of the Group owns and runs businesses, we really understand your problems at first hand.

We reason that we ought to be able to help good companies expand by arranging finance for them without seeking control.



We do like to have a direct equity involvement – our holding normally averages 20-30 per cent. We think, in fact, that we can provide something that very few other financial institutions can. Call it advice with a cheque book if you like – a continuing, interested, and helpful involvement in solving your company's financial problems. A simple way to win the game, in fact. If you think we could be helpful, call Michael Levete at Charterhouse Finance Corporation at 01-248 3999.

Or if you are in the Midlands ring Ralph Sammell at 021-236 4936.

Charterhouse

Here they come again

No, it is not another Tet offensive. It is true that the North Vietnamese have not pushed so hard or risked so much or got the men in Saigon quite so worried since February, 1968. It is also true that, just as the Tet offensive was timed to undermine the position of an American president in an election year, this year's Easter offensive is meant to make things difficult for President Nixon in November. The fact that the communists managed to seize most of a northern province of South Vietnam at precisely the moment when Wisconsin's voters were being asked to select a Democratic candidate was not just a fluke. Of course, you would have to believe that the men in Hanoi have stopwatches for minds to make out that they timed the start of their operations in Quang Tri province at the end of last week to lead up to Senator McGovern's victory in the Wisconsin primary on Tuesday (see page 35). But by turning Vietnam into an American election issue again, they may have helped him to pick up a few more votes by beating the let's-get-the-hell-out-of-there drum (see page 53).

North Vietnam's leaders may be hoping to wreck President Nixon's electoral prospects altogether, just as they believe that they helped to break the will of his predecessor. But three things make such a success unlikely. The first is that Vietnam just does not seem to matter that much any longer in American domestic politics, and so long as Mr Nixon goes on pulling troops out it is hard to rally a mass protest against bombing raids that do not involve many American lives. Second, although the communist offensive is dangerous, it should not prove disastrous. Third, although many of Mr Nixon's critics will assert that the current offensive proves the continuing strength of the communists in South Vietnam, it does not prove anything of the kind.

What it does prove is the continued determination of North Vietnam's political leaders to pursue the war at all costs, despite economic problems that can be shelved by a ruling elite that dictates its own priorities, and the restlessness among their own people that can be buttoned down by the police and the party apparatus. The contrast between what is happening now and what happened in the first months of 1968 demonstrates the changing pattern of the Vietnam war. The Tet offensive was a nationwide operation in which large numbers of southern-born and southern-based guerrillas helped the North Vietnamese regular units. Although the Tet offensive proved to be a pyrrhic victory, since the Viet-cong's men suffered enormous casualties and the hoped-for uprisings never happened, it shook the Saigon regime and panicked the Americans.

A deliberate, foreign invasion

The Easter offensive, in contrast, is a localised assault in the region south of the demilitarised zone, although it is possible that the North Vietnamese could be opening up other fronts in the central highlands and in Tay Ninh province across the border opposite Saigon. There is no evidence so far of any significant local support for the North Vietnamese forces. On the contrary, all those refugees straggling down Highway I towards Hué are a sign not just of the familiar horrors of war, but of the fear inspired by the memory of what the communists did in 1968, when more than 3,000 people were assassinated for political reasons in Hué alone, many of them being buried alive.

Most important, what is happening now is not in any real way an internal insurrection. It is essentially a foreign invasion, executed by conventional North Vietnamese forces. This is no longer a "people's war" —at least not in the sense in which that term is normally used. The North Vietnamese moved into Quang Tri province down newly constructed roads, led by at least 80 Russian-built tanks and covered by an artillery barrage from across the border. They have been setting up anti-aircraft batteries as they move south. The Easter offensive has given the North Vietnamese the chance to show off all the new military hardware that the Russians have been giving them. The fighting in Laos last year, when the North Vietnamese used big Russian-built

tanks against a South Vietnamese expeditionary force, now looks like a trial run for this offensive. It may be that the Easter offensive itself is designed as a trial run for a future confrontation in which the regular forces of South Vietnam (without their American allies) and North Vietnam would fight it out in a straight shooting match.

A decisive test of air power

Will that day come ? South Vietnam will be in grave danger if it does. The basic military lesson to be drawn from the fighting over the past week is that American air power is still vital to South Vietnam's defence. The reason why the North Vietnamese were able to cover the 20 miles or so south of the demilitarised zone so fast was that bad weather kept most of the bombers on the ground. Now that the clouds have cleared a little, the communists may find it tougher going as they advance towards Hué and encircle the town of Quang Tri. Their progress from now on is going to answer a lot of questions about the uses of air power in the kind of war that the Vietnam conflict has become. By Thursday the American bombers were in action against North Vietnam itself as well as the advancing tanks in Quang Tri. Some of the men who are hoping for the Democratic nomination in the United States, notably Senator McGovern, would like to take away the planes as well as the American troops. But Senator Humphrey at least has conceded that to take away American air power would be to take away the South Vietnamese army's crutch after taking away its wheelchair.

The patchy and contradictory reports that have filtered in over the past week make it hazardous to speculate about the outcome of the Easter offensive. About a dozen South Vietnamese outposts were said to have fallen by midweek, and North Vietnamese units were advancing towards Hué. There are several possible outcomes of the offensive, ranging from the starry-eyed to the catastrophic :

1. The most optimistic theory is that the counter-thrust that the South Vietnamese hope to deliver, while the Americans rain bombs on the communists, will actually come off, resulting in a precipitous enemy retreat across the border and the spectacle of columns of North Vietnamese prisoners. However alluring, this is probably a mirage.

2. The flash-in-the-pan argument runs that the North Vietnamese will be content to pull back in a week or so after a fairly messy firefight in the north and some diversionary thrusts farther south. This might involve the destruction of a few South Vietnamese units and the temporary occupation of a provincial capital such as Quang Tri, Binh Dinh or Kontum. But it would not be disastrous. It would embarrass Mr Nixon. It would show that the borders are porous and that the communists can throw the Saigon forces off balance. But it would not prove that Vietnamisation had failed.

3. The three-front theory maintains that the communists will back up their offensive in the north with assaults on a similar scale in the central highlands and in Tay Ninh province, in the hope of pinning down the government's mobile reserves and expanding the area under Vietcong control inside the country. There are several North Vietnamese units in Binh Dinh province, which could be used to sever Highway 19—the supply-route between Pleiku in the highlands and the coast. There has also been a marked build-up of communist forces in the Parrot's Beak and Fishhook areas in eastern Cambodia, and last weekend they seized the Lac Long military outpost in Tay Ninh province. The final outcome of this kind of offensive might be the creation of larger base-areas in the highlands and the north that would be a rallying-point for communist sympathisers.

4. The doomsday scenario is that we are watching the start of an all-out attempt to overthrow the Saigon regime at a moment when Mr Nixon's room for manoeuvre is limited not only by his timetable for force reductions but by the American election. This would involve a massive influx of North Vietnamese troops and perhaps even a direct attack on Saigon. It might even confront the Americans with the choice between resignation and escalation. This scenario is probably even less plausible than the most optimistic one. Despite communist propaganda claims (the accuracy of which can be gauged by the fact that the Vietcong still refuse to admit that there are any North Vietnamese units south of the border) the South Vietnamese have not yet suffered any decisive reverses. This may be the moment of truth for the South Vietnamese army, but it is too early to judge what the truth is going to be. Anyway, major communist troop movements outside the more mountainous part of the country are subject to American bombing, and the appearance of the invaders does not appear to have touched off a significant local response.

These possibilities must be considered in the context of the immediate tactical goals of North Vietnam's leaders, as well as the fighting potential of the South Vietnamese army. It may be that the communists are hoping to shatter the morale of President Thieu's generals while reviving the waning spirits of the Vietcong. As the Saigon government has steadily gone on tightening its grip over the countryside, communist supporters have tended to change sides or simply drift away. It is not easy to sustain morale among men who are called on to lead the harried lives of guerrillas over long periods of inaction. The Easter offensive may be intended to reawaken dwindling hopes of a famous victory.

Ready for the Americans to go

The offensive may also be geared to factors external to the conflict in Vietnam. It may be partly meant to put the communists in a stronger bargaining position at the Paris peace talks, or even to give Mr Brezhnev something to wave in Mr Nixon's face when he flies to Moscow next month. The timing may have been influenced by the desire not to embarrass the Chinese during Mr Nixon's Peking visit—although the North Vietnamese have been perfectly happy to embarrass the Chinese by toasting the Russians on several occasions since then. And then there is that biggest prize of all, the fruit at the top of the tree. Always sensitive to the rifts in western public opinion, the men in Hanoi may indeed believe that they can help to bring about the election of an American president pledged to total withdrawal from Vietnam.

The North Vietnamese are counting on that happening one day. They have been building up their own air force and armoured battalions in the hope that one day the South Vietnamese will lose the American bombers. That is why it is important for each man who hopes to be President of the United States next year to consider whether there are not some fairly persuasive reasons why the Americans should continue to wage their war in the air over Indochina. South Vietnam is vulnerable to invasion ; but an invasion makes it clear who is responsible for continuing the war. Since the Tet offensive of 1968 the government has gone a long way towards restoring control over most of the countryside. The Vietcong are a declining force, pushed back into a few sanctuaries of mountain or marsh. In this situation, it is the role of the American air force, so far as it is possible, to help to police the borders, to limit the movement of communist supplies and reinforcements, and to give South Vietnam's forces more time to learn to walk in the Americans' combat boots. No one can promise that this will lead to victory or lasting peace. The Easter offensive shows the magnitude of the threat that remains. But the fact that the communists now have to depend almost exclusively on regular forces brought in from North Vietnam itself shows how much the war has changed.

Another self-inflicted wound

That is what Mr Wilson has allowed the Labour party to inflict on itself on the referendum issue. He must rescue it from its despair

It is often difficult to gauge with real accuracy the mood of a political party during a parliamentary recess, or to predict the atmosphere in which the Commons will reassemble after it. Some MPs find just a few days away from their colleagues does wonders for their equilibrium ; others tend to become more sickened, on reflection, with the whole mess. But the morale of the Labour party has been deteriorating too steadily over recent months, and the Easter recess—just a week and a day—has been too short to leave much doubt about the mood in which many Labour MPs will return to the Commons on Monday : it will be something approaching despair. These are depressing times for sensible moderate Labour men—and they are likely to get worse.

The core of the canker is, of course, the common market issue, but it would be wrong to believe that it is only the pro-marketeers who are affected. There is an increasing number of Labour MPs who would never dream of rebelling against the party line, never mind splitting the party on the market issue, who nevertheless have increasingly solid doubts of the party being able to check the slide towards further incredibility under the present leadership. A distaste for standing on one's head on issue after issue is not incompatible with the belief that the terms for Britain's entry into the EEC are too steep. These worries are not lessened by the knowledge that there is nothing much they themselves can do about the leadership, and they are only increased by the fear that the present emotional tensions inside the party could leave permanent scars more damaging than many of the spectacular public splits of the past.

But that does not mean that the conflict over the common market issue will not erupt into an open split in the Labour party, and perhaps quite soon. The 89 Labour MPs who rebelled against the official, anti-market line last October have choked down a lot of dirt since then rather than risk a breach with the rest of the parliamentary party. All but a handful voted against the second reading of the European Communities Bill, which was in all conscience a vote against the principle of joining Europe ; that was enough for a few

more, who refused to vote against the ways and means resolution in the bill. Very soon after they return on Monday, the rest of the marketeers are going to have to decide whether they can take another great gulp and swallow their objections on principle to referendums as a system of government.

The question of a referendum on the common market is a squalid little episode. The demand for one was rejected by the party's annual conference last autumn, but Mr Wedgwood Benn, this year's party chairman, regarded it as his good deed for the year to keep the issue alive. He tried to get the shadow cabinet to support such an amendment to the European Communities Bill last month, but he was rebuffed ; Mr Wilson being consistent in his opposition to the principle. Encouraged, however, by M. Pompidou's decision to exercise his rights under the gaullist constitution and have a referendum in France, Mr Benn asked the next meeting of Labour's national executive committee to back him, which it did by 13 votes to 11, Messrs Wilson, Jenkins and Callaghan being absent. On the Wednesday before Easter the question came back to the shadow cabinet when the country's attention was focused on Mr Heath's decision to impose direct rule in Ulster, and the shadow cabinet, with Mr Jenkins and a minority vigorously dissenting, stood on its head and decided to reverse its earlier decision. After all, said Mr Wilson, knowing and leading the way, they would only be anticipating the decision of the next annual conference by a few months.

Humiliating Jenkins

For all Mr Benn's enthusiasm for anything which looks participatory, the referendum issue is a phoney cause, however much an opinion poll finds a popular majority for one, or a plebiscite might be necessary in the exceptional situation of Ulster to take the border out of communal politics. It is just another excuse for the left and others to make the marketeers eat more dirt. There were two amendments to the Government's Europe bill on the Commons order paper when the shadow cabinet took its decision. The first, in the names of Mr Foot, Mr Shore and Mr Peart, calls for a general election before the act is put into force ; the second, put down by a group of Tory anti-marketeers, calls for "a consultative referendum, having no binding effect upon the Government." Neither are worth serious consideration. The Labour party could not, and knows it, fight a general election on the common market issue, for at least half of any prospective Labour prime minister's cabinet would be composed of ministers in favour of joining Europe. And the Tory anti-marketeers for their part are merely asking the Government to run an opinion poll, the result of which they would expect Mr Heath to accept if the majority was against Europe, but which —as they have shown by their activities since the Commons voted by a majority of 112 in favour of joining the EEC—they themselves would flatly refuse to accept if the poll went the other way.

There is some slight chance that the parliamentary Labour party will decline to follow the shadow cabinet's last decision and support a referendum. But if, as seems more likely, it does not, the marketeers are back to another agonising decision. It must be reported that one aspect of the Labour party's present trouble is that even the Jenkinsites are in no great shape themselves. Mr Jenkins does not lack for supporters who would like to see him make a stand for integrity, resign the deputy leadership and vote his and their consciences every time on the market issue. That is also precisely what the left would like to see happen, yet the idea must have its attractions. The left is arrogant in its anti-market majority and is not greatly concerned with anything but intra-party victories over the Jenkinsites (it has just robbed the party of its best possible successor to Sir Harry Nicholas as general secretary because Mr Gwyn Morgan was a pro-European and identified with Mr Jenkins). It is going to go on trying to humiliate Mr Jenkins in particular, and there is a danger that he may finally decide he has had enough of it and will resign, as so often happens, on a relatively minor issue. So, the argument runs, he should go now on an identifiable issue of principle before his credibility, too, runs out.

Against that he has equally dedicated supporters urging him to play it long ; that they will guarantee him enough kamikazes on any given vote to ensure the European legislation is not lost, even with the Ulster Unionist MPs being as maverick as they think fit. Of course, some such Jenkinsites recognise the dangers, not least of which is the possibility, which is hardening into probability, that the annual conference will try to commit a future Labour government to withdraw from the EEC. If the parliamentary party endorsed such a decision Mr Jenkins's position as deputy leader would become untenable, but in the meantime they are urging him to sit tight and wait and see. Because of this division among his supporters, it would be wise to be sceptical of any reports of what Mr Jenkins believes or intends to do until he actually says it or does it himself. For in a curious way both sides can argue that whatever he does would be proof that he has the stomach for political leadership.

The showdown to come

If the Labour party is sensible it, too, will wait and see for a bit longer before it puts Mr Jenkins and his colleagues to another test. For it may well find that the real showdown which will be necessary in the coming months will not be between the Jenkinsites and the left, but between the majority of the parliamentary Labour party and Mr Wilson over his conduct of the leadership. By allowing the Labour party to get into such a mess over the referendum, Mr Wilson has allowed it to inflict yet another wound both on itself and on his own leadership. He cannot afford many more, and neither can the party. If Labour MPs decide to support the demand for a referendum, Mr Wilson should insist upon them having either a free vote or a two-line whip when the issue comes before the Commons. Either would be a double guarantee that any such amendment to the Europe bill would be defeated, but it would at least allow them all to live to fight each other another day.

A term to violence

Liberal opinion has gone wrong in not stressing the total disreputability of even mild intimidation and flouting of the rule of law. Now a serious and world wide crisis could be on us

While the environment became the fashionable issue of the 1960s it is probable that the problem that will cause most intellectual excitement and popular dismay in the 1970s is that of violence by minorities. Its importance is not only underlined by the awfulnesses over Easter in Turkey, Argentina and Andersonstown. The vital point is that weapons of quite mass destruction, whether chemical or explosive, are going to grow much cheaper in the next 15 years, to the extent where they will probably be deployable by fairly small criminal or psychopathic (cum-bogusly-political) groups. The great governments of the world already do not know how to react, except too often by surrender, to blackmailing threats to kill a single hostage, to blow up a single aircraft, or even to interrupt a cricket match. Heaven knows how they will react to blackmailing threats that large segments of some city's population will be suddenly killed unless the group making the demands is put entirely above the law. But the way that things are now going suggests that some such threats are eventually likely.

There will be a peculiar organisational difficulty in getting people to think intelligently about this in time. The lobbyists for the brand new issue of the environment in the 1960s speedily gained ground because they were lucky enough to appeal at once to the most demonstrative of right-wing Tory romantics (who like clean air and water) as well as the most demonstrative of left-wing intellectuals (who enjoy blaming pollution on capitalism) and the trendy people in between who just enjoy being demonstrative. This was a super-mass-constituency to organise as a political pressure group in a good cause. But the issue of violence by minorities will not be one where this particular constituency will be readily recruitable, because a lot of the blame for what has happened rests precisely on themselves. It is important to think out calmly now how and why we have reached the present intimidated mess.

When demos seemed darling

The root mistake was that in the late 1950s and early 1960s conventional opinion began to regard the street demo as respectable again, although the experience with Mussolini and Hitler and Mosley and others in the 1920s and 1930s had shown that in a modern society it is not. Basically, the demo is almost always anti-democratic. It tries to replace judgment based on reasoned argument (which is what democracy has to be about) by judgments bullied by at least some degree of yelled intimidation, generally and enjoyably exerted by a minority of the young and physically strong under manipulation by a minority of the politically flamboyant and ambitious. In retrospect, the reason why these demos came back into post-fascist fashion in the late 1950s was that for a period they seemed to be harmless fun, and then in the early 1960s there was an even briefer period when they appeared beautiful.

The fun period of the demo in Britain was marked by the annual Easter marches of nuclear-disarmers to Aldermaston, on which the parsons and pacifists and Frank Cousinses strode ahead of the semi-idealistic young hikers who enjoyed some emotional togetherness and even a bit of mild sex on the way. The tiny band that straggled to Aldermaston last weekend, with the rather desperate additional bait of a free pop concert at journey's end, will be indignant to be told that their predecessors were the spiritual fathers of the brutal murders of three British technicians by Turkish political bandits last week ; but social historians will recognise that that is what they unintentionally and in some small part were. A much bigger thing that went wrong next is more embarrassing to talk about, because far more of us initially applauded it than ever marched to Aldermaston.

The long-overdue victory in the battle for civil rights in the southern United States in the early 1960s was largely won through sit-ins and other demonstrations against local authorities who were not obeying federal law. Almost all the world approved of these sit-ins, and a very evanescent period of regarding demonstrators as probably beautiful people began. Outside Britain and France the same applause was aroused in the late 1950s and early 1960s by the civil disobedience that accompanied the overdue death of British and French colonialism. But the next stage should then have been foreseen.

Terrorising the majority

By the middle 1960s the non-communist and now ex-colonialist world had almost (though not quite—eg, South Africa, Londonderry) reached universal rule of all cohesive groups by the ballot-box. It had thus largely run out of causes where violence could be excused as a means of seeking changes desired by the majority of the population concerned. But the organisation of mild mob thuggery was still regarded by some as fun, by others as almost liberal, and by too many as a recipe for personal fame though not yet (usually) fortune. The second half of the 1960s therefore saw the outbreak of some mob violence directed towards seeking changes that the majority of people in the communities affected most certainly did not want. Contrary to the hopes of a very few and to the serious fears of even fewer, there was never any prospect that this would lead on to revolution. Instead, the mob part of this violence soon produced its automatic antidote in swinging to the right electorates that had been discommoded ; this happened in the French elections after the events of May, 1968, and even (contrary

to rather more forecasts) in Uruguay after the Tupamaros. But now the third stage of conventional opinion's strange post-1955 flirtation with the tolerance of violence is upon us.

In this third stage, mob violence is out of fashion even in most universities, but there is still majority popular (and liberal) support for yielding to blackmail if the threats are annoying or blood-curdling enough, and if the immediate price of buying off these threats does not greatly affect the community at large. This is a very dangerous stage: both for the future when weapons of greater destructive power will come into blackmailers' hands, and in terms of its immediate results. Some other part of the blame for the murder of three British technicians in Turkey last week lies on the heads of those who counselled that Miss Leila Khaled should be released from Ealing police station when Arab terrorists seized three passenger aircraft two years ago. This is past history. More important, two other decisions of the same kind now lie before Britain, each of a sort where some people will consider it more convenient to look the other way.

Ulster and Emperor Jones

In Ulster, the struggle until last week was to some extent a confused one of the pre-1965 sort. A majority of the Catholic population—although not of the total population—probably did feel that the terrorist gunmen were fighting for things which they desired. Since last week's initiative, it is very probable that a majority of that population prefers parleying for peace to a continuation of the gunfire, at least for the moment. This could therefore be the moment for declaring some sort of amnesty for terrorist acts committed to date, but with a clear statement that, whatever the eventual political settlement, there will be no amnesty for anybody who is accessory to any terrorist act from now on. Instead, the present inclination in Britain seems to be to prefer not to say anything so definite, and thus not to "spoil things" just when appeasement is being tried.

Nearer home, on the mainland of the United Kingdom, a majority of the British people in February became more willing to approve an inflationary settlement of the miners' strike because some violence and intimidation were making it more inconveniently effective. It was a predictable short step from this surrender to the present situation where the biggest British trade union—with disgraceful support from the Trades Union Congress—has defied a court order to stop an illegal act and declined even to tell the court why.

There has to be a term to this. The experience of the past 15 years has shown that there is a steady gradation from any glorification of the over-dramatic in protest, up through any flouting of the law for propagandist or intimidatory purposes, to murders of the totally innocent in Montreal and Kizildere and Belfast. The right prescription for policy in the 1970s has to be a shift of attitude by responsible people at each of these steps.

Three stages for action

At the stage where there is no transgression of the law, that shift must be purely voluntary. Those who enjoy passionate demonstrations of protest to show the world their grievances—whether by demo or token strike or any other form of group togetherness—should be asked to weigh the advantages that they think the world will gain from their indulging in this form of enjoyment, against the evidence that the main real consequence is to give society another imperceptible shove along the road at the end of which half-a-dozen Turkish psychopaths can say they consider it their "basic right and a debt of honour to execute their hostages." This trend needs to be reinforced by the electorate giving more respect to politicians who recognise that democracy is a matter for the ballot box and reasoned argument in the council chamber, much less respect to those who think she is a whore to be picked up on the streets or at Clydeside sit-ins or on picket lines or in fascist-style rallies anywhere.

The next shift in policy will be required at the stage where there is minor transgression of the law for propagandist or intimidatory purposes: such as obstruction of the highways, refusals by local councillors or trade union leaders or other dignitaries to obey the law, illegal picketing, rent strikes. The need here in the 1970s will be for authority to enforce the law more firmly, which does not mean more hysterically or dramatically.

The last and most difficult stage comes when government is confronted by those who say they will kill innocent people unless their demands are met. The answer here has to be total resistance. This is not to say that the answer must be more bloodthirsty punishment; often the people who commit these horrors are more in need of psychiatric than penal treatment—and certainly executions, either before or after formal capture, may make them martyrs in the eyes of romantics who like to say they agree with their ultimate objectives. But the absolute need is that no individual who indulges in terrorist blackmail will be rewarded for his act. A terrorist does not merely gain personal reward if his demands are met, but also if he is allowed to escape to adulation in some foreign terrorist den, in return for having kindly agreed not to kill somebody temporarily in his power. It is this sort of even partial success that breeds imitation. And the prospect at the end of that imitators' road is now very frightening indeed.

The next 40 years

Because of widespread interest, the survey "The Future of International Business," which appeared in *The Economist* of January 22nd, is being republished as a 48-page booklet in April.

In the survey Norman Macrae, the deputy editor of *The Economist*, has tried to turn himself into a futurologist.

He has interviewed experts whose past achievements and present opinions he most respects and analysed the likely future role of multinational corporations, environmental pressures and technological progress.

He has forced himself to make the best forecast he can of a logical course for international trends and organisation in 1972-2012 and especially 1972-1992. He has come up with some highly unconventional views.

A time for papal doubt

Pope Paul may now be having second thoughts about his own brand of Ostpolitik

Perhaps it was a pity that Cardinal Conway's dressing down of the IRA hogged so many of the Easter headlines, when his own leader in Rome was doing something that should have made more people sit up and take notice. What Pope Paul did on Sunday was to slip into his Easter message a few words of encouragement for the "church of silence." This phrase was often used by his predecessors to describe the Roman Catholic church in communist countries, but it had not been heard from the Vatican for a long time. He must have known that it would jar in many communist ears, not least in Italy. Why did he decide to use it now ?

He may have simply felt that he must make some gesture towards the 17,000 Lithuanian Catholics in the Soviet Union, who had just complained both to Mr Brezhnev and to the United Nations secretary-general about their lack of religious freedom. But if Sunday's gesture proves to be a signal that the Vatican is having second thoughts about its present policy of rapprochement with the communist governments, there will be relief among those Catholics who have been unhappy about the possible long-term effects of the papal Ostpolitik. Nobody questions the Vatican's right to try to come to terms with any government that rules over a sizeable number of Catholics. It is not the principle of negotiation that has aroused doubts in some people's minds ; it is the profit and loss account.

Some of the Pope's critics make no bones about it : they think he may be giving away a lot to communist governments without getting much in return. Some of those critics were pained when, just a few days ago, he had a friendly chat with representatives of the Rumanian Orthodox church, which in 1948 swallowed up, with the full support of the communist state, 1½m eastern-rite Catholics. Then there is the evident anger of Cardinal Slipyj (now living in the west after many years in Soviet concentration camps) at the fact that he is apparently not going to be allowed to organise the Ukrainians who live in the west into a separate patriarchate, because the Vatican knows that the Soviet government opposes anything that might encourage the spirit of Ukrainian nationalism. And many Ukrainians are upset because the Vatican made no protest when the new Russian Orthodox patriarch recently described Stalin's destruction of eastern-rite Catholicism in Russia in 1948 as one of the great events in the history of the Russian Orthodox church.

The complaints of old men like Cardinal Slipyj (and Cardinal Mindszenty, who still resents the way he was whisked out of Budapest last year without a word of apology for his long confinement by the Hungarian government) hardly prove that the Vatican should not be negotiating with the communists. Pius XII's rigid anti-communism would be completely out of place today, when even President Nixon can travel to both Moscow and Peking. But the critics' case against the present papal Ostpolitik is that it may prove to be a mixture of illusions and muddled thinking that one would not expect from the world's oldest diplomatic service.

The Vatican can claim that the Belgrade protocol of 1966 gave the Roman Catholic church in Jugoslavia a measure of genuine freedom. But in those parts of eastern Europe that are under Soviet control the policy of negotiation has had meagre results. After several years of tentative talks with the Czechoslovak government, the Catholic church's position in Czechoslovakia is now worse than it was under President Novotny. In Hungary there has been no noticeable improvement since Cardinal Mindszenty's departure last year. In Poland there has been a real improvement since Mr Gierek took over in December, 1970, but even this may prove to be only a temporary gain. In Russia there has been no improvement of the Catholics' lot, and no sign that the government will let the forcibly "orthodoxed" Catholics return to their Roman allegiance.

Even in relatively liberal Jugoslavia there is still no full equality for Christians in public life, where they seem to be tolerated but not officially recognised. If present trends in the communist world continue, the Christian can have little hope of finding any genuine pluralism in eastern Europe. But there can be little doubt that the Vatican's policy of negotiating with the communist regimes, and of relaxing its ban on Catholics joining communist parties in the west, has helped the communists both by giving them a new respectability in the west and by strengthening their regimes in the east.

It was a good idea 10 years ago

Some people in the Vatican would still argue that the internal evolution of the communist world will eventually justify these policies and that, in retrospect, writing off the eastern-rite Catholics in Russia against the promise of concessions in other parts of eastern Europe will not prove such a bad bargain after all. This calculation seems, unfortunately, to be founded on the hope of the early 1960s, when the communist world showed signs of moving in the direction of genuine liberalisation. Today that hope looks increasingly sanguine. It is easy to understand why politicians in countries where communist parties are strong want to develop friendly relations with the Soviet Union. They want to buy some domestic peace. Some of those political calculations seem to have seeped through to the monsignori who make the papal foreign policies. As for the Pope himself, the explanation may be very simple. He may have seen his Ostpolitik as a way of lessening the tensions within his church that have arisen from his reluctance to grant concessions on controversial matters such as birth control and celibacy.

BRITAIN

Whitelaw gives them the chance to calm down

On balance, Mr Willie Whitelaw's task in Ulster has probably been made slightly easier by the publication on Thursday of Mr Justice Scarman's inquiry into the riots in Belfast and Londonderry in July and August, 1969. Both communities will dispute some of the findings, but blame and praise are allocated too judiciously and gently to cause great excitement. The judge found that the police had made mistakes, particularly in using machine guns in Belfast, the B specials should not have been used and the army should have been called in earlier. But there was no anti-Catholic conspiracy by the police and no concerted Catholic attempt at insurrection. As Mr Whitelaw said, the inquiry has destroyed myths on both sides. Unfortunately, myths are usually the last things the extremists on either side in Ulster want to see destroyed.

Mr Whitelaw very wisely spent his first few days as Northern Ireland's first Secretary of State in the province itself. In the parlance of his favourite sport, he teed off rather well. He allowed the Republicans to hold their traditional—and technically illegal—Easter parades without interference from the security forces, and although it did not endear him to the Protestant extremists it was the sensible thing to do. The separate marches of the Provisional and Official wings of the IRA passed off without incident, and it was possible to believe it might be the beginning—no more than that—of some signs that many in the Catholic community would positively welcome an end to violence.

When Mr Whitelaw moved into Stormont castle after spending Easter with the army and the police the ranks of the Protestant majority also seemed rather less solid than they were a week ago. Not all Mr Faulkner's old cabinet colleagues are going to boycott Mr Whitelaw's administration. Moderates like Mr Roy Bradford and Mr Robin Bailie look as though they will give the Secretary of State the benefit of their departmental expertise on economic and development policy, while the prospect of a real working alliance between Mr Faulkner and Mr Craig seems less likely than ever. The former Ulster prime minister has rejected both violence and civil disobedience as tenable policies for the Unionists to follow, while Mr Craig's Vanguard movement still threatens to disrupt the province with a rent and rate strike and sporadic walkouts in industry. Mr Craig continues to talk wildly about Ulster declaring UDI, which will not get any support at all from Mr Faulkner and his old cabinet, except possibly from Mr John Taylor. Most Unionists are more likely to respond to the Rev. Ian Paisley's call for complete integration of Ulster into the United Kingdom.

Undisturbed, the IRA march in Belfast on Easter Sunday

But peace in Ulster is still a long way off. Both the Provisional and Official wings of the IRA have so far refused to call a truce, and the Catholic working class in both Belfast and Londonderry is not really in a mood to throw over the gunmen and bombers in its midst. It is true that a few brave women in Andersonstown, a Belfast Provisional stronghold, have begun to show their resentment against the Dublin-based leaders' orders to carry on with urban terrorism, and they got plenty of publicity for their cause when determined women IRA supporters broke up one of their meetings. The Provisional army chief, Mr Sean MacStiofain, was cheered by the crowd in the Bogside last Sunday when he shouted : "Concessions be damned, we want freedom." Nevertheless there are many politicians and priests in the north who claim that the war-weary Catholics are longing for peace. Leaders of the Social Democratic and Labour party have condemned both wings of the IRA for their decision to continue with violence, and so has Cardinal Conway, the primate of all-Ireland.

Most Catholics acknowledge that the 15,000 soldiers have been adopting softer tactics in their areas since the announcement of direct rule. House searches are fewer, and there has been a noticeable reduction in the number of street patrols. But so far the violence in Ulster is still running at an unacceptably high level. The army records show that in the first 10 days since the announcement of direct rule there were 53 bomb explosions, 106 shooting incidents, 7 dead and 87 injured.

Land

At any price

Normally, a developer whose application to build houses on a particular site has been rejected by the planning authority has about a one in six chance that the decision will be reversed if he appeals to the minister. Just now 50 per cent of housing appeals are being allowed. That is one measure of the Government's anxiety at the ever-galloping inflation in land and housing prices. In a radio interview last Sunday Mr Graham Page, Minister for Local Government and Development, assured developers who had been refused planning permission in any of the areas of south-east England scheduled for growth that Whitehall would look kindly upon them. He also urged local authorities to release their own land stocks for house building and listed, among the ideas being considered by the Government, a "Domesday book" of land owned by public bodies.

This reaction is in accord with British political tradition. Whenever land prices for housebuilding are soaring, Conservative governments tend to blame narrow-minded local authorities, and Labour governments to blame greedy private speculators. There is an element of truth in both explanations, but neither can really be held responsible for the sort of increases seen in 1971-72. Builders say that the price of housing sites in south-east England has doubled in the past year, so that they now often have to pay over £40,000 an acre. For sites on the edges of other population centres up and down the country, and in counties like Wiltshire recently opened up by motorways, price rises have also been voracious. Why ?

Page : give them land

Land prices always follow house prices, and house prices have been rising at an annual rate of about 20 per cent for over a year, led by the secondhand market. This is a direct result of the huge increase in funds flowing into building societies following government measures to ease money supply. Some of the extra money, in the hands of institutional investors, is also now going directly into land, and is a contributory cause of the shortage of sites in the hands of builders. Big builders are usually public companies : they normally carry only about three years' supply of land, but small private firms often avoid tax with land stocks to meet their needs for up to 10 years. Much of this land was offloaded during the 1969-70 credit squeeze, so that some of the same firms are now having to scramble for new stocks. There is likely to be some profit-taking by the pure speculators in the coming months, but it will not make a vast difference to the general supply.

Local authorities in the home counties retort to Mr Page that they have been granting planning permissions at an unprecedented rate in the past two years, and some trot out figures alleging that builders have plenty to be getting on with for at least the next four or five years. These latter figures are misleading. Some planning permissions are granted to owners who are merely after an increased capital value of their land, or (even in the crowded south-east) are in places people don't want to go. Permission is often being refused in, say, areas of Kent which the county council considers overfull of commuters already. Land approved for housing development in a scheduled growth area like south Hampshire will last only to 1977-78 at current building rates, and the local authorities say that more cannot be scheduled until some major sewage works are complete. In the north-east of the county, around Aldershot, part of the problem is army occupation. Action awaits the outcome of the Nugent committee on defence lands.

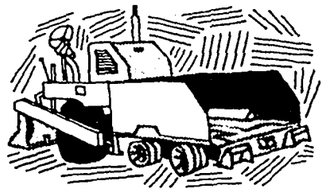
Some planning authorities do now pretend to be operating a more open-door policy—and have indicated where big development will be allowed in future, within the very broad limits of the official "Strategy for the South-East"—but have created massive frustration among builders (and encouraged interim speculation by investors) by not simultaneously speeding up their machinery of development control. Options are quickly bought up in areas like the Reading-Wokingham strip, which Berkshire has said will be given the go-ahead for housing ; but no planning permissions can be given while the usual proceedings of local consultation and precise boundary-drawing go on.

There will always be problems of land assembly and land prices in such areas. The Government is not merely looking at Conservative ways of speeding large-scale development. Mr Page clearly hopes that local authorities will use their compulsory purchase powers to fill the gap left by the Government's abolition of the Land Commission and buy up key sites within larger building areas. A working party is examining ways of promoting joint public and private housing development in the south-east. A kind of regional new town authority has been mooted; it will be unlikely to work properly unless, like the new towns, it can deal with industry and infrastructure as well as housing. If Mr Page wants to revive dormant planning permissions, his Domesday book will really have to extend to all land held by private owners too—whether they be ordinary owners, institutional investors, speculators or builders with idle sites. How keen would builders and speculators be on that idea ?

Birth control

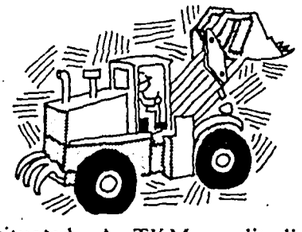
The establishment chimes in

A working party set up by the Royal College of Obstetricians and Gynaecologists, though by no means composed exclusively of gynaecologists or even doctors, has now added its voice to the view that a fully comprehensive contraceptive service should be available within the national health service. Its report* will be presented as evidence to the Lane committee on the working of the Abortion Act, but it had been deliberating for some time before that committee was set up and it is at least as much concerned with unplanned pregnancy as with disposing of one. In other words, its report is not merely the gynaecological establishment's defence of the restrictive attitude to abortion shown by so many members of the profession. It does try to answer the question why, now that information about contraception is more readily available, more and more women—and girls—are relying on abortion.



*Unplanned Pregnancy. £1.

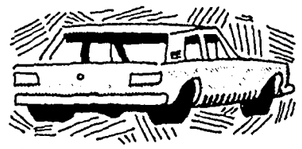
Exporters and importers who think big...



With good reason. For TKM is the world's largest specialist in the providing of short and extended term credit for the international movement of goods. Established for more than a century, TKM now has a turnover in excess of £330 million. It is a truly international organisation with 22 offices in fifteen countries and works closely with more than a hundred banks throughout the world.

Once an order is confirmed by TKM the supplier is assured immediate cash payment. No need for credit insurance or time-consuming credit control

procedures. The receipt of cash payment closes the transaction and immediately frees more capital for more profitable use.



TKM acts for the importer in whatever country he may be

situated. A TKM credit line increases the working capital of the importer without in any way influencing the financial control of the company. Normally, no security is required other than accepted Bills of Exchange, and no cost is incurred until the TKM credit is actually utilised.

TKM can assist clients in locating new sources of supply in the major manufacturing centres of the world, and has frequently introduced manufacturers to new distributors in those markets where they are not already represented.

If you have a problem involving the financing of goods – whether as buyer or seller – contact TKM now. The Company's extensive experience of international finance and trade is at your disposal.

A booklet describing the many services offered by the TKM Group will be gladly sent to you on request.

TKM 1

Unfortunately, its answer does not really get us any further. It mentions the dicing that goes on among the young, also manifest incidentally in aspirin swallowing and other suicide attempts and in motorcycling. A "morning after" pill, if an effective one is developed, would clearly be helpful in these risk-taking cases. But such a solution only emphasises, as the report does throughout, that research into all aspects of unplanned pregnancy is badly needed. So, too, is education, and in this context it is deplorable that the working party got no response at all from the Incorporated Association of Headmasters, to which a copy of its study plan was sent with a request for information.

The most far-reaching recommendation made by the working party is that there should be some form of arbitration when a woman is refused an abortion so that she does not have to shop around till she finds a surgeon willing to give her one. Any procedure that would lead to more uniformity in abortion practice should be welcome, but the working party's proposal (which it does not spell out) would seem to be too full of difficulties to be acceptable.

Teachers

Easter parade

For her sins, Mrs Thatcher has had to spend the week on the traditional post-Easter round of teachers' conferences. The worst came first, on Tuesday: a speech in Blackpool to the National Union of Teachers, by far the largest, the most industrious but also the silliest union, which has never expressed much love for the Secretary of State. True to form, a platoon of young NUT members staged a most unspontaneous walkout when she got up to speak; they had earlier criticised the executive for inviting her. The rest of the conference then pulled itself together and gave her a standing ovation; after all, the annual ministerial visit gives the conference some good publicity, and Mrs Thatcher played ball nicely by using the occasion for two modestly important announcements. The depressing report on reading standards from the National Foundation for Educational Research has, unsurprisingly, inspired her to set up a committee to investigate teaching methods; and Mrs Thatcher also announced a generous 15 per cent increase in cost limits for school building (which will however do nothing to appease those

Britton: multi-campaigner

local education authorities with such restricted secondary school building programmes).

After this interlude, the union returned to its perennial conference battle between left and right. The union has just elected a communist intellectual, Mr Max Morris, as its president. But such are the intricacies of the union's electoral mysteries that he is in fact the next but one; this year's new president, Mr Harry Allison, is a retiring teacher with plans for ordination in the Church of England, and Mr Morris's runner-up, who automatically becomes president after him in 1974, is also a more conservative figure. And it is the general secretary, Mr Edward Britton, who has the more important job.

It is not an easy one at present; the NUT, losing members, has a constant battle to avert splits and defections to a multiplicity of smaller unions. The most important of these, the National Association of Schoolmasters, had its share of Mrs Thatcher at its conference in Southport on Thursday night. The NAS is far more single-minded than the NUT. Mr Britton's executive, for example, is at present engaged on a campaign for more nursery education (a theme adopted with great enthusiasm by Labour's education spokesman, Mr Edward Short, in a speech to the Guild for Teachers of Backward Children on Tuesday), and another on class sizes. At its conference it had to reiterate its dislike of the James report on teacher education, stave off a motion from the floor in support of the Transport and General Workers' Union and push through a compromise rejecting registration under the Industrial Relations Act for the time being. But the NAS, while mounting a complicated little campaign on teachers' pensions, is concentrating its energies on classroom violence and the problems its members will face when the school leaving age goes up in the autumn. The NUT has found itself uncomfortably on the defensive on this one, but with a majority of its members in primary schools it can afford to play down the issue. And it is probably responsible—though rather holier-than-thou—to do so.

As Mrs Thatcher sensibly told the NAS on Thursday, the first thing to do is to find out if there is a really widespread problem: she now proposes to start up discussions with local education authorities and teachers' organisations. That should produce something more informative than the present crossfire between the NUT and the NAS. They will meanwhile have something else to quarrel about afresh, with the appointment of an inquiry (headed by Lord Pearson, for the second year running) after the breakdown in the Burnham pay talks.

Census

Gross results

Last April, Mr Jeremy Thorpe, with some of his old and most of his young Liberals at his heels, was in full cry after the compilers of the census forms which were arriving in every household. Come census day, there were a few complaints of illegal disclosure of information on census forms, and later there were about four times as many prosecutions for failure to fill in the form correctly as after the previous census. But a year later, the results are working their way into enormous published volumes, largely unremarked and certainly unopposed.

The first to appear was a simple national analysis of population, followed by the preliminary county reports. These were based on an "advanced analysis" for which bits of the census returns were transferred by the enumerators on to "machine-readable" documents. There have been about a dozen of these county reports published; the Office of Population Censuses and Surveys (the new and clumsy name for the General Register Office) starts with nice easy counties like Dorset and works up to the formidable density of Greater London. Within two months, national tables

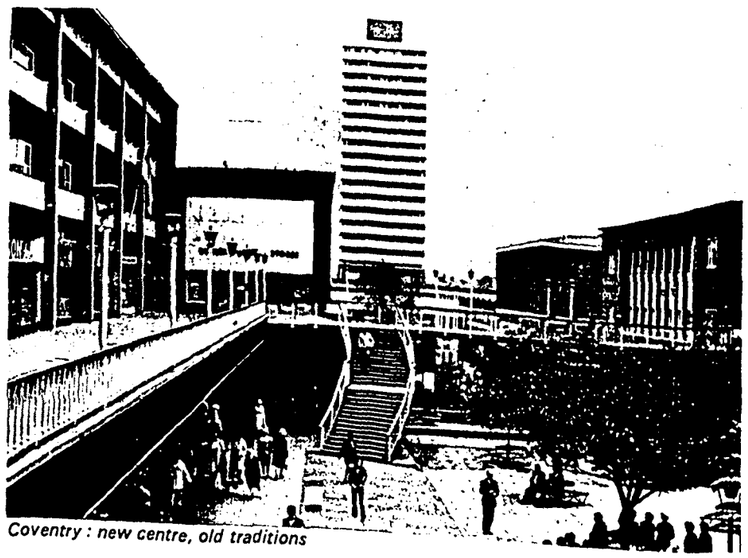
based on these should appear. At much the same time the full county results should begin to come thumping out.

If that were not confusing enough, in the summer there will appear a national analysis based on 1 per cent of the census returns, but containing rather more information on, for example, housing, industry and occupations than the advanced analysis. Why is this necessary ? Well, it was carried out in 1951 because the full results took such a long time to appear. It was dropped in 1961 because that was the first time that a computer was used and, in their innocence, the statisticians supposed that that would make everything so much quicker. This time, they were taking no chances ; but they are in fact already about a year ahead of the 1961 schedule with the full results. In the late 1960s, the results of the 1966 sample census kept bursting into print before all the tables on the 1961 returns had appeared. Anyone who could sort their way through that confusion deserves the Thorpe medal for the invasion of statisticians' privacy.

Coventry

The common touch

Labour used to look on Coventry as one of its impregnable strongholds. The party dominated the Council House for an uninterrupted 30 years from 1937 until 1967. Then, local voters expressed their resentment at Labour's national performance by putting the Tories—who won 12 of the city's 18 wards—back in office. Labour's old guard, who had ruled the city with a firm left-of-centre discipline, were swept off the aldermanic bench. But now it looks quite likely that Labour will romp home in the May elections under its new leader, Councillor George Park, an engineering union shop steward at Chrysler's Ryton assembly plant. The Tories are hanging on to power because they hold 16 aldermanic seats to Labour's 2. But among the elected councillors, Labour already outnumbers its opponents by 28 to 26.



Coventry has a taste for city boss politics, and the Tories have kept up that tradition during their five years of power. Alderman Gilbert Richards, a local solicitor, has led them since 1955 with a genial authority. He presides over a policy executive committee of the council, one of Labour's more valuable legacies, which is made up of the main committee chairmen, who meet regularly to formulate and direct council business. The Tories have done much to streamline the administration in the cause of efficiency. Its committees have been reduced from 23 to 15, and the town clerk has been transformed into a chief executive officer.

All the same, the Tories have often remained content to accept Labour's inheritance. They back up the city's development programme with their own costed capital works schemes. The direct works department was closed down, not because of party dogma but because it was losing money heavily, but no attempt has been made to sell off the freehold of the vast amount of inner city land acquired after the war. Coventry's 10 municipal cafés still go on making a healthy profit.

At the moment both parties share common ground in their concern to champion Coventry's need for new jobs. Its unemployment rate now stands at 4.2 per cent. The Tories intend to spend £250,000 to ease the problem and they have been allowed to bring forward by a year their construction plans for a new fire station and sports centre. The parties are also united in their support for Coventry's inclusion in the sprawling West Midlands metropolitan authority, even though the city is going to have only 12 out of the 104 places on the top tier council and it is going to be one of the authority's seven district councils. But both the Tories and Labour prefer that to the Maud commission's suggestion that they should go in with Warwickshire.

None the less, Labour has found enough battles to fight on the council in recent years to show Coventry is not ruled by an amiable bipartisanship There was much Labour anguish at the Tory decision to sell off leaseholds on land acquired by the council to private developers for housebuilding. And the political temperature rose last year when the Tories decided to stop building any more council houses except for the elderly and physically handicapped. Labour gave no thanks to its opponents for the £1m surplus on the housing revenue account which the Tories claim has resulted from falling interest rates. Nor did it succeed in its attempt to gain a three weeks' rent-free period for Coventry's 27,000 council tenants in February. Instead, much of the surplus is going into a general amenities fund which should help to clean up council estates.

The fact that the Tories have not won support from Labour for a reduction in the household rate this year by 1p in the pound might help to hold back the the pro-Labour swing in May. But Labour has been trying to convince the city's tenants of what it regards as the iniquities of the fair rent proposals. Councillor Park led his party out of the council chamber recently when the Tories brought in the Government's rebate scheme ahead of schedule. Labour assertions that the Tories have been bartering away Coventry's heritage cannot, however, disguise the essential continuity of government in a city whose successful postwar reconstruction after the 1940-41 blitz was the joint effort of both parties on the council.

Theatre Brief

Rep keeps on playing

In a burst of civic pride, both Birmingham and Sheffield opened magnificent new repertory theatres last autumn at a cost of £1m apiece. The price may have broken records, but the idea was far from new. In the past decade 21 theatres have been thrown up, usually funded by eager local councils with help from the Arts Council, and six more are scheduled to open during the next two years; all this at a time when television was supposed to have tolled the death knell to theatre-going in provincial towns long ago.

What is more, what goes on at some of the 50 reps in the country certainly belies the old saying: "When is a rep not a rep? Answer: when it's a success." There are, of course, still some old-style companies churning out a diet of drawing room comedies and protesting that their audience will accept nothing more daring. But the immense success of the new wave of reps can be measured not only in terms of enthusiastic audiences and many successful transfers to London's West End, but also in the amount of exciting new and experimental work some of them are doing which no commercial management could risk touching.

True, the pattern of theatregoing has vastly changed since after the last war. Then the rep movement was far from widespread but touring commercial theatre held sway. Moss Empires owned 36 of the 130 provincial commercial theatres operating before the war. Now it has only five left, the rest having become bingo halls or cinemas or been pulled down or palmed off to an unwelcoming city corporation. The commercial touring companies, which before the war numbered over 40, can now be counted on the fingers of one hand.

Sheffield's pride

Today the provincial theatres consist of (a) the few large touring theatres which, with seating capacity for 1,800-2,500 and large stages, can take big opera productions, pantomimes and occasional tours from national theatre companies, and (b) the smaller touring theatres for plays and often ballet. Then there are (c) the growing small-scale experimental theatres housed in anything from university buildings to pubs. And (d) there are the reps whose flowering derives not only from local money and enthusiasm, but also from steadily increasing subsidies from the Arts Council, which in the past year spent just under £1.5m in grants to the companies.

The big money

The Arts Council's biggest grants—last year around the £70,000 bracket—go to those reps like Birmingham, Nottingham and Sheffield which are considered to serve a wide region rather than just the local area. Ideally, the grant should relate to the size of the theatre and its catchment area and to the extent of local demand. As the council's policy is to respond to local initiative rather than dictate policy, its powers are limited and the subsidy is by no means evenly distributed over the population: a recent report by the North West Arts Association on theatre in Manchester grumbled that the Greater Manchester area, with a population of 2.77m, received only 2.14p per person from the Arts Council in theatre subsidy, whereas Nottingham had 24.88p.

Nor are the theatres evenly spaced geographically. The Midlands has a wealth of reps and with the new motorways their catchment areas have widened enormously. Leicester, Stoke-on-Trent, Coventry, Birmingham, Derby, Nottingham and Sheffield all seem to do quite a bit of audience-sharing, and Stoke claims that people from 12 different counties attended its 1971 production of "Measure for Measure." By contrast the north west and south west are badly served. Portsmouth has no rep and relies on visits from Exeter rep, which gets an extra Arts Council subsidy for such tours.

Only a few reps can actually afford to play in repertory with several plays running concurrently. Birmingham is now playing "Man and Superman" as well as "Vivat! Vivat! Regina!," which its artistic director, Mr Peter Dews, first produced at Chichester theatre. Most progressive reps try to divide their repertoire evenly between classical works and new plays, sometimes concentrating on local writers. But their artistic policies vary wildly, particularly in their approach to the area they serve.

In recent years more reps have become a prey to the lures of London's West End. The possibility of a play transferring to London has the obvious advantage that a big star will come to, say, Birmingham, to play at a much lower fee than he is accustomed to on the assumption that he will reap the benefits when it moves to the West End. The theatre gains wider prestige and gathers a tidy sum in royalties: this is usually about 1 per cent of the gross London box office takings. Birmingham has made well over £7,000 on Mr Dews's production of "Hadrian VII" which started there, played in London and New York and has since been done by most reps in the country.

On the other hand, transfers have the disadvantage of breaking up a team of actors and can put a rep far too much in the hands of London commercial impresarios who, as Mr Stephen MacDonald, director at Leicester, puts it, "are fine judges of commercial potential, but not necessarily of artistic merit." Some reps have well-established links with certain impresarios. Bristol, for instance, has long been associated with the name of Mr Donald Albery, the London theatre-owner and impresario. At one time three plays running concurrently in the West End had started life at Bristol.

At a further extreme, the Stoke-on-Trent rep, under the artistic directorship of Mr Peter Cheeseman, has decided to eschew any temptations from London. Stoke is unique in many ways: it is the only rep with an entirely permanent company (of 13) paid on a fixed salary scale —with television and films offering much more money, the number of actors wishing to sign 6- or 12-month contracts out of London is limited—and it is also the only rep that always plays in the round. Mr Cheeseman believes passionately in the importance of an ensemble of actors working together and establishing in the theatre very strong links with the local community. One director described Mr Cheeseman's work as the dramatic equivalent of the local newspaper—and he had a point.

Stoke has become famous for its musical documentaries, which tell of incidents in the history of the area based entirely on "prime source material," such as letters, documents and recorded speech. "The Knotty," produced in 1966, told the story of the building of the North Staffordshire Railway—this has frequently been revived and has always sold out. Last year "Hands Up—For You the War is Ended" told of the local newsagent's wartime adventures escaping from an Italian prison camp. Other reps have adopted the documentary idea in varying forms. Sheffield's "The Stirrings in Sheffield on Saturday Night" —about the local trades unions' fight for recognition in the 1860s—went down a treat in that brash and lively industrial city.

MacDonald and Cheeseman: community service

Birmingham's "Man and Superman"

Most reps would place service to the community as their main justification for subsidy. Stoke's actors do work in local schools, Newcastle's new theatre is open nearly all day for talks to schools and groups, open rehearsals, and lunchtime concerts and poetry readings. They often try to tie their annual Shakespeare production in with what is on the GCE syllabus: this did lead to the rather ludicrous situation in 1970 when Stoke, Nottingham, Leicester, Birmingham, Leatherhead and Oxford all found themselves playing "Hamlet." As coachloads of schoolchildren seem prepared to drive 50 miles to the theatre, the rash was unwarranted and could have been averted with a little prior consultation.

Strong emphasis on schools helps to build up a new young theatregoing public. The audience at "The Cherry Orchard" in Leicester, not traditionally a theatrical town, was largely under 30 the other day. A town like Birmingham, however, which has longer theatrical traditions, has a more conservative, middle-aged audience. But all directors agree that a new theatre brings new audiences. Most new theatres are attractive, have restaurants and bars and are generally more suited to a night out. In its new theatre which seats 900, Birmingham rep is playing to an average audience of 65 per cent capacity, the same percentage as it did in the old theatre with about half the seats. Sheffield is having similar experiences.

But moving into a new theatre doubles the price of everything—a fact that many starry-eyed managers had not fully foreseen—and councils who enthusiastically coughed up capital for building are sometimes understandably much less keen to subsidise the running costs once the building is up. They also charge the theatres rent—though this is often equalled in a grant. Nottingham, for instance, gets a council grant of £27,000 and pays the same amount back in rent. Actors' wages went up substantially last year to a minimum of £20 a week. As the previous minimum was £10.50 it was high time, but it did put up costs, and a medium-sized theatre like Newcastle found itself shelling out an extra £16,000 a year, and Nottingham cut its company down from around 27 actors to under 20.

Running costs in a large rep like Birmingham—which has a non-acting staff of around 100—will probably be over £300,000. Of this it hopes to take around £175,000 at the box office and the rest must somehow be made up by subsidy. Most reps feel that their income should divide about evenly between subsidy and receipts but they vary greatly in what they feel they can charge. Birmingham and Sheffield have a top price of £1.20, Nottingham 80p and Leicester 75p, whereas Stoke, which admittedly does not provide half the comforts of newer theatres, charges 40p (or the average price of a cinema seat). In reality the pricing does not tell the whole story. Mr Dews says: "Hardly any seat in a provincial rep is sold at its face value." Reductions for students, pensioners, parties and season-ticket holders all see to that.

But with such large sums at stake, some reps have come in for criticism for not watching their costs closely enough. Nottingham, where an average production costs about £6,000, is often accused of thinking too big for its own budget's good. It recently put itself at serious risk by placing large sums—it will not reveal how much—jointly with an impresario in a musical called "The Amazons." Presumably it expected a London transfer.

Touring revives

Some people also feel that the extravagant size and grandeur of these monuments to civic glory is unwarranted, and that with more modest plans some of the extra money might have been better spent renovating the local touring theatres which are often in a very poor condition. Only two new touring theatres at Swindon and Eastbourne have gone up since the war. Until recently the Arts Council took scant interest in touring, although there is plainly still a large demand for good quality shows. However, it did give a grant of £45,000 in 1970 to the Dramatic and Lyric Theatres Association (Dalta) which helps to co-ordinate tours by the national opera, ballet and theatre companies. Under the direction of Mr Jack Phipps, Dalta has been so successful at arranging provincial tours round a grid of 12-14 theatres that its grant has been upped to nearly £500,000 —about £200,000 of which will go on theatre—to subsidise touring in 1972-73.

The Arts Council's report, "The Theatre Today," produced in 1970, complained of the lamentable lack of "product" (ie, productions) available to touring theatres. The situation now has improved somewhat: Dalta tries to guarantee theatres on its grid 10-14 weeks (divided into two seasons) a year, pantomimes will run 8-10 weeks, perhaps the D'Oyly Carte or Black and White Minstrals (both invariable sell-outs) for 3, foreign companies for 4, touring theatre and occasional concerts for 5, amateur dramatics for 6—but this at best leaves 10 weeks when the theatre will be "dark." Moss Empires feels lucky if a theatre is used for 40 weeks a year. To complicate matters, some towns like Liverpool and Manchester are saddled with two large touring theatres vying for productions.

The slump in the film industry has encouraged commercial companies—now able to get the stars—to put more plays on the road. Last year Triumph Productions toured plays with stars like Sir Michael Redgrave, Richard Todd, Jack Hulbert and Jimmy Edwards, and at one time had nine touring at once. And good names sell. When the National Theatre —always a reluctant tourer—took "The Merchant of Venice" with Sir Laurence Olivier to Edinburgh and Manchester last year, it played to 99 per cent and 93 per cent houses respectively and made over £22,400.

But a long-term successful touring policy depends on the theatres themselves being improved. Councils are being encouraged to buy their local theatres—occasionally with a little help from the Arts Council —and to run them through trusts which keep them out of politics and enable them to adopt a more consistent artistic policy than a commercial theatre. Trusts also have charitable status and so might attract more local money and improvement grants from the Arts Council. But with only £500,000 in its Housing of the Arts fund—this has not risen for six years —the Arts Council is unable to help much, and most of the onus plainly rests with local effort.

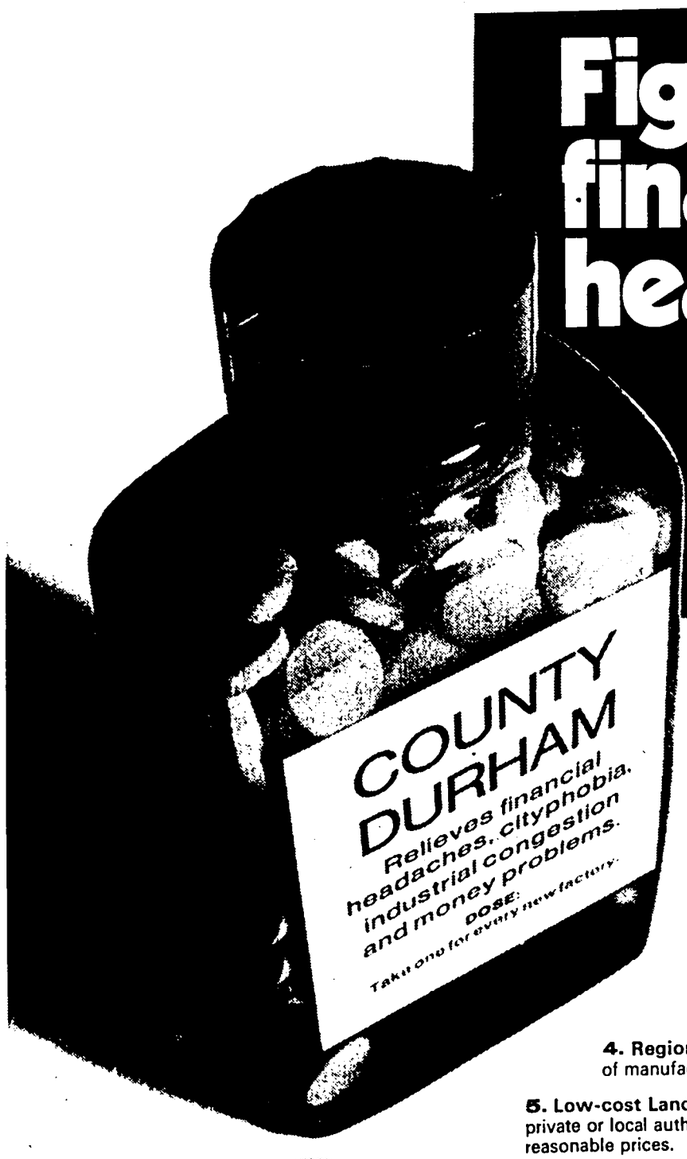
Canadian Pacific

91st Annual Report

Progress was made in 1971 toward the goal of increasing the earnings of the Company. The improvement in general business conditions which took place during the year was essential to this achievement but did not wholly account for it. At least as important for the results was the strengthened capability of the Company to create and use opportunities in a wide range of service and production activities.

Total earnings for the year, including those of subsidiaries, were $75.5 million, an increase of $9.8 million, or 14¢ per Ordinary share, over 1970. The increase in earnings before extraordinary items was $6.4 million, or 9¢ per Ordinary share. Dividends on the Ordinary stock were increased from 65¢ per share in 1970 to 66¢ in 1971. The increase came from railway and miscellaneous sources.

Net railway earnings were the highest since 1966. CP Rail was able to take advantage of an upswing in the economy in the last half of the year to overcome the disappointing first half, which was marked by unusually severe winter weather, work stoppages and a strike threat. The income of CP (Bermuda) was up substantially, as a result of a larger fleet and the temporary availability of ships for spot charters. Trucking operations produced higher earnings. CP Air succeeded in improving its earnings performance through rigorous control of costs, rather than as a result of any marked increase in its revenues. The net income of the subsidiary Soo Line Railroad Company was higher and so were that company's dividend payments.



Income of Canadian Pacific Investments Limited was down despite growth in earnings from oil and gas and hotels. The reduction was attributable in large measure to the effect of the higher exchange value of the Canadian dollar on the results of Cominco Ltd. and on the various forest products companies in which CPI has interests.

Copies of the Annual Report can be obtained from the Deputy Secretary, 8 Waterloo Place, London, SW1Y 4AQ.

Fight financial headaches five ways

Soothe away those financial strains and money worries with County Durham's five fast working ingredients for easing factory growing pains.

1. Regional Development Grants—Up to 22% of expenditure on buildings, plant and machinery for manufacturing purposes.

2. Training Assistance—The Department of Employment makes available special courses and grants for training workers.

3. Loans—Government loans can be made available at moderate rates of interest to assist in the purchase of buildings, plant and machinery and also working capital. County Council loans are available to assist in the purchase of land and construction of buildings.

4. Regional Employment Premium—cuts labour costs of manufacturers and is available until at least 1974.

5. Low-cost Land—Wide choice of fully-developed industrial sites, private or local authority owned—available free-hold or lease-hold at reasonable prices.

For advice and information on sites available, contact the County Planning Officer, County Hall, Durham City. STD 0385 4411 Ext. 338

County Durham
relieves industrialist's ills...*fast!*

THE NORTHERN TRUST COMPANY CHICAGO

Take the Northern Approach to banking in London

A total systems approach applied with personal attention by technically experienced bankers—that is The Northern Approach to the worldwide financial problems of business.

We offer a full range of financial services, including Eurocurrency financing, foreign exchange transactions, and a wide variety of financial management assistance through our London branch at 38, Lombard Street.

Add the resources and resourcefulness of our London branch to those of our Chicago headquarters, The Northern Trust International Banking Corporation in New York, our global network of business and correspondent bank affiliations, and our participation in London Multinational Bank—and you have all the facilities necessary for applying The Northern Trust's total systems approach to your financial problems.

Learn more about the facilities available at 38, Lombard Street. Contact W. James Armstrong, Vice President and Manager.

THE WORLD *International Report*

The Easter offensive

FROM OUR INDOCHINA CORRESPONDENT *Saigon*

Every year the monsoon in Vietnam brings down a heavy blanket of cloud over the 17th parallel for about two weeks towards the end of March. It provides a perfect cloudscreen for communist military activities and prevents the use of air power against infiltration across the so-called demilitarised zone separating the north from the south.

When the clouds descended on schedule a fortnight ago, the North Vietnamese set in motion a battle plan that was probably prepared months in advance. By Wednesday nearly 50,000 troops, supported by 200 tanks, had poured across the border under cover of a withering barrage of artillery and rockets, and were poised to overrun the province capital of Quang Tri. The invasion itself had long been foreseen, although many observers thought it would start in the central highlands. But its intensity was a surprise, as was the almost immediate collapse of South Vietnam's forward defences.

But as government forces regrouped to defend besieged Quang Tri the weather finally started to improve and American pilots expected to start flying up to 500 strikes daily. Already, according to some reports, more than 50 Russian-built tanks had been destroyed by air and ground fire and naval gunfire from offshore. President Thieu, who said the invasion was a "decisive battle of the war," called upon the United States for all the assistance it could give, and on Thursday he got President Nixon's answer. It was announced in Saigon that ships and aircraft of the Seventh Fleet and the American air force had opened large-scale attacks on targets in North Vietnam.

Even so, by Thursday there were doubts whether Quang Tri city, most of whose 22,000 inhabitants had fled southwards, could be held, and the North Vietnamese were expected to push on later towards the much larger and politically more important city of Hué, 35 miles to the south, which was partly occupied for three weeks in the 1968 Tet offensive.

Originally, the invasion was intended as part of a three-pronged offensive scheduled for February, about the time of Mr Nixon's Peking visit. The other two thrusts were to be against the highlands city of Kontum, close to the Laotian and Cambodian borders, and in Tay Ninh province just north of Saigon. But it is now claimed that massive South Vietnamese spoiling operations and American pre-emptive bombing forced North Vietnamese commanders in Cambodia to ask Hanoi for more time and reinforcements.

On March 30th the routine shelling south of the demilitarised zone suddenly intensified. Simultaneously, three divisions of North Vietnamese infantry in Russian-made Molotova trucks together with artillery and tanks moved across the buffer zone.

Under direct infantry assault, the firebases rapidly crumbled. At Camp Carroll, as American advisers were helicoptered to safety, a white sheet

was hoisted on the flagpole and the commanding officer shot himself. At another base, there was shooting between troops who wanted to surrender and officers who wanted to fight on. Soldiers from some bases donned civilian clothes and mingled with the tens of thousands of refugees heading south. More than 50 artillery pieces were lost in the dozen bases overrun.

By Thursday the communists held most of Quang Tri province except for the capital and the town of Dong Ha. A fourth North Vietnamese division had crossed the buffer zone and a fifth was moving towards Hué from near the Laotian border.

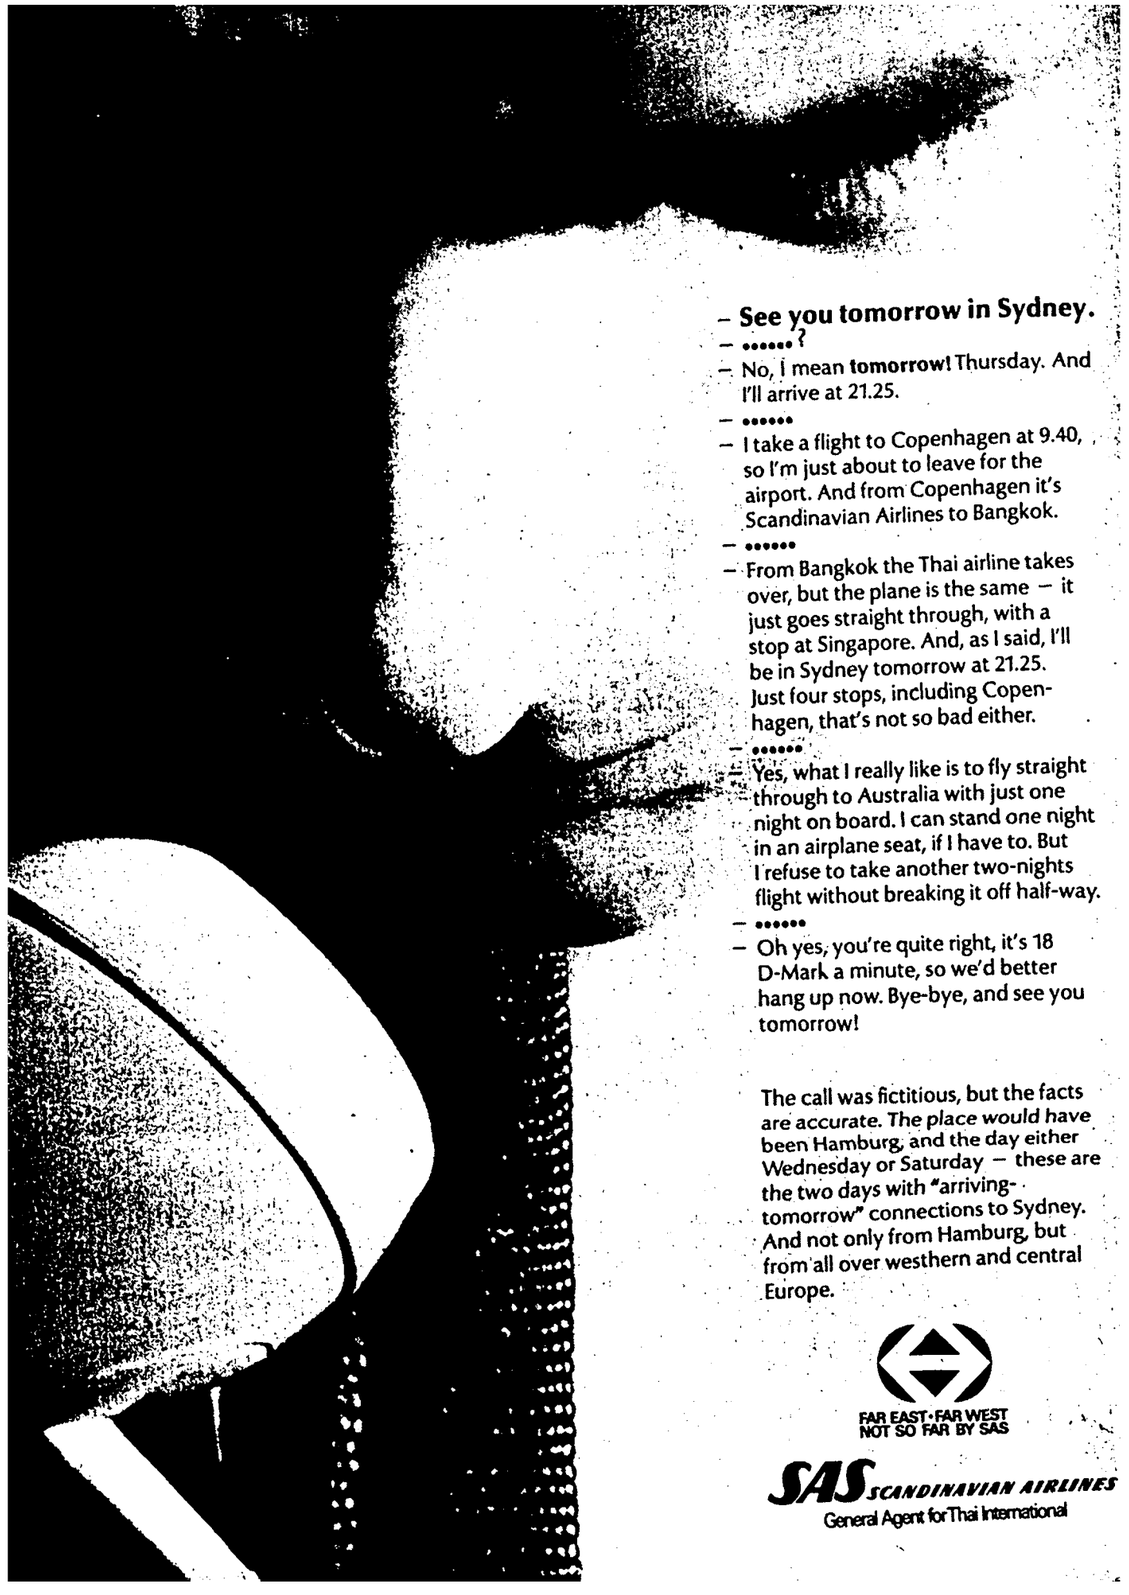
It was, on the face of it, a disastrous showing in the first real test of Vietnamisation. Yet perhaps it would be misleading to attach great significance to this single series of reverses, because the circumstances were not typical. Nowhere else in South Vietnam can the communists mount an assault with such intensity and firepower, backed up by so much heavy Russian equipment and vast reserves of reinforcements from North Vietnamese home soil.

Speaking in Hanoi a few days before the assault, North Vietnam's foreign minister, Mr Nguyen Duy Trinh, said that the main task was to "defeat the Vietnamisation of the war and the Nixon doctrine." Clearly this is the aim of the new offensive. But the Quang Tri invasion alone could be a double-edged sword. The South Vietnamese, disturbed but far from panic-stricken, noted an important contrast with 1968. This is not a nationwide uprising by southern guerrillas, but a straight North Vietnamese invasion backed by sophisticated Russian heavy weapons.

Even when the communists moved in on their other two fronts, in Kontum and north of Saigon, they were still relying on North Vietnamese units from over the border. North Vietnam's 320th division, preparing to attack Kontum, suffered some casualties in preliminary clashes. North of Saigon a thrust against Tay Ninh seemed to peter out after early gains, but new fighting erupted in Binh Long next door.

It is perhaps too early to say that the communists cannot stage another nationwide offensive, if only because the same was said late in 1967. But unless the communists mount something much more widespread and indigenous than the Quang Tri invasion they will prove only that Vietnamisation is working, and that North Vietnam really does have territorial designs on the south. Nothing could be more calculated to solidify the South Vietnamese and discredit the communists.

Is it protracted?



One of the questions arising from the Easter offensive is whether it was preceded by a basic change in the balance of power in Hanoi. Le Duan, the advocate of "strategic protracted war" —which is usually taken to mean a low-level guerrilla campaign that would allow North Vietnam to devote more of its resources to economic development—emerged as the dominant figure in the communist hierarchy early last year. Last June the dismissal of three members of the politburo who had worked closely with the Vietcong, including Pham Hung, a deputy premier, was taken as a sign that North Vietnam's leaders were inclined to play down the war.

The devastating floods in the Red river delta last year gave them a good reason for doing so, and it was reported that units from three North Vietnamese regiments in Quang Tri province were pulled back across the border to help with the work of reconstruction. As late as January this year, editorials in the party paper Nhan Dan were preoccupied with industrial inefficiency and apathy and "individualism" among young people.

It was starting to look as if Le Duan's assertion that "the needs of the war are secondary" actually meant something. At the same time, Truong Chinh (whose adopted name, which literally means "Long March," is a sign of his maoist leanings) and General Giap, who remain powerful figures in the Hanoi political establishment, have always continued to insist on the need to use large regular forces in South Vietnam. How far the North Vietnamese are prepared to pursue the current attack will be a fair sign of whose strategy has won out. A limited showcase operation is perfectly compatible with Le Duan's concept of protracted war; but the Easter offensive may amount to more than that.

The balance of hardware

SOUTH VIETNAM		NORTH VIETNAM
$564m (1971) $$$$$$$$$$$$$$$$$$$$$$$$	Defence budget	$$$$$$$$$$$$$$$$$$$$$$$$$$$$ $584m (1970)
Total: 500,000 men of which, army 414,000; navy 31,000; marine corps 15,000; air force 40,000; (+para-military forces 550,000)	Armed forces	Total: 492,000 men of which, army 480,000; navy 3000; air force 9000; (+para-military forces about 450,000)
750	Field guns	550
175 all light	Tanks	390 (300 light and 90 medium)
275	Combat aircraft	270
American ground forces in Vietnam are now down to 95,000 and will be down to 69,000 by May under the present timetable for withdrawals. But American air power is still a decisive factor. Elements of the Pacific Air Force and the Seventh Fleet are used in the Indochina theatre. The Seventh Air Force based in South Vietnam contains about 80 combat aircraft at this stage of the rundown; up to 250 combat planes, including 50 B-52 bombers, are stationed in Thailand; and the four aircraft carriers that have just been sent to the Gulf of Tonkin are said to contain about 300 combat planes. The government forces in Cambodia (around 200,000 men) and Laos (some 55,000 men) also affect the balance	The allies	Of the North Vietnamese regular units, more than 100,000 men are now deployed in South Vietnam, 75,000 in Laos, and some 45,000 in Cambodia. Estimates for the number of Vietcong vary between 40,000 and 60,000; from 20,000 to 35,000 for the Pathet Lao; and from 3,000 to 15,000 for the anti-government forces in Cambodia

The Hongkong and Shanghai Banking Corporation

Incorporated in Hong Kong with Limited Liability.

Highlights from The Chairman's Statement and International Survey for the year 1971.

Mr. J. A. H. Saunders, Chairman, speaking to shareholders on 30 March 1972 reported that 1971 had again been a satisfactory year for the Hongkong Bank.

The Hongkong Bank's net profit increased by 17 per cent to £9.2 million. Distribution for the year was 36 pence per share, slightly more than forecast, and an increase of 11½ per cent.

A free scrip issue of one new share for ten is proposed. This follows scrip issues of one for ten for 1968 and 1970 and one for one for 1969. Since 1967 net profit earned has increased by 112 per cent and distribution to shareholders by 57 per cent.

Group assets now exceed £2,000 million and Group net profit, after deduction of outside shareholders' interests in subsidiaries, rose by 18 per cent to £11.7 million.

The Group now has **230 branches in 36 countries** and Group interests have been extended to Cyprus, the New Hebrides, New Zealand and the Yemen Arab Republic.

Hongkong Finance Ltd. and **Mercantile Credits Ltd.** again improved earnings, despite the continuation of difficult conditions in **Australia.**

British Acceptance Corporation achieved very satisfactory progress in **Canada** and now operates in Toronto as well as Vancouver and Edmonton.

In Hong Kong trade and business showed steady improvement, despite the problems created by stagnation and severe import controls abroad, and an 11½ per cent growth in domestic exports was achieved. Hong Kong has increasingly become a **focal point** from which to direct **business in the Far East and Pacific.**

The widespread **inflation and stagnation** in the advanced countries affected trade in many primary commodities and demand for manufactured goods from the more rapidly developing Asian countries.

World trade should benefit both from a more realistic and flexible exchange system and from a revival of economic growth in the United States.

There was recognition that the "green revolution" eased but did not entirely resolve the problem of adequate and balanced **food supplies** and so did not remove the urgent need for family planning programmes, if the benefits of development were not to be overwhelmed by increasing **population pressure.**

There was a greater awareness of the need to give priority to **processing and light industry** to promote development and provide employment.

There was a resurgence of interest in the possibility that commercially attractive **off-shore oil resources** might be found in the seas around South East and East Asia.

The Group has offices or subsidiaries in: London, Hamburg, Paris, Geneva, New York, San Francisco, Los Angeles, Sydney and Vancouver, and across Asia and North Africa.

Amongst the Bank's subsidiaries are: Mercantile Bank Ltd., The British Bank of the Middle East, Hang Seng Bank, Wayhong Investment Ltd., the Hongkong Bank of California, Hongkong Finance of Sydney, and British Acceptance Corporation of Vancouver.

The Bank also has interests in: International Commercial Bank, London; Exporters Refinance Corporation, London; Mercantile Credits, Sydney; and New Zealand Investment Mortgage & Deposit Co. Ltd., Auckland.

The Hongkong Bank Group	1969	1970	1971
Issued Share Capital	£ 13,200,000	£ 26,300,000	£ 28,900,000
Reserve Fund	24,800,000	27,300,000	32,600,000
Undistributed Profit	2,700,000	4,400,000	5,000,000
Deposits	1,091,000,000	1,340,000,000	1,538,000,000
Advances	682,900,000	803,000,000	889,000,000
Bank Premises	7,600,000	11,300,000	12,300,000
Net Profit	9,600,000	11,000,000	12,800,000
Total Assets	£1,485,100,000	£1,808,000,000	£2,040,000,000

Those interested in developments in Asia during the year and in the Bank's operations throughout the world may obtain copies of the full text of the Chairman's International Survey and the Statement and of the report and accounts of the Bank and of other members of the Group on request to the Head Office of The Hongkong and Shanghai Banking Corporation at 1 Queen's Road Central, Hong Kong, or from the London offices at 9 Gracechurch Street, EC3 and 123 Pall Mall, SW1.

Fukuda, Tanaka, Miki and Ohira : not a charisma in sight

Japan

The four who could follow Sato

FROM A CORRESPONDENT IN TOKYO

The succession to Mr Eisaku Sato as prime minister of Japan has been an active issue in Japanese politics for most of Mr Sato's seven-year term. Now at last Mr Sato seems about to retire ; he has implied that he will step down in early summer after a ceremonial seal has been put on his greatest achievement in office, the return of Okinawa to Japan. The man who takes his place as party leader and prime minister will almost certainly be one of the following four candidates, each of whom controls a major faction in the Liberal Democratic party, Japan's conservative coalition.

Takeo Fukuda, as foreign minister and Mr Sato's chosen heir, seemed a shoo-in until recently. He is still front-runner but his prestige has declined along with that of his patron. His greatest disadvantage may turn out to be his conservative stand on China policy at a time when there are increasing pressures in Japan for an opening to Peking. Although Mr Sato took responsibility for Japan's bitterly criticised decision to co-sponsor the American resolution to keep Taiwan in the United Nations, Mr Fukuda has, inevitably, been tarred by that brush. He has been insisting on a cool approach to Japan's huge neighbour and potential rival and has countered China's stiff terms for opening talks to normalise relations with a few of his own ; he will not agree to abrogate Japan's 1952 peace treaty with Nationalist China as a precondition for negotiations.

What gives Mr Fukuda his strength is not so much his orthodox view on economic growth, trade, and education but his personal following among businessmen. He is of their generation (he is aged 67), went to their sort of college (Tokyo university), and prepared for politics in the proper way (the finance ministry). In their view, he can be counted on to give Japan firm and flexible leadership.

Kakuei Tanaka is the dark-horse candidate who is now given a good chance of overcoming an unconventional background for the top job. The son of a farming family, he is one of the few politicians in Japan who did not graduate from university. And at 53 he is much younger than the traditional Japanese prime minister.

After making his fortune in the construction business after 1945, Mr Tanaka was elected to the Diet when he was 29. He has been a full-time politician ever since and has worked his way up as a hatchet man, most recently for Mr Sato. As party secretary-general he guided the Liberal Democrats to their overwhelming victory in 1969 and thus earned the gratitude of many of his party colleagues.

Mr Tanaka has a "progressive" image ; he is open to new ideas, knows how to compromise and maintains excellent relations with the opposition parties. But he has virtually no policies on any issue. Although he has held two important portfolios—finance and now foreign trade—he has had almost no experience in foreign affairs. On the China issue, his blank record might well prove an advantage.

Takeo Miki is the nearest thing to an idealist in the top ranks of Japanese politics. During the war he refused to support the fascist substitute for political parties and after the war, as a lone wolf, he drifted in and out of three small conservative parties. He developed a reputation as a man of ideas but saw most of these ideas stolen by others. As Mr Sato's foreign minister for two terms, he advocated the return of Okinawa without nuclear weapons—a demand which Mr Sato later endorsed, achieved and took credit for. Meanwhile Mr Miki lost a contest for the prime ministership, called for a more serious attempt to talk with China and took off on another of his frequent trips abroad.

Mr Miki's faction is not part of the mainstream of the Liberal Democratic party and he lacks the support of businessmen. So if he wins it will be as a compromise candidate—or the result of a successful effort to block Mr Fukuda's candidature.

Masayoshi Ohira has inherited the dwindling political base of the late prime minister, Mr Ikeda, and has few other distinguishing features. He is a classic compromiser who accommodates as many conflicting viewpoints as he can and postpones his own decisions until the last moment, making few enemies in the process. Although he served as foreign minister three times under Mr Ikeda and as trade minister under Mr Sato, he managed to avoid committing himself on any policy questions. Since Mr Tanaka and Mr Miki are both suspect to many industrialists, Mr Ohira is their second choice after Mr Fukuda. They count on him to be the sort of prime minister who would never challenge the traditional Japanese balance of power among big business, big bureaucracy and the perennial ruling party.

Ireland

Softly, softly

FROM OUR DUBLIN CORRESPONDENT

The IRA's decision to continue its campaign of violence in Northern Ireland has found little support in the south. The Irish Independent, largest of Dublin's daily papers, declared bluntly that the Provisional IRA, led by Mr Sean MacStiofain, "are refusing to listen to a message which they should be receiving loud and clear : it is now time for that organisa-

Are you receiving it, MacStiofain ?

tion tb put away its guns and close down." On the national radio and television Cardinal Conway, Primate of All Ireland, spoke in the name of the country's Roman Catholics in asking the Provisional IRA by what right the campaign should go on. Mr Conor Cruise O'Brien, the Labour party's spokesman on Northern Ireland, sought to strip away some of the IRA's glamour. The process of change in Northern Ireland, he said, was well under way before the IRA made its presence felt at all.

It is now believed here that the Provisionals are looking for a face-saving way back from the unpopular limb on to which they have climbed. The head of the Sinn Fein faction that supports them indicated on Tuesday that the whole situation might have to be reconsidered. It is thought that they are now ready to agree to stop planting bombs, although they would still attack troops or policemen who, in their view, were too active in patrolling Catholic areas or arresting people there.

But there is a feeling in Dublin that Britain may have to shift still further before the IRA is put out of business. The release of a significant number of internees, the removal of such repressive legislation as the special powers act, and a new form of policing Catholic areas, are suggested. Meanwhile politicians in the republic are keeping their heads down, both to avoid setting off a Protestant backlash and because they recognise that they will soon have to face several delicate questions as pressures for a longer-term solution to the Irish problem mount.

Matters like divorce, contraception, abortion and the special position afforded in the Irish constitution to the Roman Catholic church are among the issues that the political parties in Dublin have not yet faced. Cardinal Conway, in his radio interview, indicated his own belief that a united Ireland would inevitably mean changes in constitutional and legal provisions. He is thought privately to believe that divorce and contraception will have to be legalised, but not abortion.

The three parties in the Dáil have now agreed on the composition of the committee that will be asked to discuss possible reform of the constitution. It will consist of four Fianna Fáil members, three Fine Gael and two Labour. This is the first time the government has accepted minority representation on any such committee, and it suggests that Mr Lynch does not want his own party to incur too much of the electoral disadvantage of trying to amend the constitution on the lines suggested.

He has suggested that the parties should undertake to accept whatever changes are agreed upon in the reform committee. Fine Gael has rejected this idea. Its leader, Mr Liam Cosgrave, will not let his party be committed by representatives who would almost certainly lean to the left of centre.

If it is decided to rush constitutional amendments through a referendum, the most likely date would be in the autumn, when a referendum on lowering the voting age to 18 has already been scheduled. But Mr Lynch would prefer to discuss the more sensitive issues in the context of a new constitution for a federal or a united Ireland. And this, he knows, is still a long way off.

France

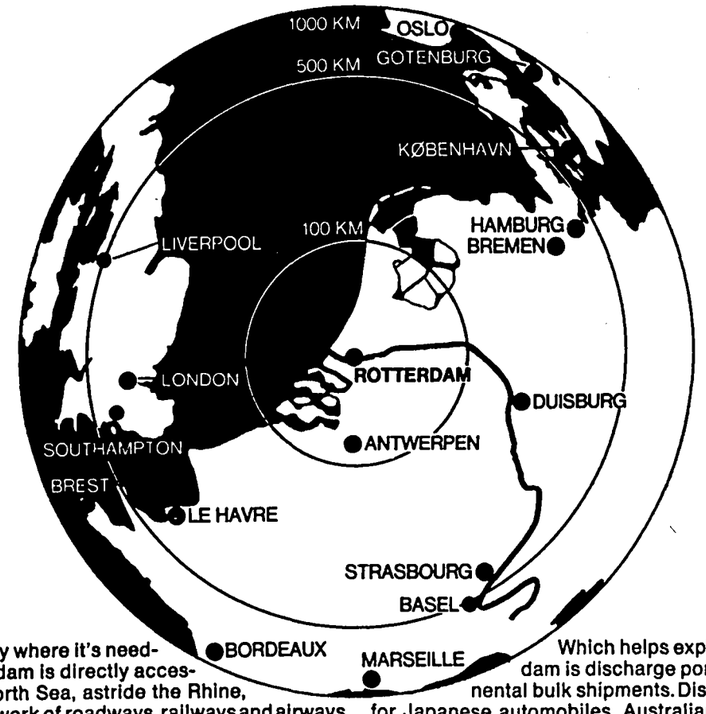
Divide and rule

That referendum in France about the enlargement of the European community is proving the two-pronged weapon that President Pompidou intended it to be. An opinion poll published by Le Figaro on Tuesday shows that 45 per cent of Frenchmen will vote yes to letting in Britain and the other applicants ; about 30 per cent intend to abstain and only 8 per cent have decided to vote no. The poll comes just after the publication by L'Humanité, the communist newspaper, of the letter in the president's name that is to be sent to each voter.

The letter asks for approval of the community's agricultural policy and its plans for economic and monetary union and " a confederation which will preserve the personality of the countries composing it, and therefore of France." France's part in the enlarged EEC will be that " to which she is predestined by her geographical position, her past, the labour of her people, the prestige of her culture." Explained in these nationalistic terms, the referendum should get a large majority, which could prove useful to President Pompidou against diehard gaullists such as M. Debré when the European summit meeting takes place in the autumn.

But everyone knows that the president had other motives in calling a referendum. According to Le Figaro, although about 37 per cent of Frenchmen think the referendum is primarily about Europe, 27 per cent regard it as M. Pompidou's device for getting a personal vote of confidence, and 18 per cent as a means of splitting the French

Marchais chose to unravel



left. And here the president has been successful beyond his wildest dreams. The Communists have decided to vote no, but the Socialists are to abstain. And both parties are now busy heaping accusations of bad faith on each other.

The trap seemed so obvious. Both M. Marchais, the first secretary of the Communist party, and M. Mitterrand, the leader of the Socialists, were quick to remark that although the referendum would have little practical effect on the building of Europe it might do a great deal to unravel the united front which their two parties have been trying to sew together since December, 1970. And a solution seemed equally obvious : a joint abstention. The Socialists could not be expected to renounce their long-standing support of west European integration by voting no ; nor could the Communists be expected to swallow their harsh criticism of the common market by voting in favour of adding to it. The Socialists compromised. But the Communists would not, even though Mr Brezhnev's recent acknowledgment that the common market was here to stay seemed to make it easier for them to abstain.

Both parties are still officially committed to working towards a joint electoral front. But in March the Socialists met to give their share of the electoral programme its definitive form and, in the process, showed up some important differences with the Communists.

On nationalisation the Socialists are reluctant to advance swiftly enough to satisfy the Communists ; the Communists dislike the Socialist proposals for " worker participation," which run against communist ideas of centralising

they couldn't have put Rotterdam at a better spot

It's precisely where it's needed. For Rotterdam is directly accessible to the North Sea, astride the Rhine, with a rich network of roadways, railways and airways reaching out in all directions. It is also at the heart of Europe's wealthiest area: a 600-mile circle containing metropolitan London, Holland, northwestern Germany's Rhine and Ruhr districts, Belgium, the heavy industry of northern France, and 160 million consumers.

Which helps explain why Rotterdam is discharge port for intercontinental bulk shipments. Distribution centre for Japanese automobiles, Australian ore, Mid-East oil, North American grain, African timber - altogether 26% of the seaborne goods that enter and leave the Common Market. A port ideal for transhipment, bulk-breaking, warehousing, inventory management, forwarding. Adding Rotterdam to your distribution system is like having four aces up your sleeve.

Rotterdam-Europoort

For more information, write Rotterdam Municipal Port Management, Poortgebouw, 27 Stieltjesstraat, Rotterdam

From April 1st, BEA will fly from London Heathrow to Marseilles non-stop 3 times a week. All flights are by Trident.

Flights depart on Tuesdays, Thursdays and Saturdays at 0940, arriving Marseilles at 1115; and return flights, on the same days, depart Marseilles at 1155, arriving London Heathrow at 1335.

We look after you on the ground, too, with our Hotel Reservations Bureau and speedy FlyDrive car hire system. It's Number One treatment all the way.

So if you're making for Marseilles, make sure it's one of ours!

Fly BEA!

BEA

No.1 in Europe

power in the hands of the state. The Communists want the immediate cutting of what links France still has with Nato ; the Socialists want to withdraw only when some alternative security system has been negotiated. The Communists want the immediate scrapping of France's nuclear force ; the Socialists want only to halt its development in the context of a general disarmament agreement. Indeed, some notable Socialists have recently been arguing that the *force de frappe* must now be accepted as a fact of life.

These might be negotiable differences, but for the growing sense of estrangement between the two parties. It started with differences of opinion over the purges of Czech writers and journalists early this year, when the Communists refused to join in any joint statement of disapproval ; it was aggravated by the different way the two parties reacted to the shooting of René-Pierre Overney at the Renault works on February 25th ; and it has now become a formal split. Time can be a great healer. But a successful referendum on top of the division of the left may encourage President Pompidou to bring the parliamentary elections, due in 1973, forward to this autumn.

Hungary

In the doghouse?

Russia and Hungary, which have not had a major public row since that one in 1956, may now be heading for a disagreement. Judging by what Mr Fock, Hungary's prime minister, said last week when he came back from Moscow, the two governments do not see eye to eye on a number of economic issues. Mr Fock admitted that he was unable to get any firm assurances about the quantity of Russian raw materials that would be made available to Hungary over the next 10-15 years. Hungary, which has hardly any natural resources of its own, is totally dependent on Soviet supplies of oil, gas, iron ore and other materials. Russia could be using its overwhelmingly strong position to extract higher prices from Hungary; it could also be asking the Hungarians to invest more in Soviet projects connected with raw materials, especially fuel extraction.

There may even be more to it than this, given the hints which Mr Fock dropped about his discussions on wider issues with Soviet comrades, including Mr Brezhnev. For the past six months there have been rumours that the Russian leaders are unhappy about certain aspects of Hungary's economic reforms. In October Mr Bilak, a hard-line Czechoslovak leader with a great deal of pull in Moscow, warned the Hungarian Communist party that it was in danger of losing its grip on the economy and on public life in general. Since then Mr Kadar, Hungary's party boss, has paid at least one rather hurried visit to Moscow (some well-informed east Europeans believe there have been as many as three) and the tone of Soviet references to Hungary has grown cooler.

All this may blow over if Mr Kadar and his colleagues modify their policies in a way that satisfies the Russians. But this would be unpopular with their own people, especially if it slows down the present movement towards greater prosperity. There must be a certain amount of head-scratching going on among party leaders in Budapest. But there is also little doubt that the answer must always be yes, if Mr Brezhnev really puts his foot down.

Turkey

Cracking down, not cracking up

The brutal murder in Turkey last week of the three Nato technicians has produced a typical Turkish reaction : the government has asked for stronger powers to root out the terrorists, and also to carry through the essential reforms which have been talked about for years but never implemented. In a stern, admonitory letter to the squabbling leaders of the four main parties, President Sunay said that both "the democratic regime and the integrity of the country" were in danger, and proposed that, for an unspecified period, parliamentary discussion should be suspended and the government should have the power to rule by executive decree.

On the face of it, the parties will have little choice but to obey, and the "democratic regime" looks increasingly like a facade. But the Turks set great store by facades, and it would be wrong to interpret President Sunay's exceptional action as the prelude to an automatic military take-over. In Turkey—unlike Greece—the army prefers to play the role of back-seat driver.

The past few days have seen a flurry of consultations between Mr Erim, the prime minister, and the leading politicians—and this may continue through the weekend. Both the Democratic and the Reliance parties have now indicated that President Sunay's proposals are unacceptable; but their defiance savours of posturing. What matters is the reaction of the two main parties, particularly the Republican People's party. Its 87-year-old leader, Mr Ismet Inönü, finds himself in a tricky spot ; he has vociferously opposed the more authoritarian measures of the present regime—the continuation of martial law and the imposition of death sentences by special tribunals on terrorists who have not actually committed murder—but the mood of the country, after last week's outrage, is in favour of tough action to end the violence. Many members of the right-wing Justice party would relish draconian measures to crack

Time for Turkish terrorists to take cover

down on the left-wing terrorists, but are not so keen on giving the government carte blanche to carry through social reforms.

The odds are that, as on so many similar occasions in the past, the Turks will muddle through, but without making any detectable advance towards a solution of their basic problems. But by refusing to be blackmailed by the terrorists, Mr Erim's government has at least won a fair amount of sympathy from the rest of the world—though this is little consolation to the families of the three men, two British and one Canadian, who lost their lives.

Egypt

Jobs for the girls

FROM OUR CAIRO CORRESPONDENT

A child is born in Egypt every 40 seconds. The population passed the 34m mark last May and is expected to reach 35m by the middle of this year. The Aswan high dam will eventually increase agricultural land by a fifth but even then only 4 per cent of Egypt's surface will provide food. Too many mouths for too little food is commonplace in many developing countries, but it is just possible that ideas for controlling population growth now emanating from Egypt could offer a model for other nations.

The Egyptian proposals, named after Dr Aziz Bindari, the chairman of the executive board for family planning, have awakened the interest of the World Bank. A team from the bank visited Egypt in January ; it is still mulling over what it heard but a second visit is expected later this month. Dr Bindari starts from the assumption that conventional methods of family planning—education and the introduction of contraceptives—are insufficient by themselves and have failed throughout the developing world. The kernel of his argument is that it is no use providing women with education unless they are also provided with jobs. Such jobs must take the women out of their homes—and out of the area of male dominance.

For Egypt, and for many other traditional societies, this is a revolutionary thesis. It also confliots with the fact that Egypt suffers from a lot of male unemployment. Even so, Dr Bindari insists that any serious effort to control population growth must include the provision of job opportunities for women. One way of doing this would be the development of small factories or workshops where women could find

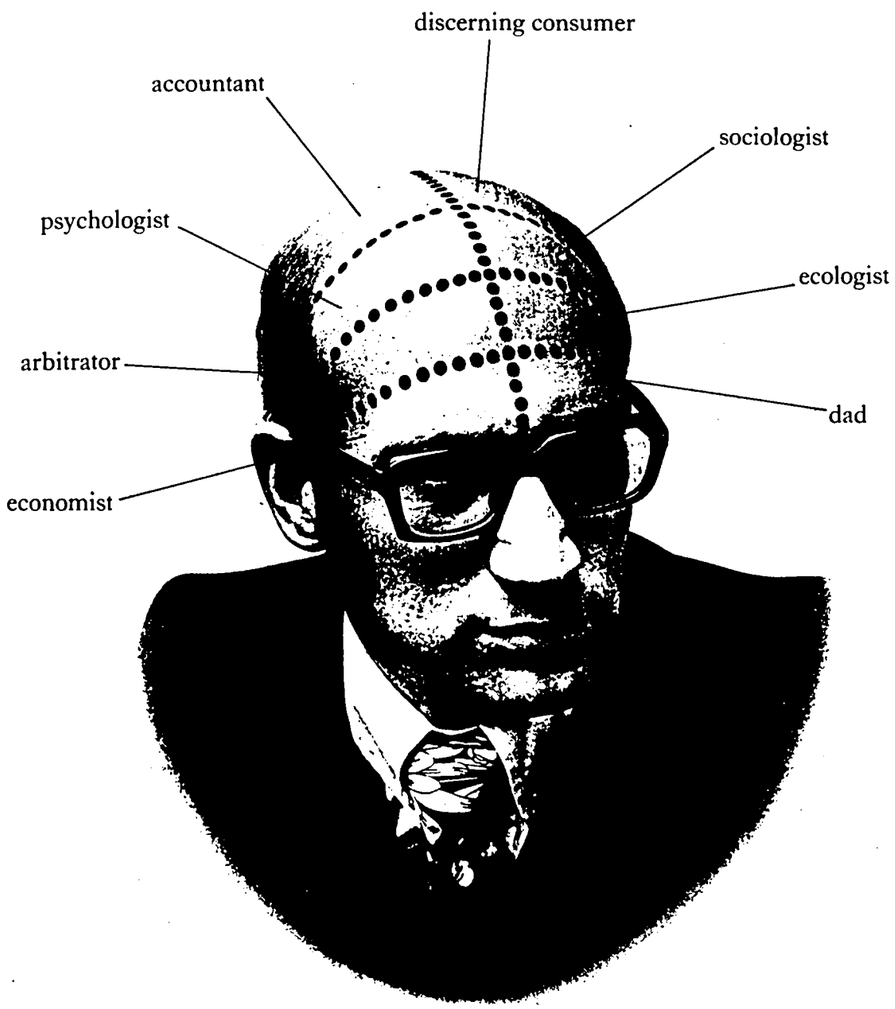
All she needs is a job

work. And women could be employed in far greater numbers than at present in the service and maintenance industries.

These plans, or hopes, for the economic emancipation of women would go alongside more conventional methods of population control. Over the past three years the annual birth rate in Egypt has dropped from 4.2 per cent to 3.6 per cent, producing a decline in population growth from 2.8 per cent to 2.2 per cent a year. But Dr Bindari, whose board started work five years ago, does not attach much significance to these statistics since the situation has been distorted by the conflict with Israel and the long absence from home of young men stationed on the Suez canal front.

Religious obscurantism is not, in Dr Bindari's view, a serious factor inhibiting birth control. An Islamic conference on family planning in Rabat in November concluded that Islamic teaching was not against contraceptive measures, although it did reject sterilisation and abortion. The debate continues among Islamic authorities, and the Egyptians have been arranging courses for village imams in an effort to persuade them not to oppose the birth control work being done at the 2,400 government health centres. An important part of the work of these centres is to educate women to care more for the health of their children ; this, at least in theory, makes them more receptive to arguments for limiting the size of their families. Infant mortality in Egypt has dropped, though still 118 per thousand, but the health of the survivors remains at the mercy of malnutrition and poor sanitation.

Dr Bindari and his board do not dispute the necessity of present methods of birth control ; they argue that conventional ideas should form the basis for new ideas. This has led to the proposition that women should not only be made more aware of themselves and their children but should also be offered a degree of economic independence ; this, they say, would help to break the social pattern of developing countries and thus the attitude towards childbirth. It is a hard thesis to sell, whether to a traditional society or to the bankers who are being asked to put up the money for the factories and the maintenance centres. But since the World Bank's president, Mr Robert McNamara, is on record as saying that the population explosion is the fundamental issue facing economists, hard thought should be given to Dr Bindari's ideas.



Lebanon

Wife and bitter

FROM OUR LEVANT CORRESPONDENT

The British pub, imported into Lebanon, is encouraging a slow but profound change in the social relations of the sexes. About six months ago Beirut boasted just one pub, The Duke of Wellington. Its owner, a Palestinian, Mr Mounir Samaha, had lived many years in England and started it in order to introduce to the Lebanese an aspect of British life that he admired. Its steadily growing popularity has added half a dozen new pubs in as many months. Their names are robustly British, The Toby Jug and The Rose and Crown, whose half-timbered front is the ground floor of an eight-storied glass-walled office block. Yet in Beirut, as in Britain, not all the new pubs succeed in capturing the authentic old-fashioned atmosphere. Most of them glitter with horse brasses, warming pans and hunting horns, but the shininess of some of the wooden beams leads one to suspect fibreglass-complete-for-export.

It is not so much the draft beer and Cornish pasty that are pulling in increasing numbers of Lebanese customers, now one-third to the foreigners' two-thirds. It is the atmosphere of discreet conviviality that goes along with a pub. It is just about the only place where anyone, especially young couples, can go for a quiet drink. Most of Beirut's bars are repellent places—dark, plastic-coated dens frequented by over-obliging young ladies. The traditional café, serving cloudy arak and an

The Sunday Times Business News caters for the businessman with more intelligence than time. Because it gives him exactly what he wants every week. The broad picture of *everything* which is likely to affect his business –not purely City news, but an interpretation of world affairs and their bearing on his commercial scene.

So, by the same token, The Sunday Times Business News is where your advertising will be most effective. It's where our readers are accustomed to absorbing as much information as possible. So your advertisements will be seen and considered as a part of this whole. And will reach him where more specialised publications may not.

The Sunday Times Business News

Harvard Executive Seminars Europe 1972

The Harvard Business School will offer a selection of outstanding programs in mid-career education in Europe this year. Directed entirely by the School Faculty, the courses have been carefully designed and tested. They are considered to be of special interest to European managers.

Seminars, varying in length from three days to six days, will take place in The Hague between June 11 and July 7. Topics will include:

Agribusiness—future trends in managing integrated firms in the food industry.

Managing Strategic Change—capital investment programs to serve corporate strategic objectives.

Corporate Financial Reporting—impact upon management decisions of recent and prospective changes in reporting practices.

Long-Range Planning Systems—design, development, start-up, and on-going management.

Management Science and Computers—fundamental concepts in analytic approaches to decision-making.

A two-week program on "Managing the Computer Operation" will take place June 18-30, in Monaco. This course is directed toward evaluating, managing, and planning the development and growth of the data processing activity.

immense variety of hors d'oeuvres, still retains its charm, but it is a traditionally male preserve; also, with the onrush of modernity, it is disappearing.

So the young middle-class Arab woman, who is no longer content to sit alone in the evenings while her husband in the café puffs a hubble-bubble and plays backgammon, is being taken to a quiet and inexpensive pub. And because of Beirut's many Arab visitors, the institution is likely to spread to other nearby capitals. This could mean, in time, a new social pattern for the urbanised Arab.

Some of Beirut's pubs have installed darts boards, but it is doubtful whether the Arab temperament will adapt to the restrained ferocity of that particular game. Indeed, Mr Samaha says that he expects the Beiruti pub to take on some local colouring but cannot predict just what the outcome will be—bitter and backgammon, gin and tonic and stuffed vine leaves? Meanwhile he is increasing his collection of Wellingtonia. He already has a couple of Waterloo medals, and a sabre used in the battle, and tried but failed to buy the sword carried by the Iron Duke at his famous victory.

Uganda

David's lost star

The closure of Israel's embassy in Kampala which Uganda's President Amin ordered on March 30th is the culmination of several months of rapidly deteriorating relations between the two countries. When General Amin seized power in January, 1971, no foreigners' stock was higher in Uganda than the Israelis'. Indeed, some supporters of the deposed president, Milton Obote, accused Israel of having engineered the coup. Certainly General Amin gave Israel special treatment, making it the first foreign country to be favoured with a visit from the new president, who arrived with a long arms-shopping list and treated himself to an Israeli presidential jet, complete with Israeli crew.

The Israelis' influence was their undoing. Having trained the Ugandan armed forces since 1964, they were heavily involved in both the army and the air force, the backbone of the erratic general's regime. Officials at the embassy had almost unrestricted access to the president and the 700 Israeli civilians—who have now been given orders to leave the country—were at work on many different aid projects and commercial undertakings.

None of this was thought well of by General Amin's numerous African critics, most of whom, publicly at least, are also critical of the Israeli cause. Many suspected, with some justice, that Israel was using Uganda to smuggle weapons into southern Sudan where, until last month, a civil war between the Christian south and the Moslem north was being waged. But the peace settlement in Sudan has raised hopes of taking some of the steam out of the civil war in Ethiopia, where Arab-assisted Eritrean rebels are fighting the Israeli-assisted government forces. There is a new mood in Africa to keep African civil wars African.

But economic aid will still be accepted from outside, and there is little doubt that General Amin has his eye on a bit of cash from Libya which might yet stave off the considerable economic embarrassment that looms large on the Ugandan horizon. It was the general's visit to Libya in early February, during which he pledged support for the Palestinian Arabs, that decisively poisoned Ugandan-Israeli relations. But that in turn was probably preceded by an Israeli refusal to buoy up the regime any more. General Amin began to have worries for his own position and, fearing the influence of the Israelis, sent them packing. The trade gap—if not the power vacuum—that they leave may now be filled by Libya.

Pakistan

The ebb tide

President Bhutto is losing his crowd appeal. He has been shouted down in Lahore, and last Friday had to stop a speech in Sind after 9,000 members of his audience walked out on him. The root of the growing dissatisfaction is his failure to get the 93,000 Pakistani prisoners of war back from India and his inability to get the Indians to withdraw from the areas of Pakistan they still occupy. Lahore is the heart of the Punjab, where most of the army is recruited and which is, understandably, most agitated about the prisoners. Large parts of Sind are still under Indian occupation.

Mrs Gandhi's announcement on Tuesday that India and Pakistan are now in direct touch marks only a very preliminary step towards an overall peace settlement. India is apparently willing to talk about its frontier with Pakistan without preconditions—except, and this is a very touchy issue for Pakistan, that it wants to turn the Kashmir ceasefire line into an international boundary. India maintains that it alone cannot return the prisoners because they surrendered to a joint Indian-Bangladeshi command; and Sheikh Mujibur Rahman insists he will not talk to Mr Bhutto until Pakistan recognises Bangladesh.

The way for Pakistan to accept Bangladesh was smoothed this week when the United States became the 55th country to recognise the new nation, and when Pakistan resumed relations with Bulgaria. This completes the reversal of Pakistan's earlier policy of breaking with all countries that recognise Bangladesh. But Pakistan still insists that Bangladesh is not a sovereign nation.

The dilemma over the prisoners is

Ralph Bunche's responsibilities in regard to operations in Cyprus and the Middle East, while some of Mr Bunche's "special political affairs" tasks will pass to Mr Bradford Morse. Mr Morse, who has shown a lively interest in UN activities during his 12 years in Congress as a liberal Republican from Massachusetts, is a man of formidable energy with a restlessly inquiring mind, and there is no reason to suppose that his lack of diplomatic experience will prevent him from becoming a very effective servant of the UN.

Australia

Two bits fell off

FROM OUR CANBERRA CORRESPONDENT

The Liberal party is in trouble again in Australia, and its chances of still being in power after the election due in November have taken a nose-dive. Before Easter the dissatisfaction of some Liberal members of parliament with their prime minister, Mr McMahon, who replaced Mr Gorton just over a year ago because people were dissatisfied then with him too, came to a head with an attempt to call a party meeting. The attempt failed, because the dissidents did not have enough support, but it left its mark. So have upheavals in the Liberal party's position in two of Australia's six states.

There is to be an unexpected state election this month in Tasmania, where a Liberal government was unseated by the defection of the sole representative of the Centre party, whom it had made deputy premier in return for his support in an evenly divided house two years ago. The Labor party is widely tipped to win this election. The other upheaval was in South Australia, where the Liberals are in opposition. The local Liberal leader, Mr Steele Hall, resigned because he claimed he was not getting proper support from his party. The upshot has been the formation of a group called the Liberal Movement within the state Liberal party, with Mr Hall as its head.

Mr Hall is being mourned more than the government of Tasmania. Mr Hall, who had a short term as premier of South Australia, was widely regarded as bringing a breath of fresh air into a state where Liberal governments had survived for decades under an electoral system which enormously over-represented the country districts and under-represented Adelaide. Mr Hall changed this and some of his supporters have never forgiven him. He will now sit on the back benches and watch the Labor premier, Mr Don Dunstan, make mincemeat of his successor, a blameless veterinary surgeon with two years' parliamentary experience. There is little doubt that Mr Dunstan, in some ways Australia's most attractive politician, has been given an extra lease of political life by this display of Liberal dissension.

South Australia and Tasmania are among the smaller and staider Australian states, with highly parochial politics of their own and only a few seats in the federal house of representatives. But Mr McMahon's federal government has been further shaken by the considerable publicity which the state upheavals have received. The Country party side of Mr McMahon's coalition is as steady as a rock in spite of (or perhaps because of) a rural recession. But there is great dissension in his own Liberal party, largely about his own performance during a year in office. He has been uninspiring in utterance and unfortunate in the timing of damaging events, from Mr Nixon's Peking visit to the announcement of increased unemployment in January. But it seems to be too late to change leaders before the election.

Papua New Guinea

Are we ready?

FROM A SPECIAL CORRESPONDENT
Port Moresby

At last the votes have come in from the highlands and islands, and Papua New Guinea—one of the world's last big colonies, the size of Thailand with 2.4m people—has completed its third general election. The voting in this territory of scattered settlements and inaccessible valleys took three weeks, and counting the votes more than another three. The result is another uncertain step towards self-government.

The new 100-seat house of assembly is more articulate and more radical than its two predecessors. In the two regions that have become the Australian administration's running sores—Bougainville island, where there is a vast new £400m copper mine, and the land-hungry Gazelle peninsula of New Britain island—separatist and anti-administration candidates won overwhelmingly. But the questions of who will lead the first local government, and when, remain unanswered. Neither of the two major parties by itself commands a majority in the new house.

The Pangu party is radical and nationalist, and is committed to immediate self-government. Its support is drawn from among the brightest local people. It won 21 seats, and has the support of 13 other new members, including the representatives of the dissident regional organisations of Bougainville and the Gazelle. It also has a sporting chance with at least eight of the 17 non-aligned members, who are now being frantically courted by both the big parties. But even this does not bring it over the 50 mark.

Its major rival is the United party—conservative, with its strength in the highlands, and backed by foreign business interests. The United party, which had hoped for at least 60 seats, has won only 40, including independent supporters. The swing against non-local candidates has been a body blow to it. Its 10 expatriate members in the last house were essential to its discipline and grasp of the complexities of government; now it has only four. Half the United party's parliamentary group have had no formal education.

The key to the first home government is held by the People's Progress party, eight strong, with the chance of up to four more seats among the independents. The People's Progress party has no platform of its own; it just wants to be a partner with whoever forms the first local administration. Its leader, a part-Chinese businessman, Mr Julius Chan, insists that it will remain uncommitted until the new house convenes on April 20th. Until then the numbers game gives only the most tenuous guide to form.

The attitude of Australia's Liberal government is that it will continue to govern the territory until an alternative government commanding a majority in the house of assembly emerges. The Labor party, which could very well win the Australian general election to be held later this year, would grant immediate self-government, regardless of the wishes of the house of assembly.

At village level the notion of self-government, so far as it is understood at all, denotes the withdrawal of Australian expertise and grants of aid, and is therefore the cause of some alarm. Papua New Guinea is peculiar among colonial territories on the verge of self-government in that no charismatic figure has emerged to mobilise the people in an independence struggle. The people of Papua New Guinea are stubbornly parochial in their politics. The principal problem will be to prevent self-sufficient and developed regions such as Bougainville and the Gazelle peninsula from seceding.

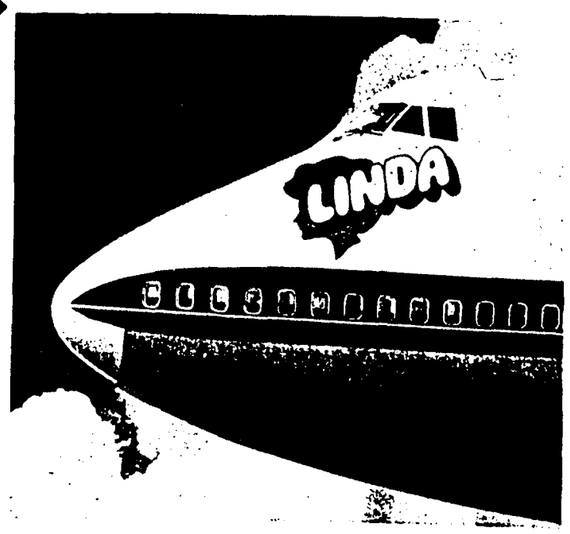
How can your company save money by spending £205,556?

By investing in the proven Beechcraft King Air C90

It's the corporate aircraft that talks managing director's language. It saves money because the standard UK price of £205,556, fully equipped ex Leavesden, includes as standard costly "extras" other corporate aircraft need for genuine all-weather operation. Because it can fly, at times that suit you, to places where corporate jets can't land and airlines don't go. Because it has proven reliability – there are over 500 King Airs in service, flying more hours per year than all other corporate turboprops combined. Because its turbine engines spell operating economy. And the C90 adds a big bonus in comfort – smooth, quiet turboprop flight, full pressurisation and air-conditioning, extra-roomy interior in a variety of layouts. Let your pilot check the C90 specification – it talks his language, too. Send us the coupon and we'll send you the proof!

Our own demonstrator – equipped to a still more advanced standard, with flight system, autopilot, reverse pitch etc. is now available – for £220,035.



Sole distributors in the UK, Republic of Ireland and Channel Islands for the versatile Beech range of aircraft.

Eagle Aircraft Services Limited

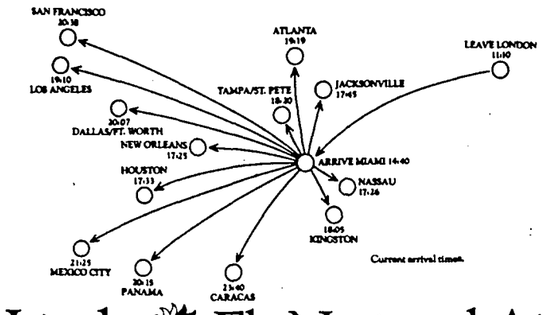
I'm Linda. National's daily 747 from London to Miami. Fly me.

I've got more going for you to Miami and the Southern U.S.A. than anyone else.



Like nice convenience, with 747's to Miami every day beginning 26 May. Pick the day you want to go.

Like nice creature comforts, too: international gourmet cuisine, first-run movies* and a choice of multi-channelled audio entertainment.

Like nice tours in the U.S.A., the Caribbean and Mexico. (Your travel agent has all the details.)

And like the nice added convenience of great connections on National Airlines in Miami to all of Florida, New Orleans, Houston, California, the Caribbean, wherever you're going.

Give it a go, won't you? Fly from London to Miami on our daily 747.

Fly Linda. Fly National Airlines.

National Airlines, 81 Piccadilly, London W.1. (Reservations: 01-629 8272)

Spring books

"Books remain essential tools for preserving and diffusing the world's storehouse of knowledge"

"Society has an obligation to ensure that everyone has an opportunity to enjoy the benefits of reading"

"To enable all to share in the world's creativity, the unhampered flow of books is vital"

"Books constitute one of the major defences of peace"

Charter of the Book, 1972

Books do furnish a year 2 Wilson's economists 3 Francis Drake 4 Nelson 6 Isadora Duncan 8 James Joyce 11 Updike 12 Habsburg empire 14 Toxic metals 17 Fishes 18 Stanley Spencer 20 Fictional history 21 Sherlock Holmes 22

Books do furnish a year

This year is International Book Year. Unesco has said it, so it must be true. And here are the commonsensical French, handing out 2m or so copies of their classics—six at a time—to those of their countrymen who present themselves for marriage, for a year from April, 1972 ; here is the king of the Belgians extending his royal patronage ; here are the other western European countries gathering together serious and impressive committees ; here is the Ukrainian republic organising its own book year exhibitions (whose theme—need one say it ?—is the fiftieth anniversary of the Soviet Union) ; Guatemala and Trinidad and Tobago have apparently been girding themselves for IBY ; Indonesia is organising celebratory competitions ; in Paraguay April is "Book Month." What, cries one half of the British book world, in an orgy of self-exhortation in which the example of Chad appears to be the favourite instrument of flagellation, is Britain doing ?

The other half knows perfectly well what it is doing : selling books. That is rather different from selling The Book. What Unesco intends with International Book Year is fairly clear : the Charter of the Book, composed by the IBY support committee, contains, between the blinding glimpses of the obvious ("Book manufacturing facilities are necessary to the development of publishing") to sweeten all sides of the industry, a clear exhortation to developed countries to help with the eradication of illiteracy and the creation of libraries and publishing businesses in the poor countries. Canada, at least, appears to have got its message. Under the ungainly slogan "To read is to be," Canadians are to be encouraged to contribute towards developing countries every time they buy a book or take one out of a library in 1972. And in America, the Asia Foundation is endeavouring to buy and ship 1m books to Asian students this year.

The Charter of the Book, a trifle defensively (is IBY another conservation year ?) maintains stoutly that "Books remain essential tools for preserving and diffusing the world's storehouse of knowledge." In Britain the defences are being prepared with an April conference, at the National Film Theatre, entitled "Do Books Matter ?" No one could suppose that the conference would be so ungallant as to conclude that they do not.

Unesco's argument is simple enough : everyone should have the chance to read, everyone has some kind of right to literacy, because it is an almost essential step to knowledge, advancement and opportunity. But how much missionary zeal can one have in Britain, where (nearly) everyone can read ? The National Book League, which is organising Britain's main effort for IBY, a National Book Week in November, is making this a kind of mission not to the illiterate but to the non-reader. Its organiser, Mr Simon Newlyn, talks of the librarian "going out into the community" as if he or she were some kind of social worker. If a country village wants a mobile library van, that's obviously a valuable service : if the NBL succeeds in its book week plan for a bus full of children's books to tour Belfast (provided it is not converted into a barricade) then it will obviously be performing another : children need every encouragement towards literacy. But if adults don't want to read, if they prefer television, why should anyone but publishers suppose that that is a bad thing ?

The Charter of the Book declaims :

> Books constitute one of the major defences of peace because of their enormous influence in creating an intellectual climate of friendship and mutual understanding.

Its authors are presumably ignoring

Book Week symbol : divine patronage ?

"Mein Kampf," or indeed "The Prince." Books do still provide the best medium for communicating certain sorts of ideas, beliefs or information. But there is curiously little agreement, or even argument, on precisely what these are. The National Book League extols books-in-general because that way it remains impartial between one publisher and another—just as it fixes on the non-reader because that way it remains impartial between the book-buyer and the book-borrower. Book-bang, the book fair it organised in London's Bedford Square last summer, sold 13,000 books and made a loss of £30,000. But the National Book League could argue that the publicity it received was worth a good deal more.

Campaign spending

The more large-minded of publishers are prepared to encourage and finance such general affairs, but it is very hard to quantify the returns. Even the publicity is of doubtful value. Selling books is a tricky business. Only the popular bestsellers—books-of-the-film, like "The Clockwork Orange," gain from big publicity campaigns. For "Tutankhamen" the publishers—also Penguin—are spending £8,000 on a publicity campaign : but then it is timed to coincide with a major British Museum exhibition and with a BBC television series (and innumerable other new and reprinted books on Tutankhamen) and is expected to sell 250,000 copies. For specialised books the thirst is for more market research : Associated Book Publishers, for example, are concentrating their energies on sophisticated mailing lists. Publishers have at present a passion for regional books, for which the local bookshop is a naturally good advertising point. One or two publishers are retiring into their shells and relying on point-of-sale publicity in bookshops. So the organisers of National Book Week are having a time squeezing £10,000—a ludicrously small sum from an industry with a turnover of nearly £154m a year—out of them.

It is not just that the publishing industry is not geared for corporate effort. It is, after all, impossible to advertise books in general in the way that brewers and farmers can advertise pubs or milk. The printed word is not interesting in itself : one can only sell individual, different books. The Swiss came as near as they could to a homogenised book with a free paperback of extracts : the result was so unappetising that one would be

astonished to learn that it had converted one non-reader.

In Britain, the book week fixtures will at least be more fanciful. Most of the work will in fact be done by local committees—which means, in effect, local libraries, with a little bit of help from their friendly bookshops. Like most of the international book fairs this year that are now flag-waving for Unesco and IBY, the first British National Book Week would have been launched in 1972 anyway : it grew out of the library weeks that were organised in the 1960s, until librarians got fed up of doing publishers' gospel-spreading donkey work by themselves. Of the national events, the Children's Book Show is also a familiar fixture ; this is one of the more hopeful of publishers' regular efforts at co-operation.

But how is the NBL preaching to the adult unconverted ? By organising the exhibition of a "live girl" in an Oxford Street shop window (accompanied by books, of course) ; by a clutch of celebrities explaining why they like to read what : by "Paperback Million," a discotheque-bookshop under Hungerford Bridge in London, with 4,000 different titles on show. With what sort of book can the non-reader be snared ? Publishers, and the NBL, have some down-to-earth answers to that : books-of-the-film, and books on hobbies—how to take your car or motorbike to bits, for example.

They're right, of course : such books sell well, to a wide audience. But it's ironic. These are just the kind of books where one would suppose the medium was at a disadvantage. Who has ever read the book, after the film, without feeling irritated at the discrepancies ? And if the book comes second, doesn't it, for most people, take second place in the imagination ? Who, for that matter, has ever read a really easy-to-follow book of mechanical instruction, one which was preferable to just 20 minutes of instruction by someone with the least understanding of the subject ? How, then, do you make people want books ? By associating them with sex, or glamour, or pop music? That may work for cars or cola drinks, but can one really turn a paperback into a virility symbol ? And if so, what's happened to the book ? There is a notice in an old part of the Bodleian Library in Oxford which says : "Books for reading." Perhaps that should no longer seem funny. Nowadays, there seem to be so many other kinds.

People

Eunuchs at the court of King Harold

THE LABOUR GOVERNMENT'S ECONOMIC RECORD, 1964-70
Edited by Wilfred Beckerman.
Duckworth. 343 pages. £4.95.

Eight of these 10 British economists were driven by progressive sympathies into serving in Whitehall during the Wilson governments. Mr Roger Opie and Mr Michael Posner write the best English ; their essays are the most amusing, the most concise, the most cynical but perhaps the least helpful. Mr Wilfred Beckerman has thought the most deeply and boldly, albeit sometimes round in a circle ; but a power of terse sub-editing is not one of his many virtues. The other essays range from the tiresomely self-exculpatory through the pedestrian to affecting laments from those who joined the Ministry of Overseas Development—without realising that Mr Wilson's political gimmick of hiving aid into a separate department tenanted by themselves was bound to mean that departmental pulling power, and thus the total, of overseas aid would be brutally curbed.

The authors express their individual opinions, but come to a fairly general consensus. The great mistake of the Labour government was not to devalue sterling sooner ; it was this that made Britain's growth record so awful and Labour's planning a farce. Labour moved to greater equality of domestic incomes than is generally credited, but was even more wicked about curbing overseas aid than is usually believed ; however, the equalisation of domestic incomes came largely through curbing profits, which led to the present slump in investment and today's unemployment. Mr Wilfred Beckerman waxes crossest with the trade unions, and wants Labour to rethink its relations with them. Militant unionism, he cries with ample economic logic, "has been against the interests of the working classes. Messrs Jack Jones and Hugh Scanlon are either incapable of understanding this or are guilty of cynical betrayal of the interests of their members." Most of the other authors would probably not go so honestly far.

Indeed, the depressing feature of this book is the way in which these intelligent men codded themselves into playing a eunuch's role. In America academics who go briefly to serve in the Administration generally come back to better jobs, especially if they have become controversial public figures while in Washington. The result is that they go there—and not only during such flowering periods as the Kennedy presidency—with a genuinely burning ambition to set the world to rights. In Britain really able men—as distinct from second-raters—who go temporarily to Whitehall on balance probably slightly disrupt their careers. The only able ones who go are therefore those with a party political commitment. Once in government, they fall easily into the awful British habit of assuming that it is right even for educated men to sponsor nonsense policies if the wicked Tories (or today wicked Labour) would make temporary political capital out of any sensible ones that were adopted. Even Mr Beckerman says at one point here that : "those who assert that the pound sterling should have been devalued in 1964 know their economics but not their politics," and the dust-cover asserts that the authors who have served in Whitehall now "appreciate that the art of economic policy is usually far more difficult inside than it may appear to those outside." On the few occasions when ministers have done what was previously called politically impossible—Butler's dash for freedom from rationing via cutting the food subsidies in 1952-55, Macleod's refusal of an agreed court of inquiry to London busmen in 1958, even Labour's eventual devaluation in 1967—the exact opposite has proved to be true. This reactionary defeatism has not only blighted British governments' policies ; it has now begun to blight British academic economics, as the doctrine of the "politically possible" castrates all progressive or original thought. The proper doctrine for any economic adviser is that eunuchry is neither honourable nor fun.

The big four

A STATE OF DISUNION
By Calton Younger.
Muller. 349 pages. £3.80.

Ireland's partition half a century ago was the result of neither divine intervention nor that English fondness for the strategy of divide and rule. Mr Younger contends that the separation of Ireland's six north-eastern counties from the rest of the country was "a weary compromise tinged with optimism" and not "a wicked British

plot." His readable and unpretentious account of the careers of four of the main protagonists who shaped the 1921 Anglo-Irish treaty—Arthur Griffith, Michael Collins, James Craig, and Eamon de Valera—is fortunately free from easy emotionalism and crude jargon. And he has made thorough use of the readily available British cabinet records for the interwar years.

Neither Lloyd George, nor even his Unionist cabinet colleagues, envisaged that partition would be permanent. The 1920 Government of Ireland Act was drawn up with the assumption that the eventual unification of the country lay, paradoxically, in its temporary division. The cabinet agreed with much reluctance to accede to the Ulster Unionist demand that it should be six and not all nine counties of the province of Ulster that were to separate from the rest of Ireland. In the event, partition seemed to become immovable. The All-Ireland Council came to nothing. The abortive boundary commission applied a narrow view to its terms of reference and merely tinkered with the frontier.

It is possible that either Arthur Griffith or, more probably, Michael Collins might have achieved reunification by peaceful persuasion. Both men emerge from Mr Younger's book as men of compromise. But there are genuine doubts about that. Captain Craig was much to blame for the hardening division, although Mr Younger is honest enough to admit that he was no Protestant bigot. But the main trouble lay with the Irish republican determination to smash the remaining tenuous political links with Britain. And here the culprit was chiefly the inflexible and determined Mr Eamon de Valera, with his vague notion of external association. Mr Younger recalls that Britain offered de Valera unity on a plate, if he joined the war against Germany in the summer of 1940. But Mr de Valera refused, despite the blandishments of Malcolm MacDonald and Neville Chamberlain. Nothing did more to build up the barriers of partition than his extraordinary public condolences to the German ambassador on Hitler's death. Mr Younger concludes that:

> had the republic meant less to him the reunion of his country might have been more attainable. But the more strenuously he worked to dismantle the treaty of 1921, the nearer he brought Ireland to its destiny as a free and independent republic, the more deeply embedded the border became.

De Valera : republic before reunion

The Protestant freebooter

SIR FRANCIS DRAKE

By George Malcolm Thomson.
Secker and Warburg. 368 pages. £3.50.

Now that privateering has again become fashionable—though in the air rather than on the sea—a life of Drake provokes comparisons. Like some hijackers, Drake was driven by ideals; unlike most of them he made a great deal of money. But he fought as well against the Armada, when there was no chance of booty, as he ever did in the Indies or the Pacific.

What made him a legendary figure in his own time, next to the queen herself perhaps the most celebrated Englishman of the age? Bandits on land and pirates at sea had long been part of European society; some of them, like Robin Hood, acquired mythical fame. But Drake, while enjoying the glamour of the bandit, angrily denied the name of "pirate." He was a privateer, product of the peculiar conditions of late sixteenth-century Europe. The vast new opportunities of the new world and the oceans overwhelmed the state machines: the Spanish crown was too weak to protect its monopoly, the English too poor to destroy it. The freebooter of genius, unofficially backed by his government, could win a fortune, serve his country, and advance the true religion. Before the middle of the sixteenth century Drake could only have been an insignificant pirate; after the middle of the seventeenth he would have been a naval officer.

As Mr Thomson very vividly shows, Drake had all the qualities required for the role. He was decisive, brilliantly original, unfailingly energetic. When necessary he was ruthless: the mutineer Doughty was summarily

Drake : strictly privateering

executed and Drake called out "Lo, here is the end of traitors!" Yet he was compassionate to his enemies and, more important still, kept such firm discipline over his men that needless killing was always avoided. He had a charismatic quality of leadership which drew men like Sidney and Essex to his expeditions. He could also obey commands: "I must not omit to let you know," wrote his superior, Howard of Effingham, "how lovingly and kindly Sir Francis Drake beareth himself; and also how dutifully to her Majesty's service and unto me, being in the place I am in."

Drake was in a way a man for all classes. Son of a poor but well-connected family, apprenticed to the skipper of a Channel trading-boat, he could handle gentry and seamen. Speaking to his crew after Doughty's mutiny he tried to reconcile the two:

> Here is such controversy betwixt the sailors and the gentlemen and such stomaching between gentlemen and sailors, that it doth even make me mad to hear it. But my masters, I must have it left, for I must have the gentleman to haul and draw with the mariner, and the mariner with the gentleman.

He could talk as well as act.

Mr Thomson has not written an academic biography and he has probably not uncovered many new facts. But he is well acquainted with the recent literature on the period, which is unobtrusively worked into his account, and he has achieved a successful balance between the life and the times. Above all, he has written a clear, compelling, well-illustrated and honest narrative, free from the heady speculation and romantic colouring which too often pervade books on this period.

Readings in British Monetary Economics
Edited for the Money Study Group by HARRY G. JOHNSON and others
These readings have been selected by a committee of British monetary economics teachers to provide a comprehensive introduction to recent work on the major aspects of the British financial structure. £5·25 paper covers £2·25

The Legal Aspect of Money
With Special Reference to Comparative, Private, and Public International Law
F. A. MANN
In this revised and largely rewritten edition, a great deal of new material has been included. In particular, some new aspects of nominalism and certain legal implications of inflation are covered, and the part dealing with the ever-growing public international law of money has been further elaborated. Third edition £9

The Prevention of Racial Discrimination in Britain
Edited by SIMON ABBOTT
This study discusses discrimination in relation to British society as a whole, reviews the history of immigration to the U.K., examines discrimination in housing, education, and employment, and reviews the prevention of discrimination through recent legislation and various bodies. £5
Institute of Race Relations

Prosperity and Depression in Australia 1887-1897
E. A. BOEHM
This book provides the first detailed explanation of the transformation of the Australian economy in the early 1890s, when an era of rapid growth and an excessive speculative boom in urban land and mining shares ended in a deep depression. £6·50

The Cloth Industry in the West of England
from 1640 to 1880
J. de L. MANN
Although 'West of England cloth' is a well-known expression, the history of its production has only been partially explored. This is the first book to cover the whole area in Gloucestershire, Wiltshire, and East Somerset in which it was made. 1 map £3·50

DOMI NVS ILLV MINA TIO MEA

Economic Sanctions and International Enforcement
MARGARET P. DOXEY
£1·25 *Oxford Paperbacks Royal Institute of International Affairs*

West Indian Societies
DAVID LOWENTHAL
In this first comprehensive study of the non-Hispanic Caribbean, the author considers the impact of slavery and colonialism, black power and *négritude*, and racial, ethnic, and class interrelationships. 1 map £4·50 *Institute of Race Relations*

Scientific Knowledge and Its Social Problems
JEROME R. RAVETZ
'. . . thoughtful, incisive, scholarly, lucid, humane, and sane. Everyone—but everyone—within or concerned about science should read it slowly and carefully.'—JOHN ZIMAN in *Nature* £5

The Fascist Economy in Norway
ALAN S. MILWARD
This is a study of the Norwegian economy under Nazi occupation, when it was managed for five years by two fascist parties, the Nasjonal Samling and the German National Socialist Workers' Party, each of which wished to create a different economic order. £5

Germany's Ostpolitik
LAWRENCE L. WHETTEN
Dr Whetten analyses the issues at stake in Chancellor Brandt's new 'eastern policy', and shows how the future development of the Federal Republic's relations with her eastern neighbours depends on and in turn affects the prospects for a broader East-West détente. £1·75 *Oxford Paperbacks Royal Institute of International Affairs*

OXFORD
UNIVERSITY PRESS

The Foreign Policy System of Israel
Setting, Images, Process
MICHAEL BRECHER
Professor Brecher illuminates Israel's behaviour in a setting of intense hostility from 1948 to 1968, and contributes greatly to our understanding of Israel's political structure. Endpaper maps £7

The Survival of Small States
Studies in Small Power—Great Power Conflict
DAVID VITAL
Professor Vital examines the problems of the small state when confronted by a major power. He first analyses the question generally; then uses three paradigms to illustrate his theme: Czechoslovakia against Germany in 1938; the Arab-Israel-U.S.S.R. conflict; and the *modus vivendi* between Finland and Russia. £2

Education and Politics 1900–1951
A Study of the Labour Party
RODNEY BARKER
This first comprehensive account of the educational policy of the Labour Party complements the traditional approach to English parties which defines them in terms of broad categories such as 'socialism' and 'liberalism', and illustrates what assumptions were held in one area of policy. £3

The Conventions of Crisis
A Study in Diplomatic Management
C. BELL
The author argues that peace between the great powers since 1945 has survived less through the institutions originally set up to protect it than through the growth of a set of conventions of crisis management. £1
Oxford Paperbacks Royal Institute of International Affairs

Outcast London
A Study in the Relationship between Classes in Victorian Society
GARETH STEDMAN-JONES
Mayhew, Dickens, Booth, and Gissing notwithstanding, the history of London in the 19th century remains largely unexplored. In this book it is argued that Victorian London experienced a crisis of social and industrial development, the central place in which was occupied by the problem of the casual poor. 12 plates 2 maps 7 text figures £4·50

INDUSTRIAL RELATIONS

A contemporary Survey

By Richard Lowndes

On the Field of Industrial Relations the Labour Government produced a White Paper and a Bill; the Conservative Government a consultative document, Bill and finally an Act; both the TUC and CBI have published analyses, reactions and proposals; and preceding all these the Royal Commission produced its own report.

In this book Richard Lowndes has endeavoured to trace a path through this material: to bring together, compare and contrast the principal proposals and interpretations that have issued from the above and similar sources.

To be published May 1972. ISBN 0-03-910134-7. Price (Limp) **£2.45.**

Apprentice Wellesley

WELLINGTON IN INDIA
By Jac Weller.
Longman. 355 pages. £5.50.

With this book on Wellesley, as he then was, in India, Mr Jac Weller has completed a notable trilogy on Wellington's military career, of which the first book, on the Peninsular war, is pre-eminent. It has been a most assiduous achievement, for Mr Weller's forte is accurate detail. Before writing these books he has, for example, tramped over every battlefield. His energy and his care seem to be almost as prodigious as his subject's.

The final result is the most complete military analysis of Wellington as a general yet written. All the facts, one can safely assume, are there. Mr Weller is an ardent and enthusiastic admirer of Wellington. He is not, of course, alone in that; but, taken together, his books are an encomium. This is not too serious a defect; the bonus from Mr Weller's unstinting admiration is that he does succeed in isolating and emphasising those of Wellington's qualities which made him so great a commander.

Of these, Wellington's physical energy and stamina are as important as his common sense. These qualities enabled Wellington in all his campaigns to be very much his own chief of staff, his own chief of intelligence and, perhaps above all else, his own quartermaster-general. In the victor of the short campaign culminating at Waterloo it is easy to lose sight of the man who was a master of what was then known as movement and supply (and is now more grandly called logistics).

It was that mastery of apparently mundane matters that brought Wellington his victories in Spain and Portugal. And, as Mr Weller—treading in the footsteps of Mr Philip Guedalla—makes abundantly plain, Wellington learnt his trade in that and many other respects in India. There, he acquired his skill in military and political administration. There, he was more audacious in his tactics than he ever proved to be in Europe. But yet another of Wellington's virtues was to see into his opponents' minds—to estimate, to use one of his own phrases, what was going on on the other side of the hill—and to shape his battle-plans accordingly.

After Waterloo Wellington rested contentedly on his military laurels. Mr Weller can now rest contentedly on his literary labours. His latest book will, presumably, command only a limited, specialised market, though taken together his three volumes deserve a wider audience than that. But the price is steep.

The sepoy general

The little admiral

NELSON THE COMMANDER
By Geoffrey Bennett.
Batsford. 334 pages. £3.90.

This is the first life of the great naval hero to be written by a professional naval officer since Mahan's appeared 75 years ago. Like its predecessor it benefits from its author's background: unlike it, it is one of a series written specifically to study the man as a commander. It aims to examine the extent to which the little admiral's colossal reputation is justified today, and it ends with that splendid phrase on the monument in Guildhall—"the period of Nelson's fame can only be the end of time." But it only reaches that conclusion after an imaginative but critical analysis of Nelson's service career.

Is there anything new to be said about Nelson, either in the discovery of new material or in the redeployment of accepted knowledge? Captain Bennett has not contributed much to the stock of knowledge; his book is more valuable for its critical reappraisal of the subject. And it must be said that the promised study of the commander's career is not as specific as the title suggests. The historian will find an imbalance between description and synthesis and

Nelson: judged by his profession

he may also cavil at one or two unsupported generalisations, such as the criticism of Keith. Both the historian and the general reader may find some of the footnotes fussy and irritating, and the twentieth-century comparisons irrelevant and unhelpful. But once they get into the book they will find it both useful and well worth reading.

The most important and the best part is that which deals with the Mediterranean from 1798 to 1800. Here Bennett makes good use of the recently published papers of the Russian Admiral Ushakov, and shows a masterly grasp of his subject in describing clearly the changing pattern of events in those waters. The same lucidity characterises the subsequent chapters on the Baltic operations and the last long blockade and chase that culminated in the Trafalgar campaign. There is an excellent sense of professional perspective when naval matters are being dealt with. The author is reluctant to dwell too much on Lady Hamilton, but makes clear the extent to which she seduced Nelson. The First Lord, Earl Spencer, showed great forbearance at that time, remarking merely that Nelson's "further stay in the Mediterranean cannot . . . contribute either to the public advantage or his own." Bennett rightly decides that all to whom Nelson's is "a peerless name" must be dismayed by his conduct when the Mediterranean command was prostituted.

Happily, the Baltic expedition restored the tactical, strategic and diplomatic reputation of the admiral. Then came that superlative last command-in-chief with the final annihilating action of Trafalgar and that glorious, so fortunately timed death. It is a pity that the last chapter produces a disappointing analysis of the career which has been so well described.

Period padre

CLAYTON OF TOC H
By Tresham Lever.
John Murray. 271 pages. £3.

Tubby Clayton's life's work was formed by three years' intense experience of war, based not at the front line but just behind it, where it was the psychological carnage that was most clearly visible. The Old House at Poperinghe, with the chapel in its Upper Room, became a focal point for troops from a wider area than the Ypres Salient; and its impact was immense. But though Clayton, like Florence Nightingale at Scutari, acquired a national reputation during his war years, like her he would not have achieved national significance had he not devoted his considerable administrative and personal abilities to developing his war experience to its organisational conclusion in Toc H.

Clayton was a cult figure in the interwar years, drawing large crowds to his sermons, dining privately with the royal family, and receiving rapturous welcomes from Singapore to Montreal. In some of the battles he fought he now seems farsighted: in his efforts to bring young people into Toc H, so as to prevent it from becoming merely a veterans' association; in his campaign to ensure that no one was barred from ordination by a lack of private means; and in his exploitation of American tours for fund-raising he was ahead of his time. But what emerges from this book is how hopeless it would be to judge Clayton in his heyday by today's standards. Most obviously, he was pro-war and anti-women, and unashamed in his preference for men from public schools with first-class degrees. His concept of spirituality was based not on any free-ranging mysticism, but on rigid discipline imposed from a standpoint of dogmatic orthodoxy. And he showed scant interest in the causes of poverty.

Mr Lever's book is adulatory. He

HMSO BOOKS

manages to convey a period atmosphere by writing totally within the conventions which bounded Clayton's thinking. There are lists of the names of his contemporaries at every stage of his career, whether he knew them or not, together with the high offices they eventually attained. There are proud accounts of the social conventions that Clayton broke and was admired for, like talking to footmen about their families. Above all, there is a total lack of concern with Clayton's methods of work—he is always described as creating an impact by force of personality, and what he actually did is left unsaid.

This absence of methodology is bound up with the purpose of Toc H itself, which was to recreate the selfless comradeship of the trenches rather than to implement any social programme. As the nostalgia recedes, Toc H declines, and it may well be that Clayton's most lasting contribution will be seen to have been on the environmental planning of Tower Hill.

Joining the dance

THE REAL ISADORA

By Victor Seroff.
Hutchinson. 441 pages. £4.

Anyone who attempts the biography of Isadora Duncan is making marks on quicksand; the more he tries to find a footing on the works of others, on Gordon Craig, on Mary Desti, on Alan Ross Macdougall or on Isadora Duncan herself, the more he finds himself engulfed in contradictions. Mr Victor Seroff seems to have a grasp of the elusive and extravagant facts—and even of the elusive and extravagant personality of Isadora herself—but his style is a sore trial to those who faithfully follow him through the 400-odd pages of his narrative. The book reads as though it were translated from Russian into dubious American, and it is daunting to come across such a sentence as this: "A violinist from childhood, at the age of 19, on Ignace Paderewski's advice, he changed to the piano"; there are too many of them.

There is something distinctly odd, too, in reading of Isadora "living and enjoying life" at "Paris Singer's chateau [without any accent] in Paignton in Devonshire." In a way this oddity, this sense of foreignness, in Mr Seroff is a positive asset when it comes to an analysis of a character which ransacked the cultures of the world, now Greek, now Whitmanesque American, now communist Russian,

Isadora: something genuine

trying them on and discarding them like a child.

Unfortunately Mr Seroff lacks the historical sense, the ability to compare and contrast, and this is a pity; there is room today for a book on Isadora Duncan which would put her in her proper perspective. She was, in a sense, the first of the pop stars, appealing to the young and the left, using the dance as her instrument as the Beatles used sound. Like them and their imitators, she reached out for a form of ready-made mysticism, and it would have been fitting had her hilarious trips round the world included a visit to the sacred Ganges and Hindu temples.

As it is, her tour of America after the first world war with her Russian poet husband, Essenin, bears a strong resemblance to those undertaken by another of the (comparatively) moderns, Dylan Thomas, with whom Isadora would have had a natural affinity; only this time it was Essenin who did the drinking, with Isadora supplying parallel outrage in the form of tactlessness and emotional excess.

Mr Seroff, however, once again misses his chances. His book, although it picks up towards the middle and the end, when he is in a position to recount conversations with Isadora and those who were near to her, remains something of a muddle. So, of course, did Isadora's life, from its unpromising beginnings in San Francisco down to the fatal motor accident in Nice. All was an outpouring of talent and generosity, but so often misdirected and fruitless. Everything to do with her was on the preposterous side, but there was something genuine—in her enthusiasm for her "schools," for instance—and heroic in her, and Mr Seroff is sensitive to it.

Places

The vulnerable lagoon

ART AND ARCHITECTURE IN VENICE

By Ronald Shaw-Kennedy.
Sidgwick and Jackson. 254 pages. £1.50.

NO MAGIC EDEN

By Shirley Guiton.
Hamish Hamilton. 209 pages. £2.50.

Quite why "Art and Architecture in Venice" should have wheedled out of Lord Norwich and his British committee the subtitle of "The Venice in Peril Guide" it is impossible to see: the coverage it gives to Venice's problems is confined to a few perfunctory sentences and a bit of exhortation from Lord Norwich himself as an introduction.

This is a nice little guide, which concentrates on Venice's lush profusion of renaissance pictures. Few guides actually tell one in which obscure church the inevitable half-acre of entirely unlit canvas is actually by Tintoretto; Mr Shaw-Kennedy has worked very hard (with, one presumes, a large spotlight) and can tell us. But anyone not about to get lost in Venice, searching from church to church, will find Miss Guiton much more interesting. She actually knows what is happening in the lagoon; after all, she lives there.

Miss Guiton bought, a few years ago, a vineyard on Torcello, that wildly attractive, almost desolate backwater which was once the administrative and cathedral centre of island life in the lagoon until, in the fourteenth century, the Rialto pushed it into obscurity. It was not until the second world war that malaria was eradicated on Torcello. Its population is still declining. Miss Guiton tells us that in 1950 it was 270; by 1970 Torcello had only 70 inhabitants.

Why should they stay? Miss Guiton can write of the difficulties of scratching an economic return out of Torcello's sparse soil at first hand; of the struggle, first of all, to buy her property from its numerous quarrelling owners; of battles with the Superintendent of Monuments, whose mission is to leave every Venetian stone unturned; and with her succession of employees, whom she tries to wean from unprofitable subsistence agriculture. Her first gardener insisted on going, each dawn, to the Rialto market to sell his produce, however tiny it might be: one morning he failed to sell his one bunch of lilies, so he gave them to the nearest Madonna. These are the episodes that give Venice, and this book, charm; but they are not a prescription for prosperity.

Torcello: beautiful problem

Miss Guiton writes feelingly, too, about the general dilemma for Italian towns along that stretch of the Adriatic: whether to exploit tourism to the

WHY DID YOU KILL YOUR PRESIDENT ?

The Book of the Century

This is the most monumental and controversial book published in the English language since the Bible. The Bulgarian writer Kyrill Goranoff deals via the prism of humour and satire with all social problems, calling a spade a spade. It costs less than LSD trips and provides more knowledge, mental strength and objective information than all religious charlatans and the Establishment can offer.

Kennedy's assassination, the Warren Report, Jackie Kennedy's infallibility, Pope Paul, the Pill and celibacy, the Profumo Affair, cabbalistic, birth control, pollution, Harold Wilson and Krushchev, Napoleon, Stalin, Cold War, whores, pimps, hippies, students, women and Religion, homosexuals, are some of the topics.

This luxurious edition, 4 volumes of 400 pages each, illustrated, is obtainable from HATCHARDS, 187 Piccadilly, London W1V 9DA, at £2.50 per volume. If ordered direct from Publishing House K. Goranoff, 1 West Berlin 37, Argentinische Allee 20, the books are mailed post free at £2.15 per volume, Europe ; and $7.00 overseas.

limit, or to degenerate into industrial babel. She is rightly angry that Mestre should have allowed itself to become an industrial slum, despoiling itself and polluting the lagoon, when other war-smashed cities were planning, if not for beauty, at least for orderly development. She is less impressive when she allows her mind to ramble on the malaises of society as a whole ; a bit of editing would have improved this book a lot. It still makes for good reading, because she has a retentive and well-stuffed memory and a nice sense of anecdote : there is the story of the Adriatic village of Cavazuccherina, which, with uncommon foresight for the beginning of this century, decided that its name was a non-starter as a tourist attraction. As Jesolo, it's now doing fine.

White tracks

THE LUNATIC EXPRESS
By Charles Miller.
Macdonald. 571 pages. £3.95.
AN ILL-FATED PEOPLE
By Lawrence Vambe.
Heinemann. 278 pages. £3.50.

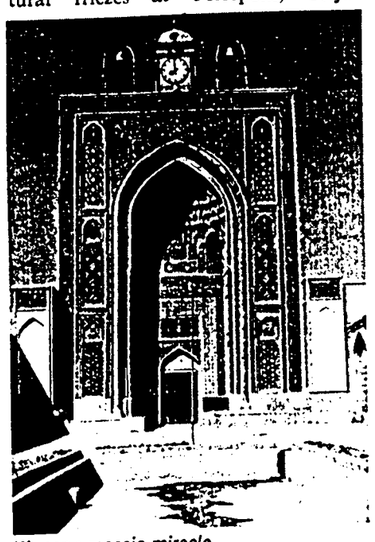
The first of these books was written by an American ; the second by a native of a colonised country. The theme of both is the way in which Europeans have changed Africa. Taken together, they provide a good insight into the workings of British colonialism in those parts of Africa which the British did not merely govern but came to settle.

The "lunatic line" (as it was immortalised in a jingle) was the railway built from Mombasa on the Kenyan coast to Lake Victoria in Uganda (600 miles inland) at the turn of the century, a gigantic operation which took six years to complete. Mr Miller's book is very much more than a description of a construction project. He has a light touch, and provides an altogether plausible picture of contemporary colonial society in east Africa. The subtitle, "An Entertainment in Imperialism," fits his book admirably (unlike the descriptions on the dust-cover, which have been written by someone who evidently sees Africa as either scorched or sultry—adjectives better applied to his own prose).

The Victoria line

For all his different attitudes and intentions, few of Mr Miller's judgments conflict with Mr Vambe's. By his own admission, Mr Vambe's book is not an analytical but a personal account, and a very good one at that. It is his own story, culled from his own memories and from tales told him by aged relations, of how the advent of Europeans in Rhodesia changed African tribal society, usually for the worse. It is a depressing history, in which the excellent descriptions of the ceremonies and rites of tribal life intermittently relieve the gloom.

Mr Vambe scotches many myths about Rhodesian history propagated by whites. He contests the view that the Mashonas were victims of Ndebele aggression in the nineteenth century, a belief that has often been used to justify the colonisation of the country by Europeans. Had it been Mr Vambe, rather than Mr Smith's information services, who had briefed Lord Pearce's commissioners on the background to present-day Rhodesia, they would have heard a very different story.



One might be inclined to think that Mr Vambe is unduly pessimistic about his fellow-countrymen. But since writing this book he must have had the grim pleasure of seeing his own prognostications borne out. Last November the multiracial Catholic mission at Chishawasha, on which he was brought up, was given orders to pack up and leave the "white" land on which it stands. A stay of execution has been granted, but it seems unlikely that a reprieve will follow. The people of Zimbabwe do, indeed, seem ill-fated. Perhaps their worst piece of luck was to occupy a land that attracted the sort of settlers it did : there is an old saying that, on leaving Britain, the officers went to Kenya and the NCOs to Rhodesia. These two books seem to bear that out.

Unpreserving poverty

PERSIAN ARCHITECTURE
By Arthur Upham Pope.
Oxford University Press. 120 pages. £1.25 paperbound.

For a scholar who decided, in the 1930s, that Persia's artistic inheritance required six huge volumes of description and illustration, the late Mr Pope performed a remarkable feat in producing this short, exciting account of the country's buildings, which is now available in Britain. And, inevitably, it is an introduction to its history, too, for architecture in Iran cannot be studied in historical isolation. The sadness is that so much has disappeared through violence, neglect or just collapse. Poverty in a country does not encourage costly preservation. And Iran has been keen to modernise and build in the so-called international style, rather than to show off the past. So, despite 2,500 years of almost unbroken monarchal rule, few royal residences have survived. The preservation of those at Persepolis, of course, is miraculous : even so, they are in ruins.

But when one thinks of Persian architecture, it is mostly of the mosques, shrines, tombs, caravanserais and Isfahan's minarets. What is fascinating about these monuments, of whatever age, is that they combine space and repose with structural inventiveness, especially in vault and dome construction, and a decorative energy. In detail and finish, the decorations are unsurpassed, whether in the stunning sculptural friezes at Persepolis, Seljuk brickwork, or the richly patterned mosaics in the Masjid-i-Jami of Kirman. It is this combination of conflicting qualities that gives the architecture of Persia its individuality. Mr Pope was obviously anxious to bring this out and he succeeded. Backed up by drawings and photographs (a few in colour so that the glowing misty blue of Isfahan is not lost), this book is the best possible introduction.

Kirman : mosaic miracle

Literature

Joycean milestone

ULYSSES ON THE LIFFEY
By Richard Ellmann.
Faber. 226 pages. £3.50.
JAMES JOYCE AND THE MAKING OF "ULYSSES"
By Frank Budgen.
Oxford University Press. 393 pages. £3.50 cloth, £1 paperbound.

One does not have to be a devotee of James Joyce to concede that as a literary artificer he ranks among the finest that the western world has ever produced. Frank Budgen, who was his constant companion during the time when "Ulysses" was taking its final shape, compares him to a worker in mosaic, patiently creating a brilliant pattern from a mass of sharply defined elements. But the analogy does not do justice to the three-dimensional quality of Joyce's artefact. "Ulysses" is a book that one can walk about in, exploring its territory. Readers and critics have been doing this for 50 years now. "Ulysses" was first published in Paris in February, 1922. Some of them have charted very serviceable maps ; but the possibilities for cartography have not yet been exhausted.

Professor Richard Ellmann's latest book on Joyce, "Ulysses on the Liffey," proves the point. It is based on a series of lectures given last year at the University of Kent, and it is a learned work ; but not pedantic or unapproachable. It is, however, a closely argued commentary, ideally to be read alongside the text of "Ulysses," and certainly only profitable to readers who are prepared to study Joyce's work with energetic attention. Professor Ellmann discerns in the book a triadic pattern, and the constant play of the dialectic. How contraries are presented and resolved is set out in some elaborate tabulations. These may be compared with the two schemata, provided at different times by Joyce himself, which are contained in an

JOHN MURRAY

appendix. Professor Ellmann stresses the importance of Aristotle and Vico in Joyce's thinking and planning, and demonstrates an even greater intricacy of workmanship than one has come to take for granted. He has also chosen some exceptionally interesting illustrations.

James Joyce once confessed to Samuel Beckett, "I may have over-systematised 'Ulysses'." Readers of "Ulysses on the Liffey" are quite likely to agree; but for anyone who wants to understand something about the genesis and structure of this extraordinary epic, and at the same time to learn how Joyce himself regarded his creation, there is the welcome anniversary reprint of Mr Frank Budgen's book, first published in 1934. It is well introduced by Mr Clive Hart, and is supplemented by Mr Budgen's attractive essay on "Finnegan's Wake" and his later reminiscences of Joyce. This is in many ways the ideal introduction to "Ulysses." Mr Budgen celebrates the humanity, the humour, and the inclusiveness of the book.

Back to Pennsylvania

RABBIT REDUX
By John Updike.
Deutsch. 407 pages. £1.95.

In reading John Updike, one is always conscious of the assignment he has set himself. He pushes at the limits of his considerable talent and does not seem to mind that the stretch marks show. In 1960 he published what many think is his best novel, "Rabbit, Run," the story of the high-school sports star trapped by the poverty of his own personality and the small town in Pennsylvania that adored him. Since then Mr Updike has tried strange exercises. In "The Centaur" he used the familiar Pennsylvania setting but entwined it with a classic myth; he even had to have a key for who stood for whom at the beginning of the book. In "Couples" he shifted to Massachusetts and set his tale of multiple adulteries against the background of President Kennedy's assassination. In "Bech," he put on a false face entirely —that of an American Jewish writer. And now he has tried the trick of revisiting an old character and picking up the story where he left off.

So it is back to Rabbit and to Pennsylvania, and thank God. Mr Updike's penchant for describing and describing and describing is more tolerable when the descriptions are laced with genuine love. The small, stagnant

Updike: home's best

city, flower-pot red, with its coal-black river and overhanging mountain is still where Rabbit lives. Rabbit calls himself Harry now. He is paunchy, conservative, a printer about to lose his job to a machine. His wife, Janice, whom in the earlier book he deserted after she accidentally drowned their baby, has overtaken him in growth and strength. It is she who runs off. It is he who stays home.

If Mr Updike were not so gifted, his experiment would be comic. Against his 1950s' man, he throws the whole catchlist of American worries of the 1970s: women's liberation, automation, black rage, drugs, Vietnam—even Japanese car imports. He interpolates the actual dialogue of American and Russian astronauts into his story, and the Kennedys come in for more digs —Teddy's turn, this time. But Mr Updike pulls it off. By the end, after sour white neighbours put a stop to his new life with a rich white girl drop-out and a revolution-preaching black dope addict, Rabbit finds his way back to health. The Middle American discovers that he has a place in his own country after all.

Too heavy an association with a particular place can be a burden to a writer, especially if he is mobile, ambitious and inquisitive. Mr Updike seems to have tried to escape from Pennsylvania and one suspects that his gimmicky experiments arise from an uncertainty of what his natural subject really is. Sex is too limited, and perhaps manhood is as well. Perhaps his main theme is the individual's struggle to distinguish his identity from his environment. If so, there is no harm in going back to Pennsylvania. For it is Rabbit and his town that echo after the book has reached its peaceful end. Mr Updike, whether he likes it or not, has made this unlovely, undistinguished corner of Pennsylvania, with its old traditions enshrined in neon signs promising "genuine 'Dutch' cooking," into his own literary universe.

Senior citizens?

OLD AGE
By Simone de Beauvoir.
Deutsch/Weidenfeld and Nicolson. 585 pages. £4.50.

Simone de Beauvoir is now 64 years old. Throughout her writing career, age has been almost an obsession. Back in 1954 in "The Mandarins," an intensely autobiographical novel, the age difference between Anne, the heroine, her much older husband and her sexually advanced teenage child serves to explain most of the action. Mme de Beauvoir's preoccupation with the female in society led her to analyse it in "The Second Sex"; similarly, from her preoccupation with age have come two studies: in 1960, at 52, she wrote a book on middle age and, in 1970, one on old age, which is now published in translation.

Because of her closeness to her subject, this book is at times quite heartrending. But it is not always the subjective judgments that make it so. It is divided into two, excessively lengthy, parts. The first is a detailed, objective study of the old, of how they have been treated in different times and environments—from the nomadic South American Indian tribes, who leave their old behind to die when they become useless, to the ancient Chinese, who revered them—and of how we deal with them in present-day western societies. The second part studies the old as they see themselves and react, mentally and physically, to the arrival of old age.

"It is common knowledge," she says, "that the condition of old people today is scandalous." This strikes her as particularly incongruous when—unlike poverty and infirmity—old age is a condition we must all expect. She traces the process of "abandonment, segregation, decay, dementia, death" to which society condemns the old. Her descriptions of some old folks' homes, both in France and elsewhere, and the statistics (in one 54 per cent of those who entered in a healthy state died within the first year) make chilling reading. Society has failed to cope with the successes of medical science in prolonging life: it retires the middle-aged often well before they wish or need to be put on the shelf—97 per cent of the job advertisements in American newspapers, she claims, place 40 as the age limit even though older people may actually be better at some kinds of work.

Simone: age is inescapable

In her second section she describes the process of ageing. This is never subjectively clear: the ageing will often put down their failings to curable diseases. But there is also shock, and revulsion, described by some writers in the discovery of their own old age. Mme de Beauvoir is fascinated by how they react to the discovery—Tolstoy remained buoyant and active; Renoir, though semi-paralysed, would not be put down and went on painting; others became tragic.

Her own solution is clear: "to go on pursuing ends that give our existence a meaning—devotion to individuals, to groups or to causes . . .," although she concedes that this course of action is of necessity confined to an educated elite. In real life Mme de Beauvoir has spent much of her time, in the past few years, campaigning for the militant feminist movement in France—a cause that should keep her going for a good many years.

Plainer tales

THE GOOD KIPLING
By Elliot L. Gilbert.
Manchester University Press. 226 pages. £2.40.

DELUSIONS AND DISCOVERIES
By Benita Parry.
Allen Lane, The Penguin Press. 369 pages. £4.50.

The ghosts of the British in India are not laid yet. They haunt us still because behind the facts of power which permitted imperial rule lay an encounter between two civilisations which still teases contemporaries, luring them back to the literature which is part of the record of that encounter.

Professor Gilbert's book is a work for literature specialists. Through textual analysis of some of Kipling's

WICKED, WICKED LIBELS

Does that scandalise you? Of course you enjoy being scandalised; "indeed life would be dull without at least occasional excesses," says Michael Rubinstein in his Introduction to this sprightly but authoritative account of the libel situation in Britain today by people actively engaged in it as a living issue, and on all sides, to wit: Louis A. Abraham, Louis Blom-Cooper, Eugene Gros, H. Montgomery Hyde, Richard Ingrams, William Kimber, Cecil H. King, Anthony Lincoln. But if *today is too much for you,* **The Habsburg Empire** assembles an exotic after-image, "history made visible . . . a commentary *on human aspirations, pretensions and* mortality" (Observer) in the form of a classic collection of photographs. Or, if *you would escape still farther from the* too-much-with-us, **John Dee: The World of an Elizabethan Magus** evokes again the *age of beckoning possibilities when* maths, magic, art, astronomy, music and theology were unashamed to acknow*ledge kinship, and the true scholar was* he who could show competence in them all. But then there's **William Blake,** if you feel young enough—eternal innocent who never wears a mask; Dr Bronowski's insight into the poetry and lively appreciation of the antiestablishmentarianism may not have come to your notice in 1944, but here is an expanded edition with still more timely relevance.

short stories he contributes to the current rehabilitation of Kipling as a serious artist, endeavouring to show how simplicity of theme, complexity of literary technique and even the countenancing of imperial power and violence are integral parts of Kipling's artistic expression and therefore aesthetically valid, though all have been used as weapons against Kipling. He defends Kipling as much against those who would divorce his art and politics in the hope of isolating the former, as against those who berate him on extra-literary grounds as the champion of imperialism, the sympathetic chronicler of complacency and brutality, instead of analysing him as a serious author.

He argues that the authentic voice of "the Good Kipling" speaks of a chaotic world immanent with disaster, on which man can never impose order. Here is no consistent view of the historical phenomenon of imperialism. Imperialism is a metaphor for daily work, "an almost mystical act" by which man discovers himself. Such a defence is satisfying at the level of close textual analysis of specific works by a skilled craftsman: but as an overall view of Kipling it is less convincing.

The chapter on Kipling in "Delusions and Discoveries" reinforces this sense of unease at Professor Gilbert's interpretation, showing that even the "good" Kipling was caught in the world view of the white imperialist, and that he never shed his ideological commitment to the raj. But, even so, Kipling emerges from Miss Benita Parry's book as one of the few writers on Anglo-India who really portrayed India with compassion, which removes his Indian writings beyond the compass of imperial ideology. The other author who for her is the supreme example of an encounter with Indian civilisation is E. M. Forster. She makes an illuminating analysis of "A Passage to India" as itself an investigation into this encounter, from the historical level of the personal interaction between English and Indian in the distorting context of the raj, to the metaphysical level of the interaction of two world views, with their different goals and ways of constricting or liberating men; the one dedicated to rationality and definition, the other open to emotional and spiritual ecstasy outside norms conceived of in the west. The other authors who receive consideration by contrast saw India as a frieze rather than as a spirit (to use Forster's words) —whether they were officials caught in a creed of authoritarian trusteeship, the women of Anglo-India appalled at this alien land and driven into isolation as a hedge against fear, or such "heretics" among the British as Edmund Candler and Edward J. Thompson who rejected the raj but never resolved the problems posed by the encounter of west and east.

"Delusions and Discoveries" is a scholarly work. The footnotes on Hindu beliefs tend to be cumbersome; but, even so, it should appeal to the general reader. It is a humane analysis of imaginative writings by English men and women caught in the imperial relationship, who were often the victims of delusions about themselves and their environment, or, more rarely, made discoveries about the possibilities of human life through their encounter with Indian civilisation.

History

Imperial day

THE HABSBURG EMPIRE: THE WORLD OF THE AUSTRO-HUNGARIAN MONARCHY IN ORIGINAL PHOTOGRAPHS, 1840-1916

By Franz Hubmann, edited by Andrew Wheatcroft.
Routledge and Kegan Paul. 320 pages. £5.50.

In 1840, when this gorgeous pictorial chronicle starts, the old order still stood firm in the lands of the Habsburgs. Its guardian, Count Metternich, employed skilful and devious diplomacy to keep the empire's foreign enemies at bay; his secret informers kept a close eye on the empire's assorted internal enemies. But this did not stop the citizens of Vienna from enjoying themselves to an extent that occasionally startled foreign visitors. An English visitor was shocked enough to remark that "there cannot be a more dissolute city, one where female virtue is less prized, and therefore less frequent." The habit of licentiousness was apparently not confined to the upper classes: Vienna's middle class was equally dedicated to the pursuit of pleasure; as the disgusted moralist was forced to conclude, "it never enters their heads that their conduct has anything improper in it." From the (rather romantic) erotic photographs of that era in this book, one can see what he meant.

This solid *Biedermeier* world was briefly shaken by the revolution of 1848, which lost the empire Count Metternich, but gave it another even more solid guardian in the shape of the young emperor. Francis Joseph ruled for 68 years, into the middle of the first world war. Mr Hubmann covers the years when Austria tottered from one military defeat to another, surviving only thanks to Bismarck's protection; when economic and political crises followed each other with monotonous regularity, while the Emperor worked in his study, reviewed his beloved army at countless military exercises which did nothing to make it more efficient, and coped with enormous ceremonial burdens which included his own countless tours of the empire and visits by foreign royalty. These could sometimes be trying: one of the particularly awkward visitors was King Edward VII, whose habits were completely different from the emperor's. Francis Joseph rose at 4 am and went to bed at 7.30 pm; King Edward had his first coffee at 10 am, could just manage to dine at 5 pm and certainly did not go to bed at the same time as the emperor.

Late empire style

Mr Hubmann's brilliant anthology does more than record the ceremonial history of the empire and its most exalted servants; it shows how the ordinary people lived, not just in Vienna, but also in Budapest, Prague, Cracow, Zagreb and elsewhere. Quaintly enough, it has already received rave notices in communist Hungary. But if this splendid book is an exercise in nostalgia, it is an uncommonly intelligent example.

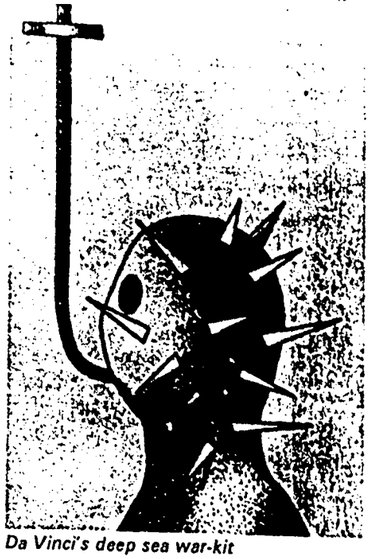
GREAT NEWSPAPERS REPRINTED

Peter Way Ltd,
28 James Street Covent Garden,
London WC2E 8PA

1638 threatened to decapitate anyone who trafficked in tobacco. At about the same time doctors in Europe were discovering the harmful effects of tobacco on health. In America at the beginning of this century 12 states had enacted restrictive laws against cigarettes, all of which were later repealed. This history of tobacco makes dismal reading for those who supposed that the health scares, the salutary warnings and the preventive legislation of the 1960s would bring smokers to their senses.

Since the early days smokers have been encouraged in their habit by a formidable army of interests. Tobacco was one of the staple money crops of the early American colonies. George Washington urged people to send him tobacco, if they could not give him money, to pay the American army. By 1880 one American manufacturer of cigarettes was sinking $800,000 a year into promoting his product. Even in its early days, Madison Avenue depended on cigarette advertising for much of its revenue.

Miss Wagner makes tobacco's importance in American politics plain. In 1962, before the latest anti-smoking campaigns really began, taxes from cigarettes provided the federal government with $2 billion and the states with $1 billion. In the same year the tobacco crop was worth $1.3 billion to the farmers and at the height of the growing and harvesting season some 3m workers were employed.



It is little wonder that the progress towards restricting smoking in America has been slow and painful. The Surgeon General's report on the connection between smoking and lung cancer came out in January, 1964. It was not until the beginning of 1966 that cigarette packets were required to carry health warnings and cigarette advertising was not banned from television and radio until January, 1971. Miss Wagner skilfully traces all the twists and turns of the smoking campaign. She covers the brilliant defensive strategy of the tobacco industry; the sympathy of the powerful Democratic Congressmen from the tobacco-producing states in the south; the silence of President Johnson. Unfortunately the smoker gets lost in the telling of the tale. But it is quite clear that whoever is suffering, from the smoker to the small tobacco farmer, it is not the cigarette makers. Sales are still going up (although the tobacco content of cigarettes is going down) and the big manufacturers are hedging their bets and moving into new products.

Deep in history

A PICTORIAL HISTORY OF OCEANOGRAPHIC SUBMERSIBLES
By James B. Sweeney.
Robert Hale. 314 pages. £3.50.

Everything at the oceanology exhibition at Brighton last month displayed oceanography as the new-born science; all future and no past. But it was Alexander the Great who first had the idea of being lowered into the sea in a glass bell. Although the science lay quiet for 1,500 years after that it was in full swing again by the renaissance. Leonardo da Vinci, predictably, could not resist a stab at it, designing the first flippers, snorkel, and an amazing outfit for an underwater warrior. By the eighteenth century the diving bell, developed largely by the British scientist Sir Edmund Halley, was an established "oceanographic submersible." But nobody was quite sure what to do with it.

If the early history of oceanography is sketchy, Mr Sweeney has little difficulty in finding ample illustrations. But he is unable to get into full tilt until the birth of the naval submarine. An ingenious Yankee thought up the world's first sub during the revolutionary war; it never got a chance to sink anything, but the British and the French were horrified at such an undignified addition to the war game. The first sub to draw blood was the Confederate *David* which broke the blockade of Charleston during the civil war. After that there was no holding back, and Mr Sweeney devotes eight chapters of often interesting text (if somewhat identical illustrations) to the last 100 years of submarine warfare.

Da Vinci's deep sea war-kit

This is not quite what oceanographers might expect from an illustrated history of their pet science, but it is a reminder that most of the hardware of underwater technology is still financed by defence budgets. The great spur to the development of deep sea submersibles came only after the American submarine *Thresher* was lost in 1963 and the United States suffered the indignity of having to rely on French help to locate it. Since then the pace of development has been too fast for a pictorial history to keep up, and a number of unlikely-looking artist's impressions creep into the illustrations. Mr Sweeney gives scant coverage of the French—or indeed any European—deep sea submersibles, and the last pages read like advertisements for America's biggest corporations.

Gringos and criollos

NORTH AMERICA DIVIDED: THE MEXICAN WAR, 1846-48
By Seymour V. Connor and Odie B. Faulk.
Oxford University Press. 308 pages. £3.50.

History is as far from agreeing about the Mexican war as leader-writers are about Vietnam. Was the annexation of Texas and the conflict which followed a gigantic conspiracy of the Southern slave power? Or was it the entirely justifiable, as well as the inevitable, extension of civilisation and democracy to an area so feebly held by its decadent sovereign, or, in effect, not governed at all? Results are as disputed as causes, utility as morality. Was the war "a good thing" because it added vast areas of actual, and still more of potential, riches to the Stars and Stripes? Or was it an absurdly costly venture? It was, after all, the costliest war in American history in relation to forces employed (its mortality rate was 110 per 1,000 men per annum). It can plausibly be argued, moreover, that it so intensified the sectional controversy as to make the civil war (for many of whose generals it was a training ground) all but inevitable.

Questions of such magnitude should guarantee the Mexican war frequent re-examination at the hands of historians. And so one ought not to cavil at Professors Connor and Faulk for reopening a file which has only been closed since 1947, when Alfred Hoyt Bill published his "Rehearsal for Conflict." Certainly this latest narrative history is free from obvious bias; it is accurate, clear and sensible. It is also, unfortunately, rather dull and clumsy in presentation and a good deal briefer than its apparent bulk suggests. There is, inter alia, very little said about the conduct of the war on the home front or the intellectual debate which accompanied it and which gives it much of its continuing interest or, in the cant phrase, relevance.

Perhaps in compensation for this, 100 pages are given over to a comprehensive bibliography which is in fact much the most useful part of the book, covering as it does both American and Mexican sources as well as the large output of scholarly articles and books which has subsequently appeared. But it might have been better if this had appeared on its own rather than as the appendage to a rather undistinguished narrative. For a war history, OUP has provided disappointingly inadequate cartography. There are few irritations more galling to a reader than to be constantly encountering place-names in the text of which no mention occurs in the maps.

Ecology

Troubled oil

THE TOXIC METALS
By Anthony Tucker.
Earth Island. 237 pages. £2.50.

Alarm about pollution has shifted from chemicals and pesticides, where the problem is now fairly well understood, to more insidious materials like lead and mercury. Mr Anthony Tucker cannot be accused of thumbing a lift on a bandwaggon; he has for more than a decade been trying, usually single-handed, to get this particular waggon to roll. His book comes out just when his arguments are beginning to collect support.

It is not an easy read. Most of the heavy metals damage the brain without leaving visible signs; the case against them has to be demonstrated statistically, as the case against smoking was. In one of his crosser moments, Mr Tucker argues that if cigarettes have to carry a health warning, then so should pumps selling leaded petrol—something on the lines of "This substance can send you mad."

The Green Revolution
by Stanley Johnson Price £2.75
The author has travelled all over the world to research for this personal view of the rural third world. It is a book about peasants, the people who work with them, and the scientists who are striving to revolutionise their living conditions.

Earthkeeping
by Gordon Harrison Price £2.50
A study of the origins and characteristics of the longest war we have ever waged – the war with nature – which we are in serious danger of winning. The theme is central to any attempt to deal with the environmental crisis.

Uncertainty and Expectations in Economics: Essays in Honour of G. L. S. Shackle

Edited (with an Introduction) by
C. F. CARTER
and J. L. FORD

Professor Shackle's writings have established him as one of the foremost economic theorists in the world, renowned both for the breadth of his knowledge and the quality and style of his writing. In this *Festschrift*, distinguished academics from North America and the U.K. have contributed essays on the application of expectations and uncertainty theory to various key aspects of economics; and on the application of the theory of expectations as developed in economics to military strategy and philosophy.

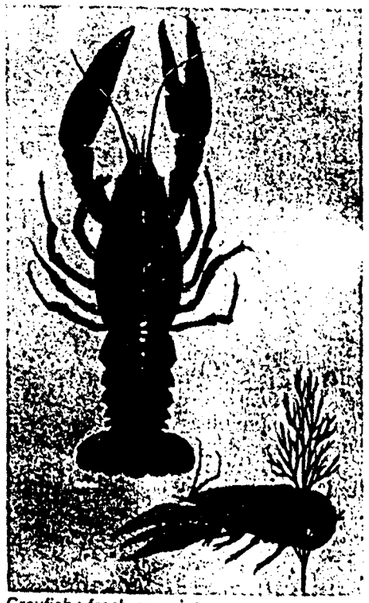
£5.25 net

BASIL BLACKWELL

The charts, tables, and medical details about blood levels and age groups are necessary, even though this is a book for laymen—the first from a publishing company set up last year to specialise on ecology—because, sooner or later, industry's apologists are going to start saying that Mr Tucker and those who believe with him are emotionally unreliable ecology buffs. Oil companies are already getting alarmed at what they would have to spend on expanding refinery capacity if leaded petrol were banned as the biggest single cause of the extra lead that has come into the atmosphere since the car population began to explode.

Unlike wholly man-made compounds like DDT, all the metals under suspicion occur in nature; many of them in food. A little more, runs the counter-argument, is not going to do much harm. Mr Tucker would not quarrel with that; his concern is that it is not a little, but a lot more lead and mercury, cadmium and chromium that is being discharged, to the detriment of health generally and, when it is discharged in concentrated quantities, causing actual tragedy. He gives his own calculations for the amount of lead being used by the oil companies in Britain: something like 12,000 tons of lead alkyl a year, and rising all the time. This, he believes, is sufficient to create a serious health hazard. The oil companies, obviously, do not.

Does anyone really know if these discharges are heavy enough to be dangerous? Not while it can be said of cadmium, for example, that it is:



> highly poisonous, poorly understood biologically, grossly under-investigated as an environmental contaminant, but widely dispersed. As a natural component of soils and water it is present only in very low concentrations but its industrial uses are expanding explosively.

What's wrong with that? Only that cadmium gives you ouchi-ouchi disease; and if you think that's a joke, read Mr Tucker.

The first water

GUIDE TO THE FRESHWATER FISHES OF BRITAIN AND EUROPE
By Bent J. Muus and Preben Dahlstrom.
Collins. 222 pages. £2.25.

Some people have fairies at the bottom of their gardens, but the lucky ones have fish. Where the water runs cool and clear, there may even be freshwater mussels with pearls in them, of

Crayfish: fresh as paint

the kind that went into medieval regalia, but the odds are increasingly against that. Mussels need pure water and most freshwater fish have had to learn to adapt to a fair degree of pollution. Not all of them have carried this to the lengths of the inedible and apparently indestructable loach, which burrows into the mud during a drought and can stay there, so it is said, for as long as a year. But tench and carp can both live in water stagnant enough to kill off most other fishes, and the ponds and streams of Europe are full of goldfish that escaped their bowls. However, the coveted salmon, trout, grayling, freshwater crayfish and the rest need clean water and plenty of oxygen and there are fewer and fewer places, outside the commercial fish farms, where they can find those.

This engaging book goes some way beyond the normal naturalist's guide to how to identify what. Pollution apart, fish have not been under the same pressure to adapt to a changing environment as animals have been on land; the water remains much as it was when the last glaciers receded. Consequently, fish have retained some extraordinary habits. Salmon and eels commute vast distances in the course of their lives; and bitterling cannot breed unless mussels first agree to act as temporary nursemaids to their eggs; lamprey turn their victims into soup before eating. Man's reaction to them is full of ambivalence; fish are slaughtered on every pretext from food

to fun, but, at the same time, elaborate modifications are made to big civil engineering works so that fish can pass through, over or round them unhindered. Mr Preben Dahlstrom's illustrations mirror this mixture of emotions; scattered among the diagrams, and his magnificent paintings of all 130 freshwater species, from stickleback to mitten crab, are romantic little pen and ink sketches of pools and streams and fish drying in the sun—happy, sentimental little drawings suggesting that the authors are a pair of thoroughly nice men. They say fishes do that to you.

Tooth and claw

THE WINTER OF THE FISHER
By Cameron Langford.
Collins. 222 pages. £1.60.

THE STORM PETREL AND THE OWL OF ATHENA
By Louis J. Halle.
Princeton University Press; London: Oxford University Press. 282 pages. £3.60.

People who would disapprove strongly of compulsive killers in real life, and howl for the police if anyone touched so much as a feather of one of their budgies, are inclined to take a much more tolerant view of four-footed murder, and it is for them that books like Mr Langford's are written. They use a great deal of violence that would be quite unacceptable if the characters were human; some sex and a lot of background detail to make up for the limited scope for psychological development among the characters. This is not at all a bad example of the genre.

Fishers can best be described as largish, sub-arctic weasels, three to four feet long from nose to tail, razor-toothed, solitary and predisposed to leap straight for the jugular. To lend variety to the rather monotonous round of eating and sleeping that makes up much of a fisher's life, Mr Langford puts his through a series of ordeals by fire, water, traps, snares and open combat from which the fisher is usually rescued, at the point of death, by a sympathetic old Indian. It is a most moral tale; nature ultimately triumphs over civilisation in the shape of hunters, trappers and an unfortunate red setter.

By normal bird-watching standards, Mr Halle has written an inoffensive little series of monographs about the sea birds that crowd each other off the rock ledges of the Shetlands. Then why is his such a difficult book to put down? Because the birds are to him more than a cluster of hollow bones and feathers; without attributing to them anything more than he can see with the naked eye, Mr Halle manages to convey his own feeling that if only he could understand more about them, then he would also understand more about the mystery of creation. Why birds manage on the whole to attract such a high quality of writing is one of the unfairnesses of the animal kingdom, but there it is.

Art

Missing link

DÜRER IN AMERICA
Edited by Charles W. Talbot.
Collier-Macmillan. 368 pages. £5.95.

To the best of anyone's knowledge Dürer has had no significant impact on American art. Appreciation of his work in America seems to have been confined to astute collectors. The title, therefore, is a bit of a cheat. All the same, it is fascinating that Americans were such early hunters of

Dürer: new world taste

Dürer prints: over 120 years ago, in 1849, the Smithsonian Institution bought a print collection off George P. March of Washington which contained 20 engravings, two etchings and a number of woodcuts by Dürer. So it all began.

When, last year, the National Gallery of Art in Washington put on an exhibition in celebration of the 500th anniversary of Dürer's birth, it drew on over 200 prints and a number of drawings and illustrated books from American collections, mostly public

Industrial Power and National Rivalry 1870-1914

Documents of European Economic History 2

Edited by SIDNEY POLLARD and COLIN HOLMES

The editors use documentary material, much of it translated here for the first time, to describe the means by which Europe imposed world-wide control over trade to illustrate the fundamental changes in the agrarian, industrial and financial structure of European society. They also demonstrate that the years 1870 to 1914 saw the growth of social class antagonism throughout Europe created by the continuing inequality in personal wealth, and the struggle to establish bourgeois values. Use has been made of a wide range of English and European sources including official reports, travel descriptions, and eye witness accounts of major developments. Concise editorial introduction puts the documents into perspective. The collection will be invaluable as a background to the present economic situation in Europe today.

Land, Work and Resources

An introduction to economic geography

J. H. PATERSON

This is a thorough but concise introduction to economic geography. The author explains the factors of world economy wherever located and shows their interrelationships and interdependence. It becomes clear from the outset that no single aspect can be properly studied, understood or controlled outside the context of the others. The author is also concerned to show the importance of the past, particularly the way in which it conditions present attitudes, responses and decisions. If the subject of this book is necessarily complex, the style in which it is written is correspondingly lucid, and economic theory is explained throughout in terms of real problems and situations.

Edward Arnold

ones. The exhibited prints, in fact, comprised three-quarters of Dürer's known engravings and two-thirds of his woodcuts, most of the books with illustrations attributed to him and his three published treatises. This book was prepared for the exhibition and comprises an introduction and catalogue, with extensive notes on the 312 illustrations.

Engravings and woodcuts (and the writing of his journals) became Dürer's chief interest quite early. He was unique among renaissance artists in having signed and preserved many of his drawings. These are all manifestations, it can be argued, of self-consciousness and self-interest. Certainly his prints, which were easy to transport, meant that his work became known throughout Europe. By turning to printmaking he also avoided the restrictive requirements of patrons. Perhaps this streak of individuality appealed to American collectors, as well as the fact that he had brought the forms and ideas of the renaissance to northern Europe. The subjects of his prints are hugely varied: some have a visionary fantasy which defies interpretation. A curiosity, for example, is number seven in this catalogue: his monstrous eight-footed pig.

Victim's view

A PRIVATE VIEW OF STANLEY SPENCER
By Louise Collis.
Heinemann. 166 pages. £2.75.

The "I" of this book is not the author but Patricia Preece, the second wife of Sir Stanley Spencer, who was publicly blamed by him for all, or most, of his troubles and frustrations in the last 20 years of his life. But it was also she who provided, as this book makes clear, much of the inspiration for the paintings that seemed important to him and that now seem important to those who appreciate his work and bid large prices for it.

Stanley Spencer was never, in fact, unappreciated; he always had admirers who paid well for his output, although he was not popular with the art establishment until late in his life. But it was never easy to understand the huge erotic religious pictures, which led to his much-publicised rows with the Royal Academy and on which his reputation now rests. This well-written, easily read account of a hitherto mysterious aspect of his life makes them much more comprehensible.

It also makes Spencer himself much more comprehensible, giving insight

Patricia: inspiration and excuse

into the "extraordinary convolutions of the inner self" of this insignificant, untidy, dirty, shambling little man, to whom sex and religion were one and the same thing and who believed that "life should be an uninterrupted course of satisfying one's own desires." Both his first wife, Hilda Carline, and Patricia Preece were victims of this belief and also of his fantastic obsessions, his refusal to face reality and his determination to tell everyone everything. But these were also the stuff out of which his pictures were made.

Awkward images

MAN AND MACHINE
Photographs by Henri Cartier-Bresson.
Thames and Hudson. 116 pages. £5.50.

Is man the master of the machine or the machine the master of man? The question is ridiculous. Man designs and operates the machine so of course he is its master. This is only common sense. But where common sense leaves off this evocative collection of photographs begins.

Although it was commissioned by the International Business Machines World Trade Corporation, hardly a radical organisation, the feeling behind this collection is plainly revolutionary. IBM presumably wanted M. Cartier-Bresson to produce a series of artistically accomplished photographs that would illustrate "the mastery by man of his own electronic and mechanical creations," as the foreword optimistically describes the book's theme. But IBM apparently did not reckon with the photographer's artistic conscience, which has led him to compose photographs that contradict the foreword and also the literary quotations, selected by someone other than M. Cartier-Bresson, that accompany many of them.

So, instead of the glorification of man and machine, we see a scientist at Houston's Manned Spacecraft Centre overwhelmed by a huge, mysterious machine that he controls—an up-to-date version of the Charlie Chaplin of "Modern Times." There is a shot of a sports event where the Japanese photographers seem not so much men as devices for holding and aiming their long-barrelled, sensitive cameras. There is an overalled railwayman who looks disadvantaged beside the gleaming metal of his train.

There are photographs, too, of the way modern architecture and the machinery of cities dominate the individual. A workman is scarcely more than a dot on the side of a skyscraper he is helping to build. New York City underground riders are captured in their lonely congestion. A shiny, blurred automobile speeds by a graveyard that seems part of another world. But the collection is not one-sided. There are numerous shots of children (though none of adults) having fun with machines. And there are photographs from the developing countries showing men with simple tools over which they are still, obviously, the masters.

M. Cartier-Bresson's perceptions are not unique. They have been expressed by artists and writers before. However, their repetition by such a gifted man is important since they are always in danger of being forgotten. No political or economic ideology, left or right, takes them much into account. Just the same, they are relevant to all industrialised nations and all classes of men. The government official or business executive gets caught in traffic jams like everyone else.

Church parade

THE DECORATIVE ARTS OF THE CHRISTIAN CHURCH
Edited by Gervis Frere-Cook.
Cassell. 296 pages. £8.50.

Virtually any book on medieval or renaissance art is perforce a book on the art of the Christian church; this book is novel only in that it takes the subject matter, and not a painter or a period, as its frame of reference.

Cross-culture Christianity

Then again, there are innumerable books on church decoration, from which this book differs only in that it takes Christianity, and not churches, for its theme. But what matters is not that other people have been here before, but that this is a particularly good, very thorough, very free-ranging book: it is also large, beautifully and copiously illustrated, and the essays are of an extremely high standard.

It is still incomplete. There are chapters on standard themes: on the origins of Christian art, the monasteries, Rome, post-reformation England and rococo; but also on the eastern Orthodox, Russia, North and South America, Africa and the Far East. But even in a book of this bulk, a chapter on Christian art in Australasia means that much less on the renaissance.

This book requires a strong taste for diversity: some of the modern Christian churches illustrated are breathtakingly ugly, and one feels an instinctive recoil at the bastard art inspired on the missions, heavy with colonial Christianity, and Europeanised New Testament figures. But this book performs a service in showing how so much of this is so good; how much of it, particularly in carving or sculpture, is free of European influence or how (particularly in the Far East) the artist's imagination actually throve on it. One of the most curious examples is a Mogul miniature of the Virgin and Child. She is plainly oriental: only her attendants are in (Elizabethan) European dress. How's that for accurate reporting?

Eccentrica

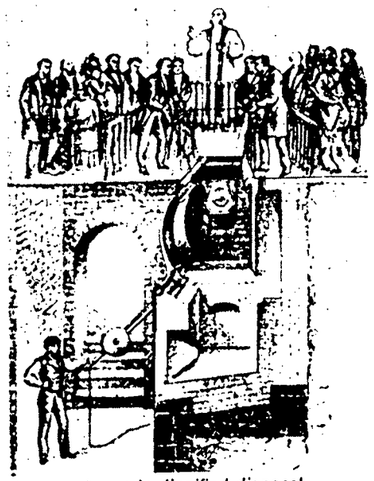
Bloody Someday

HORATIO'S VERSION
By Alethea Hayter.
Faber. 109 pages. £1.50.

IF IT HAD HAPPENED OTHERWISE
Edited by J. C. Squire.
Sidgwick and Jackson. 328 pages. £3.25.

Everyone must at some time have got infuriated with history: the imbecility of our predecessors, setting off a chain of actions that any fool could (a few centuries later) have told them would lead inexorably to disaster, is sometimes too much to bear. And any schoolchild, grinding through "Hamlet" for an external exam, must surely itch to rewrite that story. One starts Act II with such high hopes that Hamlet will murder his uncle forthwith; Shakespeare's conclusion is really most unseemly.

Miss Hayter has not set herself quite the same exercise as the several distinguished authors of "If It Had Happened Otherwise," who rewrote history with great aplomb, but she obviously found the last scene in Hamlet too untidy to bear. Her book takes the form of a commission of inquiry into the events at Elsinore (Bloody Someday?) with Voltimand—away with Fortinbras at the relevant time—as chairman. The commission's proceedings are interspersed with extracts from Horatio's diary, and the result could not be bettered. Voltimand is the archetypal inquiry chairman (not exactly in Lord Widgery's class); a touch dyspeptic, suitably dampening to Horatio, whose explanations of Hamlet's behaviour towards Rosencrantz and Guildenstern do sound a trifle wild; crossly incredulous at his allegations of poisoned rapiers and quite unable to understand how the queen, of all people, came to be poisoned; but unbiased almost in spite of himself. Fortinbras is a canny monarch, refusing to see either side until the inquiry is over, and at first Claudius's old supporters make the running: but thanks to Horatio's persistence, Hamlet is vindicated. It is a very satisfying, funny story. And there is a nice piece of detective work on the bouquet Ophelia distributed in the mad scene, from which it appears that it must have been more than a little difficult to put together such a bunch of blooms at any time of year, but with a good deal of pre-planning it could have been managed in July. The inquiry therefore takes place in September, after a decent interval of six weeks.



"If It Had Happened Otherwise" is not new: it was published in 1932, but has long gone out of print. Trevelyan's "If Napoleon had won the battle of Waterloo," the most enticing if of all, is said to have inspired the fashion for such essays when it won a competition for an essay on that subject run by the Westminster Gazette in 1907. It was not included in the original edition, and two more essays have been added: Sir Charles Petrie's jacobite fantasy, and an extract from Mr A. J. P. Taylor's "The First World War" entitled "If the Archduke Ferdinand had not loved his wife." This last is rather out of style: most of the others are designed as tongue-in-the-cheek fictional histories, nicely stuffed with the historian's grumbles about shortages of documents or unreliable sources.

There is an account from Sir Harold Nicolson of Byron's reign as king of Greece; another of how in 1930 it was discovered that Bacon did write Shakespeare, by J. D. Squires; what happened after Lee lost the battle of Gettysburg, by Winston Churchill; and the story of Don John of Austria's marriage to Mary, Queen of Scots, by G. K. Chesterton. Best of all is perhaps Hilaire Belloc's account of how Drouet's cart stuck so that he was unable to block the road and Louis XVI and his family escaped safely from France. All the essays are slightly dated, because that which they are caricaturing—the writing of popular history—has changed. The most obscure is now Ronald Knox's edition of The Times after a successful general strike. But it is nice to see them all back in print.

Funeral progress

THE VICTORIAN CELEBRATION OF DEATH
By James Stevens Curl.
David and Charles. 238 pages. £2.95.

Publishers love to encourage one along the literary trail with suggestions for further reading on the back of dust-covers, but really, sometimes they do go too far. David and Charles here offer the memoirs of a nineteenth-century executioner, "Bloody Versicles," and a collection of postmortem

An experiment in dignified disposal

reports with the inspiriting subtitle "The Correspondence of Murder." It's perfectly true that anyone who has got through "The Victorian Celebration of Death" from cover to cover must have a strong stomach and a peculiar taste for the morbid. But not necessarily a taste for the macabre: only in parts, when Mr Curl surveys the gaping, shallow burial places, the robbed, overcrowded graves of the rapidly expanding early Victorian cities, does the tale become positively unpleasant.

To begin with, at least, it is a detailed and painstaking survey of one of the most expensive, detailed and painstaking rituals in Victorian life. The mourning emporia stocked everything from mourning stationery through black lace for underclothes to black wedding-dresses and—when the life expectation of a middle-class male mid-Victorian was only 30 years, his wife's even less and the industrial poor's expectation was less than 18 years—presumably did good business. One could wish for rather more from Mr Curl on their accounts, but he is more informative on undertakers. He tells us, for example, that a good middle-class funeral in the 1870s would cost £1,000 (excluding the construction of a suitable tomb). Prolonged and elaborate mourning was not just a middle-class fancy or an enthusiasm for public celebration of the great (though Lord Nelson's funeral car would not have disgraced Tutankhamen); it was a burden even on the poor, for whom elementary saving schemes existed to spare their families the public disgrace of a burial "on the parish."

Plainly, even a hideously expensive funeral was an unpleasant business in earlier years of the reign: Mr Curl's real enthusiasm is for the splendid burial grounds laid out by the mid-Victorians: the overwhelming, grossly classical, solidity of the mausolea and memorials: the gothic chapels of remembrance, most desolate survivals of an age that tried to entrench memory in stone. Mr Curl's particular passion is for little maps and diagrams of cemeteries and the experimental crematoria, in which the Victorians, sentimental but not squeamish, invested so much industry and imagination. The Victorians overproduced death and upstaged sex: will we, who do our best to outlaw death to the seaside towns and reserve the capital for sensuality, seem any less unbalanced in another century?

Commemorators' passion

THE LONDON OF SHERLOCK HOLMES
By Michael Harrison.
David and Charles. 232 pages. £2.95.
A SHERLOCK HOLMES COMMENTARY
By D. Martin Dakin.
David and Charles. 320 pages. £3.75.

There is something about Conan Doyle's detective that arouses man's grossest commemorative urges. At the Reichenbach Falls there is a memorial to his desperate tussle with Moriarty, to the mildly incredulous amusement of the Swiss; at St Bartholomew's Hospital the pathology lab sports a plaque commemorating Holmes's lightning deduction that Watson has just returned from Afghanistan from tell-tale traces of this and that. A lot of Dickensian characters have their names up in stone, or metal plaques, all over south London (partly, one suspects, because the borough of Southwark finds this the most salubrious way to commemorate, say, Marshalsea debtors' prison); but surely no London street has been so dredged for literary association as Baker Street?

"The London of Sherlock Holmes" paces up and down the pavements yet again. Mr Harrison himself has already written "In the Footsteps of Sherlock Holmes": the footprints must be getting pretty worn by now. But this is a nice book; full of early illustrations and contemporary photographs. Their connection with the stories is sometimes rather tenuous: there is, for example, a fine view of Whitehall which must have been familiar to Holmes's brilliant brother at the Foreign Office.

If you had forgotten that Holmes was suitably endowed with relatives, "The Sherlock Holmes Commentary" is the book to turn to. This is a hilarious work, of formidable precision: even the bibliography is daunting. Its length alone testifies both to Mr Dakin's industry and to the quite terrifying voraciousness of Holmes's admirers for the most weird scraps of information: Mr Dakin, for example, contributes a list of all the characters in the Sherlock Holmes stories who wore moustaches. But much of the book is taken up with time-honoured controversies about the order of Holmes's triumphs, when he went where, what he did after his reported decease at the Reichenbach Falls, and how to explain unseemly discrepancies in the narratives. Poor Conan Doyle: perhaps in some place of torment the fiends are cross-examining him for inconsistencies with the aid of such books: but one hopes he is elsewhere, basking in the attention or at least in blissful ignorance.

Soft centre

CORPORATION MAN
By Antony Jay.
Cape. 269 pages. £2.50.

The only trouble with Mr Antony Jay's newest book is its central theme. The new biology of such writers as Mr Konrad Lorenz, Mr Desmond Morris and Mr Robert Ardrey is not only unconvincing when used to interpret behaviour inside business corporations, it is also unhelpful even if you do persuade yourself that it is relevant. The theories are simply too broad to shed much light on such a specialised area. However, they provide a broad framework for Mr Jay to roam in at will, for which readers of management books should be grateful.

Mr Jay made his name as a writer for television's David Frost and he is always clever and entertaining; adjectives that cannot be applied with justice to many other writers on management. Moreover, he had some managerial experience when he was with the BBC, and the insights this gave him are usually shrewd. But he would contribute more if he constructed his own theoretical scaffolding rather than attempting to borrow it ready-made from other people.

ELECTION '72

McGovern on his way

Madison, Wisconsin

On the morning after a famous victory it is easy to exaggerate its significance. But however much caution is applied in assessing the consequences of Senator McGovern's triumph in Wisconsin's primary election, it has certainly changed completely the pattern of the contest for the Democratic presidential nomination. With 333,000 votes, 30 per cent of the total, Mr McGovern was well ahead of Governor Wallace of Alabama who had 248,000 votes and inched Senator Humphrey out of second place. They each had just over 20 per cent of the ballot, although Mr Wallace probably would not have reached double figures but for the cross-over of Republican voters, a complication that is a speciality of Wisconsin's election law. Senator Muskie lagged far behind with 115,000 votes, 10 per cent, a little ahead of Senator Jackson with 8 per cent. Mayor Lindsay, with only 77,000 votes, has decided to go back to running New York City.

In Wisconsin not only did a quiet man of decency and principle score a victory on a scale few, including most of his own staff, had regarded as possible, but he also did it with the aid of a superb army of amateurs. Mr McGovern proved that he could win votes, which had been in doubt until then. The old-time Democratic party professionals, most of whom were closely identified with the Humphrey and Muskie organisations in Wisconsin, were thrust aside by hundreds of eager and devoted young men and women, the majority of whom had never before been involved in a political campaign. The Kennedys never possessed such a machine, nor did even Senator Eugene McCarthy in 1968.

The overwhelming mood of these young people is one of anger and disgust at the state of American politics and at what they regard as the cynical evasions of most of their political leaders. They are impatient and to some extent self-righteous, but after this week's events in Wisconsin they are again a powerful factor in American politics, as they were in 1968.

It will of course be said that Wisconsin was a special case, that Senator McGovern had admitted that if he could not do well there he could not possibly succeed elsewhere, and there is some truth in this. He comes from near-by South Dakota and he began his campaign purely as an anti-war candidate, although he has broadened his appeal lately. Wisconsin is militantly against the war in Vietnam and in the 48 hours before the polls opened that war became once again a political issue of the first magnitude, but it is hard to believe that this issue was by itself decisive.

Last weekend, travelling through the north-eastern part of the state, one was struck by the curious phenomenon of people saying that they were proposing to vote either for Mr McGovern or for Mr Wallace. At first this seemed too absurd to be taken seriously; yet it did have a curious logic. Both men are regarded as anti-establishment; both have stated their views clearly and unambiguously. Both represent a major change of direction from the politics of the past—precisely what a large number of voters in Wisconsin wanted.

The old guard of the Democratic party in the state did not appreciate the depth of this protest. In Green Bay, a large paper mill and shipping centre on Lake Michigan, the Muskie and Humphrey organisations were content to coast along gently, secure in the knowledge that they had divided up all their party's top brass behind their candidates. But an energetic man whom they all cordially detested was meanwhile in command of the McGovern forces. Mr Owen Monfils, a lawyer in his fifties and the leader of a small group of Democrats which has for years defied the local hierarchy, cleared out all the rooms in his offices for a horde of young people who worked almost night and day during the campaign. Nearly 90 per cent of the houses in Green Bay were canvassed and

every canvasser on his return to the office had to sit down and send a personal letter to everyone he had called on, covering any issue of policy that had been raised on the doorstep. The Humphrey and Muskie people did not take this seriously. Their men would never be deserted by a large Roman Catholic, working class population. But they were. Mr McGovern carried the district.

If anything, Mr Humphrey's organisation throughout the state was slightly better than Mr Muskie's, but his tactics were a disaster. Mr Humphrey belongs to a period and style of politics on which voters are turning their backs in, it appears, growing numbers. His support in Wisconsin came from the most conservative elements of the Democratic party—the trade unions and the middle-aged and elderly Negroes, who remembered the fighting young crusader for civil rights from Minneapolis that he once was. Poor Mr Humphrey did not understand, and probably never will, that the adroit side-stepping on almost every issue of principle, the easy promises, the habit of saying at inordinate length only what he thought his audience most wanted to hear, could only damage him.

It is difficult to assess who among Mr McGovern's major opponents was most seriously hurt in Wisconsin; probably it was Mr Muskie. Many of his supporters are taking to the lifeboats and his campaign is in growing financial difficulties. Now that he has lost the aura of victory, he has shown himself a poor campaigner, tiring easily, rambling in his speeches. A man of determination, he will stagger on, but unless he achieves a major victory soon, in the primary in Massachusetts or in Pennsylvania, at the end of this month—and this seems improbable—it will be hard for him to get the nomination. But Mr Humphrey too is in grievous trouble. He had so many natural advantages in Wisconsin that the extent of his defeat must have come as a bitter blow. If the scale of his defeat was significant, so was the attitude of many of Mr McGovern's supporters towards him. Most of them respected Mr Muskie and Mr Lindsay, but they regarded Mr Humphrey with almost violent dislike.

Mr McGovern is still a long way from getting the presidential nomination at Miami Beach next July. But his young chief of staff in Wisconsin has left to take over the organisation for the Nebraska primary on May 9th, and a large contingent of workers has departed for the battle grounds of Massachusetts, where Mr McGovern should do well. He is going to be a difficult man for any of his rivals to beat. With the withdrawal from the race of Mr Lindsay, liberal loyalties are no longer divided and money and volunteers will flow in. But the party regulars, who have laughed at Mr McGovern until now, will rally against him—although whom they will rally around is now the question.

Even if Mr McGovern should obtain the nomination President Nixon would remain the favourite to win. And yet one wonders. Mr McGovern is the peace candidate at a time when there is every indication that the Vietnam war may after all be a central issue in the campaign in an increasingly war-weary country. He has made America's system of taxation, with its built-in tax privileges for the few and savage property taxes for the many, a major issue of this campaign. At a time when Americans are seriously concerned about the integrity of their political leaders and about the quality of their public life, he is a man of honour and conviction.

Plot not proven

After a week of deliberation, the jury in the Harrisburg trial, of a group of active Roman Catholic opponents of the war in Vietnam, has failed to reach a decision on the more serious charges of conspiracy and five of the seven defendants will go free. The other two, Father Philip Berrigan and Sister Elizabeth McAlister, were found guilty of smuggling letters out of a federal prison; they face the possibility of heavy sentences. *Our correspondent reports from Harrisburg, Pennsylvania:*

The trial's most interested follower may have been Mr J. Edgar Hoover, the head of the Federal Bureau of Investigation, who first publicised the alleged plot in a statement to a Senate committee in November, 1970, weeks before any formal charges were laid. The defence alleged that the case was brought by the government in spite of weak evidence to bail out his public accusation. The trial revealed that several pieces of information available to the government for months before Mr Hoover's statement were only analysed in a sudden burst of activity by the FBI just after his statement to the Senate. But for those who expected the political trial of the decade it turned out to be inevitably anti-climatic.

The trial dealt with anti-war actions. The self-proclaimed pacifists clung to a legal defence within the system rather than speaking out in anger inside the court. In fact the bilious green courtroom was nearly devoid of politics but tied up in a lawyers' nightmare. Neither the judge nor the jury ever seemed to understand just what the conspiracy charge was all about. Conspiracy law, derived from the British code, is vague at best. On this occasion the government charged the seven defendants with one general plot which had three aims: to destroy conscription files; to blow up heating tunnels under government buildings in Washington, DC; and to kidnap the President's aide, Mr Henry Kissinger.

While stressing the cohesiveness of the plot the government argued that the jury had only to accept any one of these aims to convict the defendants. The defence insisted that all three aims had to be proved. The balding, dour judge, who repeatedly supported the prosecution in remarks to the jury, gave its members such murky instructions on the conspiracy law that the hapless twelve returned three times to have them clarified. Basically, the government's case boiled down to two elements: first, the 24 letters exchanged

Auditors' Report

Wood Gundy Limited:

As auditors of Wood Gundy Limited and its subsidiaries, we made our normal examination of the company's detailed consolidated financial statements as at December 31, 1971, and reported thereon without qualification to the shareholders on February 9, 1972.

In our opinion the above summaries of consolidated financial position and consolidated income and retained earnings fairly summarize the information contained in the detailed consolidated financial statements upon which we have reported.

Toronto, Canada.
February 9, 1972.

CLARKSON, GORDON & CO.
Chartered Accountants

Brazil's astonishing economic strength.

You can participate in it through Manufacturers Hanover and its new investment bank affiliate in São Paulo.

Over the past three years, Brazil's economy has grown 27%.

Manufacturers Hanover, with its representative office in São Paulo, has helped — acting as lead bank in arranging loans for government agencies totalling over $225 million.

For projects like subways in Rio de Janeiro and São Paulo ($39,000,000). Railroad networks such as Rede Ferroviaria Federal and Ferroviaria Paulista ($64,000,000). And an international airport for Rio ($99,000,000).

To further broaden its lending capacity in Brazil, Manufacturers Hanover recently became a partner in Banco de Investimento Andrade Arnaud S.A., an investment bank associated with one of Brazil's fastest growing financial groups, the Andrade Arnaud Group.

Through Banco de Investimento we extend our services to private corporations which maintain branches and subsidiaries throughout Brazil...function as an active source of working capital... and act as underwriter in the local market, providing venture capital for new as well as established companies.

In Brazil's fast-moving economy, you need an international bank that can move fast for you — with financial strength and facilities. Manufacturers Hanover.

between Father Berrigan in prison for destroying conscription files and his good friend, Sister Elizabeth McAlister, which blended personal feelings, gossip and cryptic references to anti-war actions ; second, the evidence of the government's star witness, Mr Boyd Douglas, a chubby baby-faced ex-convict who played illegal postman for the nun and priest while attending a university near the prison under a special study release programme and then turned the letters over to the FBI.

Mr Douglas, who became the priest's trusted personal emissary, reeled off in parrot-like fashion alleged talks with the defendants about heating tunnels, explosives and anti-conscription raids. His motive for turning informer was, he said, patriotism and a return to the Catholic principles of his youth. The defence lit into Mr Douglas, painting him as a provocateur and worse ; they brought out a record of assault and fraud which financed an eight-year spree of high living (interspersed with several prison stints). His face impassive —he would never glance at the defendants—he admitted lying to them and to student friends in the peace movement, telling them that he was a dedicated revolutionary and an expert on explosives.

Mr Douglas's only blush came on revealing that he "possibly" proposed to a girl whom he had just fingered to the FBI for attending a rally to which he had invited her. Under pressure and often reprieved by the judge, who consistently intervened to save him from the defence's queries, Mr Douglas admitted recruiting students into the anti-war movement but denied pressing them to take part in raids on conscription boards, in contradiction to testimony given by two university students. More important to the defence, he admitted receiving over $9,000 from the FBI for the information, though he had asked for $50,000 tax-free.

If Mr Douglas's credibility was an easy target, the letters proved more solid, though their breathless "James Bondness" often gave them the flavour of a novice's fantasies. Two of them did discuss a "citizen's arrest" of Dr Kissinger. Sister Elizabeth stared at the floor when they were read in court. In fact the defence presented the letters as "fantasies" written by a worried nun to bolster the spirits of Father Berrigan in jail and to assure him that the Catholic left was not dying. There may have been discussions of kidnapping and heating tunnels, the defence indicated, but they were only talk. "Dr Kissinger is alive and well in Peking," as the defence counsel pointed out at one stage. The defence insisted that any discussion of explosives was incited by Mr Douglas.

The defendants never emerged as personalities in the trial, perhaps because the defence presented no witnesses, a surprise move which stunned the court. The defendants argued that the government's case was too weak to answer, but their real fear was that, if they took the stand, the prosecution's cross-examination might force them to implicate other activists. They also considered it highly unlikely that the judge would have allowed them to make political statements in court. In fact, concluded one defendant sadly as the trial drew to a close, the Harrisburg case may have proved that political trials can no longer serve as forums for airing dissent to the war.

ELECTION '72

Campaign hay

Feeble and seldom enforced, the Federal Corrupt Practices Act of 1925 was replaced this week by legislation which, it is hoped, will pinpoint the sources of funds for political campaigns and will limit spending on television and radio. But the old, unlamented law showed, even as it was passing from the scene, that it had its uses after all. Under it Mr Tony Boyle, president of the United Mine Workers, has been convicted of making illegal contributions to political candidates from his trade union's treasury. The money involved amounted to about $50,000. In his autocratic way Mr Boyle had neglected to set up a separate organisation to accept voluntary contributions for political purposes from members of his union ; this would have been legal under the old law and will continue to be legal under the new one. The suit shows the Department of Justice in a crusading light which was notably lacking in 1968, 1969 and 1971 when it was offered evidence that the main political committees and a host of candidates had broken the law by failing to submit facts about their finances.

Common Cause, the national public-interest group headed by Mr John Gardner, means to monitor enforcement of the new law. But this year, on the Republican side, it may be a case of shutting the barn door after the horse has been stolen. Apparently President Nixon has no intention of disclosing contributions to his cause made before the new act came into effect. Indeed, his chief fund-raiser, Mr

Stans : early birds get the anonymity

Maurice Stans, is said to have been urging businessmen all over the country to get their donations in before April 7th ; any contribution made after that date which exceeds $100 must be reported along with the name, address and occupation of the donor. Letters from lesser Republican fund-raisers which have reached the press make the point quite explicitly.

The Demoorats, infinitely more hard-pressed for money than the Republicans, agreed early on to limit their pre-convention spending. But some of the contenders for the presidential nomination would have been happy to follow Mr Nixon's example and postpone disclosure of their benefactors until it was required by law ; publicity inhibits generosity in some cases. But these Democrats reckoned without Senator McGovern, who in February became the first presidential candidate ever to volunteer a full financial accounting. His needling has forced Senator Muskie and most of the others (Senator Jackson is the main exception) to come clean. Mr McGovern's total of $1.5m up to early March was built mainly upon small contributions of $10-$15, although recently the number of larger gifts has been creeping up. Mr Max Palevsky, of the Xerox Corporation, has given him over $100,000. Senator Muskie's total of $2m donated up to January 31st included contributions of over $1,000 each from 493 people ; one man gave $50,000, another $40,000. Senator Humphrey's dependence on big givers was greater : 90 per cent of his war chest of $838,715 came in $1,000 packets. But Mr George Wallace's claim to speak for the little man seems justified : over the past three years only 23 people gave gifts of $1,000 or more to his campaign fund, which stands at just over $900,000.

Swindled cities

Even New Yorkers, used to a scandal a day, have been shocked by the indictments just handed down by a federal grand jury against estate agents, government housing officials, a mortgage banking firm and the prestigious credit-inquiry firm of Dun and Bradstreet. If the government proves its case, poor people desperate for houses have been victimised ruthlessly and the tax-payer defrauded by perhaps as much as $200m. But that is not all. The same thing seems to have been happening in other cities: Philadelphia, Los Angeles, Chicago and Miami.

By a sad irony, the door was opened to the swindlers by idealists and reformers. Before 1968 the Federal Housing Administration had been allowed to insure mortgages only in economically sound areas, chiefly the suburbs. This caused much indignation and in the landmark housing legislation of 1968 the FHA was instructed to accept the greater risks in the city. At the same time Congress approved a programme of subsidies to encourage home-ownership among the poor; pride of possession, it was thought, would lead them to keep up their houses.

In the best circumstances, this would have been a gamble; the poor, often black or Puerto Rican, lacked the experience and knowledge to make a go of it. But in Brooklyn and Queens, two boroughs of New York City, they never had a chance, according to the indictment. The estate agents, it is charged, bought up houses cheaply, did a few superficial repairs, and obtained, by bribery, appraisals for mortgages far in excess of their value which local FHA officials were, in their turn, bribed to approve. Poor people were persuaded to exaggerate their incomes to satisfy the authorities that they were acceptable credit risks (this is where Dun and Bradstreet is alleged to have come in).

All too often the purchasers found themselves unable to keep up the payments; frequently costly repairs were necessary. Foreclosures followed, with the houses reverting to the FHA which had insured the mortgages. In New York City alone there were 2,500 foreclosures of this kind in 1970-71 and 2,500 more are expected in the next two years. In the country as a whole the FHA may soon have as many as 240,000 abandoned houses on its hands. Each costs, on average, $10,000 to rehabilitate unless it has deteriorated so far that it must be pulled down.

The cost to the taxpayer may run into billions of dollars but the grief to the poor who have been swindled and lost their homes is worse; so is the damage to any city when whole areas are blighted and housing for the poor is reduced. A cost which must also be reckoned is that Congress may conclude that housing for the city poor is a lost cause. Mr Romney, the high-minded Secretary of Housing and Urban Development, is off on another "save the cities" crusade but he might have done them a better turn by keeping a sharper eye on his own department: the signs that something was going wrong with the home-ownership scheme were visible over a year ago.

Strike for base

Professional baseball teams in the major leagues have decided to sit out the first days of the new season which began this week. Their strike seems to have caught the owners of the teams, the public and even some of the players themselves by surprise. They have chosen to make a stand, their first in the history of the game, on a minor point. They want the owners to make larger contributions to the players' pension scheme to compensate for the rise in the cost of living since the last contract was signed (it comes up for renewal next year). While the owners have agreed to increase their contributions for health and insurance benefits by $400,000 they have refused to add anything more for pensions to what they already pay into the benefit fund; at present they contribute $5.4m to it in all each year. The players argue that most of the money is already available to meet the increase that they are demanding for the pension section of the fund for this year, anyway. A surplus of $817,000 has been built up; on top of this each of the 24 baseball clubs would only have to raise another $11,000 to make up the additional 17 per cent the players want.

It is the principle rather than the money which is at stake. The owners maintain that the players have become too powerful. In their turn the teams think that the owners, playing on the sympathy of the public who hate to see their idols behave in the same way as lesser mortals do, are out to break what unity and strength the players have.

The gulf between the professional players and the owners of teams gets wider each season as the former stick out for better conditions and greater freedom. Under the present rules footballers and baseballers have great difficulty in moving from one team to another. In baseball the most notorious reason for this is the reserve clause: this in effect binds a player to one club throughout his career unless it decides to sell his contract to another. Thus he cannot bargain between clubs for better pay and conditions. The owners argue that if players were free to do this they would drive up their fees, jeopardise the smaller teams and give the wealthy ones the monopoly of the stars. Mr Curt Flood, the maverick baseballer who refused to be traded by the St. Louis Cardinals to the Philadelphia Phillies for a salary of $100,000, is now appealing against this situation in the Supreme Court. He claims that baseball should no longer be allowed exemption from the anti-trust laws, a privilege denied other sports.

St Louis Cardinals boycott their game

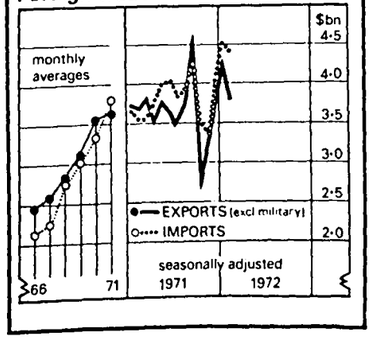
April, 1972

Bankers' spring

New York

For bankers it was like the good old days. For the second time in less than two weeks, America's banks announced an increase of a quarter of a percentage point in their "prime" or rock-bottom interest charge on loans to businesses. The latest round of increases, to 5 per cent, reflected a new, if belated, strengthening in the demand for business loans, which in turn was in line with the broadening economic recovery. Many bankers also felt flush enough to offer somewhat higher rates of return on deposits, especially the large sums ordinarily left with banks by corporations. Thus a concerted movement is under way to stockpile additional cash against the likelihood that the central bank, which began in February to retreat from an aggressively expansionary monetary policy, will now become even less open-handed.



As a result of the very easy monetary policy earlier, the supply of money spurted in the past three months by an extremely rapid 9 per cent after increasing at an annual rate of only 1 per cent in the previous five months. Another consequence was that interest rates on the short-term market plunged, setting off a flight of dollars to higher yielding securities abroad that led to renewed international jitters earlier this year. A new dollar crisis was the last thing that Washington wanted. So few knowledgeable observers were surprised when the Federal Reserve authorities abruptly pulled the plug on the excessive liquidity that they had created to stimulate economic recovery. In the space of relatively few weeks, the bellwether Treasury bill rate rose from an unusually low 3 per cent to nearly 4 per cent (it has since slipped back to 3.8 per cent). Similarly, intervention by the central bank was credited with causing an almost identical realignment in the market rate for the so-called "federal funds" that banks lend to one another, usually overnight.

But while international monetary concerns first prompted the move away from aggressive ease, the Fed can now justify its somewhat tighter stance by pointing to the recent quickening in economic activity. This is not an unmixed blessing, however, because it has again raised the spectre of a possible resurgence of demand-pull inflation. The scare became all the more real when February's report on the cost of living showed that consumer prices were again going up by a worrying 6 per cent a year.

But there has been one consolation and it has come from an improbable source. In spite of the President's warning that the deficit on the federal budget for the fiscal year ending in June could finish as high as $40 billion, a combination of unexpectedly slow outlays by the federal government and unexpectedly heavy advance payments of personal income taxes since the start of the year has enabled the Treasury to reduce its immediate demands on the money markets. Specifically the government discontinued, after only a few weeks, its plans to borrow an additional $300m each week in its regular auction of bills; it also cut back its recent offering of new three-year notes to $1.75 billion. But the Treasury is still expected to require considerable cash by late spring and by a year from now, from the present outlook, its financing needs may have grown to the point that new taxes will be required.

In February the deficit on America's trading account, at $597.6m on a seasonal basis, was the second largest on record; it had been exceeded only last October. Both exports and imports fell as a result of the dock strike on the west coast, but exports probably suffered more. In addition the costs of imported goods were pushed up by last summer's devaluation of the dollar; eventually this is supposed to discourage imports but the goods now coming in were ordered before devaluation. The total trading deficit for 1971, the first deficit year this century, was $2.047 billion.

Foreign trade

Commuters in the air

FROM A CORRESPONDENT IN WASHINGTON, DC

Promises, promises, promises. This is what has kept America's 200-odd commuter airlines—those air taxi operators who fly regularly scheduled routes using light aircraft—alive for the past decade. The latest promise was made to them by the Civil Aeronautics Board. Its chairman, Mr Secor Browne, told the commuter airlines recently that there is a plan in the works to award them some of the government subsidy which is now going to the regional or second level carriers. A bit more than $50m a year is now divided up between the 10 domestic "local service" airlines, together with four Alaskan carriers and one Hawaiian airline.

The CAB's plan calls for $2m to be diverted to no more than a half-dozen of the third level commuter airlines. In return they would be expected either to take over some of the local airlines' losing routes or to bring new service to communities now lacking any air service at all. The CAB said that the first contracts might be let to carriers in such sparsely settled states as Kansas, North Dakota and Alaska. Commuter airlines would be expected to submit bids for their subsidised routes—with the frequency and quality of the service specified by the CAB. Mr Browne says that in this way subsidy payments would be directly related to services rendered, rather than being used to prop up the whole route structure of a subsidised airline, as is now done for the regional carriers.

The reaction of the commuter airlines is one of disappointment. The idea is well meant, they agree, but the board has no authority to subsidise in this way; a change in the law will be needed before bids can even be asked for. Moreover, the promise of a possible $2m in subsidy to a half-a-dozen carriers at most is not going to sustain the other 200 commuter airlines which are scraping a precarious living from mail contracts and air taxi work.

Even if Congress acted promptly and the money was made available within a reasonable period, the bidding would be so cut-throat as to make the cake not worth the candles—or so the commuter lines believe. What they would like is for the CAB to grant them certificates of convenience and necessity. Even if these were limited to an experimental period, they would enable the commuters to borrow money at better rates and for longer periods than is possible under their present status as marginal operators with temporary mail contracts.

Sometime before long Congress will consider a bill to authorise the CAB to grant such limited operating certificates. The commuters would like the board to support this legislation and also to support them in their fast-developing battle with the already certificated and subsidised regional carriers. In a recent petition the "Big Ten" local service airlines told the CAB that the commuter airlines had far surpassed the mini-industry contemplated in 1952; then the board exempted their rates and routes from regulation with the proviso that the lines would limit their operations to small aircraft.

The purpose of this petition is to curb the growing competition from the commuters, even though such competition is in some cases encouraged by the local carriers on unprofitable routes to give an excuse for getting rid of them. As they have continued to expand, the commuter airlines have also been attacked by trade unions who see their members' jobs threatened as the regional carriers abandon unprofitable services to the commuters. The CAB's authority to approve such substitution of service was recently challenged by the Air Line Pilots' Association.

Faced with these threats, some commuter carriers are having a hard time surviving, particularly in areas where the recent recession has cut into revenues. Executive Airlines, a commuter operating in New York, New Hampshire, Massachusetts, Vermont, and in Florida, recently filed for reorganisation under the Federal Bankruptcy Act. And Air Michigan suspended scheduled flight operations in January and put its certificate and its fleet of Beech 99As up for sale after suffering continuing losses. Other suspensions are expected as hope for immediate help from either the CAB or Congress gets dimmer, rather than brighter.

Pedlars come to town

FROM A CORRESPONDENT IN SAN FRANCISCO

Whether they are described as "a renaissance of beauty in our midst" or as "parasites and pests cluttering our doorsteps," the artists, musicians and pedlars who have sprouted all over San Francisco's streets during the past year constitute a major public problem. They have spread from the street bazaars of the University of California's plaza across the bay in Berkeley. Most of them are intelligent, earnest and talented individuals who are purposely rejecting a conventional style of life. But it is not easy to fit these colourful, long-skirted or jeans-clad young bohemians into the pedestrian traffic of a modern city—in their present numbers, at least. They squat to display their sculpture, bead work, leathercraft, photographs, paintings, weaving and free-form candles wherever they can spread a scrap of carpet.

Trading on the pavement

Permits are required by law in San Francisco to peddle handmade wares on the streets. But as a result of pressure from established tax-paying shopkeepers, no permits have been granted. So craftsmen and artists, acting with a sophistication that belied their surface simplicity, banded together in a "Street Artists' Guild." They lost their appeal to the courts but their lawyer made a bargain with City Hall under which they were permitted, for a time, to display their goods inside Union Square, a park in the heart of the downtown shopping district but discreetly removed from the actual doorways of the stores. Leading businessmen have asked for a crack-down on all peddling in the streets, but so far the police have contented themselves with passing out warning leaflets instead of hauling lorry loads of long-haired girls and bearded youths off to jail.

Recently a compromise was reached which both the young pedlars and the shopkeepers seem willing to live by. Six sites have been designated as places where displays on the pavement and the sale of handicrafts will be acceptable, but none is near the shops in the business district. The plan gives the young people access to regions visited by tourists and other people with time to loiter: Golden Gate Park; a park in the Mission district, a polyglot part of town; Fisherman's Wharf, a much-frequented dockside area with restaurants and specialty shops; a lawn beside the main city library; and Ferry Plaza, at the foot of busy Market Street. When the plan goes into effect, the pedlars will have to leave Union Square.

The mayor, Mr Alioto, has been acting as intermediary, placating the businessmen while trying to find places where the artists might congregate without interfering with legitimate trade. Meanwhile harpsichord, flute and bagpipe, seriously and often brilliantly played by musicians exercising their constitutional right to freedom of expression, tinkle sweetly in the ears of the shoppers. The mayor is not alone in thinking that such quaint and unconventional activities are an asset in the grim canyons of a modern city. The San Francisco Art Commission is also working for a policy under which the city will favour such activity. But the commission has to be wary of antagonising wealthy shop-keepers who subsidise the opera and the symphony. One of its members claims that

> an artistic renaissance is going on right under our noses. The modern city has an obligation to recognise its legitimacy and to encourage and protect it. This is the young generation rejecting conformist American merchandising and impersonal urban life for more human values.

San Francisco's officials are trying to write a law that will limit peddling in the streets to genuine artists and that will show other metropolitan communities how to mesh the creative "free spirit" into the commercial rivalry of a city. But this is not easy. No sooner were the six acceptable sites made known than protests arose from the shops on the touristy waterfront. One spokesman, Mr William Roth of Ghirardelli Square, argues that the presence of street vendors in large numbers holds up pedestrian traffic and that the barefoot bazaars compete with the existing shops. Other San Franciscans fear a repetition of the tragedy of Haight-Ashbury, the haven of the flower children which has now faded into a drug-ridden near-slum.

Business Brief

The nuts and bolts of Vat

Industry has been getting private briefings on those details of value-added tax not spelled out in the white paper, through a series of more or less confidential discussion papers that the Customs and Excise has been circulating during the past year. The customs will not publish detailed regulations until the Finance Bill gets the Royal Assent in July or August. But a Confederation of British Industry seminar on Vat, held on Thursday, had two senior customs officials explaining the first points. So if you want to start your preparations now:

Registration : All businesses will get a general guide to Vat later this summer, together with registration forms. These have to be returned by a given date to one of 70 local Vat offices. The A to Cs will register first, in October ; the Zs should be finished by next February. A certificate of registration will come back, with the company's Vat number, the length of period for its Vat returns and other details. Groups will be allowed to register as one trader if they want to avoid paying Vat on intra-company sales ; indeed customs will insist on group registration if it suspects a company is deliberately splitting itself up to get its constituent parts exempted as small traders.

Accounting period : Generally three months, but one month for exporters and other zero-rated traders who will regularly be in Vat credit. Vat will be payable within a month of the end of the accounting periods which will be staggered to save the taxman from coping with a quarterly bulge. Probably calendar quarters will be observed by retailers ; quarters ending in January by wholesalers, and those ending in February by manufacturers. This would avert the possibility of unfair competition, and allow retailers to complete their Christmas stocking-up and clearing out in one quarter. Partially-exempt traders will have to account for tax on an annual, as well as a quarterly, basis ; they may be allowed to align their Vat quarters with their normal accounting quarters or with calendar quarters.

Partial exemption : Partially-exempt traders will be those who deal with both exempt and chargeable sales. Two schemes have been suggested to ensure that they do not reclaim Vat on purchases used for exempt sales :

(1) a straightforward "pro rata" rule ; traders would get credit for Vat on purchases in line with their proportion of taxable sales to total sales. Or,

(2) full credit for Vat on taxable goods that are bought for resale in the same state (eg, leather for shoes) and the "pro rata" rule for other taxable purchases.

The second scheme might be the better one for retailers. As a general rule, traders will be able to choose which form they want. Traders will also be free to suggest alternatives. The two proposed schemes would work as follows :

Scheme 1.

	£
Taxable sales (Vat-exclusive)	10,000
Exempt sales	5,000
Total sales	15,000
Percentage of sales taxable	66⅔
Total tax on purchases	1,200
Deductible tax on purchases = 66⅔% of £1,200 =	800

Scheme 2.

Taxable sales (Vat-exclusive)	10,000
Exempt sales	5,000
Total sales	15,000
Tax on goods bought for resale in same state	900
Tax on other goods	300
Deductible tax would be	900
plus 66⅔% of £300=	200
Total deductible tax	**1,100**

Retailers : No problems for shops, so long as all goods are on the same Vat rate ; ie, all charged at 10%, or all at zero. Some shops will be able to segregate the two groups in different departments. But supermarkets selling sweets, washing powder (10%), butter and meat (zero-rated) obviously would not, and it would be unreasonable to expect them to keep different cash registers for goods with different Vat rates. So customs is proposing special arrangements here, with no fewer than five different options, all designed to keep paper work to a minimum.

Cash and carry wholesalers will need different treatment again, because the retailers who buy from them need a breakdown of their purchases for Vat. Wholesalers will therefore have to provide very detailed invoices. Where the invoice is a till roll, it should be possible to use colour and letter codes to categorise by tax rates the items on the roll.

Agents : One of the trickiest problems under Vat is provided by agents, who can work for the buyer or the seller (either of whom may be taxable or not) or who may themselves be principals. Many principals employ agents to preserve confidentiality, which will introduce further complications. As a rule, customs will allow the parties involved to choose their own classification once Vat comes in. In general, taxable agents will want to bill taxable persons. An art auctioneer is usually the seller's agent ; but if the seller is a non-taxable person and the buyer and the auctioneer are taxable, the auctioneer would do well to bill the buyer, and deduct the tax due from the selling price. The best choice depends on the tax status of buyer and seller.

Imports : Vat will normally be charged at the point of entry, but registered traders will be able to pay Vat on imports with their quarterly Vat bills. Imports for re-export will largely be handled by such taxable traders (who can deduct the tax on purchases at re-sale), so there is no need for a special scheme. Postal imports will pay Vat under the arrangements now used to collect customs duty.

Imports liable to customs duty pay Vat on the duty too, but this will not became payable until the goods are removed from the warehouse. Goods in the warehouse will be outside the scope of Vat.

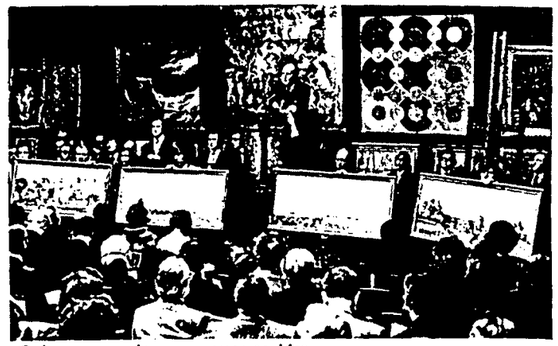
Invoices : The whole Vat mechanism hinges on tax invoices, which must be produced by all businesses liable to the tax so that they can reclaim the tax element on their purchases. The information needed for these invoices will be : the buyer's and the seller's Vat number, name and address, the date of issue, the type of transaction (eg, sale, hire, lease), the type of goods or services supplied, their quantity and tax-exclusive price, the rates of Vat chargeable on them, and the total Vat charged. In some trades this will be too much to ask. There will probably be some allowance for sales under £10. In some cases the tax-inclusive price, from which the tax element can be inferred, will be enough.

Records and accounts : Our charts give an idea of the amount of form-filling that will be needed under Vat. Computer-owners can contact the customs' computer research unit if they have problems—as they certainly will have. Documents will have to be kept for three years ; storage on a computer or on microfilm is acceptable provided the information can be easily got at. The minimum information required would be the amount of tax, the value of chargeable sales, the value of exports and the value of other zero-rated sales. The same range of data would be needed for purchases, with modifications for imports. Credits given, eg, for returned goods, would have to be similarly documented to make Vat adjustments possible. Where the accounts of a business are independently audited, the auditor's report may have to cover the Vat account.

Exports : In principle, zero-rated. Services supplied to exporters—such as shipping, insurance and dock handling—are not necessarily zero-rated although in effect any Vat charge will come back to the exporter as a Vat credit.

Trading documents will normally serve as proof of export, but where pre-recording of exports is now required for duty, it will be for Vat too. Personal export schemes will be allowed as for purchase tax, but only for taxable retailers, not exempt ones. The same rule applies to personal exports of cars.



Services provided for customers outside Britain will be less easy to monitor. Services exempt in Britain will probably have to be exempt if exported. This is tough on the City, because it will not be able to reclaim tax paid on equipment used for exports, such as computers.

Tax value : Normally the tax value for assessing Vat will be the price payable. Where goods are sold at an artificial price, as to friends, or the price includes considerations other than money, there will have to be an adjustment to "open market value." For hire purchase deals, the tax value will be the cash price on the agreement. The treatment of discounts will vary. A discount conditional on prompt payment will normally be allowed, and so will trade discounts. Service charges incurred in supplying taxable goods will be included in the tax value.

Tax point : Vat becomes due at the earliest of the following three dates : when the goods are moved from the supplier's premises (or, for items like machinery built on site, handed over to the buyer) ; three months after the goods have been made available to the buyer if they have not been shifted by then ; and the date on which the tax invoice is issued. This last point is intended to stop buyers claiming Vat credit before Vat is paid. Hired goods will be charged on the rental payments as they fall due. Progress payments on a long-term contract may be treated similarly. On services, there may be concessions where invoices are normally rendered before providing the service. Buying on credit will be no excuse for not paying up promptly.

Free samples, trading stamps : Free samples are generally not to be chargeable : but if they are worth more than £10 a year they may be chargeable at cost price.

A retailer who buys trading stamps from an independent company will be allowed to reduce his gross takings by the cost of the stamps. If he runs his own scheme, stamps redeemed for cash will reduce his gross takings, while stamps redeemed for goods will affect his purchases. Either way, no problems will arise if he is using a method of paying Vat that involves gross takings. The customs has not yet made up its mind what to do if he is not.

Going . . . going . . . over to Vat

Return of Value-Added Tax

Part 1. Account of tax payable or repayable

(This part must be completed by all registered persons. Partly exempt persons should complete Part 4 before completing Part 1.)

			£
Tax due during the period		3	
Tax credits allowed by suppliers during the period		4	
Underpayments in respect of previous periods	(a) notified by Customs and Excise	5

Action Indonesia

Rice harvest

With the world's fifth largest population the country is making up for lost time. Explore it now–with the Hongkong Bank Group.

Since 1966, Indonesia has taken some impressive steps forward. Price inflation has been reduced from an impossible 650% per annum in 1966 to 8% per annum in 1970. The current Five-Year Plan envisages that the equivalent of about half the country's annual income is for investment and the target of 5% annual growth is the aim.
As a sign of returning confidence in the country, foreign capital has been flowing into Indonesia.
Current emphasis is on agriculture and the industries which service it, understandably in a country where 75% of the population are employed on the land. But Indonesia is also rich in minerals – nickel, tin, bauxite and oil.
Textiles, electricity, paper and transportation are earmarked for dramatic growth.

With a population of about 120 million, Indonesia must offer tremendous possibilities for future trade.

The Hongkong Bank Group are in Djakarta and have branches in 35 other countries. They know about these possibilities and have packaged the facts into a concise 16 page economic summary of the Indonesian scene. Write for your copy now – and be briefed by the experts.

BUSINESS

Which way to the Wired City?

Cable television seems likely to turn into the urban communications system of the future. But it needs a strong push to beat the monopolies in broadcasting and telecommunications

If cable television is to fulfil half the hopes of its enthusiasts, it will have to change its name. It is a much misunderstood phenomenon, particularly in Britain where national policy on broadcasting has prevented cable (or wired, piped or relay) television systems from using their excess capacity to bring a great many more television channels into the home.

It is the cable that deserves most emphasis, not the television. The kind of cable that most American and many British systems use to obtain clear television reception is a coaxial cable. Hardly thicker than a telephone wire, it can carry about a thousand times as much information. And while the current interest and alarm about cable television concern the 12, or 20, or 40 television channels (depending on the sophistication of the equipment) that the cable can hold, the deeper excitement is the cable's capacity for carrying information in a great variety of forms and for carrying it in two directions. This has led to the futurologists' vision of the Wired City, to be followed in time by the Wired Nation and the Wired World.

In the Wired City, communications cables would be installed as a municipal service like water or electricity. If the cable network were combined with television sets which can produce print from rolls of paper (technically possible already), it could be used to deliver quantities of print at high speeds to specific addresses. It could, therefore, replace the postal service ; it could link computers as well, and deliver newspapers and library books. The two-way capacity of the cable is expected eventually to be used for a picture telephone service. It might also be used for voting, banking and shopping from the home, and for instructing central libraries of films or video cassettes to transmit particular programmes to individual television screens. These are not futuristic fantasies: the Federal Communications Commission in the United States has just ruled that all new cable television systems must have at least one two-directional channel.

The anticipated benefits of the Wired City range from the convenient to the utopian. At the Rand Corporation in California, sociologists believe that cable television can be used to help in solving the problems of racial ghettoes, as local television systems can bring information about jobs and medical care, as well as instruction, into the homes of the poor. The hard-headed Electronics Industries Association in the United States maintains that the kind of communications system offered by coaxial cable (called a broadband system because it carries a broad band of frequencies) will eventually enable the population of cities to become more dispersed.

Before that millennium, if it is one, arrives, cable television can bring a new dimension to existing television services. The Minister for Posts and Telecommunications, Mr Chataway, had this in mind when he decided in January, against considerable oppositon within the ministry, to allow Greenwich Cablevision to use one of its spare channels to put out local programmes—without advertising—as an experiment. Cable television can offer very local television indeed. Because the cables that lead into homes cannot be more than a few hundred yards long without losing the signal's strength, they extend back to central feeding-stations, or head-ends, that are quite close to the viewers, and that can serve as neighbourhood television stations. There are also filtering techniques available to cable systems that allow them to transmit programmes to some sets but not to others. What this means is that cable systems can create networks at random —reaching out to all the homes in a particular political district at one moment, and to all the hospitals or schools at another. Cable television is also the logical medium for pay-television. With so many channels to spare, the cable operators can easily (and would eagerly) fill one of them with a signal that can be viewed only on payment of a special fee.

Cable television has grown in both the United States and in Britain primarily because it has offered clearer reception than was available with roof-top aerials. The American cable or CATV (for community antenna television) industry has been built on the willingness of subscribers, particularly in rural areas, to pay about $6 a month to get a clear picture. In recent years, the industry has sought to win more subscribers by snatching television signals from distant cities out of the air and piping them into homes. People who are "on the cable" get more television than their neighbours who are not. This practice understandably aroused the fierce hostility of the broadcasting industry, and the resulting legal battles have kept cable television from expanding into the largest American cities. Only a few weeks ago the FCC lifted the so-called freeze, because of what it believes to be cable television's great potential.

In Britain, the relay industry has grown up solely by

offering better reception, plus the rental of the television set. Although many British systems are based on what is more properly called wire than cable, they have had the capacity to carry more than the three television and four radio programmes allowed them by Minpostel. But until Mr Chataway's advent they were forbidden to use this excess capacity (apart from the small experiment in pay television conducted by British Relay from 1966 to 1968). The rationale for this restriction was the television licence fee. "All pay the same; all receive the same" was the argument much repeated, especially at the BBC. The restriction has now been relaxed, however, and some relay companies can offer programmes from several of the ITV or BBC regions in addition to what is available over the air. Exactly how much further the relay companies may go will be decided in the national review of broadcasting policy which must take place by 1976.

Neither the BBC nor the ITA is happy about the prospect of local television (the ITA is well aware of the ambitions of the larger relay companies to be allowed to produce local programmes, financed by advertising, after 1976). Both can fight cable television by improving their transmitting facilities. But too fierce a protection of the national television services and too timid an encouragement of local television and other special services can blight the development of British cable television at the start. For it must grow piecemeal, out of the willingness of new or established companies to invest in stringing up coaxial cables.

The alternative is to wait until the post office is in a position to make a commitment to rewiring Britain. It can hardly do that while it struggles to put the telephone service right, and meanwhile it does not want to see its monopoly in public telecommunications eroded by new companies offering new services. (The post office has just managed to emerge as low bidder, against fierce commercial competition, for the contract to supply the cable communication system for the new town of Milton Keynes.) The worry is that the post office will not be as eager to develop local television or two-way communications as it is simply to install and own the cable.

The economics of cable television's future are by no means understood. Much of the American industry believes that it will spread by selling non-broadcast services —the use of the cable as an electronic burglar and fire alarm is expected to bring in much new custom. On both sides of the Atlantic optimists believe that local television programmes can be supported out of increased subscriptions, with no sale of advertising. This is the view of the Greenwich Cablevision team, which hopes to recoup the £20,000 it will spend on providing a year of local television, an hour and a half a day, by attracting new subscribers. In France a major new television company, Multivision SA, has been set up, with some American backing, to offer financial, technical and managerial assistance to municipal governments or commercial organisations interested in local cable systems.

The Sloan Commission on cable communications in New York last December made this prediction :

> By the end of the decade a cable television system will be in existence which covers 40 to 60 per cent of all American television homes; which provides in a majority of instances a capacity of 20 channels and in many instances a capacity for 40 channels or more; which possesses a limited capacity for return signals from the home receiver back to the point of transmission and which will be extensively interconnected, most probably by satellite.

What about Britain? Mr Chataway has licensed the Greenwich experiment and a few similar licences are expected to follow. But more adventurousness is needed; so is speed. The Television Advisory Committee, which he set to work in 1970, has not even made its report yet on the new communications technology. And much more experiment should be wrung out of the existing network of cables and wires. Parts of central London are wired already; so are parts of Newcastle, Hull, Sheffield, Leeds and south Wales. To see the black cables crisscrossing the wet slate terraces of towns like Ystradgynlais is depressing; they could be used to provide television coverage of local politics, school concerts, community meetings—and very much more than that—tomorrow.

The world man-made fibre cartel

The German authorities have fined nine fibre producers £6m and accused them of rigging the market and price-fixing on a world scale. Governments themselves have been rigging the textile industry for long enough

The Bundeskartellamt, the federal cartel office, has found nine west German fibre companies guilty of rigging prices in the domestic market, and of reaching agreements with Japanese companies to keep Japanese competition out. It has also accused them of participating in market-sharing arrangements with other European fibre companies. But since its jurisdiction stops at the German borders, it cannot fine them for that. Britain's Imperial Chemical Industries and the big American companies were found not guilty; there was no evidence of cartel activities in polyester.

The charges follow a year's inquiry, part of a much wider investigation conducted by the competition division of the European commission. So far, the commission has moved slowly; it has not found evidence of cartel activity outside Germany, but it is still looking. Back in November, *The Economist* reported that European fibre producers had visited the commission to discuss the prospects of an information-swapping agreement, so that investment plans could be better planned and co-ordinated. The exploratory discussions were still going on last week. The dramatic intervention by the Germans should have well and truly spiked them.

Pressure will continue. Mr Cyril Colton, chairman of the British Man-made Fibre Federation recently called for "sanity in the international pricing of man-made fibres," and added: "If it is a heresy to suggest that the conditions created by the existence of such institutions as our Monopolies Commission and similar bodies must be surmounted, then I am a heretic."

The problem that the companies faced in 1971 was a sudden overcapacity in fibre production, especially in polyester, as plants commissioned in the days of the textile industry's up-cycle came on stream during the down-swing. Evidence of excess capacity abounds. The Italian company, Snia Viscosa, has reported a loss of £5m for 1971, and glumly says that 1972 is no better so far. ICI is almost certainly trading at a loss in its £150m of fibre sales in Britain. AKZO, the Dutch multinational company, is planning to streamline its fibre activities. The Japanese companies have also been feeling the pinch. On some estimates, polyester capacity grew by nearly a half during 1971, and demand most certainly did not. The producers want a nice cosy system of information exchanging to save themselves from creating such a sudden surge of overcapacity again; once they got it, however, the interests of consumers would be planned away.

If the German findings stick—and the companies are loud in their protestations of innocence—then it will be much more difficult for European governments to be sympathetic to the cries for greater protection that the users of fibre, the textile industries, are putting up. Their war is against imports; the enemy is Japan, its economic satellites in south-east Asia, and any developing country rash enough to exploit the first big manufacturing industry—textiles—in which there is a chance of competing against the industrialised nations. For a while the rich countries thought that the changing technology of textiles was working on their side so that they could compete freely with low-wage countries. Man-made yarn, produced in capital-intensive plants, and then spun and woven, or knitted, on fast and efficient—and expensive—machinery would produce fabric as cheap as that made in countries where there was an abundance of low-cost labour. The rationalisation and concentration of the industry into a few powerful companies, as has happened to a large extent in Britain's cotton textile industry, would make the most of the technological revolution. In line with this thinking, the Board of Trade, under Mr Anthony Crosland, told the industry that quotas on imports of cotton goods were to be abolished from January 1, 1972, and that there would then simply be a tariff, as there was on imports of man-made fibre goods.

January 1st has passed, but the British industry now has both tariffs and quotas on cotton textile imports—and is pushing hard for quotas on imports of man-made fibres and the fabric and clothes made from them as well. The technological route to cost cutting has not, it would appear, worked (partly thanks to the cartel); the Nixon measures against textile imports have distorted the pattern of world textile trade, so that the goods previously sent by Japan, Hongkong, Taiwan and Singapore to the United States are pouring into Europe, especially Britain; and the Japanese are using some very dubious methods.

But if the Japanese are not playing fair, then the appropriate remedy is anti-dumping action, and the industry is preparing the case on polyester filament for the Department of Trade and Industry. The result is expected in a few weeks. But that leaves the whole broad question of what the appropriate economic policy for the industrialised nations should be.

European textile industries are totally opposed to the sort of level of textile imports—around 50 per cent of consumption of non-wool textiles—that Britain is used to. The commission at Brussels is still working on a textiles policy for Europe. The Italian government has just announced a £16m fund to restructure its textiles and is not going to open the doors to further imports. Britain's textile lobby wants imports down to the 25 per cent or so in the rest of Europe.

This is the kind of harmonisation that the British Government should resist. The British textile industry should be able to stand on its feet without further props. And European industry should be encouraged to think of doing the same, so that when the General Agreement on Trade and Tariffs next deals with world trade in textiles, a substantial lobby can make the case for freer trade. It remains bad economics to make things more expensively than they can be bought from abroad; it is bad politics to hand out aid to developing countries and then deprive them of the means of being more self-sufficient.

Towards inflaccounting

The Confederation of British Industry is right to take a look at how company accounts should be adjusted for the effects of inflation

Good luck to the CBI committee that is "to examine the problems posed by the effect on financial statements of changes in the value of money, and to make recommendations." If it takes its courage in both hands, it will recommend that published accounts be rectified for changes in price levels. The effects could be far-reaching: on the decisions made by companies; on the profits available for distribution to shareholders; and on the processes of inflation itself.

It is popularly assumed that profit-making companies will always emerge as victors in the fight against inflation. Hence the belief that equities are among the best protections in an inflationary age. Unfortunately, published profits today are grossly misleading for any company which eventually has to replace both its capital equipment and its stocks. At present, assets stay in the books at what they cost, and are depreciated on that basis; but the amounts set aside for replacement will be insufficient by

the time they do have to be replaced. Published profits are also raised artificially by a pure inflation gain from stock-holding : the £100 worth of widgets in stock at the beginning of the year will be worth £110 at the end, creating a paper profit of £10.

Profits are therefore expressed in year-end pounds, as a percentage of capital employed which is expressed in pounds of varying past years. This means that the return on capital employed can be temporarily made to look larger by keeping old-fashioned equipment running for longer than is economically desirable, and by undertaking less new capital investment than one should. The £1m spent on building a factory in 1960 can be added to the £1m spent on another one in 1970 to produce assets "worth" £2m. The only sense in which this is true is that £2m was in fact spent, and for legal purposes that is important. But economically meaningful accounts should be something more than a numerate history book.

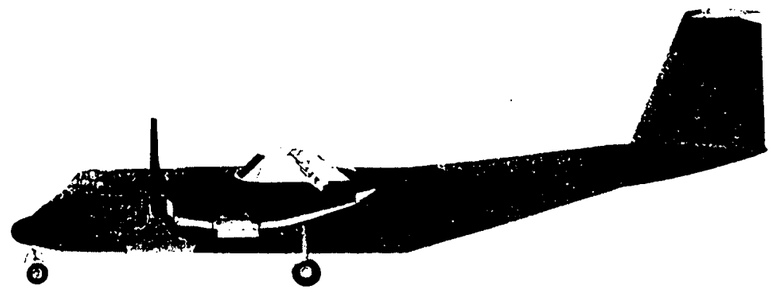
The literature of accountancy is now full of attempts to deal with the theoretical problem that the unit of measurement most commonly used is an unreliable one. In Britain, a practical basis for price-level-adjusted accounts has been demonstrated in a discussion paper published by the Institute of Chartered Accountants. The institute is now working on one of its exposure drafts, which, it hopes, will be subsequently embodied in an accounting principle that will some day be adopted in practice. As part of the exercise, 30 companies are preparing their accounts for the institute on an adjusted basis in order to see what problems crop up.

So far the results are encouraging. It does not take very long to go through the books and adjust the figures. Monetary assets—like cash and holdings of fixed interest securities—would be shown as effectively worth less. Non-monetary assets would be shown as becoming more valuable by the amount of inflation. On a balance sheet basis, those companies which have a lot of real assets financed by a lot of monetary liabilities would come off best. Property companies are a prime example. The companies that would come off worst are those which have a lot of cash and little debt. The effect on the profit and loss account would be to deflate profits as depreciation is charged on a higher base and to eradicate stock profits. Capital-intensive, but old-established, manufacturing would be shown to be much less profitable than it is sometimes supposed to be.

No company director is going to like the job of explaining to shareholders that, if they want to maintain intact the real value of the capital which is generating their earnings, then less of their earnings can be regarded as distributable. That is why the CBI initiative is so necessary. Accountants cannot go too far ahead of their clients on such an important principle.

Not all accountants are united in wanting price-level-adjusted-accounts. The institute calls them current general purchasing power accounts. Someone will have to think of a catchier name. Inflaccounts ? Several British companies simply charge an additional amount of depreciation. Many accountants argue that, since the main disadvantage of conventional historic accounts is to underplay the reserves needed for asset replacement, the simple reform is to go over to replacement cost accounting, as the Dutch Philips company has done. Compared with "inflaccounting" this would provide companies with accounts which tend to keep more reserves aside, but which are still expressed in a merry mixture of many different years' £s. If a company finds that the price of its fixed assets rises faster than the general level of prices, and that inflaccounts do not produce enough depreciation, then it can do replacement cost accounting as well.

The amounts at stake are very large. In 1969 and 1970 companies had a massive cash deficit after paying dividends and paying for new investment. The deficit came to over £1 billion in 1970, beside which the relief in free depreciation measures, etc, in the budget (costing around £200m in a full year) may look almost paltry. In order to generate internally the funds for investment, companies will have to raise prices. Under inflaccounts there will also be pressure on companies to raise prices so as to show "real" increases in profits—just as the trade unions would want to show real wage increases under a system of indexed wages. But the economy will gain if companies show how small their profits really are. The present system of misleading reporting must be leading to a maldistribution of resources.



Inflation = less profit

Profit and loss

	Historical basis £000	Adjusted £000
Profit before depreciation and taxation	1,136	1,088
Less depreciation	241	293
Profit after depreciation	895	795
Less inflation loss (see below)	—	72
Profit before taxation	895	723
Less taxation	395	395
Profit after taxation	500	328
Dividends	303	306
Retained profit for the year	197	22
Balance sheet		
Ordinary share capital		
Historical	1,495	1,495
Adjustment for inflation	—	674
Undistributed profit	2,217	1,982
Total equity interest	3,712	4,151
Current assets	3,804	3,842
Less current liabilities	1,524	1,523
Net current assets	2,280	2,319
Fixed assets less depreciation	1,486	1,886
	3,766	4,205
Less preference shares	54	54
Net assets	£3,712	£4,151

This exercise was done by one of the English Institute of Chartered Accountants' field testers and released to *The Economist* by the company, a medium-sized engineering concern. The principles used are those in the embryonic exposure draft. The £72,000 inflation loss is from holding monetary assets less a £4,000 gain to the ordinary equity from having some preference capital. The institute would welcome more field testers. It took 27 man-hours to adjust the 1969 accounts, as all the assets had to be gone through, but only five hours for the following year.

Tough as a truck, agile as a bird.

In the 1970s, the Buffalo will continue to be the world's best tactical support STOL aircraft.

Whatever comes off the drawing board, based on proven technology, the Buffalo will be the plane to beat. Its big rear door loads 41 troops or seven tons of cargo as fast as men can move.

It can operate in any country, under almost any conditions. If medals were awarded to aircraft, the Buffalo would have won several for meritorious and reliable service.

It can land on roughly-levelled strips. It has landed on sand that could bog down a four-wheel drive vehicle. The Buffalo can take your troops and supplies almost anywhere, and back again.

It's a pilot's plane, a soldier's plane, a tactician's plane.

Military experts say it's the close support plane of tomorrow.

Gordon Richardson MBE, Chairman of Schroders Limited, reports on 1971.

In 1971 the Group achieved profits comfortably in excess of any previously earned.

In London, Schroder Wagg participated to the full in the increased activity in the new issue market, and played a leading part in the field of takeovers and mergers; the growth of institutional funds under our management continued; and the fall in sterling and Eurocurrency interest rates worked strongly to the advantage of our banking business.

Our banking subsidiaries in the United States again expanded the volume and scope of their business and achieved increased profits.

Our Swiss subsidiary reported good results for the year, and developed further its banking and investment activities.

The parity changes which occurred during 1971 are reflected in the Balance Sheet in a reduction in the sterling value of consolidated assets and liabilities.

A final dividend of 7½p is recommended, making a total of 10½p for the year, compared with 9p for 1970.

Schroders Limited

For the year ended 31st December	1971 £'000	1970 £'000
Capital, Disclosed Reserves and Loan Capital	25,435	25,876
Deposits and Acceptances	461,152	475,186
	486,587	501,062
Liquid Assets	202,786	219,359
Loans, Acceptances, etc.	260,998	268,451
Other Assets	22,803	13,252
	486,587	501,062
Consolidated Disclosed Profit	2,107	1,653

Group Companies, Associates and Representative Offices in: Argentina, Australia, The Bahamas, Bermuda, Brazil, Canada, France, Germany, Hong Kong, Republic of Ireland, Lebanon, Spain, Switzerland and the United States of America.

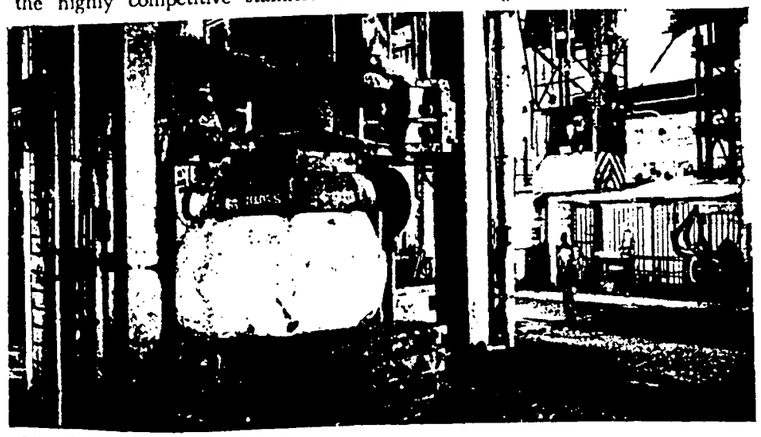
BUSINESS *Britain*

British steel buys itself a deal



The Government will spell out, next week, its plans for the future of the British Steel Corporation. Meanwhile BSC has begun the first two of up to 40 tidying-up operations. They involve selling off its brickworks in two parcels and turning its constructional steel operation into an independent subsidiary, in the hope that one day it will be able to attract private capital. But they are small beer compared with what is expected to be the next piece of surgery: the complicated swap deal with Firth Brown, the biggest private steelmaker in Britain. This weekend it moves towards completion.

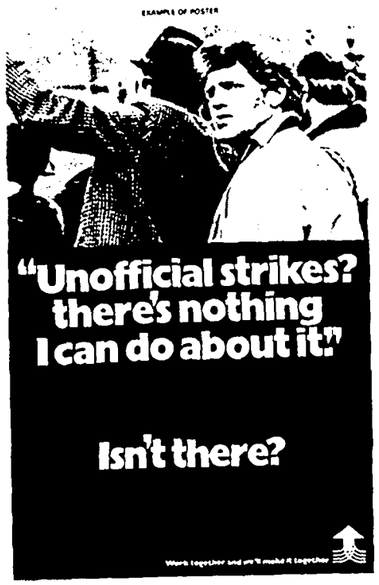
Two nominal companies are being set up to take over the various plants being transferred. The British Steel Corporation is to get the much-coveted third of the modern Shepcote Lane stainless steel plate rolling mill that it did not get after the arbitrary carve-up of the steel industry on nationalisation. It also gets the other half of Firth Vickers. More important, it will get complete control of these companies in the highly competitive stainless steel market. Firth Brown will take over the so-far unprofitable medium forge at River Don, with its vacuum arc and ESR furnaces. This will take the private sector deeper into stainless and high alloy steel forgings, although it will move out of stainless flat products.

It is bound to cost BSC a fair bit. Firth Brown is expecting to get a substantial net sum out of it, even though it will need to invest in the River Don medium forge to knock it back into shape. BSC is likely to have to pay at least £5m for the one-third share of the Shepcote Lane assets, with probably more for the potentially highly profitable Firth Vickers, particularly for the name and goodwill. It will be some time before the stocks and work-in-progress can be assessed, but BSC seems bound to have to pay more than it receives.

The deal will leave BSC with the heavy River Don forge to sort out: some time ago it was estimated that a capital injection of at least £10m would be needed to make it profitable. But to a large extent the future success of this plant is outside the corporation's control: it depends mainly on the demands of the electrical generating industry.

BSC will not be getting much gravy from selling its two lots of brickworks, although it will be more than the book value of £2m or so. One group of 10 brickworks with a refractory plant has been sold to Butterley Brick Company, giving an annual capacity of 85m bricks and 31,000 tons of refractory. The other sale, to a private, unquoted company, Innes Lee Industries Ltd, is of four works producing 25m bricks a year. In all, 680 workers will transfer with these works. So far, the changes to BSC's constructional steelworks division are in name only. A shell company has been set up, so that private money can be accepted if any should offer itself.

River Don: hiving off is hot business



Industrial relations

Very unsettled

Next Tuesday a £1m campaign will be launched to try to promote a better climate of industrial relations in Britain. Over the next three years, the theme of "working together" will be drummed home in newspapers and on hoardings. The idea originated with Aims of Industry, although it will not be running the campaign. Industry is paying for the show, and, although the Government will not officially back it, it will no doubt pronounce a blessing.

It is a propitious moment for the campaign to start. Already this year 12m days have been lost because of strikes, nearly as many as in the whole of 1971. On Thursday, the rail unions were firmly told by British Rail's chairman, Mr Richard Marsh, that BR could not raise its 11 per cent offer. Southern region drivers immediately called for a work-to-rule, and others may follow suit. More talks, however, are billed for next week.

The phoney war between the engineering employers and unions in Manchester entered its second week with the General Electric Company's Trafford Park plants joining the list of 16 sit-ins.

£1m for a better climate

The 3,500 hourly-paid employees there failed to turn up after Easter, having been told they must work normally. In common with many of the 200,000 engineering workers in the area, they were banning piecework and overtime in support of a local campaign for more money and improved hours and holidays. The engineering unions had chosen Manchester as the battleground after the national wage talks broke down. But the employers there are remaining pretty solidly together so far.

So far both sides have kept their cool. The sit-ins are purely nominal (a representative sample of men in an unheated, unlighted factory) and amount to a strike. The unions prefer to call them lockouts. Any plant-level deal made within the employers' terms is simply rejected by full-time union officials. In turn, they claim that 20 companies have made deals on their terms, but they do not say how many were with firms outside the 250 members of the local employers' organisation.

Mr Hugh Scanlon may be beginning to wonder if, rather than when, real cracks will appear in the employers' resolve. It was his decision that put Manchester (with Sheffield to follow) in the front line. A little pointed comment was directed this week at his offer to resign early, if it would help in the proposed merger with the Electricians' and Plumbers' Trade Union. And next week he has to face the wrath of Mr Danny McGarvey at the full meeting of the executive of the Confederation of Shipbuilding and Engineering Unions in York. Mr McGarvey has negotiated a deal with the shipbuilders for three £2 instalments. The engineers are blocking it while their own claim is fought. The boilermakers could decide to accept regardless, but it seems more likely that they will lead a push in the confederation to get the engineers back to the national table.

Heathrow

More trouble to come

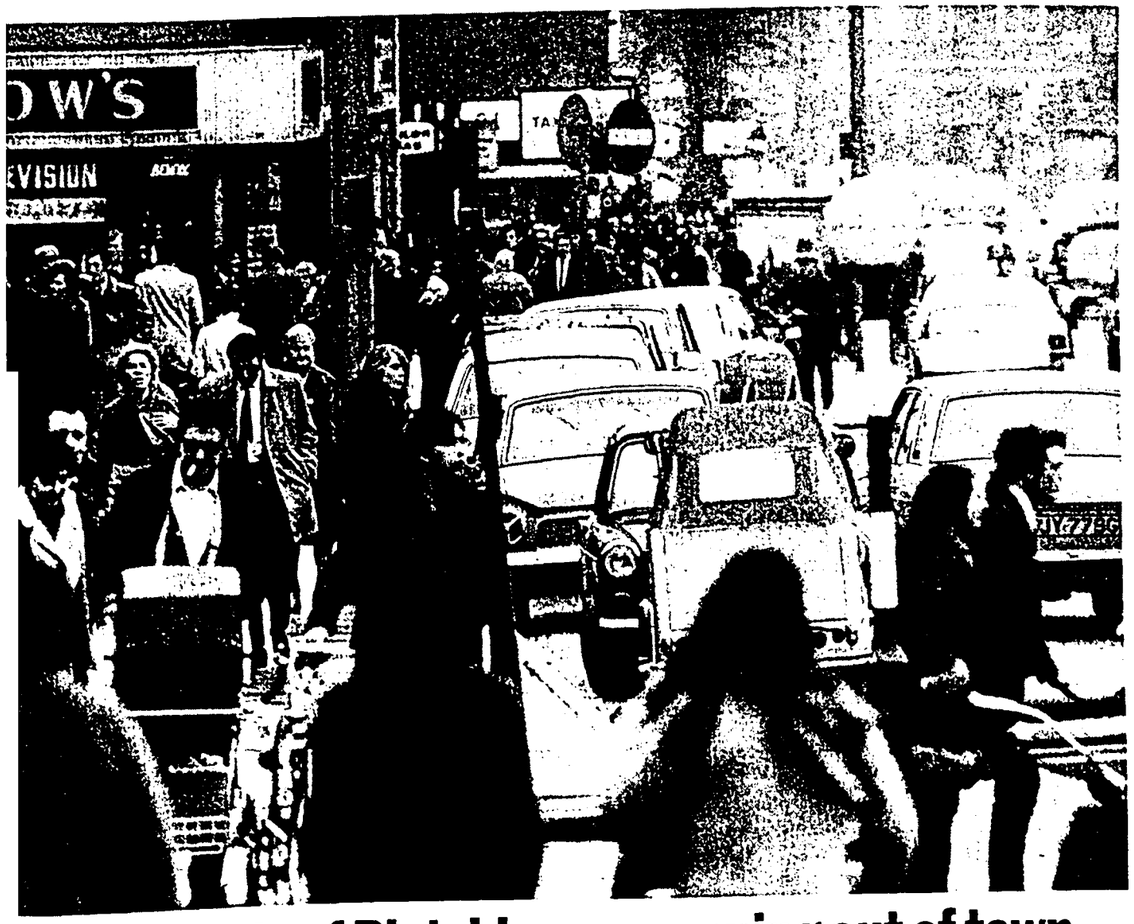
This week's work-to-rule by British European Airways pilots failed to stop a single flight in the first five days. But the work-to-rule could be intensified and cause serious trouble. The last work-to-rule, in the summer of 1970, lasted 12 days and stopped 402 flights. However, it seems this time that many pilots are not in a militant mood, and are aware that BEA, facing a deficit of £2m, is in no position to shell out for a big pay rise. Besides, there is not much public sympathy for the pilots, who already earn up to £8,000 a year.

But even if BEA and the pilots patched things up, there is likely to be more trouble soon. The 60,000 ground workers at Heathrow have been demanding more pay, and so far have been offered only a £1 a week rise. Since most earn close on £40 a week, this offer is worth under 3 per cent. Some of the clerical workers are prepared to accept this, but, as usual, the militant engineering and maintenance men are talking about a strike.

As if this was not enough, the dispute about General Aviation Services is still dragging on. Last autumn, when GAS was awarded a new contract, a strike crippled Heathrow for three days. GAS was first called in by the British Airports Authority over three years ago to give airlines a wider choice in handling services. But shop stewards reckoned that GAS might win too many contracts from BEA and the British Overseas Airways Corporation, and thus cause redundancies. Mrs Barbara Castle, when Secretary for Employment, set up an inquiry, which concluded that there was no reason why GAS should not be allowed to compete. After last autumn's trouble, Mr Robert Carr sent in a mediator to try to sort things out. A compromise was reached, whereby GAS would not be allowed to handle more than 8 per cent of total flights. But the shop stewards still have not accepted this. They now have the whiphand, since no airline is going to give GAS a new contract if this threatens to close Heathrow again.

The industrial relations chaos at Heathrow seems to be endemic. The 16 unions are badly organised, and there are too many of them. The union officials have no control over the shop stewards, and communication is atrocious. Both the airlines and the BAA have a poor reputation for industrial relations management.

Mr Carr ought to bring in the Commission on Industrial Relations to investigate why Heathrow's troubles have been so persistently bad. At the same time, he should advise the BAA and the airlines to have no hesitation in dealing with wildcat strikes, which have so plagued the airport in the past, by taking the leaders to court under the Industrial Relations Act.



Investment

Sting in the budget's tail

The changeover to the "imputation" system of corporation tax, announced in the budget, is going to be a disincentive to investment in the coming year, as *The Economist* argued on February 5th. This effect will outweigh the impact of the change Mr Barber announced to "free depreciation—that is to say, a 100 per cent first-year allowance." In fact, a 100 per cent first-year allowance is not the same as free depreciation. If next week's Finance Bill provides for a 100 per cent first-year allowance, businesses will have to depreciate 1972-73's new plant at the 40 per cent rate of tax, only to have the profit from it taxed at 50 per cent.

If the bill provides for free depreciation, businesses that invest in 1972-73 will have to wait another year to take their full write-off at 50 per cent, so they will have to do without any depreciation in the first year. This will be a mild disincentive to 1972-73 investment. Leasing companies provide a good illustration, because they isolate the cash flow effects of investment, and also because they do precise calculations of the cash flow effects of investment incentives and tax changes.

A five-year lease with complete amortisation and quarterly payments, taken out in October, 1971, on equipment worth £1,000, would have cost £60.50 a quarter, assuming a constant 40 per cent corporation tax rate

The people of Bletchley are running out of town.

It's a race against time: in the next five years or so, the number of people coming into Bletchley to shop and do business is expected to double.

(This is because Bletchley is within the designated area for the new Milton Keynes city development.)

But Bletchley (in collaboration with Milton Keynes) is planning ahead. Well before the influx reaches its peak the town centre will have been redeveloped.

The new centre will be ready in 1974: and it's vitally important that this date is met. (Take another look at that picture!)

To make sure that it is met, Bletchley Urban District Council is using a computer throughout all stages of planning, development and implementation. Already its use has saved many months' delay.

What the computer does is help coordinate the activities of the multidisciplinary committee responsible for the new centre. Using critical path analysis techniques, the computer analyses week by week, the proposals–and reports–of each working group. And indicates whether these dovetail in a way compatible with the 1974 completion date.

The computer is saving time. And money.

But to us at IBM, the Bletchley redevelopment means even more than that. Not merely because one of our computers is playing a part. But because it is demonstrating how even smaller local authorities can make use of the most advanced management techniques and tools. And because it is yet another example of what we think computers are all about: helping make life in the community a little better for all of us.

IBM

IBM United Kingdom Limited 389 Chiswick High Road, London W4

The new Hotel Bristol, Piccadilly. The age of elegance is not past.

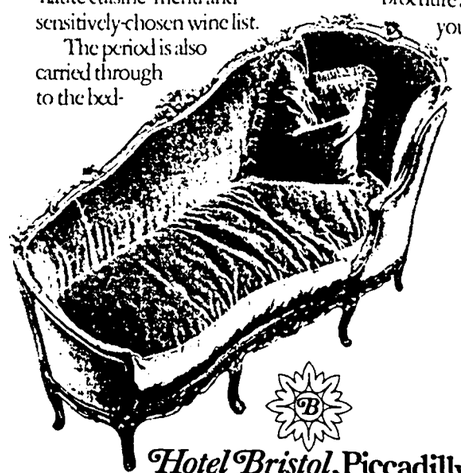
In Spring the age of elegance will be reborn with the opening of Hotel Bristol on the corner of Piccadilly and Berkeley Street.

It will be a luxury hotel with 200 bedrooms all with private bathroom, 7 luxury suites, a bar, restaurant and underground car park designed to appeal to people from all over the world.

The accent throughout will be on fashionable elegance. The interiors are designed by a team of experts in traditional decoration, who have captured the best eighteenth century French style of Louis XV.

You will see this from the moment you enter the foyer, reached via a covered courtyard from Berkeley Street. It will have walls and floor of the finest marble in the chosen colours of Hotel Bristol. A domed plaster ceiling by the lifts will carry an elegant chandelier, and the reception area will have a coffered ceiling with cut glass pendants.

The bar, situated at the approach to the restaurant, will have a sophisticated elegance with a raised floor and walls of painted plaster. Cut glass ornament and secret lighting will be used to outstanding decorative effect.



The restaurant will be a room that might have come out of Versailles itself. Its niched walls and liberal use of hand-painted panels, plaster mouldings and ornaments will give it a charm and grace which will add to the enjoyment of the 'haute cuisine' menu and sensitively-chosen wine list.

The period is also carried through to the bedrooms and luxury suites even down to the furniture and furnishings. Both in proportion and shape as well as design, they will have an elegance that distinguishes them from the usual hotel bedroom.

At Hotel Bristol, our aim will be the highest quality of personal service. All our staff will be selected for their courteous and pleasing manner as well as their competence.

Also, thanks to our efficient internal organisation, our manager will be able to spend most of his time ensuring that Hotel Bristol puts your comfort and convenience before anything else.

Send today for our colour brochure and see for yourself the elegant style of the new Hotel Bristol.

Hotel Bristol, Piccadilly.
We're here to serve you.

Trafalgar House International Hotel Holdings Ltd, Cleveland House, St James's Square, London, SW1.

throughout the five years. The corporation tax change cuts the return for the lessor by a quarter. But, if 100 per cent first year allowances are introduced by the Finance Bill, the cost for the same contract in October, 1972, would go up to £69 a quarter, nearly 15 per cent higher than it would have been last October. If, on the other hand, there is free depreciation, so that businesses take their 100 per cent in the second year, the quarterly payments on the same lease next October will be £62.25, not such an astronomic increase, but still £1.75 a quarter above last October's cost. A similar contract in April, 1973, will only involve quarterly payments of £59, a quarterly saving of £3.25 for five years for the man who delays the installation of equipment for six months from next October until April, 1973. The incentive to make such delays will be the stronger, the nearer to April, 1973, the investment would otherwise have been made.

North Sea oil

Can Scapa flow?

A joint top-level reconnaissance in the Orkneys by men from Shell, British Petroleum and the American drilling company Sedco, scheduled for next Monday, has caused a local stir. It may be too big a stir. Whenever oilmen go north nowadays, everybody seems to expect them to announce the discovery of a new oilfield. This is unlikely to happen on Monday ; but there should be scope for development at Scapa in the wake of the oil industry's arrival in the North Sea.

Scapa Flow is ideally placed as a service base for rigs and production platforms working round the top of Scotland. Aberdeen is a considerable distance from these new exploration areas, and is losing favour with some service companies because of congestion ; its harbour board is desperately pressing the Government to finance a major expansion. Already Hudson's Services is looking to Scapa to supplement its Aberdeen depot. An even more important attraction at Scapa is its immense existing capacity for oil bunkerage. It was able to refuel the Royal Navy, when Britannia really had one. Provided the naval authorities can be won round, it would be an ideal transhipment terminal at the end of an oil pipeline.

Orcadians are probably being optimistic in hoping for more. They think that Sedco will want to build rigs or platforms there, or, at the least, carry out major repairs and servicing. Timorous non-islanders must point out that there would seem to be difficulties and costs in carrying steel, heavy equipment and spare parts across a difficult sea.

Consumers

Still waiting

Retail spending was down in February, which was predictable because of the power cuts. But the figures published on Wednesday showed a drop of only 1 per cent in volume from January, rather less than might have been expected. It is a fair guess that without the miners' strike spending would have kept up its momentum. Food sales held up well : there was probably just enough hoarding to offset the inconvenience of candlelit supermarkets and occasional closures. But clothes and shoe shops suffered : those without their own generators have probably lost some sales for good. The purchase of durable goods petered out a little, too, but not that much—perhaps surprisingly, since many a customer must have been buying electrical goods for a blacked-out home. All in all, the volume of retail spending in the three months to February was level with the previous three months.

February's hire purchase figures tell much the same story. New credit was down a bit, particularly in durable goods shops and department stores, where the effect of last July's measures was beginning to wear rather thin. Still, the total consumer debt outstanding at the end of February was 19 per cent higher than a year earlier.

Retailers are now reporting a marked pickup in buying enthusiasm, spreading well beyond colour television sets. And hire purchase sales of cars in March were the highest since last October. Since official figures are always tantalisingly far behind, private market researchers are trying to catch a more current mood. The British Market Research Bureau published its latest consumer confidence poll just before the budget ; even then confidence was on the up and up, particularly among women. Gallup got in just after and recorded the biggest impact ever from a budget. It investigates consumers' expectations on incomes, prices, their financial commitments, business activity and unemployment, all of which are rolled into a "consumer confidence" index. Action is usually found to follow about three months later.

Key indicators : British economy

Reserves
Rose by £32m in March to £2,715m.

Consumer credit
New credit extended in February was £184m, seasonally adjusted, slightly below the level of recent months.

Retail trade
Sales by all but food shops fell back in February, but probably because of power cuts and holding-off by consumers before the budget.

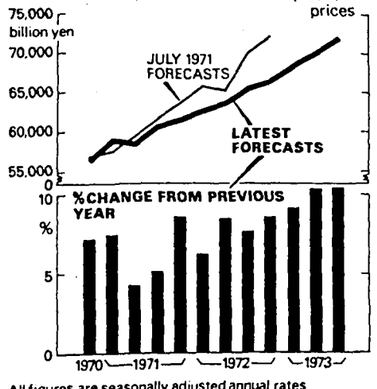
BUSINESS *International*

Back to that old time growth talk

Tokyo



Businessmen are saying that the Japanese economy could be well on the way to recovery by the summer. Recovery to them means putting aside the 5.9 per cent real growth of 1971-72 (year ended March 31st) and talking Japanese-size figures once again. The authoritative Japan Economic Research Centre (Jerc) is sticking to the 8½ per cent growth for 1972-73 which it forecast in early December, although it was then expecting a smaller upvaluation of the yen than actually happened. Jerc's forecast implies that by next winter Japan will be on a 10 per cent growth rate, back to what has been normal over the past decade. It says, in fact, that the Japanese miracle is not over. Still, last summer it was foreseeing even rosier times.

Japan's overseas trading partners will be relieved to learn that exports are expected to rise by no more than 0.9 per cent next year (with a minute rise for 1973-74 also). But—and this is the catch—that forecast is in yen. In dollar terms the rise will be substantial: from $24.67 billion to $27.07 billion. Not much of the increase will be offset by upvaluations of European currencies: Europe, west and east, takes only one-seventh of Japanese exports. However, despite the economic revival, Jerc does not expect Japan's imports to rise much either, and it expects the trade surplus, at $8.60 billion, to be much the same as last year's. This huge figure will be only slightly trimmed by invisibles (a deficit on them of about $2 billion is expected) and by long-term capital exports of $2.95 billion. So the reserves could rise from $16.75 billion at the end of March to $18.87 billion a year hence.

Even that would be a relief compared with the $20 billion by next December that Japanese ministers had been forecasting. Moreover, the Japanese have begun to implement several measures to hold down their reserves. In the past two months the central bank has lent $600m to Japanese foreign exchange banks on condition that they reduce their foreign borrowings by an equivalent sum. It is thought that these deposits may eventually swell to some billions of dollars, if the banks do not scream too loudly over the disruption of their traditional connections with American banks. The Ministry of International Trade and Industry and others plan to stockpile non-ferrous metals, and possibly also iron ore and coking coal, with finance from the Bank of Japan; importers would have to pay up after one year. The World Bank made the largest single borrowing in its history when it took Y100 billion ($320m) from the Bank of Japan last month. And there are distant plans to expand the Asian dollar market just opened in Tokyo into a long-term dollar capital market. Japan is not just lying down under the weight of its reserves.

Japan heads back for 10 per cent

Gross national expenditure at constant (1965) prices

Australia

Angry with the Japanese

Sydney

Great indignation has been aroused in Australia by Japanese steel companies insisting on cuts in their long-term iron ore contracts. Deliveries of Australian ore to Japan in the year to March, 1973, are to be trimmed by 6 per cent below the minimum contractual tonnages. The largest producer, Hamersley Iron (45 per cent owned by Rio Tinto-Zinc), has announced its agreement to such a cut. The Mount Newman consortium is reported to have agreed too, although its partners have not said so. A similar reduction will probably be made in contracts held by the Mount Goldsworthy consortium (of which Consolidated Gold Fields is a one-third partner).

The Japanese had already used their options to cut deliveries by 10 per cent. However, since the full 16 per cent reduction applies to this year's

Ore to spare

He knows the way from London with his eyes closed

So does he

There's still one road where you can joyfully ignore the speed limits, avoid traffic jams and cut straight through the rush hour.

The railroad.

While others fume, you can sit back in your comfortable Inter-City seat. Read your paper, work a little—or a lot—or stretch out and close your eyes as Inter-City carries you smoothly to your destination.

To give you more time at your destination why not use Inter-City Sleepers either out, back or both ways? Travel while time costs nothing—in your sleep!

On arrival, relaxed and unruffled, you're probably just a short cab-ride from your meeting. But if you need a car, Godfrey Davis Rail Drive car-hire service is available at over 70 Inter-City stations.

Day or night Inter-City is your best business refresher course. Start the day's journey with a good hot breakfast; unwind from it with dinner on the way home. Or sleep easy all the way.

*Facts from the Newsweek International 1971 Readership Survey.

expectations rather than to last year's deliveries, and since the contracts provide for an increasing volume of iron ore, the net result will be a relatively small reduction in Australia's total ore deliveries to Japan and all other destinations of perhaps 3m tons below the 50m tons exported last year. The companies will lose no more than between £9.6m and £10.9m in revenue, but they reckon that new production capacity worth some £90m will now be surplus to requirements for the time being.

Apart from gold a century ago, no commodity in Australia's history has had so sudden and profound an impact on the economy as iron ore for export has in the past six years. Between 1965 and 1970 the Japanese steel industry signed long-term contracts to import ore worth more than £3.6 billion from Australia, thus promoting an investment of £455m in new mining investment. Iron ore exports, begun only in 1966, accounted for 30 per cent of Australia's mineral exports last year, and both businessmen and politicians have been abruptly reminded of their economic dependence on Japan.

The Japanese steel industry produced only 88.5m tons in 1971, compared with the expected 100m tons, leaving steel mills holding large stocks of ore. Now a recovery to 95m-96m tons is expected, requiring 107m tons of ore. But the Japanese had contracted to buy 120m tons from various sources. Hence the cutbacks.

South African budget

Mildly for growth

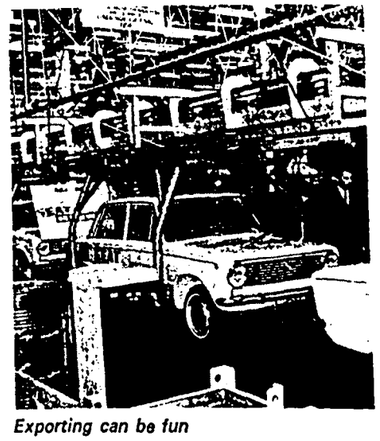
Johannesburg

Having grown at 3.1 per cent a year over the past decade, South Africa's gross domestic product per head advanced a mere 1 per cent last year. Not surprisingly, therefore, the minister of finance, Dr Nicholas Diederichs, produced a mildly expansionary budget last week, only three months after the rand was devalued by 12.3 per cent (against gold). Government spending is to rise only 6 per cent in the new fiscal year, compared with a 20 per cent jump a year ago. Even so, because of the impact of the recession on tax revenues, Dr Diederichs is to pump 800m rand (£470m) additional purchasing power into the economy through deficit financing. Credit ceilings are relaxed (although interest rates are to be pegged) and there are tax incentives and concessions for industry, exporters and individuals.

Business reaction has been generally favourable, but the widespread view is that Dr Diederichs is taking a considerable gamble. Having suffered acute balance-of-payments problems last year, South Africa now faces the alternative possibilities of a rapid revival of the economy, or an acceleration of inflation (over 6 per cent in 1971), and a still bigger payments deficit.

Certainly there is a good deal more slack in the economy than a year ago. For whites, asians and coloureds, unemployment has risen about a third in 12 months; capacity in private manufacturing has risen 10 per cent over the past two years but output has risen hardly at all.

Yet the market for skilled labour remains tight. Unemployment among skilled whites is only 1 per cent. There is obvious scope for the powerful white labour unions to take advantage of Dr Diederichs's expansionism. Demands now in the pipeline from white mining unions, textile workers and railway staffs are the shape of things to come. At the same time, while import controls —imposed immediately before last December's devaluation—remain in being, the restraining effect of foreign competition on South African prices is blunted.



The obvious solution would have been for Dr Diederichs to announce big relaxations in the industrial colour bar. But, to industry's disappointment, he did no such thing. The only concession is that industry in towns will now be allowed to employ additional black labour to work multiple shifts—something that was previously forbidden in any firm where the ratio of black to white labour exceeded 2.5 to 1. Pretoria evidently has no intention of making white unions give a bigger share of skilled jobs to the blacks. Nor was there even a hint that the proportion of the gnp going into black training and education will be raised. South Africa looks set fair—with devaluation, import controls and an expansionary budget —to boost output. The extent of the inflation that will follow—the economic price of apartheid—remains to be seen.

Spanish cars

With seats

Barcelona

For the first time cars from Seat, Spain's leading motor firm, are making an impact on the French market. Hitherto, Seat's export effort in Europe has been concentrated on smaller countries with little domestic car production, but last year it sold 3,700 vehicles to west Germany and this year 4,000 will go to France. Like Brazil (see *The Economist*, April 1st) Spain is well placed to collar a big slice of the growth in the world's motor manufacturing in the 1970s. With a gnp per head three times that of Brazil but a population one-third the size, Spain's carmakers, like Brazil's, need to boost exports sharply to maintain the industry's prodigious growth rate. Unlike the Brazilian industry, however, the leading carmaker in Spain is

Exporting can be fun

Key indicators: world commodity prices

Rubber
Continued lack of consumer demand, coupled with increased production, stocks and over-capacity among synthetic producers, have combined to push rubber prices to new lows at little over 12p a kilo. Only intervention by the Malaysian government has prevented prices tumbling further.

locally-owned.

The Sociedad Española de Automoviles de Turismo was formed in 1950 with 51 per cent of the shares held by Ini (the Instituto Nacional de Industria, the state holding company) and most of the remainder by Spanish banks and private shareholders. Fiat undertook to provide technical assistance and the licence for the use of its designs, but held only 6 per cent of the capital. The Seat factory went into production in 1953. From then to 1966 the number of cars registered in Spain soared from 8,000 to 250,000: now there are 4.8m. Seat sales boomed accordingly, and the company now has the biggest sales in Spain, worth £156m, or £50m more than its nearest rival, the Bilbao steel firm of Altos Hornos de Vizcaya. Seat is also the showpiece among the companies under the Ini umbrella. Apart from a popular image it has an excellent profits record —which cannot be said for all of them—and has been paying a regular 15 per cent dividend for some years.

However, the Spanish car market has increasingly become a replacement one, and Seat, along with other producers, has had to turn abroad. This necessitated a revision of its agreement with Fiat (which originally confined Seat's sales to Spain). From 1967 onwards, Seat gained the right to export through its own sales organisation, with help from Fiat; in return for this Fiat became entitled to appoint more directors to the board and to raise its shareholding to 36 per cent. Seats are now sold to over 30 countries, including Holland, Belgium, and Finland (where they are now the most popular car); a tenth of the output of the Spanish car industry goes abroad, and a fifth of Seat's.

At home Seat holds 60 per cent of the market. Imports are negligible because of a protective duty of 80 per cent and limits on import permits; competition comes from French and other foreign manufacturers producing in Spain. The Seat 850 holds the lead in sales of Spanish cars as a whole and the Seat 124D among cars of medium class. Last year output (255,621 cars) was hit by Spain's recession, labour troubles and the Catalan floods, but by 1975 or 1976 output is expected to reach 500,000. A second factory, with the same capacity as the present Barcelona one, is to be built at the nearby town of Martorell, and the company is scheduled to make capital investments of £74m in the 1972-75 development plan. Seat's export drive is only beginning.

Pakistan

Better without Bangla?

Islamabad

Despite President Bhutto's present political troubles, his economic policy-makers reckon that west Pakistan can achieve a real growth rate of 10 per cent once the problems of adaptation to the loss of Bangladesh have been overcome. The west wing achieved 6½ per cent annual growth in the 1960s, but, according to the conventional wisdom in Islamabad today, the east wing during this time was becoming an increasing liability. Visiting foreign aid experts endorse, though less enthusiastically, the view that the west may now be better off without East Bengal and its large, poor population.

All the same, sales to the east before the break-up were rising faster than exports and the loss of the east has already led to setbacks in the production of cotton yarn and fabrics, cigarettes, and certain chemicals. To divert these goods to world markets will require an upgrading of quality (eg, in cotton textiles), even if markets can be

Tilting at the float

New York

The Federal Reserve Board's new proposals for speeding up America's cheque-clearing procedures call for one-day payment of all cheques. This is already standard in downtown financial districts, but elsewhere it is not unusual for five or six days to elapse between deposit of a cheque to a payee's account and its subtraction from that of the payer. Manipulation of the resultant "float"—in-transit cash which is in two accounts simultaneously—is very widespread. One universal practice is kiting: risking overdrafts by writing cheques that, with luck, will not be collected until a later deposit is made; done professionally, this is a fraud which plagues many banks.

Some non-bank float results inevitably from delayed deposit of cheques and from postal delivery time, but it is the float within the banking system itself which is the target of the Fed's pressure for promptness. In-transit items held by the largest banks amount to more than $30 billion every day. And there is a further $3 billion in the Fed's float, resulting from its crediting cheques to receiving banks several days before charging them to paying banks. This fluctuates sharply and unpredictably, thereby complicating the Fed's critical role of managing outstanding bank credit in pursuit of monetary policy. And since it amounts to a perpetual interest-free loan of $3 billion to the banks, the Fed has an immediate incentive to reduce it, even beyond the broader benefits.

At the same time, however, the Fed is proposing to make uniform the now-different sets of rules for city and country banks that determine the minimum reserves they must hold against demand deposits. The result will be a net release of funds available for lending of $2.9 billion, which will be partially offset by the $2 billion the Fed reckons to chop off the float. The net increase of funds in the banking system, however, will be counteracted by monetary policy.

Two years ago, the Fed established a regional cheque-clearing centre in the Baltimore-Washington area, where cheque-kiting was notorious. Its success led to the Fed's declaration last June that it would, if necessary, set up as many as 18 new regional centres. The Fed's problem is not one of insufficient facilities, since it already has a nation-wide computerised wire-transfer system capable of achieving its goals, but it has not yet found the key to inducing the banks to use its system. They uniformly use it for a large volume of small transactions, but reserve the large ones (and the float involved) to direct transfers between banks. Even the elimination of fees for transmission of amounts over $1,000 failed to produce increased use.

For their part, the banks argue that many corporate customers prefer present methods and have hinted that a reduction in the board's reserve requirements is in order if it persists in pulling the float plug. Bankers note that not only do regional centres reduce float, but that the leading bank in Baltimore, for instance, has already lost more than $10m in interest-free deposits maintained (mainly for cheque-clearing services) by banks for which it acts as correspondents.

Heavy going

Gallaher-1971

Extracts from the Statement by the Chairman, Mr. Mark Norman

Trading Results

Turnover increased in 1971 to £453 million compared with £436 million in 1970. All sectors of the Group, including new acquisitions, contributed to the increase except for cigarettes which declined by about 4½%. Trading profit before interest increased to £22.58 million compared with £20 million in 1970; again all sectors except cigarettes contributed to this profit increase.

The Group trading profit is about 12½% up on the previous year. Tobacco profits overall showed a modest increase. Our Optical interests contributed greatly increased profits. Our Engineering interests would have produced a satisfactory profit increase (including Saunders Valve for only 9 weeks) but for losses on exchange rates arising from the revaluation of currencies. Our Wholesaling operations swung from a loss to a very small profit.

Group profits attributable to Ordinary Shareholders are 1971—£12.98 million, 1970—£11.38 million.

The Directors now recommend a final dividend of 13 per cent, making a total of 21 per cent for the year compared with 19 per cent for 1970.

Tobacco Marketing and Sales

The total cigarette market declined over the whole year by about 4½%. Gallaher maintained its market share.

The KING SIZE sector increased volume by 25% and, despite four new competitive brands being launched during the year, BENSON AND HEDGES KING SIZE has held its share.

In the last quarter of the year, sales of SILK CUT more than quadrupled due to the brand being positioned at the top of a tar/nicotine league table published by an independent survey. Additions to the SILK CUT range have been introduced in 1972 and total SILK CUT volume is expected to grow.

HAMLET is now the largest selling cigar, having overtaken MANIKIN which itself beat last year's volume. BENSON AND HEDGES SMALL CIGARS had a successful first year.

CONDOR maintained its market leadership. In the roll-your-own sector OLD HOLBORN continued to improve its market share in a sector of the market which declined during the year.

Mono Pumps Limited

In spite of rather difficult trading conditions the Mono Group, including F. A. Hughes & Co. Ltd. for the first time, increased its sales substantially and its profits before exchange rate adjustments modestly.

Mono Pumps (Engineering) Limited improved its turnover in packaged sewage equipment and associated pumping equipment and returned its best profits yet.

Metering Pumps Limited produced record sales and profits.

Saunders Valve Company Limited

In September 1971 we purchased the whole of the issued share capital of this well known engineering company.

The Dollond and Aitchison Group of Companies

The Dollond and Aitchison results were excellent.

In August 1971, we acquired for about £1.25 million cash more than 90% of the share capital of Clifford Brown Ltd., the well known firm of Dispensing Opticians with 31 Branches; their profits for 8 weeks are included in these results.

Wholesaling

1971 has been a year of considerable re-organisation and expansion and the Division is now beginning to make a significant contribution to Group sales and profits.

People

I must particularly mention again those who work and live in Northern Ireland—about 5,600—where the violence and conflict impose a dreadful pressure on the home lives and daily travel of all. To the great credit of management, staff and workpeople, both men and women, there has been little interruption to the production and distribution of our goods. Community discord has rarely moved inside the factory, warehouse and office walls, and so long as this good sense prevails there is hope that solutions will be found outside.

Outlook

For 1972 our main concerns are profit margins and the future consequence of Britain's entry into the Common Market.

Costs of all kinds have continued to rise, albeit at a slower rate; prices of our products have been held steady in most cases for well over a year. The time is coming when we shall need some price increases to restore profit margins to the level necessary for the maintenance of our facilities and the continuing financial health of our undertakings.

Joining the Common Market is going to pose some special problems for the tobacco industry, in particular those related to tobacco taxation and to the enlargement of a 'home' market from 55 million to 250 million people. We must be prepared for these changes.

SUMMARY OF RESULTS 1971

Total Sales	£452,870,000
Profit before Tax	£21,922,000
Tax	£8,615,000
Ordinary Dividends (gross)	£7,734,000
Profit retained	£5,251,000
Net Assets	£138,739,000

"Oh God, not another conference on Europe."

It's an understandable reaction.

But the fact is that for all the hot air about Europe there's been precious little discussion about the nut and bolts.

That's why the Advertising Association is devoting its 1972 conference to 'The Common Market Place.'

For two days over twenty speakers, starting with the Rt. Hon Edward Heath MP, will put Europe under a marketing, advertising and media microscope.

You'll hear of the developments so far, backed up by chapter and verse case histories.

You'll learn how British agencies and media can benefit from the European drive into Britain.

You'll hear how the Americans have responded to Europe. How consumerism is likely to affect you. Which British industries will be first to feel the crunch of Europe.

And specialists in media, research and industrial advertising will have special working sessions as well.

If you haven't yet received your invitation to join the other delegates from all over Europe who'll be coming to the conference, please send us the coupon.

But first, pencil July 4th and 5th into your diary.

It would be a shame if you were booked to do something else on the day your competitors were learning how to run rings round you in 'The Common Market Place.'

Advertising Association Conference '72
The Common Market Place.

I would like to attend. Please send me further details and registration form

Euro Advertising. With acknowledgement to Punch

We're much more modern without Bangla

found at all. Equipment would need to be imported (for which foreign exchange may be lacking); because of Pakistan's high-cost structure, subsidies may be needed. However, considerable scope is seen for expanding the output of other industries like cement, garments and light engineering products.

When it comes to agriculture, the west is self-sufficient in wheat, its staple food in normal years, and has a surplus of 1m tons of rice. With the further spread of the green revolution, surpluses ought to materialise also in raw cotton, oilseeds and tobacco, which could become trade-offs for the jute and tea which came from East Bengal. A rice-for-tea barter deal has just been negotiated with Ceylon. But all this will depend on several imponderables. More power will be needed to extend the green revolution; more inputs will be needed too, yet half Pakistan's fertilisers and all its pesticides are imported. Above all, whatever the long-term benefits from Mr Bhutto's land reform plans, a breakdown in the traditional landlord-tenant relationship could lead to a reduction in crop credit and a fall in output, quite apart from the political discontents which continue.

Even more serious will be the need to cut the army down to a size appropriate to Pakistan's new dimensions; the political difficulty, given that most of the army was recruited in the west, is obvious. On the other hand, Pakistan's aid prospects are now improving. Residuary Pakistan is now expected to enjoy an aid inflow of $250m a year, or more than half the previous total for the united country. And the Aid Pakistan consortium has agreed to a moratorium on capital repayments of existing aid, but not of interest, thus cutting the current outflow by about half, to $100m a year.

Ski Soviet style

The Russians are planning a ski resort in the Caucasus. A consortium of French businessmen, banks and ski technicians hopes to be able to sell knowhow (possibly in partnership with Swiss and Austrian interests) for a centre modelled on Courchevel in French Savoy. With 20,000 beds, it would be fully equipped with lifts and entertainment facilities to take one million visitors a year.

The one largish ski resort as yet in Russia, Alma-Ata near Tashkent, has very limited equipment and is almost inaccessible. All the same, French salesmen may be optimistic in thinking the Russians need the kind of help they are offering. A deal over communications could be more likely. Whichever resort the Russians choose, they will need to build a nearby airport.

There are still a lot of uncertainties. Might the ski resort be largely reserved for Olympic training and domestic use? Or for tourists from the European communist countries? Or will it be used to attract high-spending hard currency skiers from America, Europe and Japan?

Over 5m skiers take to the Alps every year, and the number of skiers in west Europe as a whole increases by 10 per cent a year. If Russia can sort out the travel problems, it has some hope of creaming off some of this growth, if only because of one supreme attraction: the Caucasus has snow all the year round.

Courchevel sets the style

Germany

Looking east

Hamburg

On Tuesday a high-level team of negotiators from the west German foreign office, as well as from several other ministries and the Bundesbank, left for Moscow to put the final touches to a new Soviet-German trade pact. Trade between the two countries has been going on without a formal agreement ever since the last one ran out in 1963—and was not renewed because the Russians insisted on excluding trade with west Berlin. However, thanks to Herr Willy Brandt's Ostpolitik, the political climate has improved sufficiently to make it likely that a provisional trade agreement will be reached before the end of this week. The final decision will then still have to wait until the four power agreement on Berlin comes into operation. This, in turn, will hinge on the ratification of the eastern treaties, whose fate will be decided in a key vote in the Bundestag on May 4th.

Even during the period while the trading agreement has lapsed, Russia has remained Germany's biggest trading partner in the eastern block. There are still quotas on some 40 per cent of Russian exports to Germany. Obviously, the least that Russia will hope for now is a liberalisation to the same level as for German imports from Poland, Czechoslovakia, Hungary, Bulgaria and Rumania, all of which have long-term trade agreements with Germany and quota restrictions on only some 15 per cent of their trade.

BUSINESS *Investment*

The European connection

Perhaps it was the fixing of the date of the French referendum that turned the thoughts of the market to the joys of Europe on Wednesday. A more likely explanation of the 7.2 rise in the Financial Times industrial ordinary share index that day was the celebration of the end of the tax year. But even on Thursday, ordinary shares were edging up; indeed the index closed at a new all-time peak of 522.2, although it was the first day that the investment and unit trusts could sell and become liable for a tax charge of only 15%.

Unit and investment trusts are once more going to attract a lot of new money from investors. But those that have a new angle will, in this marketing-conscious age, pull in the most.

Rothschild Investment Trust is certainly a trust with a difference, but it will be interesting to see how eagerly the public responds to the £10m it is issuing in the form of convertible preference shares with a 5% coupon. From RIT's viewpoint, the addition to the existing £9m equity base gives more scope for gearing, and the payout makes good use of the pattern of the trust's franked income. Preference shares will have the same advantages in capital gains tax to trust shareholders as the ordinary shares. While the trust is becoming increasingly multinational, through the holding of the Netherlands-based Magnum fund, it is making active use on the London market of big dollops of money. When the **Grand Metropolitan Hotels** offer document for **Watney Mann** comes out, RIT will be revealed as the holders of £9m worth of Watney shares, the bulk of the 4.2m shares that were built up "in concert" with the offerer before the bid was announced. The larger the trust, the more muscle can be exercised in this anglicised version of block trading that has been coming into fashion. At a market price of 570p, the shares are at a premium of, very roughly (RIT does not publish a detailed portfolio), 5% on net asset value, which is less than some of the other glamorous trusts around, although it is nearer 20% on a fully discounted basis. The point about RIT is that since N. M. Rothschild and Sons is not a quoted bank, there are all kinds of fancy things that the trust will do that the bank will not, and a lot of management and effort is being put into this showcase fund. At the end of the month, or thereabouts, Rothschilds will be launching another bigish trust, destined for investment in Europe.

Suddenly Europe is all the rage among fund managers. Ivory and Sime are buying control of a Dutch investment trust. John Govett's £20m **Govett European Trust** was sent off to a flying start, as clients of Hoare and Co Govett, the stockbrokers, had agreed to take £13m in advance.

The theory of the investors on the European scene is that European stock markets have failed to provide their companies with the kind of rating that they deserve. Over the next few years, partly under the influence of British investment managers, the p/es may climb towards British levels. As most of the European economies and stock markets (Italy excepted) are showing good signs of recovery, now is a good time to get on the rolling bandwagon. There are bound to be disappointments en route; Europe is, financially, a very different country, with different attitudes to stock market investment. But so is Japan, and the experts are making money for the non-experts there.

While the investment dollar premium lasts, the funds have to get round it, either through negotiating back-to-back loans, or by lending to feeder funds. Baring Brothers quietly launched the **Treaty Trust**, whose £5½m was subscribed by the institutions, and which is not destined for consumption by the general public. It will be fed through a Geneva-based subsidiary. Geneva was chosen in preference to the traditional offshore havens, most of which are proving to be more trouble, politically and in communications, than they are worth. There will be some tax liability, but only about 7.6% on capital gains, as Switzerland benefits from tax treaties with the other European countries in which the money will be invested.

Marine Midland's new Paris branch is not hard to find.

Marine Midland has just opened a new branch at 17 Place Vendôme, an address well known to both American and European businessmen. Now we can offer your business complete banking service.

Including: Local currency or Eurodollar financing. French franc or dollar-deposit accounts. Introductions to local businessmen and Government officials. Remittances in all free-world currency. Foreign-exchange transactions. Facts on taxes, labor, credit and investments. As well as import-export opportunities. The kind of help only a Full-Service bank can give you.

Marine Midland Bank—New York is the largest bank in the $9-billion Marine Midland banking system with 274 offices in 177 cities and towns throughout New York.

When you're in Paris, drop in and visit André J. Plagnol and Aimé P. Ferzan, vice presidents, at our new address (Tel. 742-5397).

Marine Midland can steer your business on a profitable course.

Damn it all, Simpkins!..

Sir?

What on earth is all this? . . .Not the tax people again is it?

Your report, Sir, on other premises, Sir. Expansion, Sir.

Why didn't you say so man? Get on with it then—how much, where, when and why?

If I might be permitted to start with 'where' Sir—the other side of Hadrian's Wall actually, Sir.

The other side of where, Simpkins?

Hadrian's Wall, Sir. Scotland, Sir—just.

But, Simpkins! We've always been down this end of the country—always.

Sir. With respect, these files represent all the available data from S.D.D., D.T.I., D.E., Development Authorities, New Towns and half the Towns and Burghs in the U.K. I've got data on T.T.C.'s and T.W.I. and T.D.S. courses and . . .

Hadrian's Wall, Simpkins? Surely that's away north of Watford, dammit Simpkins.

That's where we should investigate, Sir . . . the Central Scottish Borders. Sir. They do appear to have everything we need, Sir.

How *do* you pick them, Simpkins?

They are expecting us on the 22nd Sir.

We don't have to go by pony, Simpkins, do we?

(YOU WILL FIND OUT ON 22ND APRIL HOW HELP WAS AT HAND: HOW MUCH LONGER CAN YOU DO WITHOUT HELP?)

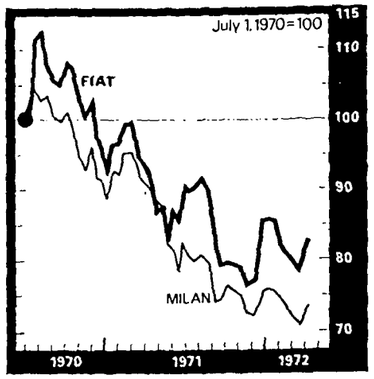
French bourse



April and the bourse is in blossom

Paris

The Paris bourse has finished the first quarter of the year in a rapturous way, having started in gloom. What is particularly encouraging is not just the continued influx of foreign money which originally, in February, woke the bourse from its long sleep, but the realisation that the French themselves feel that they are on to something more seductive than gold bars, and are investing. French shares still look undervalued. Although they have risen by nearly 20% this year, they are still 15% below their value 10 years ago. With few exceptions, company results for last year have been excellent, with a number of companies announcing increased dividends for this year.

The volume of transactions has been running well above average, at a daily figure of roughly Fr275m. Most of the buying has been in French blue-chips, but there has been an increasing amount of interest in speculative shares as well ; many private investors with small portfolios are buying shares for short-term profit rather than solid, interest-bearing bonds to pass on to their heirs. However, the bourse may be ready for a short rest. Already, investors have cashed in on the phenomenal rise during the last month in **Carrefour**, a supermarket chain, which has now dropped back from its high. Financial shares have been a particularly strong sector recently, perhaps too strong.

In the long term, the bourse and French companies will have to do something more positive in order to attract a steady flow of investors' money, and break the current pattern of long periods of stagnation interrupted by spots of frenzied trading. There is, of course, a considerable fear that London will come to be considered as the one place in Europe to raise money and get a quotation. Several technical measures easing bourse operations have been announced, but the quality of companies' reports to stockholders still leaves much to be desired. A pleasant break with tradition has been announced by **Jacques Borel International**, the restaurant chain, in declaring its annual meeting open to everybody, whether they are shareholders or not.

Fiat

But the market drives downhill

Rome

One of the few encouraging indicators of the Italian economy is Fiat's 1971 operating profit. At just over £10m, it was almost triple that of 1970. Admittedly, it is still less than half that of 1968, the last of Italy's unchecked boom years of the 1960s, when the figure was just under £23m. And to maintain a dividend of L120 per share, as paid out in previous years, Fiat's board has had to withdraw £13.8m from taxed reserves. Nevertheless, the dividend was maintained and the small rise in the share price to L2,143, from a low of L1,975, demonstrates the appallingly low morale of the Italian stock market. Shares are now worth only about a third of their market value of some 10 years ago, and the treasury minister, Signor Emilio Colombo, has been asked to try to use legal powers to limit the scope of the bear raiders.

Despite numerous strikes and constant labour agitation, 1.6m vehicles were produced by Fiat in 1971, a good deal fewer than planned but still more than in previous years. Fiat's exports (616,000 vehicles) also held up well.

Part of the credit must certainly go to the popularity enjoyed by Fiat's latest models, the 128 and the 127, in common market countries. Britain has also provided one of the strongest markets for Fiat, tripling purchases since 1969 ; this year Fiat aims, and expects, to sell 50,000-60,000 vehicles on the British market. Another recognition of the importance Fiat gives to the British market is the appointment of Lord Poole, chairman of Lazard Brothers, to its board.

Wall Street

Cooling that pooling

New York

Should security firms and banks be allowed to invest in corporations for which they provide banking services? Should bankers be permitted to sit on boards of client companies? These questions have again come to the fore with added urgency as a result of the **International Telephone and Telegraph** affair—besides the questions raised, of course, for the politicians. While a Senate inquiry drags on into whether a contribution by the Sheraton Hotel subsidiary of ITT was linked to an anti-trust settlement last summer that was favourable to the big conglomerate, reporters have been busily sifting through recent congressional records to keep the ITT story alive.

One opulent vein that has been unearthed is a report on an investigation of conglomerates filed by a House judiciary sub-committee last September. ITT, not surprisingly, is featured prominently because of its spectacular growth in the past several years. From 1964 to 1968, the period of its most rapid expansion, ITT acquired 31 domestic companies with a net worth on acquisition of some $530m, but for which it paid out nearly $1.3 billion largely in its own shares.

The report makes two key points about these mergers. First, that by the pooling method of accounting, ITT was able to make these overpayments look like growth because pooling did not require the parent company to write off the overpayments against earnings. Secondly, the report notes that Lazard Frères, ITT's investment banker, earned some $16m during this period in fees from acquisition services furnished to the conglomerate. It is noted, too, that a Lazard director, Mr Felix Rohatyn, has been an ITT director since 1967.

While Wall Street representation on corporate boards continues to be the rule rather than the exception, some firms now actively discourage the practice, believing they could become vulnerable, often unwittingly, to charges of violating the insider disclosure laws. Others contend that the banker director has too much say in client company policy for any attempt at a ban to make sense. It is clear that this dilemma will still face Wall Street long after the ITT affair has blown over.

IOS

Vesco out, but not down

It is pretty unlikely that Mr Robert Vesco and his **International Controls Corporation** just quietly washed their hands of IOS this week. True, the two ICC subsidiaries that hold 38% of the fallen mutual fund giant have been sold to four IOS executives, including Mr Milton Meissner, the president, and Mr Norman Leblanc, the executive vice-president. But the question is just how much of the complex activities they will control and to what extent Mr Vesco, although he has resigned all IOS posts, will remain a forceful backseat driver.

He has good reason for relinquishing the steering wheel. There is that little matter of the Securities and Exchange Commission's ban on Americans being both involved with IOS and having power over American companies like ICC ; and ICC shareholders must have been getting a bit concerned about the time their chairman was spending on his new task.

All sorts of plans have blown in the wind over the past year. The basic principle seems to be to spin off as many assets as possible from IOS. Some of the banking, real estate and insurance activities were recently hived off, as dividends, to IOS shareholders. They were given shares in two companies, International Bancorp and Value Capital, in which ICC remains a substantial shareholder. No one knows what the new bosses have paid for their chunk of IOS, but they paid it in cash. Whatever it was, the odds are on some help from Mr Vesco, who brought Mr Meissner into IOS in the first place.

Vesco : backseat driver ?

Whoever has the helm it looks like being only of transitory interest to the British outpost of the crumbled empire, International Life Insurance. Talks are apparently taking place which might lead to a British company taking control of that.

William Cory

A life on the ocean waves ?

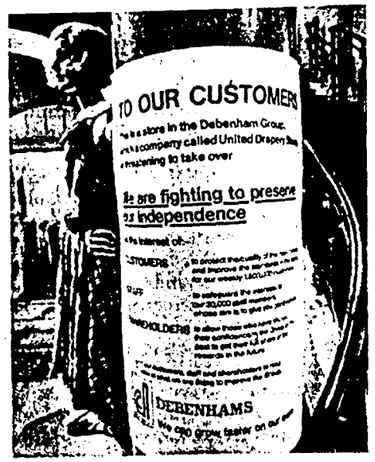
Rumours in the market on Thursday sent the shares of William Cory and Son bounding by 32p to 562p, or 47p above the cash offer of 515p from the **Ocean Steam Ship Company.** The original bidders, **Jessel Securities,** were the hot tip for a counter-bid based on an asset-stripping situation. The properties are thought to be worth £10m more than the latest balance-sheet value, with another £6m from associated companies, valued on a p/e ratio of 10. This gives an asset value of 515p, ignoring what may be extracted from other parts of the balance-sheet.

Ocean and Cory had been proposing a marriage of convenience. For Ocean the possibility of being taken over would thus become more remote, since the merger could increase its capitalisation by about half from the present £100m at a share price of 148p. That would be a bit of a mouthful for **European Ferries** or **Inchcape,** two possible bidders for Ocean, according to recent rumours.

One attraction for Ocean is that Cory's earnings could be set against Ocean's capital allowances, which will total over £100m in the next four years or so, against pre-tax profits of £6.5m in 1970. The historic figures take no account of this year's set-back at Cory, but Cory has had a bad year. Its fuel activities suffered from the mild winter and miners' strike, but the growth record up to 1970-71 was good and the diversification makes sense for Ocean.

Court Line, the third bidder, like Ocean, has capital allowances to spare, and its current bid, at 502½p, is not far below Ocean's 515p. But it is a reverse takeover, not underwritten for cash, and rejected by the Cory directors in favour of Ocean. It is one thing for a large group like Ocean to take on Cory's 1971-72 troubles ; quite another for Court, whose shareholders would probably not be too keen to see the rapid growth of its earnings get bogged down by Cory.

Whether anyone would be interested in bidding for an Ocean-Cory group is another matter. There will still be some unused capital allowances. But Ocean is not like Cunard or **Peninsular and Oriental Steam Navigation :** forward commitments tie up all its assets in ships, so there is no cash bonus. Anyone wanting it would have to want to run ships, which means keeping the proven Ocean management. So the 190p a share of assets is not quite the attraction it might be, although **Rank Organisation** is rumoured to be interested. Rank's mighty p/e of 39 could make Ocean-Cory a cheap buy for it, despite the lower growth and quality earnings.



Tobacco

Smoke signals

On Wednesday **Carreras** produced its half-time figures, showing pre-tax profits of £5.2m, against £4.5m last year. The market was slightly disappointed, since the share price had shot ahead on the week after excellent figures from two associates had suggested even better results. But the shares at 52½p are still cheap, on a prospective p/e around 9, although they have been re-rated against other tobacco shares.

Earlier in the week, the chairman of **Gallaher** was hinting at price increases. Certainly all tobacco firms want a price rise, but all are committed to the Confederation of British Industry's price pledge. Since the price leader is **Imperial Tobacco,** and its chairman, Sir John Partridge, is president of the CBI, the prospects of a quick increase are small. But few people doubt that prices will go up before the end of this year, and that should maintain the almost unbroken upward rise in tobacco earnings.

Carreras has called in the consultants, McKinsey, to see if it would pay to merge with two European tobacco groups, Martin Brinkman of Germany and Turmac Tobacco of Holland. Carreras is already well established in Europe, where tobacco sales have been growing steadily. Talks are also going on between Imperial Tobacco and **British American Tobacco,** which could result in a merger in advance of British entry into the common market. If so, the merged company would be the largest in Europe.

Ungenteel appeal

Debenhams

Woman power

Will Debenhams' stalwart lady supporters frustrate rapacious United Drapery Stores? They form the bulk of the 46,000 small shareholders on the register with less than £1,000 each in the company, and Debenhams is cleverly aiming a series of appeals to them. First off were some big bright posters in all 99 stores in the group, including Swan and Edgar and the Cresta chain, referring snappishly to "a company called United Drapery Stores trying to take over" and dealing with sympathy-getting topics like the quality of merchandise and the interests of the staff. This week big red stickers have been added shouting: "Help Debenhams Stay Independent." Next will be car stickers available in the stores and the chairman, Sir Anthony Burney, claims to have a few more cunning tricks up his sleeve.

Surprisingly few companies in the same position have thought of appealing to the well-known loyalty of the ladies, who account for more than half of all private shareholders. The Women's Shareholders Association, now the Small Shareholders Association, fought for years against its members' tendency to stick by their investments out of sentimental attachment long after they should have sold. Not that this is the only reason for holding on to Debenhams, which remains a stubborn 40p to 50p above the UDS offer. It was among the stores shares that helped the London market to see the old financial year out with a bang on Wednesday.

Performance

Paging all pension funds

Astonishingly little attention has been paid to the performance of pension funds. Need for more attention is well highlighted by the Bank of Scotland's recent revelation that it has had to make an extra provision of £7m to meet its pension liabilities. Now, at last, tunes are changing. The Society of Investment Analysts has published a report* showing how to keep an accurate tab on the way pension fund managers handle the vast sums of money under their control. Recently an independent statistical consultant, Mr Ian Clark, started on the hard task of listing pension funds in a league table.

The investment analysts' booklet tackles the big technical problem that has always inhibited any real measurement of performance by the pension funds: namely that the timing of flows of money in and out of the funds can completely distort their results. In the example illustrated by our table below, funds A and B, both of £1,000, are assumed to be invested in identical portfolios. Their performance is to be measured over an imaginary period between October 1st and December 31st. For the first half of this period, up to November 15th, the shares in their portfolios rise by 5%. In the second half they rise by 10%. Fund A receives an inflow of £500 on November 15th, but fund B does not.

In our example, the manager of fund A would be rated better than the manager of fund B only because he happened to take in extra money at a good time for the market. The problem is specific to pension funds because their money flows are both substantial and spasmodic. Insurance funds have a steady flow so the effects of timing even out. Unit trusts value their units before money is invested in them, so unit performance represents performance overall. In other invested funds the flows are usually small.

The mathematical solution to the problem is simple enough for mathematicians. It is summed up in the formula at the bottom of the page for finding the time-weighted rate of return.

Translated from mathematics, almost into English, this means that the time-weighted rate of return is reached by multiplying the ratio of return to fund size over each successive period between money flows. Unfortunately, this requires a valuation of the fund before each money flow. No one wants to bother with this cumbersome and costly procedure just for performance purposes.

The investment analysts' suggested solution hurdles over these difficulties rather neatly. Under it, the straightforward "money weighted" rate of return is measured for the period, and then compared with a national fund invested in the Financial Times all-share index and some standard measure of average fixed-interest performance. Success or failure is then represented as a gain or loss against the notional fund. A further calculation, based on the comparison, can produce an estimated time-weighted rate of return accurate enough for interfund comparisons. Variations in the investment policy of the notional fund can then show the extent to which performance is due to selection of particular sectors or shares by the managers.

*The Measurement of Portfolio Performance for Pension Funds. *Society of Investment Analysts*. 35p.

The problem

	Fund A	Fund B
	£	£
At October 1st	1,000	1,000
At November 14th	1,050	1,050
At November 15th	1,550	1,050
At December 31st	1,705	1,155
Average sum in fund over period =	1,000+ ½ x 500 =1,250	1,000
Return over period	205	155
% return over period	16.4%	15.5%

The formula

$$TWR = \frac{M_1}{M_0} \times \frac{M_2}{M_1 + C_1} \times \frac{M_3}{M_2 + C_2} \times \frac{M_n}{M_{n-1} + C_{n-1}} - 1$$

M_0 = value of the fund at the start of the period
M_1 = value of the fund before the first cash flow
C_1 = first cash flow
M_2 = value of the fund before the second cash flow

CHAIRMEN'S STATEMENTS

Carrington Viyella LIMITED

Extracts from the Statement by the Chairman, ***Mr. J. A. Lewando*** *and the Directors' Report for the year ended 31st December, 1971*

RESULTS AND DIVIDEND The consolidated profit for the year before taxation amounted to £5,844,000 compared with £981,000 (the comparative figure represents the consolidated results of the Carrington and Dewhurst Group Limited and its subsidiaries for the nine months ended 31st December 1970 and those of Viyella International Limited and its subsidiaries for the year ended on that date). In view of the considerably improved results the Directors recommend a final dividend of 3%, making the total dividend on the Ordinary Shares 5%, compared with 1% for the period from 5th April to 31st December 1970.

The results show a return on capital employed for 1971 of 9·0% and earnings per fully paid Ordinary Share of 2·1p. The dividend is covered 1·7 times.

RATIONALISATION Rationalisation and integration, started after the merger, has continued throughout the year. Considerable progress has been made in developing a more vertical structure and in the closing or disposal of unprofitable activities.

There is a developing world wide trend for major fibre producing companies to become engaged in yarn texturising as an integrated operation with fibre production. It was therefore agreed during 1971 to sell to ICI our two major texturising units.

OVERSEAS COMPANIES AND EXPORTS The turnover of the Group's overseas companies was £10·7 million. The Group's direct export sales in 1971 amounted to £15·3 million, the main areas of activity continuing to be North America and EFTA.

CAPITAL EXPENDITURE Total capital expenditure of the Group for the year was £7·7 million of which approximately £1·9 million was spent overseas.

PRODUCTIVITY Productivity in the Group showed an encouraging trend in 1971, but the level of performance will have to be improved further to enable the Company to become fully competitive.

EEC With the entry of the UK into the European Economic Community less than twelve months away we look forward to the opportunity of operating in this greatly expanded market and consider that the resources of the Group should place it in a *strong position. The Group is already well* established in the EEC with manufacturing plants in Belgium and Italy.

TARIFFS AND QUOTAS In 1972 a tariff on imports of cotton textiles from the Commonwealth countries has been introduced. In December last year the Government announced that quotas would also be retained on imports of cotton textiles for another year. This policy recognises the need for a transitional period in which both tariffs and quotas exist and has regard to the employment situation and the need to align British commercial policy on textiles with policies in the EEC.

This is welcomed and it is hoped the Government will recognise the need to extend quotas to other sections of the textile industry.

PERSONNEL At the end of 1971 the Group had 31,500 full-time employees in the UK and 1,500 overseas, a net reduction of about 5,000 of which just over 3,000 were transferred as a result of sales of companies.

Industrial relations within the Group have remained very good. In a year of many difficulties our policy of consistency of treatment and early consultation with employees and trade unions has undoubtedly helped to maintain good understanding.

The Annual General Meeting will be held at The Dorchester Hotel, London, on 26th April 1972 at 12 noon.

Copies of the Annual Report can be obtained upon request to The Secretary, 24 Great Pulteney St., London W1R 3DB.

DUNFERMLINE BUILDING SOCIETY

One Hundred and Third Annual General Meeting

A year of substantial progress.

The Society's 103rd Annual General Meeting was held in Dunfermline on 28th March, 1972, Mr Robert L. Veitch, C.A., Chairman of the Society, presiding.

A tribute was paid to the late Mr W. G. Blair whose wise counsel and life-long knowledge of Building Society business had been at the service of the Society since 1947, when he joined the Board of Directors.

The Chairman's Speech

In proposing the adoption of the Report and Accounts for the year ended 31st December, 1971, the Chairman noted that total assets had increased by £2,300,000 to a total of £25,767,870. The Society's advance department had a busy year and total advances for the first time exceeded £4,000,000 and of this figure £1,300,000 related to loans approved in respect of newly constructed houses. The average loan agreed in 1971 was £3,500 as against £3,100 in 1970. Shareholders' funds increased by over £2,000,000, the end of the year total being £24,275,138. The total reserves and carry-forward amounted to £970,768, showing an increase during the year of £69,000.

The Report and Accounts were adopted and the re-election of retiring Directors confirmed.

The Chairman announced, with great regret, that the Board of Directors had recently acceded to Mr Stoddart's request that he might retire from the position of General Manager with effect from 30th April, 1972, after completing 26 years of highly valued and loyal service to the Society. During these years the Society's funds have increased from £2,000,000 to over £25,000,000.

ANGLO-AMERICAN SECURITIES CORPORATION LIMITED

The Twelfth Annual General Meeting of the Company was held on 29th March in London. The Rt. Hon. Lord Latymer (the Chairman) presiding. The following is an extract from the Report of the Directors.

From gross revenue of £2,213,795 as against £2,250,957 last year, the net revenue attributed to Ordinary shareholders increased from £1,407,086 to £1,433,085. This represents earnings on the Ordinary Capital of 2·66p compared with 2·61p last year.

A large part of the liquid funds was reinvested during the year and this has resulted in a considerable reduction in deposit interest which was only partially offset by increased investment income. Furthermore our income from U.S.A. was reduced in terms of sterling due to the depreciation of the U.S. dollar. A final dividend of 1·45p is recommended making a total of 2·45p for the year. Last year a total dividend of 2·375p was paid.

In the year to 15th January 1972 the valuation of investments increased from £55,797,745 to £71,357,541 giving a net asset value of the Ordinary capital of £59,439,784 compared with £45,125,581 at 15th January 1971. This is equivalent to 110p as against 84p at the previous year end.

It is expected that our revenue will be sufficient to maintain the dividend at the increased rate of 3·45p.

CHAIRMAN'S STATEMENT

The SCOTTISH PROVIDENT Institution

for mutual life assurance

The 134th Annual General Meeting of The Scottish Provident Institution will be held within the Head Office at 6 St. Andrew Square, Edinburgh at 2.30 p.m. on 18th April, 1972.

The following are extracts from a Statement by the Chairman, Mr. J. C. R. Inglis, B.A., LL.B., W.S.

New Business

It is my pleasure to be able to report once again record new business results. Net new sums assured amounted to nearly £124 million, over 20% up on the previous year, and net new annuities exceeded £4 million, over 80% up on the previous year. These figures in themselves give great cause for satisfaction and, when one notices that new annual premium income has increased by 34% and single premiums by over 125%, it is clear that 1971 has witnessed a very substantial expansion in the Scottish Provident's business. I take this opportunity of acknowledging how greatly we value the support of our agents, which has made such figures possible.

New SPI policies

There is no doubt that a great deal of the increase in our new business has been brought about by the two SPI policies to which my predecessor referred last year. It is hard to believe that three years have elapsed since the SPI—Selected Period Investment—assurance was first announced. We still think of it as a new policy and its unique flexibility, so valuable to the younger man or woman, continues to attract favourable comment. In January we introduced two further new contracts, both designed to provide pension and life assurance benefits approved under the "new code" enacted in the Finance Act 1970, and I refer to these again later.

Declaration of Bonus

We have maintained the bonus at £4.20% per annum compound on immediate-profit assurances and at £3.50% per annum compound on Distinctive System assurances where the "accumulation period" has been completed. That immediate-profit assurances have enjoyed a rate of declared bonus of £4.20% for each of the past eight years is surely a record of which to be proud.

Annual accounts

At the time of the last valuation three years ago the Funds of the Institution stood at just over £117 million and total premium income stood at under £11¼ million. Now the Funds exceed £156 million and total premium income for 1971 exceeded £20 million—remarkable progress indeed.

As on the occasion of the previous investigation, the Directors have brought £5 million of capital appreciation into the Revenue Account to increase the surplus available for distribution to policyholders in the form of bonuses. Such has been the increase in the general level of stock exchange security values that during 1971 our investment reserves increased from £19 million to £48 million even after deduction of the £5 million brought into the Revenue Account. At the end of 1971 therefore the value of our total invested assets exceeded £204 million. In view of the fluctuations which take place in stock exchange values the amount of the investment reserves at any given time must also fluctuate but the present relative size of these reserves does underline the exceptional financial strength of the Scottish Provident.

It will be recalled that towards the end of 1970 we borrowed $10 million under two "back-to-back" loan arrangements. By the early part of 1971 all this amount had been invested in high-quality U.S. common stocks, and I am glad to say that at the end of the year there was a useful margin over the amount borrowed.

The major portion of the increase in funds during 1971 was invested in fixed interest redeemable securities and these had shown substantial appreciation by the end of the year. The U.K. ordinary share market rose over the year to a considerably higher level and the Institution benefited from the heavy investment made in ordinary shares during 1970.

Further investment in property continues to be made, a freehold property on an excellent site having been obtained in Birmingham. Our branch office is now accommodated in part of this building. In addition the opportunity has been taken to complete acquisition of a site adjacent to our new head office building and redevelopment is currently in progress.

Pensions developments

I have already referred to our recent introduction of two new pensions contracts, which between them cover the whole field of retirement benefits provision. Both offer attractive terms and have been very well received.

The SPI—Simplified Pension Investment—funding plan is intended for schemes covering at least ten employees, and we have incorporated in its design the best features of traditional insured schemes, managed funds and privately invested arrangements. The plan fully participates in the profits of the Scottish Provident and I am confident that it will compare favourably with other funding media.

The 'E' Type policy has been introduced to deal with key personnel and small groups of employees so that it in effect replaces the existing top-hat contract in the U.K. There are seven component parts to the 'E' Type policy which gives the employer a wide choice as to the type and level of benefits to be provided for any individual employee.

We shall in the course of the next twelve months be in touch with all our pension scheme policyholders to introduce them to our new contracts, and generally to discuss with them the implications of the "new code" of approval and the Government's state pension proposals.

We are very pleased that in the Finance Act 1971 steps were taken to increase the maximum premiums allowable under "self-employed" pension policies and to permit a portion of the benefit to be taken as a lump sum. This mitigated a serious disadvantage suffered by the self-employed in comparison with those in employment. It is appropriate that I should remind our members that the Institution offers an extremely attractive with-profit "self-employed" pension policy.

Head Office: 6 St. Andrew Square, Edinburgh EH2 2YA.

APPOINTMENTS

Kingston Polytechnic

Senior Lecturer/Lecturer II Accountancy (3 posts)

Suitably qualified candidates will be expected to play a leading part in the development of teaching and research in one of the following areas : Capital Budgeting ; Business Finance ; Auditing ; Taxation ; Financial Accounting ; Financial Management.

Senior Lecturer/Lecturer II Marketing (3 posts)

SL/LII in Industrial Marketing
SL/LII in Distribution
LII in Marketing and Communication Studies.

Further details and application forms can be obtained from the Appointments Officer, Kingston Polytechnic, Penrhyn Road, Kingston upon Thames KT1 2EE. 01-549 1366.

Salary Scales : Senior Lecturer £3249-£3613 (bar) £3886
Lecturer II £2473-£3201
(subject to confirmation)

Senior Lecturer/Lecturer II in Economics (3 posts)

preference given to those qualified to teach either Microeconomics (Business Studies and Marketing) or Urban Economics or Macroeconomic theory.

Senior Lecturer/Lecturer II in Quantitative Methods (2 posts)

with reference to business studies and social science.

Senior Lecturer/Lecturer II in Politics

specifically Political Behaviour and Comparative Politics.

APPOINTMENTS

Coleg Prifysgol Cymru

The University College of Wales
ABERYSTWYTH

Department of Economics
Lecturer

in some aspects of Management Studies.

Applications are invited from persons with an interest in one of the following fields :
Industrial Relations
Financial Management

The appointment will be made on the appropriate point on the scale £1641-£3999.

Application forms and further particulars are available from the Registrar, to whom applications should be returned by 10th May, 1972.

University of Durham

North-East Area Study

Applications are invited for the post of DIRECTOR OF THE NORTH-EAST AREA STUDY established with S.S.R.C. support within the Faculty of Social Sciences. Candidates should be qualified in a social science and have experience of survey research.

The appointment will be for *five years, from as soon as possible.*

Salary on the scale £3,852 to £4734, plus F.S.S.U. Benefits.

Further particulars from the Registrar and Secretary, Old Shire Hall, Durham, DH1 3HP, to whom applications (3 copies), naming three referees, should be sent by 28th April, 1972.

NATIONAL AND LOCAL GOVERNMENT OFFICERS ASSOCIATION

Applications are invited for the appointment of Local Government Service Conditions Officer at NALGO Headquarters at a salary in accordance with Principal Officer Grade XII (£4185-£4641) plus a London Weighting allowance of £144 per annum.

The duties include participation in the negotiation of salaries and other conditions of service through the N.J.C. for local authorities' staffs, and acting as Staff and Joint Secretary to the N.J.C. and other joint bodies ; assisting in the service conditions work generally and particularly that work relating to the Local Government service membership.

Applicants should have experience in trade union work in all its aspects. Knowledge of the local government service would be an added advantage. The appointment will be to the permanent pensionable staff and the successful applicant will be required to contribute to the Staff Superannuation Fund. It is possible in certain circumstances for appropriate service elsewhere to count for superannuation purposes. Reasonable removal expenses will be paid.

Applications should be made on the official form, a copy of which and particulars of appointment are obtainable from the General Secretary, NALGO House, 8 Harewood Row, London, NW1 6SQ. The closing date is 17th April 1972.

COMPANY STATEMENT

THE SCOTTISH NORTHERN INVESTMENT TRUST, LIMITED

SUMMARY OF RESULTS

	Year to 5th February 1972	1971
Investments at Valuation	£55,642,918	£40,731,741
Total Assets	£55,544,384	£41,281,629
Ordinary 25p Shares in Issue	35,161,219	34,938,120
Asset Value per Share	133.95p	99.70p
Revenue available for Ordinary Shareholders	£694,046	£670,695
Earned per Ordinary Share	12.6%	12.6%
Ordinary dividend rate	12.5%	12%

- The Annual General Meeting will be held on 20th April, 1972 and the final dividend of 1.875p per share, if approved, will be paid on 21st April.
- In December, 1971 the Company borrowed £2,000,000 from Clydesdale Bank Finance Corporation Limited for five years. The funds were invested entirely in the British market with considerable immediate advantage to the Company's capital account. It is estimated that in a full year the revenue derived from the investment of the loan will be more than sufficient to cover the net service charges.
- With regard to the discoveries of oil and gas in the North Sea the Company has made investments in two unquoted companies, Pict Petroleum Limited and Triton Petroleum Limited and its portfolio also includes a representative number of quoted companies with North Sea exploration interests.
- Consideration is being given to increasing the proportion of total funds invested in Europe.
- The prospects for the current year are regarded as favourable. It is intended to maintain the rate of dividend proposed for the year ended 5th February, 1972.

CHAIRMAN'S STATEMENT

THE MERCHANTS TRUST LIMITED

Extracts from the Statement by the Chairman Mr. G. P. S. Macpherson, O.B.E., D.Litt., in the Report and Accounts for the year ended 31st January 1972

- The Board have recommended an increase in the Final Dividend for the year—4½%, making a total of 8% (1971—7½%).
- Present estimates indicate that earnings should be sufficient at least to maintain the present rate of dividend.
- During the year a further £1,710,000 was invested in the U.K.
- A further $5,000,000 was borrowed and largely invested in North America; there was a disinvestment through the dollar premium market of £1,136,000.
- At 31st January 1972 the proportion invested in the U.K. was 61.5% (1971—55.4%) and in the North American market 30.1% (1971—34.5%). The change is accounted for largely by stock market performance.

	1972	1971
REVENUE AVAILABLE FOR ORDINARY STOCK	£927,865	£869,663
EARNED FOR ORDINARY STOCK	8.1%	7.6%

APPOINTMENTS

SAMUEL OSBORN & CO., LIMITED

ASSISTANT TO GROUP FINANCIAL DIRECTOR

up to £2,500 p.a.

Samuel Osborn is a £20 million public company in special steels, engineers' cutting tools and engineering with substantial overseas interests.
The Group Financial Director, responsible for finance and planning wishes to appoint an Assistant. The work will include appraisal of capital expenditure, new product and marketing proposals and similar financial planning assignments of a 'one off' nature. He will not be involved in the day to day accounting function.
The successful applicant will be a graduate aged 23-25 years, probably with a good degree in economics and/or an M.B.A., having had at least two years' industrial experience. Some knowledge of company accounts would be an advantage.
This appointment represents an outstanding opportunity for a young man with the necessary intellectual and personal qualities to broaden his experience to include finance and corporate planning and to have the opportunity of reporting on matters affecting company policy at Director level.
Please write with full details of education, qualifications and experience to :
R. A. Williamson,
Group Financial Director,
Samuel Osborn & Co., Limited,
P.O. Box No. 1,
Sheffield S3 8JF.

APPOINTMENTS

University of Cambridge

Department of Applied Economics

RESEARCH WORKERS with appropriate qualifications are invited to apply for posts as Research Officer or Junior Research Officer to work on the Cambridge Growth project which is directed by Professor Richard *Stone. This project* is developing a disaggregated economic model in order to study problems involving growth and fluctuations in the British economy. Applicants should normally have at least a good second-class honours degree, and should be familiar with British economic statistics, and interested in their development for use in a disaggregated model. However, opportunities will exist for work on all aspects of the model.

The pensionable stipends of these posts are under review. At present they range from £1,902 to £2,727 for a *Research Officer, and from* £1,247 to £1,902 for a Junior Research Officer.

Appointments will be made from 1 October 1972 for one year in the first instance, with the possibility of renewal.

Applications, giving personal details, academic qualifications, experience, and research interests, together with the names of two referees, must reach the Administrative Secretary, Department of Applied Economics, Sidgwick Avenue, Cambridge, CB3 9DE, not later than 18th May 1972.

University of Newcastle upon Tyne

Department of Agricultural Marketing

The University invites applications for a post of LECTURER IN MARKETING. Candidates should hold degrees *in a Social Science or in* Marketing and be familiar with quantitative techniques.

Salary will be at an appropriate point on the Lecturers' scale £1,641-£3,705 (maximum to be raised to £3,999 by 1st October, 1973) according to age, qualifications and experience. Membership of F.S.S.U. required.

Further particulars may be obtained from the Registrar, The University, Newcastle upon Tyne NE1 7RU, with whom applications (3 copies), together with the names and addresses of three referees, should be lodged not later than 13th May, 1972. Please quote reference E.

Assistant General Secretary

work may include union negotiation, research, tuition, editing and administration. Scale maximum exceeds £4,500 : starting pay negotiable. Non contrib. pension, 6 weeks' holiday. Applications in confidence to **General Secretary, APOE, 345 Upper Richmond Road West, *London* SW14 8QN** *marked* 'AGS', by 1 May 1972.

University of St. Andrews

to reach him not later than 31st May, 1972.

Cranfield

Centre for Transport Studies

9 Research Officers

The Centre has been awarded a major grant by the Science Research Council for studies of the assessment and development of transport technology. These studies will form part of the joint programme of research being undertaken in collaboration with Loughborough University of Technology.

The work to be carried out at Cranfield consists of two roughly equal parts :—

(i) detailed studies of three major problem areas in the methodology of transport assessment — travel demand forecasting models (particularly modal choice and latent demand), the quantification and comparison of the user and non-user attributes of transport systems, and the relationships between travel demand and system operating characteristics ;
(ii) the application of assessment to three specific areas of transport innovation—V/STOL aircraft, the air-ground interface process and the accommodation of the private car in urban areas.

In addition a critical review will be made on an international basis of the current state of transport technology.

Applications are invited for up to nine Research Officer posts forming part of a large multi-disciplinary team. Members of this team will come from a wide range of backgrounds including engineering, planning, economics and natural sciences. Appointments will be for 2-3 years, at salaries in the range £1,350-£3,705 (with FSSU). The junior posts are suitable for persons with little previous experience of transport studies, and it is possible for such persons to read for higher degrees.

Details of the research programme from the principal investigator Dr. J. M. Clark (telephone 0234-51551, ext. 445). Further information and application form from Assistant Registrar, Cranfield Institute of Technology, Cranfield, Bedford, quoting reference 366.

University of Waikato
HAMILTON, NEW ZEALAND

Appointments in German and Politics

Applications for the posts of SENIOR LECTURERS or LECTURERS are invited from candidates suitably qualified in any of the fields in German and in Politics. For the Politics appointment, preference will be given to persons with interests in public administration, political theory, or comparative government, and in appropriate cases, appointment at the level of *READER* will be considered.

The appointments will be made at an appropriate point within the following salary ranges and scales : Readers, a range $NZ9094 to $NZ10,658 ; Senior Lecturers, a scale $NZ7278-$NZ8579-$NZ9358 ; Lecturers, a scale $NZ5559-$NZ7149. The appointments are to be taken up on 1 February 1973.

Conditions of appointment and details of application procedure are available from the Secretary-General, Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF (Tel : 01-387 8572), and the Registrar, University of Waikato, Hamilton, New Zealand.

Applications close on *28 April 1972.*

New Zealand

UNIVERSITY OF CANTERBURY, Christchurch

The Economist

BEFORE THE BUDGET

SECRETARY TO GOVT., FINANCE DEPT. 10 OCT 1972 GOVT. OF TAMIL NADU

With the Compliments of the BRITISH INFORMATION SERVICES (INDIA) 250-A MOUNT ROAD, MADRAS-2.

It might as well be spring

He proved that one bank is better than twelve. If it's the right bank.

A multinational manufacturer shipping products to eighteen different countries had a problem. Payments for goods sold took too long to arrive. And because he was dealing with twelve different international banks he never knew his total cash position at any one time. A solution was suggested by our man-on-the-spot in Antwerp: a global Cash Management Program tailored to the manufacturer's needs.

Today, a Bank of America cash management system speeds the corporation's receipts and provides improved controls and more current information. Results: reduction of float, by an average of 50%, and savings on foreign exchange transactions. Add to this the fact that the manufacturer knows his cash position to the penny every workin day, and you can understand why Bank of America is now his major bank.

If you would like to find out how a Bank of America Cash Management Program could help your profit picture, give us a call. In Antwerp. Or America. Or anywher else in the world.

BANK OF AMERICA

Billion-off budget?

Mr Barber has the opportunity to make large tax cuts. He should increase the incentives to innovate and to dare, instead of indulging in a charity bazaar, page 13. The main reason for this opportunity is that the average British family is now trying to save about £38 a year more than the Treasury expected it to do last year, page 75.

Brandt or Pompidou?

Should Britain be looking to Willy Brandt's Germany as its main ally inside Europe, instead of Georges Pompidou's France? M. Pompidou's visit this weekend should show why the answer is no, page 16.

The king's plan

King Hussein tries to clear a way through Arab confusion and Israeli nervousness—and it's still just possible he will make headway, page 18. Life on the occupied West Bank, page 40.

Wallace shakes them

Governor George Wallace has run strongly among his people in Florida, and all the other Democratic hopefuls—except for Hubert Humphrey—have tasted a bitter defeat, page 55.

A jolt for Ulster

The Government probably wants more from Mr Faulkner than he, and Ulster's Unionists, want to give. But anything less would not appeal to Ulster's Catholics at all, page 15. Mr Wilson, in Dublin, seems to have opened up a semi-official line for the IRA to get its terms across in any talks, page 33.

It's there all right

There is three to six times as much oil off Britain as the Government is admitting to. Why so shy?, page 89. Will they build the drilling rigs at Clydebank?, page 99.

Philosopher's stone

It took the property men to find how to turn stone into gold, but there are some places where, even for them, the magic does not always work as well as it did. A survey of where the prospects still shine bright, what places to steer clear of, which men to watch, after page 64. The property bond groups are finding it hard to get hold of decent investments, page 113.

PPBS

SIR—When the Pentagon introduced PPBS ("Mind your Par, Pesc and PPBS," March 4th) it was under the orders of a businessman and by courtesy of the Rand Corporation, which developed the thinking and supplied a distinguished economist to be Mr McNamara's comptroller. When President Johnson ordered his other government departments to follow suit, the contrasts in actual achievement were dramatic. Health, education and welfare put PPBS under a dynamic under-secretary (Mr William Gorman) who brought in a team of a dozen or so gifted helpers from outside and made both bureaucrats and general public widely familiar with what was being aimed at. In consequence, it is possible today for *The Economist* to summarise some of the well-documented outcomes in HEW. But the same kind of object lesson does not emerge when one looks for the response of certain other departments of government to the presidential ukase.

Perhaps there are two distinct morals to be drawn. Even in the United States, it seems still to be the case that new ways of thinking demand new people, backed by firm authority. And it remains to this day an open question whether the State Department could conveniently introduce PPBS and carry it through with a well-publicised programme of objectives!—Yours faithfully, A. G. LEHMANN
London, W1

Metric time

SIR—On a recent trip to London I observed that business and scientific groups, as they work towards Great Britain's adoption of the metric system, quite plausibly urge a "think metric" discipline. It is unfortunate that they neglect to advocate the early conversion to metric time, the very tool which could make every person think metric many times each day.

Outside the scientific community metric time is little known and seldom used. But the virtues of simplicity and precision in data processing are winning converts in other fields. This was predicted at the original international time conference in Barcelona. Metric time, for those who do not know the system, is based upon a 10-hour day, with 100 minutes per hour and 100 seconds per minute. It is virtually indispensable in equations with exponential time projections.

America, of course, lags considerably behind other countries in metrication. But even here the newer tables of engineering data specify whether time factors are calculated in metric or conventional. In New York the telephone company, which gives the time of day upon dialling a code number, is considering giving alternate announcements in metric time. Hobbies magazines are preparing articles on conversion kits that will change conventional clocks to metric timepieces. Surely Great Britain, a nation intent upon the prompt and orderly transition to metrication, could do this much and more.—Yours faithfully, ROGER MAHEY
New York

American medicine

SIR—You have pontificated about "America, whose medical care system . . . has broken down because it has priced itself out of the market." On this side of the Atlantic that sounds strange indeed, particularly to one like myself who has involuntarily recently had more contact with American medicine than he would have liked. This country today has more physicians (some of them Britons who have fled your socialised medicine) than ever before in its history and their numbers have been rising at three times the rate of population increase. The latest data make plain that by such commonly-used indicators as infant mortality rates and life expectancy at birth Americans have never been as healthy as they are in these early 1970s. And, of course, a large fraction of this country's population gets much, or most, of its medical care free of direct charges through Medicare, Medicaid, and the very extensive system of private health insurance. All this doesn't sound as though we have a medical care system that has broken down.—Yours faithfully, HARRY SCHWARTZ
New York

Britain in Europe

SIR—You admit once again (March 11th) that a unified Europe currency would gravely harm this country, putting it in the position of Ulster or West Virginia. However, you have for some time been trying to suggest that this will not come about. What grounds are there for this? The position of the Six remains currency union hopefully by 1980, and our Government's position is that they will go "as far and as fast" as any.

Quite apart from these specific agreements, what marketeer can quarrel with Mr Heath's analysis, made to the House on May 9, 1967 (and repeated by Mr Maudling on that occasion): "There is no doubt that the logical conclusion in a complete market is to move over de facto or de jure to a common currency?" Marketeers cannot extol the virtues of unity and then pretend that whatever aspects of this are harmful to national interests will not occur. If this were so then the market would merely be a forum for exchange of opinions. Whoever supports our membership must support its consequences, and the consequence of economic union is a single currency, whose consequence is to drain peripheral areas like Britain dry, and to hand control of the country to whoever controls issue of the currency.—Yours faithfully,
London, NW2 DAVID LAZARUS

An amusing little pint

SIR—An interesting theory on one effect of Britain joining the common market:

(a) Eventually the duty on wines will cease and vin ordinaire will be sold in supermarkets at around the same price as it is in France—thus becoming the drink of the working classes.

(b) The predicted price rises in public houses as a result of them opening continental hours will push the price of beer up to the point where it is largely enjoyed solely by the more affluent sectors of society.—Yours faithfully, D. A. WALKER
Bingley, Yorkshire

Election '72

SIR—With all your analysis of the candidates in the coming American presidential election, and their associated issues, you seem to have missed relating them to the biggest issue of all—which is their addressing themselves to the real problems and anxieties of our very large and overwhelming middle class. The candidates repeatedly address themselves to issues (sometimes radical) affecting only the loud demonstrative special-interest groups, ie, students, minorities, intellectuals, women's liberationists, etc, which take up most of the news media's attention.

But what about our farmers and businessmen and housewives, etc, who make up the vast majority of America's population? Where is their representation? These people have concerns too (which seem rarely to make the news). Notwithstanding the impression given by our news media, most Americans are not young, are not black and are not poor. But one would never believe it from listening to Messrs McGovern, Wallace, Lindsay, Ashbrook, McCarthy and Yorty, all of whom continue to ignore those issues affecting our non-noisy and non-demonstrative populace. President Nixon, alone, literally consumes with zest the problems of this silent majority. Our President seems to stand alone in listening and responding to the anxieties of our mid-America, ie, maintenance of law and order, inflation, school busing, disparaging judicial decisions, the Lt Calley case, etc.

So it is in our very real and true democracy; the people (majority) will speak up and have their say at the polls this November. And so it is that Richard Nixon should and will be re-elected.—Yours faithfully, WESTERN G. DOWER
San Francisco

SIR—Your article, "Road to the White House" (February 26th), pointed out, perhaps unwittingly, one of the basic maladies of "American" politics. What you said, "The main objection is that Mr Nixon is not just a candidate, he is the President

MANAGEMENT APPOINTMENTS £7000 PA AND OVER

THE LONDON GRADUATE SCHOOL OF BUSINESS STUDIES

Principal

The Governing Body of the London Business School invite applications for the office of Principal of the School. The post will become vacant from July 1, 1972 when the incumbent and first Principal of the School will be resigning in order to resume his business career. It is hoped that the person appointed will be able to take up the appointment by September 30, although this is not an essential condition.

The School has a student body averaging about 375 and offers Masters and Ph.D. programmes and a range of executive programmes of from one or two weeks to ten months duration. In addition, the School conducts widespread research activities in the management field. The work of the Principal involves leading a team of teachers, researchers and administrative staff totalling about 165, and the overall supervision of the academic work, the finance and administration of the institution.

The ideal candidate will have a background of substantial managerial or administrative responsibility and a knowledge of relevant academic disciplines and/or academic administration.

The remuneration will be at Vice-Chancellor level and a house is provided. Membership of the Universities' Superannuation and Life Assurance Scheme is required.

Applications accompanied by a curriculum vitae should be submitted to The Secretary, London Business School, Sussex Place, Regent's Park, London, NW1 4SA and marked, "Confidential". The closing date for applications is April 30, 1972.

Financial Controller

• THIS is an opportunity to join a dynamic business in the City, a leader in its field, with an outstanding record of profitable growth and strong international connections.

• THE ROLE is twofold: to control a major reorganisation within the finance division, and to work increasingly with the Financial Director on broad aspects of the company's international development. The job offers considerable scope for personal advancement.

• A CHARTERED ACCOUNTANT is required with a proven record in financial control at senior level. Equally important is the ability and temperament to contribute in an intellectually demanding environment. Experience in the City is a strong advantage.

• AGE early thirties. Salary will attract men already earning £7,000.

Write in complete confidence to G. W. Elms as adviser to the company.

JOHN TYZACK & PARTNERS LIMITED

10 HALLAM STREET · LONDON W1N 6DJ

and cannot trample on the law," would tend to indicate that the men who are "just candidates" can feel free to trample all over it. Some of them are obviously doing so.

Let us face it, in a democratic society, such as the United States of America, "just candidates" cannot be considered anything less than potential Presidents and, as such, they should react accordingly.—Yours faithfully, RICHARD PEARSE
Nassau, Bahamas

SIR—The visit by Mr Nixon to China shows the sad state of American politics. In the gigantic game of one-upmanship which goes on in an election year, we have the top executive of the most powerful country in the world courting almost to the point of "pre-marital sexual relations" the avowed enemy of his own type of society. What the American Administration forgets so easily is that Mao, etc, are not just bent on "containing" the imperialist enemy but on converting it to their own philosophy by any means on their "inalienable" suggestion that this end justifies these means.

Therefore, so that he might win an election and continue to occupy the White House, Mr Nixon, with the valued company of Mr Kissinger, journeyed to China for the greatest pre-election spectacular, with a cast of millions (everyone an enemy in word and in deed), and sent by television to the gullible American public the Richard Nixon Show.

Further, Mr Nixon showed how eager he is to dispense with smaller allies in the stupid hope of softening up a formidable adversary. While not suggesting that the native Taiwanese have any great love for their present rulers, it would be, and indeed is, naive to say that the future of that small land will be decided by mutual agreement between itself and China. Such agreement can only be looked at in the sense of the sledgehammer and the nut

The budget

SIR—In your note on 1972 budgetary strategy (February 12th), you attempted to disprove the presence of marked stagnancy in the yield of expenditure taxes. Your result is, however, spurious and depends entirely on the treatment of import deposits. These are defined as a receipt of HM Customs and Excise and, since there were substantial repayments of deposits in fiscal year 1970-71 (over £400m), they substantially reduce C & E receipts in that period. However, import deposits are not normally considered as part of the tax system and, in any case, have no relevance whatsoever for this year's budget, since they disappeared entirely last September.

In the last three quarters for which we have reliable data, receipts of all expenditure taxes (less Set) increased by slightly under 4 per cent over the previous year's figure. This contrasts strongly with your estimate of an 11½ per cent increase and certainly does not disprove the existence of a powerful offset to income tax buoyancy.—Yours faithfully,

RICHARD ALLEN
National Institute of Economic
London, SW1 and Social Research

Solving inflation

SIR—It is somewhat disturbing that neither in your columns nor anywhere else does one seemingly fundamental solution to inflation appear to be under consideration.

It has now been accepted by the large majority of people in Great Britain that whenever any institution has too great a financial control over the lives of the majority, its assets and control are taken over by the state: this is largely true, whether referring to the oldest nationalised industry, the Church of England, or the newest, Rolls-Royce—or should it be the three UCS yards?

The biggest remaining free-enterprise power blocks in this country are the trade unions, which represent 20 per cent of the population directly, but whose effectiveness in free-enterprise bargaining has consequences for all.

Nationalising trade unions would certainly be the best way of achieving an incomes policy, giving the backing of the state to ensure both fairness to workers against too grasping employers and fairness to the remainder of the country against too selfish employees.

There would be difficulties, of course, both in initiating and in administering, and introducing the scheme would involve either the loss of finance to one major party, or the nominal loss of principle to the other. Still, I do believe that this is one solution which every economist should be actively considering, even if it may be too socialist an answer for many. But the recent miners' strike clearly demonstrated that we have not got the balance between state-owned industries and privately-owned trade unions correct yet.—Yours faithfully,
Wolverhampton, Staffs. F. D. L. SELKIRK

The Patiño family

SIR—Professor Arrowsmith's letter (March 4th) asks for correction of the erroneous facts contained in his letter of February 5th.

(1) It cannot be "a significant fact" that there is a boardroom connection between Consolidated Tin Smelters and the London Tin group. The CTS report does not reveal any connection at all.

(2) The CTS board does not currently hold a Belgian member. United Kingdom companies have to state the nationality of their members.

(3) There is no information anywhere that CTS owns stock in the Billiton group.

(4) In 1929 the Patiños did not control CTS, although they had an interest in the company. Holdings were built up in dribs and drabs over the years. This emerges from the CTS reports.

I think it is evident that the Patiño management is unsuitable for administering such a complex and diversified group as CTS and therefore it is inexplicable why Patiño NV shareholders were denied the opportunity to obtain $21m for an investment which brings them no return, when Patiño NV could use the money and their management to the benefit of Patiño NV shareholders.—Yours faithfully,

L. A. MAGISTRATE
Director of research
New York Copper Studies, Inc.

Buy British

SIR—As an Englishman with twenty-four years overseas in twelve different countries, I have had plenty of opportunity to compare the prices/quality of British and foreign manufactured goods of all descriptions.

Believe me, Mr Squire (Letters, February 26th), if he really believes what he says, is living in a dream world. The quality of Japanese goods of all types has been improving each year, and in many products the quality of their goods measures up favourably with the best that the world produces.—Yours faithfully,
Diyarbakir, Turkey J. F. CROSSLEY

Treaties

SIR—You start the article on the Russo-Arab friendship treaties with the nice sentence: "A treaty, like beauty, is in the eye of the beholder . . . (March 4th). It reminds me of what the late President de Gaulle said in a celebrated after-dinner speech in 1963, less than a year after the Franco-German agreement was signed. He said: "Treaties are like roses and young girls; they last while they last."—Yours faithfully, SREEDHAN ROY
Birmingham

Pan Am introduce the first-ever First Class dining room

The China Clipper was a Martin M130 with a cruising speed of 130 mph; she was one of three owned by Pan Am. She could seat 32 passengers—only 15 to 20 on long journeys. With a range of 2,400 miles, she was Pan Am's first long-distance aircraft.

In 1936, when 'Gone with the Wind' first hit the bookstalls like a hurricane and William Powell starred in the glassy, glittering 'Great Ziegfeld,' the Pan Am China Clipper flew with the first-ever flying dining room.

Pan Am first served food on board in 1929. In 1935, galleys were installed and the first hot meals served. A dining room came next.

It was small but well appointed, like a lift in the Waldorf Astoria, and it seated fifteen diners very comfortably while still leaving the lone steward room to manoeuvre.

...again.

After 35 years Pan Am have another aircraft big enough to carry a dining room again.

The 747 travels at 625 mph with a range of 6,700 miles. Unfortunately there cannot be a dining room on board to accommodate all the thirty-eight First Class passengers. Just ten can use the dining room, so far.

Perhaps it should all be one big dining room, but till that day, should you decide that you want to be a pioneer too, please remember to book your table early.

Suddenly, you're (dining) somewhere else.

Pan Am

THE 12-WEEK MONEY-MAKING COURSE

Many people are making money from stocks and shares. So can you. You don't have to be well-connected or even rich (a mere £50 capital is enough to start with). The secret is in knowing the whole art of investment; what to do and when to do it. This you can learn quickly and simply.

How?

A group of successful, qualified accountants, stockbrokers, professional investors and financial writers have pooled their knowledge to produce a highly recommended correspondence course "The Art of Investment". They show you, simply and practically, how to deal confidently in stocks and shares, how to build your own portfolio, how to buy and sell so that you come out ahead of 2 million other investors. A course so practical that you can almost earn as you learn. No single text book or even combination of text books can give you the expert guidance of this unique home-study course. Send for the free full details in order that you may judge for yourself.

In 12 weeks time you can be profitably dealing in stocks and shares.

PROPERTY

Now Pacific Harbour offers you the most beautiful property investment in the world.

THERE is a Pacific travel boom. Tourists from Australia, New Zealand, Japan and America are beginning to flock to the South Seas. The Boeing Company recently stated 'It is quite evident that the area represents the highest growth potential for travel in *the entire world*'.

The communications centre of the South Pacific is Fiji. Strategically placed between Australasia, the Americas and Japan, it is one of the most beautiful islands of all and has virtually no seasonal variation in its climate. It attracts visitors all through the year.

After ten years steady and sustained growth the most recent Fijian Government estimate of a 20% per annum increase in tourist arrivals already appears to be a gross underestimate. The 1971 increase over 1970 was approximately 40%.

In Fiji, there is an important property development—Pacific Harbour. It is in the sterling area, and the backers include Slater Walker, P. & O., and Jardine Matheson. The development is on a superb site overlooking the Pacific Ocean, and a complete infrastructure of roads and services is nearing completion.

A unique attraction of an investment in a Pacific Harbour site, is that under Fijian law only about 10% of the land mass is freehold and that only a small proportion of this is suitable for development. Pacific Harbour already occupies one of the prime sites, with easy access to Suva and exceptional beaches, views and other amenities. These will include its own airfield and a Robert Trent Jones designed championship golf course for which Peter Oosterhuis acts as tournament professional and golf consultant.

In view of the shortage of comparable development sites, an investment in Pacific Harbour should give excellent long term capital growth; in addition, there are comprehensive facilities available for building and letting villas to produce a secure and rising income.

Prices of fully serviced sites range from £4,250 depending upon size and position. Lending facilities can provide 75% of the purchase price, repayable over 5 years.

Of course, the success of an investment in Pacific Harbour does depend upon the continuation of the South Sea travel boom. But the trend, coupled with increasing prosperity in the tourist areas and with the prospect of easier access through Jumbo Jets and Concorde, suggests sustained growth of land and property values in the Pacific Harbour development.

As was said in the Financial Times on September 11th, 1971, 'a quarter-acre plot near to the golf course at Pacific Harbour could be the answer for capital appreciation'.

PROPERTY

THE CITY IS OUR PARISH

Not a negative answer but a positive approach to the complexities of today's property world. Planning, valuation/investment, and management are the three principal elements in this vital and highly sophisticated field. From established independent firms of chartered surveyors this comprehensive service is becoming much sought after by business management as an integral part of their planning for the future.

Valuation
Investment/Agency

Valuation is the vital factor in all property decisions. Independent firms active in the investment and financing markets are able to extend the traditional skills of the valuer to the analysis of problems relating to share issues and takeovers, planning valuation and implementation of development. Advanced analytical techniques are utilised to assist and advise in the decision making process of industry and commerce at home and overseas. Independent advice on the identification of underlying opportunities and constraints, coupled with objective consultancy on the marketing, letting and disposal of assets is an essential service available to business management.

DEVELOPMENT NOW

On the North side of Glasgow, at Springburn, there are Industrial Sites ranging from 4 to 21 acres ready now for immediate development.

Each of the sites has the same easy access to the Northern flank of the city's new inner ring road system, which in turn links with all the major roads and motorways including the Townhead interchange and the A(M)8. There are too, direct connections with Glasgow Airport, the docks, road haulage and rail container depots in the area. For employees, the sites' position offers an excellent public transport service.

In a very short time the city of Glasgow will be the most advanced in Britain, and these sites are part of its huge redevelopment. This is why our Springburn Sites offer unrivalled potential. And it's why you should make a positive move in our direction.

The Economist

March 18, 1972

The billion-off budget?

The Economist has several times set down its recommended strategy for next week's budget. Mr Barber should go for 5 per cent annual growth, even though this will bring balance of payments trouble before the end of 1973. The threat of a payments deficit should be met in advance by a redevaluation of the pound, whose exchange rate has been allowed to drift up too high again. The reason for going for 5 per cent is that any growth target below it for 1972-73 will not allow unemployment to fall or cause industrial investment to rise, since the annual growth in productivity from the existing labour force at the present level of unemployment with today's equipment can temporarily rise to 4½ per cent when more overtime begins to be worked.

At the end of three successive calendar years (1969, 1970, 1971) in which the growth in Britain's real gross domestic product has been below the stagnationist figure of 2 per cent on the year-to-year figures, the country probably did recover to around 4¾ per cent annual growth in the second half of 1971, but present signs are that this will fade unless there are substantial tax cuts next week. So long as unemployment remains near to its socially sickening winter million, the danger of more inflation by giving men jobs should rate lower than the threat of continued stagnation in investment—which carries the danger that, through the 1970s as through the 1960s, Britain might lose out on yet another decade of technological advance. It follows that Mr Barber should determine next week to take more risks on the side of overshooting 5 per cent than of undershooting it.

That is why this newspaper's original advice to him was that he should look at the most pessimistic reasonable forecast available to him on budget day of by how little gdp would grow in the absence of tax reliefs, and then give enough reliefs to bring it up to 5 per cent. Until last week we had assumed, as Mr Barber did last year, that, with Britain's money gdp now running at almost exactly £50 billion a year, and with multiplier effects probably just about cancelling the two technical Keynesian factors known as "leakage into savings" and "fiscal drag," each £500m of tax reliefs should spur gdp by about 1 per cent a year. We had also assumed that the most reasonable forecast of the growth in gdp between the first halves of 1972 and 1973, in the absence of any tax reliefs, would be between 3 and 4 per cent. To lift growth from 3 to 5 per cent would require just over £1,000m of tax reliefs, and this is the "Barber billion" that we had decided to recommend.

But the National Institute of Economic and Social Research argued last week that "fiscal drag" was so large, in modern inflationary conditions that it now takes about £800m a year of tax reliefs to stimulate gdp by 1 per cent; and that, in the absence of any reliefs, Britain's economic growth between the first halves of 1972 and 1973 would again be under 2 per cent. It therefore recommended the Chancellor to reduce taxes by £2,500m in a year. This would be equivalent to cutting the rate of income tax on all earned income in half.

Halve that tax?

There is an argument for considering seriously whether that is not precisely what Mr Barber should do. If there was a ghost of a chance that he now had £2½ billion to give away, then his best course would be to stand up, say he was cutting all income taxes on earned income in half, and then sit down again.

This would cause a mightly shock abroad and some weakening of sterling, but a weakening of the inconveniently strong sterling exchange rate is what Mr Barber should want. By the time most commentators and businessesmen had recovered from their heart attacks, they would be writing about, or participating in, economic and social revolution at home, and Britain's last two decades of miserable economic performance suggest that such a revolution is what the country needs. Reliefs of £2½ billion would not necessarily lead to huge demand-pull inflation, because the national institute's economic model suggests that they would keep total demand expanding at only about the pace at which it was expanding just before this winter of 1m unemployed—and

nobody said that that was too fast. It is true that the national institute's model threatens a certain wounding of amour propre among those—including *The Economist* as well as the Treasury—who have hitherto relied on more conventional forecasting models ; but the slow pace at which both America and Britain have been dragging themselves out of their recent recessions has caused many of us to doubt whether our conventional models are right. It is possible that the industrial countries have now moved into a phase where fiscal drag and a growth in voluntary savings mean that, as in the 1930s, we need to take a much smaller part of our national incomes in taxation —perhaps partly because marginal consumer demand is going less into hire purchase goods than it did in the 1950s and 1960s. Mr Barber should in the last week have checked through the national institute model on the Treasury computers, and seen whether he thinks that there is even a one-in-three chance that it might be right.

Making everyone love Teddy ?

However, our assumption in the rest of this article is that he will have decided that it is not right, and that he will feel he has only about £1 billion of reliefs to give. How to distribute them ?

The fashionable thought at the moment is that next Tuesday's affair should be not so much a budget, more a charity bazaar. The Government is already committed to an annual review of all old age pensions. Even though the richest old people now draw these as well as the poorest, the happy fairy story is that perhaps Mr Jack Jones might come to love Mr Edward Heath if pensions have a super-added rise this year. But the whole point of a review system for pensions is that contributions should at last be a percentage of earnings, and pensions should then go up with the general level of earnings as the contribution fund thus automatically swells. If you have a super-added rise one year, and then a below-average rise in another year when electoral pressures are regarded as smaller, you are going to turn all of us when we are old back into being the playthings of politicians, instead of being protected by an automatically rising pay-as-you-go fund.

The other indiscriminate welfare benefits that might be raised on March 21st are family allowances. There is a slightly better case for them than for the likely super-added rise in pensions. However, the real reform needed in family allowances is to permit families just above supplementary benefit level to borrow. Families with a swarm of school-age children today will have a swarm of teenage earners in a few years' time, and they should be able to transfer income from a more comfortable part of their lives to a more uncomfortable one ; the same system of loans could replace all supplementary benefits payable to the families of strikers, with the loan recoverable from or through the strikers' trade union—although this will be regarded as a nastily provocative thing to say. The most important general point to make about welfare benefits on March 21st is that the increases in supplementary benefits and other discriminate services should be at least as large as the more popular (but less poverty-relieving) handouts in the indiscriminate services like old age pensions.

The political temptation to push this year's tax reliefs towards indirect taxes is immense. But there are two reasons why the Tories will be wrong to abolish the last half of selective employment tax next week. A tax on services is going to be reimposed next year with the introduction of value-added tax ; it will be better to let Set die with the introduction of that, rather than do a disappearing-cum-reappearing trick now. Secondly, if Mr Barber gives a billion in reliefs next week and finds next month that £2½ billion would have been right, he can cut indirect taxes (including finally abolishing Set) in the summer, but he cannot then cut direct taxes, because that is called administratively difficult.

For the same reason it will be foolish to concentrate next week's cuts on purchase tax, even though from April, 1973, some of the things on the luxury purchase tax rate (such as cameras, records, cosmetics) will be on much lower rates under Vat ; but remember that, although Vat should be kept to as few rates as possible, preferably one, there will be room for extra excise taxes on particular things. They will certainly stay on tobacco and alcohol. The indirect taxes that Mr Barber would be wise to cut this year are on fuel oil and possibly petrol. The industrial use of fuel in Britain is being distorted in an uneconomic and old-fashioned and pollutant manner, now that we have so large a tax on cheap oil and so large a subsidy on expensive coal.

The direct reliefs to give

Even with a bare billion of reliefs, the right place to concentrate next Tuesday will be direct taxation. The way to push these reliefs to the bottom of the scale is to lift the starting point at which anybody pays any tax (thus removing millions from paying tax at all), and to introduce 10 and 20 per cent tax rates below the 30.1 per cent rate (surely on Tuesday to come down to 30 per cent) which is effectively the standard rate of tax on earned income now. The top 5m-10m taxpayers—all those remaining at or above the level where they will pay the new standard rate tax on marginal income—would then all get a flat-rate maximum tax handback of perhaps around £60 a year. This system of a poll untax is not recommended, but it would be a device for preventing surtax payers from gaining more. Simpler and straighter tax reliefs naturally give back most to those who pay most tax, and in a strange world this can be made to sound inegalitarian.

On economic grounds, the Chancellor would be wiser to make straight tax cuts, even if they did benefit the surtax payer invidiously ; and to forget some of the specific middle-class boondoggles with which previous Tory promises have saddled him. It is still not at all clear why he has to restore income tax relief to those who borrow money.

The effect of the budget on investment will be most important of all. Mr Barber will be announcing the new corporation tax system that he will apply after 1973, and he may take the opportunity sharply to cut corporation tax rates. The best investment incentive has always seemed to be "free depreciation"—ie, allowing industries to write off their investment against tax in as short a period as they choose, mostly as a current cost. The objection to this has usually been that it would cause a large revenue loss in the early years, but this can now be afforded. It would be wise to add some special sweetener to spur new technology : perhaps an investment allowance for those who exploit new patents ?

Large new regional incentives will be wrong. In a properly functioning free economy the spontaneous medicament for areas with declining industries should be that wage rates there rise a little less sharply than in the rest of the country, thus encouraging industrialists to open new factories in these places. As the trade unions will not allow this wage differentiation the whole burden is now taken in the form of higher general unemployment there. The high unemployment is now making the local male workers angrier in their strikes and sit-ins and factory seizures. The Government then buys them off, thus making strikes and sit-ins and factory seizures seem still more worth while, thus scaring off new industrialists (who have a reasonable dislike of seeing their factories struck or sat-in), and the Government, still handing out still more money, wonders why its regional problem somehow grows worse and worse.

Some of the remarks in this article will be regarded as reactionary. But the real reactionaries are those who do not realise the opportunity. The whole lesson of economic experience since the war lies in this : if a country gets on to a path of 5 per cent per annum economic growth it doubles its real income in 14 years, but if it has half that growth doubling takes you twice as long. The reason for so much that is wrong in this country —including the beastly way we treat the really poor in housing and other non-amenities—is that we are the only major industrial country in the post-Hitler world that has actually slipped below the lower of these trajectories (ie, actually below 2½ per cent per annum growth). If we got on course again for doubling our real income every 14 years, our real welfare services would double every 14 years also ; if we turn aside to make generalised welfare services for all lame ducks our central aim, we will continue to live in a slowly decaying aviary.

High marginal taxation has not been the main reason for Britain's slow growth, but it has been one of the reasons. Now that we at last have an opportunity to make a large cut in that taxation, the absolute priority should be to reinfuse in the nation all the lost incentives to risk, to innovate, to invest, to dare. Instead, the signs are that some ruling politicians think that the really top priority, at this moment of history, is to remove the unfortunate public impression that the present prime minister of this country is rather a cold fish; and to try to make good-hearted people and the trade unions regard him instead as a great, big, lovable, soft-hearted, cuddly teddy. One of the smaller tragedies of any such muffed opportunity is that they will not regard him as that at all.

A jolt for Ulster

No new political initiative on Northern Ireland can hope to succeed unless it jolts Mr Brian Faulkner, but the British cabinet does not want to dislodge him

The Government's decision to go through with a political initiative in Northern Ireland is a very risky business, and no one knows it better than the Government. But in the end it probably had no choice : it had talked so long about an initiative that it passed the point where it could no longer not have one. Now, if it even gets the reluctant acceptance of an altered political system in the province by a majority of Protestant and Catholic politicians there, it will still be only at the beginning. The Government knows that it has to antagonise and disappoint many Protestants and Catholics to have any chance of getting even the reluctant acceptance by enough other people in both camps. If it antagonises too many Protestants the outcome could be a real civil war. If it disappoints too many Catholics the present IRA bombings and shootings will go on with even greater Catholic support.

At the centre of the Government's dilemma is Northern Ireland's prime minister, Mr Faulkner. If the Government's ideas were all acceptable to Mr Faulkner they would, by definition, be unacceptable to the Catholic opposition, from the parliamentarians of the Social Democratic and Labour party on out. If the Government's ideas were, on balance, unacceptable to Mr Faulkner they might or might not be acceptable to many Catholics but they would certainly be unacceptable to the majority of Protestants. So what Mr Heath probably hopes to do is to jolt Mr Faulkner visibly with some ideas (for the Catholics to see) but not to dislodge him altogether (for the Protestants to see). Many Catholics, of course, will have nothing to do with the deal if Mr Faulkner survives it; many Protestants will still have nothing to do with it if he swallows it. But it looks as if the Government's preference is to keep Mr Faulkner within the administration of Northern Ireland, if it can, whereas Mr Wilson's policy would plainly dispense with him.

What would be unacceptable

The responsibility being put on Mr Faulkner is therefore very great indeed. His caustic exchange with Mr Wilson this week seems to have been chiefly to influence Tory backbenchers, in which he succeeded ; but ministers cannot have learned much about the precise limits of his tolerance. Mr Faulkner is not an easy man for British politicians to understand. How much credit they still give him for carrying out the past set of reforms is doubtful. He has not looked quite the same to them since internment. Clearly, after what he said to Mr Wilson, Mr Faulkner would find it intolerable if Mr Heath envisaged

any programme for Irish unity that went beyond the declaration of 1949 and what Mr Heath himself has often said. He would not expect to be told that parts of Northern Ireland (Londonderry and Newry, in particular) were being severed and given to the republic. Nor would he expect internment to be stopped and suspected hardcore IRA men released.

But, supposing Mr Heath did not insist on these concessions, Mr Faulkner must know by now that he will have to make up his mind on such matters as the release of, say, over 100 lesser internees, the control of internment being put manifestly in British hands, and an assured place being found for representative Catholic ministers in the Stormont government. Mr Faulkner has spoken about such ideas many times, usually scathingly; if Mr Heath actually is pushing him to comply now, he may feel that he has been let down, but he should not answer until he has thought through three questions.

The first question is whether these concessions would so undermine his own political position, in his cabinet and the Unionist party, that he would cease to be prime minister, that he would be out before he had even served a year in the job. If the answer is that they would not (and they might not), then his responsibility to his own province would be to carry on and not to precipitate direct rule and the disorders that would be likely to follow it. The second is whether, whatever Mr Bill Craig and Mr Billy Hull do, he thinks British opinion would be more or less sympathetic to the Protestant interest if the break were to be on demands that might not seem impossible in Britain. And the third question is whether he considers these are the last concessions the Heath Government is going to insist on, or just the beginning of a long retreat; he knows what a Labour government would ask of him. This is perhaps the most difficult question of all.

It would be answered, of course, if the Heath initiative did, indeed, do enough to persuade sufficient Catholic politicians of the calibre of Mr Gerry Fitt and Mr John Hume to consider there was something to be gained from talking to Mr Heath and Mr Faulkner at all. It is doubtful if anything short of the ending of internment and the prospect of Irish unity will attract them. But they, too, should be asking themselves where their responsibility lies: whether they should settle (if they were allowed by the IRA to settle) for certain clear advantages instead of persisting in a nationalist ambition that can now be got only after a civil war, short or long. Both men seem to believe that the Catholic population is ready to go on indefinitely and that the threat of a Protestant backlash is not very impressive. These are legitimate beliefs, for the Catholic population is still excited by what is happening to it, and the Protestant gunmen's effort has hardly begun. Mr Heath's initiative is coming precisely when exhaustion, the chief ally of the peacemaker, is still a long way away.

It deserves a fair start

The Government took a gamble with Catholic feelings when it agreed to internment last August; it seems to be having to gamble the other way now. Many people, in Britain as well as Ireland, will automatically say that the Government has not gone far enough when they read its proposals; many others will say just as automatically that it has gone too far. No initiative on Northern Ireland should be turned down instinctively, sight unseen or half-read. The Government has taken the view that the present security operations are not likely to bring any early, decisive improvement in the political situation; it has felt it had to try to put something more into the argument, and it has probably gone to the limit of the best advice it could get. Mr Wilson, especially when he comes to speak in the debate he has insisted on having on Monday, and Mr Lynch in the republic have a responsibility to give any initiative a fair start in Ulster, even if they cannot bring themselves to praise it. There is a grimmer solution for Ireland if this one fails.

The French are here again

But would Mr Heath do better talking to Herr Brandt rather than President Pompidou?

President Pompidou of France visits Mr Heath this weekend, for their first encounter since Mr Heath travelled so effectively to Paris last May. M. Pompidou was meant to come a month ago but was put off at the last instant when the miners' strike won its way into Downing Street. As a consequence Mr Heath is in the eyes of Paris Britain's now-not-quite-so-invulnerable European. But there is no harm in that; anything which helps to shed some of the lovesickness which has crept into Franco-British relations can be counted a good thing. Might disenchantment now usefully be carried further between Britain and France? That is the question which any self-respecting member of any British government —not just Mr Denis Healey writing in the Sunday Times last weekend—might use to test any British prime minister who has, like Mr Heath, bound himself so firmly to Paris. France, after all, has already let Britain into Europe—and the referendum which M. Pompidou announced on Thursday is a foregone conclusion. What more can a friendship with France offer Britain which it might not more certainly get alongside Europe's strongest economy and most Atlantic-minded member, west Germany?

It sounds a simple question. It is too simple. Of course, Britain will on occasion win as good a compromise standing shoulder to shoulder with Germany in Brussels as with France. That is obvious enough. The more important fact is that France knows it. Neither M. Pompidou nor anyone else in Paris expects British friendship with France, or with Germany, to be exclusive. For French and British foreign servants, who have grown used to gutting one another over a period of 20 years, the fresh idea to get used to is that France and Britain too are now often condemned to agree.

Take, first, the Six's common agricultural policy, Cap, the expensive seedbed of Brussels politics which Britain has accepted as the cost of entry. Among Britons the Cap is remorselessly misunderstood. From it, as Mr Healey wrote last Sunday, "flow most of Britain's disadvantages and France's benefits." But the changes this farm policy must go through each year matter rather more than the historical fact that it exists.

They grow it, we eat it

In Brussels this week it has been the Germans and the Dutch—as it has been the Germans and the Dutch since the farm policy's inception—who have been trying to ratchet a further lunatic rise in feed grain prices on to the system. It is France, like Britain, which campaigns for a bigger switch to meat production. This is the second successive year that France, with Italy, has found itself losing against the needs of Dutch and German coalition politics for an excessive and maldistributed annual rise in Europe's farm prices. The fact of Brussels farm price policy is that on every major product except sugar, and in some years milk products, British interests are nearer those of France and Italy than those of Germany and the Low Countries. What Britons should at this late stage grasp is that Europe's main customer for imported food (Britain) and its potentially most efficient food grower and exporter (France) naturally suit each other in an age when world food prices are on a secular rise. The reason is important to see, particularly since French politicians never dare enunciate it. All France needs to turn its vast rural advantage into reality is a sufficiently stringent European price level to force other less blessed producers (mostly Germans) to go out of business; and in the process France's own less efficient producers would get squeezed out too.

Such a change must be made by stealth. This is the decisive long-term farming contract which M. Pompidou has effectively made with Mr Heath. France needed Britain's market to save French surpluses sinking the farm policy for good. In return, and under American pressure too, France knows that within five years or less some form of local subsidy system will have to be grafted on to the common prices Europe has now. The only question will be in which of two ways this will be achieved. Either change will be forced on a France that will use all its usual negotiating skill to delay the day—which for Britain would be expensive, and might even sink the common market itself—or, as the French administration would prefer, Britain and Italy will be allowed a real regional and industrial policy in return for not forcing through changes in the farm policy—however much they would like to do so—faster than French politics can stand.

When it comes to industrial free trade Britain stands next to France in one important respect: the industries of both countries stand in awe of Germany. British industry competes directly with Germany's all around the world. If Britain's balance of payments does suffer as a result of German competition when Britain goes in, it is France's and Italy's example in bending or breaking common market rules that Britain will find itself following; the unlikely European exponents of probable Bank of England practice in exchange control are two Frenchmen, M. Ortoli and M. Giscard d'Estaing. In the first experimental step towards monetary union, Britain's interest lay clearly with Herr Karl Schiller's preference for semi-floating exchange rates. But the fact is that Britain has more or less ignored Herr Schiller since it became apparent that his German cabinet colleagues would make him give way because they want French backing for their Ostpolitik. Any alternative German government is likely to be even less of Herr Schiller's way of thinking than is the present one. France, by contrast, the preacher of an unreal monetary purity, has the most encouraging record among the Six of exchange rate sin, which Britain should copy.

What all this says is that France has a liking for climbing on to high horses, and an aptitude for climbing off them again once encouraged to do so by someone it reckons a friend. Herr Brandt played that part when France lost the currency and trade battles with the United States last December and January. Any wise British prime minister should reckon to do the same again when the next bout of Atlantic economic warfare comes around. And Mr Heath should be doing it already in the approaching struggle (which M. Pompidou will want to talk about this weekend) over the place and shape of future European institutions to cover areas of common policy outside the Treaty of Rome.

Don't set up in Paris, please

On this subject Mr Heath, and any likely successor of his in Downing Street, have identical views with the French. They wish to prevent an unrepresentative federal power rising up in Brussels by mistake, or before it can be politically sustained. At the same time they share Germany's view in not wishing to see Europe's budding togetherness turned into more of a nonsense than it is already. This will happen if Eurosecretariats are set up in Paris (as France wants) when most of what already happens in the common market and Nato takes place in Brussels. Precisely because France trusts Britain's lack of enthusiasm for supranationalism in Brussels, Mr Heath has a better chance than others of deflecting President Pompidou from using next October's summit meeting to putting everything new in Paris.

Time and again, on many issues, Britain is going to find itself pulling against France and together with, sometimes even as the spokesman of, its German and other partners in Europe. It is because he knows it in advance, and because he is Europe's chief proponent of national interest, that President Pompidou is willing to accept such an idea. He can live with opposition on details from a country like Britain, so many of whose deepest interests marry with those of France. He is the right man for Mr Heath to be talking to this weekend.

The king's plan

Some Israelis—and Arabs—are saying that King Hussein's plan for the West Bank is as unrealistic as a Red Indian plan for New York. Is it?

With a peal of trumpets King Hussein has reasserted himself and his people. Jordan has taken a back seat as the Egyptians and the Israelis played out their slow, open-ended drama of war or peace or neither; it was generally assumed that any Israeli-Jordanian settlement would have to wait on the outcome of this duel. But as the outcome recedes into never-never land, King Hussein has struck out on his own.

The heart of his 5,000-word speech on Wednesday was the proposal that the East and West Banks of the Jordan should be linked in a federation to be called the United Arab Kingdom. The West Bank, possibly to be joined later by Gaza, would be known as Palestine. The two regions would have their separate executive, legislative and judicial authorities; their capitals would be respectively Amman and Jerusalem.

The first reaction to all this is whether it will be the Arabs or the Israelis who, literally or metaphorically, shoot down the king first. Both Israel and Jordan flatly deny the reports, started in Baghdad and taken up in Cairo, that the king's proposals fit into the framework of a prior and secret deal with the Israelis. Certainly the proposals as they stand suggest no such deal. But there is a scattering of evidence to support the argument that the king's bid to side-step the Egyptian-Israeli deadlock may have been given the green light by at least one member of Israel's far from homogeneous government. The Israelis will go only so far as confirming that "lines of communication" have been established between themselves and the Jordanians; it seems improbable that these lines were restricted to the publicised visit of Mr Anwar Nusseibeh, a former Jordanian minister and diplomat who lives in Jerusalem, to Mrs Golda Meir's office. A more significant encounter may have taken place on neutral ground between the king and Israel's deputy prime minister, Mr Yigal Allon.

Shortly before the 1967 war Mr Allon produced his proposal for the West Bank; this envisaged a demilitarised island of Palestinians linked in some way to Jordan but without Jerusalem and shut off from Arab armies by a wide Israeli "security belt" of fortified settlements along the Jordan river and the Dead Sea. While Mrs Meir has scarcely moved forward from her position of querying the existence of a people called Palestinians, and Mr Moshe Dayan is preoccupied with Egypt, Mr Allon has preserved his contention that the future of a thickly populated region is of at least as much consequence as the Sinai desert. There does not seem much in common between the squashed little figure-of-eight that Israeli encroachments would leave to the Palestinians (see page 40) and King Hussein's vision of a viable semi-autonomous Palestinian state with Jerusalem as its capital. But the king is already on record as saying, at a press conference in Rome, that Jordan's main aim is to establish some basis for negotiation with Israel, in any form whatsoever.

First reactions suggest that the king's timing and presentation caught the Israelis by surprise. On Wednesday a curiously large number of cabinet members vanished beyond range of questions; they were attending a funeral in Galilee—and perhaps trying to sort themselves out. The line, by Thursday, was rejection. Speaking in the Knesset, Mrs Meir reaffirmed Israel's readiness to negotiate—but not on the basis of the king's plan. This was not, she said, a message of peace.

The right wing attacked or ridiculed the proposals: Mr Begin, the Gahal leader, demanded the immediate extension of Israeli law to all the occupied territories. Israeli officials, including the ambassador to London, Mr Michael Comay, interpreted the plan as an internal political ploy closely bound up with the forthcoming municipal elections in the West Bank. True, municipal elections in the northern bulge of the West Bank are due on March 28th; the southern towns will be holding theirs on May 2nd. If the king fails to get a positive response from the Israelis, he will at least have demonstrated to the West Bankers that he has not gone back on his commitment to offer them a form of semi-autonomy.

An Israeli quoting an Arab compared King Hussein's proposals to an argument between Red Indian chiefs over which of them should take New York back from the whites. This is fair comment if one assumes either of two points: that the king's move was a purely tactical exercise; or that nothing will budge the Israelis. The first assumption does not stand up if the king's plan is considered in conjunction with his reported readiness to negotiate with the Israelis about everything. Given these two statements, he is not indulging in hypothetical talk; he is throwing a negotiable basis for discussion into the field. The second assumption will be put to the test by Israel's response.

Is it really no?

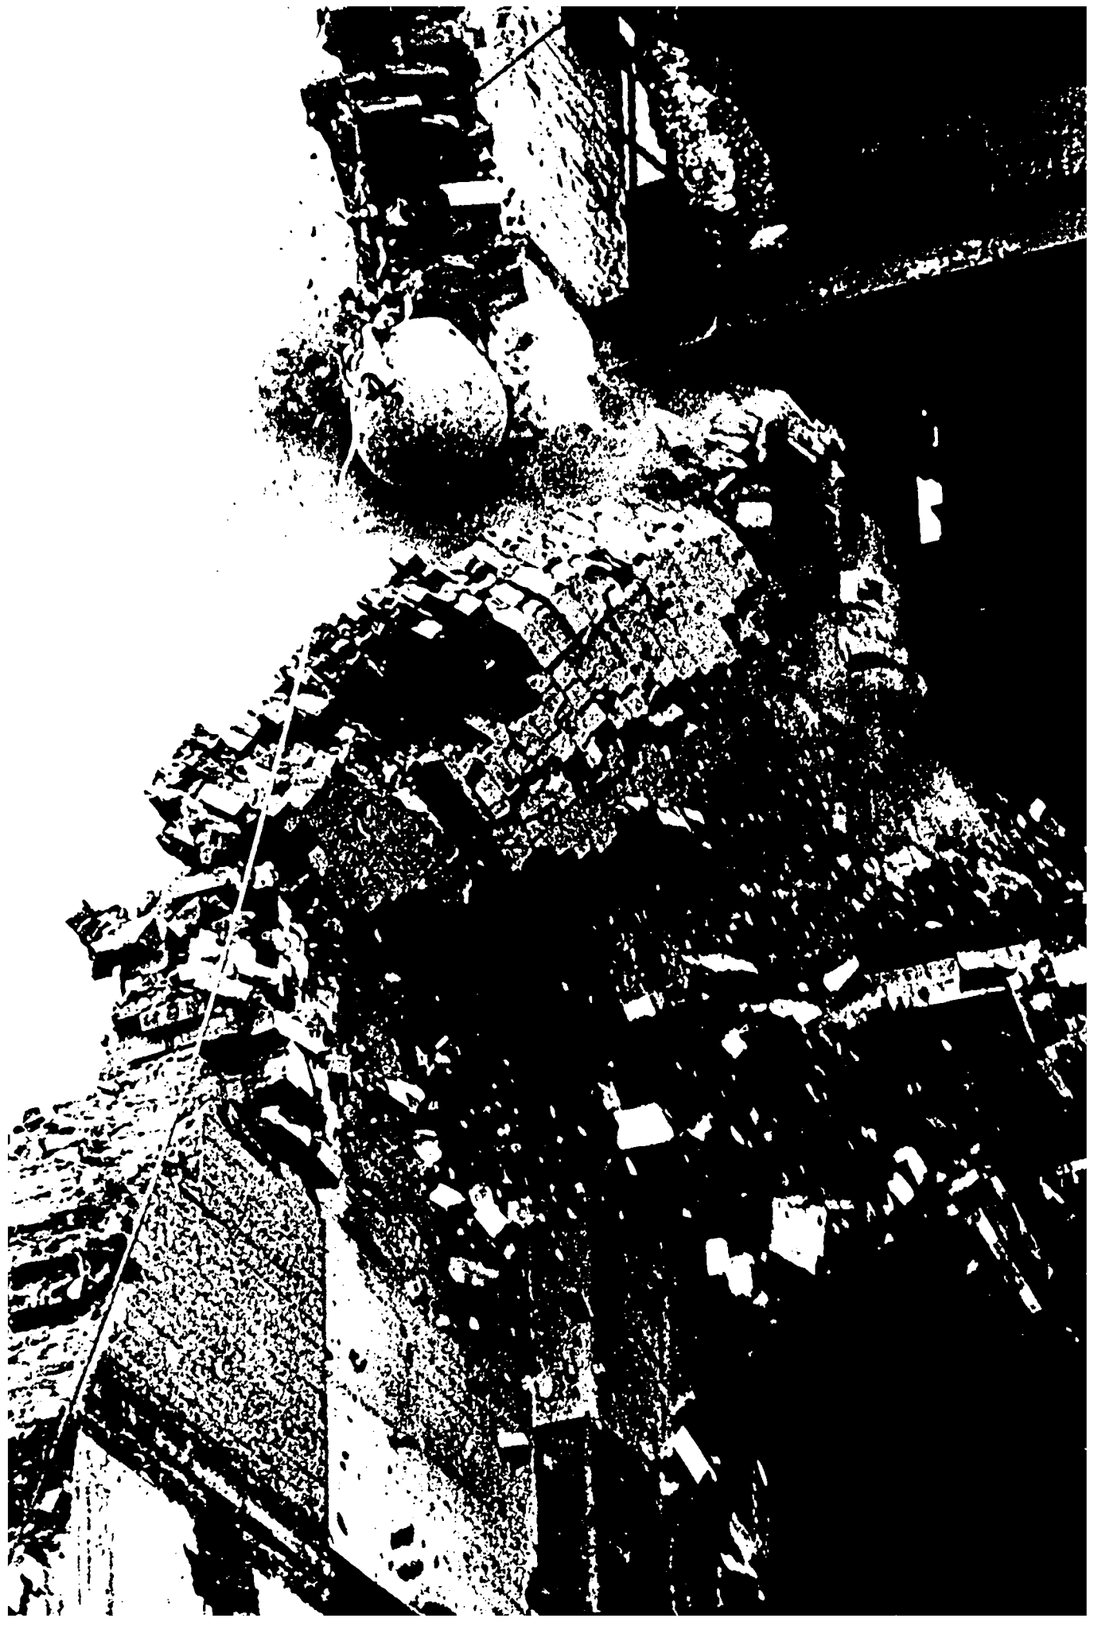
The Israelis, when they get around to it, may take a less negative line. After all, a lot of them do not want to stay an occupying power for ever. The Americans will certainly urge this course; one advantage, among others, is that it neatly cuts out the Russians. But negotiation by itself means nothing unless the Israelis can discover within themselves the intellectual courage to negotiate in terms that King Hussein has a chance of selling to the West Bankers—and this means compromise, from the Israelis as well as from the Jordanians, over Jerusalem and the security belt. If the king can convince the West Bankers, against the pressure from both the guerrilla movement and other Arab governments, that he can lead them out of their status as occupied people, they may accept a solution and abide by it. Otherwise it would be better not to begin.

Where the 'Homa' flies.

(Or how Iran Air links Europe with Iran and the Persian Gulf daily)

The 'Homa' flies across Europe, touches down at the great cities and wings its way to Tehran, the Persian Gulf and beyond. It also makes a unique direct flight from London to Abadan. This fabulous bird can be seen on the tailplanes of Iran Air's fleet of Boeings. On our 707s and 727s that jet through international skies. On our 737s that serve our vast internal network.

Thousands of years ago, according to legend, the 'Homa' brought good fortune to Cyrus the Great, King of Persia (now Iran). He founded an empire which has recently celebrated its 2,500th anniversary.



Today the 'Homa' inspires our airline and stands for all the best things about flying. Like pilots who are artists at feather-light touchdowns. Like fresh food picked up on route (never frozen). Like friendly service from the modern Iran Air family who keep up the age-old national tradition for hospitality. And a swift, efficient cargo service.

It all starts when you catch your first 'Homa'. Track it down at your local travel agent.

IRAN AIR

What would you do to a department losing half a million pounds a year.

Get shot of the department, you say.

Mmm.

Could we? When the department was Service? In a business like compressed air.

No. But how can ½ million just disappear like that?

We didn't have to look far for the answer.

Inspecting most of our 361 workshops around the world was like a factory tour through the 19th century.

Let us use one example: toolboxes.

Would you believe digging out tools kept men occupied for 1¼ hours a week?

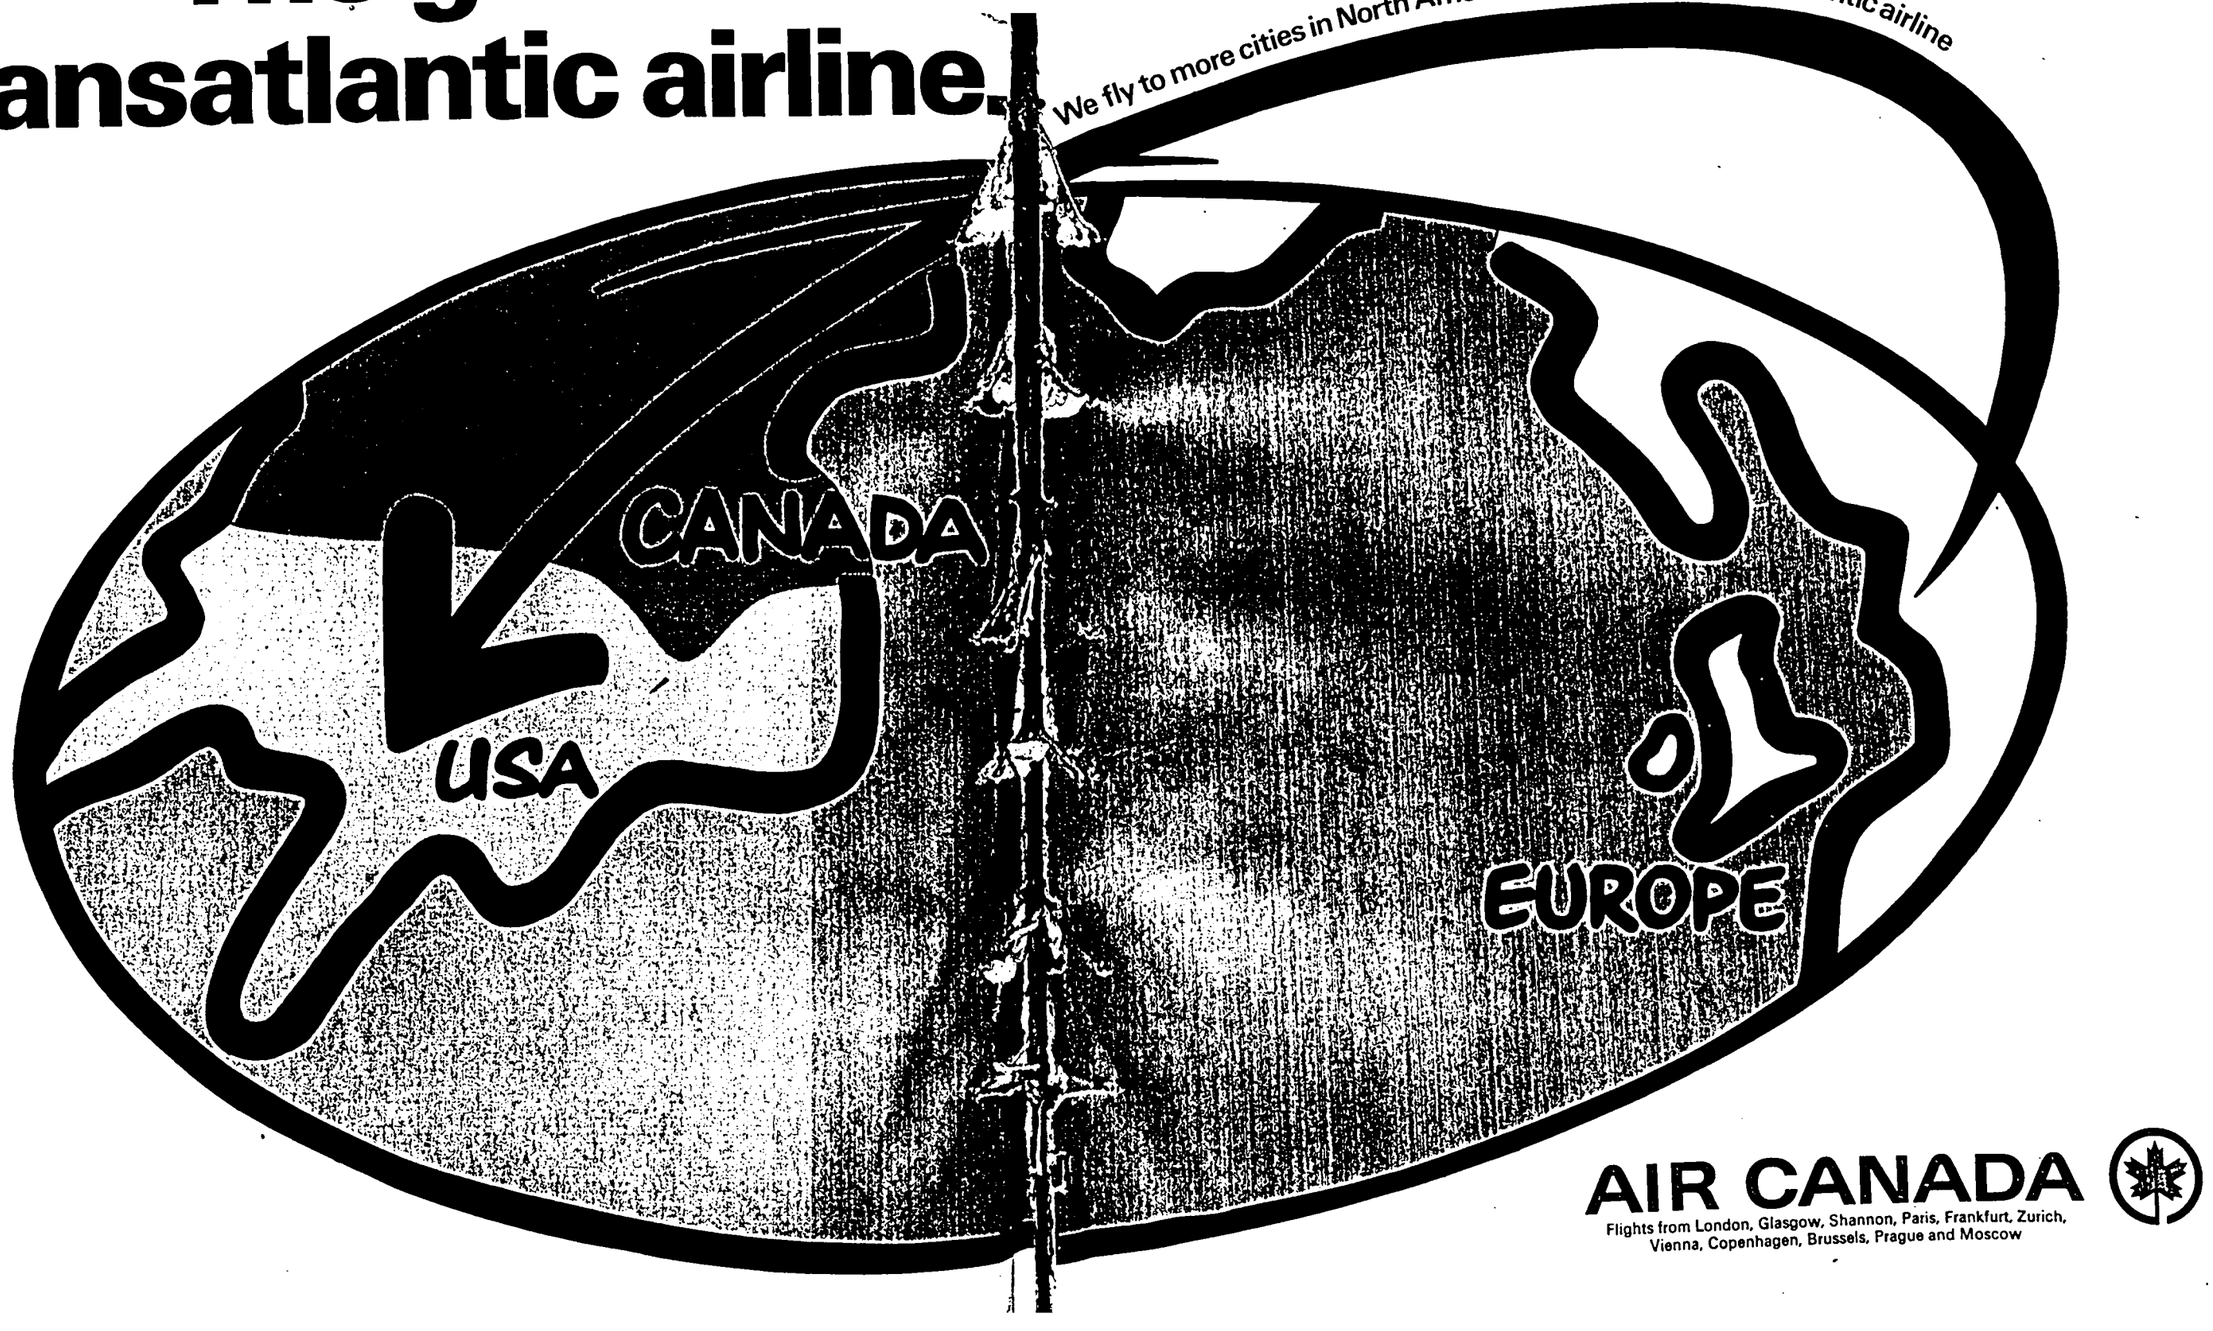
Those toolboxes had to go. In their place, we brought in toolboards.

Then bigger parts stores here. Fault diagnosing equipment there.

And before we knew it, we'd replaced whole centres with new ones.

Ah yes. But are customers' machines better serviced for all our efforts? Do parts arrive earlier?

We'd reply yes. Based purely on the evidence of our personal barometer: customers.



Service has chalked-up a 60% increase in work over the last 2 years.

And a modest profit.

Atlas Copco

BRITAIN

Roy must just get used to being misunderstood

Jenkins : who, me ?

It is a commentary on the poor state of the Labour party—and the standard of much political reporting in the British press—that Mr Roy Jenkins has only to make the first of a projected series of speeches dealing with party policy and he is greeted with the almost universal headline : Jenkins starts bid to oust Wilson. Mr Jenkins, in his speech at Worsley in Lancashire on Saturday, thought he was speaking about poverty (see page 29) ; but the Labour party, too, prefers plots to policy, so he had to go on the radio the following day and say it was "absolute nonsense" that his speech, and those to follow, "in any way represents some decision to go against Mr Wilson for the leadership."

That denial will by no means convince everyone in the parliamentary Labour party that Mr Jenkins has not begun the process which will lead to an inevitable confrontation with Mr Wilson for the leadership. It is too well known that some of Mr Jenkins's more excitable supporters have urged him to resign the deputy leadership now and start such a campaign. And it did not help at all that when asked whether he would support Mr Wilson when he comes up for re-election at the beginning of the next parliamentary session (which should be the autumn) Mr Jenkins gave an honest prevarication. In pursuit of their ambition to make life as embarrassing as possible for their deputy leader some of the wilder left-wing MPs can be relied upon to try to pin him down on that question.

The truth is, of course, that the Jenkinsites (like most Labour MPs) have devoted many small hours since around 1967 to the pleasurable pastime of working out scenarios which would guarantee that Mr Wilson would be replaced by their man. But they have long since been forced back to the conclusion—reached also by the Bevanities when they indulged in similar fancies in the later years of Clem Attlee's leadership—that the only way to get rid of a Labour leader is summed up in the phrase : "while there's death there's hope." In other words, Mr Wilson will have to destroy himself by resignation or reducing his leadership to a total shambles before anyone can hope to succeed him.

Yet that does not mean that Mr Jenkins might not stand against Mr Wilson this year, just as Mr Wilson stood against Hugh Gaitskell in 1960 although he knew he had no chance of success. If the worst happens—as well it might—and the Labour party conference comes out with a firm declaration that the next Labour government should withdraw from the European Economic Community and Mr Wilson accepts that decision, then all Mr Jenkins's friends will expect him to oppose Mr Wilson for the leadership of the party. It would have to be done, even though it might seem doomed to failure. And it is not a fanciful prospect. As it is difficult to see how Mr Jenkins and his pro-market friends could affect to be prepared to serve in a Labour government committed to withdrawal from the common market, it will no doubt inspire some left-wingers in the PLP and the unions to get such a commitment this year or next; but among the more sensible it will be Mr Wilson's biggest undeclared deterrent against the party taking such a step.

On Sunday, Mr Jenkins bitterly resented the fact that his speech had been interpreted as raising a "personal issue." Most newspaper commentators had latched on to the passage beginning : "When the next election comes we shall not be judged by the vehemence of our perorations, still less by the dexterity with which we follow the transient twists and turns of public opinion." Who else could this refer to but Mr Michael Foot and Mr Wilson ? Well, quite a lot of Labour MPs, actually. But, of course, there is a personal issue behind Mr Jenkins's programme of speeches : it concerns his own image and integrity.

Mr Jenkins has shown publicly his distaste for his own decision to go along with the PLP's tactics of voting against the Government's European Communities Bill by voting in the lobbies but being conspicuously absent from the front bench during most of the speeches. He has managed, behind the scenes, to get those tactics modified, but not yet to a degree where his reputation (and that of his friends) has been restored to what it was last autumn. *The Economist* has always had sympathy for Labour's pro-marketeers in their dilemma since October 28th. A split in the Labour party which left it largely in the hands of the bully boys and the left would not, in present circumstances, greatly benefit the British party system. Yet there is a limit to which even Mr Jenkins can be seen to be standing on his head "for the good of the party" without attracting to himself precisely the kind of criticism directed at Mr Wilson's style of leadership. Mr

Jenkins not only wants but needs to break out of that uncharacteristic posture. The Labour party may not want but it desperately needs any sensible new policies which Mr Jenkins may serve up in his speeches. If he can do both it will be for the good of British politics generally. But if he succeeds neither Mr Jenkins nor any of his friends should be surprised if most of their left-wing colleagues are stingy with their applause.

Elections

Storm in a Sidcup

Mr Heath is facing a little local difficulty down in his south London suburban constituency of Bexley. He has defended with success through seven general elections what has often been a Tory marginal. And in June, 1970, he notched up a record majority of 8,058 in a five-cornered contest. But now Bexley—it is to become Bexleyheath—looks likely to become a Labour capture in even a reasonable Tory year because of the redrawing of the constituency boundaries. This is due to the loss of Bexley's plushest Tory stronghold of St Mary's ward—15,000 strong—which is going to make up a third of the newly formed seat of Sidcup. Local pundits do not doubt that Sidcup should prove to be a comfortable pasture for any Tory. And Bexley Tories are determined that Mr Heath should be Sidcup's first Tory candidate. But that is where the trouble lies.

The remaining two-thirds of Sidcup's 43,000 voters are coming from half the neighbouring Tory marginal of Chislehurst. The redoubtable Dame Patricia Hornsby-Smith held that seat from 1950 until her defeat in 1966, but she recaptured it for the Tories in 1970 with a 3,363 majority. Local Tories do not rate her chances very high to retain the new Chislehurst constituency, 20,000 of whose voters are coming from mainly Labour council house estates in neighbouring Bromley. Consequently, they would like Dame Patricia to get the Sidcup nomination even though this may well provoke an unseemly wrangle with Mr Heath's local supporters in Bexley.

Chislehurst Tory leaders are already resentful at some of the alleged antics of their Bexley neighbours. They claim there has been a good deal of "obstructionism" from St Mary's ward on the steering committee which has been responsible for the difficult business of reorganising the constituencies. Accusations have been made that

Dame Pat: unmusical chairs

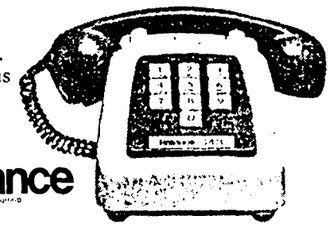
some zealous Bexley Tories have been canvassing among the Chislehurst faithful for Mr Heath's nomination for Sidcup, despite reassurances that nothing would be decided about that delicate matter until the Sidcup association was actually formed. Some Tories even suspect that wealthy St Mary's ward, although a minority in Sidcup, may tighten its pursestrings as a way of getting compliance with its wishes in the new association. Tories gather together on Monday night to elect officers and an executive council for the Sidcup association. But there is already unmannerly talk that some Bexley Tories might try to pack the meeting in order to keep Dame Patricia's supporters out of positions of influence.

All this intrigue is an unnecessary embarrassment for those other local Tories who would like nothing better than for Mr Heath and Dame Patricia to reach a personal understanding between themselves which would be acceptable to the local protagonists. There is little doubt that Dame Patricia feels some resentment at the uncertainty which she has had to suffer over the past two years about her own political future. And she has every reason to dislike the way in which some Bexley Tories—certainly without any encouragement from Mr Heath—have never bothered to disguise their determination to make quite sure she does not get the Sidcup nomination.

It seems likely that Dame Patricia will make full use of her rights, laid down with admirable clarity in Lord Chelmer's revised rules on the selection and adoption of candidates. These rules allow all sitting members to submit themselves for selection in any constituency which may incorporate any part of their old constituency, even though, when the vacancy is notified, there may be an MP for another part of the constituency. Local Tories would then have the invidious job of choosing between Mr Heath and Dame Patricia. There are hopes in Chislehurst that Mr Heath may decide to accept the nomination in a newly formed Tory stronghold like the Isle of Thanet or Chesham and Amersham. But so far Mr Heath has given no sign that he wants to leave the Bexley area. Only recently, he turned down an offer from Christchurch and Lymington, another new seat which looks cosy.

Housing Finance Bill

Poets' corner



The guillotine came down on the Housing Finance Bill when two-thirds of the clauses and nearly all the points of real controversy had already gone through committee. But the Government decided to take up the challenge of the delaying taotics adopted in recent sessions by the Opposition, especially by certain backbenchers. Some unserious parliamentary observers are sad that the life of this committee has been cut short, for it has shown of late not only how well its members know their Shakespeare, but has revealed also on both sides an unexpected richness of invention, so much so that there have been calls for the publication of an anthology of Housing Finance Bill limericks—in a very limited edition.

But the Government had other, more relevant things on its mind. It resorted to the guillotine because of the present crush of parliamentary business and because of the need to make sure the bill gets through in time to introduce statutory rent rises in October. It suits Labour to be able to depict the Government as forcing through an unpopular measure, and suits the Government to blame Opposition left-wingers for baulking the bill's progress. Many crocodile tears were shed in Monday's debate on the guillotine motion.

To be fair, for most of the time since the committee first met on November 25, 1971, the Opposition's tactics have been normally constructive. The bill is a complex and radical measure, many details of which were barely sketched in before publication. Local authority resistance to certain aspects of it is not confined to Labour councils, as last week's special meeting of the Association of Municipal Councils made clear. So the time spent, if not the time wasted, on the bill has been justifiable.

The committee must now report by March 29th. After Easter only three

This is the Reliance E-Link telephone.
The 'E' stands for 'electronic' – push-buttons for speed! No stroll-along dial. E-Link can punch out a 3-digit number in a cool fraction of a second. And a lot more accurately than the old disc-dial could ever promise you!
With push-buttons, pressure is downwards. That means the 'phone is always steady on the desk – not waltzing across it!
And, on a Reliance rental contract, E-Link is guaranteed for fourteen years.
That's free maintenance for as long as you have it!
Reliance E-Link is the fastest 'phone on the desk – not across it!

A consumer-durable should be as durable as the consumer.

In the jargon of marketing, a "consumer-durable" means something that people buy and expect to last.

The trouble is that some durables aren't. The cooker that leaves your food nice and cold. The toy that is child's play to break.

TI believes that durables must live up to their name. Consumers, on the other hand, don't have to.

Tube Investments is a very large and diverse engineering group: large and diverse enough to make Churchill machine tools, Creda cookers, Ascot water heaters and Raleigh bicycles. 40% of the TI group is actively concerned with consumer goods. Some are made by TI overseas; many more are exported.

All of them are *good* goods. Shared research gives TI a technological edge that is not misused.

TI's attitude—and it's found at every level—stems from two basic beliefs.

One is that any business owes a responsibility to its employees and investors. They have every right to a fair return.

The other is that any business owes a responsibility to its customers. They have every right to a fair deal.

The one thing TI has never planned is obsolescence.

TI

Advanced engineering.

days are allotted for the report stage of the bill, and it is presumably at that point, if at all, that the Government must introduce the expected concessions to furnished tenants, at present excluded from the new-rent allowances. It is a pity there will be so little time to scrutinise those proposals, if they are in fact ready in time.

Commercial radio

Vox pop

Any proposal that a commercial local radio station should be run with the guidance of a "powerful advisory committee," whose members would include, "among others," representatives of the "city council, other local authorities affected, the university, the churches, local business and industry, trade unions, students, several local educational interests, local sporting interests, voluntary societies in the area, local press, local entertainment, etc" merits initial suspicion and might well expect to provoke—among professional broadcasters at least—a high degree of alarm and despondency. And the suggestion that the manager of such a station "might wish sub-committees to be formed, reporting back to the advisory committee, on specific fields" invites incredulity. For all that, the draft application for the licence for Radio Cambridge, published on Thursday on behalf of the Cambridge Educational Development Trust, deserves a second look.

The application has been drawn up by another committee appointed for the job, chaired by Mr Brian Jackson, the lively-minded educationist. While the ultimate shape of commercial local radio is still very much a matter for argument—as the minister, Mr Chataway, has discovered during the committee stage of his Sound Broadcasting Bill—anything resembling an experimental idea, which shows some understanding of bread and butter realities, is welcome.

Radio Cambridge would be a "community radio station." So, one hopes, would the 60 stations which the bill proposes to set up. But the prospectus for Radio Cambridge puts much more stress on serving minority interests—schools and colleges, children, the old, the handicapped and the distressed, the churches and local government—than other commercial stations are likely to do. What also distinguishes it is that the trust which will manage it is registered as a charity and that it expects to take much of its programme material, free of charge, from members of the community.

What saves it from the charge of unrealism is its recognition that it would have to go for audiences at certain times of the day and must look to advertising as its prime source of income. Where it is undoubtedly on strong ground is in its contention that Cambridge is unusually rich in talent and in activities worth putting on the air and the potential audience is much more attractive in spending power than the average local station can hope for. What is more, the BBC has no local radio remotely within earshot.

This idea for Radio Cambridge appears to have genuine and substantial support among local opinion. There ought to be room within the pattern of commercial local radio for one station of this kind to show what it can do.

Poverty

Chancellors and shadows

The car workers in Mr Jenkins's constituency may not have enjoyed their mention in his quite courageous preamble to a promised series of speeches on poverty this summer, but the only time he descended from exhortation to policy was to criticise the Tories' efforts at selectivity. The Government itself has become worried about them. There are now so many selective schemes that few people are sure of which they qualify for (hence the low take-up for such novelties as the family income supplement) and there are large costs in manpower to inform people of their rights and yet keep free-riders away. The most established of the selective organisations, the Supplementary Benefits Commission, has administrative costs of some 8 or 9 per cent of its budget.

The other disadvantage is the much-disputed disincentive effect of a cluster of means-tested benefits. There is little evidence that it really exists, but it does contribute to the idea of the "poverty trap" that Mr Jenkins made play with last Saturday: at the top of the fis scale a rise of £1 in income will almost entirely disappear in tax and reduced fis payment, even before other benefits are taken away. The tax threshold will have to be raised in the budget next week, or this will become worse when the fis limits are raised in April.

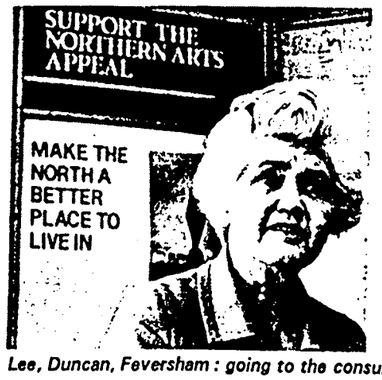
This is one of the reasons why the Child Poverty Action Group, in its annual memorandum to the Chancellor this week, is still sticking doggedly to its presciption for poverty: a large increase in family allowances. This was also advocated by the Fabian Society in "Labour and Inequality," its programme for a Labour government published early this month. Family allowances are notoriously unpopular with the Labour party rank and file; and though an increase was promised in the Tories' election manifesto and is quite likely to emerge next week, it is not over-popular with Tories either. For this unpopularity the 1967-68 exercise in "clawback" is at least partly responsible, not only because the ensuing reduction in personal allowances brought many people on low incomes into the tax bracket for the first time, but also because both the tax on the family allowance (though not the family allowance itself) and the reduction in the tax allowance showed up in a man's pay packet: the point was being reached at which he appeared to be more heavily taxed than the single man.

Clawback, as the CPAG would like to see it operated in this budget, would work differently. It argues that the family allowance should be tax-free; and that the tax threshold should be raised, so that no new families should be brought into the tax bracket and no family man should appear to be paying more tax than a single man.

The CPAG's scheme is a far cry from the Tory ideal of a negative income tax, towards which the family income supplement was only a first step. Nor has the Government abandoned the idea. It can glean some comfort this week from the annual report of the Institute for Fiscal Studies, which concludes that the Government has improved the income position of the very poor (and the very rich). But that assumes a good take-up of the selective benefits on offer, and the CPAG strongly disagrees with this conclusion. Both of them are working in the dark: not only because their figures are inevitably out of date, nor even because there is scanty information on how many people are poor, but also because there is precious little agreement (beyond the arbitrary definition of it as living below the supplementary benefit level) on what poverty is. It is this question that Mr Jenkins must try to answer if he is, in these promised speeches over the next six months, to provide a policy for, in his words, "the elimination of poverty as a social problem."

Arts Brief

Arts in the provinces



Lord Eccles may not be the pin-up of most national museum curators, but he is developing a sizeable fan club outside London. Ever since he took over as the minister responsible for the arts, he has been stressing what a poor artistic deal non-Londoners get. The House of Lords will hear more about his actual plans for the regions when he speaks on March 22nd in the debate on the future of Regional Arts Associations, organisations which he plainly feels will be crucial to any future plans to channel more funds to the arts in the provinces. His approach is supported by Mr Heath, who talks of building up arts associations, and thus making areas more attractive to potential investors, as part and parcel of his regional policy.

The provinces have long felt themselves to be the poor relations in the Arts Council's priorities. Theatre enthusiasts living in Carlisle are just out of luck—the nearest professional theatre is over 50 miles away. Similarly, opera lovers in a major city like Manchester (and a Manchester in Germany would have a resident opera company) must make do with three weeks a year from touring companies if they are lucky. Throughout Britain these disparities exist, a world apart from most European countries, in which a tradition of princely patronage has been taken over by the state. The provincial scene is made more galling by the fact that London since the war has become the theatrical and musical centre of Europe.

Regional Arts Associations—a comparatively new phenomenon—were started to try to redress this balance. Lord Feversham, chairman of the Yorkshire association, who is opening next Wednesday's debate, describes their function as a "partnership in patronage between central and local government and the private sector." The associations collect money from these sources (the ideal is one-third each) and spend it helping artistic enterprises in their area either by direct grants to independent promotions or, less frequently, by putting on shows of their own. They also introduce attractions like travelling exhibitions and dance groups into the area from elsewhere and try to build up their audiences by such incentives as travel subsidies, voucher schemes and the like. By now, the country is almost covered by a network of such associations (see map) and next year the Government will spend at least £700,000—most of which is already allocated—on them. This is over £260,000 up on this year.

Lady (Jennie) Lee first gave the RAAs the official go-ahead in her 1965 manifesto, "A Policy for the Arts," but only in the past few years has the Arts Council shown a really strong commitment to them. Their great attraction, according to Professor Alan Peacock, an expert in artistic finance, is that they are consumer-oriented: it is extremely difficult for the Arts Council, sitting in Piccadilly, to gauge the needs of people in Nuneaton, whereas a locally-based grant-giving body—provided it has a regular turnover of advisers and so does not become the pastime of a small artistic elite—is much better placed to do so.

Some associations are still extremely small-time set-ups—two started only last year—but the older ones are by now in big business and Northern Arts (the largest one founded back in 1961) has a smallish staff of 16 but an estimated income for 1972-73 of £312,000. Northern Arts has, in a way, provided a rough model for the associations that followed (those which started before 1961 just consisted of groups of local arts societies which did not wish to disband when the Arts Council closed its regional offices in the mid-1950s). Its enormous success stems from an entirely local initiative: in its early days it merely received token support from the Arts Council.

Lee, Duncan, Feversham: going to the consumer

Northern Arts—originally the North East Association for the Arts—began alongside the North East Development Council and the Northumbria Tourist Board as part of an effort by a group of largely Labour local authorities, inspired by the redoubtable Mr Dan Smith, who were deeply worried by the growing unemployment queues and wished to attract new industries their way. In the first year 20 authorities rallied round and, with a meagre £500 from the Arts Council, drummed up £24,000. By now 100 of the 107 authorities in the area (enlarged in 1967 to include Cumberland and Westmorland) contribute, although not in any spendthrift way. The Local Government Act of 1948 allows authorities to spend up to the product of a 2½p (6d) rate on the arts. Northern Arts sets the product of 0.12p as a target for each contribution, but only 30 authorities give that much.

The association's annual report reads in some ways like a small Arts Council report: £42,000 to the Northern Sinfonia Orchestra, £16,500 to the Newcastle University theatre, and so on. But more interesting are those items aimed at widening the audiences for productions both geographically (through travel subsidy schemes by which the association underwrites a proportion of the cost of a busload of people coming from far afield to an event) and socially (by ticket voucher schemes aimed at bringing young people into the theatres and concert halls). Anyone under 21 can obtain a free booklet of vouchers which are worth 15p each at the box office. The association reimburses the theatres concerned—last year to the tune of about £22,000.

Mr David Dougan, the present director of Northern Arts, insists that marketing is vital to attracting regular audiences. He plans to use much more local television and sees a splended potential outlet in local radio. In the meantime the association collaborates with the Northern Echo newspaper in producing 110,000 copies of a free monthly pull-out supplement listing artistic events in the area; it distributes 25,000 independently to members, libraries and schools. Other associations publish varying sorts of calendars of events either as a monthly magazine or as a newsletter.

All associations appoint advisory panels (generally one each for art, music, drama, literature and film) which meet regularly and decide how the money should be spent. Some associations have gone in for some quite extensive market research into the needs of their region: Mr Neil Duncan actually wrote a book on the arts in the South before settling down as the southern association's active director. But most directors would agree that, where the arts are concerned, research into what people say they want is of limited use: after all, they insist, if you have never been to the ballet how can you know if you would enjoy it or not? The success of the Northern Dance Theatre founded by the North West association, touring in country previously unused to ballet, does add substance to this attitude.

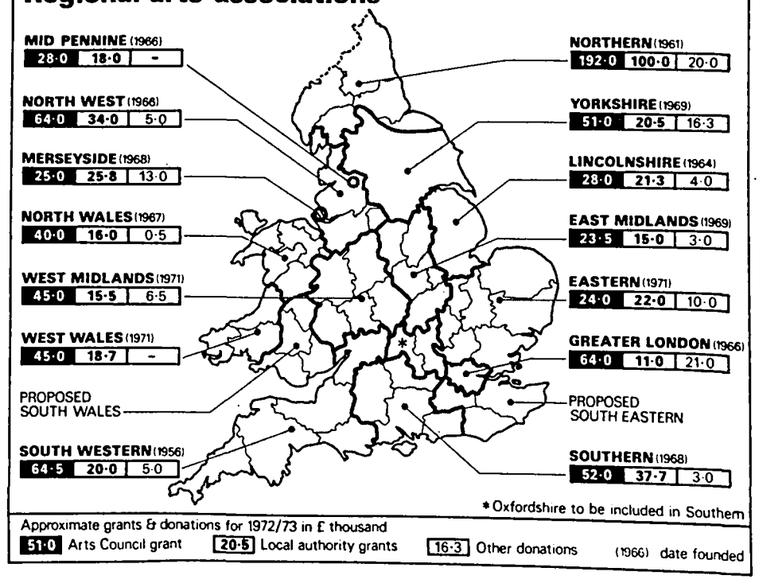
Mr Nigel Abercrombie, the Arts Council's regional adviser in charge of the associations, sees them eventually becoming "central information agencies" for a very wide spectrum of the arts and crafts in their areas.

Already much of the associations' meagre staffs' time is taken up in advising or co-ordinating various productions, exhibitions or festivals and often helping them with their publicity. The Greater London association is currently up to its neck in a grand summer plan to hold festivals in all 32 London boroughs, starting at the end of April.

The Arts Council, founded as it was to promote high professional standards in art, tends to be a bit dogmatic about the division between professional and amateur events; a division which is in reality not necessarily so cut and dried. Regional associations need have fewer scruples and although, in general, Mr Michael Dawson, director of the Yorkshire association, reckons that only about 10-15 per cent of his budget goes on amateur productions, he estimates that they take up more than 50 per cent of his staff's time. Often grants to amateurs are to help to improve standards by a bit of stiffening from professionals—a good conductor might work wonders on a rather shaky choral effort.

Most associations have steered clear of setting up their own promotions because they are not only time-consuming but expensive. However, there are notable exceptions. The Merseyside, Mid Pennine and Lincolnshire associations set great store by their own promotions. But the biggest impresario of all is Mr Alex Schouvaloff, the former assistant director of the Edinburgh Festival, who now runs the North West association. Besides the dance company, which cost it £13,500 this year (the Arts Council giving another £15,000), the association now runs two small travelling theatres called Orbit and TheatreMobile, both at a comparatively low annual cost of £10,000. It brought the famous Paul Taylor dance company from America to St Helens, of all places, in 1969 and in the same year invited the Polish Mime Theatre to Manchester as part of a three-week Polish festival which was heavily subsidised by the Polish government. Last August Mr Schouvaloff directed the first Rochdale festival.

One advantage of specific promotions is that they tend to attract more private patronage. Local firms are naturally keener to sponsor an art exhibition than the day-to-day running of an office. Because of this the Gulbenkian Foundation—which is strongly committed to encouraging the arts in the provinces—decided at an early stage to do the dirty work and give grants towards administration. Mostly, it has given £12,000 spread over the first three years of an association's life. The possibility of more private patronage has not by any means been fully explored and most associations are still only "thinking" of employing a fund-raising officer. Mr Harry West, of the Greater London association, thinks that he could bring in an extra £100,000 a year if American-style tax concessions were introduced for donations to the arts. But most other directors are less optimistic and hasten to point out the great disadvantage of private patronage: it is higly undependable.



A major problem facing some associations is that certain areas just feel more regional than others. It is not too difficult to set regional pride in action in the more deprived North, as Northern Arts has shown, or in the South West which feels isolated anyway. But Mr Duncan, who used to work for Northern Arts, has much greater difficulty in the Southern region, where a generally wealthier public is used to being heavily dependent on London for its entertainment and where someone in the Isle of Wight feels no common identity with someone from Swindon. The large new Eastern association, centred on Cambridge, is likely to run into very similar identity problems, as will the South East if, as is expected, an association is started there. Greater London is even worse off and has clearly had trouble deciding its priorities in a region whose 8m inhabitants have only to jump on the tube to reach the West End.

Already there have been some breakaway groups in the North West, where the various authorities on Merseyside and in the Mid Pennine area decided to form their own associations and claim, as a result, to have attracted more local support. This is plainly against the Arts Council's general policy as small associations of necessity carry less weight. Lincolnshire certainly suffers from this problem, and there are rumblings that, with the reform of local government, it might be sensible for it to take a bite out of the East Riding of Yorkshire, which will be part of the Humberside authority.

Now that the Arts Council is so plainly committed to the associations, it appears that Lord Eccles would like to see a nationwide network of strong associations through which much more of the council's money could flow. But with some embryo associations still consisting of a director and a secretary in one room, this idea is plainly quite some way away.

In the meantime, the associations are beginning to think of themselves as a national movement and have taken the step of forming a standing conference, chaired by Lord Feversham, which meets to discuss common problems and exchange ideas. It is also intended to act as a spokesman for the associations. It held its first residential conference in Oxford last year and is pondering holding its next one in France at a Maison de la Culture (the closest French counterpart to our associations). So far its main headache is that only a few strong, large associations have the time to think on anything but a local level. It is also somewhat split between those doves who believe that it should be a passive, discussing body and those hawks who see it as potentially a strong political force. There are even noises among their number that the associations should eventually take over the majority of the Arts Council's functions outside London. But this plainly will not happen if the council has anything to say about it.

Regional arts associations

Jack, do you mind if John speaks for the gunmen ?

Wilson opens up a line with the IRA

FROM OUR DUBLIN CORRESPONDENT

Mr Harold Wilson's 24-hour visit to Dublin early this week was a big personal success. He pleased Irish television watchers in the interview he gave, chucked the press some throwaway titbits and impressed the leaders of the political parties with his knowledge of the complicated Irish scene. But some doubts remain in Dublin about the real reason for the visit. Although the invitation to appear on television had been open for months Mr Wilson's staff revived it at short notice. Clearly it was a cover. And Mr Wilson convinced his hosts that he was not privy to Mr Heath's proposals for Northern Ireland: so there was no question of his acting directly as an emissary for the Prime Minister, sounding out likely reactions to the long-awaited initiatives.

The most convincing theory is that Mr Wilson was in Dublin on his own account to discover how best the IRA could have their views considered in any proposals for a settlement in Northern Ireland. This theory explains both the references made by Mr Wilson to the IRA on television and his meetings with the politicians. In his interview he said that he himself would not talk to the IRA but added that all had their contacts with them. He described them as a disciplined, tightly knit organisation whose writ ran to the extent that a truce could be honoured and whose peace demands, although unacceptable to any British government, should be considered in all-party talks.

These, and other references to the IRA, could only boost the Provisionals' prestige. But it seems that Mr Wilson's main aim was to discover if the politicians in Dublin would accept that the Ulster Social Democratic and Labour party (SDLP) can put the IRA view at all-party talks. The Irish party leaders will accept it, and the SDLP's Mr John Hume was summoned to Mr Wilson's hotel to hear the consensus. The IRA itself is also believed to accept the SDLP, certainly in the initial stages of talks, as representing its point of view.

In anticipation of a new British initiative on Ulster, Mr Lynch has modified his views on the subject in three important respects. First, he now recognises that unity of the two communities in Northern Ireland must precede unity of the two parts of the island. So long as eventual Irish unity is not ruled out, therefore, Mr Lynch will accept a restatement of the existing British guarantee to Northern Ireland.

Second, the Irish prime minister has come down heavily on the side of Mr Wilson's gradual approach to a solution. He hopes that Mr Heath will simply take the steps necessary to launch talks between representatives of the main political parties in Westminster, Stormont and the Irish Dáil, leaving it to the commission Mr Lynch hopes these talks will create to work for the ultimate solution. Third, Mr Lynch is no longer insisting on the total abolition of Stormont, but merely on its suspension pending the outcome of the parliamentary commission talks.

These three modifications of previously expressed policy are seen in Dublin as substantial concessions. They reflect a lot of hard thinking by the prime minister in recent months. Mr Lynch relies for counsel about Northern Ireland on a small group of advisers who have no status as a team and who do not meet as a group. Cabinet discussions are concerned largely with the pros and cons of specific proposals: the ideas themselves are often the outcome of the thinking of the six people who are closest to Mr Lynch on the subject.

Senior among the six is the deputy prime minister, Mr Erskine Childers. Austere, aloof, cultured, Mr Childers —though conservative in his general views—is not associated with the right wing in the cabinet, which favours a harder line than that taken by Mr Lynch. He has spoken out strongly against the IRA and has been noted for his loyalty to Mr Lynch even during the difficult months of the cabinet crisis last year which resulted in the dismissal of three ministers.

The only other minister who carries

more than average weight in determining Mr Lynch's northern policy is Mr George Colley, the minister for finance, and a former rival of Mr Lynch's for the premiership. Although philosophically belonging to the older homespun school of republicanism associated with President de Valera, Mr Colley is temperamentally more in the realist, technocrat line of Mr Lynch's predecessor, Mr Sean Lemass. Hardworking and ambitious, Mr Colley has swung in recent months more fully behind Mr Lynch's moderate policies while still remaining somewhat to the right of the prime minister.

Mr Lynch also receives advice from three members of the Irish foreign service ; although the foreign minister himself, Mr Patrick Hillery, has been so preoccupied with negotiating entry terms to the common market that he has not played a great part in determining northern policy. The three are Mr Hugh McCann, a former ambassador in London, Mr Donal O'Sullivan, the present ambassador who was recalled after the "bloody Sunday" shootings in Londonderry, and Mr Eamonn Gallagher, the head of the foreign ministry's small Anglo-Irish political section. Mr Gallagher is widely regarded as the liaison man between the Irish government and the minority leaders in Northern Ireland.

The last of the six close advisers to Mr Lynch on northern policy is Mr John Hume, the SDLP man, who is president of the "alternative assembly of the Northern Irish people." Mr Hume's advice was largely instrumental in determining Mr Lynch's attitudes at the Chequers meeting with Mr Heath last year. But internal dissension in his party, and the desire of many of its members to be more closely associated with the Irish Labour party, had once weakened the links with Mr Lynch. Like the prime minister's other close advisers, Mr Hume is a moderate—as is Mr Lynch himself. All have some influence over the prime minister but Mr Lynch remains the chief architect of his policy.

France

The party against violence

FROM OUR PARIS CORRESPONDENT

Can the French left restore what passes for its unity ? The Communist and Socialist parties have long been agreed, in principle, on an electoral alliance for 1973 and, hypothetically, on an alliance in government thereafter. After M. François Mitterrand's Socialists had met last weekend to settle what they thought a future left-wing government should do, the two parties were due this week to resume discussing their rival and often divergent programmes.

They can unite for a funeral

But the fallout of the Overney affair has shown up other, no less serious, divergences. René-Pierre Overney was the young maoist shot dead three weeks ago by a member of the Renault security staff when he and his comrades were trying to enter the car company's Billancourt works near Paris. The Communist party promptly denounced not the killing but the maoists, who, it claimed, were manipulated by the government. Ever since, it has been severely criticised by other left-wing organisations, the Socialist party included. For them, however little they might approve of revolutionary violence, when a member of the left is shot dead by a servant of the bosses, there is only one side of the barricades on which to stand. And the Communists had chosen the wrong side.

The Communists got a stinging rebuke a week later, when some 30,000 people marched in Overney's funeral procession. But the party did not, and will not, retreat an inch from its analysis of the affair. Last week's reprisal kidnapping of a senior Renault employee, Robert Nogrette, by a far-left group so small as to have been generally unknown until that moment, fell like manna into the Communists' lap.

Most French papers found the kidnapping of 63-year-old M. Nogrette a cause of greater concern than the death of M. Overney. President Pompidou and the prime minister, M. Chaban-Delmas, denounced it. In vain did Overney's friends point out that he was not merely kidnapped but dead, the victim, they claimed, of cold-blooded murder. The French public, so far as one can judge, fully shared the revulsion against the left-wing kidnappers expressed not only by politicians and the press of the right but, in more balanced terms, by opposition papers too. Feelings were only slightly mollified when M. Nogrette was released, after 48 hours, unharmed.

Here was proof for the Communists that the antics of the far left were as harmful, in terms of public opinion, as they had maintained. Still better, the far left itself, briefly united for the Overney funeral, had been thrown into dispute and confusion by the kidnapping.

So far, for the Communists, so good. But it will take a long time for their potential allies to regain confidence in a party which, even in a pre-electoral period, is quite so ready, for electoral reasons, to kick the principles of other left-wingers in the teeth. The violence with which the Communists have done so, and their extreme enthusiasm to show themselves a responsible party, prompted your correspondent, who remembers the evolution of Italian politics, to a very wicked thought this week. How long before we see the French Communist party angling for inclusion in a government not with Socialists but with gaullists ?

Germany

The disintegrating army

FROM OUR BONN CORRESPONDENT

German soldiers speak of him sometimes as "the letter-box uncle," or "the ombudsman." But his proper title is parliamentary commissioner for defence. Any aggrieved west German serving man or sympathising relative may write to him directly, confident of receiving at least a reply if not a visit from Uncle himself. Last year the commissioner, who is appointed by a Bundestag resolved to keep professional soldiers in their place, looked into a total of 7,891 complaints or inquiries —749 more than in 1970.

So notes the present holder of this office, Herr Fritz-Rudolf Schultz, in his report for 1971. Herr Schultz is

The Marseillaise.

New service from April 1st.
London-Marseilles non-stop 3 times a week.

From April 1st, BEA will fly from London Heathrow to Marseilles non-stop 3 times a week. All flights are by Trident.

Flights depart on Tuesdays, Thursdays and Saturdays at 0940, arriving Marseilles at 1115; and return flights, on the same days, depart Marseilles at 1155, arriving London Heathrow at 1335.

We look after you on the ground, too, with our Hotel Reservations Bureau and speedy FlyDrive car hire system. It's Number One treatment all the way.

So if you're making for Marseilles, make sure it's one of ours!

Fly BEA!

How long do you think they would hold the Russians ?

troubled by evidence of steadily deteriorating discipline among the 460,000 men in the west German armed forces. It is not just that this former Free Democrat deputy sees things with the eyes of the proficient tank officer who won the Knight's Cross with Oak Leaves in the second world war. Surprisingly in the circumstances, he relates, for instance, how he intervened to stop an artillery unit detailing a gunner every day to sweep the canteen, empty the ashtrays, and water the flowers, on the ground that such practice was incompatible with a directive that the "citizen in uniform" should be ordered to do only what served military ends.

Herr Schultz's indictment asserts that "unauthorised absence from duty, desertion, disobedience, and violent conduct against superiors, along with petty theft in the barrack room and major theft of arms and equipment, increased substantially in the period under review." He tells of 15 mountain pioneers, armed with climbing picks, releasing by force a drunken companion whom the orderly officer had put under close arrest ; and of some 140 Rhineland troops smashing Uelzen railway station on finding that no transport had been laid on to take them back to barracks after celebrating a carnival. He deplores the fact that in many units a directive recommending regular discussion between officers and other ranks is misinterpreted as a licence for *Mitbestimmung*—the equal say in management demanded (and practised here and there) by militant left-wingers in the trade unions and the universities.

And then there is the funny business of the militant long-haired, to whose studied waywardness nine whole pages are devoted. To keep abreast of democratic times the present minister of defence, Helmut Schmidt, abolished the compulsory traditional short military haircut, remarking that he was interested more in what was beneath a soldier's skull than on top. Herr Schmidt directed that the excessively hirsute should wear a hairnet in circumstances in which long hair might impede efficiency. Later the minister ruled that the long-haired should wear a net the whole time while on duty. According to Herr Schultz some soldiers, reporting sick with headaches purportedly caused by the army issue net, wangle permission to buy a more elegant model from the local hairdresser—at the taxpayers' expense.

Herr Schultz concedes that the anti-authoritarian influences at work in the army are bred of similar tendencies in the permissive society outside. He is none the less disturbed by the growing number of soldiers who not only resent compulsory military service (already reduced from 18 to 16 months) but also challenge its validity. He thinks part of the cause is the failure of west Germany's leaders to explain Germany's obligations to itself and to its allies. "The removal of the traditional picture of the enemy has led many soldiers to suppose there is no longer any threat from outside."

The second chief cause of restlessness in the armed forces is, in Herr Schultz's opinion, systematic communist subversion. The commissioner tells of leaflets and handbills distributed at barrack gates and posted on barrack walls inciting soldiers to disobedience and slackness. Perhaps, he reflects, they have already been influenced to some extent by communist teachers in the schools. He records that in 1971 as many as 27,657 conscripts asked to be registered as conscientious objectors—8,294 more than in the year before. Draft-dodging is not a purely American phenomenon.

Spain

The Vatican cellars

FROM OUR SPAIN CORRESPONDENT

The Vatican, it seems, can speak in more than one voice. Conservative Spanish churchmen have long been scheming against the new archbishop of Madrid, Cardinal Enrique y Tarancón, and their friends were warned to expect a development that would discredit him and perhaps enable the authorities to take legal action against the Bishop of Huelva, guilty of releasing a strongly anti-government report on social injustice.

Until last autumn, Spanish conservatives considered Cardinal Enrique y Tarancón a safe "establishment liberal." But in September he aligned himself with the radical majority at the joint assembly of Spanish bishops and priests. The assembly called for political democracy and denounced torture and political courts martial. Half its members went so far as to vote for a resolution asking the Spanish people to forgive the church for its role in the civil war. Cardinal Enrique described the assembly as "a great step forward" and promised more outspokenness of this kind.

It now looks as if a plot against him was hatched last February. Conservatives said to be connected with the lay Roman Catholic organisation Opus Dei began circulating a report issued by the Holy Congregation of the clergy, in Rome, which strongly criticised the joint assembly—and indirectly the cardinal—on both theological and disciplinary grounds. Monseñor Guerra Campos, a conservative prelate who is one of General Franco's personal nominees in the Cortes, claimed that the criticism was upheld by "high authority"—presumably the Pope. Had this been so, the balance within the episcopal conference would probably have swung in favour of the conservatives.

When, after a fortnight's delay, Cardinal Enrique received the report, he left indignantly for Rome. On his return he was able to read to the assembled bishops a letter signed by the Vatican's secretary of state declaring that the Pope had not seen the report and that its conclusions were not binding. He denounced the "grave calumny" of the right-wing faction and virtually accused Monseñor Guerra Campos of being a liar. Afterwards the cardinal was elected president of the

conference and most other posts went to liberal bishops.

As the liberal Catholic monthly *Cuardernos para el Diálogo* observed recently, the Spanish church has undergone a "spectacular change of attitude." This change has been due partly to "Pope John's reformation" and partly to local factors. As the civil-war bishops retired, priests began to oppose the establishment first on regional and then on social issues—some for moral reasons, others because they were anxious to defuse the anticlericalism provoked by the church's alliance with General Franco. Left-wingers denied legal outlets of their own infiltrated Catholic organisations and publications.

But the church still has reasons for caution. It prefers the state's substantial subsidies to the rather shadowy charity of the average Christian (anyway, only about 15 per cent of Spaniards are regular churchgoers nowadays). General Franco, for his part, is profoundly religious and too shrewd to forget his own advice to Perón in 1955: "Always keep the church on your side."

South West Africa

A plan for Namibia?

FROM OUR SOUTH AFRICA CORRESPONDENT

On the surface, Mr Kurt Waldheim's visit to South West Africa (or Namibia, as it is called at the United Nations) looked a futile affair. For two days the UN secretary-general was whisked about by the South African authorities, like any other visitor on an information department ticket, getting the full propaganda treatment. He saw the tourist sights, hydroelectric and other development projects, and he talked to government-nominated black councillors. True, he also saw critics of the government who handed him petitions. But receiving petitions on South West Africa is hardly a fresh experience for the secretary-general of the United Nations.

Even the visit to troubled Ovamboland in the north was uneventful. This is the region where appalling contract-labour conditions led to a strike by 13,000 Ovambo workers earlier this year, and where subsequent clashes between strikers and police have now culminated in emergency rule and detentions. But Mr Waldheim showed no particular interest in the cause of the trouble. That, he said, was beyond his terms of reference.

It was all too bland to be true. And even while South Africa's pro-government press and radio were cooing at the apparent public relations triumph, some voices began to inquire whether there was not perhaps more to it than appeared on the surface. Was it not true, asked the Johannesburg Sunday Times warily, that the real purpose of Mr Waldheim's visit lay not on the plains of Namibia but in the government offices of Capetown?

Which is precisely the point. Mr Waldheim came to talk, not to see. His purpose was not to examine the merits of the case that South Africa should withdraw from South West Africa and allow it to become independent. So far as he is concerned, the verdict on that has already been given both by the International Court at The Hague and the UN Security Council. His purpose was to determine how to get the verdict implemented. His terms of reference, outlined by the Security Council in Addis Ababa on February 4th, were to make contact with the South African government in an attempt to secure its co-operation.

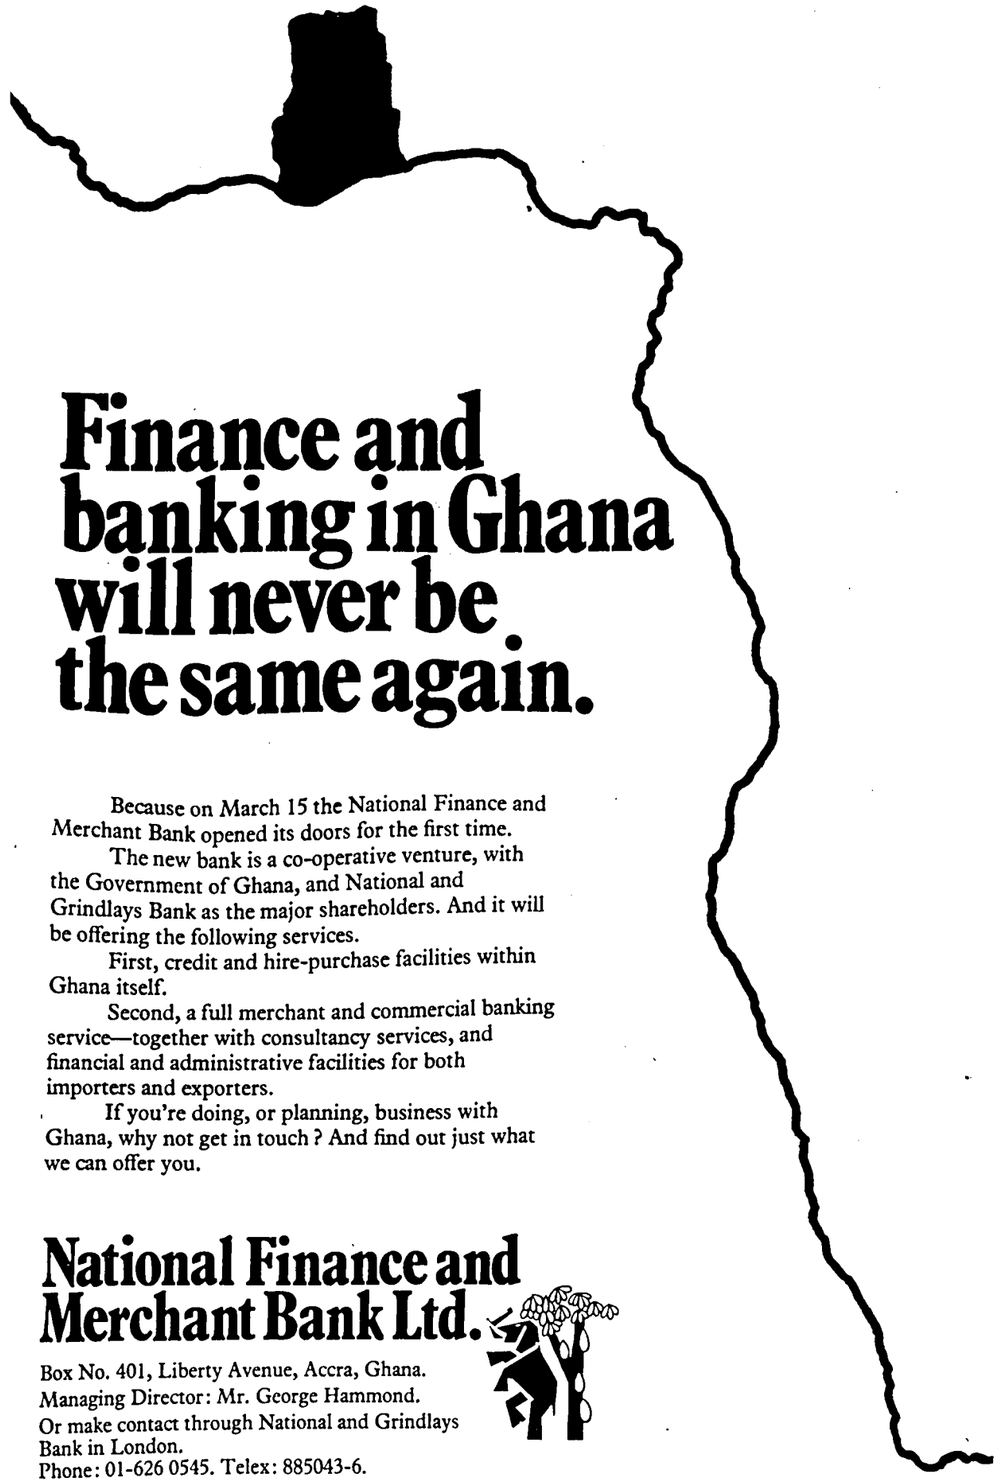
The sole purpose of Mr Waldheim's visit, therefore, was his two meetings with the prime minister, Mr Vorster. The tourist bit was merely a matter of diplomatic courtesy. Seen in this way the trip raises an intriguing question: why should Mr Vorster be prepared to talk with the secretary-general on such terms? Can it be that South Africa, which has been so adamant for so long about refusing to contemplate any withdrawal from South West Africa, is reconsidering the position?

In an extremely cautious and qualified way, the answer may be yes—at least sufficiently to raise hopes of some sort of compromise agreement with the UN. Mr Vorster has had a lesson in the experience of Rhodesia of how unsatisfactory it can be to allow a stalemated situation to drag on. He could be growing anxious about the South West African issue blowing up into something larger if the stalemate there continues, especially now that there is an adverse International Court judgment on record.

Whether there can be any compromise depends, of course, on what you mean by independence. Both Mr Waldheim and Mr Vorster talk of independence for the people of Namibia—or South West Africa. But they mean very different things. For Mr Waldheim, it means simply another independent African state like all the others. For Mr Vorster it means a series of 11 tribal bantustans that he is prepared to ease towards some kind of political independence, just as he is doing in South Africa itself, with the 90,000 whites remaining apart in the bulk of the territory which would continue to be administered by South Africa.

However, as the dialogue with Mr Waldheim unfolds, it could be that South Africa would be prepared to consider the 11 bantustans coming together under the guise of some federal arrangement. And with an adjustment in the apportionment of land it could be that some elements in the UN would regard this as a bargain at least no worse than the one Britain is trying to strike in Rhodesia. And that, from Mr Vorster's point of view, would mean a lot.

Cambodia



Lon Nol protects his cucumbers

FROM OUR SAIGON CORRESPONDENT

The supreme stewardship of the Cambodian nation has weathered some strange vicissitudes in its divinely guided history. On one occasion the grower of royal cucumbers found an intruder lurking in his garden at night, and after impaling him on a spear found the unfortunate victim to be the king himself. Far from being punished, the vigilant cucumber-grower was promptly elected to the throne, founding a new dynasty.

Alone at the top now

Finance and banking in Ghana will never be the same again.

Because on March 15 the National Finance and Merchant Bank opened its doors for the first time.

The new bank is a co-operative venture, with the Government of Ghana, and National and Grindlays Bank as the major shareholders. And it will be offering the following services.

First, credit and hire-purchase facilities within Ghana itself.

Second, a full merchant and commercial banking service—together with consultancy services, and financial and administrative facilities for both importers and exporters.

If you're doing, or planning, business with Ghana, why not get in touch? And find out just what we can offer you.

National Finance and Merchant Bank Ltd.

Box No. 401, Liberty Avenue, Accra, Ghana.
Managing Director: Mr. George Hammond.
Or make contact through National and Grindlays Bank in London.
Phone: 01-626 0545. Telex: 885043-6.

The Cambodians could therefore be excused for seeming rather bored this week when Marshal Lon Nol booted out the chief of state, appointed himself first president of the Khmer republic, and at the same time solemnly undertook to uphold the 1947 constitution—which happens to be a monarchist one, or what is left of it. To be sure, Marshal Lon Nol's actual assumption of the presidency was not unexpected. But the manner of it was. Until a few days earlier, it had been planned that Lon Nol would wait for March 18th (the second anniversary of Prince Sihanouk's dismissal as chief of state), by which time the constituent assembly would have completed work on a brand-new republican constitution and paved the way for a smooth transition to presidential rule.

But late last week the marshal returned suddenly from the seaside, partly recovered from the stroke which last year left him crippled and semi-paralysed. Within hours, the interim chief of state, Cheng Heng, had "resigned" and nominated Lon Nol to replace him. The marshal, who was already prime minister and head of the armed forces, accepted. This marked the first patently unconstitutional link in the chain of succession that started with Sihanouk's ouster in March, 1970. Lon Nol quickly scrapped the almost-completed republican constitution, closed down the constituent assembly and dismissed the government. Then, on Monday, he swore himself in as president.

Nobody is sure what impelled the new president to move with such uncharacteristic swiftness and in a way so calculated to cast doubt on the legality of his own position. The official explanation was that the draft constitution was unacceptable to the government, and had to be aborted before the assembly could formally give birth to it. As one minister put it, the draft provided for a "dictatorship of parliament"—meaning that the assembly could dismiss the government but not vice versa. Marshal Lon Nol therefore sprang what amounted to a pre-emptive coup by the government against the assembly.

But there seemed more to it than just that, and one of the more ominous possibilities was that a group of army officers had pushed the marshal, fearing both the anti-military tone of the draft constitution and the rising star of the assembly chairman, In Tam, who is no friend of the generals but has significant political support of his own. Of course, one cannot rule out the possibility that the marshal acted as he did simply because his astrologer told him to.

In any event, a war-torn nation which sorely needed good leadership now finds itself in the hands of one superstitious and sick man, whose political judgment is erratic and whose physical strength was again visibly ebbing after four days back in the capital. And yet the transition was accepted with complete calm in Phnom Penh, where Lon Nol remains popular. The students and Buddhist monks seemed to approve, although student demonstrations against his right-hand man, General Sirik Matak, mainly because of his princely rank in the former royal family, resulted in the news on Thursday that Matak is retiring. The American embassy, surprised and shaken by the turn of events, could only hope that it would not make Congress angry back home.

No more chicks for these boys

West Bank

The farmer's worries

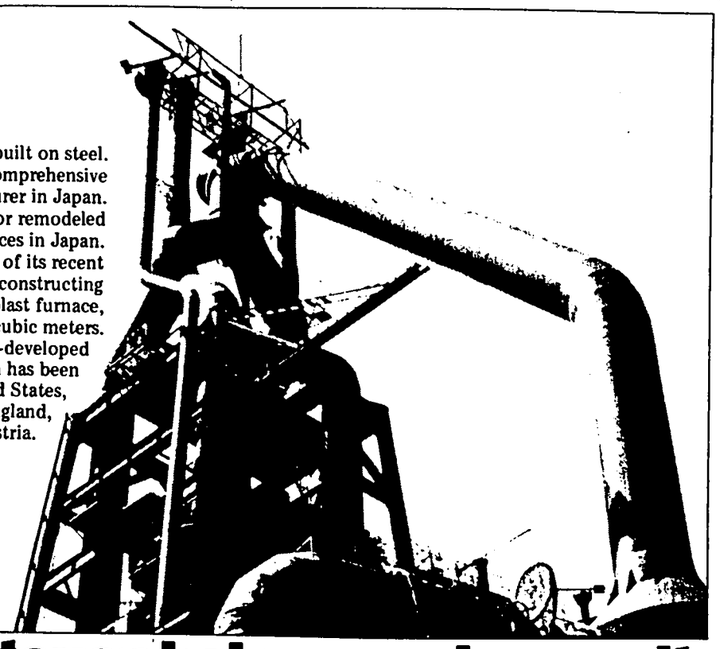
FROM OUR SPECIAL CORRESPONDENT

Jericho

As time runs on and Israel's physical presence on Jordan's occupied West Bank becomes more vigorous and penetrating, the Arabs there stare at their shrinking map and wonder what sort of autonomy can be picked out of the jigsaw. Israel now has 12 settlements on the West Bank. Are any negotiable? ask the Arabs. Or would the areas they stand in belong to Israel? Mr Dayan has said that wherever Israelis settle they mean to stay.

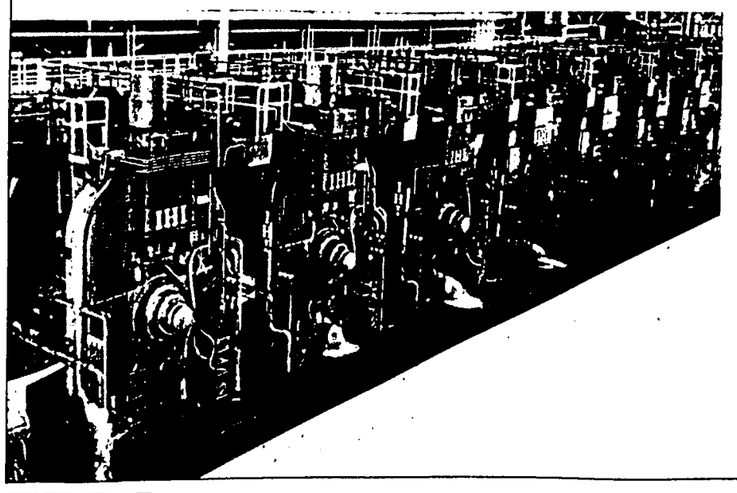
Sheikh Ali Jabari, the veteran mayor of Hebron, has consistently, and with some moral courage, pursued a policy conciliatory to Israel. But this has not spared his area from Israeli colonisation. The Israeli army commandeered 2,500 acres of agricultural land near Hebron for Israeli settlers. Now, on the brow of a hill commanding the city, big blocks of flats have gone up with the same fortress-strong appearance as those that enclose Jerusalem. Plans are in hand, though at present suspended, for constructing 1,000 more Israeli homes in the same style.

Between Hebron and Bethlehem is a block of three Israeli settlements. Down in the broader stretches of the Jordan valley the boys and girls of eight new Israeli settlements are starting their own agriculture on the fields that were formerly worked by Arabs. This was the region of Jordan's most luxuriant farms, but only a few Arab cultivators are allowed to work there now. On much of the land that the Israeli army holds, but is not using, orchards and market gardens have been allowed to wither away.



Before 1967 agriculture was the mainstay of the West Bank's economy. Now farming is feeling the draught because of land lost to Israel and the loss of labour: the 40,000 Arabs who have gone to work at Israeli building sites or factories. Property-owners—the people who will vote in the coming municipal elections—are, even if not farmers, concerned by this threat to the West Bank's basic economy. No serious alternative industry is being developed to which Arab labourers might turn when Israel's building boom slackens.

These Arab workers in Israel get at least £1.40 take-home money a day. The Arab smallholders who need farm labourers cannot keep up with such rates. The bigger farmers might do so if they could sell their produce in Israel, where the wholesale prices paid are commensurately high. But except when there are occasional shortages in Israel, the West Bank farmers must sell on the low-paying West Bank, or else in east Jordan—where prices over the past year have been abysmal.



The Israeli authorities on the West Bank concerned with agriculture are doing their best to assist the Arab farms—advising them about crops, providing insecticides and helping them to get piped water. But they cannot shelter them from the thrusts of Israel's powerful commercial interests. The effect of this has been felt in the

The modern world is built on steel.
And IHI is the most comprehensive iron and steel plant manufacturer in Japan.
IHI has either made or remodeled more than half of the blast furnaces in Japan.
And as a typical example of its recent assignments, IHI is now constructing the world's largest blast furnace, with an inner volume of 4,000 cubic meters.
Also, the technology of the IHI-developed blast furnace top-charging system has been exported to the United States, West Germany, England, South Africa and Austria.

The Earth. Whatever helps people span it, develop it, live on it, IHI is involved in it.

The land gives us metals.
And IHI breathes life into them.
By constructing various rolling mills.
Slabbing mills, blooming mills, hot and cold strip mills. And others.
IHI's hydraulic mill is especially commanding keen interest.
One of its notable completions is a 4-high, 5-stand full-continuous tandem cold mill for the NKK's Fukuyama Works.
All the way. For top manufacturer of rolling mills worldwide, it's IHI.

U.S. markets are profitable but the competition is tough.

British companies are expanding into the USA.

Because the returns can be high. But selling into the mecca of marketing isn't for the faint-hearted; the competition is tough and they are fighting in their own backyard.

Irving can help.

Through our London Branch you get direct access to all the commercial banking facilities of our Wall Street headquarters. Complete financial services covering the whole of the USA. Data on your particular US market; its history, present activity and forecast. Location and introduction to agents, distributors, lawyers and consultants. Credit information. Help with planning and execution of mergers or acquisitions. In fact, the whole range.

We are big enough ($1 billion in deposits in London) to give you full international services yet small enough to give you personal attention.

Let Irving be your *personal* guide to international banking.

IRVING TRUST COMPANY

36-38 Cornhill London EC3 Telephone 01-626 3210 Telex 888851/2
Head Office: One Wall Street, New York

Together, we chose a Rover 3½ litre.

"The governor thinks I like to get my head under a bonnet that means business.

But the truth is, I never even have to think about her.

Power-assisted steering so I can park in the city with one finger on the wheel.

Thick leather armchair, which makes long waits something to look forward to.

And she's so quiet I can hear him snore at top speed.

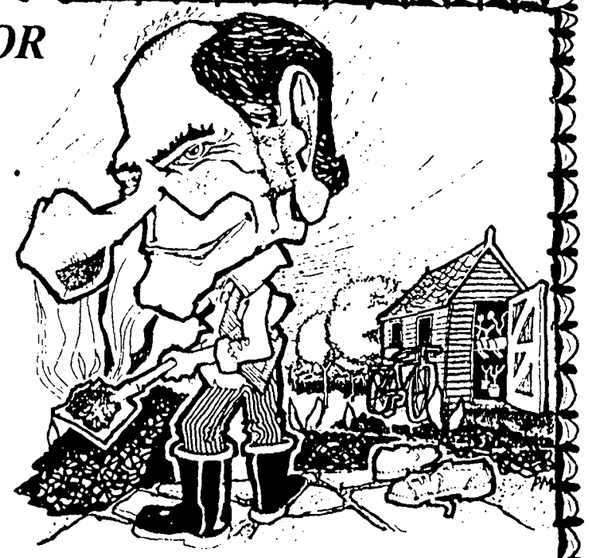
He doesn't know it, but we got it to prove that a chauffeur's lot is an easy one."

"Forbes, interested as ever in my image, must have thought she'd be a suitable symbol of my promotion.

Well, it is the finest bit of four-wheeled prestige I've sat in what with its wood-panelled interior and noiseless grace.

But he doesn't know about my weekend secret.

Just let me get at that wheel and a 184 bhp engine with servo assisted brakes to show that this company can impress all sorts of company.



Besides, it must be pretty good value for money, for the firm to let me have a chauffeur."

Rover

The Rover Company Limited, Solihull, Warwickshire.

MARKETING DIRECTOR

I'm the Marketing Director (they used to call me 'Sales')
Now Marketing is the 'in' word, but it's still a bed of nails.
I live just like the adverts—the image being vital
So I go around in every town as if I'd got a title.
I lunch in five star hostelries, I smoke the best cigars
Drop words like 'Lamborghini' when we're discussing cars.
But at heart I'm just a homely chap. At weekends I like quiet
A long run in the country, fresh air, a change of diet.
Now when I worked in London, the weekend drives were Hell
For fifty million others were on the road as well.
But back in 1968 the Chairman did his sums
And said 'We're off to Washington, now that's the place for plums.
Environment, incentives—My boys they've got it all.*
It's the greatest thing for England since the Romans built the wall.'
So up we came. I bought a house (with roses round the door)
Of twice the size and half the price of the one I had before.
And each weekend it's fishing, or exploring country lanes
Or gardening, or just pottering in the greenhouse when it rains.
For charging tired batteries this treatments efficacious
Enabling me to face each week in manner ostentatious.

** Planners and politicians word for anything that is difficult to explain in precise terms.*

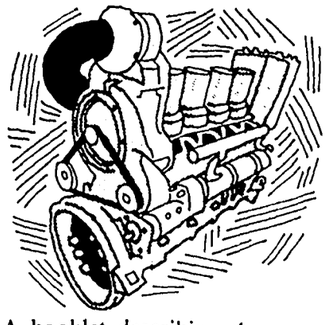
Money For the big import export deals

TKM can usually help. For TKM is the world's largest organisation specialising in the providing of short and extended term credit for the international movement of goods.

The period between the goods leaving the factory and the importer receiving payment from his customers is often a long one and locks up resources which could be more

profitably employed. TKM overcomes this problem by providing substantial lines of credit. Close analysis and a flexible approach enable TKM to solve most financing problems. The aim is to provide credit in line with the



commercial and cash flow requirements of a client's business.

The knowledge which TKM has gained in the financing of international business has given the Group a very special understanding of the needs of importers and exporters. It is knowledge based on over a century's practical experience. Today, with a turnover exceeding £330 million, TKM has 22 offices in fifteen countries and works closely with more than a hundred banks throughout the world.

Continued from page 40

man-made oasis near Jericho created by the Palestinian philanthropist Mr Musa Alami—the vocational school and farm of the Arab Development Society (ADS).

Here again the Israeli army has taken a great deal of land, the citrus trees dying upon it ; but there remain 1,000 acres of hospitable oasis. Yet it has been hard done by. It was once the biggest dairy and poultry farm in the region. It has had to cut down its herds because its principal former customers, the big hotels in east Jerusalem, are now obliged to buy Israeli milk. It used to supply the whole West Bank with day-old chicks and broilers. Now it can no longer do so because it could not compete with similar Israeli products subsidised by the government that were dumped on the West Bank at half the normal price during its necessarily short trading season. So the ADS was put out of the poultry business except for the selling of eggs. This was a severe blow, for the ADS applies its profits to housing and training destitute Arab boys.

With the farm activities curtailed, the number of children to be cared for had also to be reduced. Last autumn Mr Alami was officially informed that the ADS was acting "unlawfully" in running a smaller establishment, and told that if it did not expand to its former (pre-1967) strength the Israelis would take the whole place over. This ultimatum has now been withdrawn ; but that it could ever have been given remains disturbing.

Many farmers have a fear—perhaps groundless—that, should they run into difficulties in getting labour or markets, their farms might be expropriated. Meanwhile the farmer, like everyone else, Arab or Israeli, breathlessly tries to keep pace with the rising cost of living. On the West Bank this follows closely on Israel's, which has increased since 1967 by 300 per cent.

There is a clash between two economies, between Israel's grant-aided, intensely capitalised and broadly protected agriculture, and the Arab kind, labour-intensive, manually highly skilled but vulnerable and unorganised. It is a pity that some of the famous "resistance" money that King Hussein until recently was paying out in personal salaries did not go into something more constructive—into strengthening the Arabs' still embryonic farming co-operatives, or supporting the institutions where young Arabs get the technical training that will always ensure them a job.

India

Khaki election

It was more an annihilation than a defeat. Mrs Gandhi's Congress party swept the polls so completely in last week's state elections in India that the country is now virtually a one-party state. With 1,921 out of the 2,715 seats declared, Congress won a clear majority in 14 out of 16 states ; it failed to win only in the tiny hill states of Manipur and Meghalaya, where no party gained control, and in the special Goa area.

The most astounding victory for Mrs Gandhi was in the chronically chaotic state of West Bengal, where Congress captured more than two-thirds of the seats and the formerly fearsome Marxists were reduced from a near majority to a derisory handful of 14. Only the pro-Moscow communist party survived the Congress tidal wave in Bengal and its 35 seats can be attributed to an election alliance with the Congress party.

The largest remaining base for the Marxists, apart from Kerala which did not vote this time, is now in Tripura, another tiny hill state adjoining Bangladesh where refugees outnumbered the local population last year. These 15 seats, plus four more scattered around India, gave the Marxists a grand total of 33 in the whole country. The only opposition party which fared worse was the party of capitalists and princes, Swatantra, whose representation has dropped to 15 from 185 seats in 1967.

Other opposition parties were similarly struck down. The Hindu Jana Sangh, which is now the biggest opposition group, took 105 seats compared with the 174 it held in the outgoing assemblies, and lost its valuable base in Delhi. The pro-Soviet communists, no longer a proper opposition party, sailed along on Mrs Gandhi's coat-tails where they were allied with her in Bihar as well as Bengal, but lost where they were on their own in Maharashtra and Andhra Pradesh. This may be something of a reward to the Soviet Union for the help it gave India in the Bengal war in December.

It was the defeat of Pakistan more than anything else which gave Mrs Gandhi her overwhelming victory. India's national psyche received a bigger boost from the December war than from anything since independence. As a Jana Sangh newspaper complained bitterly on Monday, "a glorious national achievement was made to look as if it belonged to one party alone." The Bangladesh refugee problem also helped Mrs Gandhi by providing her with a ready-made excuse for sidestepping all questions about her government's performance last year. But now, with a vote like this, she has no excuse left.

Triumph, and no excuse left

Bangladesh

India steps into the breach

"Our problem is that they love us too much," an Indian diplomat remarked recently after a visit to Bangladesh. "Sheikh Mujib acts as if Mrs Gandhi were his prime minister and keeps phoning her up while his officials look to us to solve all their problems." "Of course," he added, "we know this can't last."

With her characteristically acute sense of timing, Mrs Gandhi is making her first state visit to Dacca this weekend to capitalise on what will probably be the warmest moment in Indo-Bangladeshi relations for some time. She comes flushed with victory in India's state elections—a triumph which must bring considerable comfort to Sheikh Mujib, since it kept the Marxists out of power in the neighbouring state of West Bengal. And she comes just in time to celebrate the withdrawal of the last of the 100,000 Indian troops who won Bangladesh its independence three months ago.

Although Indian troops were remarkably well-disciplined for an occupation army, the highly visible presence of turbaned Sikh soldiers inevitably provoked resentment and

Mujib salutes his departing friends

scattered clashes. So the pullout—two weeks in advance of schedule—is bound to enhance Mrs Gandhi's popularity in Bangladesh. But in fact Mrs Gandhi is said to have been even more anxious than Sheikh Mujib to get the troops out—less to put an end to sniping incidents than to quieten foreign suspicions.

The withdrawal should bring some quick benefits to Bangladesh in the form of American recognition and perhaps the start of a conversation between India and Pakistan's Mr Bhutto. But it may also set off a new round of troubles by removing the main buffer between the Bengalis and their detested minority, the Biharis. At the very moment the ceremonial retreat was sounded in Dacca last Sunday several hundred Biharis were reportedly being killed and wounded at a jute mill near Khulna. If more such attacks occur, it may redound on the Indians because of Mrs Gandhi's refusal to allow the Biharis to migrate back to their former homes in India.

Both the Indians and the Bengalis are highly aware of this and other potential pitfalls in their relationship. Both know that certain commercial conflicts are inevitable once Bangladeshi trade gets going again—over jute markets, for example, over smuggling of essential commodities to the higher-priced Indian market and over attempts by Indian businessmen to set up shop in Dacca behind Bengali frontmen. India has tried to forestall Bengali fears of an Indian commercial takeover by limiting trade between the two countries to state trading corporations. And it has instructed its diplomats and technical advisers in Dacca to walk softly. But its major method of keeping Bangladesh sweet is through aid.

India is far and away the biggest benefactor of Bangladesh and promises to remain so unless and until Mr Nixon swallows his pride and opens his coffers. The Indians have given their help with a minimum of fanfare as much to defuse opposition at home as to keep the Bengalis happy. (If commodity grants were announced, prices would immediately rise in India.) Total aid this fiscal year will be more than £50m. This includes a £5m sterling transfer in London to back Dacca's new currency, £10m in grants to returning refugees, and 500,000 tons of food grains.

Although Mrs Gandhi has proclaimed that India can and will meet all the needs of Bangladesh, she and Sheikh Mujib have a common interest in wanting to spread the aid burden. Sheikh Mujib's recent trip to Moscow was an attempt to spread it in the direction India favours most. The package the Bangladeshi leader returned with—an £18m credit previously promised to united Pakistan and unquantified pledges of technical aid—was considerably smaller than he must have expected from his best friend's best friend. But Russia won a strategically valuable toehold by offering to clear the Bangladesh port.

The failure of western countries to raise $6m for the port contract is symptomatic of their faint-hearted aid efforts. A $565m UN appeal launched last month for urgently needed relief goods, mainly food grains, has been answered by fewer than a dozen countries, of which only the United States has given enough to amount to more than a drop in Dacca's empty bucket—$35m in food and cash.

Bangladesh not only needs just about everything ($2 billion-$2.5 billion worth over the next two years according to its government estimates); it needs a good portion of it immediately in the form of expensive transport equipment if relief supplies are to get beyond the blocked-up ports. India has been doing its bit by rebuilding most of the 500 shattered bridges, and by donating 800 trucks; and some other help has come from voluntary agencies. None the less, very little is moving into or out of Bangladesh. It is probably already too late for enough housing materials to be imported and distributed to provide shelter for the millions of homeless before the May monsoon. And while governments fiddle with reports and committees, it may become too late to prevent a Bengal famine.

Iran

Firing squad at work

FROM OUR TEHERAN CORRESPONDENT

With the execution of a further nine Iranian political prisoners last Sunday, the number shot by firing squad since the present batch of political trials began in late January has risen to 19—and the end is not necessarily in sight. The group executed on Sunday was said to have been concerned with the murder of policemen, an attack on a police station in Tabriz, bank raids and other guerrilla activities. But the announcement of their execution by the department of military justice was the first indication of their arrest or indeed that further trials have been taking place.

In the wake of adverse criticism of the trials in the foreign press and fearful that the presence of outsiders might provide opportunities for prisoners to publicise allegations of ill treatment, the government has barred foreign reporters and observers from the hearings of the military tribunals. Not since the trial of 11 members of the Iranian Liberation Movement, an offshoot of Mossadeq's National Front, ended on February 18th, have there been any further reports in the local press. How many people have gone before the courts or what sentences they have received remains a mystery. All that is certain is that the military appeal courts have in many cases substantially increased the sentences imposed by the tribunals and have handed out a greater number of death penalties. Ten people, for instance, were granted reprieves by the Shah on Sunday, but some of them had been sentenced by the primary tribunal to terms of imprisonment only; their sentences must have been raised to the death penalty on appeal.

The impression in Teheran had been that after the first six executions the Shah did not want to risk alienating feeling abroad by having any more death penalties carried out. He may have changed his mind because of the persistence of sporadic guerrilla incidents. While these were not enough to do much damage, they kept the police on edge and made them excessively prone to pull out their revolvers. Bomb explosions have been matched by continuing student agitation. One measure of how seriously this is taken is that Savak, the security organisation, recently risked the unpopularity

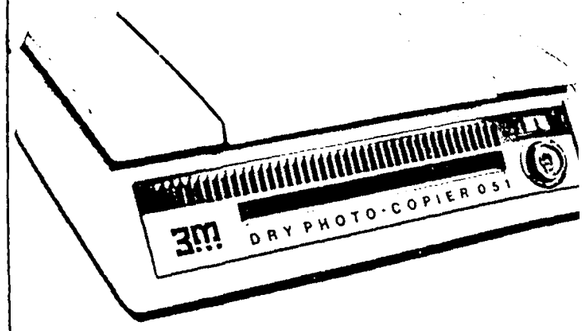
10th TOKYO INTERNATIONAL TRADE FAIR

April 20th - May 7th '73

A DISPLAY WINDOW FOR THE ENTIRE WORLD

The 9th Tokyo International Trade Fair held in 1971 was an outstanding success from every point of view, with sales totalling US$107,500,000. This is the only large comprehensive trade fair in Asia, and participation is the surest and most effective method of introducing products to the Asian market. The 10th Tokyo International Trade Fair will take place in spring of 1973, and we invite applications from any country or company worldwide to take part in what promises to be the greatest trade fair ever.

Location: Harumi International Trade Fair Site, Tokyo.



Applications for entry accepted from September 11 to September 30 '72.

TOKYO INTERNATIONAL TRADE FAIR COMMISSION

No. 16, 4-chome, Harumi, Chuo-ku, Tokyo

C.P.O. Box 1201, Tokyo, Japan Cable: TOFAIR TOKYO

To everyone in a small business

The 3M 051 dry copier costs £49!

The nearest comparable copier costs £90.

Here's a copier every small business can afford. The 3M 051 dry copier. It needs no chemicals or powder and costs just £49. The nearest chemical competitor costs £90. It's sturdy, portable and will give a clean, clear, high-quality copy of virtually anything: type, ballpoint, half-tone, photographs and colours.

It copies larger than foolscap (up to 8½" x 14"). Even in the smallest business the 3M 051 will pay for itself in a matter of months.

3M 2024

Post today to: Mr. G. Kemp, Business Communications Division, 3M United Kingdom Ltd., 3M House, Wigmore Street, London, W1A 1ET.

Please let me have full information about the 3M 051 £49 dry copier.

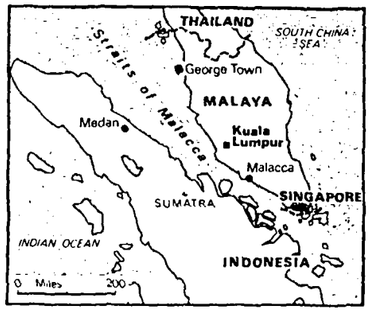
of arresting two of Iran's best known football players, both of whom have played in the national team and both of whom are accused of communist activities.

The Shah now seems to feel that swift, sharp blows are necessary to eradicate both violent and non-violent forms of protest before the country marches in concert, to the music of swiftly expanding oil and gas revenues, towards what is termed "the great civilisation." But the social and political malaise among the middle and poorer urban groups is more complex than this. And many Iranians who would like to see the application of recognised standards of justice are ashamed for their country at the way the trials are being conducted. The tribunals are certainly damaging to the Shah's wish that Iran should be treated on a par with the rest of the civilised community.



Malacca straits

The 12-mile tangle

In a world where many small countries are claiming up to 200 miles or more of territorial waters, the old 12-mile limit observed by Malaysia and Indonesia seems modest indeed. The problem is that, at their narrowest point, the Malacca straits are just under 24 miles wide. Does this mean that they are not an international waterway? More than 37,000 ships passed through the straits in 1970, and some of their owners will be a little perturbed if they are suddenly told that they have been sailing in territorial waters. But that is precisely what the Malaysian and Indonesian governments are now claiming the waters to be.

Their declarations were triggered off by a meeting between the Russian ambassador to Japan, Mr Oleg Troyanovsky, and the Japanese deputy foreign minister, Mr Haruki Mori, about a fortnight ago. The Russian was quoted as saying that the Malacca straits are "an international waterway which must be kept open for free passage by foreign ships." The Japanese were more discreet, but they are known to be interested in dredging the straits to clear away some of the silt that has narrowed them into a single shipping-lane.

The conference on the international law of the seas that is due to be held in Stockholm next month will give the lawyers a chance to wrangle over the respective merits of the Russian and

Malaysian-Indonesian claims. A victory for the Malaysians and Indonesians might set a tricky precedent. They have made it plain that they do not propose to interfere with ordinary shipping, but the Indonesians have claimed the right to stop military vessels. One of the immediate questions is who is going to pay for the dredging of the straits if the Japanese are told to keep off.

East Europe

Decadence moves east

FROM OUR EAST EUROPE CORRESPONDENT

Until very recently the communist regimes of eastern Europe clung smugly to the conviction that narcotics, alcoholism, hirsute hippy movements, juvenile delinquency and other manifestations of social alienation happened only in the decadent west. They seem to have been kidding themselves. Last month the Czechoslovak government, which does not readily admit flaws in its society, held a press conference to air its grave concern at the rising incidence of juvenile delinquency, robberies, alcoholism and prostitution. Apparently 30 per cent of all crimes and 50 per cent of all robberies are the work of people under the age of 18. And Prague Radio has claimed that Czechoslovakia is now distinguishing itself by climbing steadily to the top of the world alcoholic league table.

In Poland the authorities have stepped up measures against teenage hooliganism and alcoholism. One suggestion is that further strengthening of laws might even involve total prohibition—a measure described by one commentator as "noble but totally unrealistic." One difficulty is the ambivalent approach common to all east European governments: although they are concerned with the growing social problem, they are grateful for the growing financial revenues that come to them through their monopoly control of alcohol.

They are faced with no such dilemma over narcotics, which was the subject of a conference in Sofia in October attended by all of east Europe's governments. Bulgaria was a suitable choice for the conference, on the long trail from Turkey and the Middle East to western Europe. One smuggler who did not make it was a young Englishwoman towing a trailer containing 927 kilograms of cannabis. Her 18-month prison sentence could be considered lenient compared with the four-year sentences being handed out in Prague for the same offence. But then a newspaper poll in January revealed that 70 per cent of Czechoslovakia's "long-haired youths under the age of 18" were regularly taking drugs.

Curiously it is in Bulgaria, a particularly orthodox country, that the drug problem is being most openly aired. There is open discussion of the disaffection of the young and some youths have been publicly quoted as not accepting "the constrictive framework of philistine narrow-mindedness and materialism." An enquiry carried out last year by the party youth paper among 11,430 secondary schoolchildren in Sofia discovered that more than 50 per cent of the boys and 35 per cent of the girls regularly drink strong alcoholic spirits. It is perhaps for this reason that Bulgaria has introduced compulsory hospital treatment for 6-12 months for young alcoholics and drug addicts.

RUBBER TRENDS

Issue No. 53, March 1972

With natural rubber producers having to improve the quality of their products to remain competitive, Rubber Trends issue No. 53 examines the situation in the Indonesian rubber industry and considers its future. Country articles include USA, JAPAN, FRANCE, CZECHOSLOVAKIA, AUSTRALIA, CEYLON AND NIGERIA.

02.35. The airport is deserted – but the Hertz girl is waiting with the car the customer ordered. She checked that his flight was late. And stayed behind to meet it.

Hertz has the car you want, when you want

The first thing a businessman wants from a car rental company is the car he ordered, at the time he ordered.

Hertz has enough cars in enough places to meet almost any demand. Hertz keeps really business-like hours, with a willingness to stay open late if your plane or train is delayed, and we know you're coming.

In choice of car, too, Hertz is with you all the way. Over 20 types of Ford and other fine cars at every branch, and a further 12 executive and sports models in the Special Car Fleet based in London and at Heathrow. A better choice of cars – by far – than you get anywhere else.

Save time when you fly.

Hertz is with you all the way at 18 UK airports with the Flying Start Service. While you wait for your flight to be called you complete all the rental formalities at the Hertz desk. While you're in the air Hertz goes to work, so that when you land your car is ready and waiting.

'Ready and waiting' is the key to another great time-saver from Hertz: *Standby Service.* If your own car is in for service or repair at one of the 2,000 Hertz Standby garages in the UK, we'll save you time and trouble and meet you there with a replacement with no delivery charge. It's the most convenient way to make sure you're never without a car.

Hertz can save you time and trouble in other ways. You can charge rentals with a free Hertz Credit Card, or any other well-known credit card. And we can offer other convenient ways of charging to suit your accounting methods. You can make instant reservations – not just for this country, but anywhere in the world – through your local Hertz branch.

Like to see our tariff which lists the whole range of cars and prices? Ask your secretary to 'phone your local Hertz branch for one. She'll find us listed in the 'phone book, Yellow Pages or local paper.

THE WORLD

American Survey

Preferred by Florida's Democrats: Wallace (42 per cent), Humphrey (18 per cent), Jackson (13 per cent)

ELECTION '72

Wallace makes it a new ball game

Miami, Florida

Only Governor George Wallace of Alabama yet knows what his game is going to be in this presidential campaign year of 1972. Does he expect to play a serious part in the proceedings of the Democratic National Convention at Miami Beach in July? Does he merely want to disrupt the convention as he successfully disrupted the Democratic primary election in Florida on Tuesday? Or does he still think of campaigning in the autumn as an independent candidate for the Presidency? His present apparent lack of interest in the American Independent party of which he is supposed to be the leader, together with his evident neglect of the elaborate legal preparations which would be necessary to put him on the presidential ballot nationally, go against the third theory, but it still cannot be ruled out conclusively. All that is plain is that he is enjoying himself and that he is the winner by a bigger margin than anybody expected in the election in which Florida's Democrats showed their preference among their party's presidential candidates.

The Democrats are the larger of the two parties in Florida because, since local offices mostly belong to the state Democratic party by old habit, voters register as Democrats whatever their opinions in order not to waste their votes. Many of those who voted as Democrats on Tuesday would not think of voting for a Democratic President. Their numbers were swollen this week by people who wanted to vote for Governor Wallace as well as by others (as is apparent, decidedly fewer) who wanted to vote against him and who registered as Democratic voters for the one purpose or the other.

However it happened, Governor Wallace got 42 per cent of the popular vote in Florida's Democratic primary election and he can look forward to having 75 out of the state's 81 voting delegates to the Democratic national convention. The strength in delegates is not unexpected: the surprise there, to most observers (though not to those who appreciated the effectiveness of Mr Humphrey's state chairman, Mayor Kennedy of Miami, the place where Mr Humphrey picked up his six delegates) was that any legitimate Democrat won any delegates at all.

As Mr Wallace said, lounging elegantly enough in a reproduction baroque hotel chair in his right-wing stronghold of Orlando on Tuesday night, the electors of Florida have given the Democratic party a jolt. They are, said Mr Wallace, "fed up." What they have got to be fed up about is rather a puzzle: Florida is not a place that is suffering from unemployment or other economic hardship. If there is a pattern that is noticeable, other than the preference for Mr Wallace, it is a preference for candidates who support high spending on defence and on space travel over those who do not.

After Governor Wallace, Senator Humphrey did best. He conducted in Florida the kind of big-hearted, jolly campaign that four years ago turned on nearly enough, but not quite enough, people to defeat President Nixon. Mr Humphrey is still in good condition, health and spirits, his old friendships are still warm: it all brought him in 18 per cent of the Democratic popular vote, a respectable total in a crowded field. Next after Mr Humphrey came Senator Jackson, a loyal friend of the federal government's largesse to the defence and aerospace industries which are plentiful in Florida. Senator Muskie, Senator McGovern, Mayor Lindsay and Mrs Shirley Chisholm do not support such spending and they were the candidates who came at the bottom of the voting lists. Mr Muskie got 9 per cent of the votes; the others even less.

By all the earlier expectations it should have been Senator Muskie who came next after Mr Wallace. This is

the big event that did not happen. Not only did Mr Muskie speak out against the project for a shuttle vehicle in space, but he also ran a lacklustre campaign. He was sluggish, tired, moody and mostly lugubrious ; his staff work must have been poor since there was a notable lack of fuss, pomp and attendance at his meetings and, when he did arrive and did address those few who were present, he talked mostly not about anything substantial but about the problems of campaigning.

Clearly something has got to happen to Senator Muskie if he is to continue as a possible Democratic presidential candidate. There was a sign on Tuesday night that this change was in fact taking place. Senator Muskie as acknowledged leader of the field of Democratic candidates has been a vague and tedious spectacle, but Senator Muskie defeated and humiliated was a man noble in his anger and worthy of respect.

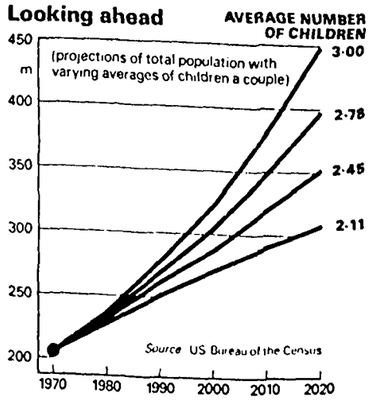
At a moment like this the thoughts of campaign planners turn to the rulebooks. A Florida state law ordains and regulates the primary election. Within its framework the state Democratic party made the rules by which delegates to the Democratic national convention are chosen. It had to pay regard to the guidelines for the selection of delegates laid down by the national party under the reforms ordered by the last national convention at Chicago in the fatal year of 1968. These are the texts over which the political scholars are now poring. The men who wrote them did not consider the possibility that an outsider, Governor Wallace, might not only enter the primary but sweep up nearly all the delegates.

The rules say that delegates must not be simply appointed by the chieftains, but must be chosen by caucuses (meetings) of those who say that they are the candidate's supporters. They allow each candidate a choice, to call such meetings in every congressional district before the primary election or to wait until it is over and then call meetings in the districts where he has won. Governor Wallace, who decided to wait, will now have to summon a caucus of his supporters in every district that he has carried to elect delegates committed to vote for him at Miami Beach.

Once they are chosen there will be 61 of these district delegates. With the idea of making room for delegates representative not just of districts but of the whole political life of the state, the rule-makers next provided for the district delegates to meet in a state caucus to choose 12 more, who must all be committed to support the statewide winner, Governor Wallace. The Democratic chairman in the state, Mr John Moyles—who neither could nor would support Governor Wallace himself—has the bitter duty of summoning this meeting. That done, the state Democratic Committee has the right to appoint eight more delegates to bring the total up to 81.

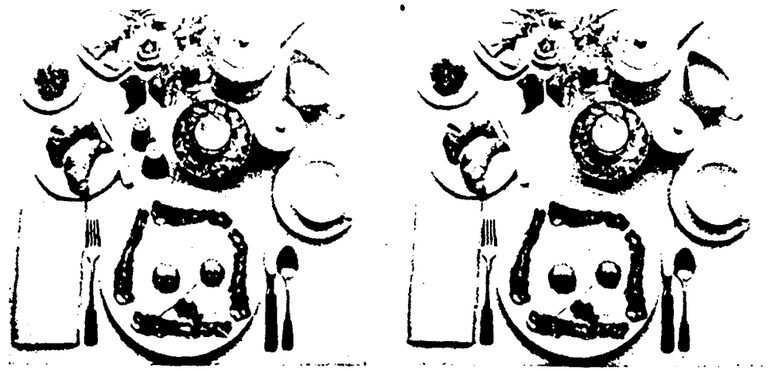
But all the delegates would then be obliged to vote for Governor Wallace either in the first two ballots, or until his total vote fell short of 35 per cent of all the delegates at the convention. Neither Mr Moyles nor the Democratic Governor, Mr Reubin Askew, could decently undertake to vote for Governor Wallace—and neither will. All the same, there are some openings here for Trojan horses, men who might join the Wallace delegation with the intention of eventually voting for somebody else.

With a delegation pledged to no recognisable Democratic leader, but to Governor Wallace, is Florida's Democratic party to play dead at the convention and forgo any part in choosing the party's national candidate? Obviously there are going to be some pressures to seek another way and at this stage two possibilities are visible. Governor Wallace might declare himself ill-treated and call on his delegates to walk out of the convention, whereupon an alternative group, putting itself forward as the "regular" Florida delegation, might claim the vacant seats. The other possibility is that the Wallace delegation might be challenged in the credentials committee as having not been put together in accordance with the national guidelines, which, among other things, call for a fair representation of black people, women and the young.



Who will do the challenging? Senator McGovern and Mayor Lindsay have at their disposal regularly selected teams of delegates from the districts, chosen before the primary ; Senator Humphrey, Senator Muskie and Senator Jackson have not, and there is no provision for them to summon caucus meetings and cause delegates to be elected now that they have lost the popular vote. Thus, in the absence of some compromise not yet thought of, the attempt to seat an anti-Wallace delegation might tend to favour Mr Lindsay or Mr McGovern : so the other candidates might be expected to resist it. The legal advisers to the various political factions look like having a busy time.

Target zero



Two years ago President Nixon and Congress set up a commission to consider what level of population growth would be best for the United States. The answer has now been delivered : no benefits are to be expected from continued growth. The country's national policy, therefore, should be first to slow down the increase in population, then to keep it stable altogether. This declaration by the Commission on Population Growth and the American Future will delight all those who for several years have called for Zero Population Growth, ZPG. But this week's section of the commission's report, the first of three instalments, will not comfort those who have been arguing that the major reason for stopping the growth of population is to avoid crises such as the exhaustion of sources of energy or intolerable pollution of the air. The commission did not find the dangers ahead to be those of environmental disaster, but rather of an increase in public regulation and of a loss of freedom of choice in using resources like water and roads.

The United States, the commission suggested, could reach ZPG around the year 2050 if the average couple chose to have two, rather than three, children. That recommendation has already offended the United States Catholic Conference. It could be embarrassing for President Nixon who is flatly opposed to liberalising abortion laws. Yet while it appears radical to suggest that America should abandon for the first time its traditional belief in the virtues of bigness, that may be what is happening in practice anyway. Recent studies show that the country seems already to have shifted to the ideal of the two-child family. If that ideal were

Looking ahead

How to tell good room service from bad room service.

Nice guy that you are, you'd probably never complain about missing salt and pepper shakers, a broken egg or a late start.

But the way we see it, you have every right in the world.

Maybe it's just that we define "elegance" with a little more precision than most people. To us it means an ease and a style and a way of doing things.

And a whole lot more than just hot water.

That's why our 63 hotels around the world are subject to no less than 800 checks on everything from blankets to banquets, several times a year. It's a Quality Control System we've devised to tell the good guys from the bad, middling, or mediocre ones.

And, speaking of good guys, we've got some pretty special ones on our side.

In fact, you might think our worldwide staff was involved in some incredible, ongoing conspiracy, with one single aim: To make you happy. And we don't deny it.

So don't be surprised when that simple little breakfast of yours comes complete with a bunch of flowers and a bright-eyed waiter with a smile a mile long.

Or when you sit down to dine in a setting that's lush and rich and right out of Victorian England or Louis XVI, or any of 60 magical eras.

Our people just happen to care a little more than most people. It's that simple.

And that philosophy has gotten us around the world and back again. 63 times over, all in just 26 short years. That means thousands of rooms. Millions of satisfied guests. And—need we add—a few raised eyebrows in the hotel industry.

But every single one of them is a feather in our cap.

For reservations call Inter·Continental Hotels or your travel agent.

Inter·Continental Hotels. How to tell the good hotels in:

Abidjan. Amman. Amsterdam. Auckland. Bali. Bangkok. Barranquilla. Beirut. Berlin. Bogotá. Bucharest. Budapest. Cali. Caracas. Ciudad Guayana. Cologne. Cork. Curaçao. Dacca. Djakarta. Dublin. Düsseldorf. Frankfurt. Geneva. Hamburg. Hanover. Helsinki. Hong Kong. Jerusalem. Kabul. Karachi. Kinshasa. Lahore. Libreville. Limerick. Livingstone. London. Lusaka. Managua. Manila. Maracaibo. Medellín. Melbourne. Monrovia. Munich. Nairobi. New Delhi. Pago Pago. Paris. Persepolis. Ponce. Quito. Rawalpindi. San Salvador. Santo Domingo. Shiraz. Singapore. Tahiti. Tehran. Tokyo. Valencia. Vienna. Zagreb.

to hold, then the population would be stabilised at around 350m by the year 2070.

The total number of Americans is now over 208m. It has been increasing at a fairly steady annual rate of 1 per cent in recent years. Yet the general fertility rate (the annual number of births for each thousand women between the ages of 15 and 44) has dropped from 120.6 in the peak years, 1955-59, to 77.5 in mid-1971. An even more significant indicator, the average number of children that women expect to have in their entire reproductive span, dropped from a high of 3.6 to 2.8 over the same period. For younger wives, the average number of births expected was even lower. The total number of births has also been declining; the 3.6m children born in 1971 were 4 per cent fewer than in 1970. Moreover, a recent non-governmental study of census statistics suggested that the birthrates among poor, and especially among poor and black, women were dropping even more dramatically than those of other women. To ensure that this trend continues, the Population Commission is expected to recommend in its later reports that there be greater spending on birth control by the federal government and further easing of restrictions on abortion—but nothing more drastic. The commission's view, not shared by some demographers, is that much of the problem of growth can be solved by preventing the birth of unwanted children.

Black agenda

FROM A CORRESPONDENT IN GARY

For a number of years, many black as well as white leaders have preached that the ultimate goal for America's Negroes is to achieve a fair share of the political pie, to obtain, through the ballot box and through political pressure, the "clout" to which their numbers—23m, over one-tenth of America's population—entitles them. It was to this end that 2,776 delegates and 4,000 alternates and observers met last weekend in a high school gymnasium in Gary, Indiana, a place which six years ago elected Mr Richard Hatcher to be the first black mayor of a large American city.

The organisations represented, as well as their philosophies, were diverse, as might be expected in any group that attempts to speak for 7.5m voters in a state of turmoil. There were the militant black separatists who reject any idea of working within and profiting from white society and the white system. On the other end of the spectrum were such old-line organisations as the National Association for the Advancement of Coloured People which has for decades used the law courts to achieve black goals in education, housing and job equality.

Hatcher, Baraka and Jackson

There were also men and women schooled in the ways of elective politics, such as Mr Percy Sutton, the borough president of Manhattan and leader of the New York delegation, and Mr Julian Bond, the young legislator from Georgia who has played a forceful, if quiet, role in the black movement in America. Then there was Mr Roy Innis, the head of the black nationalist Congress of Racial Equality, a group which has moved from moderation into increased militancy since the assassination of the Rev. Dr Martin Luther King, Jun. There was also, of course, the Rev. Jesse Jackson of Chicago, the young lion of the American civil rights movement who recently took his followers out of the conservative Southern Christian Leadership Conference to form People United to Save Humanity.

But the most arresting of the personalities in Gary was Imamu Amiri Baraka, the brilliant and aggressive black playwright who abandoned his white name, LeRoi Jones, and became an abrasive critic of all things to do with white society. Mr Baraka was named chairman of the convention and sought (with a large degree of success) to make its three days of plenary meetings run as smoothly as possible. This he did by the sheer force of his own personality, with a mixture of tough rhetoric and jokes. He was able to keep intra-delegation battles off the floor and thousands of people in some reasonable semblance of order. Ultranationalist blacks, who had always admired Mr Baraka for his attacks on whites, were disappointed at his even-handedness but the more moderate elements represented at the convention were not. Indeed, the moderates, who had some initial misgivings about Mr Baraka at the outset of the convention, credited him at its end with being largely responsible for its accomplishments.

Just what these accomplishments were depended on the point of view of the various groups represented. Moderates were disappointed that the convention passed a resolution condemning enforced busing of black schoolchildren at the same time that white conservatives, such as Governor George Wallace of Alabama and President Nixon, were condemning busing of white children. Moderates regard opposition to busing as racism, whether the opposition is white or black. Militants were dissatisfied with the broad spectrum of the agenda which left open until a future date discussion of a separate black political party while implying that blacks should work within the Republican and Democratic parties to achieve their aims.

One fight that was headed off was over endorsement of the presidential candidacy of Mrs Shirley Chisholm, the first black woman to sit in Congress (as a Democrat from New York City) and the first black woman to become a serious contender for the Presidency. The New York delegation had wanted an endorsement for Mrs Chisholm; then it became known that some of the most powerful black leaders opposed either a presidential endorsement or Mrs Chisholm, or both, and Mrs Chisholm did not attend; instead she sent a telegram saying she was ill in Florida, where she had been campaigning.

The agenda, drafted in advance by an interdisciplinary team of professionals, established an "independent black political assembly" which would meet every four years before the presidential nominating conventions were held by the official parties. The agenda, since it seeks support from most American blacks, is necessarily vague and cuts across a broad range of social, economic and political isobars. It calls for 66 blacks in the House of Representatives (which has 435 members in all) and for 15 Senators (of a total of 100). A larger representation of blacks in federal government jobs is also urged.

In addition, it criticises American policies towards South Africa, Rhodesia and Portugal and calls for a greater black voice in formulating official relationships with the rest of Africa, as well as with the black nations of the Caribbean.

More important than the statement of goals, however, was the machinery established for continuing the black assembly as a political entity. The convention agreed, with much persuasion from Mr Baraka, to create " an ongoing structure naming 50 state chairmen plus a chairman from the District of Columbia " to see to it that the convention's agenda was carried out. What that group will do is now anyone's guess, but its creation was a significant accomplishment. For the first time, American blacks have a single steering committee, representative of and approved by the factions which in the past, and particularly since the loss of the unifying leadership of Dr King, have been at irritable odds with one another.

Story of a fake

Mr Howard Hughes, the billionaire recluse, said that it was a fake and now two months later the author, Mr Clifford Irving, has agreed with him. This week Mr Irving and his wife pleaded guilty in a federal court to charges of conspiring to defraud the publishers, McGraw-Hill, Inc, of the $750,000 which the company agreed to pay out for the Irvings' version of the autobiography of Mr Hughes. On the same day they and their researcher, Mr Richard Suskind, also pleaded guilty in a New York state court to charges of grand larceny and conspiracy. The sentencing has been held off until June 16th—an unusually long delay. No doubt Mr Irving will spend the time profitably on his new book telling the story of the forgery. The rights for this are reported to have been sold for $146,000—but not all of this will go to Mr Irving.

It was in the Irvings' best interests to make a clean breast of the whole affair. Their time in prison now promises to be short compared with what they might have expected if they had been convicted on all the charges which were brought against them by federal and state grand juries at the end of last week ; these included perjury, mail fraud and possession of forged instruments. At most they will now get five years and a fine of $10,000 for conspiring against McGraw-Hill and eight years and a $1,000 fine on the other

Suskind follows the Irvings

charges. In fact they are expected to get off with much less than this. Also, in return for their revelations and cooperation, the American government has agreed to intercede for Mrs Irving, a Swiss national, with the Swiss authorities who are trying to extradite her from the United States. She deposited the $650,000 which McGraw-Hill intended for Mr Hughes in a false bank account in Switzerland and has been charged there with forgery, counterfeiting and embezzlement.

It is McGraw-Hill which has paid the heaviest price for the whole affair. Although the company expects to get its money back its reputation has suffered badly. It was largely thanks to Mr Hughes rather than to its own diligence that it was saved from publishing a forgery under cover of the real thing. The billionaire, probably egged on by his camp followers, was angered enough, by what he still claims was an attempt to discredit him on the part of his enemies, to break his years of silence and denounce the autobiography in a bizarre interview over the telephone with a group of specially picked journalists.

McGraw-Hill had more explaining to do this week when the New York Times revealed that part of its best selling book " The Memoirs of Chief Red Fox " had been taken almost verbatim from an earlier account of the massacre of Wounded Knee Creek by another author. The publisher knew about this over two months ago when a suit for plagiarism was brought against it but it chose to remain silent. Furthermore, McGraw-Hill does not appear to have checked the authenticity of the manuscript with experts before publication. A number of specialists have since questioned the story of the man who claims to be Chief Red Fox. McGraw-Hill's mistakes are likely to revive considerable interest in reforming the old copyright laws.

Fairer schools?

The solution for the financial crisis of the schools is to have the states levy all school taxes and distribute the money among local districts in a way which would equalise educational opportunity. This is the verdict of the President's Commission on School Finance, headed by Mr Neil McElroy, which made public its report last week. Many educationists and reformers are bitterly disappointed by the commission's failure to recommend a substantial increase in financial aid to the schools from the federal government, which now pays only 7 per cent of the $45 billion a year spent on the schools (the states pay 41 per cent and local communities the lion's share of 52 per cent). But to a President harassed by huge budgetary deficits, this may be the best news in the report ; it also accords with his philosophical distaste for centralised government.

Without a big increase in federal assistance, there can be no equalisation of educational opportunity between children in, say, impoverished Arkansas and wealthy California. But there are immense inequities within the states which the proposals could do much to end. Local communities depend on the property tax to raise 80 per cent of their spending on schools ; poorer ones are finding that the voters, whose property taxes have doubled in the past decade, are simply refusing to approve new expenditures on education. The states can use the income tax and sales taxes, as well as the property tax which, if it were state-wide and uniform, would be less burdensome for the poor and the retired.

The commission proposes that transitional help should be given to the states and suggests $1 billion or so a year for five years. At about $20 a child, this is not much of an incentive, particularly as, in addition to paying the $26 billion now carried by local governments, the states would also be expected to level up spending on the poorer schools ; this, it is estimated, would cost another $6 billion a year. The states will certainly plead that they cannot afford this (although only half of them make even moderate use of the income tax). But they may soon have no choice, if the Supreme Court upholds the rulings of lower courts in six states which have found that reliance on the local property tax to finance the schools is unconstitutional in that it discriminates against the children of the poor.

In a week in which President Nixon

Why National Lead changed its name to N L Industries, Inc.

Last April, National Lead shareholders approved a resolution to change the company name to N L Industries, Inc. That's how we're listed now, that's the name on our product lines now.

Like many diversified companies these days, we had grown to the point that our old name no longer reflected current operations or future plans. With annual sales of over 900 million dollars, our operations have broadened to encompass a wide variety of products and services for today's essential industries.

For more information on what we're doing, write for our new corporate brochure.
N L Industries, Inc., Room 1523,
111 Broadway, New York, New York 10006.

NL INDUSTRIES

Industry just wouldn't be the same without us

1970 CONSOLIDATED SALES

Metals and Bearings (33%—$301 million in sales.)

We supply many basic metals such as zinc, tin, antimony, cadmium and primary lead. Also a wide range of finished products and components. Among them: radiation shielding, screws, bolts and metal fasteners; railroad and other bearings; steel containers; and aluminum extrusions for aircraft. We also supply precious metals, and associated chemicals for photographic and other uses.

Titanium Pigments (23%—$208 million in sales.)

These are the pigments that make and keep paint, paper and plastics white and bright. Employing both the sulphate and chloride manufacturing processes, we're a leading producer of titanium pigments.

Die Casting (15%—$140 million in sales.)

We're the leading custom producer of die castings, working in aluminum, zinc, magnesium and brass—making parts and assemblies for appliances, business machines, aircraft, motor vehicles, lawn mowers and many other industrial and consumer needs.

Chemicals and Plastics (11%—$104 million in sales.)

This area includes anticorrosive pigments, stabilizers, gellants, flame retardants, battery oxides, and extender pigments—for the paint, plastics, ink, electronic and adhesive industries. We also produce custom injection molded plastic products.

Oil Well Materials and Services (10%—$90 million in sales.)

Oil is, of course, one of the most vital of today's products. We supply unique and essential drilling materials, chemicals and engineering services to the petroleum industry.

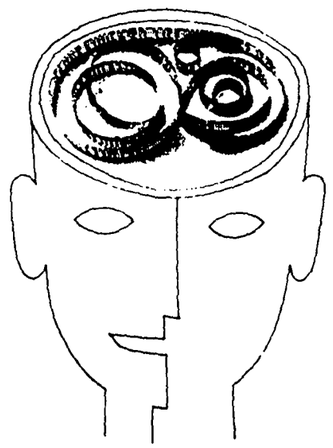
Other Products (8%—$73 million in sales.)

Other products we make include Dutch Boy paints, electroceramic materials for electronics manufacturers and specialized high temperature refractory materials. One of our divisions provides special dies and tooling for Detroit's prototype cars. We also meet a broad range of nuclear fuel, shielding and shipping needs.

Our New York Stock Exchange symbol has changed from LT to NL

Quality in an age of change

FAMOUS GROUSE SCOTCH WHISKY



For the true connoisseur, the first taste gives unusual satisfaction and arouses considerable interest. The mellow character of carefully-aged Whiskies reflecting our blending skill belies mass production. Compare it neat with any other Whisky—the really sure way to make a test. The difference is unmistakable. **Famous Grouse Scotch Whisky**—with a century and a half of family experience behind it.

is making up his mind about how he should oppose the busing of children to even out the racial mix in the schools, a point he must be pondering is whether the commission's proposals would lead to more money for schools in black ghettoes and thus lessen the pressure for integration. The commission proposed that the federal government contribute $1 billion a year for schools in the inner cities and would also expect the states to take the cities' special needs and high costs into account. If they did not, some cities would be worse off than they are today.

Spirit of '76?

The celebrations for the 200th anniversary of the founding of the United States have got off to a shaky start in Philadelphia, the city where the new republic was born. With only four years left to go and under pressure from Washington to submit plans for international approval next month, the city authorities have finally decided on a place for the World's Fair which is supposed to be the focal point for the country's celebrations. Four other sites had already been rejected. Furthermore few of the inhabitants of the City of Brotherly Love have much enthusiasm for being disrupted by this kind of commercial festivity. Even the famous Liberty Bell which proclaimed the birth of the new nation is being moved from its traditional home in Independence Hall to a new tower so that more people will be able to see it.

Philadelphia has settled on a deserted stretch of rubbish-strewn land between the noisy international airport and the smelly oil refineries on the outskirts of the town. To add to the unpleasantness the land is marshy and may be too soft for heavy construction. But there will now be no need to pull down buildings and houses to make way for access roads and pavilions. Two of the other areas which were considered would have encroached on either the crowded Negro district or on one lived in by the white, blue-collar constituents of the city's new mayor, Mr Frank Rizzo.

Other critics have been reconciled to the idea of the exposition because they think that it is a good way of getting money from the federal government to help to clean up an eyesore. Philadelphia already owns the land but the city is hoping that Congress will approve its plans and put up an initial $375m for the project. Even then the city, which has already spent $2.5m on plans and promotion, will have to find another $25m in working capital over the next four years.

But Philadelphia hopes to reap a big reward. One optimistic report suggests that the exposition could draw as many as 52m people and an income of $8.4 billion over six months. To achieve this the city will have to do something drastic about its hotel accommodation and its transport. At present there are not even enough beds for a modest convention; even if there is a building boom the exposition will have to rely on day trippers from New York and Washington.

Three other cities, Boston, Washington and Miami, are also planning bicentennial celebrations. But all these will be dwarfed by the new scheme for parks and recreational pavilions in each of the 50 states. The land, from 100 to 500 acres, will be given by the federal government to each state which will then operate and maintain the park. The money for the design and the construction of the buildings will come from Washington and the whole project will cost about $1.2 billion.

Bombs are catching

Luckily nobody was hurt by the bomb which damaged a Trans World Airlines jet aircraft at Las Vegas. But the week's scares—a bomb was found and defused on another TWA aircraft and a very primitive device was found on one belonging to United Air Lines—have led to cancellations by nervous passengers. TWA's bombs, the first ever to be hidden on an aircraft in the United States, were part of a scheme to extort $2m from the airline. As it turned out the plotters received nothing, but this seems to have been because they took fright. Like hijacking, extortion is contagious; last week's attempt may well have been stimulated by the successful extortion of $5m or so from the west Germans.

Unless the extortioners can be kept at bay, air travel may be crippled. President Nixon lost no time in ordering the airlines to put into effect at once new precautions which were not due to go into effect until June: tighter checks on cargo and luggage, closer examinations of passengers and prevention of unauthorised access to aircraft. There is so much air traffic in the United States—on average 450,000 passengers travel on 14,000 flights every day—that there is a temptation for the airlines to let down their guard once a crisis seems to be over. This will be less likely when precautions are required by law.

Mr Volpe, the Secretary of Transportation, who called an emergency meeting of airline chiefs last week, has also suggested that legislation might be needed to forbid the paying of ransom. More certainty of punishment for the guilty if they flee abroad would also help. The international covenant against hijackers seems to have discouraged this kind of air piracy to some extent and there will be pressure now for ratification of its companion measure, the covenant against other kinds of "unlawful interference."

Meanwhile the airlines are on full alert. Aircraft are being guarded; air parcels are being opened and some airlines are refusing to carry them at all. Luggage is being searched. Measures are also being taken to ensure that any intending bomber travels on the same aircraft as his bomb; no longer will it be possible to check luggage through and get off at an intermediate stop. Most of the "air marshals" who have been travelling on certain flights to deal with possible hijackers are being assigned to ground duties on April 1st.

One other suggestion is that airline employees should be required to work in pairs on aircraft on the ground. It is thought that last week's plot could only have been carried out by present or past employees. The bomb which was found was in a case of the kind used by pilots; the second was so well hidden that three searches did not reveal it. And the plotters showed a knowledge of how airports operate which outsiders are unlikely to have had.

How long is a piece of string?

Depends on how much you need and for what purpose. It's the same with commercial property. Whether you are in the market for shops, selling a warehouse or securing an office investment —whatever you are looking for to meet your requirements you need that "piece of string" to tie things up neatly. Take the question of professional advice for example. One of the biggest firms in the field specialising in commercial property is Healey & Baker, offering over 150 years of experience. It is an entirely independent consultancy providing clients with a professional team covering management, town planning, estate agency, consultancy, investment and valuation throughout the U.K. and Europe.

The philosopher's stone

More millionaires have been thrown up by the property business in Britain since the war than by any other industry. Office rents are higher in London than in New York, Paris, Brussels and just about anywhere else. Rents have risen much faster than inflation. In 1971 a great number of investors found their way into big office blocks through property bonds. Every year the revaluations of property company assets effortlessly create gargantuan surpluses. Through economic boom and recession the men of property have been turning stone into gold. Can it last ? Where else can they go to gild the pavements ?

Faith, hope and . . .

Today, the property world is in a state of high excitement. It has always been excited, to a greater or lesser degree, since the war. But, now, the excitement is feverish. Everyone who has anything to do with property—and everyone with capital to invest now wants to have something to do with it—is convinced that property values can only go up.

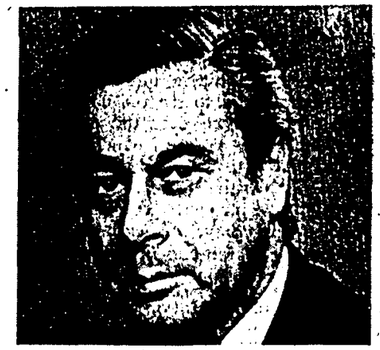
On a tight and crowded island, much of whose stock of building is old and in need of replacement, there is a lot going for that belief. The population is growing and so is the demand for space per head—but the supply of developable land is limited and it will be limited even more as the environment lobby grows more vociferous. So the act of faith that property values will rise faster than consumer prices is well based.

But this belief is not as copper-bottomed as all that. There have been times this century when property values have fallen and there is the strong possibility that demographic movements will convert areas where there is currently a shortage of office space into desolate places where the offices will stand empty. The detailed planning restrictions make this possibility seem a far-fetched one, since the aim of planning is, or should be, to allocate the use of land to places where the demand for it can be satisfied, subject to the housing and transportation being available for those who are to work in the offices. But planning is sometimes overtaken by events.

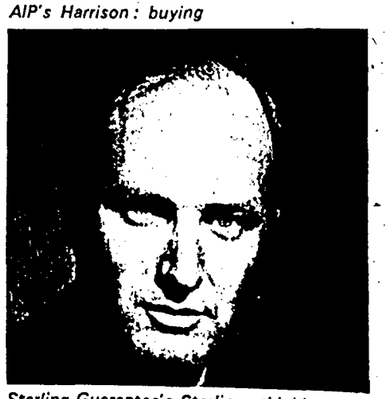
Who is to say that in the next 20 years the demand for space will continually rise faster than the supply, guaranteeing its owners a continually rising value for it? Certainly no one would dare project the demand for any other commodity with such confidence.

And yet these projections are made every day by the sound and solid men of property finance. The growth of the property illusion—that what goes up, keeps on rising—is now part of the subconscious of financiers, insurance companies, pension funds, banks, and now, through property bonds, of the man in the street. Most people in business were trained and indoctrinated with conventional commercial wisdom in the years since the war. Those years may prove to have been exceptional, as the war left London and other important centres in desperate need of rebuilding.

Since then, however, the alluring sums of property development have entered the general consciousness. No one, for example, thought it in the slightest bit odd when Reed International popped £36m worth of sites into a joint company formed to exploit them with Metropolitan Estate and Property Corporation and then said that they would be worth £200m in a decade and a half. It may come true—but where in that estimate is the normal business caution that prudent men of affairs usually exercise ?



The property market has gone somewhat mad. The madness centres on the concept of asset values. In no other country in the world is an asset value defined in the way that it is in Britain for property. In the United States, a property is valued at what it cost and the Securities and Exchange Commission (SEC) does not allow companies to write their property assets up to market values. The SEC reckons that the only true value for a piece of real estate is what it cost or what it is sold for. The idea of valuing real estate at what it might possibly be sold for in the property market ruled out in the United States—but not, of course, in this country. Each piece of property is unique, and its price depends on what a willing buyer pays to a willing seller. The share market is different ; each share in a company is like every other and the actual prices of transactions in the stock market can be used fairly to determine the values of shares held. The



Star's Llewellyn : risen

British Land's Ritblat : rising

AIP's Harrison : buying

Sterling Guarantee's Sterling : thinking

property market is a whole series of individual and unique transactions.

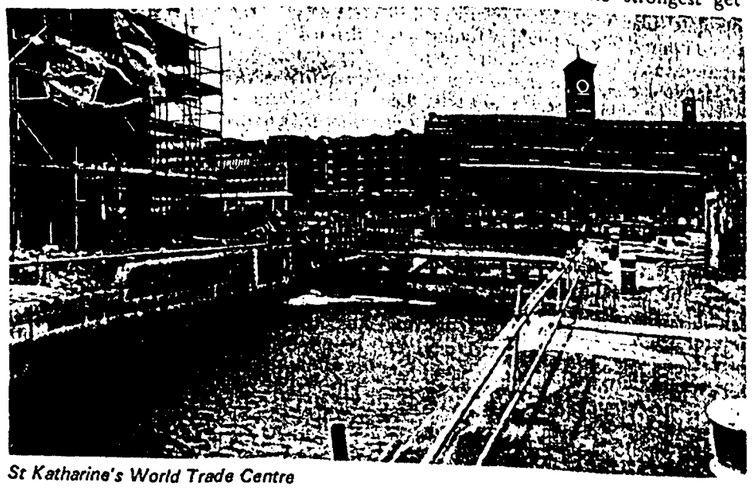
Such an obvious statement of the commonsense facts of life is, however, regarded by the sophisticated financiers, estate agents and property men of Britain as antediluvian thinking. They value property as a multiple of the annual rent roll. So if rents on a top class building, with a first rate tenant and covenant, amount to £1m and the current yield on which such properties is being sold is 5 per cent (which, at the moment it is for the very best), then that property is worth 20 x £1m—that is £20m, even if it only costs £10m to buy the site and develop it. Plainly, so long as rents continue to rise and there is no danger of that building becoming vacant over the 20 years, then the present value of that building is, indeed, £20m. But that danger of vacancies is so far from anyone's thinking about property values, that all business decisions concerning property are made on the basis of continually rising rents.

Acts of faith are the stuff of business. No one would lend money to anyone else if he thought only of the dangers of an economic slump on a grand scale. But the acts of faith with property are of a different order. Take, for example, the way property is financed. A property company recently went along to a bank to arrange a long-term loan. The bank asked to see the company's cash flow forecasts over the period of the loan. This request, which a bank would make to any industrial client, was met with blank amazement. "Why," the property company said, "if we don't have the cash to repay the money at the end of the period—we'll sell one of our properties."

By way of illustration, consider the balance sheet and profit and loss account of Land Securities Investment Trust, the largest property company in the world and one of the best and most conservative of British property companies in its accounting methods. Its property assets are entered in the balance sheet, at valuation, at £682m. Against them stand short and long-term loans and mortgages of £364m. These loans will, one day, have to be repaid. Most of them are not being repaid annually. But, as an academic exercise, it is possible to calculate how much the company would have to set aside out of its cash flow each year to repay the loans by the latest date of their redemption. For 1971 that comes to roughly £24m. And what is the profit after tax (before transfers from reserves) of the company? All of £5m before dividends and a mere £1m of retentions after the dividends have been paid.

How, one asks wonderingly, can a company with practically no cash flow (and a good many property companies actually have a negative one) sustain borrowings of £364m? How do all property companies break the elementary rules of finance—that what is borrowed should be capable of being repaid out of earnings?

This question, which will, no doubt, be deemed eccentric and alarmist, is usually quelled in the following way. The important thing for a property company, it is said, is the relationship between the income from properties and the interest paid out on the money borrowed to create those properties. Land Securities' income is £28½m and its interest outgoings £21½m. At any time, it is further argued, the debt can be refinanced so long as this relationship holds true. Not only that, it is added, but the rental income will grow as leases fall in and are renewed at higher levels—and the increased rents will in turn feed back on the value of the assets (which, in the end, provide the underlying security). That is what has happened since the war—and that is what everyone assumes will continue to happen.



Like any act of faith, it is true so long as it remains true. As yet, there are no signs of any crack in the edifice of belief. But followers of the property religion should at least pause, every once in a while, and ask: "But suppose there isn't a god after all?"

The market and the money

Rents are going to rise for the foreseeable future—but the rise is not inevitable for ever. Land is fixed and the demands for its use grow even faster than incomes as people want more space in which to live, work and play. Recreation is very land-intensive, and land is continually becoming a scarcer resource, as the national income figures reflect: as a percentage of gross national product, rents were 5.5 per cent in 1960 and 7.0 per cent in 1970. But higher productivity means that the land used for factories and offices and shopping might grow more slowly than the growth in the labour force. An out-of-town shopping centre, with a very high turnover to space ratio, could release the high street of shops for houses—or even indoor swimming pools. Demographic changes could result in a more even distribution of the population.

So that although land is fixed, it is not as fixed as all that for some purposes. In part, the growing proportion of national income going in rent is related to the shortage not of the land but of the hardware built on it. The economic depression before the war meant that buildings were not replaced as they should have been and the stock of offices was depleted even further by war destruction. The scarcity element in rents may come down, so that office rents will simply rise in line with inflation, or perhaps even less.

The pressure of the demand for competing uses of land, in a free market system, means that the strongest get

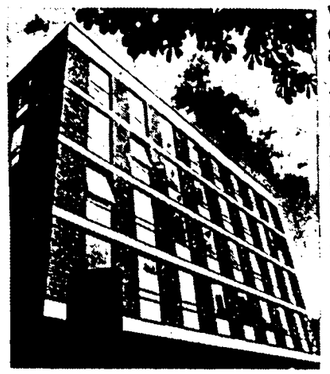
Some people are a little worried when someone recommends a property bond.

They tend to think of money being tied up in enormous buildings that may be difficult to sell.

Not so with Property Growth Bonds.

Just tell your clients that our purchasing policy is a little different.



We tend to favour a certain size and type of property. The average-size office block and factory building. Because that's the kind that is permanently in demand by the largest sector of the market.

Very small and very large buildings don't appreciate so quickly because demand for them tends to fluctuate.

It's our type of property that tends to appreciate in market value just that little bit quicker because it is always sought after.

It's a policy that has certainly paid off.

If you'd like to know more about Property Growth Bonds, simply clip the coupon and we'll send all the details.

The property we buy makes us easier to sell.

PROPERTY GROWTH ASSURANCE

The Property People

it. Society has tried to restrain market forces by planning consents, which designate certain tracts of land for specific uses. But gross inequities remain. A new class of middle income poor has grown up in London, unable to buy a house and too well-off to get council accommodation. Such devices as the Land Commission and the Betterment Levy tried to reallocate land and the super-profits of development. The Labour government tried a simple ban of offices. A future government which is more dirigiste might decide to dismantle the market mechanism entirely (by nationalising land) or partially (by creating disincentives for certain types of development like offices). Such a change—unthinkable under the present Government—might become thinkable in a decade.

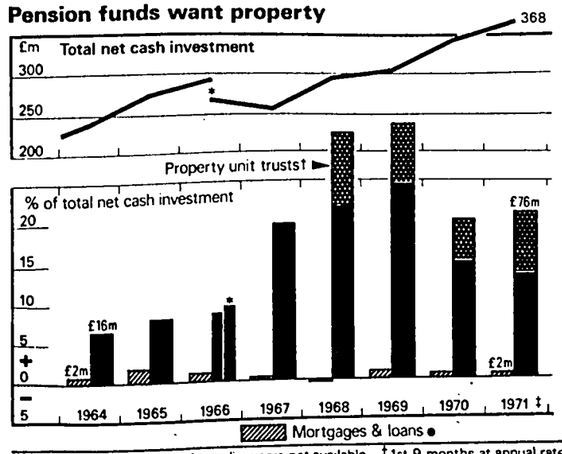
But for the time being the demand for offices in London is still creating rents which are too high for the liking of the Government. Mr Graham Page, the Minister for Local Government and Development, said in Parliament :

> London. There should be no restriction on the provision of modern office space in London to replace obsolete or outworn premises or to satisfy the requirements of businesses which can function properly only from London. More than that there needs to be a supply of new and modernised space to take advantage of new stimuli such as the entry into Europe.

Presumably, the solution will be to get the GLC to become flexible enough to allow more central offices but in such a way as to avoid the danger of over-supply as is currently affecting Manhattan (where many office blocks cannot find tenants and where rents have actually fallen). Once Britain is in the common market, there will be an undoubted growth in demand by European banks, stockbrokers and companies for an office in the City or West End. This, in turn, will attract the Japanese and (even more) Americans to London town.

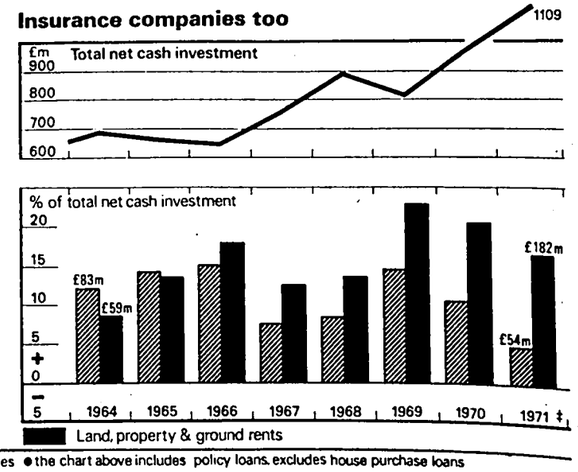
The City

Planning permission is granted by boroughs in consultation with the GLC. The Corporation of the City of London (the fancy name for the City's borough) is widely believed to be pushing planning consents through at a rate of knots to use up its meagre allocation so that it can then go back and press for more. British Rail has got the go-ahead for 131,000 square feet of offices above Blackfriars station—which fits in with the objective of letting some commuters step out of their trains and into lifts taking them to their desks. So the omens are fair for the redevelopment of the massive space above and around Liverpool Street and Old Broad Street stations —though quite when is a question a lot of people that have bought sites around and about would dearly love to know.



The area was once totally unfashionable for any self-respecting City gent. But the areas of respectability have already spread to the north—and they may well spread to the east. If a development is big enough, and well-enough planned, a whole neighbourhood can be transformed. Even London Wall, a triumph of brutal planning, has been a great success. The development of the brewery site in Chiswell Street, which Whitbread hopes to do with Trafalgar House Investments, will extend the City farther north. The City Corporation is studying the Spitalfields market area, which is run down and seedy and could provide further expansion.

The Thames-side ex-docks are in the process of transformation. On the right side of the river, Taylor Woodrow is turning the St Katharine's Docks into one of those World Trade Centres, with hotels, flats and even a marina. Across the river, not far from where Christopher Wren rowed after a hard day's work at the Cathedral, the Hay's Wharf site will, if intelligently planned, overcome the reluctance of City based and bred men to regard Southwark as a prestigious place to work. The snag is that the combined office space desired by the Whitbread/Trafalgar and Hay's Wharf schemes pre-empts a third of the GLC target for the whole of central London. Will they get it ? What effect will this addition to space have on the level of rents ?



There are, in addition, a lot of big schemes planned for the heart of the City—Hambros Bank along Bishopsgate, Palumbo Plaza opposite the Mansion House and the National Westminster Bank also in Bishopsgate. No one knows the answers. Rents have again started their upward swing and are back to over £10 a square foot for the newest and the best. In New York a similar quality of space would rent for £4 (including rates), in Paris £6 and Brussels £2½. Is the City worth four times as much as the Quartier Léopold ?

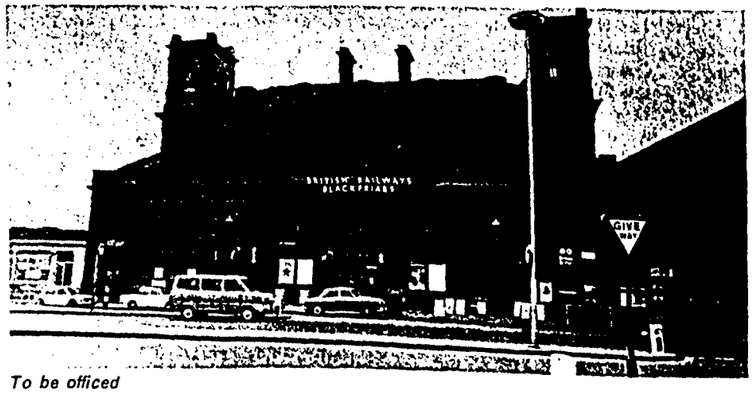
Those who are prepared to by-pass the City, who reject the East End (in spite of the best salt beef restaurant in London), and who do not want to go to the surburbs might find a place in the shop-ridden West End and so make their secretaries happy—and their accountants too, as rents are in the £7 to £8 per square foot range. The

Pension funds want property

Insurance companies too

* Revised basis † Figures for earlier years not available ‡ 1st 9 months at annual rates ● the chart above includes policy loans, excludes house purchase loans

re-re-revised plans for Piccadilly are again going to be a focal point for argument, and once Lady Dartmouth has mulled over the future of the Covent Garden area (which takes in the best part of the Strand too) with the help of one of those vocal residents' associations, which are springing up all over the place, then there will be more offices there too (as well as, according to some delightful rumours, a cherry orchard). The concept of really comprehensive development is gaining ground. The Grosvenor Estate, for example, has had prepared a fascinating future plan for the whole of Mayfair and beyond, which cannot but force the planning authority to define its own thinking more closely. One of the side effects of the plan is a pedestrian Oxford Street, which the Metropolitan Estate and Property Corporation is involved in helping to realise.



Funds

Rents are determined by the supply and demand for space. Property values are determined by the supply and demand for property as an investment. That, in turn is influenced by the future outlook for rents and the supply of money.

Some investors have recently been prepared to buy completed properties on a yield of 5 per cent, or over 3½ per cent less than the return on gilt-edged securities. The relationship between the two is close. A pension fund wants a stream of income running into the future ; and it has to weigh up the total security and liquidity of gilt-edged stocks, and the constant flow of interest they provide against the risk and illiquidity of bricks and mortar, which are likely to produce more income at each rent review. It also has to consider the rival attractions of equities as a hedge against inflation. The pension funds and insurance companies did, it would appear, somewhat reduce their purchases of property in 1971 as the bull markets in both gilt-edged stocks and equities got under way.

Spitalfield : to be developed ?

To be officed

But they have also found that the competition for properties has pushed yields above levels they reckon are justifiable. The growth in money supply has put cash into the hands of other buyers, and the number of top rate investments has not kept pace with demand.

In addition, the availability of money has given the developers more bargaining power. Whereas many in the past were forced to sell the properties to the institutions and lease them back (so giving up a considerable proportion of the subsequent rent increases they were in turn charging the tenants), they are now able to negotiate better terms on such leaseback deals. Or, sometimes, they can obtain straight fixed-interest loans without giving up a slice of the equity. Or they find the money from other sources, like the banks. There are two forms of leasebacks : one where the developer takes all the risks and gets a higher slice of the profits ; and the other where the institution shares in the risk by splitting the profit according to some kind of formula. Between the two there are many variations, which the one in a stronger bargaining position can negotiate to his advantage.

But yields are also influenced by fashion, and the phenomenal way the property bonds burst into prominence last year has had an influence greater than the sheer bulk of money (around £100m) they had to find a home for. The coincidence of bond fund advertisements on one page of the newspaper and the latest deal by a rising or risen property company on another has created the atmospherics of a bull market in property.

Once interest rates rise again, so will yields. If this happens at a time when rents are on a plateau, the implications for the property bond funds could be serious. The way that they have been advertised has emphasised growth plus security, and the small investor is as much impressed by that promise as he is disillusioned by the failure of unit trusts to come up to his expectations. If growth does not, for a year, take place, if rents fall and/or yields rise, then the bondholder might sell. In any case, as funds of no matter what sort mature, a steady stream of redemptions will build up. A slump in sales meeting rising redemptions in an open-ended fund would, unless the fund has a cast-iron credit standby, force the fund to sell properties off into a market that would be in a bad shape.

This gloomy prognosis might never happen—but the Scott Committee, which is investigating property bond funds, will have to make recommendations to guard against such an eventuality. Liquidity remains the main bugbear of property bond funds and some people are worried about the quality of the investments that some of the funds, especially the smaller ones, have been making. Unless there is a dramatic slump, top class property investments will always find a buyer—but some of the small shops in distant high streets will not, and however conservatively the funds are valued, the basis of valuation is current market prices. So there is no real margin of safety for a slightly worse market in property.

GLC's office floorspace targets

The plan for London

There is one fact about London that even the most ardent property developer dare not ignore: its economy has been declining, is declining, and could decline much faster than even the haters of congestion want.

In 1939 the residential population of Greater London was 8.5m. In 1961 it was down to 8m and the Strategic Plan for the South East foresaw a population of between 7.1m and 7.3m by 1981. But, 10 years before that date, London's population has already shrunk close to that figure. The employment situation is even worse. In the past five years, the number of jobs available has fallen by 10 per cent to 4.1m, and the range of jobs available to the least mobile—broadly those that live in council houses—has diminished.

The reason for London's much faster than expected contraction is the acute shortage of most categories of housing. The inflation in the cost of somewhere to live is driving people out of London. By definition, these men and women are the most mobile section of the community and the ones whose jobs cannot be filled by ex-dockers or gas workers. The fall in population and the change in the composition of the population that stays behind could cause a serious imbalance in the regional economy of London which might in turn accentuate its decline.

The art of guiding regional economies is even less advanced than that of providing a reasonable standard of living for the country at large. The statistics are poor; the tools for analysing the interaction between regional economies primitive; and the weapons for implementing policy decisions totally inadequate. So it is inevitable that the strategy for London as spelt out in the Greater London Development Plan (the GLDP) has met with severe and penetrating criticism in the inquiry examining the GLDP—and outside it. Most of the heat has been generated by the proposals for the Ringway road systems—and much of the rest of the plan has been dismissed almost contemptuously.

But the GLDP cannot be dismissed by property developers as lightly as that. The plan lays down a target for the increases in new office space for the period to 1976. That target is 29m square feet for the whole area; 12m for the central area (the City and bits of Westminster, Camden, Islington and the other boroughs bordering the centre), 5m square feet for the other "inner" boroughs, and the rest for the outer ones like Croydon, Hillingdon and Enfield. Where there is competition for development within an area, criteria are laid down to determine priorities. Like it or not, these are the broad rules the GLC and the boroughs will be using to decide on planning applications.

Developers will not like these rules. While each of them is convinced of the need for planning—for restrictions on supply enhance the landlord's bargaining strength with his tenants—each individual developer has splendid reasons for his particular project getting the go-ahead. There are, however, excellent grounds for attacking the office-building philosophy of the GLDP—and it is a shameful reflection of the lack of an intelligent self-interest by developers that so few of them bothered to go to the inquiry to put the case against it.

The GLC settled on floor-space targets for implementing its employment policy for the best and worst of reasons. Control of land use is the only effective economic weapon the GLC possesses—and will remain so until the central government works out a coherent national framework for regional authorities to operate in. The brief for the GLDP as stated in the 1963 London Government Act is to "lay down considerations of general policy with respect to the use of land." Sensibly, the GLC interpreted this

Estate agents! Your philosopher's stone

To transfer a paper asset into gold, people with really valuable property to sell must contact those in the market to buy.

Every week, The Economist Property Pages (just before the paper's first leading article) are read by an influential, international audience of substantial investors in commercial and private property; by many too who become involved in decisions affecting the location of their companies' premises.

Use The Economist to reach the buyers and sellers of important properties.

This week on pages 10 and 11.

widely to mean setting "broad policies and strategies for the future development of London as a whole." So the GLC looked at employment and population and economic movements, as well as roads and houses, to determine the policies needed "to create a physical environment and a social and economic framework which will conserve and improve standards of life in London." That sounds well—and the main threat to its achievement was in economic activity.

So one objective of the plan is to cut the net annual population loss back from 75,000 a year. Another is to stimulate new employment to compensate for the losses "particularly in manufacturing employment"—as yet another objective is to maintain a range of job opportunities. The notion that London is a burgeoning centre for the service industries and that these industries will provide jobs for all those displaced by the shutting down of factories, docks, distribution centres and the like has been dealt a sharp blow by GLC research. This shows that the decline in employment in the service trades as a whole was appreciably higher in London than elsewhere in Britain in recent years. The only sectors with a strong demand for labour are: insurance, banking, finance; professional and scientific services; and miscellaneous services. All of these require professional or clerical skills and office space—but the GLC wants to divert employment to those that have lost their jobs in warehousing, in furniture-making and the fur trade.

But the GLC does not have the weapons to pursue a thorough-going employment policy. It can do something about housing (there was a devastating critique of the GLC's housing policies by Mr Christopher Holmes at the inquiry) and something about transport, both of which bear on employment—but its most important policy instrument for employment is the passive one of granting, or not, permission to build offices or factories. And even there it is circumscribed by the central government's controls through office development permits and—currently a far more acute source of frustration—through industrial development certificates. The government is engaged in the kind of detailed scrutiny that should clearly be left to the local authority; and it is doing so because it feels something should be done, but does not really know what.

The lack of an adequate array of tools for the policy the GLC rightly wishes to carry out, and the consequent reliance on the planning machinery to guide employment along the desired channels, should lie at the heart of the criticisms that the developers should level at the GLC. But there are other criticisms as well. As the chief dynamic of employment is found in the demand for the kind of office-based services that the City and the rest of London provides, there is a strong case for encouraging office development, rather that the reverse. The method used for calculating the floorspace target is, in any case, somewhat primitive (see below). And even within the context of the stated targets, the actual granting of permissions needs to be speeded up. The table (page xvii) shows that the rate at which permissions have been granted is well below the 8m square feet a year required to hit the target of 29m square feet of new office space by 1976. (And it is a long way behind the liberal rate at which the Department of the Environment is now granting office development permits.) Further, the method of allocating office

The GLC's target

The Greater London Council has a precise idea of how much new office space it wants by 1976: 29m square feet, or roughly 10 per cent more than the existing office stock. As this number is the main constraint on office development in the region, it is worth examining how it was arrived at. The assumptions and the calculations are spelt out in a background paper (number B 452) for the Greater London Council Development Plan inquiry.

The method is simple. Take the target of office employment in 1976 and multiply it by the average space per employee to get the total space needed. Deduct the existing stock of office space—and the balance is the new office space needed.

Number of office employees in 1976	1,610,000
Average space per employee	216 sq ft
Total space required	348m sq ft
Existing stock in 1971	317m sq ft
Extra space required	31m sq ft
Provided from vacancies	2m sq ft
New space needed	29m sq ft

But the calculation is the only simple thing in the exercise. The basic target of employment has been formulated by extrapolating past trends (which might change) on the basis of very poor statistical evidence (so the trends might not be trends after all) and in some major industries (construction, transport and communications) future demand is based on "judgment." The industries were put into broad groups of operatives (manual workers) office workers and others. Employment in offices is growing, but other job opportunities are fading away, as this calculation shows:

	000s	
	1966	1976
Operatives	794	620
Office workers	1,535	1,610
Others	2,096	1,857
	4,425	4,087

The target figures for 1976 are the result of adjusting past trends of the increase in the demand for labour by changes in the supply resulting from GLC housing policies and from improvements in the transportation of commuters. But the underlying growth in demand is less than that of supply, and there is a danger that the targets will not be met, setting in motion a cycle of declining demand and falling income that could perpetuate itself.

The factories close down; so do the jobs

Office Development Permits

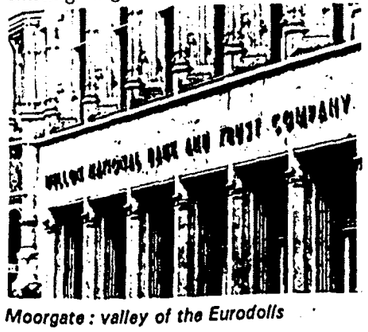
space between the boroughs where demand is likely to exceed the detailed targets is bound to cause trouble and delay. Back in 1970 the GLC's senior planner for the central area, Mr Christopher Kirby, was asked at the inquiry how the allocation was going to be apportioned. He said:

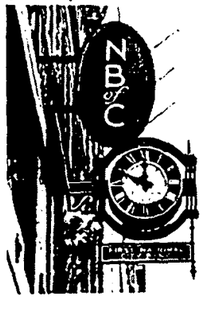
> We have no guidelines. We do not have very much idea of how you do resolve this particular question of allocation. We do not know, quite frankly, how we are going to come to a just and equitable solution. It imposes on us a necessity over and above the normal planning purpose to work with the boroughs.

There are, now, some guidelines—six to be precise—which include: the redevelopment of areas of poor layout or design; provision of residential accommodation in conjunction with development; improvement of the public transport system; and the provision of small suites of offices. There are some small signs of more flexibility. Following the Hay's Wharf scheme, and allied proposals for developing the waterfront, the allocation for Southwark has been increased by 1m square feet to 1.4m—but that is still not enough. Moreover, the revised version of the GLC's written statement of the plan now has a new sentence in it recognising that "London, as a capital city and centre for international trade, must make its full contribution to national objectives and in order to do so it must provide the necessary space, skills, communications and other services." It would make a great deal of sense to increase the central area's allocation at the expense of the other areas of London; but in any case the GLC's planning procedures will have to be speeded up just to cope with the existing targets.

Dealers and developers



The largest property deal for several years was carried through by one of London's smallest banks when Dalton, Barton, with a capital of about £4m, bought the elephantine Bush House in The Aldwych for itself and clients at a cost of £22m. Those who have ventured into the depths of Bush House to do a broadcast for the overseas service of the BBC or to get a cheap meal from the rather good canteen there might wonder why anyone should want to buy such a hideous monster, built by a North American, Mr Bush, in the 1920s. When Mr Bush built his house there were no such things as plot ratios, garaging space and all the other restrictions that limit the amount of office space developers can now put up. There is a lot of space in Bush House, and much of it is let at well below normal market rents. The sums that could arise from redevelopment are mouth-watering. Once modernised, the 360,000 square feet could be let at over £6 per square foot, increasing the rental income from the current £700,000 per annum to £2.3m by 1980. By then, the building will probably be worth £37m, leaving a profit, before modernisation costs, of about £15m—although, of course, the purchasers having bought the property on a yield of 3 per cent, will be losing the difference between that and the cost of financing the purchase in the interim. One could reasonably ask the vendors, the Representative Body of the Church of Wales, why it did not go in for redevelopment itself. The Church of England, with the help of Jewish property entrepreneurs, long ago saw the benefits of getting a continuing slice of Mammon's property cake for its clergy.



One would have thought that by now most people had woken up to the potential of property. Even the dullest of industrial companies should have worked out the property development possibilities of its sites and offices—though many sold their birthright in the years of credit squeezes by selling their long leaseholds or freeholds to the institutions and then renting the office space back. Often they had no choice, but many of them seemed to believe that property was such a different business that it should be left to the specialists to exploit. This attitude is reprehensible. While the property illusion lasts, shareholders should get their cut of it. Companies too dull to think about their property will find themselves bought out by the growing number of latter-day Charles Clores who are nosing around looking for cheap sites hidden in the balance sheets of trading companies.

But property development is far more tricky than it looks. The developer has to have a special kind of skill and flair: an eye for seeing a shopping centre where the untrained observer sees a disused warehouse; a talent for getting as much finance as possible out of the institutions without parting with much of the equity; and, lastly, a knowledge of planning law and real estate practices. He has to orchestrate a team of lawyers, planners, architects, builders and estate agents and nurse the project through the several years it might take to mature.

So the manufacturing company which thinks it is sitting on a gold mine may well find it difficult to do the mining. Those that have the flair tend to be running their own property companies and will only help out for a large slice of the cake. Estate agents, especially the large ones with project development departments, can help—but there is always bound to be some dilution of enthusiasm if the people running the development do not have an interest in its equity.

Firms of estate agents fall into two categories: those that are entirely independent and those that are linked with property companies. Into the first cate-

gory come the large firms like Edward Erdman, Jones Lang Wootton, Healey and Baker, Richard Ellis and into the second come D and J Levy (Mr Joe Levy is a director of Stock Conversion and Investment Trust), Hamptons (owned by Trafalgar House Investments), and Conrad Ritblat (owned by British Land, and where the senior partner, Mr John Ritblat, is the chairman of British Land).

The estate agents-cum-property developers keep both sides of their business separate, but they admit that the contacts, clients and propositions that come in through one door may go out through the other. There is nothing much wrong with this arrangement so long as the clients are quite certain what the picture is, as they are almost bound to. The entrepreneurial estate agent gets his satisfaction out of putting two and two together to make eight while the professional gets the same sort of job satisfaction as a lawyer or accountant does. Since estate agents now know so much about finance, about what other people are doing and about the arithmetic of investment (many run the property portfolios of the institutions), the temptation to become entrepreneurs as well is very strong.

Nominally, estate agents have to be partnerships, but since there are ways round this which allow the partnership to be owned by a corporation, the most honest thing is for the Royal Institute of Chartered Surveyors to allow them to become limited companies and define precisely the relationship with associated property companies. Then everyone would know where they stand.

The new boys

The most spectacular movement into the capital gains end of the property business was made by Mr John Ritblat, who was encouraged by Sir Maxwell Joseph to sell the partnership to Union Properties and run the company. Union was merged with British Land and two further acquisitions created the ninth largest property company (by market capitalisation) in Britain. The company's rapid progress has delighted shareholders—and confused investment analysts who cannot quite understand how the company is making any profits. The reversionary income of which Mr Ritblat is so fond (the increase in rents when the leases fall in) is yet to come, and in the interim he seems to be relying on dealing profits and the profits of the partnership. The big bonanza is expected from Plantation House, that giant block in

The top fifteen

The property share market has risen by 4½ times since the beginning of 1967, twice as much as the Financial Times-Actuaries all-share index. In 1971 it dumbfounded the experts, who did not believe the boom could continue, and today it is still going up. The dividend yield, a mere 1.85%, is treated by investors as an irrelevancy; they are hooked on the underlying asset valuations. Of course property dividends will be boosted by the proposed corporation tax changes—which helps those companies which distribute up to the hilt, but all of that and a bit more has long been discounted.

Land Securities and Investment Trust, the biggest and most solid of the companies, is looking the cheapest. Its image has suffered as chairman, Sir Harold Samuel, avoids the limelight that many of his newer confrères seek, and the company is often regarded as conservative and undynamic. But it offers the best value for money. MEPC has recently undergone a radical re-rating; and the market has swallowed its practice of valuing developments still in the pipeline as if they were completed and let without any hesitation. But the developments are there, and will no doubt pay off—but the MEPC shares are fully valued. Town and City is another company with a large (£150m) development programme, which the Prudential Assurance is largely financing. St Martins continues to look dull. It has none of the glitter of Star now without the over-dynamic Mr Robert Potel but better organised to exploit the many good things he initiated.

Hammerson, as the yield demonstrates, goes after capital growth and its geographically broad development portfolio is exceptionally high-geared: a rise of a third in gross assets will double the assets per share. A good share, but not for the nervous. Only half Capital and Counties' portfolio is in offices, and it also does housebuilding and construction, and has some developments in hand which will probably result in a loss before transfers from reserves (interest payments on work in progress is effectively extracted from the profit and loss accounts of most property companies).

Slough Estates is the expert on industrial estates, is low-geared, but indexes rents annually to inflation; thus a good steady hedge, but no great leaps of growth should be expected. British Land is new and exciting, Stock Conversion is old and exciting, and may pick up if the Piccadilly scheme goes ahead; Central and District is also run by old hands at the property game who still have a few tricks up their sleeve, but the old-timers at Great Portland only have arms there. Bernard Sunley should not really be in the table as it is half a construction company, but it looks quite inexpensive. London City and Westcliffe is in unfashionable residential properties, whereas Amalgamated Investment and Property is in everything that is fashionable, and is looking dear. Trafalgar House Investments is missing because it has successfully diversified into other industries from the capital base established by property. In all, the advice for potential investors is: be very cautious about property shares and consult the experts like brokers Rowe Rudd, Reade-Hurst Brown and Quilter Hilton, Goodison.

	Market Capitalisation £m	Asset Value* p	Current Price p	Discount on assets † %	Dividend Yield %

*Rowe Rudd Estimates †Undiluted discount (+premium) on estimated net asset values

Mincing Lane which is to be modernised (releasing even more space) so that when the leases fall in the rents can be bumped up to produce an income from the property of closer to £3m than the £1m at present coming in. As an estate agent, Mr Ritblat is well aware of how to get every ounce of profit from a building; and as a financier he can see how to split Plantation House into separate units which could be individually sold off or mortgaged. The same approach will no doubt be applied at the Croydon centre, all 600,000 square feet of which were bought for £10m.

Another of the property names to hit the headlines in the past few months is Sterling Land, run by a team of four, one of whose members, again, is an active estate agent, Mr Stuart Lipton. This is one of several property companies to which Mr Jim Slater has lent his name, with a consequent miraculous effect for the share price. What Slater Walker reckons to have done is to speed up the natural forces of growth by several years by nurturing the company with cash and know-how. Slater, Walker also has major stakes in Cornwall Properties and Argyle Securities, which, with share prices unrelated to anything except expectations, provide excellent currency for takeover bids, and it has its own property portfolio of around £25m.

Another company, Sterling Guarantee Trust, is rather special. It thinks of itself as a financial group with strong line management, capable of moving into badly run operating companies, and turning that side of things round, while finding the best way of exploiting the property assets. Since companies with a poor trading record tend to sell cheap, the property they own can be got hold of much cheaper than if it was bought in the property market. The company has a more relaxed atmosphere about it than some of the dashing go-go companies around. Sterling Guarantee's major success to date has been the takeover of Gamages, and much is expected from the stakes it has recently acquired in Earls Court and Olympia.

Yet another company continually in the news is Amalgamated Investment Properties, which is run by Mr Gabriel Harrison. He has a great talent for buying property, but, so far, he seems better at buying than at anything else. He is closely associated with Mr Michael Rivkin, who is helping Hay's Wharf to develop some of its 30 acres along the river (for an as yet unknown slice of the profit). These are some of the new men of property. On the whole they are young, and their youth invites scepticism. The question is whether they will be able to survive if the bull market in property comes to an end.

Housing remains the problem

Bonds in disguise

The closest thing to a property bond fund in the United States is a Real Estate Investment Trust (REIT). There are in all about 120 REITs, with total assets over $6 billion (of which $4 billion came in during the last two years) and institutions like the Chase Manhattan Bank and Connecticut General Life Insurance have sponsored their own REITs. When Wall Street tumbled, investors turned with enthusiasm to a form of savings which offered high income and the prospect of some capital growth.

REITs invest in (a) short-term construction and development loans, (b) long-term mortgages, (c) property, or (d) a combination of all three. Mortgage buyers often obtain an "equity kicker in the form of options or a share-of-rentals arrangement, but even so REITs are far closer to specialised property banks than to real estate funds as these are understood in Britain.

They were first authorised in 1960 by federal legislation designed to boost the supply of mortgage capital. A minimum of 75 per cent of their assets must be in loans or property and 90 per cent of the income must be passed on to shareholders. In such circumstances they are exempt from paying federal income taxes, which enables them to offer shareholders an unusually high dividend yield of 7 or 8 per cent. This is the attraction for investors, rather than the possibility of a capital gain when the properties are sold and, indeed, REITs are not allowed to value their properties other than at cost. Those REITs that hold mortgaged properties get an increase in their equity value as the mortgages are paid off, and the American practice is to do so annually.

Many REITs invest solely in short term loans, and with all of them their equity capital is geared up by their own borrowings. So their success is largely determined by their ability to maintain a wide spread between the cost of borrowed money and the return obtained from it. As closed-ended funds, (unlike offshore property funds) their share price is determined in the stock market by expectations of future earnings far more than by considerations of the "value" of the underlying properties—if they have any. The enthusiastic projections of underwriters (the shares and debt of $1.4 billion raised in 1971 by REITs account for fully 16 per cent of all underwritings) have not been borne out, but as a whole their performance is often very creditable.

But the market values of trust shares have not risen accordingly. The difficulty seems to be that stock market investors will not bid up the trusts' share prices (thereby lowering their yields) because they have somehow been led to expect, from the REITs, a miraculous contradiction in terms: a high-yield growth stock.

Unhappily for the optimists, the perpetual-motion upward cycle has been prevented by several factors. First, the well-publicised failure of one of the largest trusts, Continental Mortgage Investors, to show the expected increase in earnings in 1971 led to a lot of sales of shares in REITs in December, from which even the more successful trusts have not yet fully recovered. Second, the proliferation of numbers of trusts, while probably irrelevant to their operations (since they are only a tiny part of the vast real estate financing field), has prevented investors' demand from being concentrated on single issues. Third, the variety of different kinds of companies, and the complications in their capital structures resulting from the widespread use of warrants and convertible debentures, has made evaluation and comparison of individual issues difficult.

REITs are clearly an important new addition to the money markets, offering flexibility to their sponsors, high yields to investors and a new source of money for the construction and real estate industry. But at least until they have longer records of results and are better understood, their shares on Wall Street are likely to continue to act like bonds in disguise.

HOW TO TURN £50,000 INTO £120,000,000.

Do what we did.

We took over a handful of properties worth a mere £50,000, no dividend for 17 years, no money and no staff.

That was 20 years ago. Today Capital & Counties is amongst the biggest property companies in the world.

At the moment, our assets are well over £120 million. And in the next few years we hope to add another £100 million to that.

Apart from our citadel in the United Kingdom, we also operate in three of the world's most important growth areas, Singapore, Europe and Australia (which in 18 months has become our largest overseas investment).

Capital & Counties has made a lot out of a little. And we intend to turn a lot into a lot more.

Capital & Counties

Amalgamated Investment & Property Co Limited
9-10 Grafton Street, London W1X 4DA. Telephone: 01-499 0432. Telex: 24441.

HQ Europe

There are two types of foreign businessmen on the continent of Europe. Those who like Paris, and those who cannot stand it. Those that cannot stand Paris tend to go to Brussels, because of the ganglia of bureaucracies and communications, or to Amsterdam because it is so nice, or to Frankfurt or Dusseldorf because they have to. They would go to Switzerland, except they would have to spend all their working time outside Switzerland. Italy is a non-starter. In all the major European cities the service industries are growing, and the offices and hotels to service the service industries. There is plenty of scope for future development, particularly in Paris and Brussels.

I loved Paris

The Paris of many people's springtime is changing fast. Place de l'Etoile is now Place Charles de Gaulle. Looking down the Champs-Elysées from it, every other building seems to be yet another glossy car showroom. Two huge buildings which should never have been built because they are totally out of scale with their surroundings crop up in most Parisian panoramas. The new Faculté des Sciences skyscraper in the Quartier Latin is one, and the Tour Maine-Montparnasse, rising fast to 60 storeys, is another. More through-roads are encroaching on the banks of the Seine, taking the world's most individualistic drivers to one of the innumerable underground car parks that have been constructed for their benefit. The Boulevard Péripherique ring road has been driven through the outskirts of the Bois de Boulogne, though in a triumph of environmental engineering, it goes underneath the Lac Supérieur. They have even painted the Eiffel Tower a different colour.

Paris is far from being a boom town for property developers, in spite of all the cranes and building sites and notices advertising new apartments "de grand standing." Property people of all sorts are now under a cloud following the "scandale" of the Guarantie Foncière. This is quite unfair. The swindle was a simple financial one. Investors were guaranteed a 10 per cent return—and the promoters used new money subscribed to pay it out. The properties were bought from associated companies at inflated prices which could not possibly have given a 10 per cent return to anyone. Inevitably, the pyramid collapsed. But in the minds of many, property development is once again associated—as it always used to be in France—with the murkier side of business. Which is one reason why the impeccable gentlemen from Britain are now being sought after by French promoters who need a name and a balance sheet and finance behind them.

The promoters

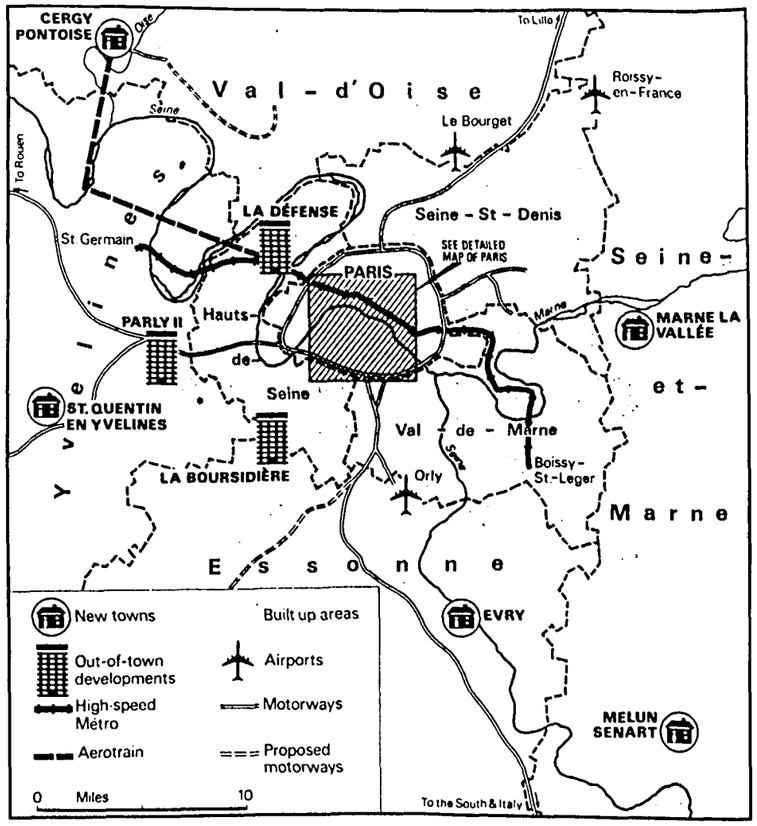
The process of raising property finance in France has a great deal in common with film finance. At the centre of things is the promoter who has an option on the property (same argot in both fields) and bustles around to find a backer who will take all the risk and give him as big a slice of the profits as he can negotiate. He juggles with the site, the planning permission and the money. If the scheme works (the movie makes money), his credibility rises and he finds it easier the next time. If it flops, the banks carry the candle and he pushes off to Lyons or Marseilles to try his luck again.

The postwar property pioneers in London were also speculators. But the difference was the availability of long-term finance in Britain, at that stage provided without an equity stake by the insurance companies and pension funds. They would lend a high percentage against the investment valuation of their security, the completed building—a sum large enough to pay for the site and the construction costs. In France buildings are traditionally valued at cost (though this is changing), and no one will provide long-term finance. The insurance companies buy property outright. The banks, if they can be persuaded to lend longer than 10 years, demand capital repayments from the outset. Thus the common form of financing is to go to a specialised property bank to get the medium term money, and to sell the apartments, or shops, or offices or factories off to the occupiers—or the institutions. This property trading

Skyscrapers make kidnapping tougher

activity is certainly lucrative. Buildings which yield 11-13 per cent on completion (this is the net rents as a percentage of the site and building costs) are sold by the developers to the institutions on yields of 9-11 per cent. For example, a building which costs £1m and is rented out for £130,000 can be sold to an institution for £1.3m. This makes the developer 30 per cent on his money, and a much higher return on the actual equity he will have put up. Usually he will find a quarter of the equity himself and so, with luck, he doubles his money, though he will make less if he sells before completion—and many do. The eventual landlord has his rental income indexed to the cost of living, giving him a guaranteed hedge against inflation.

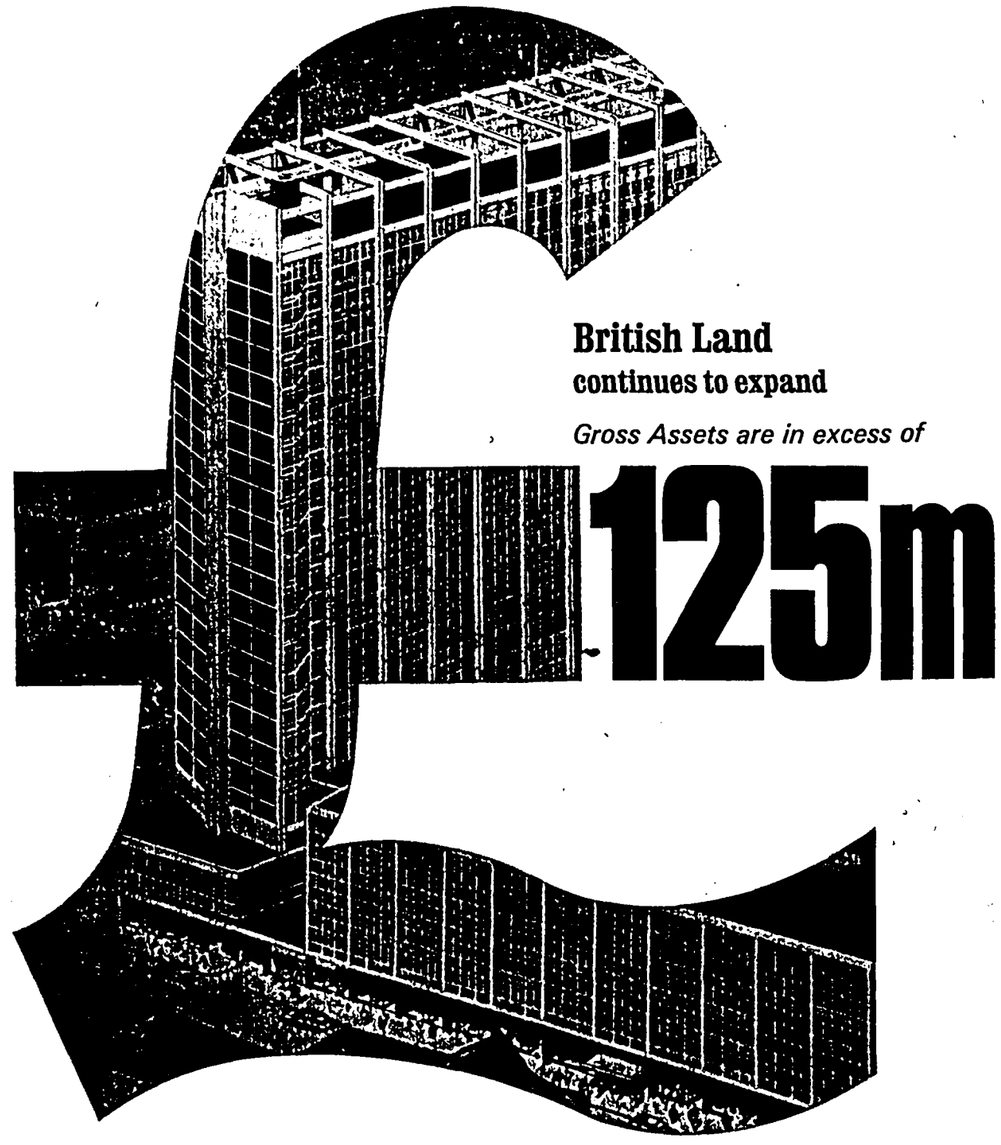
The financiers



One of the leading private property organisations in France is the Immobilière-Constructions de Paris group (ICP), founded in 1926 by the Blum and Weil families. The 30 companies in the group (whose initials make up such slavic-sounding mnemonics as Cofimeg, Sefimeg, Ufimeg, Silic and Sofap) basically do two things: promotion and financing. They are separately constituted to take advantage of the various types of institutions for which the government provides fiscal incentives to promote real estate developments of one sort or another. The main institutions are:

Sociétés d'économie mixte. These have private shareholders, who provide the property development expertise and some of the finance, and public shareholders such as government agencies or local authorities who provide the muscle to purchase the land compulsorily. They are mostly concerned with urban renewal and comprehensive suburban development. La Défense and Montparnasse are two examples.

Le vieux Paris



La Région Parisienne

Sociétés immobilières d'investissement. These are also designed to encourage the provision of flats and houses for rental, but in them the local authorities do not participate. Shareholders get part of their dividends exempt from tax.

Sociétés immobilières pour le commerce et l'industrie (Sicomi). These institutions buy offices and factories and rent them out. They also sell them on hire purchase, an arrangement confusingly dubbed with the Anglo-Saxon term "leasing." They are usually run by a bank on behalf of a pool of other banks. ICP's Sicomi developed the rather beautiful factories on the way out of Orly airport—so beautiful in fact that they are used as offices. Again, part of the dividend is tax free; 80 per cent of the profits has to be distributed.

The money-lending side of ICP's activities is handled through the Banque de la Construction et des Travaux Publics (BCT). It has £260m out on loan, a half in mortgages to home buyers and a third in loans to promoters. The loans are generally for under five years. The BCT says that the property developers do not want to borrow for longer as they have little interest in staying in as investors. They simply want to tide themselves over until one of the Sicomis or insurance companies buys them out. But the British developers are asking the BCT for long-term money and the BCT is gradually and grudgingly extending the length of its loans to them. Since the current, perhaps temporary, regulations of the Banque de France prevent money being brought in from abroad for property investment, all the finance has to be raised locally (for the Banque de France does not want any more sterling or dollars raised in the Eurodollar market in its reserves) with the

British Land
continues to expand

TED BATES

In France 30 km from Paris (10.000.000 inhabitants) The industrial, warehouse and office areas of the new town of Cergy Pontoise are now complete for operation.

This estate, developed according to the « schéma directeur d'aménagement de la Région Parisienne », is completely equipped and offers opportunity for immediate revenue :
- In the neighbourhood of the new town of Cergy-Pontoise, where the Prefecture and several public administrations are already installed and where the communal services and amenities now being built will allow to accomodate 300.000 inhabitants.
- Easy access to and from Paris and direct communication with the new business center of La Défense (9 mn by aerotrain), Cergy-Pontoise will also be connected to the new international airport of Roissy-en-France which, in 1973, will allow, with supersonic flights, ultra-rapid connections with all international metropolis.
- Administrative proceedings are simplified, quickly and easily with the support of the « Etablissement Public d'Aménagement ».
- A square meter of land (building ratio 60 %), totally equipped, including fee and all taxes, is sold from fr. 80. (S 14,50).

Many International Companies have already chosen Cergy-Pontoise to settle in France (for example : Ericsson, Johnson, Sagem, Jaeger, Usinor...)

British parent company putting up a guarantee of eventual repayment.

Recently the BCT participated for the first time ever in a loan to a British company covering the whole cost of site acquisition and building for a period of seven years. Only 30 per cent of it was guaranteed by the parent company, the rest being secured on the property. However, the BCT would not have taken part in this loan unless a local British bank had not taken part as well. There are now faint signs of an embryonic long-term mortgage market in France, and the specialist banks like the BCT will be organising it. The BCT already organises consortia to participate in schemes. The other main ones are Compagnie Bancaire, associated with the Banque de Paris et des Pays-Bas (Paribas), and La Hénin, the subsidiary of the Compagnie Financière de Suez. The Crédit Lyonnais and the Société Générale are also active property lenders. Barclays Bank now does medium-term financing and the Société Financière Européenne, the medium- and long-term credit bank group of a number of big banks including Barclays, Bank of America, Dresdner Bank and the Banque National de Paris, is getting more interested in property finance. The money is there ; but the French banks and the insurance companies have to be persuaded to lend it.

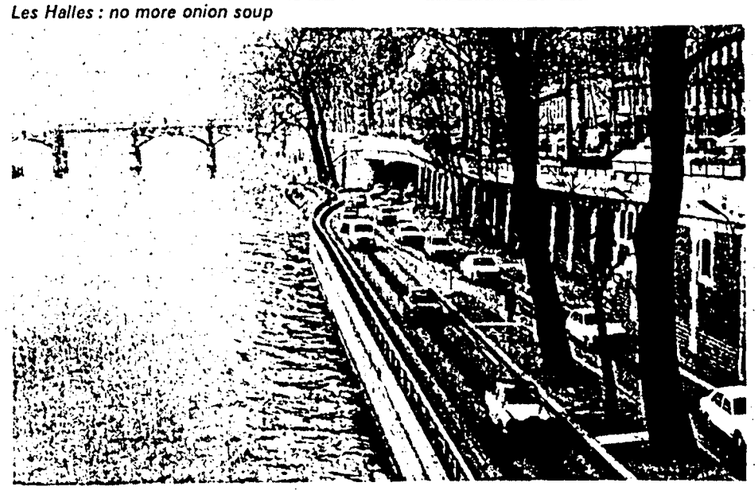
The banks and financial institutions suffer from pervasive and deadening government control and influence. This reinforces the native French belief that everyone is on the fiddle and money should be kept liquid and stacked under the bed or in a Swiss bank account. Similarly the French stock market is a dead duck and even deader for property companies that might want to raise long-term capital. However, if foreign banks and institutions are allowed to operate freely in France, things might change. There is talk of a massive development to be organised by a British property company and backed by British institutions. These could, perhaps, borrow medium term on the Eurodollar market (once foreign exchange restrictions are lifted) and, in five years' time, refund the borrowings with long-term money transferred from London. The influence of the British insurance companies might also push the investment yields on completed developments down closer to British levels.

Permits

Office permits in Paris have become very tight in the past year. The government is now firmly committed to a national planning policy whose broad strategy is worked out by a small but high-powered agency, La Délégation à L'Aménagement du Territoire et à l'Action Régionale (Datar), directly responsible to the prime minister's office. The aims of the policy, as elaborated by M. Chaban-Delmas in a recent speech are :

(a) To prevent saturation growth in the Paris region ; to stem the growth of population ; and to move inessential activities outside the region.

(b) To discourage the fast-growing service industries (responsible for 1.4m of the 1.7m new jobs which will have been created in the 10 years to 1975) from settling in Paris by ensuring that they grow in areas where agriculture and mining is on the decline.



To do this, Paris is to be squeezed and the regions made more attractive. In Paris the annual total of new construction licences is to be limited to 6½m square feet ; priority will be given to the new towns outside the central area and to the poorer eastern section of Paris ; and any development in the Paris region will have to have a strong justification for being there. The regions are to be given far more fiscal and financial help.

That is the theory. In practice there will be much " dérogation "—or bending of the rules, the well-known method which the lower echelons of the bureaucracy use to cope with the precise and intellectually coherent and often unworkable directives of the top civil servants.

But the policy is biting. The Paris region planning authority, consisting of Paris and the adjoining seven prefectures, has reduced the number of new towns planned from nine to five

Les Halles : no more onion soup

Cars in—fishermen out

under pressure from Datar. Within the region it is being very tough on office planning applications in the central area, especially the business districts of the eighth and ninth arrondissements. In general it is pushing the new towns and the eastern part of Paris. Datar is trying to cut the expansion of the massive La Défense office developments (already amounting to 5m square feet) as, once again, it favours the western parts of Paris—the bits stretching back from the Champs-Elysées, and the favoured residential 16th arrondissement and from the exclusive suburb of Neuilly.

There are three control techniques. Office licences ("agréments") are granted by a decentralisation committee on which there are representatives of Datar and the Paris region, and the applicant usually has to name a tenant for an office building. Then there is planning permission. And, lastly, there is a development tax ("redevance") of £3 per square foot overall, which is reduced to £1.50 in places where urban renewal is needed and to nothing in the new towns. It is payable a year after planning permission is granted.

If the experience of the Labour government's ban on office development in London is anything to go by, restrictions of supply in places where there is a natural demand pushes up the rents in the popular spots and transforms the prospects for previously unfavoured districts. This is already happening in Paris.

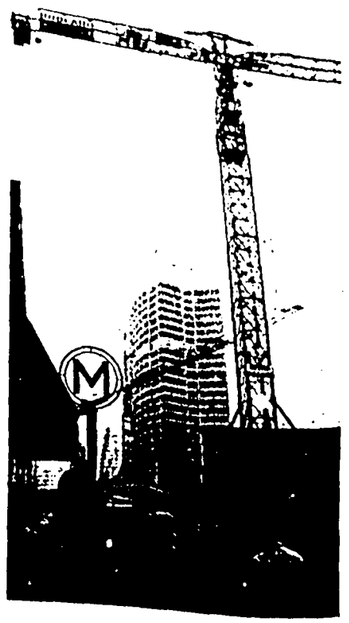
The sites

The most sought-after area for offices in Paris is around the Champs-Elysées. Rents are in the £6-£8 range per square foot and will go higher. There is a fair amount of construction underway, and the Intra Bank site next to Le Figaro with part planning permission for 200,000 square feet of offices is up for grabs (and has been on the point of being sold for four years), but the chances of new permits being granted in that area are slim. The same goes for the other main business area around the Bourse and the Opéra.

So where should the developers aim? There is always the off-chance of getting permission in these areas for a small building if the developer can produce a firm tenant. One or two British companies have not been in the past above getting their friends in London to write to the Parisian authorities saying that space in such and such a location is absolutely vital. The British have gone for small blocks so

(Continued on page 32)

Tour Maine-Montparnasse

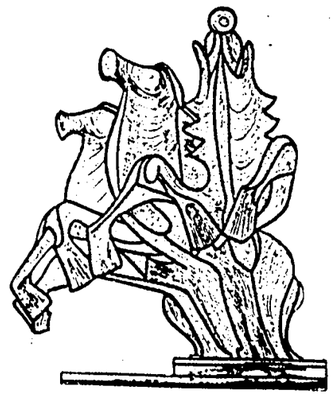


The Eiffel Tower is still the tallest building in Paris—but only just. The Tour Maine-Montparnasse will be 656 feet high; the Eiffel Tower is 906 feet. The man now responsible for it, M. Jean-Claude Aaron, is not guilty of understatement when he says "it is not just an office block—it is a monument"—a monument against which many Parisians are now, far too late in the day, protesting. M. Louis Vallon, a deputy for Paris, recently called for construction of the tower to be halted: "It is going to dominate the whole of Paris and crush the most outstanding buildings of our capital with its mass." Too true—and too late.

The development plan for the area around the Gare Montparnasse was concocted in 1958 by the Société Nationale des Chemins de Fer Français (SNCF) and the City of Paris. The SNCF needed a new station, and Paris thought it would be a good idea to provide employment for the commuters right there. So a société d'économie mixte was set up, and the plans for a huge office complex were shown to the public in 1961. The voices of dissent, if there were any, proved ineffective.

The 1m square feet of office blocks bordering the station platform, massive and hideous, are completed and let. But the tower was much more of a problem. An American, Mr Wylie Tuttle, had first crack of the whip, but failed to raise the money. Then M. Aaron, a successful developer, was asked in. His approach to raising the £40m-odd cost of the tower and surrounding exhibition halls and galleries was to sell half the space from the drawing board. The buyers were the 24 insurance companies, banks and pension funds that took shares in the company, and the eventual occupiers. The tower was sold off floor by floor, at a cost of around £40 per square foot, and 40 out of the 53 lettable floors have gone. Some of these were bought by Sicomis and overall a fifth of the space is designated for rental rather than sale, at rents of around £4.50 a square foot. The spectacular view out will make letting easy.

M. Aaron and his own company do not own any of the equity of the company doing the development. They will get a share of the profits. But he is hoping to try to create a fully fledged quoted property company along British lines in France, to find a way of capitalising his development skill. He will, inevitably, need bank backing—and he has already assembled British and American institutions and banks, as well as French ones, to get it. But please, M. Aaron, no more monuments.



It's big—which ever way you look

de Balkany 2

The Parisian bourgeoisie has a precise dream of what suburban life should be like. It consists of a centrally heated apartment in a modern block of flats set in a park dotted with swimming pools. Monsieur wants to be able to get into Paris fast, either by driving along an autoroute or to the station and getting on a train. Madame wants to be able to push her shopping cart to the enclosed air-conditioned shopping centre and, having bought the food in a supermarket, wants to have a coffee and then wander round the local branches of the top Parisian department stores, perhaps popping in to the cinema in the afternoon. The enfants want places to play in and to swim in, horses to ride on, schools to play truant from.

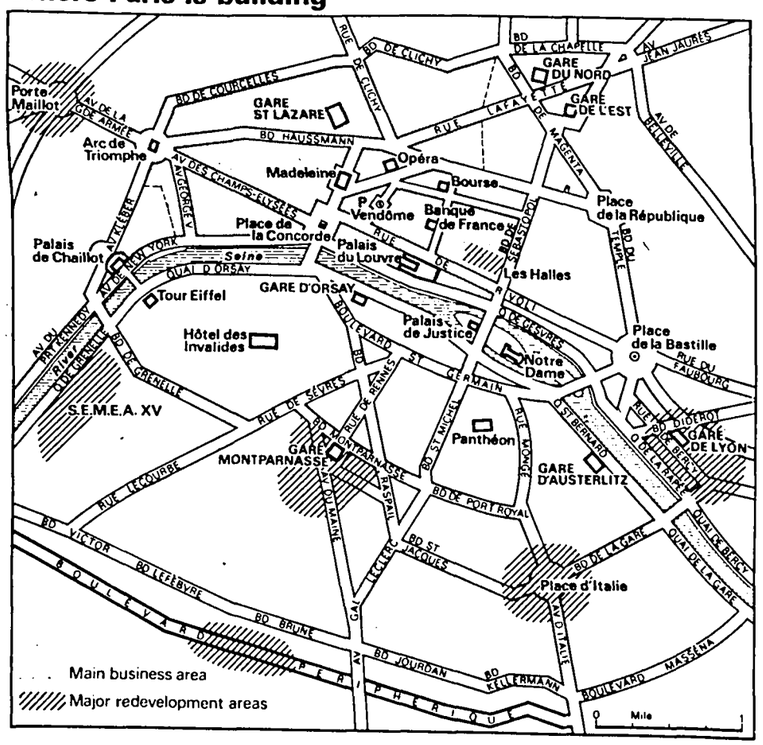
The dream has been realised with taste and imagination at Parly 2. Although clearly not everybody's idea of paradise—certainly not the French movie-makers who frequently choose Parly 2 in which to set films of domestic alienation and bored infidelity—if people must live in suburbs, better Parly 2 than Balham 1. The man who has realised the suburbanites' dream is M. Robert de Balkany, young, dynamic, aggressive—all the kind of things needed when vision has to be converted to reality. He got his first taste of grand conceptions when studying architecture at Yale University. Luckily he flunked out, for few qualified architects survive the transition from the fantastic and idealistic visions of schools of architecture to the bricks and mortar of a municipal refuse collection headquarters.

Back in Paris he went to work in his father's business. Then, in the late 1950s he set to work on his first apartment block. Although it contained only 18 flats, it took three years to complete. Then came Elysée 1. All 500 flats were sold in three weeks. Then Elysée 2; its 2,000 flats were sold in a twinkling of an eyelid—and the "2" suffix stuck. He has now built 20,000 flats and has another 15,000 under construction. In the development of huge shopping centres his company has no rivals in Europe. In total he has something over £400m of developments on hand or recently completed. The main ones are shown in the table below.

How, in a country as conservative in its habits as France, has M. de Balkany brought it off? There has been a retailing revolution in France. In one bound, France has moved from the corner store to the giant hypermarket, supermarket discount store and huge covered shopping centre. With the benefit of American experience, few mistakes have been made. The key element in all the schemes is the demographic and economic study carried out by the French office of the American property consultants, Larry Smith. Once the future economic development of the area to be serviced has been researched and road and rail access studied, much of the guesswork has been removed. The regional planning authorities have also taken a strong and sensible line. Having planned which are to be the growth towns, permission for only a certain number of shopping centre sites has been given. In the greater Paris area, the number is 14.

If the planning is advanced, the financing is not. There is no quoted de Balkany property company. Each development is a separate company, owned largely by the financiers. The financing method for the housing is straightforward. The company puts up the money to buy the land and do the studies, and gets a short-term loan for the building. Then the apartments are sold from the drawing board; 80 per cent mortgages are arranged for the buyers; and the mortgage companies hand the money over as the building progresses. The below-the-line profit to the developer is somewhere between 13 and 18 per cent.

The financing for the shopping centre has to be done—because of the lack of a sophisticated long-term capital market—in a way that leaves little of the equity in the developer's hands. Usually 65 per cent of the shopping area, the amount taken by the big stores, is sold to insurance companies or Sicomis which then rent the space to the stores—on a yield that gives them 10 per cent on cost. There is little profit to the developer on this part of the deal. The gravy comes from the 35 per cent of the shopping area rented out to the smaller shopkeepers who are charged a rent which is equal to 6 per cent of their turnover, with a basic minimum. In 1971 the sales at Parly 2 reached about £30m, and the annual sales increases have been phenomenal. In January, 1972, sales were 24 per cent up on the previous January, which was in turn 35 per cent up on the year before.



For M. de Balkany there is no way of capitalising his profits. He is looking towards Britain with another of those twinkles in his eye. There is talk of a regional shopping centre outside Manchester that he would like to do with Trust Houses Forte. There is the thought of those lovely British price/earnings ratios on property companies applied to the leaping profits of his companies. M. de Balkany would like to have a quoted company on the London stock market one day.

		cost £m
Parly 2	7,500 dwellings, 600,000 sq ft of shopping	100
Grigny	7,500 dwellings	80
Velizy 2	1m sq ft of shopping, 107,000 sq ft of offices	12
Rosny 2	1m sq ft of shopping, 1m sq ft of offices	30
Lyons	1.2m sq ft of shops, 1m sq ft of offices, hotel	40
Other shopping centres		20
Other housing developments		140

(*Continued from page 28*)

far. They can be easily sold when the medium-term loans mature if refinancing proves difficult. And foreign companies setting up shop in France—and French companies under pressure to decentralise—do not need acres of space in the centre.

Within central Paris there are various schemes in different stages of development. Most advanced is the Montparnasse development. Already 1m square feet is up and let, and the 1m in the tower block is taken care of. But the scheme has acted as a magnet. A tall Sheraton hotel is on its way, and several smaller blocks too—one of them by Chesterfield Properties.

Another station development is round the Gare de Lyon and Gare d'Austerlitz—the Bercy La Rapée district, famous for its wine merchants and aromatic odours. To most snob Parisians it is just one of those working class areas on the wrong—the east—side of their city and the developers will have to overcome a lot of Parisian prejudice. But 1.3m square feet are up, or going up, and another 1.2m planned.

The French are great believers in the power of rapid transit to bring growth and prosperity. The new high-speed métro, already in operation between Auber and La Défense (La Défense is 3½ miles, and four minutes away, from Etoile) and will be passing through the Gare de Lyon on its way east. The vital necessity of being near a main-line station or a high-speed métro makes it difficult to expect too much from the urban renewal scheme SEMEA XV along the Seine in the 15th arrondissement or from the Galaxie area round the Place d'Italie in the 13th arrondissement.

As for the new towns, they are all to be linked to Paris with motorways and high-speed métros and trains and aerotrains, but the risks in office development there are still high. Shopping centres (though many have already been collared by the formidable M. de Balkany) and the construction of factories for rent seem a far better bet at this stage. Star (Great Britain) has taken a bold gamble by developing 600,000 square feet at La Boursidière on the outskirts of Paris. But the cheapness of the site and efficiency of construction are making for very low rents.

Several British estate agents have established themselves in Paris, such as Richard Ellis and Weatherall Green

Get set for Europe – in West Suffolk

Modern-minded ports like Felixstowe, Ipswich and Harwich are leading the field in the race for European trade.

If your factory's in one of the expanding towns of West Suffolk, those ports are right on your doorstep.

But that's not all. West Suffolk offers industrialists attractive sites and mortgages, low rents for ready-built factories and excellent housing for workers. Travel is easy; and living is better.

Join the big exporters and the Queen's Award winners! Send off the coupon or phone Bury St. Edmunds 63141 today. Ask for James Gorst or Cliff Gregory.

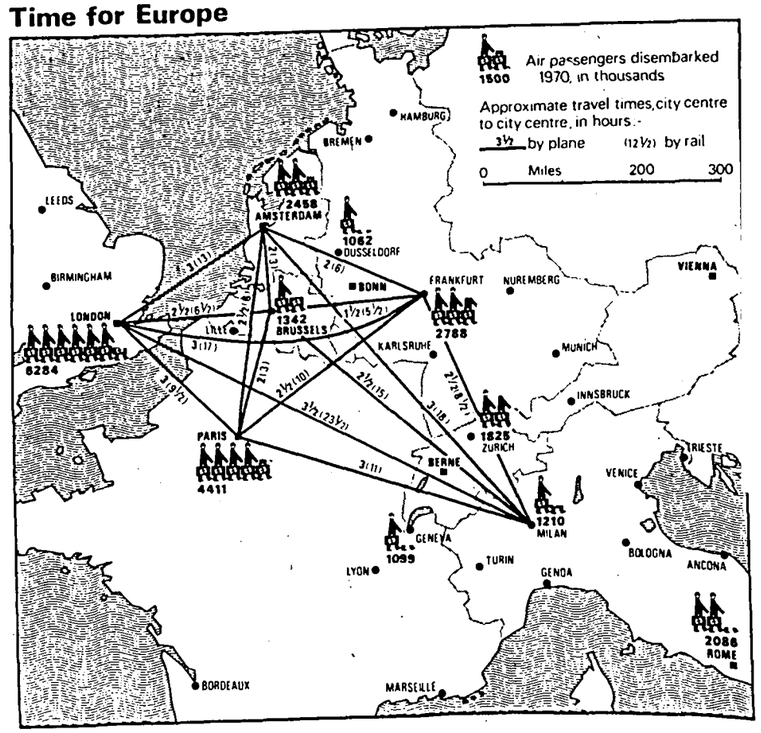
Brussels is sprouting

It is easier and quicker to get to the centre of Brussels from London than to the centre of Paris. It can take less than three hours door to door if all goes well. It is easier to dabble in property development in Brussels than just about anywhere else. That is why the British have done, or are doing, about £60m worth in office buildings. The trouble with Brussels is that it is all too easy

For those who want a headquarters in Europe from which to oversee subsidiaries dotted around the continent, Brussels is probably the best place. For those who have to watch the doings of the common market commission, an observation post in Brussels is obviously vital—provided that the facts, views and opinions obtained there are checked out in the ministries of Paris, Bonn and so on. For those who want to create businesses in Belgium, the rival attractions of Antwerp could well win out, for that is where the industry is. For those who just want to work in a quiet, pleasant, provincial atmosphere Brussels is fairly quiet, fairly pleasant and very provincial. In spite of the commission and Nato, Brussels is not an important place to be in. As a financial centre it has a dull stock exchange and, on the whole, a conservative banking community.



But it is the nearest thing Europe has to a capital; and the first name that comes into the head of British developers who are trying to prove themselves good Europeans is Brussels. Everyone seems to speak English: the Flemish population speaks English as well as it does French; the Walloons prefer speaking English to Flemish. The main source of instability in Belgium is the language problem, which brings down governments with monotonous regularity, which seems to be getting worse rather than better, and which occasionally erupts into street rioting. But to take a property realpolitik attitude, property values might actually benefit from this situation. French-speaking Brussels is an enclave in the Flemish-speaking region and the 19 communes that make up Brussels cannot expand. Brussels is surrounded, in local parlance, by an iron collar.

Brussels also speaks the language of commerce fluently. Since Belgium exports 45 per cent of its gross national product and imports 44 per cent, contact with foreigners has always been extensive and the provision of services associated with trade is generous. Belgium has very liberal exchange controls and tax policies which are highly favourable to foreigners. So successful has Belgium been in attracting foreign companies that over half of new investment each year is generated by them. Belgium is stiff with American, Dutch and German businessmen, and if the local politicians had not been so busy with their linguistics, they might well have turned their polemics to the domination of large pieces of their economy by non-Belgians.

American executives and their wives are particularly fond of Brussels; it is a rather better home from home. The suburb of Waterloo, with large houses, swimming pools, and nearby supermarkets, is largely an expatriate colony. Apartments are cheap and plentiful. Good roads and a clever tram-cum-métro system make it easy to get into town. And the good roads, the Trans Europe Express and the slummy airport 20 minutes away from the centre make it very easy to reach other European capitals fast. The telephones, courtesy of Bell Telephones, work better than in most places.

So there are plenty of good reasons to think about property development in Brussels. But there are better reasons for turning it down. Brussels breaks the cardinal rule of property development which states: the tougher the restrictions the greater the profits. The concept of city planning in Brussels is in a rudimentary state. The Belgians would say that they have all the planning they need. Being Belgians, that is not very much. Planning applications have, by law, to be decided on in three

Time for Europe

months. There is no restriction on how space is to be used : apartments can be used as offices, offices as hotels, hotels as warehouses, warehouses as car parks. (Even the Grand' Place, that miraculously complete square left over from the seventeenth century, is used as a car park—though cars are to be cleared away from it as an experiment.) There is no such thing as an office development permit, and offices can be plonked down where the developer wants, and, more or less, as big as he wants.

There are rules and regulations concerning the height and depth of buildings, and on the amount of car parking that has to be provided. But the rules can be bent. There is a regulation which demands that one car space should be provided for 500 square feet of offices—but it is not enforced. Certain areas have a "plan d'aménagement" which lays down the type and amount of permitted development within them. About a fifth of Brussels is covered by these plans, and a further two-fifths are under study. Again, there is flexibility in their application. The Avenue Louise, once a stately street of elegant, (if run down) town houses, is turning into a ribbon development of amorphous office blocks whose heights are determined by the sight lines from the Royal Palace. However, the ITT tower and the Tour Louise are to rise up out of it with brutal disregard for the scale of the neighbouring buildings.

If planning is no problem, neither is finance. The mortgage banks like IPPA and the Caisse Hypothécaire will grant mortgages for periods of up to 27 years, with floating interest rates. In January, 1971, the going rate was 9¾ per cent ; now it is nearer 8 per cent. The mortgage might only be up to 70 per cent of the cost, but the rest can be obtained against a guarantee. British property companies, with their strong balance sheets, have had no trouble at all in raising local finance. Some of the more aggressive banks will even bring both the site and the offer of finance to potential developers. With a bit of tough negotiation sites can be bought on a contract which grants let-out clauses if building consents and finance cannot be arranged.

Sites abound, but the British have wisely stayed close to the Avenue des Arts and are responsible for half the developments along it (see map). The triangle stretching back from there through the Quartier Léopold to the Rond-Point Schuman near the commission is the one most favoured by Jones Lang Wootton, the British estate agents who decided eight years ago (possibly wrongly) that Brussels was going to be the big city for Euro-property developers. However, the unfamiliar quality of independence and professionalism that the British agents have brought to Belgium has assured them of plenty of local business. Knight Frank Rutley has linked up with a local, M. Jacques de Duve, and has adopted the role of being a principal rather more than the firm would in Britain. The third of the British triumvirate that has practically sown up the property market in Brussels, Richard Ellis, has gone for the Avenue Louise area and has tempted Heron Holdings, Brixton Estate and Town and Commercial, three of the 17 British property companies busy in Brussels, to try their luck there.

And luck comes into it, as is inevitable in such an open city. The past few years have been boom ones—but in 1965 rents actually fell. A pretty chart prepared by Jones Lang Wootton shows increases in rents from 1963 to 1970 which are not mouth-watering : in the centre of town they have gone up from £1.12 to £1.39 per square foot ; in the Avenue Louise from

Charlie de Pauw

One man dominates property development in Brussels. His name is M. Charles de Pauw. He is familiarly known as Charlie, and he has given his initials to the series of companies he has promoted, like Consortium des Parkings and the Compagnie de Promotion. Very early on he realised that affluence and the ease of motor access to Brussels would give rise to a significant demand for parking space. That is what he set out to provide.

From cars he moved on to the village for Shape and large office developments. It is popularly assumed that his path was smoothed with help from an ex-prime minister, M. Paul Vanden Boeynants, then the councillor in charge of public works for Brussels and now the Belgian minister of defence. A book called "Les amis de Paul Vanden Boeynants et leurs affairs" assembles all sorts of bits and pieces of information into a montage of innuendo in which the names of de Pauw, Blaton (also builders and developers), and Vanden Boeynants and others are continually linked. No allegations of impropriety are made, merely implied. They may all be false, but it is as well to bear in mind that conflicts of interest are not frowned on in Brussels with anything like the same severity that they are in Britain. Unlikely things can often be managed. The tower block that ITT is putting up among the low-rise buildings of the Avenue Louise might not, for example, have survived the public outcry had M. Paul-Henri Spaak not been on the local ITT board.

The two main developments M. de Pauw has completed in Brussels are the 500,000 square feet each of the Philips building and the Grande Poste building (in which the city of Brussels has taken most of the space) set over an attractive and well planned complex of shops known as the Galleries Anspach. But he is now working on his most ambitious project to date—one of those World Trade Centres that every city now seems to want. One block of 500,000 square feet is going up, and another seven of equivalent size are on the drawing board. Finance for the first block has been put up by the Banque de Paris et des Pays-Bas, who are taking around half the space. The second block will probably be started quite soon, but those who are pushing Brussels as a developers' bonanza are casting doubt as to whether any more will get off the drawing board in time to affect the whole property market. That reckons without the excellent salesmanship of M. de Pauw.

Paris-Nord: the most english of french business centres

And for the very simple reason that Paris-Nord is located at Le Bourget only fifty minutes away from London. That makes the office complex at Paris-Nord the nearest French business centre to the British capital. It is also the first business centre that combines:

a strategic location. Only a few minutes from Paris. At the intersection of three motorways: the famous Autoroute du Nord (A 1), the B 3 spur and the A 87 ring motorway. Public transportation, rail and buses, already exist. The new Paris Airport is just up the road.

offices in a park. The gardens are almost English. Even the roofs of the parking buildings will be planted. In the Blanc-Mesnil park: swimming pool, athletic club, sun deck.

centralised services. Within the complex there is a comprehensive range of restaurants, a medical centre, shopping area, post-office, etc...

accommodation "à la carte". From 300 to 20,000 s.q.m. units with maximum flexibility for partitioning. Office layouts prepared free of charge. Air-conditioned, finished with light fittings and floor coverings ready for partitioning.

all electric. Paris-Nord is the first pollution-free business centre. With the cooperation of French Electricity Board, systems have been developed that considerably reduce occupants' overhead charges.

Paris at suburban prices. The location-quality-price ratio is unbeatable. Accommodation may be purchased outright, or by hire-purchase or leased. The sale price is: **£ 155 per sq.m.**

Are you getting the best return from your investment?

The use of unsatisfactory methods of capital budgeting is still fairly widespread. It is in the interest of individual firms and the economy as a whole that better methods should be used.

This new edition of 'Investment appraisal', produced by the National Economic Development Office, describes discounted cash flow techniques and illustrates possible applications. It takes into account the investment measures introduced by the government in October 1970 and July 1971, and discusses the criteria underlying decisions to invest in physical assets in private industry, including many points which are relevant to other forms of investment.

Published by Her Majesty's Stationery Office 'Investment appraisal' costs 20p or by post 22½p.

Copies can be obtained from Government bookshops or through booksellers.

Please supply copies of 'Investment appraisal'. I enclose cheque, postal/money order for £ p payable to Her Majesty's Stationery Office.

Books

Grand synthesis

GRAND STRATEGY: VOLUME IV, AUGUST, 1942-AUGUST, 1943
By Michael Howard.
HMSO. 801 pages. £7.25.

BRITISH FOREIGN POLICY IN THE SECOND WORLD WAR, VOLUME II
By Llewellyn Woodward.
HMSO. 693 pages. £4.10.

Except for a preliminary volume surveying the situation before September, 1939, Mr Michael Howard's book completes the official British history of the grand strategy of Britain and its allies during the second world war. The five earlier instalments of this history are without exception indispensable guides to the complicated problems and the painful and often controversial decisions from which grand strategy—the harnessing of national resources to the waging of war and the winning of victory—was constructed. Not unexpectedly, Mr Howard maintains the excellent standards which they set. Despite its length, nearly 600 large pages without its appendices, it is a compact account of its period, and his talents as a military historian have combined with the weight and sweep of his subject to make it also truly absorbing.

If not the most crucial of the war, the period was at least as central in its importance as it was in the war's chronology. At the beginning of it, in August, 1942, the Allies were still on the defensive in Russia, the Middle East, the Far East and the Atlantic—in every theatre and campaign except the strategic bombing of Germany, which was yielding poor returns—even if their victory was already sure. At the end, in September, 1943, North Africa and the Mediterranean had been cleared, Italy had been knocked out of the war, the Russians had begun their counter-offensive, the U-boats had been mastered, and the western Allies, as well as landing at Salerno, had hammered out the essential details and timing of an invasion of Europe from the United Kingdom in the knowledge that their control of the Atlantic and a vast expansion in American shipbuilding were at last removing the most serious obstacle to the free deployment

Salerno: first foothold

of their mounting military resources.

This change was the result of victory in hard-fought battles in North Africa, Russia and the Pacific, as well as in the Atlantic. But, as Mr Howard says, these battles could not have been won "if decisions had not been taken to deploy certain forces at certain points in order to achieve certain objectives," and it is with these decisions that he is concerned. They were often bitter and always protracted because the problems involved, some technical and others political, affected the highest circles and the deepest concerns of states. As the problems did not lend themselves to rapid decision, he has been right to judge that, in the course of recounting the decisions, "to summarise would, only too often, be to distort."

Since the evidence he has used is now being made available to other historians, instead of remaining confidential until 1992-93, he feels that he may have recounted them with too much quotation and paraphrase and at unnecessary length. His fear is unfounded. The general public, for whom in part this history was intended, will welcome the detail, while no one who follows after him in the search through the files is likely to be other than profoundly thankful to him for charting the way.

To the second volume of the late Sir Llewellyn Woodward's history, which covers the period from the middle of 1941 to the end of 1943, the second of these remarks applies with equal force. The government long ago met the needs of the wider public by publishing his single-volume account of British foreign policy in the second world war. As this fuller version—in five volumes—comes out, it, too, has to compete for the attention of the experts with the archives themselves. But the decision to issue these volumes is one to be applauded. Within the limits of the task he set himself, which was to analyse the British government's wartime foreign policy on the basis of the evidence available to the government at the time, rather than to assess it after the event, Sir Llewellyn's work is emerging as an impressive exercise in arrangement and synthesis, and as a guide to those who labour with the documents it will remain serviceable for many years.

On the flip side

THE LAST OF THE GIANTS
By C. L. Sulzberger.
Weidenfeld and Nicolson. 1,067 pages. £6.

FALLEN OAKS
By André Malraux.
Hamish Hamilton. 123 pages. £2.

Conversations with the great tend to produce better anecdotes a year later than weighty reporting the next day. When the great are seriously selling a line they are invariably dull and unpersuasive; when they are not selling a line they much prefer to talk about the past or people of the past, and so say things that are glad and sad by turns but are not history, and are not immediately printable if the journalist wants to be asked back again.

So Mr Sulzberger's anecdotes of everyone from de Gaulle and Churchill to forgotten diplomats and Africans is a highly readable and enjoyable flip side to his staid, responsible, ask-me-back columns in the New York Times. To M. Malraux no cliché uttered in his presence, far less one by himself, is devoid of philosophical importance. So he is a trifle high-falutin'; but since not many people got to hear de Gaulle's last table talk his recollections, too, are entertaining: a sort of flip mandarinese.

Mr Sulzberger's Churchill is almost in a half-world: Chartwell had a visibly declining owner whereas the Boisserie never quite seemed to, even

at the end. Churchill in 1956 has three glasses of wine, two of port and two of brandy at lunch, reads his books aloud, plays with his carp and defends Stalin (who "never broke his word to me"). But although his lucidity no longer has a dynamo to keep it going, he seems more at peace with destiny than Malraux's report of de Gaulle, living with his cat, two television sets, his trees and the stars. The general is profoundly pessimistic, surviving "consciously at the end of a civilisation," watching "the funeral procession of a world." Nixon is popular "because Asia still believes peace to be possible." But that is a Pandora's box :

> I don't believe the United States, in spite of its power, has a long-term policy. Its desire, and it will satisfy it one day, is to desert Europe. You will see.

That is the authentic voice of gaullism all right, and it explains the despair of the Americans Mr Sulzberger writes about who had to deal with de Gaulle in his prime. M. Malraux can be as superficial as the next man : spotting a plough, he is instantly reminded of the Cincinnatus indoors. But then he hits the essence of gaullism in the next sentence :

> Perhaps the clue to his character was not simply the impulse to say "No," but that he was at ease only when he said "No."

So there is great contempt for the Pompidous of the world who believe things can be solved by getting people to lunch together. That, of course, would never do for journalists, Mr Sulzberger among them. Not much misses his eye or ear : Tito pouring claret into his champagne (learned from King Paul of Greece), Prince Bernhard drinking only bourbon because the Germans had robbed him of his scotch, an ill Dulles saying "the hell with it" in Paris and taking two portions of lobster bisque.

There are, naturally, many unguarded remarks. George Brown declares Gaitskell "is always away when troubles comes." Macmillan admits on the common market in 1962 that he has no alternative policy : "I have always made it a rule in my life to avoid fall-back positions. When you have a fall-back position, you always fall back." Allen Dulles of the CIA boasts : "The Russians are too smart to put bases on Cuba." Dean Acheson muses on Dulles and Selwyn Lloyd : "They're a pair of slick lawyers trying to outsmart each other." And Randolph Churchill and Julian Amery will not mention Eden in July, 1956, except as "the jerk."

ECONOMIC HISTORY REVIEW
SUPPLEMENT 5

R. H. Tawney's Commonplace Book

Edited with an introduction by
J. M. WINTER and D. M. JOSLIN

An intellectual diary kept by the distinguished historian in Manchester between 1912 and 1914 which records the assumptions that supported Tawney in his work as a socialist and a scholar. The ideas displayed in his diary reveal much thinking which was at variance with the socialism of the day and the capitalism of established society.

CAMBRIDGE UNIVERSITY PRESS

Mafia at home

HONOUR THY FATHER
By Gay Talese.
Souvenir Press. 542 pages. £2.75.

So much has been written and revealed about the Mafia in recent years that this once deadly secret organisation has become close to an open book. Crime experts have plotted its rise and its organisation ; in prison Joseph Valachi sang to the federal authorities ; in 1969 the Federal Bureau of Investigation released thousands of pages of the intimate conversations of Mr Samuel de Cavalcante, a minor boss whose office it had bugged (much of this treasure-trove appeared in paperback) ; recently a novel about the Mafia was turned into a film. What can Mr Talese add ?

The answer is that over a period of six years he cultivated and then became a friend of Mr Bill Bonnano, son of Mr Joseph Bonnano, head of one of New York City's five Mafia families. Over this period the Bonnano women and children came to know and trust Mr Talese. Thus he knows not only what it was like to be a mafioso, but also the strain and loneliness of being

Bill Bonnano : family failing

a mafioso's wife, sister or child.

Mr Bill Bonnano, third generation American, is a significant and tragic figure, with one foot in the Sicilian underworld, the other in the world outside. There was a point, after college in Arizona, when he might have turned his back on the Mafia, although his qualifications for life outside it were slight. But his father, whom he respected and loved, needed him, and the days of boredom and worry, punctuated by terror, began ; this was the period of the famous "Banana war." The Mafia and its feudal loyalties were breaking up.

Not only was the federal government embarked on its own onslaught against organised crime, but the organisation itself was running downhill, rent by feuds which ageing leadership could not put down ; new recruits were of poor quality. Young Bonnano was finally sent to prison—for a credit-card fraud. Long before then, both he and his father had recognised that Cosa Nostra was becoming a thing of the past.

Mr Talese has sympathy for the argument that the Mafia could not have existed without the demand of ordinary Americans for pleasures, particularly gambling, which puritanical laws put beyond their legal reach. It had its standards, too, not only of family life, but in business ; its commission of elder statesmen strongly opposed expanding into narcotics. In a way, "Honour thy Father" is almost elegiac. But it would have been a better book if Mr Talese had not succumbed to the fatal temptation to manufacture thoughts and conversations; this does not lend verisimilitude but arouses scepticism which is probably not warranted.

Introducing Persian Architecture
ARTHUR UPHAM POPE
A beautifully illustrated survey of Persian architecture from 3000B.C. to the present. Photographs in colour and black and white; text-figures throughout paper covers £1·25
Asia Institute of Pahlavi University

From Puzzles to Portraits
Problems of a Literary Biographer
JAMES L. CLIFFORD
This book examines the problems of a literary biographer in finding relevant evidence, and putting it to use once found. It is largely based on the author's own experience in writing biographies of Samuel Johnson.
Frontispiece £2·75 North Carolina

Theatre and Nationalism in Twentieth-Century Ireland
Edited by ROBERT O'DRISCOLL
An important new study of the writers who moulded the mind of modern Ireland: Yeats, Synge, O'Casey, Shaw, and Beckett. 4 plates
£3·25 Toronto

The Ordering of the Arts in Eighteenth-Century England
LAWRENCE LIPKING
Here is a rich and comprehensive analysis of eighteenth-century English writings on literature, music, and painting. Frontispiece 7 illustrations £6 Princeton

Biographic Dictionary of Chinese Communism 1921-1965
Volume I : Ai Szu-ch'i—Lo I-nung
Volume II : Lo Jui-ch'ing—Yun Tai-ying
DONALD W. KLEIN and ANNE B. CLARK
The first dictionary of its kind in any language, this reference work contains 433 biographies of important Chinese communists which provide a comprehensive history of the period. £14
Harvard

Origins of the Chinese Revolution 1915-1949
LUCIEN BIANCO
Translated by Muriel Bell
Widely acclaimed in its original French edition as the best introduction to Chinese Communism ever published, this book focuses on the dynamic social forces underlying the Chinese Communists' rise in three decades from obscurity to power. £3·50 Stanford

BOOKS FROM OVERSEAS

Frederic William Maitland
A Life
C. H. S. FIFOOT
Frederick William Maitland (1850-1906) greatly advanced the cause of legal history, opposing the idea that legal history was law rather than history. Mr Fifoot traces the origin and development of his works, using them to show the man himself and the qualities of his mind and spirit. Frontispiece £4·75
Harvard

The Early Nineties
A View from the Bodley Head
JAMES G. NELSON
This study of the growth of one of the first modern publishing houses analyses its impact on its artists and writers and on the aesthetic development of the period. 21 plates £7·25

Christian Discourses *and* The Lilies of the Field and The Birds of the Air *and* Three Discourses at the Communion on Fridays
SØREN KIERKEGAARD
Translated with an introduction by Walter Lowrie £1·30

WHICH confidential publication is read by ten presidents, twelve prime ministers, two reigning monarchs, ministers, diplomats, businessmen and investors the world over ?

● The answer is the FLEET STREET LETTER—Britain's oldest weekly news-letter. For over thirty years it has been essential reading for those who must be really well informed.

● It provides inside information about what is really happening in Britain and the world—information not found in mass circulation newspapers.

● It has acquired an unrivalled reputation for detecting apparently insignificant items of news which lead to major developments. As a result, subscribers are ready for the news before it breaks.

● Its sources occupy high places in Whitehall, the City and world capitals. To protect them the right is reserved to cancel the subscription (and repay the unexpired portion) of anyone who fails to respect its confidential nature.

● Costs (Europe) £13 a year (US airmail $40)—soon repaid many times over by its share recommendations. Quarterly reviews of buy signals. Answers to questions on particular shares Portfolios reviewed.

● *As a special introductory offer the Letter will be sent for three weeks to those interested absolutely FREE and WITHOUT OBLIGATION. Just fill in the coupon below.*

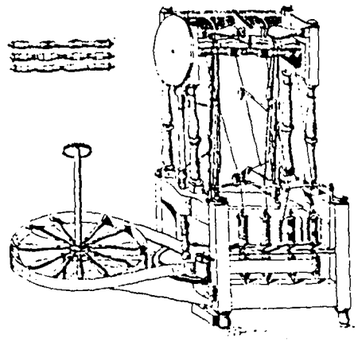
Where philosophers fear to tread

BEYOND FREEDOM AND DIGNITY
By B. F. Skinner.
Cape. 225 pages. £2.25.

"Beyond Freedom and Dignity" comes the demise of autonomous man. Beyond free will, liberty, choice comes the recognition that man is controlled by his environment—"influenced" is only a misleading, soporific synonym. Mind becomes an explanatory fiction for a physiological relationship between physical stimuli and behaviour; a simple (in the philosophical sense) "causal" relationship which science will eventually be able to describe. Professor Skinner exhorts by example; we should not be content, he says, with a philosophical explanation of human behaviour which has changed little since classical times—are we content, he asks, with the same level of development in the physical sciences? We no longer accept the personal, rogue element of individualism imputed to the elements by the ancients: nor should we accept this in a science of humanity.

This is persuasive, coherent, fluent, gripping stuff: it is enough to make this an important book, though the philosophical logic is not always very sophisticated and the arguments are not very rigorous. Professor Skinner's equation of the concept of goodness with a positive reinforcement to action is drastically naive: with Austin died the idea that goodness has no meaning beyond what a man chooses to do. With freedom he deals in greater depth, starting from Mill's unhelpful definition that "Liberty consists in doing what one desires"; he reduces the idealistic, inspiring passion for freedom into a characteristic of the human organism, an urge to avoid "aversive" elements of the environment, and he does no disservice here.



Professor Skinner has expounded his theory admirably simply, and without the obfuscation of references or more than a scattering of footnotes, so that it is hard to tell how much of, say, Strawson's analysis of the nature of memory and mind he would accept as a stumbling-block in his spring-cleaning of non-physical concepts. But in any case his philosophy is of minor interest. This is not because he agrees with Hume, that whatever theory one ends up with does not by itself change anything; he can discard mind, as Hume discarded anything outside it, but "man remains what he has always been." It is because he is a psychologist, and what he wants is not just a better science of behaviour (he does not go into its present state of development at much length) but a technology through which this science can be used.

In this mood he is once more interesting and less clear. He is at pains to reassure: "Man is not made into a machine by analysing his behaviour in mechanical terms." No: but he is discovered to be one. He emphasises the use of "positive reinforcers" (rewards) to control mankind rather than "negative" ones (punishments); but there is no intrinsic difference between them, to his argument. There is a good deal in his plea for a greater understanding of the environment's effect on human behaviour, but his parallel with the natural sciences breaks down when he adds that this will only come when we know how the environment works on man; the nature of scientific experiment has been the observation of consistent consequences, not an insistence on a causal relationship before the emergence of convincing evidence. But perhaps his most subtle argument is the substitution for an individual's self-control of control over others, since each man's environment is largely man-made. We can alter the actions of others, but only think that we determine our own. Professor Skinner, in his optimistic mood, believes that the evolution of a culture becomes "a gigantic effort in self-control." No one could say he has discarded idealism.

Georgian tinkerers

SCIENCE, TECHNOLOGY AND ECONOMIC GROWTH IN THE EIGHTEENTH CENTURY
Edited by A. E. Musson.
Methuen. 211 pages. £2.25 cloth, £1.10 paperbound.

In history, as in other subjects, the tidal wave of collections of reprinted articles has been of considerable use to professional scholars as well as to students. Mr Musson's volume (the work of nine authors) is concerned with the industrial revolution and with two overlapping sets of relationships: between science and technology on the one hand, and between technical change and economic progress on the other. It contains case studies as well as general surveys and material on trends and individuals as well as institutions like that "eighteenth-century technological research organisation," Birmingham's Lunar Society. In addition—an unusual bonus in

Georgian technology: Spinning Jenny

books of this sort—it has a very lengthy introduction by the editor.

Much of the book is concerned with only one aspect of the problem: the extent to which technological innovation was the product of systematic training and scientific interest, or the work of "practical tinkerers" and "native empiricism." The answer, as always, is obfuscated by the nature of the question. We can doubt neither the importance of "unscientific" technicians nor the significance of systematic procedures and scientific curiosity among industrialists and innovators.

The other main aspect of the problem—the role of technical change in the industrial revolution—is less satisfactorily dealt with. Of course, since the late Professor Ashton swept it aside, no one can respectably support the claim that the industrial revolution was merely "a wave of gadgets." Nevertheless, the attempts of modern economists to measure the various contributions of capital accumulation, education or technical change to economic growth are reflected in the recent ambitions of economic historians. Unfortunately, little systematic research has yet been done (or, some might argue, could be done) on the measurable impact of technical innovation on eighteenth-century industrial development. Hence the need for Mr Musson's introduction, which is largely a valiant, if rather inconclusive, survey of the treatment of technological and scientific variables in growth theories. This is a helpful guide to the literature, but it does not really advance the historical discussion. Our uncertainty about such matters as whether technical change was "merely" a response to changing demands or was itself an independent variable in economic growth leaves plenty of scope for controversy. And to judge by Mr Musson's strictures on some of his critics, "Vitriol in the Industrial Revolution" is more than the title of one of the articles that he reprints.

Becoming respectable

COMPARISON OF ECONOMIC SYSTEMS
Edited by Alexander Eckstein.
University of California Press. 366 pages. £7.50.

Once upon a time, the comparison of economic systems meant little more than a description of the United States and a description of Russia. The subsequent inclusion of other countries made the textbooks longer and, if anything, even more boring. But then people began to realise that differences between, say, America and Poland might depend on differences between Americans and Poles as well as between capitalism and socialism. The advent of a rather unclassifiable economy in Jugoslavia added to the complications.

These developments, together with a decline in chauvinism among intellectuals, mean that the burgeoning literature on comparative economics has now become interesting. What is more, the "meta" stage has been reached. This means that it is now intellectually respectable to discuss the methodology of comparative economics. The present work is an impressive monument to this, since only one of the papers presented to the conference which it records can be epitomised. (This is Professor Bergson's statistical demonstration that in 1960 the Russian economy produced noticeably less output per unit of input than did the American.)

Two major papers attempt to construct new sets of pigeon-holes for the filing of observations. Dropping the grand "isms," they concentrate on ways of classifying a number of separate aspects of economies, such as organisation and motivation. Some quite high-powered mathematics is used in an attempt to produce general definitions of such concepts as centralisation and decentralisation. Later on, near the end, there is a survey of eastern European economists' views on the comparative evaluation of economic systems. This makes it clear that they too—since the death of Stalin—have gradually become more interesting. Finally, in the last chapter, an author commissioned to write "An Integration" was only able to conclude with a few platitudes. This, however, is a normal and healthy symptom in a field of rapidly advancing scholarship.

Journal of WORLD TRADE LAW

Editor: Gerard Curzon, Geneva.

Six issues per year.

Annual subscription: £15 (U.S.$ 45).

Articles since 1967 have included

● World Agricultural Trade ★ Fats and Oils ★ World Trade in Sugar ★ An International Cocoa Agreement? ★ The Regulation of Trade in Tea ★ Government Intervention in Trade in Wheat ★ The Challenge of Synthetics: I Textiles; II Hides and Skins

● The Cotton Industry and World Trade ★ The International Tin Agreement ★ The International Oil Industry ★ Legal Status of Oil Concessions ★ The International Pharmaceutical Company ★ American Regulation of Oil Imports ★ The American Steel Industry ★ The Petroleum Chemical Industry in Europe

● Patents and World Trade ★ The Patent Co-operation Treaty ★ International Copyright ★ Know-how in the Soviet Union ★ Licensing Agreements ★ The International Sale of a Plant

● Border Tax Adjustments ★ Tax Incentives for Export ★ Value Added Taxation ★ Dumping in International Trade ★ Export Financing in France ★ Export Credit in the United Kingdom ★ The American Selling Price

● Legal Practice in Foreign Banking ★ The Sterling Area ★ The Euro-Dollar Market ★ Gold and the Dollar ★ European Monetary Union ★ The Franc Area ★ Investment Legislation in Africa

● The Puzzle of GATT ★ The Agreement on Preferences ★ Tariff Quotas and GATT ★ GATT and Export Subsidies ★ Trade Patterns and Technology ★ The Most-Favoured-Nation Clause ★ The Mills' Bill ★ The Common Customs Tariff of the EEC ★ UNCTAD and Shipping ★ P&I Clubs ★ European Insurance and the Third World ★ International Carriage by Container

Business Brief

Unctad: eight years on

Unctad's secretary-general, Mr Manuel Perez-Guerrero, published his report to Unctad III —the third United Nations Conference on Trade and Development—this week. From April 13th to May 19th Santiago, the capital of Chile, expects to entertain over 2,000 delegates from 135 countries, 600 United Nations officials and countless hangers-on for this occasion. Unctad is regarded by many developing countries as their best single hope for economic take-off. Many western countries consider it the biggest talking shop in the world. Both are right.

The prophet who inspired Unctad was Mr Raul Prebisch, the evangelical Argentine economist. The success of the first Unctad conference in Geneva in 1964 (which at least produced a permanent Unctad organisation and secretariat and set up the four-yearly monster talk-ins), was largely secured by the unrelenting diplomacy of Mr Prebisch, and also by Mr Edward Heath, then British Secretary of State for Industry, whose crucial intervention at Unctad I is still recalled with genuine admiration at Geneva and in the third world.

Mr Prebisch convinced the less-developed countries (ldcs) that their best hope lay in presenting a united front, and in putting their demands to the rich countries as a matter of right. He formed the "Group of 77" (which now has 96 members). The 77 message was this:

- The rich countries are getting richer, the ldcs poorer relatively, and often absolutely, despite the influx of aid and investment.
- Ldcs are denied fair access to the markets of the rich countries. Rich countries tend to repel cheap-labour imports. Bargaining on trade and tariffs in treaties like the General Agreement on Tariffs and Trade is on a trade-off basis. Ldcs, with their tiny home markets, have little to offer as bargaining counters.
- Ldcs have suffered and will continue to suffer a continuous worsening of the terms of trade.
- Simultaneously they face a mounting burden of debt-servicing charges. They are also discriminated against in other ways: eg, on shipping, insurance and by multinational companies.
- These trends, in the long run, threaten world political and military stability. Rich countries therefore have a vital interest in reversing the process.

Today these ideas seem fairly uncontroversial. But in 1964 they evoked cries of indignation from rich countries, not only protectionist ones like the United States, but even do-gooders like the Scandinavians.

Preferences

In 1964 Mr Prebisch and the 77 proposed that ldcs should be given a tariff preference in the markets of the rich countries as a universal rule, and with no quid pro quo. This represented a complete breach with post-war trade and tariff thinking.

The 77 said they were asking for special treatment solely because they were poor. This was vehemently opposed, particularly by America and also by Japan, the Nordic countries and some of the Six. Mr Heath's plan, embodying some sort of "generalised preferences" scheme, saved the day. Since 1964, the opposition has largely melted away. Generalised preferences have been introduced by Australia (1966), the EEC, Japan and Norway (last summer), and subsequently others, including Britain (January, 1972). Among the rich countries this leaves only Austria (expected to introduce a scheme this year), Ireland, New Zealand and Canada. And, of course, America.

America's position here is crucial. It has only recently shelved its main points of opposition to generalised preferences: its complaints against the "reverse preferences" enjoyed by France and Britain in their former colonies, and the "special preferences" enjoyed by some ldcs in the EEC and British markets. It is retaining the right of reopening these issues later, but seems ready to give Administration support to an outline scheme under which sensitive items like shoes and textiles would be excluded (as they are in most other other countries' schemes). All the schemes taken together should produce benefits for about $6 billion a year of the ldcs' exports, might produce extra trade for them of $300m a year by the mid-1970s, and should certainly provide a big incentive for international companies to set up manufacturing in the ldcs.

At Santiago the 77 will press for America to hurry up, for all the schemes to be widened (eg, to include more agricultural products), for less draconian safeguards and for deeper tariff cuts.

However, the spotlight has now shifted off preferences. The 77's main thrust at Santiago looks like being concentrated on monetary affairs. Here ldcs say:

- The extra liquidity created by the increase in the gold price is far less advantageous to them than an equivalent issue of special drawing rights (SDRs). Because of the gold price rise, forthcoming SDR issues will be smaller.
- SDRs ought to be handed out directly to them as a form of aid, rather than to rich countries.
- They want a say in future monetary reform.

The rich countries, at Santiago or later, may well concede the first point. A once-and-for-all hand-out of SDRs to compensate ldcs for the gold price change would not wreck the SDR system. Points 2 and 3 will no doubt be turned down flat. But Unctad's whole history so far testifies to the effectiveness of persistence, provided the 77 can hang together.

As the SDR becomes an increasingly accepted medium of international settlement, and as more and more ldcs run into big debt-servicing problems, it is quite possible that opinion in the rich countries will swing towards saying that some of them should be disbursed as a form of aid. This is a policy that *The Economist* has advocated for many years. On monetary reform, feelings in the developing world have been running high since last August's events, not least because some ldcs (India, Brazil), have bigger reserves than some Group of Ten members (Sweden). It is absurd that the Group of Ten should be treated as an inner sanctum, which nowadays tries to fix up between rich countries' politicians matters that can much better be handled by a free market. America agrees the Group of Ten is too narrow.

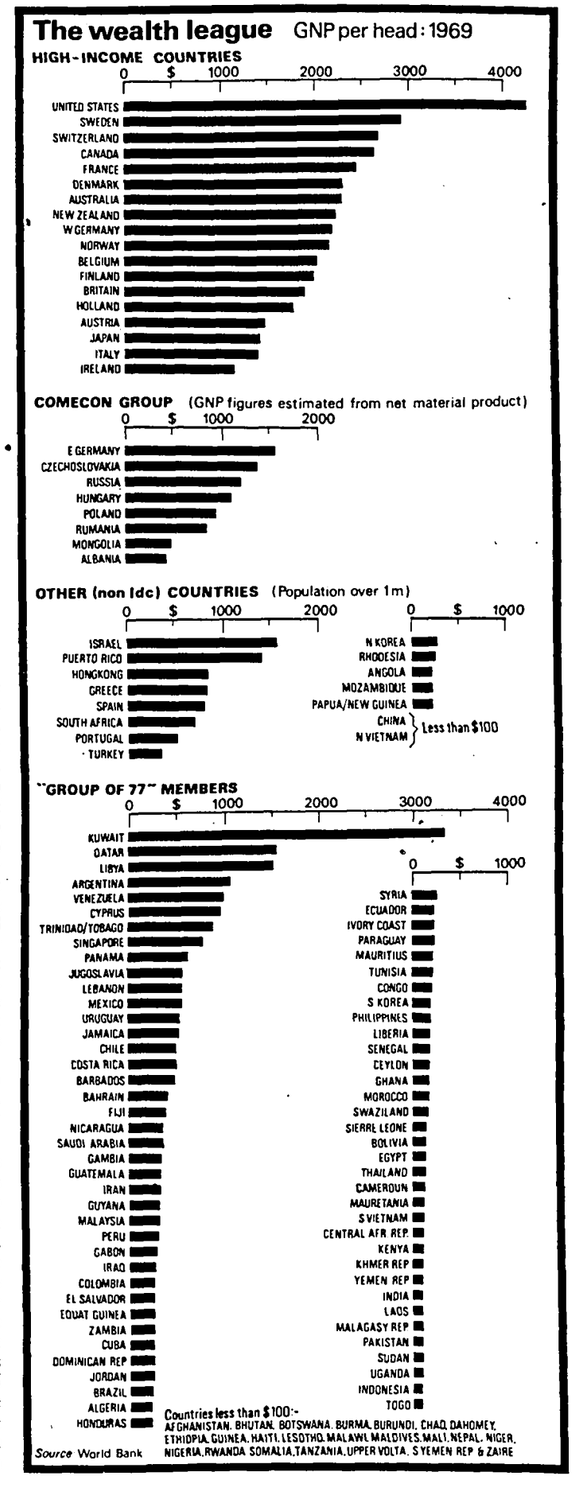
Prebisch started it

Politically, the west ought to be very thankful for Unctad so far. At Geneva in 1964 the communist countries were dumbfounded to find themselves classified along with the other rich countries, and asked what they were doing to help. Their refusal to admit any general responsibility (or even to commit themselves to an aid target) unleashed powerful criticism; their excuse, that not being former or current imperialist powers they were not to blame for the poverty of the developing world, evoked scorn and disgust. The Chinese will be at Santiago, fresh from acting as hosts to the Nixons and ready to bid for the leadership of the ldcs. The Soviet block's decision to reduce or abolish preferences on their exports is recognised for the non-event that it is. Now ldcs are pressing for their surpluses on trade with individual communist countries to be automatically assignable to other ldcs.

Even more awkwardly, the ldcs want to be able to use surpluses to buy from other communist block members. This second proposal would mean that an ldc, having earned a surplus on trade with Bulgaria, might demand east German machine tools in payment. It is an open secret that the Comecon members are at loggerheads about permitting this sort of very limited multilateralism even among themselves.

On less central issues, the ldcs have achieved some solid progress. On shipping, it is now agreed that the liner conference system does work unfairly against countries outside the charmed circle of the traditional maritime powers, although there could still be a row over proposals to police the system. On multinational companies it is now accepted that when subsidiaries operate in places like India, then the exporting and buying policies of the subsidiaries, as well as the transfer pricing within the multinational firm's own internal accounts, are matters of legitimate concern to host countries. Something will also have to be done about the operation of the patents system, and the vast and accelerating cost of transferring technology to the ldcs.

How united?



Future progress now hinges on one big "if." Will the 77 keep going as a group? Consensus is easy on straight issues between rich and poor: like cocoa—where the rich (ie, America) have resisted a price-fixing agreement; or research on natural commodities (eg, rubber) to meet the challenge of synthetics; or persuading rich countries not to stimulate their output of produce competitive with the ldcs, such as sugar, rice, vegetable oil, citrus fruits. Agreement is more difficult on issues like tea and coffee, where a new group of ldcs is trying to increase production at the expense of traditional ldc producers. Most serious of all is the explosive new problem of the least developed countries. Countries which have always thought of themselves as poor hate to be told that they are now members of the world's middle class.

Despite the progress Unctad has made, benefits from the system are not evenly distributed. The lion's share goes to a score or more countries that are already relatively well off (Brazil, Mexico, Singapore), or have their own extensive industry even if their gnp per head is low (India and Pakistan). They will be special beneficiaries of the preferences scheme. So now the least developed, in return for their political backing, are demanding something for themselves.

Who are the least developed? After much haggling, the secretariat has worked out a set of criteria—taking in gnp per head, industrialisation, and literacy—under which 25 ldcs qualify for "hard core" status. Unfortunately, only one, Haiti, is in Latin America; given the political push for Unctad from that continent so far, this is inconvenient. Also excluded are Indonesia, India and Pakistan, despite their claims to have more starving people than all of the hard core countries put together. The hard core, mostly in Africa, has a total population of 148m (8.5% of the ldcs' total). The argument about who should qualify will continue. Behind it lies the fear that rich countries may seize on this issue, not just as a way of dividing the 77, but as an easy way of giving aid on the cheap —by, say, steering more towards the hard core while cutting back elsewhere.

This fear is probably misplaced. More serious will be the trend for the richer ldcs consistently to hog more than their share of private investment and grow faster than ldcs as a whole. This will tend to happen anyway: the early stages of industrialisation are normally a phase of rapid growth, and private investment inevitably concentrates in the most advanced country in any region: Kenya in East Africa; Senegal (where Dakar was the former capital of French West Africa); Singapore; Mexico and Brazil. The process could induce the rich countries to argue that making concessions to the 77 as a group is a nonsense. The 77 could spike this suggestion in advance if the richer of them agreed now to help the poorer ones.

A hopeful start on this course is the batch of schemes under which ldcs intend to lower tariff barriers to one another. Many of these schemes operate on a regional basis: one hope is that the richer countries in each region will unilaterally throw open their markets to the more backward members of that region. Just as Unctad has sprung from the awareness of the widening gap between the ldcs and the rest, so it could be poisoned if inequalities between the ldcs were left to widen unchecked.

HERCULES INCORPORATED

Record 1971 results

A report from Werner C. Brown, President

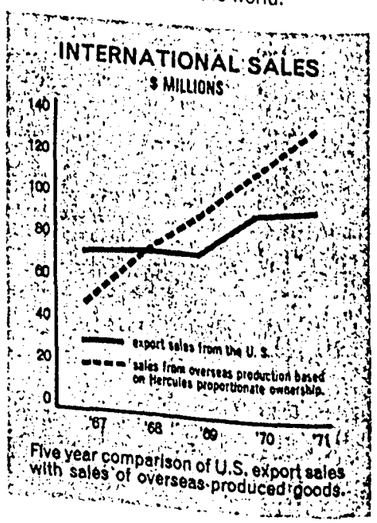
Sales of Hercules and its consolidated subsidiaries increased for the thirteenth consecutive year, reaching a record $812 million. Net income rose 6.9 per cent, equivalent to $2.78 per share, compared with $2.61 in 1970 (restated).

Earnings for both years include, for the first time, Hercules equity in the income of affiliated companies in which Hercules owns a 20 per cent or greater interest. This increased earnings per share by $.11 in 1971 and $.10 in 1970. Realignment of currencies added an additional $.09 per share in 1971.

The increase in sales came entirely from commercial business.

Hercules international sales continued a strong trend, with new export records from the United States and from sales of overseas production. The company now owns or participates in the operation of 39 main plants in 19 countries outside the United States. Overseas sales are handled through 28 principal companies; 13 are wholly owned and 15 are companies in which Hercules ownership ranges between 20 per cent and 80 per cent.

During the past 5 years over $111 million has been spent in research in a continuing effort to meet the challenging needs of growing markets and opportunities in the '70's. To keep pace with this effort, Hercules now has more than $850 million invested in expanded property, plant and equipment. Contributing to this worldwide programme, and of the utmost importance, are over 20,000 employees and more than 24,000 shareholders.



Hercules, a worldwide chemical company, makes over 1,000 basic chemical materials and products such as rosin and rosin derivatives, synthetic resins, rubber products, paper chemicals, plastics and polymers, agricultural chemicals, cellulose and cellulose derivatives, Dimethylterephthalate, and many others. They are sold to manufacturers of all kinds of industrial and consumer goods that feed, clothe, house, transport, and fulfil the working and leisure needs of people all over the world.

BUSINESS

Where we are now

Wherever Mr Barber sees the economy going after his budget next Tuesday, it has failed to come up to his expectations of a year ago. What went wrong?

The last economic indicators before Mr Barber's budget have suggested that Britain is in a state of profitless recession. On Wednesday it was learned that industry had started 1972 by turning out no more than it had done in the closing months of 1971—or, more to the point, than it had done as far back as the spring of 1970, in the last days of Mr Wilson's government. Earlier in the week had come the news that manufacturing industry had cut its investment by nearly 10 per cent in the October-December period, reducing it to its lowest for more than three years. So British industry has expanded neither its output nor its investment during the lifetime of the present Government.

Even the overseas trade figures have turned sour. On Monday a £32m deficit was announced for February, with imports up sharply. With all-too-familiar echoes from the past, but for the first time for quite a while, the trade news sent sterling nose-diving in the foreign exchanges, the spot rate losing 1¼ cents in two days.

This was not the stuff Mr Barber was looking for on the eve of his second budget. Yet, surprisingly, the explanation he will have to give on Tuesday of why the growth forecasts of his Treasury advisers at budget-time a year ago have not materialised will not feature any disappointment over investment or exports. The cause is more simple, or at least more homely: it is that the British people have not spent enough.

In the 1960s the Treasury nearly always underestimated the shopping zeal of the British people: it was as if they found something faintly abhorrent in it. But its expectations for 1970 and 1971 exceeded actuality, despite the huge wage settlements in these years. Our table illustrates the point. Halfway through the first half of 1971, that is to say at budget-time a year ago, the Treasury assumed that in those first six months personal consumption (in real terms) would be 3.3 per cent higher than in the first six months of 1970. But it ended up no more than 2.3 per cent higher. At the same time, the Treasury had looked forward to a 5.3 per cent rise in consumption over the coming 12 months, a forecast subsequently uplifted by the July tax boosts to around 6 per cent. The National Institute of Economic and Social Research now expects a growth in consumption of only 4.9 per cent in these first six months of 1972 if Mr Barber does nothing next week to jack it up. Since consumer spending is now running over £36 billion a year, and on the plausible assumption that the institute is right, the cumulative effect of these two errors has been that today's consumer spending is running about £700m a year less than the Treasury expected in March, 1971. The average British family is saving (or at any rate not spending) about £38 a year more than Mr Barber expected it to do.

It is not hard to see how this shortfall came about. Mr Heath and his ministers, like good Tories, believed that steady economic growth in Britain can only be achieved through stimulating more productive investment, better management, better labour relations, better marketing overseas and all the other things that add up to industrial efficiency. But that stimulus, they have argued, could come only after business confidence had been established; and, in their old-fashioned wisdom, they thought that business confidence could be generated only through a booming home market. Hence the lopsided efforts to get British consumers consuming.

What this cycle of reasoning overlooked was that consumers need to have confidence, too. The assumption that they are mugs, and businessmen are not, has been proved wrong. British workers have not been prepared to fling their money around just to please the Treasury knights; they have been wary of spending as the prospect of becoming unemployed or on strike has become all

Guessing Britain's growth

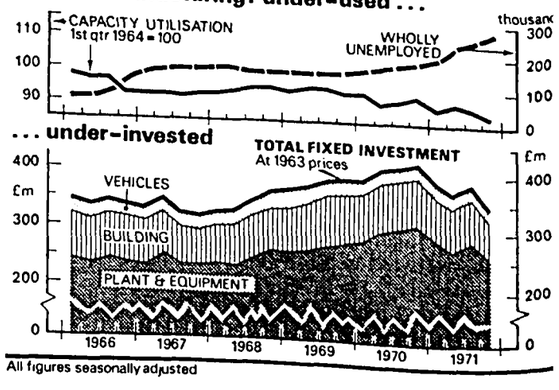
†Excludes purchases and sales of land and existing buildings.

too real. The brief splurge which followed the July measures last year seems to have largely fizzled out. The abolition of hire purchase controls and the purchase tax cuts naturally caused some big spending on durables, particularly on cars ; new car registrations topped 1.3m in 1971, after several years around the million mark. Domestic suppliers could not meet domestic delivery dates ; and, temporarily, the proportion of imported cars among new registrations went up to one in four, which in part explains the jump in Britain's import bill. There was a similar rush for colour television sets. Spending on property, as a hedge against inflation, has also gone pretty mad in some parts of the country: more and more people are not only buying one house, but two.

But except on property and cars, the spending momentum seems to be fading away. Consumer confidence which was only middling around Christmas time, suffered a bad setback with the miners' strike and some potential purchases were lost for good. At least when there are a million unemployed around, the British no longer say "buy today because things will be dearer tomorrow." Like the Americans, they tuck something away until times get better.

What about inflation ? Until the Wilberforce II fiasco, it looked as though the Government's informal incomes policy was having some measure of success. Settlements in the public sector since the second half of last year had been running at 8 or 8½ per cent, compared with 15 or 15½ per cent a year earlier, while the private sector (which last year lagged behind many of the nationalised industries) had been settling at around 9 per cent. Now, with the miners' success fresh in everybody's mind, expectations for the next round will have been jacked up by a number of percentage points, as the railwaymen are demonstrating. But perhaps the line will be held at 10 or 11, rather than the miners' 25.



On the eve of Wilberforce II retail prices were rising at "only" an annual rate of 5 or 6 per cent, where last year they were going up in double figures. Wholesale prices had slowed down even more. Some of the improvement was caused by the Confederation of British Industry's initiative to keep price rises down to 5 per cent in the year to next July. It is doubtful how much longer industry is willing or able to keep this up. In private industry, the drop in profitability will slow investment and cause more unemployment. In the nationalised sector, the increase in unprofitability will cause more deficits. Coal, as a "special case," has already breached the limit with its post-strike 7½ per cent price rise ; steel is due for a 5 per cent increase in April, and possibly quite a bit more in the autumn when it changes over to the common market pricing system. Others, like the post office, are able to keep their increases down to 5 per cent only by running into very red figures. Last week's announcement of lower sugar, milk and potato prices, by courtesy of the Government, was a purely political gesture, and not a very intelligent one. By paying £31m of taxpayers' money into the marketing boards, it will make a small impact on only 3 per cent of the items in a family budget.

The biggest new concern this week was over the way exports have been running absolutely flat in recent months, while imports have risen by leaps and bounds. February's import figure of £784m was the highest ever, and £43m higher than in January. Tobacco which had been held up by the American dock strike accounted for some of the rise, but there has also been a steady upward trend in imports of finished manufactures ; car imports alone have increased by a quarter in the past three months. Imports of industrial materials have hardly moved as yet, but will rise sharply if there is a real economic upturn. Britain's current account surplus of £952m in 1971 was helped by a 5½ per cent "improvement" in Britain's terms of trade, largely because our exports became 9 per cent more expensive (which may hit our long-term competitiveness hard). For the moment, those invaluable invisibles are still more than making up Britain's trade losses, and are continuing to earn £50m or more net a month. The customary deficit on shipping has recently come down, while net earnings on other services, especially insurance, have increased. The only laggard is travel. After several very good years, the surplus on this slipped to only £26m in 1971, when the number of British people taking holidays abroad went up by 25 per cent.

Even if the national institute is right in its rather optimistic forecast that world trade will expand in volume by 8 per cent this year, it now seems likely that a revival of economic growth in Britain will bring us back into balance of payments deficit. Mr Barber's proper course is to take this on the exchange rate.

There are three dangers for the unemployed in next Tuesday's budget. One will be if the Chancellor pays more attention to the worsening of the foreign balance and to protecting the present artificially high sterling exchange rate than he has hitherto said that he will. The second will be if he underestimates the extent to which the rise in voluntary saving now allows a cut in the "normal" burden of taxation ; the scope for tax cuts, because of this, could conceivably be very high. The third will be if the Government fixes a price restraint pact with the CBI which keeps profitability and investment down. If any of these three things happen, Britain is likely to continue in profitless recession.

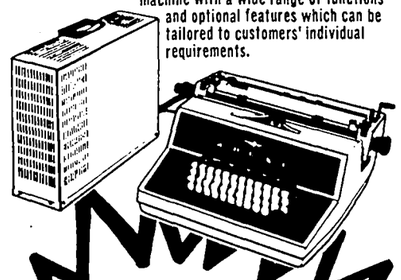
OEM
stands for the best in Office and Electronic Machines

ADLER

Adler Electric 21D
Incorporates a redesigned keyboard for maximum speed and featherlight touch. Dual carbon/fabric ribbon with fingertip control. The essential machine for every personal secretary and typing pool.

Gabriele 5000
A compact portable electric typewriter with featherlight performance and high powered features. The 5mm key lever movement ensures fast, effortless typing. Push-button carriage return, 5 repeat action keys and repeat line spacing. The precision mechanism cannot be jammed by mal-operation.



Adler 1414P
Electronic desk-top calculator with control tape. The colour-coded keyboard enables easy operation, and fast 14-digit capacity, three methods of round/off, automatic percentage, memory, exchange function and many other features.

OEM are the distributors for Adler & Citizen machines. Typewriters. Adding machines. Calculators. And complete accounting systems.

Whether you buy or lease your Adler or Citizen machines, the name of OEM is your assurance of quality and reliability.

Adler TA10
An inexpensive and very cost effective electronic accounting and invoicing machine with a wide range of functions and optional features which can be tailored to customers' individual requirements.

LOOK AT THESE EXAMPLES FROM THE OEM ADLER & CITIZEN RANGES

GO TO YOUR LOCAL DEALER OR WRITE TO OEM for full details of all the Adler & Citizen business machines.

CITIZEN

Citizen 310
The world's fastest and smoothest mechanical multiplier. Operates at 360 rpm, lists 10 columns and totals 11. Auto-total key, overflow safety lock, minus multiplication, easy operation. Still the most inexpensive method of doing simple calculations.

Citizen 100L
Accurate, speedy and easy to use, this electronic desk-top calculator is the latest from the famous Citizen range. The 100L is built to solve most complicated mathematical operations. With constant key.

Adler 800
A mere 9" × 6½" × 2" and weighing only 3lbs. And yet the 800 is a full four functions, eight digit electronic calculator. Silent, easy to use, versatile.

The générale's charmed circle of friends

Belgians are more than a bit fed up that the bulk of their industry is controlled by so small a handful of people. But there are pitfalls for anyone who thinks it is easy to move in and shake things up

The oldest and biggest of the Belgian holding companies is the Société Générale de Belgique, known simply in Belgium as the générale. It has a capital of a mere £77m from which small base it exerts a powerful influence over large sectors of industry ; the companies in the group have assets of around £2½ billion, their turnover is said to represent a third of Belgium's national income. Much of what they do not control is in the hands of a few family groups, led by the Boël, Janssen, Solvay alliance, whose outlook is usually in sympathy with that of the générale. Many people would like to celebrate the 150th anniversary of the société générale this year by tearing it apart.

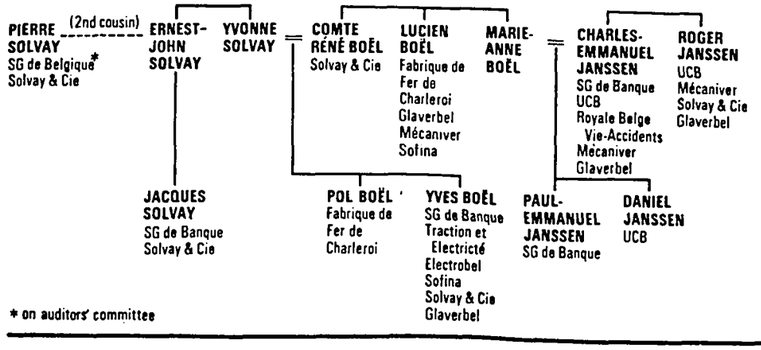
M. Henri Simonet, then a Socialist deputy, introduced a bill last year calling for much tougher control over the holding companies by the Commission Bancaire, the regulatory agency for financial institutions. The bill failed, but M. Simonet is now Belgium's minister of economic affairs in the new government formed early this year. As a backbench MP he accused these tightly controlled giants of "laying down the law in vast industrial, commercial and financial complexes without taking account" of wider needs or even of shareholders' interests. But as minister he needs the co-operation of the holding companies to solve his regional economic development problems—particularly in the depressed French-speaking areas of Wallonia. Precisely because they are largely oblivious to their shareholders, the holding companies can probably respond the most easily to government prodding to invest in backward regions.

In the past 15 years there have been a total of 41 takeovers ("offres publiques d'achats") among quoted Belgian companies. Only one was contested and although it happened seven years ago the reverberations have not yet died down. The bid was by the Compagnie Lambert for control of Sofina, a holding company in which Lambert had been a frustrated shareholder for years, unable to prod the management into exploiting its underemployed assets. But the powerful Boël family was also a major shareholder together with Lazard Frères, the French bank, and the two decided to resist the Lambert bid. To their flag came Mediobanca from Italy and the société générale from nearer home. The générale decided that Lambert should be prevented from winning control whatever the cost. And Lambert did not win control. The shares have never since reached the price of the takeover offer, which Lambert would probably have improved on had it not seen the storm clouds gather. Ever since this alarming breach of the traditional calm, the links between the générale and the Boëls and their relatives by marriage, the Solvay and the Janssen families, have been strengthening.

Other Belgian companies, startled by the noise of conflict, have taken steps to ensure that large blocks of their shares are defensively placed in the hands of friends. Mergers that would involve dilution of control are spurned. Rights issues of shares to raise fresh capital are a very last resort after all the loans and overdrafts have been used up. The holding companies have been tidying up things among one another, swapping companies and, at the instigation of the Commission Bancaire, buying out the more hopelessly impotent of the minority shareholders. They have emerged more invulnerable than before. The générale, in particular, has used its muscle to shake up important sections of industry.

Started by King William I of Orange to foster economic development (in a part of his country that eight years later, in 1830, became independent Belgium), the générale still thinks of itself as an economic development agency. It hears little from its shareholders. Not that shareholders in Belgium are practised at asking probing questions. As on much of the continent, shares are bearer shares—that is, they are held anonymously unless their owners want to vote at shareholders' meetings, in which case they have to register the shares with the company. Locking shares away anonymously is a good way of avoiding the tax inspector, but helps explain Europe's dull stock markets. Under 10 per cent of société générale's shares are registered, and the majority of those are in the name of two giant Belgian insurance companies. They are in turn controlled by the société générale, which obligingly votes its shares in favour of the management at their shareholder meetings—a nice example of the autonomy given to management by the cross-holding arrangement.

The registered shares thus carry a weight out of all proportion to their number or value. This is one of the chief bonds linking société générale family companies to mother, even though the proportion of total equity held, either directly or through other family members, is usually less than 25 per cent. Control is reinforced by interlocking directorships. Another important bond is cash. Associated companies with surplus cash give it to mother who redistributes it to more needy members of the family. About £40m of cash belonging to the associated companies (and their forgotten shareholders) is on deposit with the parent company, a hefty addition to the £77m of its own capital. But the strongest link of all is probably the feeling of belonging to a powerful club. Although the operating companies are allowed considerable autonomy, people within them do move from one to the other, so that the société générale provides a life career that culminates, for the chosen few, on the board. The scientific and technical exhibition that the générale is mounting this year to celebrate its 150th anniversary will be showing off what each member company can do and fostering the feeling of togetherness in the process.



The chairman of the board, carrying the traditional title of governor, is M. Max Nokin, who has been welding the group into a more coherent shape. Its old fashioned coal, steel, cement and textile businesses were once much bolstered by the Congo, which by 1960 was contributing half the group's income. In the past 10 years the group has undergone a vast change and is concentrating on steel (Arbed, Cockerill and Sidmar) ; on non-ferrous metals and metallurgy (Hoboken-Overpelt and Union Minière); on banking (Société Générale de Banque) ; and on tidying up the rest of the sprawl.

This reorientation would have been difficult if the générale had not been able to commandeer the resources of its affiliates. Union Minière has been particularly useful, because it gets an annual compensation payment from the nationalised copper mines of Zaire—the new name for Congo Kinshasa—based on copper sales, which came to £10½m in 1970. Union Minière contributed to the more than £100m cost of the générale's modern Sidmar steel plant, well out of its usual non-ferrous line of business; and also helped to make the Hoboken-Overpelt metallurgy business into the générale's outstanding success. The holding giants do sometimes use their power for the greater economic good, but shareholders are not consulted much in the process.

Sometimes, however, the results of the system are dismal. Just after the war, Acec, a sprawling electrical company controlled by the société générale and the Empain group, seemed to be in much the same boat as the Dutch Philips company. Philips is now large and international ; Acec is controlled by Westinghouse. Neither of the Belgian controlling shareholders would cede control to the other, and the company slid from bad to worse. The société générale's record in more advanced industries like electronics, computers and plastics is far from a shining one. This makes the choice of a scientific and technological exhibition for the celebrations a bit ironic. Pour encourager ?

The Commission Bancaire has done what is within its power to persuade the holding companies to open out to their shareholders. They now publish details of investments held directly and indirectly, including their market value. There is growing support for a Belgian version of a takeover code, with the Commission Bancaire acting in

The Boël/Solvay/Janssen directorship tree

* on auditors' committee

The Solvays are the descendants of the two brothers who founded the Solvay company in 1863, now the 13th largest independent chemical business in Europe. It went public in 1967, but Solvay/Boël families keep control with a private holding company, Union Financière Boël. Home base for the Janssens is another chemical company, UCB and Glaverbel (glass). They merged the Société Belge de Banque group with the Société Générale de Banque in 1968, making them important shareholders of it. The original Boël base is the Fabrique de Fer de Charleroi steelworks.

place of a takeover panel. Proposals spelt out in a recent paper given by the head of research at the Commission Bancaire, M. Guy Gelders, would in the Belgian context be little short of revolutionary: equality for all shareholders, both in terms of information about takeover bids and of price offered; once in control, a successful bidder should extend the same offer to all other shareholders; directors should regard themselves as trustees for all shareholders, not just custodians for the controlling ones.

One trouble with Belgium, and (for that matter) France and Italy and Germany too, is that there is no real stock market. The absence of a stock market creates a hothouse in which the holding companies flourish like tropical vines. Companies seeking capital look to the holding companies and banks rather than to shareholders. This is how they lose their independence. The holding companies, for their part, cannot trade their shares without losing control. The market has no volume, and prices do not reflect true values. When the insurance company, L'Escaut, was bought recently, the price paid was £1,340 per share. The shares had last been traded at £149 on the over-the-counter market. Many institutions do not, therefore, bother with investing in equities.

The more dynamic Belgian companies are looking to countries with an active stock market. Compagnie Lambert, whose attitude is more that of an investment bank than a holding company, is substantially increasing its interests in the United States, and other companies are thinking seriously of getting a quote on the London market. Many people are hoping that British insurance companies, recently very active in Belgium, will teach the locals about portfolio management.

The continental holding company is an anachronism. There is a strong argument for saying that the way most of continental Europe owns and controls a good many of its industries and financial institutions is old-fashioned, inefficient, inegalitarian and socially wrong. So far in the postwar years the system has also meant a high level of growth and investment, while British industry, with a more fluid and democratic form of capitalism, could be said to have paid too much attention and too many dividends to vociferous shareholders when it should have been installing new plant and machinery. However, in the next decade the quality of investment is going to be as important as the quantity, and it is doubtful whether a European octopus will be able to move nimbly enough. Odd though it may seem, European businessmen with a taste for independence and a quest for further growth are looking to Britain as a model of how businesses should be owned and controlled.

Group Lambert

The most dynamic group; assets and earnings have grown about 15% a year over the past decade, except for bear-market-1970. Origin of the group goes back to 1840 when Samuel Lambert opened an Antwerp agency for the Paris Rothschilds. Samuel's son married a Rothschild and their grandson made it an independent bank. When Baron Léon Lambert took over in 1949 it was a tiny deposit bank. In 1953 the Compagnie Lambert—the holding company—was formed and in 1959 the bank was merged into it. The late start enabled the group to avoid the old heavies of Belgian industry and plump for financial services. The baron is very much of an international deal maker, driving the group towards greater size, and in all directions.

Group de Launoit

Origins go back to 1871 when Belgian financiers and German bankers set up the Banque de Bruxelles as an investment bank. After the 1934 banking law, the bank was hived off and the rest put into Brufina. In 1937 Cofinundus, the holding company of the de Launoit family, gained control of Brufina. To support its investments in the older industries—steel, coal, glass—and attempts to diversify, Brufina has been selling off shares in the bank, including some to a "friendly" bank, the Algemene Bank Nederland. In 1970 Baron Lambert increased his stake and is now working closely with Comte Paul, and his brother, Arsene de Launoit. It would make sense for the Banque de Bruxelles to merge with the Banque Lambert to narrow the gap with the SG de Banque.

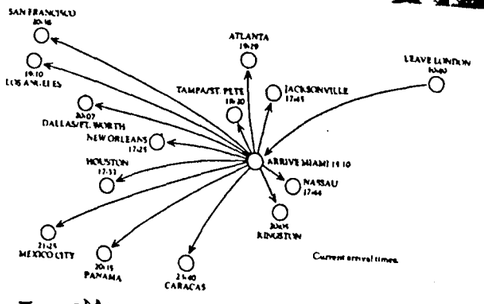
I'm Jo. Starting 26 May, I'll have daily 747's from London to the Sunshine States of America.

Fly me.

I've got a lot going for you to Miami and the Sunshine States of America, with daily nonstop flights from London and our own kind of personal service. And a lot from Miami: I've got great connections to all of Florida, New Orleans, Houston, California; you name it. Then fly it.

And starting 26 May, I'll have more: the nice convenience of daily 747's to Miami. Pick the day you want to go.



And the beautiful luxury of the great 747, with more cabin room than any airliner in the sky today.

And the 747 extras en route: first-run movies,* multi-channelled audio entertainment and our international gourmet cuisine.

And a refreshing kind of personal service, person-to-person.

We know how to wrap up rubber plants

Wrapping things up is second nature to Tarmac. Whether we're handling a complete project like building a giant tyre manufacturing complex, or producing millions of bituminous paper plant pots from one of a wide range of roofing felts we make, we've got the matter very much under control. In fact, we're resourceful enough to wrap up your business in anything from bitumen sheathed pipelines to decorative concrete cladding, from sea walls to reinforced concrete reservoirs.

Whatever the project, Tarmac's roots go deep enough to make a healthy success of it. Ask any rubber plant.

Tarmac

THE MEANS AND THE END

A sigh of relief for people who live with jet noise.

The world's quietest big jet.

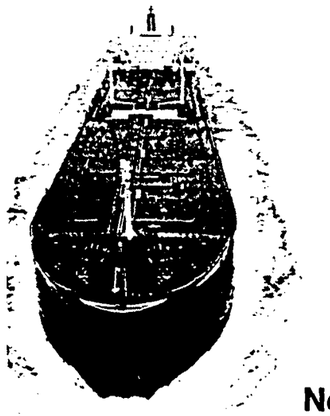
The best way to stop the public outcry over jet noise is to cut down the noise.

Which is exactly what we did.

We built a jetliner that doesn't sound like one. It has RB.211 engines from Rolls-Royce. The quietest big jet engines in the world.

Rolls-Royce designed the RB.211 with fewer moving, noise-making parts. These Rolls-Royce engines lift our L-1011 off the ground with more than twice the thrust of older jets. But with less than half the annoying jet noise, according to acoustical annoyance studies published in U.S. Government reports. So just because a plane is big, it doesn't have to be noisy.

But you haven't heard the half of it.



The high-velocity exhaust sounds that couldn't be designed out of the engine are wrapped in an insulating shroud of low-velocity air. Other sounds inside the engine are muffled and absorbed by acoustical honeycomb.

And 80% of the air that's sucked into the L-1011's engines bypasses the hot engine core. So you hear a steady hum. With most jets, almost all of the air is forced through the engine core, so you hear an earsplitting whine.

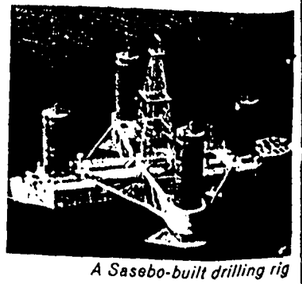
All of which makes the TriStar the quietest big jet in the world. Air Canada, Air Jamaica, Delta, Eastern and TWA will be flying the TriStar soon.

It'll be a welcome relief.

The Lockheed L-1011 TriStar

SASEBO

Nine years ago we started a trend. The 132,000 dwt tanker "NISSHO MARU" was the first of the big tankers.



Five years ago, we started building 210,000 dwt tankers that set a new standard for size. In all we shall build 21 one after the other.

Now we have researched and designed the 270,000 dwt tanker, and we're ready to build the first one.

Three years ago, to build these mammoth ships, we expanded our No. 3 Repair Dock to take ships up to 400,000 dwt. Now it's in use. Our No. 4 Dock is being enlarged to the same size.

Now, after modernizing our yards, we're going to build a super-dock to take the megaton tankers of the future.

So that, whatever the demands of the industry in the coming years, we are ready to build and serve.

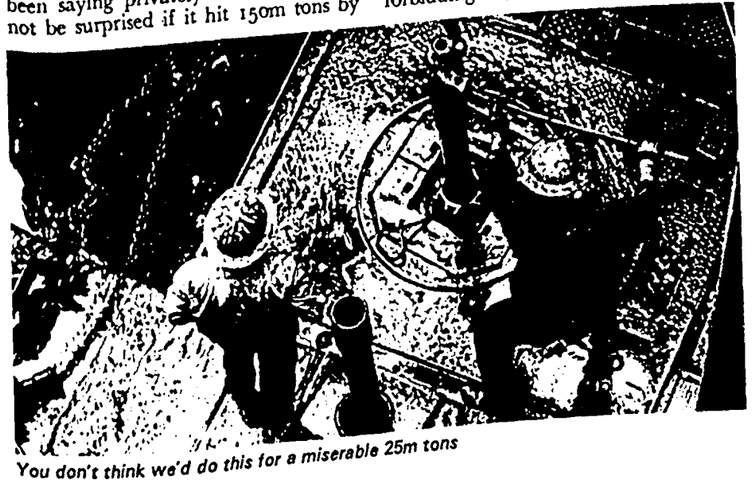
We're terribly conservative about oil in the North Sea



The British Government continues to put an extremely low figure, in public, on the probable size of the oil and gas reserves in the British sector of the North Sea, which ties up neither with what is being said inside Whitehall in private, nor with the eagerness with which the oil companies are rushing to spend sums on exploration that could not be justified if there really were as little oil as the Government is making out.

When he announced the fourth round of licences allocated for North Sea exploration on Wednesday (probably the last licences to be allocated for several years), Sir John Eden, Minister for Industry, estimated the North Sea's potential output at 25m tons a year by 1975 and perhaps treble that by 1980. This compares with current consumption in Britain of approximately 100m tons a year. But as recently as December, Sir John had already put potential output at 50m tons by 1975, and his own officials have been saying privately that they would not be surprised if it hit 150m tons by 1980, and 250m tons five years later. Even these are regarded as conservative estimates. There are some, not necessarily optimists, who would double them.

If these last figures are anywhere near right, it would make Britain one of the largest oil-producing nations in the world, and certainly self-sufficient, which should be a cause for rejoicing in a week when the major oil producing countries now are extracting a higher and higher price for their oil, and inventing a host of subtle ways for extracting more money from the oil companies and the customers. In 1969, America led the world with an output of nearly 520m tons, followed by Russia with 328m and Venezuela with 187m. Iran's 168m topped the output of any other Middle East producer.

This alone explains the enthusiasm with which the oil companies seized on the licences offered on Wednesday to drill in the North Sea, Irish Sea and to the west of the Shetlands and Orkneys in some of the world's most forbidding water. In all, 66 separate companies and groups were granted licences for 246 blocks in offshore British waters. Willingness and ability to explore were factors that played a big part in deciding who got which blocks, and undertakings have had to be given to carry out extensive seismic work and to drill 224 exploratory wells in the initial six years of the licences. Altogether, it is expected that the 66 companies will spend well over £200m. You do not take on that sort of risk for a probable 25m tons a year. So what exactly is the Government's motive in playing down the best economic news it has had in years? It is difficult to see Mr Harold Wilson playing such a card this way.

It is inoreasingly evident that western Europe, and Britain in particular, is going to be much better off for oil. Some of the richest finds so far have been in the Norwegian sector at Ekofisk. For months it has been uncertain whether the oil and gas should be piped ashore to Britain, Norway or Denmark; Ekofisk is equidistant from all three. The choice might have been Norway if a trench in the sea bed, 300 metres deep, did not slice an unspannable gap between the find and the Norwegian coast. Also, Norway's home market is not all that big. Now the Norwegian parliament is almost certain to recommend that the pipeline is run to Britain, and if work on the pipe begins this summer, the oil could be coming on shore in the autumn of next year.

You don't think we'd do this for a miserable 25m tons

In full retreat

While the North Sea allocations were raising oil men's spirits, the Organisation of Petroleum Exporting Countries was depressing them. Meeting in Beirut, OPEC practically gave the western oil companies an ultimatum to agree during the next three months to its demand for 20 per cent participation in the companies' oil concessions. Though much tough negotiating lies ahead, the companies appear to be in retreat. The Arabian American Oil Company (Aramco)—a consortium made up of Standard of New Jersey,

Mobil, Texaco and Standard of California—was the first to announce its agreement in principle to participation in its concession in Saudi Arabia, and the Kuwait Oil Company (BP and Gulf) followed.

So long as the world needs OPEC oil, the producing countries hold the high cards and, possessed of a keen memory of all the years when they barely understood the business and the companies made huge profits, they are hardly shy about playing them. Most friction will be generated in the next few weeks over who owns the oil still in the ground. The countries regard it as theirs and will offer the companies little or no compensation for it. The companies naturally think they should be paid something for the profits they would have made on the oil if they had retained 100 per cent ownership. They can apply some pressure by asking stiff prices to transport and distribute the producing countries' 20 per cent share of the oil, but OPEC's leverage is the greater.

Still, the oil companies are fortunate that negotiations on the OPEC side are being led by Sheikh Ahmed Zaki Yamani, Saudi minister for oil, and not the Libyans, who, it is believed, will soon demand not 20 per cent but majority control of all oil concessions in their country. Libyan diplomats are thought to have been negotiating with Russia and East European countries to find a market behind the iron curtain. If these negotiations are successful, Libya will have nothing to fear from a western boycott.

Currencies

Crawling?

A return to calm in the foreign exchanges this week deceived nobody. It cannot last. There were a number of reasons why last week's heavy selling of dollars abated: the Dutch and Belgian authorities clamped on new restrictions to stem dollar inflows, American interest rates edged up, and central bankers in Basle last weekend made some reassuring noises. The last of these factors should be discounted; it is obviously in the interest of central bankers to try to support the December 18th currency agreement, for which they are largely responsible. As for the first factor, we wrote two weeks ago of the dangers of exchange controls which the agreement was designed to avoid; unfortunately the threat of their spreading has become reality.

The rise in American short-term interest rates, which took three-month treasury bills to 3.85 per cent, the highest since mid-December, is being interpreted by optimistic European central bankers as a new spirit of co-operation from across the Atlantic. It is nothing of the sort. Mr John Connally, the American Secretary of the Treasury, does not eat his words lightly. When he said a few weeks ago that action on American interest rates would be taken as and when it suited domestic policy, and not to please European central bankers, he meant it. The Federal Reserve has simply reacted to the brighter domestic economic picture which offers little justification for keeping money as easy as it was: the money stock had been rising at something like an annual 7½ per cent. It has been convenient that the money rate differentials between America and abroad have been narrowed, but that was not the main object of the American exercise.

Even in the short term, the easing of the pressure on the dollar this week should not be exaggerated. The D-mark, guilder, Belgian franc and Japanese yen at midweek were still about 2 per cent above their central rates, and the commercial franc about 1½ per cent above its. Sterling had dropped to within ½ per cent, but mainly because February's trade figures were so bad. There has been more talk in Tokyo of a further yen revaluation: some businessmen there are said to be doing foreign business on a crawling peg system which presumes a yearly upvaluation of the yen against the dollar of 2 per cent.

This made plans for forming a Group of Twenty, including representatives of the developing world as well as the rich country club, to organise the reform of the world's money system, seem purely academic. It will not be their broader and lengthier discussions that will force the next step, but the breakdown of the December 18th agreement.

Germany

Recession recedes

Herr Karl Schiller, Germany's economic supremo, told the Bundestag on Wednesday that the income and corporation tax surchage, levied at the height of the 1969-70 boom to cream off purchasing power, will now definitely be repaid during June. This will release £700m into the economy, as an instant weapon against the recession which looked a distinct possibility at the close of 1971. It is being pumped in just when some forecasters are saying that the recession may already be going away.

The government's economic experts still reckon that Germany's growth rate in 1972 will be a very modest 2½ per cent and that most of this will be concentrated in a marked upturn towards the end of the year. But, rather to everyone's surprise, the very latest signs suggest that the economy is already back on a rising trend. The way in which Germany has temporarily got away with a rather undervalued exchange rate again, plus the cut in the discount rate three weeks ago, has pleased industry. The Ifo economic research institutes report a marked rise in optimism since December. Figures released by the Bundesbank this week confirm that new orders for industry rose strongly in January, including the investment goods sector which was recently very depressed. Unemployment in February was down slightly, to 370,000 (1.7 per cent of the labour force): and short time working, widespread last winter, has been cut back. Inevitably, there are fears that reflation will breed more inflation. Herr Schiller has had some success in getting the unions to stick to his wages norm of around 7 per cent: the chemical workers, next on the negotiating list, have tabled an 8 per cent claim in one area. But consumer prices in January

Key indicators: world commodity prices

Fashionable furs

When the world's stock markets slid back in 1970 most women found that their furs had to last another season. Now that excuse no longer holds, fur prices are soaring. At the Hudson Bay auctions in London 39,000 Polish blue fox, 12,000 red fox and 51,000 of the usually unfashionable beaver pelts were sold effortlessly at prices 25% higher than three months ago. Many buyers left empty-handed.

NatWest would like to change your mind about factoring.

Too many people have still got the wrong idea about factoring: a survey commissioned by our subsidiary, Credit Factoring Ltd, proves the point.

To set matters straight, we'd like to stress that, in our view, factoring is more—much more—than a way of releasing money. Factoring must relieve the client of all sales accounting, provide credit management and give a 100% guarantee against bad debts. Offer, in a word, service. Credit Factoring Ltd operate this way. And, as the table below shows, it's the service aspect that people who use factoring find most important. It also shows that the more you know about factoring, the better you like it.

An elegant demonstration of the difference between ignorance and bliss.

The Pros and Cons of factoring, as seen by users and non-users.

Non-users		Users	
PROS	CONS	PROS	CONS
"You have fluid money to spend."	"Factoring is far too expensive. There is nothing to stop any self-respecting person going to the bank." "Factoring is additional expense to the firm. No extra income is gained by using one."	"I do not think the cost is much more and you gain in terms of service." "We expand by over 33% a year and factoring is for us." "If you quadruple your business you can carry it up without going for outside capital." "We are an expanding firm and Credit Factoring gives us a 100% guarantee against bad debts." "Factoring is good for the image. Customers feel you must be of some strength for them to take you on." "We have not had any redundancies - we have just run down our staff through normal wastage." "Credit Factoring would not do anything to upset the relationship between us and our customers." "We employ a credit factor for our export trade, which works exceedingly well. It is an advantage for the customers to pay in their own currency." "It is nice to know that the money will be in by a certain date. With the old system we had no idea when to expect payment." "The advantages are: regular cash flow, no bad debts, you know how much it is going to cost, and most importantly, if we didn't factor we would have to attract quick payment by offering discounts."	*
"I suppose if you had no liquid assets you would have to factor."			
"One of our suppliers uses factoring. It didn't imply to me that they were in financial difficulties. It was just to their convenience."			
"Factoring is a greater thing in export than in home selling because of the complications in exporting."			

* The British Market Research Bureau Ltd, who conducted the survey, found that users of Credit Factoring Ltd were pleased with the service. Any National Westminster bank manager will be delighted to point the moral for you. Or, if you prefer, please write or telephone Christopher Blower of Credit Factoring at: Smith House, P.O. Box 50, Feltham, Middlesex. Telephone 01-890 1390.

Credit Factoring Limited

A member of the National Westminster Bank Group

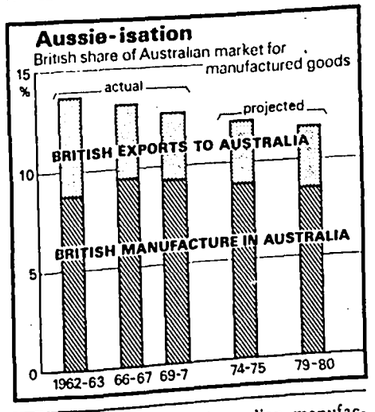
were still 5½ per cent higher than a year earlier. Few people now believe that the government can get the rate of rise down to its forecast of 4½ per cent this year.

Aussie-isation

Spare a pommie penny



There have been several signs that Australia was growing mildly concerned about the flow of investment from overseas after Britain is in the common market, one of the more significant of which was the publication on Thursday of a survey* that went to some lengths to show that there is more money to be made still by investing in Australia than among the Six. It depends, of course, on which years you pick to prove the point. The Australian British Trade Association argues that the Australian investments of British companies.

were more profitable than EEC investments from 1964 to 1967.

So they were, but the table included in the survey also shows that in 1961-63, and again in 1968, it was the other way round.

Australia needs funds from overseas because the country is unlikely to be able to generate more than 85-90 per cent of its gross capital needs this decade. Investment accounts for a quarter of gnp, given a growth rate of 5½ per cent. But manufacturing productivity is growing at only 4 per cent, which is lower than among the Six and one reason why investing in Europe is likely to be the more attractive, in the short run at least. "Temporarily significant, but marginal in the long run" is how the survey describes it, and accompanies the forecast with warnings that other countries, like Germany and Japan, will be only too ready to move into Australian industry.

Had the association included mining among its list of industries, the arguments would have been proved beyond question, but then overseas investors hardly need encouraging to invest in Australian minerals. A politically stable source of minerals is no mean attraction, and there is a good deal to be said from the British end for relaxing the "voluntary" controls that still exist on British investment in the developed sterling area. The return on Australian investment, even in manufacturing, is now running at nearly 8½ per cent, and it does seem unnecessarily stringent to insist that the foreign exchange cost of any investment must be recouped somehow or other within three years. Something more for the budget ?

*British investment in Australian manufacturing industry. *Australian British Trade Association with the CBI.* £2.50.

Common marketeering

Send three lids

The Six have never managed to harmonise their rules on the sort of sales promotion that takes 2p off, or puts toy soldiers in the corn flakes. But they are now making efforts to do so. If they succeed, and the rules are extended to Britain, it will knock a lot of fun off the supermarket shelves.

France bans the sorts of promotion that give a gift in exchange for three jam lids or six packet tops ; this is demanding proof of purchase and against French law. Most of the EEC countries have tough laws about premium offers ; if these are gifts, they must somehow relate to the produce. A coffee cup could be given away with coffee, but not a plastic daffodil. It would take a lawyer to assess whether a tea tray would be in or outside the rules. Most of the big advertising agencies already know their way round Europe well enough to keep their clients out of trouble there. But they are aware that marketing in Europe is regulated by a complex body of written law that was originally designed to prevent unfair competition between traders, and is now being turned on its head to serve as a form of consumer protection. Injured parties can slap injunctions on offenders and halt them in their tracks ; then the offence has to be proved in the courts. In Britain, by contrast, there are no laws about fair or unfair competition, but there are tight rules about trade descriptions that stick better in court.

Japan

Spare a yen

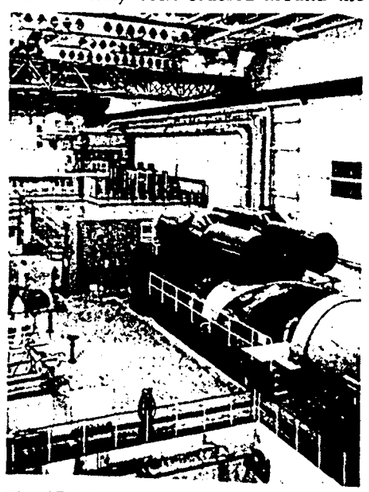
Tokyo

Foreign begging bowls are out in Tokyo. One after another, prospective borrowers are appearing in the Japanese capital, meeting prime minister Sato, being received in imperial audience, and then being sent back bolstered with large cheques. The latest such visitor was President Echeverria of Mexico, who left with $42m in loans, finance for a major steel mill, and a $10m bond issue. The Australian treasury officials have also been plying back and forth, and now seem to have fixed up a $30m loan ; but a recent posse of several hundred Brazilians went away empty handed. Early in the summer, Sheikh Mujib is expected from Bangladesh.

Only a year ago the idea of Japan freely dispensing international capital would have been unthinkable. But the coffers now are not merely full ; they are embarrassing, with reserves standing at $16.5 billion. The finance ministry has instructed the Bank of Japan to start making large deposits of dollars with Tokyo's foreign exchange bank. The idea is to force Japanese banks to reduce their borrowing from overseas. At present outstanding loans to Japanese from New York banks alone are estimated at $4 billion. American banks are gloomy about losing this business. They will face even more competition if more foreigners are permitted to borrow from Tokyo at long last.

But Japan is reluctant to part with capital unless it can be sure of a rapid return in increased trade. That is the one yardstick ; and a number of communist countries have suddenly realised that they measure up admirably. Last week the ministry of finance gave the go-ahead for the first major loans to eastern Europe. The Aussenhandelsbank in east Berlin will borrow $35m from a Japanese banking consortium, and the east German government is to get another $10m from the Bank of Tokyo on a five-year loan that is tied closely to the purchase of Japanese goods. Last year Japanese exports to east Germany were $35m, largely in iron and steel ; imports of east German goods into Japan were a mere $15m. A loan of this size clearly presages plans for a major expansion of trade with the communist block. Smaller loans to Rumania and Hungary have already been made. Next week a delegation of North Vietnamese will arrive.

BUSINESS *Britain*



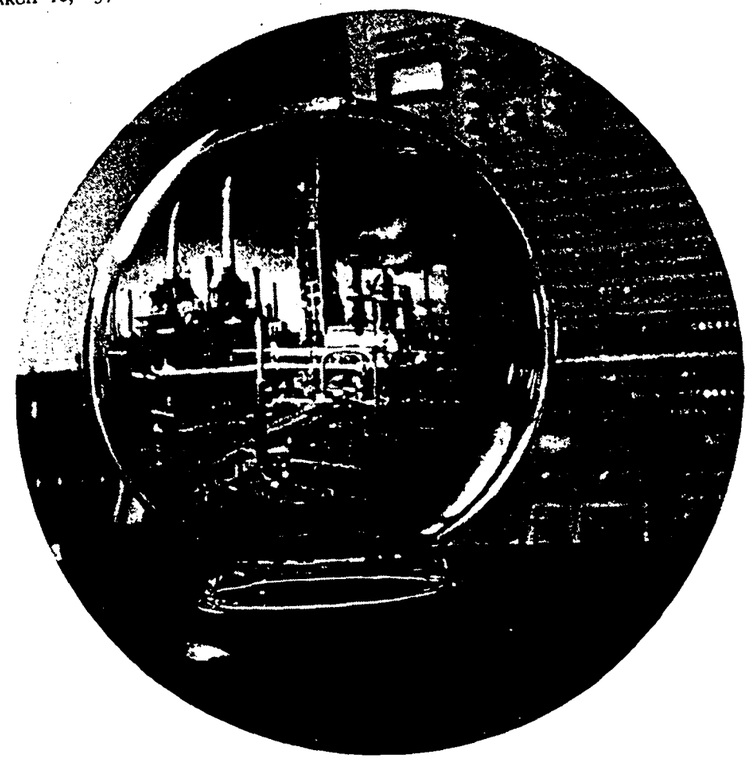
The wrong nuclear choice

The Government could be on the way to another disastrous choice for nuclear power. Twenty years ago, this country established an apparently unbeatable lead in the then new atomic industry by ordering the first commercial-size nuclear power station. This lead was subsequently dissipated by endless design changes over the years, so that no two nuclear stations built in Britain were alike. This has kept costs up and sales down. It also guaranteed that no power station was ever free of teething troubles.

Now yet another new type is contemplated. It looks increasingly as if the next nuclear station ordered in Britain will, on government instruction, consist of a reactor where steam is raised in pressure tubes that are suspended in the reactor's core: a design that resembles nothing so much as a can of heavy water filled with steel spaghetti. The objections to this design are based on safety and cost; but it has the strong backing of the Atomic Energy Authority, which designed and is operating a prototype. The AEA has apparently convinced Mr Peter Vinter's committee at the Department of Trade and Industry that this should be the choice.

There are growing misgivings in America about this kind of reactor, where the source of water that flows over and cools the fuel elements in the reactor also provides steam for the turbines. American boiling water reactors, which operate on this principle and originally swept the market, are now going out of favour for a variety of reasons, including a major worry about safety. When a fuel element leaks, which happens with predictable regularity, some radioactivity gets into the steam; because no turbine system is ever 100 per cent leak-proof, it then gets into the atmosphere. The amount of radioactive contamination is minute, but enough to worry environment-conscious America and Central Electricity Generating Board engineers here in Britain. They foresee the same leaks if the new steam-generating reactor is built.

Another worry is the cost of scaling up the 100 megawatt prototype reactor that the AEA has been operating since 1968, to the 500 MW needed for a commercial station. Theoretically, this ought to be a relatively easy matter of increasing the banks of pressure tubes inside a rather bigger can, but the British nuclear industry's record of scaling up from prototypes is not a happy one. The CEGB would prefer to order the other type of American reactor, where the works are sealed inside a massive, leak-proof, steel pressure vessel. In this it has the backing of much of the nuclear construction industry. About 80 of these stations have already been ordered around the world, and construction headaches are a thing of the past. Industry reckons that a British order for one of them would certainly lead to export business. But the AEA has managed to swing opinion in the DTI against it, on grounds ranging from the openly chauvinistic to heavy emphasis on the undeniable fact that long exposure to high radioactivity brings on a condition in the pressure vessels that makes them brittle as eggs if they are ever allowed to cool. Some of the Government's advisers think this a greater hazard than the occasional small release of radioactivity from other reactors.



The AEA shouldn't let off steam

Surprisingly, yet another type of reactor under development in Britain has made little headway with the review committee, although it has a gas cooling system and a graphite structure that is in direct line of descent from the early reactors of 20 years ago. This design operates at much higher gas temperatures than any yet built; the system was first developed here with backing from the Organisation for Economic Co-operation and Development, but it has subsequently been taken up in America where Gulf General Atomic has sold several, to the discomfiture of the American nuclear establishment. The Germans are also keen on it. More development work on it would be needed, but the problems do not look as big as some of its detractors maintain.

There are at least two other courses that would seem preferable to a choice of the steam-generating design. One would simply be to order more of the standard, advanced gas-cooled reactors: in the hope that if industry repeated the designs often enough, it would eventually be capable of building one both to time and within estimate. The other would be to forget existing reactors and concentrate the whole British programme on the fast breeders—where, for the first time in two decades, this country has a world lead again. The Government's advisers appear to be very nervous about recommending such a course, but possibly only because they still see

Is refinery modernization in your future? Kellogg has something new to offer.

Our crystal ball is KELPLANS, Kellogg Planning & Analysis Systems. KELPLANS uses the latest linear programming and related computer techniques to complete complicated process, economic and cost studies for clients planning a new refinery or refinery expansion.

KELPLANS can be applied to such areas as defining optimum "grass-roots" refinery schemes, expansion alternatives, day-to-day material balance and blending activities, financial analysis and planning, transportation and supplies, multi-product process scheduling and utilities economics. KELPLANS consolidates and summarizes the complex time-system of investment, cost, income, depreciation and taxes to provide a meaningful measure of the profitability that can be expected from the project.

In developing the best possible process for your refinery, Kellogg can draw upon experience that spans more than half a century. Kellogg engineering and construction forces have been responsible for designing, engineering and/or building almost 1,000 refinery units throughout the world including fifty grass-roots refineries and major expansions.

Kellogg construction management teams have the skills and experience required to execute complicated refinery construction plans. They also know how to apply strict cost and quality controls to keep the project on schedule—even when working with critical timetables, budgets and labor forces in different parts of the world.

If there's a refinery in your future, talk to Kellogg now. We have something new in KELPLANS to evaluate the project and develop the best solution.

Foreign exchange has been a businessman's headache long enough!

Let's not kid ourselves.

When dealing with so many foreign exchange regulations and problems, no bank can wave a magic wand and make all your headaches vanish.

But we believe a bank can—and should—do everything in its power to help.

We do.

We have branches and offices of subsidiaries (48 to be exact) all over the world to keep us abreast of local market information and regulations.

16th century woodcut by Hans Baldung suggests that foreign exchange was a headache even 500 years ago.

And Cenfex—our network of foreign exchange desks in major money capitals—allows us to handle transactions efficiently. With instant access to the varying rates, we can produce the most attractive exchange rates for our clients.

But we do considerably *more* than this.

We'll sit down with you. And listen.

And really try to iron out your own particular problems.

If it's a time of monetary unrest, for instance, and you ask us to evaluate your risks, we'll show you all the alternatives open to you. Then let you decide which suits your own business condition best.

We might even suggest you *not* exchange your funds at current rates. Or give you alternate banking methods which will do the same job as an exchange of funds, at less cost to you.

We might not be able to *end* all the headaches of foreign exchange.

But we'll do all in our power to ease the pain.

American Express International Banking Corporation

American Express International Banking Corporation has 48 branches and subsidiaries handling all types of banking transactions all over the world. We're in these major financial centers: Amsterdam, Athens (2), Basle, Bombay, Brussels, Calcutta, Cannes, Chittagong, Copenhagen, Dacca, Djakarta, Düsseldorf, Florence, Frankfurt, Geneva, The Hague, Hamburg, Heidelberg, Hong Kong, Karachi, Kowloon (2), Lahore, Lausanne, London, Lucerne, Lugano, Milan, Monte Carlo, Munich, Naples, New Delhi, Nice, Okinawa (2), Paris (2), Piraeus, Rome, Rotterdam, Salonica, Taipei, Tokyo, Venice (2), Vienna, Zurich. International Headquarters: 65 Broadway, New York, New York.

"There's a place in every man's portfolio for the investment that's as safe as houses"

You need look no further than the Halifax. Halifax investments give consistently good interest whilst having the added advantage of being easily realisable.

Application for permission to deal in and for quotation for the undermentioned Ordinary Shares has been made to the Council of The Stock Exchange, London.

Nippon Fund Sterling Limited

(A company limited by shares and incorporated in the Islands of Bermuda)

SHARE CAPITAL IN POUNDS STERLING (£)

Authorised	*Issued*
£5,000 in 5,000 A Shares of £1 each £500,000 in 5,000,000 Ordinary Shares of 10p each	£500 (5,000 shares of £1 each 10p paid)
£505,000	

ISSUE OF ORDINARY SHARES of 10p EACH FULLY PAID AT £1 EACH

payable in full on application
(inclusive of an acquisition charge of 2½p per share payable to the Manager)

Nippon Fund Sterling Limited ("the Company") is an open-ended investment company incorporated in Bermuda. It operates on similar principles to a unit trust or mutual fund in that, under its constitution, it will issue and redeem its own Ordinary Shares in accordance with its bye-laws.

The Company's objective is to offer investors resident in the Scheduled Territories ("the Sterling Area") a participation in a balanced portfolio of Japanese growth stocks, while minimising the risk of a fall in the investment currency premium.

The greater part of the Company's assets will be invested in Units in The Nippon Fund, a Unit Trust constituted under Bahamian law. The performance of the Fund since the first Units were issued at U.S.$10·00 (including an acquisition charge of U.S.$0·25) on 21st August, 1968 may be summarised as follows:—

The Nippon Fund

Date	Net Asset Value* U.S.$	Total Net Assets U.S.$	Tokyo Stock Exchange Index
21. 8.68	9·75 (100·0)		125·75 (100·0)
31.12.68	10·85 (111·3)	7·07m.	131·31 (104·4)
31.12.69	17·58 (180·3)	23·37m.	179·30 (142·6)
31.12.70	13·50 (138·5)	19·41m.	148·35 (118·0)
31.12.71	21·06 (216·0)	31·01m.	199·45 (158·6)
1. 3.72	24·60 (252·3)	36·02m.	222·94 (177·3)

*No account has been taken of distributions of income, which have totalled U.S. $0·81 per Unit.

The Fund is designated by the Bahamian Exchange Control as an external account and the Units are valued in U.S. Dollars. It is therefore free from the requirement to purchase and surrender investment currency at the premium rate in order to purchase and to switch its investments. Subject to Bermuda Foreign Exchange Control requirements, the Company intends, in the light of ruling market conditions, to purchase Units in the Fund with the proceeds of foreign currency borrowings and otherwise to purchase Units in the Fund with investment currency acquired at the dollar premium.

The purpose of the borrowing is not to produce gearing but to minimise the risk of a fall in the investment currency premium. As a result of the borrowing, only some 13 per cent. of the Company's initial holding of Units will be vulnerable to a fall in the premium, whereas without the borrowing this vulnerability would apply to the entire holding.

The Company is managed by The Bank of Butterfield Executor & Trustee Company Limited, Hamilton, Bermuda and The Nippon Fund is managed by Bridge Management Limited, Nassau, Bahamas. Bridge Management Limited is controlled by Vickers, da Costa & Co. (Bahamas), who act as investment advisers to the Manager of the Company and to the Fund.

The minimum initial application under the terms of this issue is for 200 Ordinary Shares of the Company.

The Subscription Lists for the Ordinary Shares will open at 10.00 a.m. on Wednesday 22nd March, 1972 and will close as soon thereafter on the same day as the Company may decide. Applications will not be acknowledged, and Renounceable Letters of Allotment will not be issued, but Share Certificates will be issued to applicants by 19th April, 1972.

Copies of the full Prospectus, on the terms of which alone applications will be considered, and Forms of Application are available from:

LLOYDS BANK LIMITED, Issue Department, P.O. Box 287, 51 Gracechurch Street, London EC3P 3DD.

Continued from page 94

Britain's choice as lying solely between coal-fired or nuclear power stations. They overlook the extent to which a limited building programme of oil-fired power stations, fuelled from the North Sea, could take much of the risk out of any decision to go for broke on the fast breeder, complex as it is.

Clydebank

Jimmy has to deliver

The deal with the Houston-based Marathon Manufacturing for the old John Brown yard at Clydebank is still in the balance. The trouble is not with the size of the Government's handout, for ministers would be glad to get shot of the problem at almost any price. Now that they have given £35m to the three Govan Shipbuilders yards, they can hardly quibble over the salvage price for the fourth which, in Marathon's terms, involves £12m to rebuild Clydebank plus assistance for a second plant down river about 10 miles below the Erskine bridge, where the legs will be put on the drilling rigs that Marathon plans to build at Clydebank. Marathon will also have to set up a servicing base where the oil is, on the east coast, and wants government help there. But this is no obstacle.

The deal turns not on money, but on the Americans getting the sort of labour contract that they are used to in Texas, and that means undertakings that there will be no strikes. Marathon's chairman, Mr Wayne Harbin, wants an undertaking that is

> not legally enforceable, necessarily, but one which we have confidence that the union leaders can deliver. For us to do our thing in your yard, we have to attract buyers and that means being able to deliver on time. We just cannot have stoppages or we will be right back in the present position.

Already, union leaders like Mr Jimmy Reid are saying that an agreement on those terms would be beyond their power.

There are other problems too: because Erskine bridge gets in the way, Marathon needs to float the platforms down from Clydebank to deeper water where a major part of the 420 ft legs will be attached. If some of the men at John Brown want to keep their jobs, they may find that they will be expected to commute to work, something they have never shown any willingness to do in the past. And because drilling platforms call mainly for steel erectors, it is difficult to see Marathon providing jobs for the carpenters and other tradesmen at Clydeside who fitted out the old passenger liners. Redundancies among them seem inevitable, but the unions have been insisting that there should not be any, just as they have been insisting that the future of Govan Shipbuilders depended on finding a means of keeping Clydebank open.

Marathon's formal request for government help was put in the post on Tuesday evening. On Thursday morning, the Breaksea group, also Houston-based, countered with an announcement that it would submit its formal proposal, a month from now, to build liquid gas carriers at Clydebank using—wait for it—Rolls-Royce engines. That should be good for a few more million quid.

Car pollution

Give a lead on lead

Mr Peter Walker, Secretary of State for the Environment, has got himself into a corner over the issue of lead in petrol. Three times he has promised a statement. In the belief that it is imminent, the environment lobby has been campaigning against the car and oil men, who are entrenching themselves in defensive positions. But Mr Walker has a problem: he faces a serious lack of generally accepted evidence on which to act.

To a considerable extent, the decision is out of his hands. The car industry is international and heavily dependent on exports, especially to America. Already the rules for changing to no-lead petrol have been set in hand by American legislation. The Germans and Swedes, too, have cut the permitted lead content of petrol, but for a different reason. The Americans are sniping at lead because it will upset the catalysts they are introducing to clean exhaust gases of other pollutants. Their concern is more with the smog-generating oxides of nitrogen and sulphur. The Europeans are attacking lead pollution itself.

No one doubts that lead absorbed in relatively small quantities causes brain damage, or that the potential danger is increasing. To meet the demand for higher car performance (ie, smaller, hotter engines) more and more lead additives have been used. The additive companies are secretive about how much organic tetra-ethyl and tetra-methyl lead there is in the "anti-knock" compounds they sell, but it

Key indicators: British economy

Overseas trade
Deficit of £32m in February as *imports reached a new high of* £784m, seasonally adjusted.

Manufacturing investment
Fell sharply in the fourth quarter of 1971 taking the year's total 8% below 1970, in real terms.

Industrial production
No upturn yet.

	Month	Index 1963=100	Percentage change on previous month	three months	one year
Industrial production*	January	124.4	+0.4	−0.2	−1.9
employment*	December	89.9	+0.1	−1.0	−4.7

Export trade, retail trade, engineering order books: in volume terms (value at constant prices). Unemployment: wholly unemployed excluding school-leavers; latest rate 3.8 per cent.
**Seasonally adjusted ‡Provisional*

is estimated reasonably reliably that 10,000 tons of lead were used in this way in British petrol last year. Of that, something like two-thirds came out in the exhaust.

The statements of the car and oil industries have generally been feeble. They claim that cleaning up car exhausts would reduce pollution by only a small amount. There is even some backing for this from the Medical Research Council, as Mr Walker knows: he has used it as a defence for not taking action in the past. There has also been some show of concern for the consumer. The oil industry is worried that the extra cost of refining lead-free petrol will put motoring costs up by 5 per cent.

Time is running short for Mr Walker. There seems little logic in attacking lead alone: lower engine performance means increasing engine capacity. But this would bring a proportional rise in the other pollutants. Mr Walker cannot hope to sit tight and wait for the development of a suitable substitute for the petrol/diesel engine, either. The current range of electric cars and buses using lead-acid batteries are so slow and have such short range that they are scarcely practical. Other battery systems, like the much vaunted zinc-air device, seem to have faded.

Jobs

Anyone for Ulster?

The announcement from Northern Ireland on Wednesday of a three-year campaign of industrial development to boost employment looks a brave effort at window dressing and not much more.

The finance corporation with £50m at its disposal, suggested last December by Sir Alec Cairncross to help companies hit by the bombers, is getting off the ground after Easter. Its chairman is to be Mr Charles Villiers, of Guiness Mahon, once managing director of the ill-fated Industrial Reorganisation Corporation. That sounds like action, but the dole queue lengthens each month. It reached 46,721 in February, which is 9.1 per cent of the work force and 11.3 per cent of all men. Well over £25m worth of damage has now been done to factories, shops and offices. Since July, 86 manufacturing firms have suffered losses in production and eight, employing 600 people, have closed for good. Last year 85 per cent of the 7,200 new jobs created were from expansions in existing industry. The flow of new industrial investment is no more than a trickle.

Hotels

Swiss roll, bed roll

Making Swiss and sausage rolls is a business that demands more uninterrupted floor space than J. Lyons now has on its old Cadby Hall site, so what could seem more sensible than to put a proposition to Hammersmith council to develop the site for a hotel plus supermarket, particularly when Hammersmith is being tipped for a face-lift ? But it is put forward at a time when hotel profits have begun to be clipped ; last year was the first for a long time in which hotel prices rose by less than the cost of living.

Lyons is thinking in terms of 1,000 rooms, but would not expect to open for at least seven years, which is just as well, given the surmising among hoteliers about over-capacity. Even the consultants, Cornell, Greene Bertram and Smith, are sounding a warning note about the level of tariffs, and the penny-pinching of the American new poor whose holiday habits are likely to reflect the effects of dollar devaluation for at least the next two years. Before that has worn off, hotelkeepers will have had to come to terms with value-added tax and with the Greater London Council's threatened bed tax. But, given the limitations of the Cadby Hall site, it is difficult to see what Lyons could have proposed that would not have had some question marks hanging over it, and 1979 is a long time away.

You could describe it in the brochure as a site ripe for development

Vat

Told your computer ?

The form that value-added tax will take next year is going to be announced during next Tuesday's budget, but many of the details needed for bookkeeping purposes may not be settled until the autumn. This will give companies alarmingly little time to prepare for a changeover that is going to involve some of them in everything from the ordering of new stationery to the reprogramming of all their computer software. The main reason why so little has been heard of these difficulties is that, having made such a fuss about switching to decimal currency last year, and then being made to look exceedingly foolish when it passed off almost without a hitch, the computer industry is shy about crying wolf again. Its silence this time is being read by both Government and industry as a sign that there is really nothing to worry about. But Vat is a much bigger problem than decimalisation.

There are about 35,000 companies in this country big enough to use some form of mechanised accounting, all of which will have to be changed. Much of their present equipment does not have the physical capacity to cope with Vat. Computers used by many companies will need a third more computing ability than they have now. A lot of reprogramming will have to be carried out ; the Singer company has estimated that it will take the equivalent of 35 man-years of work to convert all its customers. Honeywell was the first of the computer manufacturers off the mark with a special Vat package deal for customers. The reception of it suggests that, in spite of warnings, orders are not expected to reach a peak until the end of 1972. With deliveries of multi-part stationery taking eight weeks now, before the heat has even begun to build up, there is a promise of some fine old muddles in Vat's first financial year of 1973-74.

UNITED BISCUITS (HOLDINGS) LIMITED

1971 RESULTS

The Board of Directors of the United Biscuits (Holdings) Limited report as follows on the results of the Group for the 52 weeks ended 1st January, 1972.

Dividend

The Directors recommend a final dividend on the ordinary share capital of 10 per cent payable, less income tax, on 6th June, 1972 to shareholders on the register at the close of business on 14th April 1972. This dividend, together with the interim dividend of 6 per cent paid in November 1971, brings the total distribution for 1971 to 16 per cent (1970—13.5 per cent).

Results

The results for the 52 weeks ended 1st January, 1972, subject to final audit, with comparative figures for 1970 (53 weeks) are as follows:

	1971 £000's	1970 £000's
Sale to third parties before discounts	101,400	94,800
Share of sales of associated companies	5,800	400
	107,200	95,200
Trading profit before depreciation	10,951	9,188
Depreciation	3,193	3,150
Trading profit	7,758	6,038
Interest	1,521	1,565
	6,237	4,473
Share of losses less profits of associated companies	133	206
Profit before taxation	6,104	4,267
Taxation	2,417	1,600
Profit available for shareholders	3,687	2,667
Ordinary dividends		
Interim of 6% (1970—5.5%)	749	686
Proposed final of 10% (1970—8%)	1,254	998
Retained profit for the year	1,684	983
Extraordinary items (net)—see note 2	583	(1,177)
Balance retained	1,101	2,160
Earned per share (before extraordinary items)	14.7p	10.7p

Notes

1 The results of the associated companies have been consolidated in the above figures for the first time and the comparative figures for 1970 have been adjusted accordingly.

2 Extraordinary items comprise reorganisation charges, after taxation relief, of £1,040,000 (of which £426,000 relates to associated companies) and a transfer of £43,000 to deferred liabilities for pensions, less taxation provisions no longer required of £500,000.
The corresponding credit for 1970 represented taxation recoverable of £1,463,000 less reorganisation expenses and other adjustments of £286,000 after tax relief.

Capitalisation proposals

The Directors consider this is an appropriate time to bring the issued share capital more into line with the assets employed. Accordingly they recommend a scrip issue to ordinary shareholders in the ratio of one new share for every two shares previously held. This will result in the capitalisation of reserves amounting to £6,269,000.

It is also considered that it would be in the interests of shareholders if the nominal value of the shares was reduced. It is therefore recommended that each share of 50 pence should be split into two shares of 25 pence.

The final result of this share split and the scrip issue referred to above will be that a shareholder will hold three shares of 25 pence each in place of each share of 50 pence previously held. The Annual General Meeting will be held in Edinburgh on 11th May, 1972 and the Report and Accounts will be posted to shareholders on 17th April, 1972. Shareholders will be invited to pass resolutions at the meeting to give effect to these proposals.

The Directors consider it desirable to include with this preliminary statement of results the following comments on the prospects for 1972.

Prospects for 1972

The outlook for the year is encouraging and a further considerable increase in profits is budgeted. The Directors would expect this to lead to an increase in the total amount distributed and it is their present intention to declare an interim dividend in September of this year at the rate of 5 per cent on the increased share capital. The equivalent interim dividend for last year was 4 per cent after adjusting for the proposed scrip issue.

Professionals only, please

An investor who bought a share on the London stock exchange last Monday need not pay for it until April 12th, nearly a fortnight after the end of the longest account of the year. By the time he makes out his cheque he will not only have ridden through an enthusiastic bull market which had pushed up the Financial Times ordinary index by 9½ points between Monday's opening and Thursday midday, but will be in the new financial year; this account ends on the last dealing day but one, in fact, in which he can take a profit or loss to even up his capital gains tax bill. And plopped neatly into the middle of the account is the budget.

Not a time for the amateur dabbler. But for the professional watching the exchange by the moment, jobbing in and out of stocks, the activity of the next two and a half weeks should give the opportunity to make as much as a post office deposit account offers in a year. The risks are there and the heavy amount of dealing on the exchange shows that the professionals are remaining very light on their toes; and that means that your friendly broker is quietly making a packet.

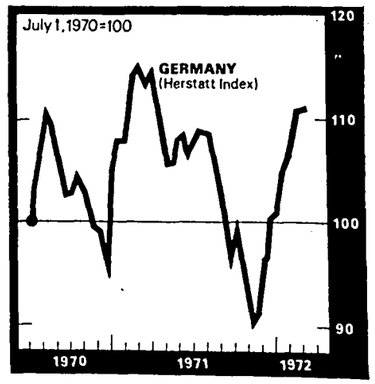
As if the immediate future is not explosive enough by itself, the market is being kept on edge by a raft of takeovers and bid rumours. The £350m bid by **Grand Metropolitan Hotels** for **Watney Mann** is the second biggest the market has seen, and it is certain that Watney's fight against it will be long and tough. So here the classic takeover rule applies: sell Grand Metropolitan, which can only increase its offer and pay for it by a larger handout of equity, and hold Watney Mann.

The bid has improved the prices of the whole brewing sector. But there are a host of other rumours whirring around Threadneedle Street, probably mostly well founded, which encompass many of the stock exchange's favourite or most established companies: **Ranks Hovis McDougall, Montague Burton, Scottish and Newcastle, European Ferries** and **British Relay** are among the tipped.

But behind all this immediate market activity there is a growing undercurrent of opinion that is quietly changing from the market's glamour stocks and chasing after the classic hedge equities: the gold mines, companies with large overseas earnings, and those that would benefit from another devaluation, or at least from talk of it. And with an expansionary budget and worsening trade figures that talk is bound to come. Perhaps the best example has been De Beers, which last year improved its profits by 30% to £52m, but which only in the last week has advanced by 22p to 260p.

German bourses

Achtung



Germany's eight bourses have taken a knock in the past two weeks, after a welter of bad news from the country's largest corporations. Previously, the Herstatt index, which measures the Dusseldorf exchange, had been rebounding nicely: in early March, it reached a point 28% above its four-year low of 87 in November, 1971. Then the warnings came.

Thyssen Huette, Europe's largest steelmaker, led the way by announcing that its crude steel output for the first quarter of 1972 was 20% below 1971's level. Its investment programmes are being cut and most of its plant is working below capacity. Last year was bad enough; profits dropped 70% and the dividend was sliced in half. The shares at Dm 80 now stand 17% down on last year's high. If you think that the German economy is on the upturn (see page 90), this is the time to buy.

Thyssen Huette's story was re-echoed within a week by Germany's other big coal and steel company, **Friedrich Krupp.** Krupp has issued no figures, only a bald announcement that this year's earnings are lagging behind 1971's and that order books look bleak. Similar reports have come from **Kloeckner Humboldt Duetz,** the heavy engineers, and **Degussa,** the chemicals and metals concern. All this spells caution for the foreign investor; and the economics minister, Herr Karl Schiller, is probably rather relieved that it does. Although the D-mark is again close to its exchange ceiling, investors who buy German shares with the hope of catching the next upvaluation of the mark have been staying away.

In one sense, Germany might seem to offer a safe two-way bet. If its economy recovers, so will its shares; if it stays in recession, its balance of payments surplus will force another upvaluation. But there is a major snag in German equities as a recession-time upvaluation counter.

Since most German companies are closely tied to banks and hence have easy lines of credit, they have become more highly geared than their counterparts in Britain or America. When

new profits slacken, dividends are cut drastically and without much compunction, and long-term investment plans are relegated to the bottom drawer. One startling exception is **Siemens**, the electrical group, which has been enjoying a sustained period of growth and is raising £40m in a rights issue next month. At Dm245 the shares are considerably above this year's low of Dm171, but still look an attractive buy once the rights have been absorbed.

The Germans themselves have little faith in equities at the moment. They are investing instead in a flood of new bonds, in the belief that their market interest rates may go even lower. But the equity market is likely to find new life when the £700m tax surcharges are repaid this summer ; much of it ought to filter back to the bourses.

ITT

Record breaker

New York

Amid the buzz of embarrassing wheeling and dealing, the embattled International Telephone and Telegraph Company has not lost its touch for making money. The giant conglomerate reported worldwide revenues of a record $7.35 billion in 1971, or 13% above a re-stated $6.48 billion in 1970. Its net income was up 12% to $406.8m, or $3.45 a share, before an extraordinary $70m charge to reserves for the loss by expropriation of its partly-owned Chilean telephone subsidiary. Earnings in 1970 were $362.5m, or $3.14 a share, adjusted to reflect companies acquired through pooling of interests. ITT's fame springs from its 51 consecutive quarters of improved profitability since the legendary Mr Hal Geneen

Money-making, money-giving, Geneen

became its president 12 years ago. Its present notoriety stems from allegations—strongly denied by all parties concerned—that the American Justice Department's anti-trust division settled three anti-merger suits against the company after being favourably impressed by a $400,000 contribution by its hotel subsidiary to the Republican national convention that is going to renominate President Nixon in San Diego next July. Members of the Senate judiciary committee, investigating the charges in Washington this week, heard denials of involvement from the former attorney-general, Mr John Mitchell.

Under the merger settlement, ITT agreed to dispose of three fairly recent acquisitions, but was able to retain Hartford Fire Insurance. Mr Geneen believes strongly that Hartford Fire's heavy annual premium income is important to ITT's finances, and has stoutly resisted a succession of efforts to de-colonise it from his empire. It is not a declining empire. In his annual statement, Mr Geneen said that the money raised by sales forced by the other divestitures will be reinvested to produce replacement profits. ITT's share price recovered $2.6 on Tuesday, to $61—in a turnabout session on the New York exchange which took the Dow average up 5.34 points to 934.0 after five consecutive days of declines.

Insurance brokers

Reassuring

A batch of insurance brokers' results will soon be coming in. They are expected to be cheerful, and current share prices discount this. But a good start has been made by **Sedgwick, Collins**. Its international business, with the emphasis on big risks like oil companies, produced profits up 14% to £3.2m, even though the dollar's devaluation cost it £200,000. Insurance brokers have gained from the increasing business sent to London since the devaluation of sterling, from the cut in selective employment tax, from the higher premiums which insurers have been charging across the board in Britain and America, and from the fact that increasing competition has prompted the life business, in particular, to give brokers a bigger slice of the growing cake.

Although there may be no real bargains to go for, the sector should ride along safely with the market. One spill-proof ride ought to be Sedgwick, Collins itself, selling on a prospective p/e of 17. The company has low expenses, vital in this business, and does not rely, like some of the lighter weights, on short-term investment of premiums for a chunk of profits. Those that do could be vulnerable to a decline in interest rates. Other heavyweights with the same virtues as Sedgwick, Collins are **Leslie and Godwin** and **Alexander Howden** (but the latter, on a p/e of 32, looks too dear). The aggressive and rapidly growing **Minet Holdings** could be the more speculatively inclined ; it has the bonus from the underwriting upturn in Lloyd's 1968 account still to come. **C. E. Heath** and **Staplegreen**, among others, have already accounted that profitable year ; they may thus have less scope for further advance.

BARCLAYS BANK BRIEFING-117

A quarterly information service on money matters

Mr. ANTHONY TUKE, Chairman of Barclays Bank International, discusses the future course of world trade.

Economic Crossroads

ANTHONY TUKE
Chairman of Barclays Bank International

The international monetary and trading situation is confused, but there is no doubt that we have reached the end of an era and a turning point in international affairs. For a quarter of a century certain cardinal objectives have dominated our economic thinking and actions: the liberalization of world trade through the progressive reduction of tariff barriers; a consequent sustained erosion of preferential trading groups; the maintenance of exchange rate parities with devaluation or revaluation undertaken only as a last resort; the use of the dollar and sterling as reserve currencies setting them apart from the rest.

We may regret the demise of the old regime under which a great deal was achieved, but it is futile to believe that it can be restored in unmodified form. The question we now have to face is what sort of system will be built up for the future and what part an international bank should play within the new framework.

Any new system must, if it is to work, take into account the basic fact that the present world environment is very different from what it was in the late 1940s. In the immediate post-war years the economic power of the United States was unchallenged, but as other countries of the western world, helped by U.S. aid, recovered from the effects of war, the balance of power changed. The change has been accentuated by the creation of regional unions and alliances and by the decline of the dollar.

Third World

I welcome the development and growth of larger economic units such as the Common Market, but it would be disastrous for world trade and prosperity if these rich groups, frightened by the recent upheavals, turned in on themselves and tried to achieve stability by protectionism and isolation. Such a policy would particularly damage the developing countries of the Third World, which have suffered enough in the past from vacillating commodity prices and deteriorating terms of trade.

It is in developing countries that I see an international bank such as Barclays playing a most important part. In the past we contributed towards the growth of their international trade and provided finance, often from external sources, for local development. We shall continue to provide these facilities but the requirements of developing countries are changing. They are demanding, and must be given, an increasing say in world economic management and decisions, as well as seeking greater control of their own economies and natural resources. Local bank deposits are for them a vital raw material and the days are past when funds could be freely transferred from one such country to another.

Rich countries have since the war given a great deal, though not

CONTINUED ON FOURTH PAGE

BARCLAYS MOVE INTO LEASING

To its already wide range of financial services Barclays Bank has now added leasing facilities, by which the bank buys equipment and rents it to the lessee. In introducing this increasingly popular means of obtaining capital equipment Barclays is taking particular advantage of its United Kingdom network of nearly 3,200 branches.

Like the General Practitioners with whom they are often compared, bank managers will rightly call in the specialists whenever a customer's financial needs go beyond those of everyday banking.

A unique exception to this rule is provided by Barclays' new leasing service: branch managers themselves can provide a standard form of leasing agreement. Thus for the business with a straightforward leasing proposition – and so many of them are – all that is involved is a quick and simple transaction.

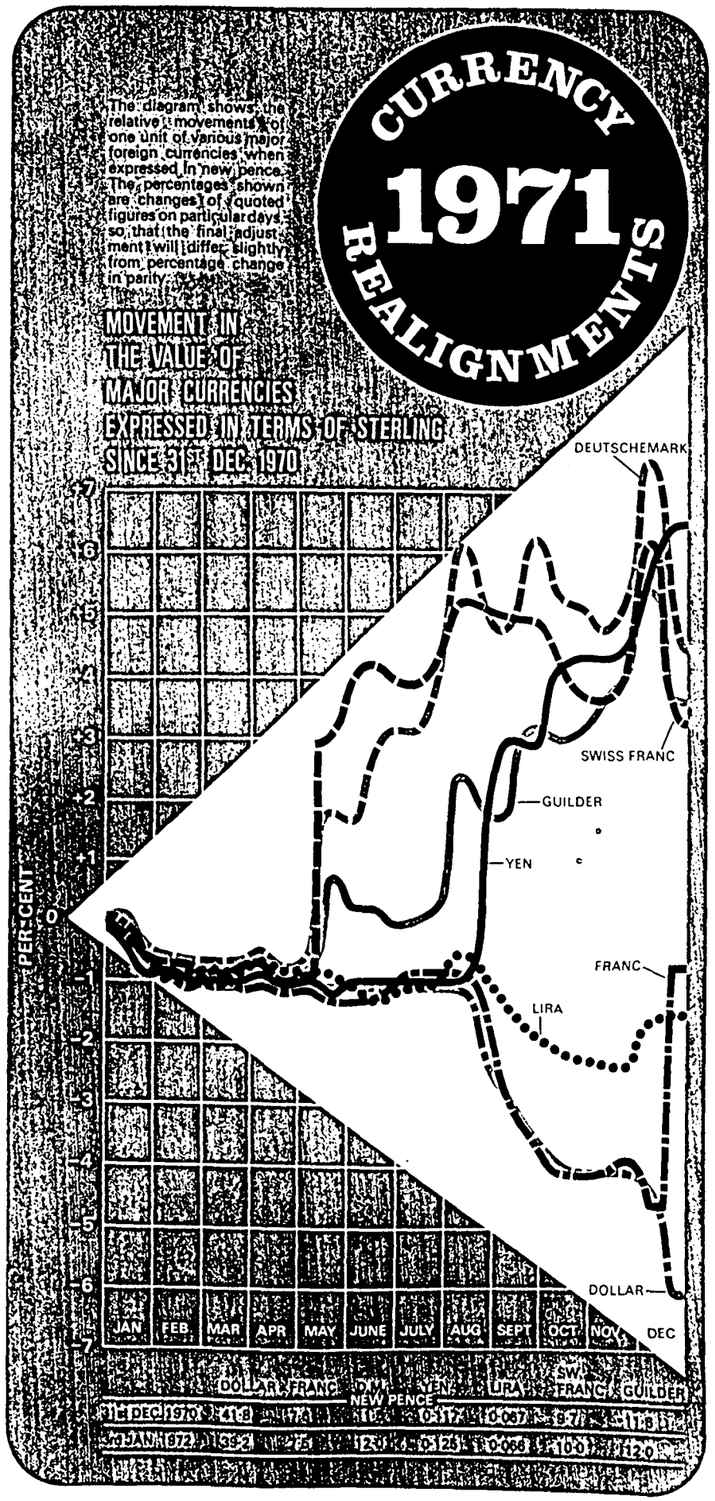
"We believe this approach to leasing makes the best possible use of Barclays' countrywide branch network," says Mr. R. E. Thornton, Chief Manager of Barclays Export and Finance Company. "And the business concern, whether a Barclays customer or not, gains the benefits of a speedy transaction with the local Barclays branch at very competitive rates."

When the proposal is large or more involved, however, the Leasing Division of Barclays Export and Finance Company, which is a wholly-owned subsidiary of the bank, is brought in. The Leasing Division has been set up under the management of Mr. Derek R. Soper, who previously held senior posts in two major leasing companies. Mr. Soper and his management team are ready to travel anywhere in the United Kingdom to discuss a major proposition.

Mr. Thornton sees leasing as complementary to Barclays' other financial services. "It has distinct advantages which, in the right circumstances, can make it preferable to a bank loan or overdraft, hire purchase or using retained profits as a means of financing capital equipment."

He points to four major advantages:

- **The freeing of working capital for more profitable use than when absorbed by fixed assets.**
- **The maximizing of advantages from taxation and cash flow situations that can stem from incorporating a specially-designed rent structure in the lease.**
- **The savings to be made by purchasing capital equipment at today's prices.**
- **The increased profit margins that can result when leasing forms part of a well-planned forward budget.**



Hotel furnishings: one example of the wide scope of leasing contracts
(Photo by courtesy of Embassy Group of Hotels, London)

That leasing will remain a growth dustry, in spite of the proposed changes Britain's tax system, Mr. Thornton has doubt. "Between 1965 and 1969 the mated amount of investment by leasing panies more than doubled, even allowfor inflation. As costs increase in line h the greater sophistication of capital ipment the scope for leasing contracts only widen.

"There is," he says, "growing evidence t those larger private and public mpanies that have modern methods of vestment appraisal available within their ganizations, are the same companies that utilizing leasing facilities."

He expects Barclays to be dealing in a oad range of items, from the more ditional, like manufacturing plant and ring equipment, to comparative newmers such as closed-circuit television and anced computer equipment. Already jor contracts are being negotiated for the sing of supermarket equipment and the plete refurnishing of a group of hotels. Comments Mr. Thornton: "The truth t profits stem from the use of equipment, t from ownership, is daily gaining wider gnition."

ESTATE PLANNING WITH BARCLAYS

ESTATE PLANNING
Barclays Bank Trust Company

Estate Planning is the arrangement of your affairs to the best advantage of yourself and your family. It takes account of your needs in your lifetime and your family circumstances generally.

It is not, as Barclays Bank Trust Company's new booklet *Estate Planning* points out, concerned solely with estate duty and tax matters. There may be many others. An estate plan would review your present financial circumstances and go on to suggest any changes aimed at making the best use of the resources available.

In drawing up your personal plan the Estate Planning Manager would consider factors such as your age, present income, assets, state of health, domestic considerations and the number and ages of potential beneficiaries. His recommendations for the rearrangement of your assets could include gifts, trusts, annuities, life policies and property which is exempt from duty or subject to duty at a reduced rate. He could propose changes in your investments and in private company or business interests.

How wealthy do you have to be to benefit from this service? There is no minimum, but usually an estate plan would help anyone with total assets of more than £40,000. Charges are moderate.

For a copy of *Estate Planning* call at any Barclays branch or write to the Estate Planning Department, Barclays Bank Trust Company, 80 Gracechurch Street, London EC3V 0PX.

ECONOMIC CROSSROADS

continued from page one

enough, aid to the developing world. A large proportion, particularly from the private sector, has been channelled into industrial and urban expansion. Industrialization is a legitimate aim for any country, and we have helped the process through Barclays Overseas Development Corporation, but there is a great danger that, in the haste to industrialize, more fundamental problems are overlooked. Education and social services lag behind and the magnet of the big city entices farmers from the land.

Barclays' contribution in the way of direct aid can only be small, but we have set aside £100,000 a year to provide "pump priming" grants for socially desirable projects which would not qualify for support on purely commercial grounds. We are also intensifying our search for viable schemes to finance in the rural sector and our agricultural officers are available to provide technical information and advice.

Country people have always resisted change more fiercely than city dwellers, and the introduction of modern farming techniques must take time, but unless rural development is achieved and the gap narrowed between earnings in town and country, the dangerous migration to the towns will continue and a vital natural asset will be increasingly wasted.

Communist bloc

I have already mentioned the polarization of the world into larger units and the danger of isolationism. The most isolated group of all is the Communist bloc and it seems to me that an international bank might be able to do something towards breaking down the barrier between East and West and improving mutual understanding. Perhaps traders in an essential international commodity such as money are in as good a position as anyone to penetrate curtains of iron or bamboo and I do not see why we should not try.

THIS BRIEFING has been prepared by Barclays Bank in the hope that it will provide a useful service for journalists, economists and everyone interested in finance. The tables have been specially compiled from the latest available statistics.

Try Atlas's amazing 27,000-lumen cocktail

More sparkling than a Horse's Neck, more complex than a Straits Sling, more freshly natural than a Sunshine, warmer-hearted than a Kentucky Gentleman, cleaner and clearer than a Gibson and as good to have around as a Gloom Chaser, Atlas's unique cocktail is called the °Kolorarc. Switch to it, and you're hooked.

The Atlas °Kolorarc is the unique metal halide lamp that makes all other industrial and commercial mercury lamps look a little blue. 27,000 amazing lumens of light the °Kolorarc pushes out, and every lumen has the natural glow of a soft summer morning.

°Kolorarc contains what Atlas call a 'cocktail', a subtle blending of vapourised metals that balances its lumen output happily along the spectrum, producing a light uncannily close to daylight.

Just like Harry, Charlie and the Senator.

Only Atlas know how to mix metal-vapours to get the °Kolorarc cocktail. Just as only Harry of Ciro's could shake an authentic Monkey's Gland, just as no one but ol' Senator Fairbanks ever grasped what you do with Noyau and Vermouth to achieve a Fairbanks Cocktail, just as it took Charlie at the Racket Club to conjure the H.P.W. out of what ought to have been a Gin and It, or Sidney of the Cecil to realise you could graft Grenadine to Dubonnet and come up with a Rose, so you'll have to go to Atlas and °Kolorarc if you want to look at a mercury lamp and see daylight.

If you're interested in the commercial possibilities of °KOLORARC for your Company premises, please send for your exhilarating free copy of The Atlas Atlas of Cocktail Recipes to Thorn Lighting, Thorn House, Upper Saint Martin's Lane, London WC2H 9ED.

Atlas Kolorarc

a new kind of lighting up there

Blundell-Permoglaze Holdings Ltd.

Significant Progress Achieved

Salient points from the Statement by the Chairman, Mr. E. B. Calvert, for the year ended 31st October, 1971.

Consolidated net profit after tax (excluding Australian losses) amounts to £304,912 compared with £182,719 a year ago, an increase of 70%.

Both trading companies, namely India and United Kingdom, contributed to this significant progress. Blundell-Permoglaze Ltd. had an excellent year with considerably increased profits while the Indian Company staged a marked recovery on the previous year.

During the year our loss-making subsidiary in Australia has been sold, our factory at Slough closed down and certain unprofitable lines have been discontinued. I am confident that as a result there will be a worthwhile improvement in future profitability.

In the light of the results and the Directors' confidence in the Group's future prospects, a total dividend of 14% is proposed (last year 12%).

Addressing Shareholders at the Annual Meeting, the Chairman said:

In my Statement which accompanied the Accounts Shareholders were informed that at this meeting I would provide them with as much information as possible with regard to the Group's progress during the current financial period and, at the same time, give them my opinion with regard to the final outcome of the year's trading.

First, with regard to the United Kingdom Company, I have available to me sales and provisional profit estimates for the first four months of the year. These disclose a satisfactory position inasmuch as the upward trend of sales and profitability has continued and increased.

Secondly, in respect of the Indian Subsidiary, the provisional figures for the first half of the year have been received and these show a very substantial increase in profitability. Also I have available provisional sales figures for the first two months of the second half of the year and these are encouraging.

On this occasion my forecast of the Group's trading result of the year has to be made against a background of a national crisis which has occurred both in the United Kingdom and in India. In this country thanks to the Works Management and operatives, very little production was lost. The progress of the Industrial Division has been checked temporarily, but the Decorative side of the business has continued to expand. With regard to India the Emergency in that country adversely affected business in December, but a steady recovery took place in January with a return to normality in February. To sum up, based on all the evidence I have presently before me, my firm belief is that both companies will produce very good trading results with profits substantially higher than those recorded during the previous year.

We can do a lot more for you than lend you money

At the Bank of Nova Scotia, we have a lot of things to give you as well. There's knowledge, expertise, and time.

Take knowledge first. Since 1832 we've grown into an organisation with over 900 branches spread right across the world.

This means that, when you're doing business abroad, we can help you with a full range of international banking services. Upon request on your company letterheading we can supply one of our latest 'Business Guides' by return of post. Our most recent guides which are available for Canada, Bermuda, the Bahamas and Jamaica, will help you on local taxes, legislation and other trading conditions. Guides on other countries are being prepared and these should be available shortly.

Then there's expertise. Over the years we have acquired a lot of insight in various specialised financial areas. For example shipping financing. But we also know about Trust Companies. Through our subsidiaries we can offer world-wide Trust Company facilities. Why not approach our United Kingdom Trust Company Manager for further details by calling London at (01) 629 7071.

Last, but by no means least, we offer time, without charge. And that includes time to assess your business propositions and requests for loan facilities.

Now that credit restrictions have been eased in the UK you will also find that we can lend money at very competitive rates.

We think our job is to do more than lend you money. It's also to offer you help and assistance when you ask for it.

Contact our local branch manager or our business development officer at our European regional office, 19/23 Knightsbridge, London, SW1.

The telephone number is (01) 235 1105. And we are in the telephone directory not only in the City, but also in Edinburgh, Glasgow, Belfast and Dublin.

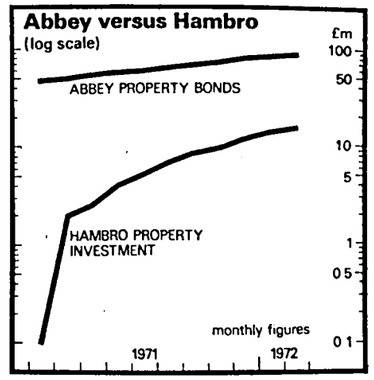
C.B.A BANK

Property Bonds

All ready and nowhere to go



The managers of property bond funds are crying all the way to the estate agents. A year ago when *The Economist* published the first of its six-monthly surveys of property bonds, the 25 funds totalled about £80m, and they were struggling to establish the credentials of this enfant terrible of the savings business. There are still only 26 of them, with the Pearl and Samuel Montagu as the latest famous institutions to join the ranks; but their funds are now nearly £200m. This is still a long way from the £2.1 billion of the unit trusts, but money is coming in to them at a rate of between £10m and £12m a month. Meanwhile, the Scott committee is still working out in what form they should be allowed to exist.

All the other property-loving institutions are also flush with cash. Pension funds, insurance companies, and property companies themselves are all looking for the same kind of top quality property investment as the property bonds. For the time being, the old bugbear that property bonds are illiquid—the nagging question of "what happens when the bond funds try to convert property into cash in a hurry?"—has been turned on its head. The funds cannot get enough money into property. They are flush with bank deposits, while their managers ring round the estate agents for something to buy at a reasonable price.

The managers are boasting of their restraint in not buying property at fancy prices, and in not sending the property market into an even more crazy upswing. But their restraint has only just begun to be extended to cutting back their advertising campaigns. Since property bought dear, and valued dearer, will fall furthest if and when the property market becomes more bearish, a few managers are now pulling in their horns. This goes against some grains: property bonds, because of their tax structure, can get more mileage out of their initial charges than unit trusts. But

Silk's Bishopsgate block: sold for £480,000

the new campaign planned for **City of Westminster** by the new owner, Mr Pat Matthews's First National Finance Corporation, has been dampened. The newspapers may not be reaping such a fat harvest as last year, when Mr Mark Weinberg spent £350,000 promoting **Hambro Life** in direct competition with his ex-baby, **Abbey Life**—which spent £½m to make sure it stayed number one. For some funds newspaper advertising is more a way of keeping their name before the public than of attracting their money directly. **Property Growth**, and most of the tiddlers, are getting a great deal of money from the clients of insurance brokers.

One way of solving the problem of not being able to shunt the funds into property is to make a virtue out of shunting it elsewhere. The so-called "managed fund" puts the investor's money into subsidiary funds: of property, of equities and sometimes of fixed-interest securities. City of Westminster points out sadly that it has had just such a fund—**First Unit Fund**—for the past eight years, and no one has ever called it anything special or noticed it before.

Some managed funds, like First Unit and Abbey's **Selective Fund**, maintain a fixed proportion—a third in all cases—in each sector. But the newer idea pursued by Hambro Life, **Tyndall** and **Save and Prosper** is to vary the proportions according to market circumstances. This creates the pleasant impression of the managers pondering the omens and getting their investors' money into just the right places at the right time.

In practice, the managed funds are unlikely to switch wholesale out of property even if the equity market looks like booming ahead, and their managers do not seriously claim that

they will. These managed funds are really very similar to the old-fashioned life assurance funds, except that the appreciation (or depreciation) comes through directly rather than in the form of a periodic bonus. They should, therefore, produce the same sort of reliable, if a bit pedestrian, returns expected from a with-profits policy—with a bit of a boost from being free of the conservatism inherent in the bonus system. Once the bonus has been given it cannot be removed. Several more managed funds should be putting in an appearance soon. **Target** is pondering one ; so is **Nation Life,** now owned by the Stern family's part of the divided Freshwater group and Sterling Industrial Securities.

Another answer to the property shortage is for funds to take a hand in developing their own property. Specialist funds like Westminster's **Speculator** and Nation Life's closed-end **Performance Fund** do the whole development themselves. The more cautious approach of Abbey and Hambro is to own the land, provide development finance, and agree to buy the property at the end of the day at a fixed multiple of the rent achieved. If the developers get more than an agreed minimum, the difference is split with the fund. Property Growth has always taken a particular interest in development ; 30% of its fund is in a wide variety of partnership agreements, where the fund holds the freehold and the developers hold a lease. Abbey has put a 25% limit on the proportion of the fund in developments ; and is already rapidly approaching it.

There are problems about valuing the developments as they progress. Valuers are quite properly conservative about this more risky end of the business, and value developments at cost. This means that today's bondholders carry all the risk, while those joining later might be just in time for the big rise in fund values. A discussion is in progress between bondmen and valuers to achieve a fairer balance. An alternative and sounder line, pursued by Hambro (among others), is to reach more flexible forms of agreement with developers, so that they share part of the risk with the fund. The developers might, for example, pay the fund an income during the development period, in return for a bigger share of the profits at the end.

Property bonds should not seek spectacular performances. Their attraction is a steady growth in capital values and from reinvested income. At present their histories are too short for any but the City of Westminster's sturdy progress to mean anything much. The sudden leap of the **Robert Silk** fund, which looks so thrilling in our table, is due to a recent sale of a Bishopsgate property which accounted for well over half the fund ; it cost £320,000 and fetched £480,000 at the end of the day. The Silk family, who manage the fund, now have to find another investment ; this will be the real test of what they can do. They have their hearts—along with £180,000 of their own money—in the fund ; but other holders might callously judge this the right moment to take profits.

Abbey precincts in Bedford Square : posh properties at a premium

Small funds like Robert Silk have to make the difficult choice between putting a lot of their eggs into one expensive basket of property or collecting a larger number of smaller investments. The latter may look the safest at first glance, but in the current market large properties are a good deal more marketable than small ones and there is less risk of their losing value. That was why the Silks made their Bishopsgate killing. But it is still possible to pick up bargains at the lower end of the scale. Target, for example, is trying to collect small shops and offices in blocks ; this should make them more attractive to institutional buyers. Other funds may have to follow Target in this hard work of small property hunting, because the prestige blocks are becoming rarer and rarer.

M&G Year Book 1972

The Year Book examines M & G's unit trusts and assurance schemes in detail. It gives a breakdown of each portfolio, and graphs comparing capital and income performance with both the Financial Times Index and the cost of living.

Although it is designed as an aide-memoire for professionals, the Year Book is also available for the serious private investor. And this year it will be more in demand than ever, since The Times recently declared: "If the unit trust industry awarded a prize for ingenuity and innovation, by now M & G would be the permanent or outright holder of such a trophy".

Please send me a free copy of the M & G Year Book 1972

CHAIRMAN'S STATEMENT

SEDGWICK, COLLINS (Holdings) Limited

International Insurance Brokers

STEADY EXPANSION

Salient points from Mr. P. W. Milligan's report to shareholders.

- The Group Profit before taxation for the year 1971 amounted to £3,187,412. This shows an increase of 12.2 per cent over the Group Profit for 1970 which itself showed an increase of 11.3 per cent over 1969.
- The Group's turnover of £7,314,991 shows an increase of 14.2 per cent over the comparable figure for 1970. The turnover would have been approximately £200,000 more had the American dollar not been devalued.
- Work on the foundations of the new office building next to Aldgate underground station has already begun. It is intended to cover the cost from available resources within the Company.
- The Group grows in strength from year to year and I am reasonably happy that both the immediate and the distant future can be faced with confidence.

Five Year Growth (£000's)

	1966	1967	1968	1969	1970	1971

APPOINTMENTS

The Queen's University of Belfast

Lectureship in Accounting Science

The Senate of The Queen's University of Belfast invites applications for a Lectureship in Accounting Science in the Department of Business Studies from 1st October 1972, or such other date as may be arranged. Candidates should be graduates in Economics, Business Studies or a related field and/or members of a professional body of Accountants. Salary scale is £1,491 to £3,417 (under review) plus contributory pension rights under F.S.S.U. Initial pacing on the scale will depend on qualifications and experience. Applications should be received by 7th April 1972. Further particulars may be obtained from The Senior Assistant Secretary (Personnel), The Queen's University of Belfast, BT7 1NN, Northern Ireland. (Please quote Ref. 72/E.)

Australian National University

Research School of Social Sciences

POSTS IN ECONOMICS

Applications are invited for appointment in the Department of Economics, Research School of Social Sciences:

SENIOR FELLOW: $A11130-$A13068 per annum;
FELLOW: $A8062-$A11113 per annum;
SENIOR RESEARCH FELLOW: $A9922-$A11860 per annum;
RESEARCH FELLOW: $A6700-$A9220 per annum.

The Department is concerned with long and short run processes of economic growth and structural change, and with econometric and more generally quantitative studies of economic problems and decisions. Within the very wide ambit of these interests, all of which involve both empirical and theoretical elements, it is not intended to designate any particular field in which an appointee need be specially qualified. He will be expected to give his basic attention to research, with the opportunity to take part in the supervision and training of postgraduate students. The present head of the department is Professor T. W. Swan. Professor F. H. G. Gruen will take up duty late this year.

Senior Fellows and Fellows are appointed for an initial period of five years, after which they are normally reappointed to retiring age. A Senior Fellow is entitled to one year's study leave on full pay, plus a contribution towards travel and other expenses, in every six years of service, and a Fellow in every seven years.

Appointment to Senior Research Fellowships and Research Fellowships is normally for three years extendable to a maximum of five years.

Superannuation is on the FSSU pattern with supplementary benefits. Reasonable travel expenses are paid and assistance with housing is provided for an appointee from outside Canberra.

Further particulars may be obtained from the Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF (Tel: 01-387 8572).

APPOINTMENTS

University of Malawi

CHANCELLOR COLLEGE

Applications are invited for the post of LECTURER IN ECONOMICS, tenable from 1st September 1972. Candidates should have a Master's degree or equivalent and/or experience. A good background in economic theory is necessary. Applicants able to teach any of the following courses particularly welcome: Agricultural Development, Planning, Public Finance, Quantitative Techniques. Salary Scale (including expatriate addition) £1,360-£2,250 p.a. plus *either* a University Addition of £360 p.a. (taxable in Malawi) *or* salary supplemented in range £540-£576 p.a. for single staff and in range £636-£684 p.a. for married staff in appropriate cases by the British Government (supplementation normally tax free). Gratuity; superannuation scheme transferable with F.S.S.U.; family passages; various allowances; biennial overseas leave. Detailed applications (6 copies) naming 3 referees by 4th April 1972 to Inter-University Council, 90/91 Tottenham Court Road, London W1P 0DT, from whom particulars are available.

Teesside Polytechnic, Middlesbrough

Department of Business and Professional Studies

Applications are invited for the following posts:
Senior Lecturer in Comparative Government.
Lecturer II in Financial Accounting.
Lecturer II in Cost Accounting.
Lecturer II in Economics.
Research Assistant in Economics.

Applicants should be graduates with teaching, commercial or research experience to lecture on degree, diploma and professional courses.

SALARY SCALES:

Senior Lecturer £2,920-£3,260.
Lecturer II £2,195-£2,875.

New Zealand

UNIVERSITY OF CANTERBURY
Christchurch

Sir James Fletcher Chair of Industrial Administration

The Council of the University invites applications for the Sir James Fletcher Chair of Industrial Administration, which was established and is supported by a grant from Tasman Pulp and Paper Company Limited. The Chair carries with it the Headship of the Department of Business Administration. Applicants should have appropriate academic qualifications and experience but persons not at present holding academic appointments should not be deterred from applying, since consideration would be given to candidates who after formal education in, say, science or engineering have later occupied responsible executive positions in industry.

At present the salary for a Professor is within the range $NZ11,698 to $NZ14,947 per annum.

Particulars, including information on travel and removal allowances, study leave, housing and superannuation may be obtained from the Secretary-General, Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF (Tel: 01-387 8572).

Applications close on *1 May 1972*.

TENDER

STATE OF ABU DHABI

Exploration and Exploitation of Oil Resources

The Government of Abu Dhabi invites hereby internationally reputed oil companies having marketing facilities and willing to participate in exploration for and development and exploitation of Oil and other hydrocarbons in areas in Abu Dhabi totalling (14,827) sq. km., to apply to the Ministry of Petroleum & Industry. (P.O. Box 9, Abu Dhabi, Arabian Gulf) for information regarding the areas in question, the terms and conditions to which applicants should conform and any other information. Documents and information will be supplied only to oil companies or to a duly authorized representative of such companies.

Bids should be submitted in a sealed envelope marked "Confidential – Bids for Oil Rights in Abu Dhabi" to the Minister of Petroleum & Industry, not later than 5th July 1972.

(Signed) Mana Saeed Al-Otaiba
Minister of Petroleum & Industry
&
Chairman of the Board of Administration
Abu Dhabi National Oil Company
Dated 13th February, 1972

CHAIRMAN'S STATEMENT

VOSPER LIMITED

Points from the 1971 Accounts and the Statement by the Chairman, Sir David Brown.

★ The Group made a profit of £645,183 before tax, against an equivalent annual rate of £548,284 for the previous sixteen month period. I submit that this is very satisfactory in the circumstances.

★ The Woolston Shipyard was fully occupied in completing the second Mark 5 Destroyer for Iran, a Mark 7 Frigate for Libya and progressive construction of three Type 21 Frigates for the Ministry of Defence (Navy). The volume of work, which we are undertaking for the M.O.D.(N), is very much larger than it has been for many years.

★ Preliminary work has been proceeding apace on our major order for Frigates from The Federative Republic of Brazil, and actual construction work has now commenced.

★ We have reached agreement with a Swedish company to operate two V.T.1 Hovercraft between Malmo and Copenhagen and a joint company has been formed for this purpose.

★ The Singapore subsidiary again had a successful year with further growth in turnover.

★ Prospects remain good and, exceptional circumstances apart, I shall hope to report a further improvement on completion of this financial year.

APPOINTMENTS

Makerere University
UGANDA

Applications are invited for (a) SENIOR LECTURESHIP OR (b) LECTURESHIP IN ACCOUNTING, DEPARTMENT OF COMMERCE. Applicants must be graduates with post-graduate training in Business Administration with Accountancy as a major field or be a member of a recognized professional body. Several years University teaching and research experience and/or experience in Commerce and Industry required. Salary Scales: (a) £U1,950-£U2,615 p.a.; (b) £U1,350-£U2,230 p.a.; (£U6= £7 sterling). The British Government may supplement salary in range £612-£900 p.a. (sterling) and provide children's education allowances and holiday visit passages. F.S.S.U. Family passages; biennial overseas leave. Detailed applications (6 copies) naming 3 referees by 4 April, 1972 to Inter-University Council, 90/91 Tottenham Court Road, London W1P 0DT, from whom particulars are available.

Personable girl, probably in her 30's, needed by Oxford Management Centre, to work closely with the Centre Fellows and small groups of senior managers. Responsible for programme administration. Able to organise, type, maintain records and liaise with companies Title Courses Registrar, Salary £1,491-£2,040. Apply Director, Oxford Centre for Management Studies, Kennington, Oxford.

Nuffield College, Oxford
Gwilym Gibbon Research Fellowship

Applications are invited from men and women who wish to undertake a year's research into, or study of, a problem in the field of government and administration. Preference will be given to candidates with experience in one of the public services—central or local. Further particulars from the Warden. Applications should reach him by Tuesday, 25 April 1972.

Morgan Grenfell & Co. Ltd.
HAVE A VACANCY FOR AN ECONOMICS GRADUATE

to work in their economic intelligence area.

This post would suit a recently graduated Economist with an interest in a career in Merchant Banking.

Applications with full particulars including curriculum vitae should be sent to: B. J. Pennington.

MORGAN GRENFELL & CO. LIMITED
23 Great Winchester Street, London, EC2P 2AX.

The University of Manchester Institute of Science and Technology
Department of Management Sciences

The Department is one of the oldest and largest centres of management education in the United Kingdom. It has 49 members of staff, including 5 Professors and is an interdisciplinary Department teaching more than 300 undergraduates reading for an Honours degree in Management Sciences. There is a substantial research school with some 120 postgraduates and a number of industry sponsored research projects.

As part of the planned expansion of the Department applications are invited for the following vacancies:

LECTURER IN MANAGEMENT SCIENCES (MS/34/AD)
Applicants should be suitably qualified graduates in Economics, Statistics, Operational Research, Accounting or Sociology, with some research experience. The appointee will be expected to develop his own research and teaching interests in Management Sciences.

LECTURER IN MANAGEMENT SCIENCES (PRODUCTION) (MS/35/AD)
Applicants should be suitably qualified graduates, with research experience in Management Sciences. The appointee would be expected to develop research and teaching in the control and measurement aspects of Production Management.

Commencing salaries will be in the scale £1,641-£3,705 per annum with Superannuation under F.S.S.U.

Requests for application forms and conditions of appointment, quoting appropriate Reference number, should be made to the Registrar, U.M.I.S.T., Sackville Street Manchester, M60 1QD, to be returned not later than 10th April, 1972.

The University of Manchester Institute of Science and Technology
DEPARTMENT OF CIVIL & STRUCTURAL ENGINEERING

Special Research Assistant To Develop Mathematical Models for Financial Control of Capital Projects

Following the award of an S.R.C. grant a temporary post is offered, working with the project management group in this Department, for a period of 2 years. The successful applicant will develop the specification for the models by discussion with interested firms, write the resulting computer programs, and test their validity on one or more current industrial projects.

Applicants should preferably be graduates with a minimum of 5 years' professional or industrial experience, including work on a relevant commercial topic. Evidence of ability to prepare efficient computer programs will be required.

Salary range envisaged—£2,000 to £2,500 p.a.

Applications and enquiries on the above should be addressed to Mr. P. A. Thompson, Department of Civil and Structural Engineering, University of Manchester Institute of Science and Technology, P.O. Box 88, Sackville Street, Manchester, M60 1QD; telephone 061-236-3311, Extension 379.

Monash University
MELBOURNE, AUSTRALIA

Chair of Economics

Applications are invited for appointment to a Chair of Economics. Preference will be given to applicants who have special interests within the general area of micro-economics, interpreted broadly to encompass both pure and applied analysis, general and partial equilibrium and topics such as managerial economics, agricultural economics and welfare economics.

The Chair will be held in the Department of Economics in which there are several Professors of Economics, whose interests are in Economics of Industry, Macro-economics, International Trade and Monetary Economics, and Labour Economics. There are also specific Chairs in Accounting, Administration, Economic History, Econometrics and Marketing.

Enquiries about the Department may be addressed to the Chairman, Professor D. Cochrane, in the University.

Salary: $A15,264 per annum. Superannuation is based on an endowment assurance scheme, the employee and employer contributing 5% and 10% respectively.

Full information on application procedure, conditions of appointment, etc., is available from the Secretary-General, Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF (Tel: 01-387 8572), or the Academic Registrar, Monash University, Clayton, Victoria 3168, Australia.

Closing date: *30 April 1972.*

The Council reserves the right to make no appointment or to appoint by invitation at any stage.

CHAIRMAN'S STATEMENT

THE FOREIGN AND COLONIAL INVESTMENT TRUST COMPANY LIMITED

(Member of the Association of Investment Trust Companies)

The Annual General Meeting will be held on Wednesday, 5th April, 1972 at 12 noon.

The following is a summary of the statement by the Chairman, Mr. C. G. G. Wainman, which has been circulated with the Report and Accounts.

Consolidated net assets rose from £100m. to £124m. and net assets per share from 127½p to 167½p, a rise of 31% compared with 42% and 11% in the F.T. Actuaries All Share Index and the Standard and Poors 500 Share Index respectively.

With the U.K. Stock Market so buoyant the company's wide geographical coverage was not an advantage in 1971. Nevertheless the American and Japanese portfolios performed well against the relative indices. The sharp falls in our Canadian and Australian mining stocks were not anticipated.

In the current year the company has taken advantage of low interest rates in Switzerland and has borrowed the equivalent of £3·5m. for periods of up to five years, the proceeds being invested in Europe and America.

Investment policy remains that of capital growth and it is expected that this growth will continue to produce a steady improvement in income. This year it is proposed to make a small increase in the dividend payment. This requires a transfer from revenue reserve, but in the current year income is improving and the Board expect to maintain this rate of dividend.

TEN YEAR RECORD

Year ended 31st December	Consolidated gross revenue	Earnings and ordinary dividends (adjusted to present capital) Earned	Paid	Net assets value per 25p share (adjusted to present capital)	Capital gains certificate per share	Growth of £100 investment in ordinary shares at market value on 31st December
	£	p	p	p	p	£
1962	1,916,234	2·36	2·000	68		100
1963	2,065,926	2·55	2·175	79½		113
1964	2,346,478	2·81	2·500	78½		102
1965	2,699,573	3·20	2·875	86		116
1966	2,712,660	3·01	2·875	80	Nil	113
1967	2,886,556	2·90	2·875	124	0·52	180
1968	2,906,373	2·62	2·875	177½	10·94	286

WINCHESTER HOUSE, 77 LONDON WALL, LONDON EC2N 1DD

APPOINTMENTS

Market Intelligence Manager

Salary from £4,000 p.a.

is required to set up a small Market Intelligence Section in our new and expanding Marketing Department. He will be expected to acquire a full understanding of London Transport's markets and operating environment and to make known the implications of this knowledge to senior management.

Applicants should preferably be aged 28-40. Graduates in either Economics or Mathematics, of proven managerial ability, with relevant experience in some of the following fields; statistical analysis, economic research, market research, sales forecasting. They will probably have worked in a large consumer-orientated organisation, in consultancy or in an economic research organisation.

There are a number of fringe benefits, including travel facilities.

Applications to Chief Establishment Officer (Ref. F/VO.137/2) London Transport, 55 Broadway, SW1H 0BD giving career details.

LONDON TRANSPORT

Economic Statisticians

H.M. Treasury
to computerise public expenditure statistics

This vacancy within the Public Sector Group at the Treasury is for a Statistician who has practical experience of economic statistics and of the use of computers, and who is familiar with the principles of national Income accounting. As one of a team of administrators, economists and statisticians, your major responsibility will be to devise a computerised storage, retrieval, and analysis system, for data on past and projected expenditure. The information is for use in Policy making in the field of public expenditure, in the compilation of National Income statistics and for publication in the annual series of White Papers.

Department of the Environment
U.K. transport statistics

The successful candidate for this new post will examine the work in the field of transport statistics for the Department, which is likely to result from the European Community requirements, investigate possible methods of supplying the figures, and advise on the courses to be adopted. As the work will involve collaboration with counterparts on the Continent, and visits to Brussels, Luxembourg and other centres, a working knowledge of French would be an advantage.

Starting salaries for these Main Grade posts could be above the minimum of the scale £3,653–£4,883 (Inner London), with prospects of promotion to Chief Statistician £5,175–£6,475.

Applicants should normally be aged at least 27 and possess an honours degree in statistics, or in another subject involving formal training in statistics. Several years relevant experience is essential. Appointment may be permanent and pensionable or on a short term basis (with FSSU).

There are also vacancies for Statisticians and Senior Assistant Statisticians in other Government Departments. Senior Assistant Statisticians (salary £2,476–£2,984 Inner London) must be at least 24 with relevant postgraduate experience.

For full details of acceptable qualifications, together with details of all current vacancies in the Government Statistical Service, and for an application form (to be returned by 5th April 1972) write to the Civil Service Commission, Alencon Link, Basingstoke, Hants, or telephone Basingstoke 29222 Ext. 500, or London 01-839 1696 (24 hour 'Ansafone' service) quoting reference A/619/16.

APPOINTMENTS

Regional Planning

Applications are invited for an appointment in The Secretariat of the Standing Conference on London and South East Regional Planning.

The Conference is an organisation of the local planning authorities in South East England.

The successful applicant will be primarily concerned with a data collection and information system which is being established. Suitable candidates would be likely to be in their early twenties and have a knowledge of the techniques of statistical analysis and presentation.

Salary up to £1,971 plus London weighting.

Applications by letter with any supporting material by 4 April, to The Secretary, SCLSERP, 28 Old Queen Street, London, SW1.

The International Federation of Cotton and Allied Textile Industries (IFCATI)

has a vacancy for a

STATISTICIAN/ ACCOUNTANT

at its headquarters in Zurich, Switzerland.

The position involves taking charge of the Federation's statistical service, general economic research, simple accounting and administrative duties. Fluent English and working knowledge of French and/or German desired. This is a challenging opportunity for a young

ECONOMIST or STATISTICIAN/ ACCOUNTANT

to join the small staff of this leading international trade association at its modern headquarters in Zurich. Some foreign travel involved. Excellent working conditions; terms of employment by mutual arrangement.

Applications, preferably by single men under thirty, marked "Personnel," with full details, to The Director, IFCATI, P.O. Box 289, 8039 Zurich, Switzerland.

PLANNING
- Project Planning and Administration

Three or four teaching posts covering the subject areas listed above are available in the Department of Management at the Middle East Technical University in Ankara for the academic year 1972/73 under the Technical Assistance Programme of the O.E.C.D. The University occupies a special position in the educational system of Turkey, is technically oriented, and teaching is in English. The modern campus is finely located on the uplands just outside Turkey's capital and provides favourable academic conditions for international staff, with challenging opportunities to initiate research into industrial development problems.

Attractive salaries and allowances according to qualifications and experience will be offered to candidates with higher degrees and substantial experience in teaching and, if possible, in the direct application of subject matter. Preference will be given to nationals of O.E.C.D. Member countries.

Applications with résumé or inquiries to:
MR. MAURICE DOMERGUE, Head, Technical Co-operation Service, O.E.C.D., 2 rue André-Pascal, Paris 16ème.

UNIVERSITY OF DUBLIN Trinity College

JUNIOR LECTURER IN ADMINISTRATION

Applications are invited from suitably qualified candidates. Applicants should indicate their area of interest, eg, finance, information, systems, marketing or personnel.

Salary Scale: £1,544 x £102-£1,952 p.a.

Marriage and children's allowances are paid and there is a non-contributory F.S.S.U.-type pension scheme.

Further particulars may be obtained from

The Assistant Secretary (Staff), West Theatre, Trinity College, Dublin, 2,

who will receive completed applications up to 25th April, 1972.

Staffordshire County Council

COUNTY PLANNING AND DEVELOPMENT DEPARTMENT

SENIOR GROUP LEADER
Reference No. 36.
(S.O.1/P.O.1A—£2283 to £3180 per annum)

SENIOR PLANNING ASSISTANT
Reference No. 59.
(A.P.4./S.O.1—£1932 to £2766 per annum)

Applications are invited for the above posts in the Research and Industry Section of the Department. The Section is responsible for research on a wide range of economic and social topics as well as monitoring of Industrial Development. It has a major role in the preparation of the County Structure Plan in the fields of Population, Employment, Industry and Shopping.

The Senior post will carry special responsibility for Population and Employment studies and forecasts and related needs in terms of Shopping and Social Services. Applicants should have considerable experience in initiating and conducting research projects, analysing and evaluating statistical data, and in the preparation of reports.

Applicants for the post of Senior Planning Assistant should be familiar with sources of data and have experience of statistical analysis. A knowledge of and interest in computer techniques will be an advantage.

The commencing salary for the successful applicant will be at any point on any of the grades commensurate with age, qualifications and experience.

Applications (no forms) giving details of age, education, qualifications, present and previous appointments, experience, present salary, and the names and addresses of two persons to whom reference may be made, should be sent to J. H. Barratt, County Planning and Development Officer, Martin Street, Stafford, by not later than 30th March, 1972.

Relationship to any member or senior officer of the County Council must be disclosed.

APPOINTMENTS

University of East Anglia

School of Social Studies

GRADUATE RESEARCH ASSOCIATE IN ECONOMICS required to assist Professor H. F. Lydall in a study of the effects of trade expansion on employment in developing countries; from an early date to the end of 1973. Salary on scale £827-£1641 according to qualifications. Good degree in Economics, including quantitative methods and interest in empirical research required. Applications, with curriculum vitae and the names and addresses of two persons to whom reference may be made, should be sent by 7 April 1972 to Professor H. F. Lydall, School of Social Studies, University of East Anglia, Norwich, NOR 88C, from whom further details may be obtained.

School of Agriculture
ABERDEEN

The North of Scotland College of Agriculture and University of Aberdeen

Applications are invited for three senior College-paid posts in the Economics Division (Head: Professor G. R. Allen):

A. *Deputy Head of Division*, with broad supervisory and administrative duties which can be adapted to the appointee's particular interests, but which will include research, investigations, and extension (probably with emphasis on farm production) and liaison with government departments; experience in supervising research with a substantial mathematical component could be an advantage;

B. *Senior Economist, Farm Production and Extension*, with responsibilities in supervision of some of the Division's teaching programmes, in research, and in furthering liaison with technical specialists and advisers; experience in mathematical techniques is sought;

C. *Senior Economist, Marketing*, to assist the Head of Division in developing marketing studies (feasibility appraisal, outlook) for teaching, research and advisory purposes.

All three appointees will be associated with University teaching and research supervisions in Agricultural Economics.

Salaries, according to qualifications and experience, on the scales of Grade I or II (posts A and B) or Grade II (post C); at present:

Grade I £3,789 to £4,839
Grade II £3,142 to £3,789

Federated Superannuation System for Universities. Medical Examination required.

Forms of application, together with further particulars, may be obtained from the Secretary, The North of Scotland College of Agriculture, School of Agriculture, 581 King Street, Aberdeen AB9 1UD with whom applications, which should state for which post (A, B or C) application is made, should be lodged *not later than 18th April, 1972.*

University of Essex

Department of Economics

Applications are invited for a post of . . LECTURER IN ECONOMICS (£1641-£3852) in any field of Economics. Preference will be given to candidates specialising in Econometrics.

Applications (six copies, quoting reference SS/19/E) must reach the Registrar, University of Essex, Wivenhoe Park, Colchester, CO4 3SQ, Essex, from whom further particulars are obtainable, by 4 April 1972.

E·I·U

Urban Planning

EIU Planning Services are presently undertaking a number of interdisciplinary planning assignments both for public and private sector clients. A vacancy exists for a recently qualified town planner, preferably with a background in one of the social sciences. An interest in, and knowledge of modern technical and social development in planning is required. The applicant should be prepared to help in building up planning consultancy services for government departments, local authorities and private sector clients at home and overseas.

Applications showing how these requirements are met, together with a detailed curriculum vitae and indication of present salary level should be sent to: EIU Planning Services
THE ECONOMIST INTELLIGENCE UNIT LTD
Spencer House, 27 St James's Place
London SW1A 1NT

UNIVERSITY OF DUBLIN Trinity College

JUNIOR LECTURER IN SOCIOLOGY

Applications are invited from suitably qualified candidates for the above post. Candidates with an interest in the sociology of industrialised societies and social stratification; political sociology or contemporary and historical class-structures are particularly encouraged to apply, although applications from candidates with interests other than the above are equally invited.

Salary Scale: £1,544 x £102-£1,952 p.a.

Marriage and children's allowances are paid and there is a non-contributory F.S.S.U.-type pension scheme.

Further particulars may be obtained from:

The Assistant Secretary (Staff), West Theatre, Trinity College, Dublin, 2,

who will receive completed applications up to 25th April, 1972.

OPERATIONAL RESEARCH

The South Western Gas Board has openings for two Operational Research Assistants at Head Office, Bath.

The salary ranges are (A) £1824-£2145 per annum and (B) £1494-£1764 per annum.

The successful applicants will be involved in a variety of projects covering marketing, stores control, manpower utilization and forward planning of the Board's activities.

Qualifications, university degree or equivalent in operational research, mathematics, statistics or a social science.

For the more senior position a minimum of two years experience in industry is desirable.

Both posts are pensionable and offer three weeks holiday a year, sick pay scheme and five day week.

Applications in writing stating age and experience, and quoting ref: C8769 to: Director of Personnel, South Western Gas Board, 9a Quiet Street, Bath, BA1 2JX. Closing date for applications March 25.

South West Gas

APPOINTMENTS

NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

The Institute has the following vacancies:

1) a Senior Research Officer to work as a member of a team forecasting short-term developments in the UK economy and undertaking research into the structure and behaviour of the economy;

2) a Senior Research Officer or Research Officer to work on the forecasting of developments in international trade and payments for the National Institute Economic Review;

3) a Research Officer to join a project on innovation mainly in the energy sector.

The salary scale for Senior Research Officers is £3330 x 147—£4065; x 147—£4653 and that for Research Officers £1647 x 147—£2676; x 147—£3705. The Institute also pays £162 London Allowance.

Applications by April 4 to the Secretary, NIESR, 2 Dean Trench Street, Smith Square, London SW1P 3HE (Telephone 222 7665) enclosing curriculum vitae and names of two academic referees.

The University of Lancaster

International Centre for Research in Accounting

RESEARCH STUDENTSHIPS

The International Centre for Research in Accounting (ICRA) is an independently financed unit within the University of Lancaster. It has been established to engage in research into accounting principles and their application to the problems currently facing the profession.

Two research projects which are being given priority are:
(a) A comparative study of the similarities and differences between accounting reporting principles and practices in major industrial countries, with particular reference to problems which may arise when Britain becomes a member of the E.E.C.

(b) An investigation into the nature, purposes and objectives of published financial accounts, with particular reference to the needs of users and potential users. This project is aimed at defining the fundamental concepts and principles which should underlie the preparation of company financial reports.

One year and two year Studentships are available to suitably qualified persons interested in pursuing full-time research into either of the above projects. The one year Studentships will normally lead to an M.Sc. degree, while the two year Studentships will lead to the Ph.D. degree. In appropriate circumstances it is possible to convert from the M.Sc. to the Ph.D. programme.

These Studentships form part of a general Ph.D. programme in accountancy within the University of Lancaster, and there will be ample opportunity for contact with other post-graduate students attached to ICRA and to the Department of Accounting and Finance.

The annual stipend of the Studentships will be set in the range £1000-£1800, depending upon a candidate's qualifications and circumstances.

For further details, and application forms, please write to the Director of ICRA, Professor Edward Stamp, Furness College, Ballrigg, Lancaster, quoting reference Number L.653/C.

APPOINTMENT WANTED

ITALY—Italian engineer, classics high school and University degree, Italian and English mother languages, UK resident, wide technical-commercial executive experience in sales and export, seeks executive position with British company in Italy or in the UK. Present salary is high. Wants to explore possibilities offered by Britain's eventual entry in the Common Market. Apply Economist Box 2431.

APPOINTMENTS

The Economist A BUSINESS CAREER FOR AN AMBITIOUS YOUNG MAN

An attractive opportunity to train for a rewarding business career is now offered by this newspaper to an ambitious young man (over 23). The successful candidate will not only have ambition, graduate status and preferably some sales experience, he will also have convinced us of his ability to succeed.

Application forms may be requested from the secretary to the Advertisement Manager, **The Economist Newspaper Ltd. Tel: 01-930 5155**

Registered as a Newspaper. Authorised as Second Class Mail, Post Office Dept, Ottawa. Composed by David Brockdorff Ltd., Walthamstow, London, E.17, and printed in England by Hazells Offset Ltd., Slough. Cover and colour section lithographed by Taylowe Ltd., Maidenhead. Published by The Economist Newspaper Ltd., 25 St James's Street, London SW1A 1HG. Telephone 01-930 5155. Postage on this issue: UK 8p; Overseas 7½p.

Do all Japanese banks look alike?

NFB is a little different. Unlike commercial banks, we serve progress and prosperity through long-term credit banking. We raise funds by issuing debentures, and offer long-term credit to enterprises in a wide range of industries. Today we are increasingly active outside Japan. You'll be hearing more of us.

SUGAR

Recommendations of:

1. **January 1971 — Sell on near term advance. Weakness will follow.**
2. **March-April 1971 — Broad downward trend. Buying opportunity around mid-year.**
3. **July 1971 — Expect selling on approach to 4.5¢ spot.**
4. **August-September 1971 — Only moderate further weakness followed by recovery to new highs. Add to purchases on weakness. Long term trend up. Maintain long positions.**
5. **October-November 1971 — Long term trend up. Maintain long position.**

For over a quarter of a century, our basic research has enabled us to anticipate well in advance a major reversal in the price trend. It is indicative of the commodity work performed by us for many large corporations in industrial and agricultural commodities.

Finding the money to finance new industries is a problem that knows no boundaries.

In Buenos Aires, and around the world, Citibankers tackle the big problem.

In any country, new industry means growth. In fast-growing Argentina the emphasis is on development of *non-traditional* new industry ranging from light appliances to heavy trucks. And who can help in the financing better than Citibank? We were the first U.S. bank to open an office in Argentina over 50 years ago. Today, we have 31 offices in eleven cities there. Throughout the world, Citibank has branches, subsidiaries and affiliates in 86 countries to tackle *your* problem.

March 11, 1972

No applause, please

Mr Heath has got to go through the ritual penance for trying to stop wage inflation, but he should stick to his guns in warning the country of the consequences of giving in. If he has ideas on Ireland he should make them known, page 17.

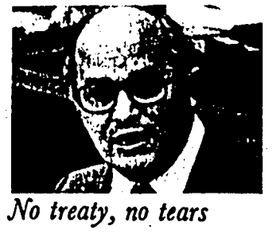
Budget for bulls ?

Mr Barber gave many hints to investors last year about what might be in this year's budget, and it may be worth while to rearrange your share portfolio in the week ahead in order to place bets on them, page 79. Britain's foremost economic forecasting institute has advised the Chancellor to give £2,500m of tax reliefs ; this would be equivalent to halving income tax on all earned income, and the Chancellor is unlikely to agree, page 83.

By the time the Government has finished baling out coal and other unprofitable nationalised industries, it will have given them subsidies equivalent to 1 per cent of the country's gnp, page 77.

Rule of three

A special survey of the Maghreb—Morocco, Algeria and Tunisia—follows page 54.



Mr 48 per cent

Senator Muskie won in New Hampshire but fell short of the running start he needs, while Senator McGovern did unexpectedly well. The Democrats are just at the beginning of a long fight, page 49.

The struggle in Chile

A shadowy armed struggle now accompanies the political contest between Dr Allende and his opponents, reports our special correspondent, page 25.

No treaty, no tears

If Herr Barzel stops the treaty with Russia being ratified the loss will not be great ; Moscow would not have loosened things up anyway, page 18. How the Bonn coalition has been hit by defections, page 39.

The miners' strike

SIR—In recent months we have witnessed the disruptive effects of strikes by air-traffic controllers, television technicians and now radar technicians in Canada, by coal-miners in Britain and by longshoremen in the United States. In each, the degree to which the work stoppage has been caused by severe inflation in the respective countries is probably significant, and yet the various settlements have only exacerbated those inflationary trends. By now, a vicious circle has developed that is clear for all to see, indeed, no clearer anywhere than in Britain.

It was two centuries ago that Adam Smith firmly established individual self-interest as the guiding maxim in man's economic affairs and yet, in the intervening 200 years, the pursuit of that self-interest has often been restrained in many areas of economic activity as a result of democratic governmental decision. It would appear that the time has now come to introduce such restraint into the area of labour relations, as the effects of frequent strikes in key sectors of the economy become more serious.

In Britain, the miners have merely succeeded in doubling the number of unemployed, making life highly uncomfortable for the average Briton and seriously endangering any hope of national economic recovery in the coming year. It is easy to sympathise with their cause, but one wonders why everyone from old-age pensioners to the seriously ill should go without light and heat, and all the services dependent thereon, simply to satisfy these workers' economic self-interest. Surely man, in all his wisdom, can devise a method of labour negotiation more civilised than the strike, which is, after all, nothing more than a sophisticated form of blackmail. One can foresee such a reform, infinitely more radical than the Tories' Industrial Relations Act, being merely hastened by the miners' action.—Yours faithfully, PETER J. CONNELL

Waterloo, Ontario

SIR—Mr G. A. D. Emerson (Letters, March 4th) does not commend the tactics of Freedom Under Law in "considering the prosecution of Mr Daly on a conspiracy charge," and would prefer individuals to take legal action on their own account. We completely agree with him on the latter point.

We have always made it clear that we intend to prosecute only as a last resort, if neither the DPP nor the police nor private individuals are stirred to press for justice in the courts.

We place the education of the authorities and the general public concerning the present dangers to our freedom as one of our first priorities, that of persuading them to take action next—and are prepared to shoulder the responsibility ourselves only if no one else does. We should be delighted if "individual persons and businesses" took action to defend themselves and thus worked us out of our self-imposed job.

The idea that the law of conspiracy is too delicate to be used, however, strikes us as somewhat fanciful. The law exists for our use. There is surely no room for ornamental laws? This particular law is, indeed, a "very valuable" security for our freedom, and it would be a rash and foolish government which was tempted to abolish it.—Yours faithfully,

JOHN CHAPMAN
Deputy director,
London, WC2 Freedom Under Law

SIR—Surely the answer to Mr I. F. Campbell's question (Letters, February 26th), how should public opinion show its disapproval of the miners' strike without resort to violence, is that it need only, in fact, disapprove.

Disapproval can be made manifest without violence, but the strength of the miners was that public opinion did not disapprove, and this was also the weakness and the shame of the Government, that it did not, to quote your own words, "actively mobilise the forces of common sense."—Yours faithfully, JEAN LECLERCQ

London, SE23

SIR—Arising out of the Wilberforce report is the recurring question: "Do we adjust humanity to suit the economic facts of life, or do we adjust the economic facts to take account of humanity?"

Most people probably felt that the miners had a case. Most people probably deplored some of the side effects of the strike (on old people, of violent picketing). Most people probably felt vaguely uneasy about the strike's economic effects—holding the country to ransom. Nobody was clear whether a rigid economic solution or a primarily social solution was called for. Lord Wilberforce was called in to make up our minds.

You say (February 26th): "The Wilberforce report—in all its resoluteness for drift—spoke truly last week for the majority of the people of England." You are right. We are not yet sure to what degree we want a profitable or a humane economic policy. At least after Wilberforce the policy is likely to be more flexible. At its best, that means the Government will be able to respond to the needs of the situation more readily; at its worst it means roaring inflation. In the meantime we drift whilst we make up our minds.—Yours faithfully,

London, SW7 A. A. WINDHAM

SIR—As a regular reader of *The Economist*, which writes so much sense on so many things, I find your tirade against wage increases (February 26th) most depressing.

With Mr Heath's Government we were promised a new course for Britain. I and others, I believe, thought this course would be high wages, low taxation, phasing out the welfare state, denationalisation and encouragement for the individual. It is doubtful if the miners' strike would have occurred in a private coal industry. It is certain that private coal companies would never run continuously unprofitable pits.

A high-wage earner will—as most middle-class people do now—insure himself against ill-health, unemployment and his children's education. This is the sort of Britain for the future, with responsible citizens looking after themselves—not falling back on an inefficient "Auntie Welfare State."—Yours faithfully,

NICHOLAS DAVIE-THORNHILL

Matlock, Derbyshire

Canada

SIR—I very much hope *The Economist* is receiving a great many congratulatory letters following publication of your survey (February 12th). For a great many Canadians who will not, alas, read it, it should be made, in some way, required reading. I could myself supply quite a list of speakers and writers on Canadian affairs who have not a one-hundredth part the knowledge and insight (with such warmth of expression) of Mr Roland Bird.

Perhaps the only word of dissent might come from the 6,000 Indians who occupy the area of development if the James Bay project goes through. The area is described as "virtually empty except for five important rivers, some timber of doubtful value, and rich wildlife."—Yours faithfully, IAN P. CAMERON

Toronto

SIR—In your survey of Canada's economic and political trends (February 12th) it is indicated that the current account in 1971 is likely to be about "between $700m-$750m." You are aware, I am sure, that Canada's current account had been deteriorating rapidly since the first quarter of 1971, on a seasonally adjusted basis. In the fourth quarter of 1971 the current account was in deficit on either a seasonally adjusted or on an unadjusted basis. For 1971 as a whole the surplus was $245m.

I bring to your attention this rather small point in an otherwise excellent survey that is unusually readable for this type of analysis. I myself enjoyed it very much.—Yours faithfully, G. K. KARDOUCHE

Associate economist,
Montreal The Royal Bank of Canada

SIR—In Roland Bird's survey on Canada (February 12th) he wrote about the maritime provinces: "By any administrative logic, the three provinces should be bundled into one." And he added: "But nobody will be crazy enough to try." It was disappointing for many of your readers in this country to realise that a paper with the reputation which *The Economist*

SECOND CLASS POSTAGE FOR *THE ECONOMIST* PAID AT NEW YORK, N.Y.
Published weekly every Saturday, fifty-two times a year in London, England.

MANAGEMENT APPOINTMENTS £7000 PA AND OVER

U.K. Banking

• THIS career appointment is at the centre of an established international banking activity in London.

• A COMMERCIAL banking Manager is required to join a young and versatile management team. The role is to support the Director in charge of UK operations in extending the Bank's UK business, principally in the area of medium term lending, in sterling and the Euro-currencies. Responsibility will centre on the development and consolidation of client relationships in defined geographical areas.

• THE demand is for a young Banker experienced in this field.

• INITIATIVE, sound judgement and organisational ability are the key qualities required. Preferably these will have been developed in a commercial banking environment involving the lending of medium-large units.

• REMUNERATION is for discussion. It could be £6,500 – £7,000 for especially relevant experience and could escalate rapidly. There are generous fringe benefits.

• AGE probably in the range of 28–35. Prospects are especially bright.

Write in complete confidence
to A. Barker as adviser to the Bank.

JOHN TYZACK & PARTNERS
LIMITED
10 HALLAM STREET • LONDON W1N 6DJ

Corporate Engineering Director

DESIGNATE

for a major international group supplying a wide range of sophisticated components to the automotive and other industries.

• A KEY member of the executive team, his role is to stimulate and direct product design and development to maintain and extend the lead already achieved by the group in world markets.

• BROAD technical and business experience at top level, backed by an outstanding record of creative achievement, in automotive engineering is essential.

• AGE under 50. Terms will be designed to attract men now earning a substantial five figure salary.

Write in complete confidence
to K. R. C. Slater as adviser to the group.

JOHN TYZACK & PARTNERS
LIMITED
10 HALLAM STREET • LONDON W1N 6DJ

For further management appointments see page 7

enjoys should have printed such harsh words without taking note of developments taking place in the maritime provinces.

In March, 1968, the premiers of the three maritime provinces commissioned Dr J. J. Deutsch, principal of Queen's University, and Mr F. R. Drummie, then economic adviser to the province of New Brunswick, to carry out a special study on "maritime union, including the possibilities for economic and other forms of regional co-ordination and co-operation." In October, 1970, the "Report on Maritime Union" was published, together with the various studies underpinning its conclusions and recommendations. As early as January, 1971, the three premiers decided to establish the "*Council of Maritime Premiers*" for the purpose of promoting co-operative action and to provide a framework for joint action by the three provinces.

I might also call your attention to the fact that since 1970 the Liberal party holds 27 of the 32 seats in the legislative assembly of Prince Edward Island. Is this what is meant by a "gnat's whisker majority?"

Je vous prie de croire, Monsieur, qu'il nous ferait plaisir de vous accueillir aux Maritimes en vue de vous fournir tous renseignements utiles.—Yours faithfully,

EDGAR GALLANT
Secretary to the
Council of Maritime Premiers
Halifax, Nova Scotia

Universities and the left

SIR—You published (January 15th) an interesting report on how the radical left, although in a minority, are winning control of student parliaments in German universities, thus implementing Rudi Dutschke's call for a "long march through the institutions."

In Uruguay, under the cloak of democracy, and ostensibly to allow students to participate fairly in the selection of professors and lecturers, the drawing up of study programmes, etc, the radical left has penetrated the one university and many secondary schools over the past 30 years to the point that today these institutions are almost completely under their control.

Once control has been attained, all semblance of democracy and fair play on the part of the radical left disappears, and it is almost impossible today in Uruguay for any professor, lecturer or teacher without strong left-wing sympathies to be appointed. Consequently, the university staff, and to a smaller extent the school teachers, are almost wholly indoctrinated left-wingers, and ordinary university students have great difficulty in getting through their exams, which are mostly oral, unless they subscribe, at least tacitly, to left-wing doctrines.

The intellectuals and professionals of Uruguay, especially lawyers (including several judges) and medical doctors, are nearly all supporters of, and activists in, the ranks of the Tupamaros. With the formation of the Broad Front (assorted radical left-wingers, communists and terrorists) for the national elections of November 28, 1971, they thought the hour had come for them to take over the whole country. But they failed—they got only 18 per cent of the total vote. Why? Because of free elections and the obligatory secret vote.

The purpose of this letter is to recommend to German and British university and school authorities that the organisation of any and all student participation in their institutions must include three basic democratic requirements: (a) obligatory secret voting, including proxies, for all elections to committees, to ensure that the wishes of the majority are reflected in the results; (b) termination of the committee meetings before a reasonable evening hour, to avoid the favourite communist tactic of prolonging them until the wee small hours and then taking pro-communist decisions after sensible people have gone home to bed; and (c) ratification of all important committee decisions by secret vote including proxies, which represent in total a substantial majority of registered students. Compliance with these conditions must be ensured by the university or other competent authorities, not by the students themselves.—Yours faithfully,

G. S. H. BAIN
Montevideo

Glasgow schools

SIR—Our local council (Labour) proposes to shut down and make comprehensive five of the top schools in Glasgow. They are the High School of Glasgow, of which I am a pupil, the Girls' High, Allen Glen's, Hillhead High and St Mungo's Academy.

This is an act of vandalism, destroying the historical and high standards of education in these schools. The High School of Glasgow has an 800-year-old tradition to its credit, and many famous people have been educated there. The council plans to shut the High School down and make the others comprehensive at the end of the 1973-74 school year. At the beginning of next session it intends to prevent any further intake to the primary or secondary departments, and also to transfer pupils from the present 1st and 2nd forms of the secondary department to other comprehensive schools.

No local politicians should have the authority to shut down, and make comprehensive, the top schools in any city. It should be up to the parents where and what kind of school they should send their children to.—Yours faithfully,

Newlands, Glasgow BRIAN D. BLASS

Air travel

SIR—I was pleased to see (February 26th), "Keep those flying peasants in their place," that you are again taking up cudgels on behalf of the poor independent air traveller.

One point that seems to be made consistently in the battle between charter and scheduled airlines is that, whatever happens, business traffic is inelastic as businessmen have to fly, therefore why reduce scheduled air fares? If the scheduled air carriers can be shown that businessmen will fly more if air fares are reduced, then I am sure that sanity will again prevail and Iata can get on with its job of providing the grease in the airline business. Because scheduled air carriers give the impression of being determined to keep up their fares for businessmen, they find themselves indulging in ridiculous contortions to justify a reduction in fares for groups—either young, old or chrysanthemum—for a period just long enough to make sure they keep out the so-called inelastic business flyer.

Surely now is the time for business groups, collectively and individually, throughout the world to put pressure on their own airlines to come forward with facts showing how a reduction in fares would stimulate business travelling to the greater benefit of world trade and the greater financial health of scheduled airlines.—Yours faithfully,

H. B. G. MONTGOMERY
Chairman,
London, W1 Exhibition Consultants, Ltd

Spain and Portugal

SIR—I think you should extend to your successive surveys of Spain and Portugal (February 19th and 26th) the apocryphal saying by Confucius amusingly depicted on your cover of February 26th: "When Powerful Men are in power, Wise Economists praise them."—Yours faithfully,

London, SW14 ANTÓNIO DE FIGUEIREDO

50th milan trade fair

14-25 april 1972

youthful
in its dynamism
mature
in its experience

During its fifty years Milan Fair has made constant progress, and in the period that followed the last war it rose to a place of honour among the great fairs of the world.
Here are some of the figures for the annual exhibition cycle May 1970 to April 1971: 42 specialized trade shows as well as the general trade fair □ 26,316 exhibitors □ 1,498,237 sq.m. of display sites and premises □ 90 countries sending exhibitors □ 72 countries officially participating □ over 4 million visitors, including 120,276 from 130 countries of all continents.
Plan a visit to Milan Trade Fair, and make sure of coming to the specialized trade show that covers your line of business.
The Advance Catalogue, listing 80% of all exhibits shown at the big April trade fair, is available every year as from February 1st. Its detailed index of commercial items is in English, French, German, Italian and Spanish.

Visitors' Cards and information may be obtained from: Segreteria Generale Fiera di Milano, Largo Domodossola 1, 20145 Milano (Italy) or from the Milan Fair Representative: Dr. Vittorio Schiazzano, 20 Savile Row, London ☎ 01-734 2411.

Aboard Noah's Ark.....

Capital, born of stability,
cannot prosper today without keeping on the move.
Make it go.
Put it aboard the free ark
that epitomizes your business experience, your hard work,
your ability to foresee the future.
Make it land, where the future is already unfolding.
Make it expand in a serene open land
in **Italy's Mezzogiorno,**
where pacesetting corporations
(ALFA ROMEO, FIAT, KLOPMAN, MONTEDISON, PHILIPS, ...)
have already brought a steadily growing Common Market
closer to Africa and the Middle East, on the trade routes
between East and West.
Make your capital develop and thrive
where grants, soft loans, tax exemptions and other facilities
for new investments in industry and tourism,
have been raised to the highest standard in Europe.
For a first move, come and see us at the MILAN FAIR
CIS - International Trade Center - Hall S2 - 1st Floor -
or apply for information to

** Sun. from 1 July dep. 1400, arr 1615.*
† Not Sun. 1 April–13 May.
From 29th October all departure times will be one hour earlier than shown.

From 1st April BEA flies to Eastern Europe up to 30 times every week.

We take you by Trident jetliner, with our first-class Sovereign Service available on most flights. All flights are non-stop except those to Belgrade and Bucharest which go via Zagreb and Sofia respectively.

Journeys are comfortable and fast; and in most cases we can help you with hotels, car hire and other requirements when you book your seat.

So if you're heading for Eastern Europe, take the smooth way out.

Fly BEA!

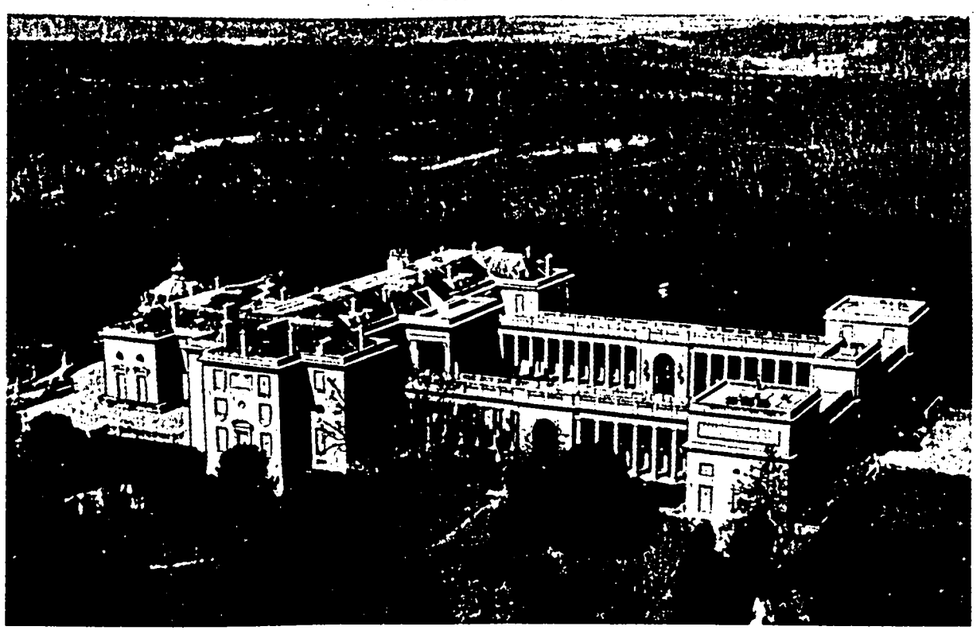
No.1 in Europe

PROPERTY

Offices of Messrs. GUEILHERS and PENOT, Solicitors, VERSAILLES (78)

SALE BY AUCTION IN THE LAW COURTS OF VERSAILLES



on Monday, 27th March, 1972, at 2 p.m.

MANSION and LANDED ESTATE

used as golf links, 45 acres in area

at ROCHEFORT-en-YVELINES (DISTRICT OF RAMBOUILLET)

28 miles south of **PARIS**
(FRANCE)
Offers over Fr.2,700,000.

Deposit:
Before making bids, prospective offerers shall have to deposit prior to auction one third of the upset price, that is:

Fr.900,000.

1. In the form of a certified cheque drawn on a French Bank or the Paris Branch of a Foreign Bank, said cheque remitted to their Solicitors.
2. Failing which, give their Solicitors proof of the bank guarantee for said amount originating either from a French Bank or the Paris Branch of a Foreign Bank.
   The guarantee shall be maintained in case of allocation during six months as of 27th March, 1972.

For further information, please apply to:
—**Mr. GUEILHERS,** Solicitor, 20 rue des Etats Généraux, Versailles (tel. 950.02.62).
—**Mr. PENOT,** Solicitor, 41 Avenue de Saint-Cloud, Versailles (tel. 950.02.18).
—**Mr. BEURIOT,** "Agrée", 107 Boulevard de la Reine, Versailles (tel. 950.01.37).
—**Mr. BARRAU LE FOLL,** Syndic, Place Gambetta, Rambouillet.

For visiting, apply to "Maître" **GUEILHERS** or "Maître" **PENOT,** solicitors, **VERSAILLES.**

March 11, 1972

No applause, please

Mr Heath should be himself. He is not going to be able to turn into Mr Willie Whitelaw overnight, as everyone is telling him he should. Sweet reasonableness is not his forte. He was never built to be popular. But there is a national ritual to be observed whenever a prime minister's policy has come unstuck, and Mr Heath is having to go through it now. First, the man must show a proper humility: that is, he must sign the surrender terms himself inside No. 10 Downing Street. Then he must throw himself on the mercy of the people: this means making a particularly embarrassing appearance on television. Then he must show signs of repentance: this is done by abjuring the normal pleasures of politicians, such as attracting crowds or playing up to cameramen or even conducting orchestras.

But the penitence is not complete without a course of listening. It is not that the man is left to read what the papers think of him (for there have been prime ministers who are known not to think much of the press, let alone read much of it). He has to be lectured at in his own drawing room by the collective wisdom of the leading lights of the Trades Union Congress and the Confederation of British Industry. He is already acquainted with many of these worthies, and is even acquainted with what they have in mind to tell him. But since he has been detected in a reckless personal policy, such as trying to reform the unions or refusing a wage rise, he has to be seen to be reassuringly in consultation again.

All this Mr Heath must undergo. He must ask what the terms are, and not let himself be too provoked by them. He must inquire gently if the approval of such as Mr Jack Jones and Sir Arnold Weinstock has been given to the proposals. He must himself urge the merits of restraint and co-operation. He must meekly acknowledge that he has made mistakes himself. He may even have to play to the gallery in the way at which Mr Wilson used to be a pastmaster, and the way which has hitherto earned Mr Heath's most bitter contempt. On Wednesday it was announced that the three foods in which prices are normally artificially kept up by predatory official marketing board manoeuvres (sugar, milk, potatoes) will, for this spring and summer only, have their prices artificially put down by official marketing board manoeuvres. As subsidies from tax revenue are being increased in consequence—and as the poor are no longer mainly potato and sugar eaters—nobody will really gain, but the nonsense is being perpetrated so that some newspapers can say that the Prime Minister is cutting prices at a stroke. After this period in penance, parley and vaudeville Mr Heath must then get back to the business of governing the country. If fate has been kind, if the economy is discovered to be growing at anything near 4 per cent, if the Labour party looks even worse than it does now, then the great man, rehabilitated, may be able to go out and about again one day without being pointed at rudely by small children.

The penny is starting to drop

But Mr Heath must not be deflected from putting the truth about wages and prices and profits before the country. This is where the Government's performance has been bad. But there is a faint stirring here and there. British newspapers told their readers this week that the Wilberforce award to the miners, which the country had willed, meant increases in the price of coal and electricity (which, of course, the voters will take the first opportunity they can of telling Mr Heath they had not willed). They also reported that men wanting jobs as miners had been turned away because there were no vacancies for such dangerous and dirty work. Something may be starting to get through, and ministers should not hang back coyly for fear of being thought to be bad losers. There are the railwaymen coming down the line: they will push ahead much harder if they think they see a demoralised cabinet in front of them.

The budget on March 21st should be the moment for the Government to pull itself together again, a budget that should err on the side of growth, deliberately and even riskily so (although there are risks and risks, see

page 83), for failure there will not leave much of the Heath doctrine behind, not even the record of a beneficial entry into Europe. So, once again, on the modest figure of Mr Barber rest the immediate hopes of restoring Tory self-confidence and delineating the essential programme that has to be carried. If Mr Heath is considering changes below the cabinet (and a number would be helpful and mildly invigorating in the party), they should not be delayed much beyond Easter. Since the Prime Minister, with Europe and Ireland on his hands, will probably not want to make any scapegoats at present, and since the Tory second eleven is one of the weakest since the war, a bigger operation can wait until the autumn, or at least until the European legislation is not in jeopardy in the Commons. If men existed who could catch the country's ear, they should be put in the cabinet now ; but they are not to be discovered.

Then there is Ireland. The Government's kite on a political initiative, although riddled with flak, is putting up something of an endurance record. Ministers can say that no sooner had they got it launched than they had to turn round to deal with miners and Mintoffs, but the uncertainty has gone on too long and must be ended one way or the other at once. Unhappily for Northern Ireland, and for the Government's reputation, the longer the suspense on these occasions, the greater the expectation, and the greater the sense of disenchantment if the mountain proves to have given birth to something visibly mouselike. That, of course, may be no bad thing if the cabinet's resolve is to stand by Mr Faulkner and the Stormont government. But the danger is that, with the best will in the world, the Government could now end up with something that would be just enough to tip more Protestants on to Mr Bill Craig's side, while falling far short of reconciling the Catholics to anything.

The appearance of indecision

The Government does not need to be warned that the Widgery report on the shootings in Derry is likely to cause difficulty and embarrassment even if the political initiative gets going at all, and since the IRA is still as active as ever (and still, apparently, as acceptable as ever to much of the Catholic population, despite the harrowing accounts of the latest explosions), it is going to be a long haul anyway. There is no easy answer to Ulster: everyone understands Mr Heath's and Mr Maudling's dilemma. But the impression of the cabinet's indecision is not so much that of responsible men carefully making up their minds as of preoccupied ones trying to make sense of what seemed to be someone's good idea a month ago. Ireland's crisis is not going to be contained, let alone helped towards resolution, in that way.

Not the end of the world

If Herr Barzel's men do kill that Russian-German treaty, it won't be all that much of a disaster

The marriage that has been arranged may not take place after all. It now seems entirely possible (see page 39) that the west German parliament will refuse to ratify the treaty Herr Brandt signed with the Russians in 1970. If it does, and if Herr Brandt cannot persuade the German electorate to give him another Bundestag that will say yes to the treaty, which he very likely cannot, the Russians say they will refuse to sign the agreement about the future of Berlin that was worked out last August. But a Russian signature on the Berlin agreement is the West's price for the all-European conference that the Russians have wanted for years and the west rather half-heartedly agreed to last year. No ratification, no Berlin deal ; no Berlin deal, no great get-together. That was the house that Willy built, that was ; or so it could turn out, if one Social Democrat defector and two Free Democrats carry their doubts about Herr Brandt's eastern policy to the point of voting against the Russian treaty, and nobody from Herr Barzel's opposition crosses the floor the other way.

Herr Ehmke, the minister who runs the chancellor's office in Bonn, said on Tuesday that the collapse of his government's eastern policy would "be looked upon with concern throughout the whole world." Certainly it would destroy the assumptions the foreign ministries have been working on for the past year. So should Sir Alec Douglas-Home and M. Schumann and Mr Rogers be flying to Bonn to persuade Herr Barzel to let the treaty through after all, and keep the Ostpolitik alive ?

It does look as if one dangerous consequence of the Ostpolitik has now been avoided. It was avoided, to be precise, on December 29th, at the end of Herr Brandt's visit to Key Biscayne, when Mr Nixon told him that there would be no withdrawal of American troops from Europe without a balancing cut on the communist side. The worst possible outcome of Herr Brandt's policy would have been for the next few years to be spent on a weary succession of mammoth all-European conferences, at which nothing very much might have happened, but which would have created enough of an illusion of change to persuade the Americans to take most of their troops home, and the west Europeans to cut their defence budgets, while the Russians in fact maintained their political control over eastern Europe and kept their army east of the Elbe more or less intact. That would not have been detente, or reconciliation, or an opening up of Europe, or any of the other things Herr Brandt wants his Ostpolitik to achieve. It would have been, unmistakably, the pushing of western Europe a few notches down the balance-of-power scale compared with the Soviet Union ; and, since independence is always relative, it would have reduced western Europe's freedom of action against the Russians.

There is little doubt that this is what the Soviet government hoped Herr Brandt's policy would lead to ; and until Mr Nixon's statement of December 29th they might have thought things were going that way. It is Mr Nixon's refusal to order a unilateral American withdrawal from Europe, and his apparent confidence that he can keep on beating Senator Mansfield and the other pullers-out, that have saved Herr Brandt and western Europe from the worst outcome of his approach to the Russians ; and if Mr Nixon is re-elected in November the danger will probably have been removed for another four years.

But if the worst has been avoided, it must also be said that the high hopes of the supporters of Herr Brandt's policy are coming to look increasingly unrealistic. Herr Egon Bahr was the man who originally thought out the Ostpolitik, and what Herr Bahr hoped it would do is plain enough. He believed that it would slowly loosen the ties that bind the smaller countries of eastern Europe to Russia: that these countries would gradually be free to do more trade with the west, and allow more of their people to travel to the west, and let more non-communist books and newspapers leaven the diet of communist orthodoxy their population has to live on. In fact, it is now pretty clear that the Soviet Union has no intention of letting this happen, and has already taken the necessary steps to prevent it happening.

It could be a stand-off

Under the present five-year plans, which govern the economies of the east European countries up to 1975, these countries are being required to do a larger proportion of their trade within the communist world than they were in the previous five years ; the only exception to this dismal trend being Rumania. The number of people allowed to travel to the west last year from Hungary and Poland—the two most liberal of Russia's allies—may actually have been slightly smaller than it was in 1970. The recent opening up of the border between east Germany and Poland (no passports are needed since January 1st, and there is hardly any customs check) is an admirable thing in itself, but it is an indication of the way things are likely to develop in the next few years. The Soviet Union is prepared to let the countries of eastern Europe conduct their relations with each other in a slightly more relaxed way, but it does not want them to remove the physical and intellectual barriers that separate them from western Europe. It is summed up in the word the east German government uses about its relations with west Germany—*Abgrenzung*, which means demarcation, or ruling off. Plainly neither Mr Brezhnev nor Herr Honecker means to let the Ostpolitik produce the results Herr Bahr was hoping for ; and even if the men who run the other east European countries did, it is highly unlikely that they would be allowed to get away with it.

So the likeliest outcome of the whole thing could be neither the most the optimists hoped for, nor the worst the pessimists feared, but a stand-off. Herr Brandt would have tacitly accepted Russia's position in eastern Europe, and the continued separate existence of Herr Honecker's part of Germany ; and in return he would have got little more than the Russians' formal approval of Berlin's communications with the west, which they would almost certainly not attempt to challenge anyway. It could amount to as little as that. Indeed, the idea that the Ostpolitik might have led to a real opening up of eastern Europe was probably based on a fundamental misjudgment about that part of the world. It is certainly true that most of the people who live in eastern Europe would like more contacts with the west, and less control from Russia. It is also true that public opinion in those countries has slightly more effect on the government's policies than in the Soviet Union. But when it comes to the test the communist parties of Hungary and Poland and the rest are no readier to risk their monopoly of power than the Soviet party is. It is not just that such men as Mr Gierek and Mr Kadar have to operate within the limits that Mr Brezhnev imposes on them ; they also have good reasons of their own for avoiding any change that might imperil their own position.

The conference isn't indispensable

But if that is all the Russian-German treaty might have led to, its rejection by the German parliament would not be an overwhelming tragedy. There is just not that much to be lost. It might give the west Europeans a certain satisfaction to get the Russians at a conference where they could be asked yet again in public, as they have so often been asked in private, why they will not allow a freer movement of people and ideas between the two parts of Europe. It might be possible to set up a sub-committee of the conference to see whether there is any possibility left of cutting the armies in both halves of Europe, although the Russians are still refusing to receive the man Nato has appointed to negotiate with them on the subject. But that is about the extent of it. The grand conference of all the Europeans, plus America and Canada, that is advertised as the climax of the negotiations of the past two years has always seemed a clumsy and inappropriate instrument. If the Russians are ready for a real change in the affairs of Europe, most of the actual negotiating will have to be done at smaller, technical meetings ; if they are not, they are not going to be pushed into it by being asked embarrassing questions at the big conference. It has never worked that way at the United Nations.

Perhaps it will not turn out like this. Even if the Bundestag does reject the Moscow treaty, the Russians may decide not to lower the boom on the Berlin agreement after all ; they might, just conceivably, even agree to look again at the part of the treaty the Christian Democrats find most objectionable, the phrase which implies that the frontier between east and west Germany is "untouchable." Whether they go and sulk in their tent will itself be a test of how seriously they want a new relationship with their European neighbours. Herr Brandt was right to make the Ostpolitik experiment ; when a 20-year-old policy has achieved nothing, it is always worth trying something different. It is not his fault that the expectations he attached to it have shrunk as Russia's response has become clearer. But the more they have shrunk, the less of a disaster it has come to seem if the policy has to be abandoned as a gallant failure.

Limits to misconception

How seriously should we all take the forecast from the Club of Rome of impending world doom?

Four years ago an idealistic Italian industrialist interested in ecology tried to recruit up to 100 world savants into a well-financed project, whose main object turned out to be to sponsor the sorts of computer model through which one school of academics at the Massachusetts Institute of Technology has long been forecasting the doom of the world. Rather fewer internationally known scholars joined this Club of Rome than publicity about it has sometimes claimed. But some have done, and the result is that a lot of otherwise sensible people are suspecting this week that there must be something in the first MIT project commissioned by the club.* As usual with such reports, it advocates that mankind should stop the growth of capital investment as well as of world population, because a computer has said that the highest possible standard of living that this planet can afford is one that stagnates at half today's North American level, and that it should be shared equally among a stabilised world population living for an average of 70 years.

The report represents the highwater mark of an old-fashioned nonsense, because the MIT team has pumped into its computer so many dear, dead assumptions. It falls with both eyes open into the central trap before all futurologists, and is thus in danger of discrediting the germ of truth that should make more considered researches of this sort worth while.

The central trap is that, ever since economic growth really began with the industrial revolution 200 years ago, any scientist has always had to forecast world disaster if he plots existing exponential economic growth against the elasticities of supply and substitution for particular things as assumed within known technology. Since it is exponential growth in technology that is spurring exponential growth in income, of course your computer tells you that you are heading for breakdown if you tell it to assume continuance of the effect without continuance of the cause. As an example that has been quoted here before, in 1872 any scientist could have proved that 1972's quantum of urban transport and travel within London was impossible (and therefore a city the size of London was impossible), because where were Londoners going to stable all the horses and how could they avoid being asphyxiated by the manure?

On the other hand, the germ of common sense behind researches like the Club of Rome's is the suspicion that today's pace of exponential growth in gross world product must run into inelasticities of supply in some particular things some time. For the past 25 years many people have been trying to forecast what they would be, but getting them wrong.

About 20-25 years ago the imminent inelasticities were supposed to come in food and raw materials, so that eminent scientists were asserting that world famine was certain before 1970 (we were going to create a lot of dustbowls) and the Paley report in America said that raw materials would rise steadily in price compared with prices of finished goods. Instead, the industrial countries have piled up butter mountains, and the terms of trade turned sharply against raw materials in the year of the Paley report itself, because the elasticity of supply and substitutability for many foods and raw materials has actually been increasing rather fast. Later in the 1950s many people thought that the worst inelasticity would come in our power to get rid of growing pollution from our air and water; but even crude legislation like Britain's Clean Air Act of 1956 has worked surprisingly well, so that the smoke content of London's air has been reduced by three-quarters in 15 years and fish have appeared under some central London bridges for the first time in 100 years. Certainly, we should watch for any turnround; but bottlenecks appear where elasticities of supply are declining near to nought, and it is not logical to forecast that the first ones will appear where extra effort has recently brought forth greater results than originally expected (ie, where elasticities of supply are rising).

The trendy ignore the trends

By the late 1950s many people (including this newspaper) had switched into thinking that the really lasting inelasticity might be in the provision of education to underdeveloped countries (because the supply of adequate teachers willing to go, or able to be trained, there is so limited); but computer-assisted learning programmes now already promise a real future breakthrough there. By the mid-1960s, the main inelasticity appeared to be in the supply of decent urban living systems (this was not only because high-rise housing is proving a nasty way of living, but because a lot of urban public services, ranging from police protection to garbage collection, appeared to be breaking down); there is still reason to be worried about this, although the signs are better than they were. Probably the main worry at the moment lies in the breakdown of various social patterns, and in a possibly emerging inelasticity of supply of the unknown satisfactions that could keep them reasonably cohesive.

There would be great advantage if the Club of Rome sponsored computer research into suggesting what are the things now coming into inelastic supply. Instead, the MIT team has done the opposite. Its computer model assumes artificial inelasticities in the supply of the three things—food, raw materials, pollution control—that were wrongly thought to be inelastic 20-25 years ago. This is always the easy and popular thing to do, because there

* "The Limits to Growth," a report for the Club of Rome's Project on the Predicament of Mankind, Potomac Associates, 205 pages. $2.75.

You won't know how rich you are

You won't know how rich you are or how rich you can be,
until you bank with us. We believe banking is a two-way business.
We see our job as being more than merely helpful.

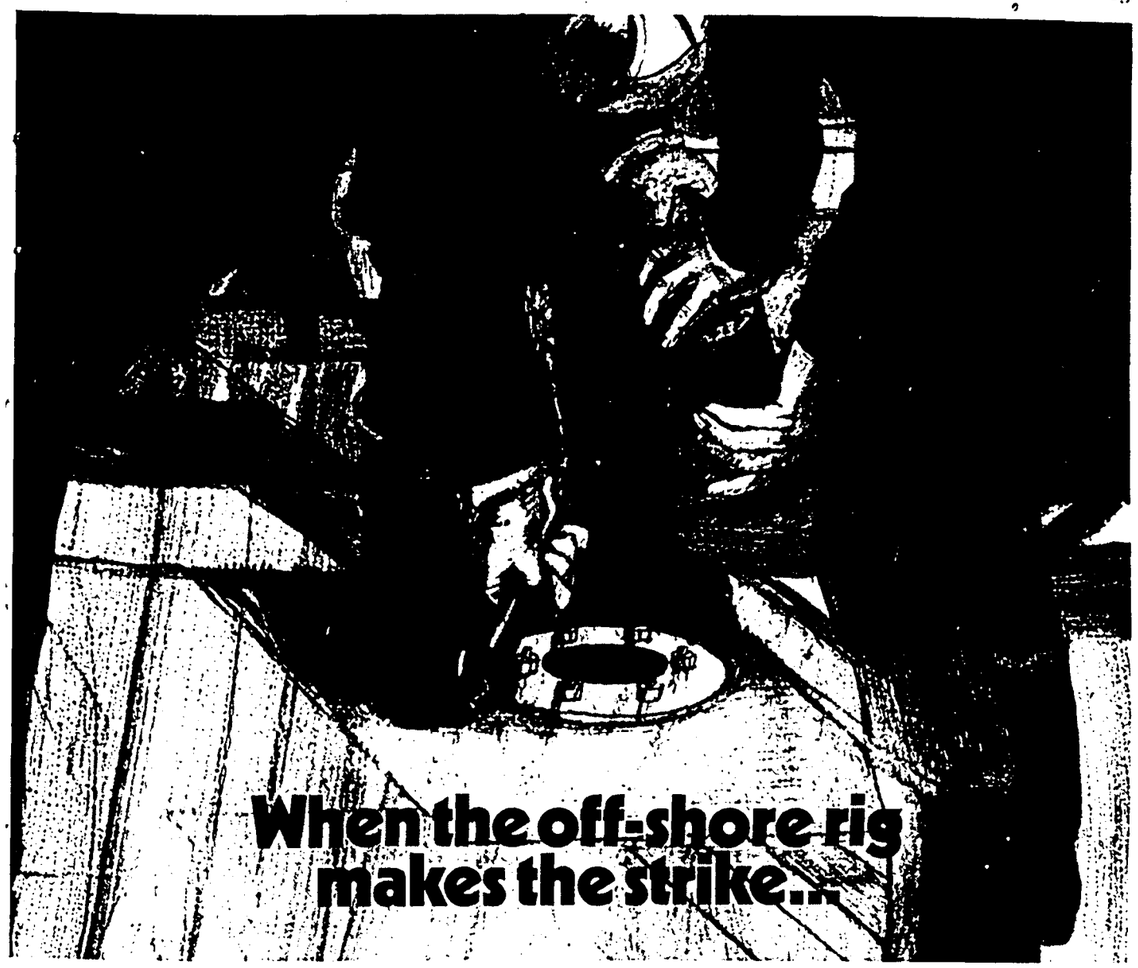
WILLIAMS & GLYN'S BANK

are naturally lots of distinguished people around who wrongly made these forecasts then and long to agree that they were not wrong after all. In addition, food scientists, pollution experts, etc, naturally think that food science, pollution control, etc, are the most important things in the world, and they can then be paraded as expert opinion to say how right the Club of Rome is to proclaim that much more attention should be concentrated on the fields in which they are experts and to which they have devoted their lives.

This report thus actually does more than fall into the usual trap of assuming present state-of-the-art elasticities of supply. It postulates eventual absolute inelasticities of supply in its three chosen causes of breakdown—food, raw materials, pollution control—by constantly proclaiming that "this is a finite world" (ie, a world in which supply of everything eventually becomes totally inelastic), and then draws charts in which the curve of exponentially rising demand crosses these straight lines showing absolute inelasticity during the next century. The absolute inelasticities are pulled forward to an earlier period than is commonsensical by the usual semantic muddle of assuming that the meaning of a word in today's technology will be the same in tomorrow's technology.

Arable is infinitely indefinable

Thus it predicts that the exponentially rising curve of demand for food (without defining what the word "food" might mean tomorrow) will cross an absolute limit set by "arable" land in our children's lifetimes (without recognising that the word "arable" is an existing-state-of-technology-word that is necessarily changing its meaning all the time). If we ever did find demand rising towards the club's supposed straight line—and at present, to repeat, the gap is widening rather than narrowing—then it is highly probable that the forces of market innovation would shift the line upward again by such relatively foreseeable new technologies as inventing new plants in pods, turning agriculture from its present incredibly inefficient reliance on unharnessed solar power, substituting present fish-hunting by sea farming, etc.



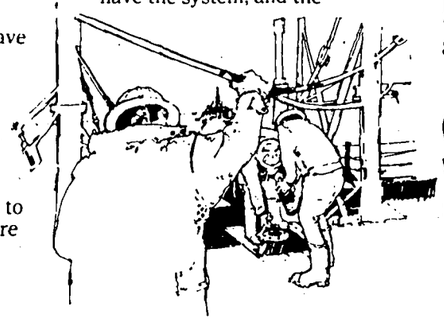
The limit for raw material production is luckily not set in this report by citing the old canard of "known world reserves," at a time when every oil drill pushed down into the North Sea finds oil reserves that nobody even 15 years ago had suspected, but the straight line that the doomsters need to be cut by their exponentially rising demand curve can still be readily manufactured by saying "assume that real world reserves are twice present known levels or five times them," and then pretending that this is optimistic. But in reality it is much more likely that we will for a time exponentially increase raw material reserves (depending on how you define both materials and reserves) in line with exponentially rising demand, because the coming breakthroughs to fusion and harnessed solar power as sources of energy should enable us to extract minerals from rocks and start to put matter together molecule by molecule. The assumption in the report that pollution will stop economic growth, even if supposed food and material shortages do not, is merely asserted, not scientifically assessed with any eye on possible new technologies (or even on recent legislative results).

Is there any value in this sort of exercise when it can apparently lead such very clever people into such misconceptions? While it would be absurd artificially to slow down economic growth (which depends on growing technology) because you think that technology will not grow fast enough, population could well go on swelling inconveniently even if technology slows down. It is therefore useful to inspire new thinking now on population control, although the problem is probably not going to be the easy one which this report assumes—of spreading known technological aids like the pill to help voluntary birth control. The real problem is that in the next few decades we are probably going to learn how to cure a lot of degenerative diseases and thus how to keep too many old people alive; incidentally, this report, while calling for population control, also thinks that the non-resource-using activity of medical research is one activity that we should increase—either most oddly, or because it knows that there is a scientific community of medical researchers that will applaud it for saying this. We should face the fact that total world population probably will outrun one of the real supply inelasticities—which are unlikely to be food, raw materials, or pollution control—and that some future generation may have to choose either to resort to compulsory rationing of births (especially as women in the future may be able to order the sort of babies they want by clonal reproduction in their own bodies), or to euthanasia, or to genetic engineering (if we were to turn ourselves into a race of six-inch men instead of six-feet men, most of the Club of Rome's problems would be solved). It does seem rather desirable to think out which we would prefer rather well in advance.

It would also be welcome if computer studies could be turned to trying to check what things are coming into inelastic supply. For goods and other satisfactions sold in the market the price system shows this, but for other goods and satisfactions (ranging from simple public services like sewage, through to more complicated satisfactions like social living patterns appealing to the younger generation) it does not.

The budget

The Chancellor of the Exchequer, Mr Barber, opens his budget box on Tuesday, March 21st, and there will be the usual full coverage of his proposals and their effect on industry, the market and the economy as a whole in *The Economist*. In next week's issue there will be pre-budget analysis of what the Chancellor is likely, and ought, to do. This week: a special assessment of what could be in store for investors (page 79) and comment on the latest advice to reach the Treasury (page 83).



...it's news you want to shout in secret.

CABLE & WIRELESS
THE BIG LINK

In thirty years our cities will be twice as crowded. Think about it.

The need for better urban planning is obvious. Equally obvious is the enormous complexity of choosing a plan now, which will still be relevant in 30 years' time. The number of variables, alternatives, unforeseen political or economic shifts is incalculable.

Can the computer help?

That question prompted the setting up of a joint study by the management of the County Borough of Teesside and computer scientists from the nearby IBM Scientific Centre at Peterlee New Town's Science Park.

Together they are constructing a computer model of Teesside.

The decision makers can then use the model to explore a myriad of policy alternatives and a variety of assumptions to determine the most efficient use of available resources consistent with given facts and long-term preferences.

When factors change – as they will – the model can be run again to see how and why any change affects the overall plan.

And necessary adjustments can be made.

For the County Borough of Teesside the model promises a welcome degree of rationalisation and consistency to their work.

And for the people of Teesside it will mean eventually the best urban life possible with the resources to hand.

The planning potential that models such as that at Teesside is revealing could, of course, not have been realised without the immense speed and capacity of the computer.

But, more specifically, it could not have been achieved without the determination of man to make the computer work for him.

IBM

CHILE WITH ALLENDE

Birth of a civil war

BY OUR SPECIAL CORRESPONDENT *Santiago*

In the Chilean summer, it is hard to imagine civil war. The yachts bob out in the Pacific at Algarrobo, beautiful girls sip pisco sours in the Grand Hotel at Zapallar, and apart from a few conscientious "summer widowers" Santiago is strangely empty over February as the population streams west to Viña del Mar and the other resorts. "Silo," the name of an obscure Argentine apostle of hippiedom scrawled on the pavements, seems more relevant than all those political slogans that have eaten up the whitewash since President Salvador Allende took office in November, 1970. But summer is nearly over, and behind the holiday smiles most people are conscious of the long rough winter ahead.

Over the past year, there has been a complete transformation in Chilean politics. Last summer Dr Allende was performing a skilful balancing act; the opposition was fatalistic and divided; and although the economy was running down it was still possible to believe that the Popular Unity planners would abandon their ideological obsession with state control in order to persuade people to invest. Today, Dr Allende is very much on the defensive. The defeat that his coalition suffered in the by-elections in O'Higgins, Colchagua and Linares in January showed not only how strongly the tide of public opinion is running against him, but also that the opposition Christian Democrat and National parties have managed to submerge their personal differences and cement a firm alliance.

Last month, the Popular Unity leaders got together in a house at El Arrayan just north of Santiago to mull over their defeat. An extraordinary internal communist party document leaked to the conservative newspaper El Mercurio while the meeting was taking place provided evidence of the squabbles within the government coalition as well as the bruising effects of the by-election. The communists blamed the "ultra-leftists" within the alliance for their defeat: "The enemy has tried to identify the idiocies of the ultra-left with the actions of the government. . . . The ultra-left tries to make out that there is a contradiction between trying to win over the middle class and trying to win over the proletariat. This idea has been expressed by Comrade Carlos Altamirano" (the secretary-general of the Socialist party). The communist tactic, in contrast, is to aim for the support of the middle class and of moderate opinion, to "neutralise and then win over the social base of the Christian Democrats" in order to isolate the most conservative elements.

The bid to win the centre is the key to Dr Allende's current political manoeuvres. He is trying to get the eight political groups that form his coalition to agree on a single list of candidates for the next election. He is also trying to build up the rump of the Radical party headed by Sr Carlos Morales and the Leftist Radical party (PIR) (more conservative despite its name) into a third force within the Popular Unity alliance. Sr Morales told this correspondent that he believed that Dr Allende was personally committed to the "decentralisataion of power" within the coalition.

But the Radical party has lost much of its grassroots support, and many of its leaders are suspected of shady dealings. The PIR, on the other hand, is firmly opposed to marxist ideology, and has been one of the stumbling blocks for Dr Allende's attempts to move towards a single government party. Anyway, the support of the middle class does not depend upon which jobs a clutch of Radical or PIR leaders are given within the cabinet, but on the state of the economy and the constant expansion of state control.

Allende gestures towards the centre

Economics is power

In the space of 16 months, Dr Allende's government has created enormous, possibly insoluble, economic problems. The men who run the economy—and above all Sr Pedro Vuskovic, the minister of economy who is closely aligned with the Communist party—are narrowly obsessed with widening what they like to call the "social area," a euphemism for state control. Since they have been in office, they have failed to create a single new industry of national importance, to import new technology, or even to rationalise or reorganise the private industries they have been swallowing up. On the contrary, skilled technicians and managers have been replaced by politicians and standards of service and production have dropped alarmingly.

Driving up to Santiago from Rancagua, this correspondent passed a crowded passenger train travelling at night with only five or six light-bulbs burning in the carriages. Most people were sitting in darkness. The decline of the state railways under the management of Sr Nahum Castro, a Socialist

party militant, is an extreme example of the effects of Popular Unity supervision. According to some sources, 300 trained engineers have been replaced by political elements, including members of the Movement of the Revolutionary Left (Mir) who advocate armed struggle in Chile. Despite a 72 per cent increase in the government subsidy last year, the work of construction and repair has slowed to a standstill because of shortages of materials and imported equipment. Some 40 per cent of the rolling stock is rumoured to be out of service awaiting repair.

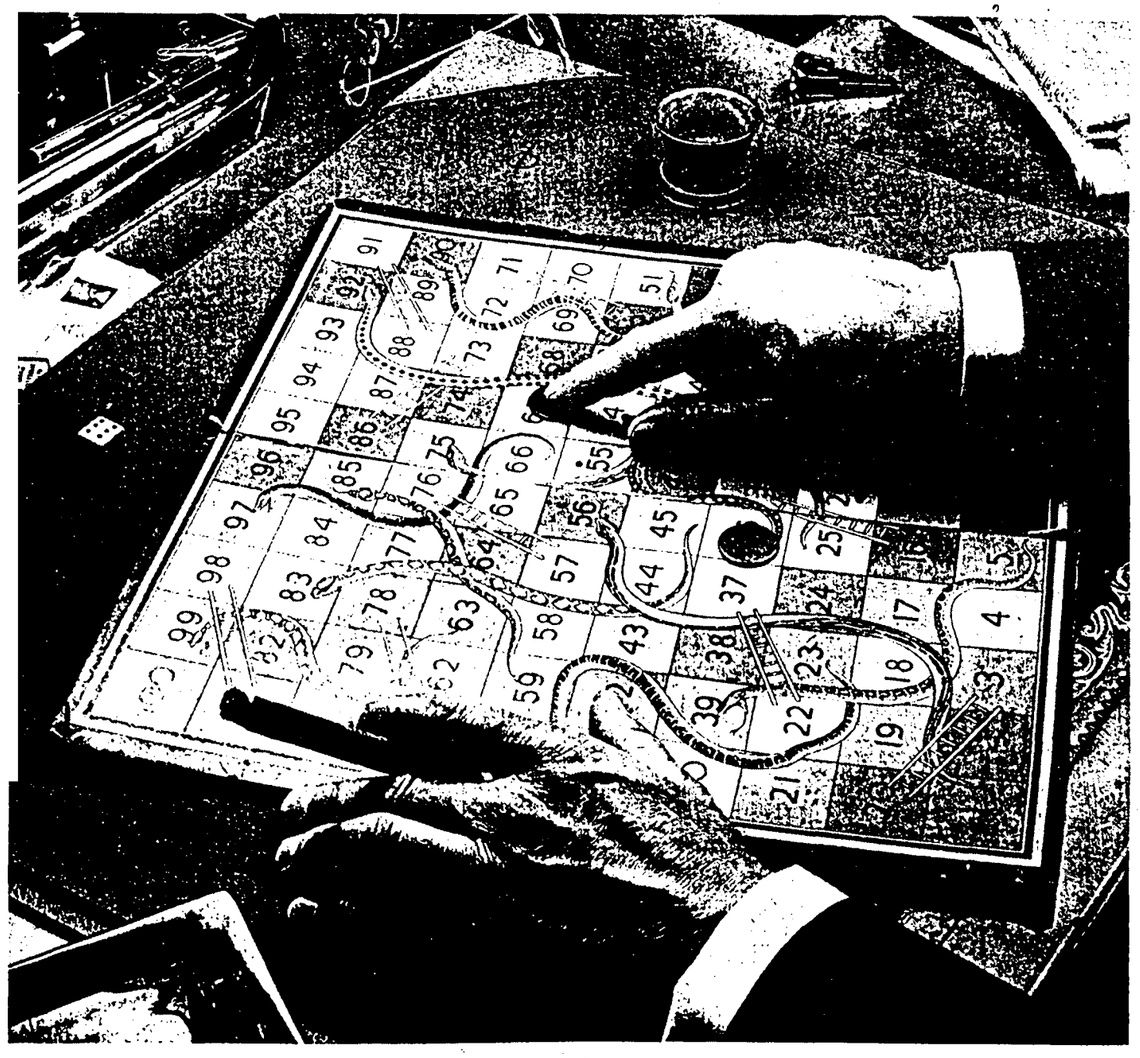
But it is the impact of state management of the copper mines that has the most serious implications for the economy as a whole. Although total copper production in Chile rose last year, this was due to the opening up of the Exotica and Andina mines. Production in the three big mines taken over from American companies—Chuquicamata, Salvador and El Teniente—dropped by more than 8 per cent between January and September. The decline in production and the persistent labour troubles in the biggest copper mines cannot be shrugged off (as Mr Graham Greene and other observers have tried to shrug them off) as the result of the whims of a "labour aristocracy." Sr Carlos Correa Iglesias, a former supervisor at the Chuquicamata mine, has provided an insider's view of the copper crisis in a series of articles published in El Mercurio around Christmas. He showed that, under the direction of two communists, Sr Julio Zambrano (appointed president of the administrative commission with sweeping powers) and Sr Antonio Berthelon, the sub-director of industrial relations, the Chuquicamata mine has been turned into a happy hunting-ground for the extreme left.

Systematically, government agents have worked to expel managers and technicians regarded as politically "unreliable." The result has been the loss of scores of trained men with many years' experience. The shortage of skilled manpower became so acute that Codelco, the state copper corporation, prepared a contract for employing Jugoslav copper technicians at inflated salaries to be paid in dollars. At the same time, under state supervision company resources have been abused for political ends. It has been charged, for example, that the number of company guest houses at the Chuquicamata mine has been raised from three to eight in order to accommodate the communist Ramona Parra and socialist Elmo Catalan paramilitary

The miners won't be voting for Popular Unity

brigades, which make use of company cars and store arms on the premises.

Mismanagement of the mines has added to the problem of low world prices. While the world market price of copper dropped from 80 cents at the end of 1969 to 47 cents at the end of 1971, production costs climbed to 32 cents—a very slim margin for a country dependent on copper as the prime earner of foreign exchange.



But the copper crisis is only part of the reason for Chile's economic malaise. The government has been working with formulae borrowed from the Russia of the 1920s and from Cuba. Sr Vuskovic's economic strategy is in a sense entirely political. It is concerned with power, with destroying the economic base of the middle-class opposition. That is why increasingly many Chileans are asking themselves whether political liberty is conceivable without economic liberty. On the one hand, the opposition can score heavily against Popular Unity in a by-election and has a good chance of winning a two-thirds majority in congress in the legislative election that is coming up next year. On the other hand, despite the constant opposition of a hostile congress that is now trying (through the Hamilton bill) to limit the power of the state to buy up private companies, the government has steadily tightened its grip over the economy by executive action and the purchase of shares.

The list of 91 companies scheduled for expropriation that was issued last month is a death-warrant for private enterprise. It remains to be seen whether the government has the power or the cash to execute it, since the take-over of the 91 depends mainly on the sale of private shareholdings, and many of the companies seem determined to resist.

Anyone who talks with the opposition and with individual businessmen in Santiago today will be immediately impressed by the new spirit of resistance. The case of the Papelera (Compania de Manufactura de Papeles y Cartones) late last year—when private shareholders held out against an attractive state offer to buy them out—set an important precedent.

But the overall outlook for the economy is bleak. Industrial investment is down to nothing, and not many people are convinced when Sr Vuskovic ascribes this to "monopolistic conspiracies." It is not just that private investors have stopped spending. The vast increase in state spending over the past year was used, not for new capital investment, but to buy up existing companies and to finance dramatic rises in salaries and social benefits. This creates a huge problem for the future. Industrial production rose by something like 10 per cent last year because managers were able to meet increased consumer demand by running down stocks and drawing on unused productive capacity. The drying up of new investment could mean static or declining production this year—with alarming inflationary effects.

Up to the end of 1971, the government played out the parable of the emperor's clothes : because Sr Vuskovic could not detect any sign of inflation, it could not exist. In fact, when you raise wages by 50 per cent and increase the monetary supply by 118 per cent in the course of a year, something is bound to happen to prices even if you

The corporate finance game.
And how Charterhouse can help you climb the ladders and avoid the snakes.

City institutions are not all alike. Most of them can arrange a loan for you, or issue a debenture.

Fewer give close and continuous consultation to help you determine exactly what you need over a long period of time. And get it.

Charterhouse Finance Corporation is one of the few. Through its merchant banking subsidiary it can draw on the skills of an expert corporate finance division as well as expertise in areas as widely different as foreign exchange, investment management or insurance broking. If it's appropriate to raise finance by a Eurodollar Loan, we'll tell you...and arrange it.

If an aggressive acquisition programme will best solve your problems, we can help with that too.

And if you need help to fight off a predatory bidder we'll be by your side.

We are probably the most business-orientated of all City financial institutions. In another part of our group, we own and run businesses ourselves, so we really are sensitive to the problems of money management today. That's one reason why we believe we can help on a long term basis – not only with money, but with advice.

If you think we could be helpful, call Michael Levete at Charterhouse Finance Corporation at 01-248 3999.

Or if you are in the Midlands ring Ralph Sammell at 021-236 4936.

Charterhouse

The Charterhouse Group Limited, 1 Paternoster Row, St. Pauls, London, EC4P 4HP.

Exports totalled £414 million which was substantially higher than ever achieved previously by any British company of any kind

The following are salient points fom the circulated statement of Lord Stokes (Chairman and Managing Director).

★ **I am glad to report better results than last year.** The improvement was a combination of the effects of our own internal rationalisation and reorganisation, more sustained production and the general upturn in the domestic car market following the Chancellor's measures in the summer.

★ Profit before tax in the financial year ended 30 September 1971 was £32.398 million compared with £3.932 million in the previous year. All five groups and divisions of the Corporation traded at a profit. The Directors recommend a final dividend of 1.375p per share making a total of 2.0p for the year compared with 0.9375p last year.

★ **Sales by value increased from £1,021 million in 1970 to £1,177 million** with domestic sales increasing from £522 million to £614 million and overseas sales from £499 million to £563 million. **Exports from the UK totalled £414 million (1970—£351 million)** which was substantially higher than ever achieved previously by any British company of any kind.

★ Sales by units totalled 1,057,000, including 852,000 cars, 193,000 trucks, buses, vans and other commercial vehicles and 12,000 agricultural tractors, compared with a total of 984,000 in the previous year.

★ Although profit was very much higher than in the previous year it fell a long way short of the requirements of a corporation of our size. We must achieve substantially higher profit to support the major product and modernisation programmes which are essential if we are to remain viable as a major world motor manufacturer. Since the first days of the merger our plans have been developed with this in mind. It is gratifying to see the results beginning to work through to the financial figures but inevitably it will be some time before the full effects are felt.

★ The organisational principles agreed at the time of the merger have proved a sound basis for managing the Corporation and we are systematically continuing the process of rationalising and improving our products, sales outlets and manufacturing and assembly facilities at home and overseas.

★ Last year I said that the Board had approved a comprehensive industrial relations policy. During the past year the Corporation has actively pursued its implementation. One of the essential elements of our policy is the replacement of wage systems which have outlived their usefulness. We still have a long way to go but it is very encouraging to report that in those plants where new systems have been introduced time lost through industrial disputes has dropped significantly.

★ **In April, 1971 the Morris Marina was successfully launched.** This was the first major model introduction of a vehicle which has been conceived, designed and developed since the formation of British Leyland. **It is already a major competitor in the popular and growing family class of cars and, in addition, has special appeal to fleet owners.**

★ We welcome the decision that Britain should enter the European Economic Community as it opens up to us a very large vehicle market. My colleagues and I believe that **we are better placed than ever before to face the challenge of the Common Market and of increasing competition from other overseas countries.**

★ The year under review has seen a steady return towards more acceptable profitability and the new financial year offers continually improving prospects. Whilst we still have difficult labour situations in certain locations, we are encouraged by the general response we are getting from our people at all levels and subject to the national situation, we look forward to a period of increasing production, higher sales and rising profits.

Copies of the Annual Accounts and Chairman's Statement can be obtained from the Secretary, British Leyland Motor Corporation Limited, Berkeley Square House, Berkeley Square, London, W1X 6DL.

BRITISH LEYLAND
MOTOR CORPORATION LIMITED

apply a control system of steel-like rigidity. Figures produced by the Christian Democrats suggest that the real rise in prices last year may have reached 35 per cent.

At any rate, a series of dramatic price hikes early this year suggests that inflation has finally caught up with Popular Unity—the average price of cars, for example, is up by 56 per cent, petrol is up by 33 per cent, and on top of the price rises there is a new bill calling for a wage bonus of 120 escudos a month to enable workers to stay ahead of the cost of living. When you add to the prospect of this sort of inflation the shortage of foodstuffs (especially meat) and of imported goods, the burden of the foreign debt that Dr Allende's envoys are having trouble in renegotiating in Paris despite his softer line on copper compensation, and the huge budgetary deficit, it is easy to understand why the government is not looking forward to the next election.

Stirrings in the barracks

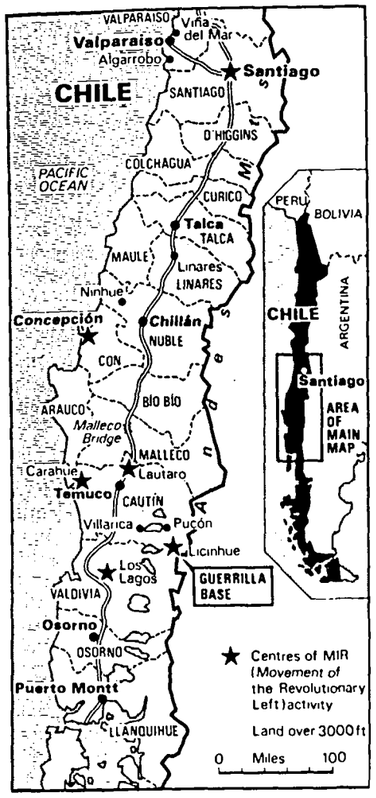
Will that election be held at all? The answer, as always, depends largely on the armed forces. Dr Allende has continued his assiduous courtship of the men in uniform, to the point of presenting one of his generals with a huge silver cigarette-case on the first anniversary of his appointment to office. That kind of attention to detail has paid dividends. On the other hand, it has encouraged a consciousness of power among the officer corps. When the president transferred Sr José Tohá to the ministry of defence to skirt an opposition censure motion in congress a couple of months ago, for example, he walked from the Moneda palace to inform his chiefs of staff.

The spectacle of a president going to wait upon his generals was something new in Chile. There have so far been few cases of political interference with the armed forces although the Chilean CID, Investigaciones, has been placed in charge of political appointees—an electrical engineer and a psychiatrist. The only two senior officers who have been sacked since Dr Allende came to office were Colonel Labbe, formerly the commandant of the military academy, and Walter Heitmann, the air force chief of staff. Colonel Labbe was an outspoken conservative who was vehemently opposed to Dr Castro's visit to Chile and came under suspicion when his cadets suddenly fell victim to a "flu epidemic" on the eve of Dr Castro's visit to the academy. He was promoted to a desk job afterwards, and then sacked. All the same, his dismissal—like that of Sr Heitmann—came from the commander-in-chief, General Prats, and not directly from Dr Allende.

Not everyone loves Che

It is still generally agreed that Chile's armed forces would have to be seriously provoked before they would step outside their apolitical tradition and act against a government that has doled out more generous salaries and treated them with greater deference than either of its two predecessors. On the other hand, there are plenty of examples of a growing restlessness in the barracks. There was the admiral in Valparaiso, for example, who threatened the *intendente* of that city with the warning that his men would move into the streets unless the police cracked down on left-wing rioters within an hour. There was the military audience in Temuco that failed to applaud the president. There was the secret poll that showed 82 per cent of the officer corps would like to see General Viaux (the hero of the far right who staged an abortive uprising) released from jail.

Two issues that the army feels particularly strongly about are Cuban influence and the activities of left-wing paramilitary groups. The Cuban role in Santiago can be easily exaggerated, but it is still true that Cuba's embassy, with 48 listed diplomats, is nearly five times as big as the British embassy in Santiago, and that three-quarters of its members are believed to be members of Cuban intelligence. The counsellor at the Santiago embassy is said to have been the desk-officer responsible for co-ordinating Che Guevara's Bolivian operation from Havana, and it is worth observing that another top Cuban diplomat said to have intelligence associations, Sr Fernandes de Oña, recently married Dr Allende's daughter Tati. There have been reports that the Cubans were flying in arms for the Mir guerrillas to the Pudahuel airport in unmarked planes last year.



The Cubans have probably been more interested in general in using Santiago as a base for subversion in neighbouring countries—Bolivian exiles such as Major Ruben Sanchez, for example, have been moving back and forth between Santiago and Havana. But this correspondent talked with leaders of the Mir in the "Che Guevara" slum suburb of Santiago who said that Cuban instructors had been visiting their settlement regularly to conduct political education courses. The Cubans have also helped to train the presidential guard (and have been widely blamed for its tonton macoute image—sunglasses, fast cars and sabre-rattling). It is still probably true that Dr Castro's visit to Chile last year was a setback rather than a gain for Cuban influence. One of the strongest terms of opprobrium one can use in Chile is "tropical," and Dr Castro made the mistake of displaying himself as the Caribbean demagogue, talking too long and outstaying his welcome.

Until recently, Dr Castro's Chilean admirers were making their greatest gains in the south of the country. Now they have competition.

It has started in the south

A civil war has already begun in the south of Chile. The news will take time to filter through to most people in Santiago, since Cautín is probably farther away from the capital psychologically than Belfast is from London. The beginning of the conflict in Cautín can be dated precisely: around midnight on Thursday, February 17th. That was when about 60 small landholders climbed into their cars and drove out to the Santa Ana farm outside Lautaro. The farm (about 25 basic hectares) belonged to the Gonzalez family. It had been seized by a shock-group of Mirista guerrillas leading 70 or 80 Mapuche Indians.

The men who went out on February 17th to take back the farm by direct means belonged to something new in Chile: a disciplined vigilante movement, well armed, well led and with a coherent strategy. They call them-

selves the Guardia Blanca, or "white guard," but that is really only a label applied to them by other people. In the province of Cautín alone, they have a pool of about 60 cars (a lot of transport in that district of dirt roads and broken-down trucks) and there are about 600 small farmers ready to join in operations, as well as a small group of professionals many of them unemployed labourers who know how to use a gun.

The battle of Santa Ana was an easy victory. The 20 Mapuches holding the farm defended themselves on a hill, but were quickly driven away, leaving five dead horses behind. When the Indians later lodged a complaint with the carabiñeros, they found the authorities only too ready to accept Sr Gonzalez's story that he was just taking some friends out for a barbecue. Since they had been forced to stand by while the Ministas took over farms illegally, why should they interfere when the farmers reclaimed their property?

The Santa Ana skirmish was followed up by the recapture of another farm, Vista Hermosa, the following night. There will be more *retomas*. The Guardia Blanca in Cautín are ready to defend themselves against any new attempts to take over farms illegally. They have a system of bush telegraph and they have guns. "Last year," one of the Guardia leaders told this correspondent over lunch in a sleazy restaurant near Temuco, "we had only 22-calibre guns. Now every one of us is going to be armed with a machine-gun from Argentina." They have good relations with the local garrisons and the local police, who recognise them for what they are: a resistance movement of desperate men who have seen their lives and livelihoods threatened by violent land seizures.

The discipline comes from the German Chilean farmers of the south, some of whom have become right-wing extremists. But the rank and file are small farmers who have found no protection in the law or the police apparatus. It is a classical phenomenon: the resistance to arbitrary takeovers in Chile has begun with the little men, the small and medium farmers, and not with the big men, the *latifundistas*. This is the great problem for Dr Allende, that the reform programme has cut into the interests of the people who cannot fly off to Buenos Aires or Paris, and that they are defending themselves. It is also a problem for the far left.

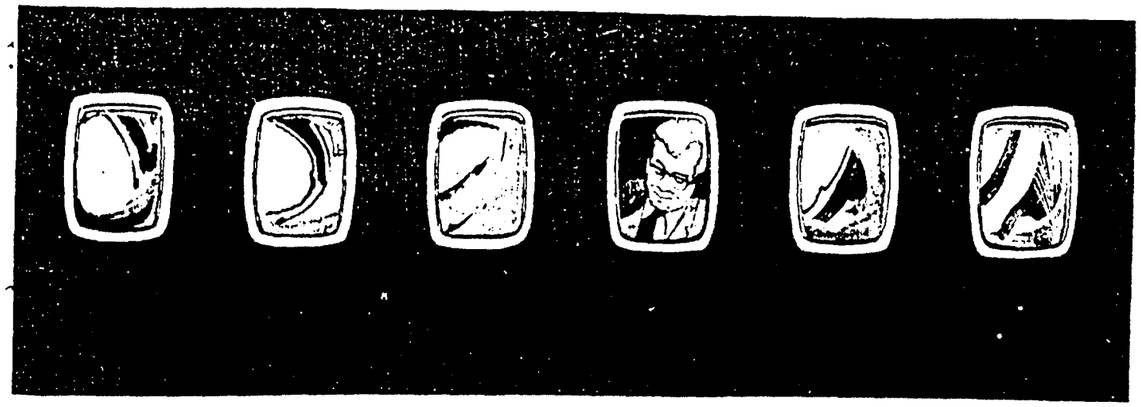
In Cautín, the Guardia Blanca has frightened the Mir and its rural branch, the Revolutionary Peasants' Movement (MCR). This correspondent visited the Lautoro farm that used to be the Ministas' headquarters in Cautín. It was possible to drive straight in because there were no guards on the gate—the Guardia Blanca had been shooting them up. The farmhouse was covered with slogans and paintings of a Che Guevara figure waving a machine-gun. At first, there was no one in sight, apart from the crowd of Mapuche children of five or six who started chanting left-wing slogans as soon as they saw the car. *Momio, escucha, el campo esta de lucha* ("Reactionary fascist, hear this: the countryside is at war"). The men who ran the farm clearly had little to learn about the politicisation of the young. One by one, Ministas began to appear—not students from Concepción, but indoctrinated Mapuches who had been left to run the farm.

The Mirista leaders were said to be up in the Andes with Comandante Pepe, the military leader, at his base near Licinhue. Pepe is still running an area of some 18,000 hectares up along the cordillera as his private fief, and turning back army patrols as if he were a foreign power. One man reported having seen a convoy loaded with 50,000 rounds of ammunition passing through Pucón on its way to the guerrillas in the hills.

The peasants at Lautaro, however, were not confident guerrillas, but frightened, suspicious men, who were not impressed by this correspondent's unconvincing story that he had come to buy a pig for a barbecue. They locked the gate and at first refused to let the car out. "You are Guardia Blanca. You have come to spy on us." They were terrified despite the fact that their farm has been expropriated by Cora, the official land reform agency, so that they have legal title to the land. But they will fight for what they hold, like the Ministas who are still camping illegally on 70 farms in Cautín alone.

One Guardia leader claimed to see the future for Chile as a whole as an *enfrentamiento de frente* (direct confrontation). Operating as private groups, the small farmers have already re-occupied 80 farms that were seized illegally in Cautín—40 of them by "direct action." Now they have an organisation with a national perspective and links with the rural syndicates and the right-wing movement *Patria y Libertad*. There is another vigilante group in Osorno, and the Guardia is forming cells in Linares. On the other side, there are still said to be 1,200 Ministas in Cautín alone and 800 in the single district of Lautaro. Outside the slummy Terraz hotel in Temuco, one can watch busloads of Concepción students arriving to lend their muscle to the summer wave of land seizures. But this year they have been held in check. The rate of land

Pakistan Bangladesh Afghanistan



What are the chances of the economic survival of an independent Bangladesh and a diminished Pakistan? The latest QER contains a detailed, yet concise, assessment of the situation after the war.

Every quarter the EIU publishes 70 reviews covering 150 countries. An annual subscription to one review (4 issues and an Annual Supplement) is £10. Airmail postage £1.25. Single copies £3 (payment with order). Details from the Subscription Department

Success in Kuwait and the Gulf is doing the right thing, at the right place, at the right time.

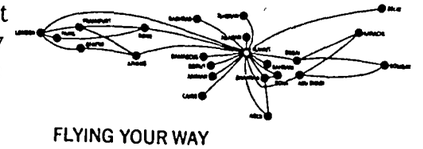
KUWAIT AIRWAYS

With Kuwait Airways as your airline that's a lot easier than it sounds.

Because KAC can give you valuable inside information on trade prospects in the Gulf.

They can also give you details about hotels to stay at during your visit.

And conveniently timed departure and arrival times to ensure you don't waste a second.



Add to this famous in-flight hospitality, helpful hostesses and superb food and you can't fail to be a success.

KAC fly 6 weekly Boeing 707 320c jet services to Kuwait, connecting with Abadan, Abu Dhabi, Aden, Baghdad, Bahrain, Delhi, Dhahran, Doha, Dubai, Karachi, Bombay and Teheran. Non-stop flight London to Kuwait Friday. Non-stop flight Kuwait to London Wednesday

A phone call puts you in the right place at the right time.

The rest is up to you.

Kleinwort, Benson, Lonsdale
LIMITED

"A NOTABLE YEAR IN OUR HISTORY"

A summary of the Statements by Sir Cyril Kleinwort, Chairman of Kleinwort, Benson, Lonsdale Limited, and Mr. Gerald Thompson, Chairman of Kleinwort, Benson Limited, from the 1971 Report and Accounts.

Sir Cyril Kleinwort
Chairman, Kleinwort, Benson, Lonsdale Limited

THE RESULTS
1971 WAS A NOTABLE YEAR in our history. The reported Group profit is £3,774,000 after taxation, compared to £2,563,000 for 1970, an increase of 47 per cent. The main contribution to this very satisfactory result comes from the banking activities of the Group, reinforced by investment opportunities in a rising market. The most striking feature in the consolidated balance sheet is the increase in capital and disclosed reserves by 48 per cent, from £24,782,000 to £36,706,000. In addition to the sale of our leasehold interest in St. Albans House, we took the opportunity of the transfer of KBIT shares to disclose capital reserves of that Company which had previously been deducted from the book cost of investments, and also to adjust the book cost of the investments acquired before 5 April 1965 to the market value on that date.

DIVIDEND
The total dividend of 15 per cent (3¾p per share) compares with the equivalent of 12 per cent (3p) last year.

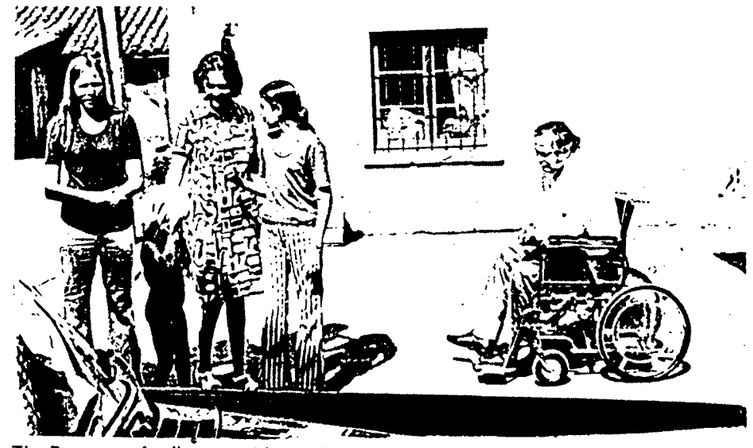
Kleinwort, Benson Limited

Mr. Gerald Thompson
Chairman, Kleinwort, Benson Limited

PROFITS FOR THE YEAR
An increase of 68 per cent in the profits for the year of the banking group, after tax, at £2,951,000, reflects improvements in most sections of the Group's activity.

GROWTH OF INTERNATIONAL BUSINESS
Our banking business, particularly in the international field traditional to us, has shown increased profitability. The Eurofinance Department has been particularly busy, having raised during the year, as leading managers of public issues in the Eurobond market, $180 million of straight debt on behalf of international borrowers.
Kleinwort, Benson Incorporated made satisfactory profits in its second full year of operation and featured as an underwriter in a large number of United States domestic issues. Kleinwort, Benson (Europe) S.A., our Brussels subsidiary, has achieved its highest profits and Kleinwort, Benson (Geneva) S.A. has expanded considerably. Business in Japan, both with banks and with companies, has developed substantially.
In June last year we and the Bank of America established in London the Bank of America Limited. Bank of America have also agreed to join us in our Australian associate, Merchant Bills Corporation, as have the Dai-Ichi Kangyo Bank, the largest bank in Japan.

INVESTMENT MANAGEMENT
The Investment Trusts, Pension Funds and Private Clients' portfolios under our management have shown a notable performance as have our own funds including those of KBIT.



CORPORATE FINANCE
On the domestic front our Corporate Finance and Banking Divisions have been continually active, while our subsidiaries in the Channel Islands have again shown most satisfactory results. Our Export Finance Department is managing syndicate finance for major projects by British contractors amounting to over £150 million, and the commodity trading subsidiary, Fendrake Limited, has had a successful year.

seizures in Cautín rose as high as four a week last year. There have not been that many so far this year, largely because of the vigilantes.

It remains to be seen how the Miristas will respond to the new challenge from the right. It is likely that a series of increasingly violent private battles are about to be waged in the south. Whether or not they will involve the authorities will depend on whether the Guardia decide to resist the official land reform agency and on whether Dr Allende chooses to ignore them.

The Benavente family : casualties of Cora

If you sow wind

Que siembra viento, cosecha tempestas, runs a Chilean proverb. "If you sow wind, you reap storms."

Outsiders who talk comfortably about agrarian "reform" have little conception of what is actually taking place in the Chilean countryside. Chile is not a rich country in agricultural terms ; about 3.6 per cent of the total land surface of that country squashed like a tapeworm between the Andes and the Pacific produces half of its produce. Less than 5 per cent of the country's total agricultural capacity is in farms bigger than the 80 basic hectares that has been established as the legal maximum. In its six years in office, the Frei government expropriated some 1,400 farms covering more than 3½m hectares—most of them located in the rich provinces of the central valley. The Christian Democrats organised most of the farms they expropriated as *asentamientos*, rural co-operatives under the distant supervision of Cora.

The Popular Unity government has accelerated the pace of expropriations. As the Arrayan statement boasted, by the turn of the year the government had expropriated 1,378 new farms, covering 2.7m hectares. At the same time, agricultural production dropped back, and cattle stocks fell alarmingly. The result was that last year Chile was obliged to spend $280m on food imports, which is equivalent to 20 per cent of the country's total currency revenues. Government apologists are fond of saying that foodstuffs are in short supply because everyone is eating better. Anyone who takes the trouble to travel around the south will realise that the root of the problem is the way that the agrarian reform is being administered.

The Popular Unity government has replaced the Christian Democrat co-operatives with state-run *centros* that seem to please no one except the bureaucrats who run them. One peasant in Linares whose employer's farm had just been taken over complained that the workers on the neighbouring state-run farms had not been paid for two months. "How will we eat, Señor ? They say this and that about the *momios*, but at least the *momios* paid us and you could always go to one for help if you were in trouble." Among small and medium farmers, there is a general mood of depression and uncertainty. Although the legal maximum for an individual holding is 80 basic hectares (the physical acreage varies according to the quality of the land) you are safe from state takeover in theory only if you hold fewer than 40 basic hectares, and the Socialist party wants to halve that figure.

There are more than 50 pretexts upon which Cora can take over a farm apart from the simple question of size. The plight of Sr Juan Benavente and his family on a vineyard near Ninhue in Linares is a case of the abuse of authority by Cora that is extreme only in its degree of human tragedy. Sr Benavente has been a cripple since his early twenties, but still used to have himself hoisted on to his horse in the morning, with an apparatus like that used by medieval knights, to supervise the vineyards where he produced his excellent Collipeuma wine. He has a family of six children, and ran about 130 basic hectares. He was expropriated on the ground that, when his father and his aunt set up a family company back in 1952, they failed to publish an advertisement.

Although legally entitled to a reserve, he was offered only a derisory plot of 20 hectares on top of a hill, without water, electricity or vineyards. For the past year, he has stayed on to bottle his wine and to haggle with Cora over the valuation of his land and his equipment while the farm is supervised by the state. The Cora valuation of the farm is about $40,000—a preposterous figure, though he hopes to get more out of Cora. Like many Chileans, Sr Benavente clings to a faith in reason and compromise. He also has remarkable courage. He talks of trying to set up a small dairy farm somewhere else in the area. The farm itself is running to seed. Over the past year, the peasants have been growing wheat for private sale and neglecting the almond orchard and vineyards that took 10 years to establish. Vultures wheel and turn over neighbouring (expropriated) hills where the vines have turned a sickly yellowish-grey.

It is one story among many. The important general point is a legal one. In many parts of Chile, Cora has made itself absolute master of the countryside. Although the president is legally required to appoint agrarian tribunals to provide expropriated farmers with the right of appeal from Cora decisions, there are 16 provinces without these tribunals. Dr Allende's legal advisers discovered that the law does not lay down a period of time during which the president is required to appoint tribunals. At the same time, Cora can take over any farm on the ground that it is "badly exploited." Cora officials carry out the valuation of property and plant. And the situation is all the more serious because Cora has been so heavily infiltrated by extremist elements—as even the Chilean communists complained in the secret document quoted earlier.

Where does all this lead? So long as the government fails to curb the excesses of Cora officials (who went far beyond the law on a recent occasion when they took over a timber reserve belonging to the Schleier family in the

Lautaro district) ; so long as small farmers are denied legal redress and police protection against violent takeovers, there will be a steady drift towards forms of direct action like the Guardia operations. This could develop into a full-scale civil war in the south that could precipitate events in the capital. At the very least, there are political processes at work that are beyond the control of the government and possibly even of the national parties.

The three battles

And not just in the countryside. In Santiago itself, one of the most alarming signs is the politicisation of the slum *poblaciones*. The Mirista "Che Guevara" settlement, for example, contains 1,200 families and their goal, according to Compañera Natalia, a Socialist party militant and the "vice-president" of the *poblacion*, is "the liberation of the whole of Latin America." They receive regular visits from Cubans, Bolivians, Uruguayans and Argentinians, and the Che Guevara settlement has sent out assault groups to participate in land seizures in the provinces. Although Compañera Natalia refused to admit that military training was being carried out, the settlement has a system of guard posts and watchtowers. It also has discipline. It is forbidden to sell liquor in the settlement, and although the houses are only squalid wooden shanties peopled with lean mangy dogs and staring children, they are laid out geometrically.

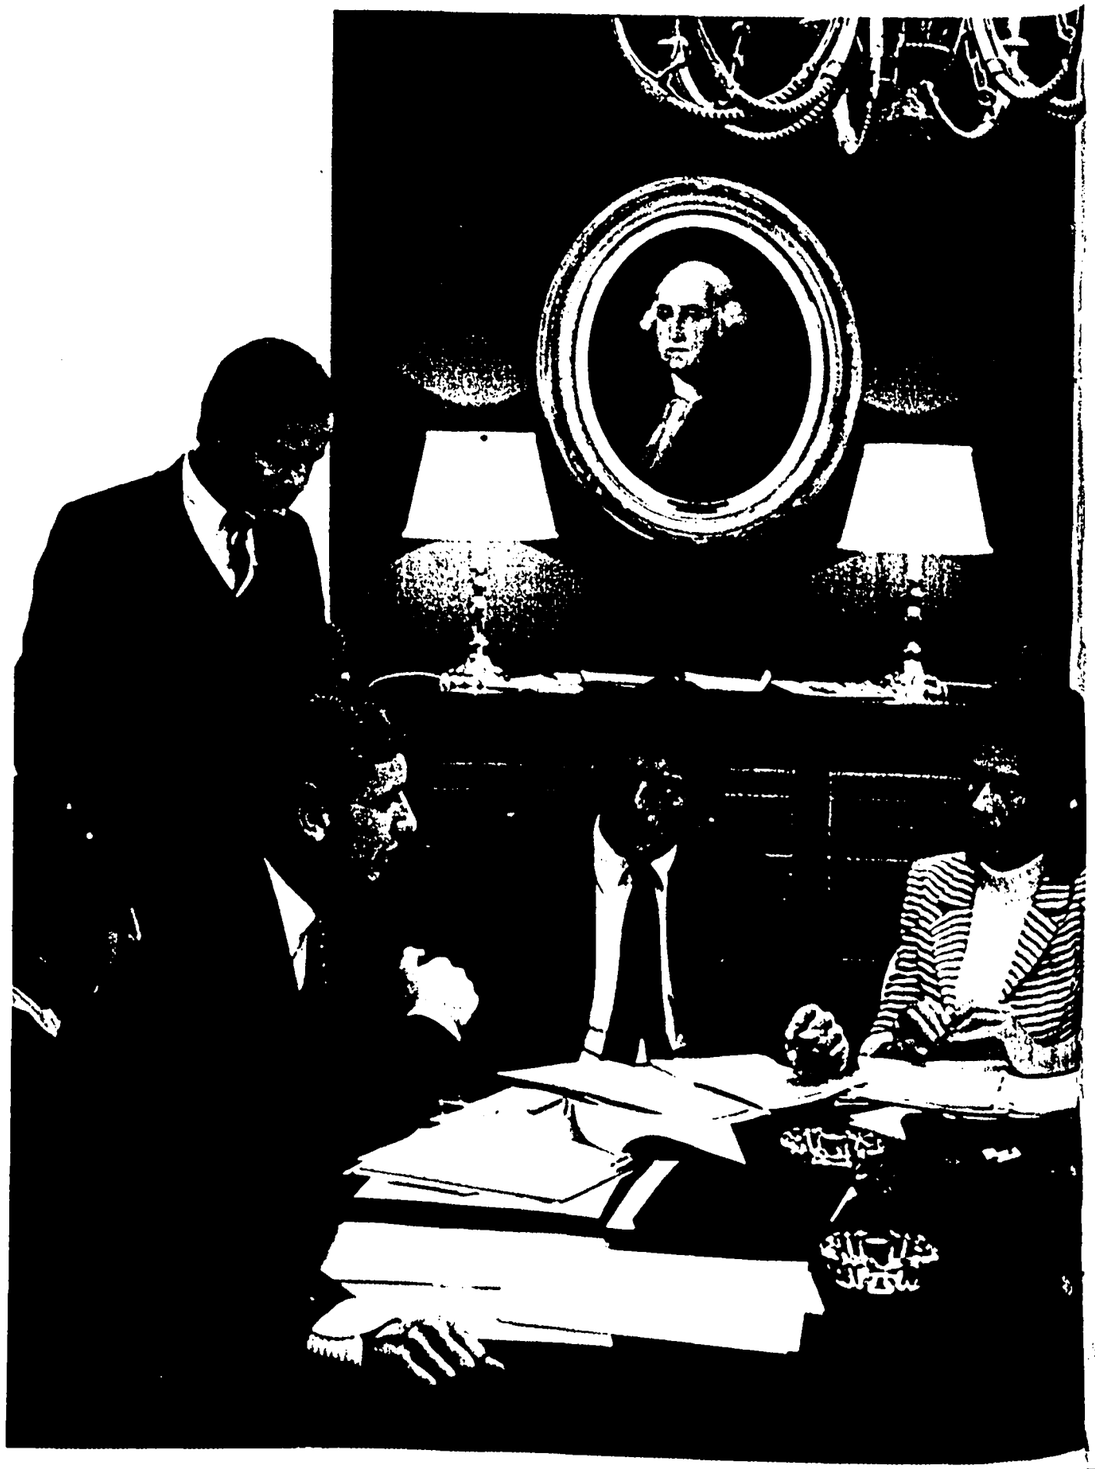
The Ministas are said to have a strategy of "encircling" Santiago from the slums and, in the short term, of staging takeovers in comfortable commuter suburbs such as Las Condes. If so, they will meet resistance. One of the signs of the times is the rapid growth of the *Patria y Libertad* organisation, founded after the September, 1970, election to agitate for the choice of Alessandri for president by congress.

Its leader, Sr Pablo Rodriguez, is an intelligent lawyer who has made himself the ideologist of the extreme right. He believes in a modified form of the corporate state and declared to this correspondent that "in every case that the democracy of political parties has been carried to its logical extreme, it has resulted in communism or civil war." Originally, a movement of upper-class youth, *Patria y Libertad* has made inroads in the *poblaciones*, vying with the Mir for its recruiting grounds. During the "march of the casseroles" in December, it displayed its discipline and its numbers when militants turned out in helmets to do battle with left-wing brigades.

The general proliferation of paramilitary groups is a depressing spectacle for anyone concerned with the future of Chilean democracy. The very real danger is that the violence of the streets may trigger off an army coup or a messy civil war. So far, despite police action against the People's Organised Vanguard (VOP), the government has failed to show the capacity or the desire to control the extreme left.

But to grasp the situation as a whole, one must comprehend that three battles are being waged simultaneously in Chile. The first is the electoral battle, and most opposition party leaders cling to the hope that somehow they can find the money to finance a triumphant campaign at the legislative elections next year and then recapture the presidency (and a legacy of economic disruption) in 1976. The second is the armed struggle, the shadowy contest between the extremists of both sides, and between the vigilantes and the land-grabbers. The third battle is for control of the economy.

In the private sector, as in the countryside, there is a new mood of militancy, demonstrated by the publicity campaigns of organisations like the Front for the Defence of the Private Sector (Frenap), Sociedad Fomento Fabril (Sofofa) and also by the growing strength of opposition syndicates and the movement initiated by Sr Jaime Guzman in the universities. It remains to be seen whether many of the 91 new enterprises scheduled for expropriation can hold out for long against the variety of pressures that the authorities can bring to bear. In the short term, one of the greatest assets of the opposition is the survival of the free press. There is still an amazing variety of magazines and newspapers on the Santiago news-stands, and the survival of El Mercurio is, in itself, a tremendous source of encouragement for the rest of the private sector.



Dr Allende, one Christian Democrat leader maintained, "is a man who turns back when he gets into a cul de sac." The political future of Chile depends on whether that judgment of character is accurate. There is nothing very revolutionary about most of the men in the present government. They are middle-aged ; they enjoy the good life ; they have been in parliamentary politics for a long time. A cartoon in the right-wing periodical PEC shows a Communist party boss in a big American car saying to a dishevelled businessman : "Join the party, comrade. I was once like you . . . a poor and miserable factory boss." The optimistic argument runs that because Chileans are born compromisers and not keen on shooting at each other, and because the Popular Unity government is, at heart, more interested in the perks of office than in the socialist millenium, Dr Allende will turn back when he comes up against serious opposition.

But there is another argument. It is that many of the men in Dr Allende's government are bent on holding on to power and that political democracy cannot survive indefinitely in the face of the decline of economic democracy. It is also possible that the extremists of either side may trigger off a political crisis through their own actions. Those who have come to love the country that has been called "the England of Latin America" will hope that the optimists are right. But there is stormy weather ahead.

The battle is also for the minds of the young

Five of Morgan's Financial Services officers: Marc Varangot, Eduard Will, Nicholas Whitlam, Jean Pierre Desbons, and Marie-Luce de Baudry d'Asson

If multinational growth is important to your company, consider Morgan Guaranty

In the continuing search for increased profits, your company may have concluded that expansion into other countries is essential. But growing across international borders poses some fundamental questions. For example, what countries offer the best economic climate? What are their regulations regarding acquisitions, mergers, and joint ventures? What's the best way to finance expansion into another country?

Morgan Guaranty's Financial Services specialists—a key group in our Corporate Finance Division—are uniquely experienced in answering questions like these. Working from Morgan offices in major financial centers around the world, they have wide-ranging familiarity with countries, conditions, and companies. They can call on all of Morgan's expertise in areas such as international money management, corporate research, and Euro-dollar financing.

Our Financial Services professionals will help you construct a long-range plan for multinational growth, then assist you with their knowledge of available partners or acquisitions. They'll provide evaluations of a country, an industry, or a prospective partner, and explain the restrictions involved in inter-country diversification. They have the experience and innovative talent to recommend the best ways to finance your corporate expansion. And they will act as your financial adviser before, during and after negotiations. For help like this, and in dealing with problems you might not even know you'll have, contact a Financial Services officer through any Morgan office.

Whatever your corporate goal, consider Morgan Guaranty. You'll be in good company. We're already helping 95 of the world's 100 largest corporations.

All of a sudden the ground trembles under Willy's feet

FROM OUR BONN CORRESPONDENT

A dog's dinner of discouragement was awaiting Herr Brandt when he got back to his desk in Bonn on Thursday after four days in Teheran dedicated to repairing frayed German relations with Iran. If the chancellor could have been as sure as he had claimed to be that a majority of the electorate supported his Ostpolitik there was little doubt he would have decided then and there to hold a general election.

But there was no such assurance. The chancellor was confronted with the result of a new public opinion poll carried out last week by the Wickert institute. Some 1,477 qualified voters, living in 346 different parts of the country, were asked how they would vote if a general election were held today. The result indicated that 50 per cent of the electorate would vote for the Christian Democratic Union and its Bavarian counterpart, the Christian Social Union, 44 per cent for the Social Democratic party, 3 per cent for the Free Democratic party, and the remainder for one or another of the parties of the extreme left and right. When the same question was put in January the result had been 45 per cent for the Christian Democrats, 45 per cent for the Social Democrats and 6 per cent for the Free Democrats.

Why has the coalition's stock dropped so markedly? The Wickert hounds drew only rather loosely formulated objections to the government's actions. But there is no shortage of detail among critics elsewhere.

It is true to say that all Germans who think about these matters have conceded all along that national risks are being taken in accepting the post-war frontiers of central Europe, and thus virtually the indefinite continuation of two separate sovereign German states. Many believe with Herr Brandt and his foreign minister, Herr Scheel, that acceptance of all this, and the ensuing respite of suspicion, would pay substantial dividends to Germany and Europe in the long run. Just as many others, it seems, object that the treaties in their present form offer an expansive Soviet Union an irresistible temptation to go on pushing in the west politically and commercially.

Between these two equal-looking forces are the undecided, whose turning this way or that will decide the validity of the treaties with Russia and Poland, either in the present Bundestag or at the polls in the event of an early election. And it looks very much as though their number is being reinforced as a result of a series of setbacks suffered lately by the government.

The first occurred on February 9th, when in a first reading the Bundesrat passed the treaties back to the Bundestag for further consideration unless 12 questions were satisfactorily answered; the questions were mainly about the German people's right to self-determination. In the Bundesrat, which represents the governments of the 10 federal states, the opposition is in a majority of 21 to 20. This could be changed if the Social Democrats win the Landtag election in Baden-Württemberg on April 23rd. But it is not expected that they will. The Bundesrat can be overruled only by an absolute majority of the Bundestag.

Holding between them 251 of the 496 Bundestag seats, the coalition parties had an absolute majority of two and a simple majority of six until the beginning of last week. But on February 28th the Social Democrat deputy Herbert Hupka, who as chairman of the Silesian refugees' association has consistently rejected the treaties since they were signed in 1970, joined the Christian Democrats. Herr Hupka protested that the Social Democrats had tried to gag him by removing him from the Bundestag foreign affairs committee, which is now considering the treaties. (Another Social Democrat, Franz Seume, resigned from the party on March 3rd, but he is a Berliner without a vote.)

Hupka won't be gagged

Then last weekend a prominent Free Democrat, Baron Knut von Kühlmann-Stumm, announced ominously that he too has serious misgivings about the treaties and would withhold his vote were they not removed. On Monday another Free Democrat, Herr Wilhelm Helms, spoke up in much the same vein. And according to Der Spiegel two more, Georg Gallus and Richard Wurbs, are contemplating defection to the opposition should the Free Democrats fail to clear the 5 per cent hurdle in Baden-Württemberg next month. Herr Erik Blumenfeld, the Christian Democrats' foreign affairs specialist, has denied rumours that he secretly approves of the treaties and intends to defy the party whip. The doubters' misgivings have not been allayed by the latest scoldings from Pravda and Izvestia.

Should the government decide to clear the air by holding a general election it would be a hotly contested one—and not solely on account of Ostpolitik. Herr Brandt has had once again to reaffirm his dedication to

western Europe, and once again he has had to do it by calling to heel Herr Karl Schiller, his economics and finance supremo, on the subject of monetary co-operation inside the common market (see page 87). Herr Schiller prefers monetary independence for Germany, and prefers dealing with the Americans at times of monetary difficulty rather than with his common market colleagues in Brussels. The paradoxical upshot of Herr Schiller's show of freewheeling Atlanticism is that it weakens Herr Brandt's longstanding claim that his east European adventures are firmly rooted in west Germany's continuing attachment to the west European common market. The consequent strain in cabinet shows itself throughout the Brandt coalition government, and is not lessened by the fact that Germany's internal economy has not escaped the generally depressed conditions in the rest of the world.

As the Wickert poll suggests, there is widespread disappointment in the country at the government's failure to fulfil its handsome promises of internal reform—particularly to extend and modernise education, and to introduce a simpler and more equitable system of taxation. The resignations of the minister for education and science, Professor Hans Leussink, a non-party man, which is to take effect on March 15th, and of Herr Heinz Haller, the state secretary specialising in taxation reform have scarcely assured the public that all is well.

Sensing their opportunity, the Christian Democrats say they would like an election now, short as the party is of funds. And they are promising, in the event of victory, to ask the Soviet Union to renegotiate its treaty with west Germany. They will not ask Poland to do likewise. It is the inexorably hard frontier between east and west Germany that the Christian Democrats find unacceptable, not the Oder-Neisse boundary with Poland.

Dutch passions run high

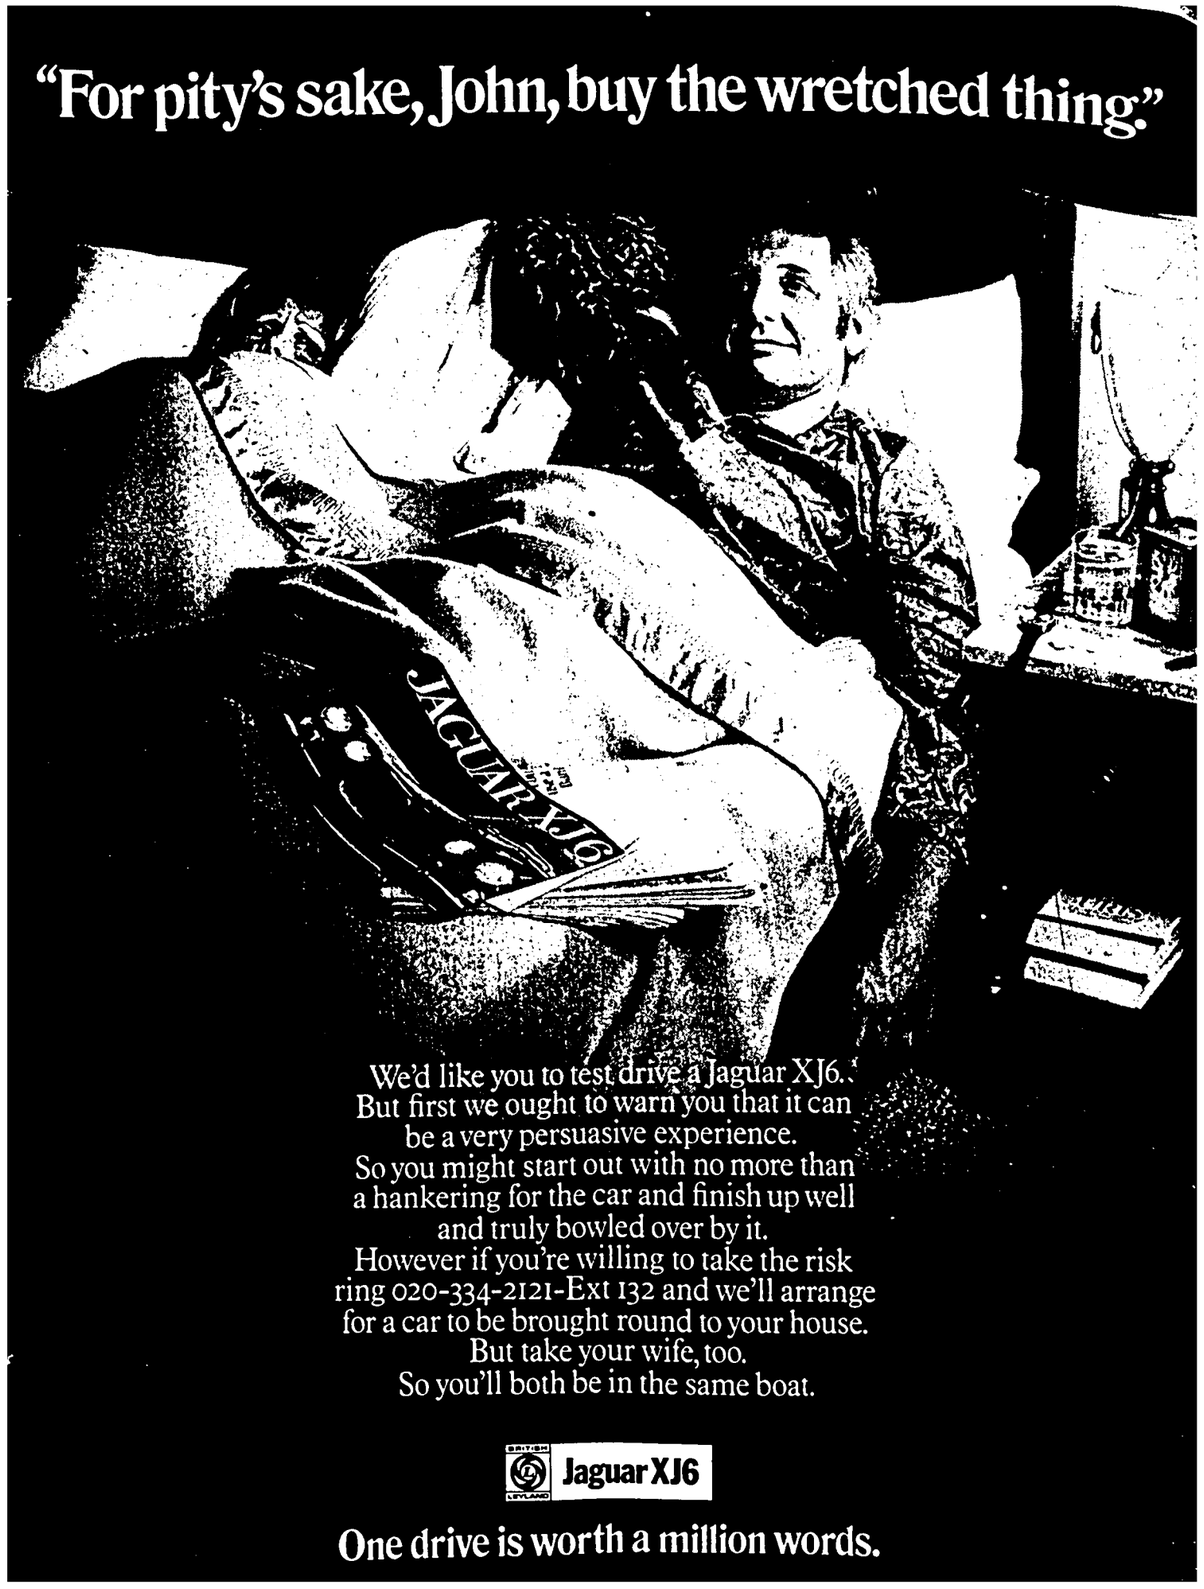
Holland

The prisoners of Breda

Three elderly German Nazis at Breda prison have caused Mr Bisheuvel's government in Holland a humiliating political setback that may well shorten its life. The Dutch cabinet announced last month that it intended to release these three prisoners on humanitarian grounds, even though they had committed very serious crimes during the Nazi occupation: one had been in charge of the Amersfoort concentration camp for Dutch Jews and the other two had been senior officials concerned with the deportation of Jews to the extermination camps. The government argued that the punishment of these old men, who are no longer a threat to society, should not continue indefinitely.

But society, or a very vocal part of it, clearly did not agree, and the government had a nasty shock when parliamentary hearings started at the end of last month. There were demonstrations outside parliament in The Hague by Jewish and other war victims' associations, and disorderly scenes inside it. A passionate debate raged throughout the country: even Quaker prayer meetings agonised and divided over whether these old Nazis should go free.

Under this pressure the lower house of the Dutch parliament voted last week by 81 to 65 to reject the cabinet's proposal. The vote is not binding, because pardoning prisoners is the crown's prerogative. But the cabinet, responding to the public outcry, found a face-saving formula at the weekend, whereby a commission will now look at the individual petitions from the prisoners. Another emotional debate in the near future is on the cards. It is strange that this should happen in one of the least bloodthirsty and vengeful of European countries, which sentenced only 14 Nazis to death after the war, executed only five and released six—leaving the three men of Breda.



Malta

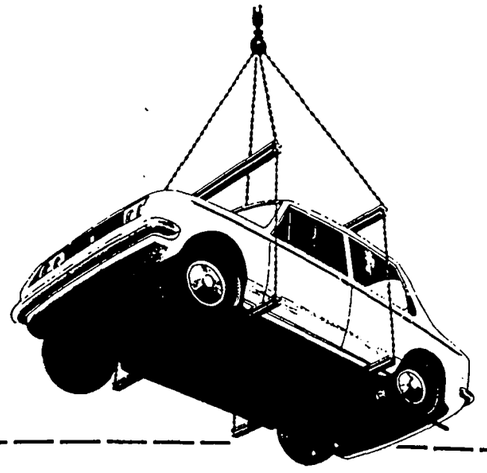
Three weeks left

Lord Carrington and Mr Mintoff both said that "some progress" was made during the talks on Malta that hiccuped into life again on Sunday and Monday. Of course neither defined what "progress" means. But the Ministry of Defence in London says that the two sides have moved slightly closer together on the question of British employment of Maltese on the island.

At present the number of Maltese employed by the British forces stands at 6,017, all of whom have now received notices of dismissal to take effect from March 31st, the deadline for British withdrawal. Although no figures are being revealed, Britain has now improved on its previous offer—said to be 3,800—for the number who will still be wanted if the British stay, and there will be phased redundancies for those who cannot be employed. Mr Mintoff's reply will come when he has discussed the proposal with his cabinet and his supporters in Malta's General Workers' Union.

The main sticking point remains the annual rent. The Nato offer stands at £14m. Not a penny more, said Lord Carrington, and the Nato secretary-general, Mr Joseph Luns, took the same line as the London talks ended. That was what they were both saying when the Rome round of negotiations broke off a month ago. But since then Mr Mintoff has come up with another proposal: for a separate cash payment of £5m, to be paid immediately, to

Japan could sell 250,000 cars in Europe.....



The figure may even reach 300,000 in three years time, and 530,000 to 640,000 cars within seven years.

From virtually nothing to an annual output of over 2½ million cars and over 2 million commercial vehicles in 20 years. That is the record of Japan's motor industry.

Just how well or how badly do they perform in their export markets? And what scope is there for British motor and component makers, following Japan's recent trade liberalisation?

'Japan: its motor industry and market' is a detailed report published by the Motor Manufacturing Economic Development Committee (Little Neddy) which analyses the Japanese industry and motor products market.

Published by Her Majesty's Stationery Office 'Japan: its motor industry and market' costs £2·25 or by post £2·34½. Copies can be obtained from your nearest Government bookshop or through booksellers.

Please supply _____copies of 'Japan: its motor industry and market'. I enclose cheque, postal/money order for £ p payable to Her Majesty's Stationery Office.

cover a budget deficit and other debts including salary bills for the island's civil service. Mr Mintoff sees this figure as a concession, since his proposal at Rome was for £18m as the annual rent and an immediate cash payment of £10½m on top of this. Lord Carrington does not see it that way at all.

So the ball has been played back to Mr Mintoff. But the Maltese prime minister has a rare capacity for not returning it over the net straightaway. He has often referred to Malta's "alternatives." The flirtation with Libya's Colonel Qaddafi might have led to one possible alternative. The recent visit to Malta by the Russian ambassador in London was clearly another attempt to spread Mr Mintoff's options. And the visit of a French delegation on March 1st, headed by the deputy foreign minister, M. de Lipkowski, was presumably not made for climatic reasons. Will Mr Mintoff be able to push the bargaining with Nato into yet another round with the alternatives he claims to have in mind? March 31st is only three weeks away.

Cyprus

Bishops or pawns?

By Thursday it looked as if the month-old Cyprus crisis was at last coming to a head. President Makarios—who seems to have relished the whole affair—appeared to be about to give his reply to both the Greek government and the three dissident Cypriot bishops. The Athens government had demanded that he should surrender his secretly imported Czech arms to the United Nations and form a "government of national unity." The three bishops, at a meeting of the synod of the Greek Orthodox church of Cyprus, had called for his resignation, on the ground that his temporal and ecclesiastical functions were irreconcilable.

The bishops were a bit late in the day in making this discovery, for Archbishop Makarios has been head of state and head of the church since Cyprus became independent in 1960. The bishops' intervention looked like a heavy-footed stratagem engineered by the Greek government (which has now disavowed the use of force to resolve the crisis) to use the church to undermine the president's position. None of the three bishops commands a significant following in Cyprus and one, the elderly Bishop of Paphos, is a nonentity. Their challenge to the president is almost laughable, as the pro-Makarios rallies throughout the island in the past week bear witness.

Nevertheless, speculation has persisted that Archbishop Makarios might in fact resign—or, more accurately, appear to resign. He would do so in the almost certain knowledge that a tidal wave of popular support would sweep him back into office within a day or two (unless General Grivas, the former Eoka leader, should suddenly decide to strike). After all, President Nasser did almost exactly this in June, 1967, at the end of the Arab-Israeli war—and the archbishop's position is infinitely stronger than Nasser's was at that time.

More fundamental than the challenge of the three bishops, or indeed the disposal of the Czech arms, is the whole question of reforming the Cypriot cabinet. The odds are that, after protracted wrangling, the arms will eventually find their way into UN custody. But the Greek government's virtual claim to a right of veto on the appointment of President Makarios's ministers and advisers seems to many moderate Greek Cypriots an affront to Cyprus's sovereignty; and it is hard to see how the archbishop can accede to this demand—at the moment. But, as on so many other things, the president may temporise. It is conceivable that, after a few weeks or perhaps months, when the excitement has subsided, a quiet reshuffle of the Cypriot cabinet will be announced. The world will barely notice it, but the Greek government will have its ounce of satisfaction. This is how politics in the byzantine tradition has been conducted, since the time of Byzantium itself.

It's taken the bishops 10 years to spot the irreconcilable

Turkey

Backlash

The campaign by a section of the British press to raise a public outcry against the six-year prison sentence on 14-year-old Timothy Davey has backfired. The Turkish press did not let such words as "barbaric"—splashed in two-inch-high letters across the front page of the Sun on March 2nd—pass unnoticed. This week it has counter-attacked.

The Turkish daily Hurriyet quotes Timothy's mother, Mrs Davey, as saying that she abhors the anti-Turkish campaign of British journalists and is grateful for the exceptional treatment given to her son in prison. The paper adds that the courts have a duty to implement the laws passed by parliament. The editor of Milliyet has warned British newspapers to "rid themselves of the illusion of their majestic British Empire . . . which leads them to put pressure on other countries to achieve what they want."

Turkish members of parliament reflected the views of the newspapers. On Monday the foreign minister, Mr Haluk Bayulken, had to answer questions which suggested that Britain could never forget its defeat at Gallipoli. Although he pointed out that the British Government had not sought to influence the course of justice, Mr Bayulken said that Turkey could not tolerate doubts being cast on its independence and dignity. Even the Turkish prime minister, Mr Erim, has felt it necessary to make a gesture of protest. He has announced that he has cancelled his plan to spend a day in London on his way to the United States, a plan of which he had never informed the British Government.

The one person likely to suffer from the headlines of British newspapers and expressions of hurt national pride is Timothy Davey. It is now most unlikely that the Turkish parliament will give the boy a pardon.

Arms talks

Salt and soya sauce

It was clearly desirable that President Nixon's visit to Peking last month should not be overclouded by Chinese suspicions that the Americans were simultaneously working out deals with the Russians. So it was logical to make this the time for a break in the long run of the Russo-American strategic arms limitation talks (Salt). It has been predicted that a first agreement may emerge just before Mr Nixon goes to Moscow in May, or may be announced when he gets there. But optimism was not encouraged by the circumstances surrounding the decision to adjourn the Salt session in Vienna on February 4th, and to set March 28th as the date for a resumption, this time in Helsinki.

Unusual discretion has been maintained by the negotiators on both sides since these talks began in 1969. The communiqué issued when the talks adjourned merely restated the aims that had been publicly announced nine months ago: to limit anti-ballistic missile (ABM) systems by treaty, and to agree on "certain measures" for the limitation of offensive missile systems. Five days later, Mr Nixon's report to Congress on the state of the world seemed to suggest that the ABM agreement was in sight, but he described the "interim offensive agreement" as being still the subject of "intense" negotiation.

His message also placed heavy emphasis on his intention of preventing any "further erosion of the strategic balance." He indicated that if the Russians continued to expand and develop their nuclear armoury, while the talks dragged on, the United States must do likewise. A week later there came the annual defence statement in which Mr Melvin Laird predicted that by 1973 the Russians would have as many missile-firing submarines as America and might also draw level in their ability to put Mirvs—multiple independently targetable warheads—on their missiles.

In the gloomier versions of the Salt story, the Russians' rejection of any curb on submarine development was cited as the main reason why the talks in Vienna had ended rather abruptly, and why an interval of nearly two months would occur, leaving little time before Mr Nixon goes to Moscow. Another difficulty, it is said, arose over ABM quotas. The Americans, alarmed by the threat to their land-based missile sites posed by the huge Soviet SS-9 missiles, particularly if these can be Mirved, wanted to be allowed 200 ABMs to defend two of their sites. The Russians, who previously seemed interested only in building up to 100 missiles in their existing ABM system around Moscow, now wanted another 100 to protect one of their missile sites. In congressional circles in Washington, there is now some expectation of a deal giving each power the right to deploy about 150-200 ABMs where it pleases.

Mr Nixon cannot have had much hope that the mere sight of him visiting Peking would spur the Soviet leaders towards compromise. But they cannot now deny the relevance of China to the question of limiting strategic arms. According to the latest American information, the Chinese are already deploying missiles with an estimated range of up to 2,500 miles, as well as turning out bombers with a 2,000-mile range—copied from the Tu-16s they got from Russia in the good old days. The industrial centres of European Russia are thus within China's strategic range. The Soviet army newspaper, Krasnaya Zvezda, dwelt anxiously on this new development in a long article on February 25th.

Just before Mr Nixon set off on his journey to Peking, there were reports from Washington that he would offer to support any Chinese move to claim a seat at the 25-member Geneva disarmament talks. It appears that the Americans did raise the point during the Peking talks, but the Chinese were inscrutable. When the latest round of the talks at Geneva began on February 29th, Mexico's delegate argued that neither China nor France would accept a seat there while America and Russia remained co-chairmen of the conference. The Americans seem to recognise the logic of this. But the Russians, so far, have kept mum about it.

Sudan

Salute your rebel general

FROM A SPECIAL CORRESPONDENT

Juba

President Numeiry is now in southern Sudan trying to explain to the 12,000 northern troops stationed there the agreement that ends the eight-year civil war between north and south Sudan. Since he took over in May, 1969, the president has exhorted his troops to

It was just "leave without pay"

root out the "imperialist-zionist-backed" rebel Anya-Nya movement: now he is touring all units in an effort to convince officers and men that their former enemies are brothers.

Northern public opinion had been poorly prepared for the terms of the peace agreement with the south. "Regional autonomy" was little more than a slogan during the first two years of President Numeiry's regime. Although a regional constitution for southern Sudan was drawn up by the southern members of the government, and approved by the president, as far back as last October, it has never been published in Arabic. It provides wide powers for the southerners to run their own affairs; the exceptions being external defence, foreign relations and a few minor matters such as telecommunications and customs duties. It also contains built-in safeguards against any unilateral change in the constitution. But all this has been virtually unknown. It was only last Friday, March 3rd, that the president spelt out the details, and the ceasefire arrangements, at a public rally near Khartoum.

The northern civil officials in the south, who still provide the backbone of the administration at provincial and district level and run most of the technical services, have grown used to working under southern Sudanese. Since October southern Sudanese politicians have been in charge as provincial commissioners. But the old fears of what might go wrong, born of the massacre of northerners at the time of the Equatoria Corps mutiny in 1955, are likely to affect future recruitment. Once autonomy becomes a reality and the southern exiles return home, many a past grudge against the northerners

could hit surface. Southern officials do not seem concerned about an exodus of their northern counterparts but the standard of administration could seriously suffer.

The position of the northern troops, particularly of the officers, is more difficult. Given generous hardship allowances, many local perks and the run of the land, they have become remittance men with no great desire to rush home to their families. They are now being told to receive into their ranks those of the Anya-Nya rebels who wish to join the regular army ; the size of this rebel army has been variously estimated but the number of trained, armed men is around 1,500. The recruitment of southerners into the army is to continue until the army corps in the south is half-southern, half-northern.

It is difficult to see a young Arab captain, after two or three years' campaigning against the rebels in the south, saluting as his senior "General" Joseph Lagu, the erstwhile rebel leader whose recent supplies have come almost entirely from Israel. Renegade officers from the Sudanese army who have been leading the rebels will, if they wish, be recommissioned with their former seniority as if they had merely been on leave without pay. Thanks to the rapid promotion in the past few years of coups and counter-coups they will now rank as full colonels or brigadiers.

The president will have his work cut out to persuade the officials to stay and the young army officers to honour the peace agreement he has sprung on them abruptly. He will be helped during his tour by his vice-president, Mr Abel Alier, a southerner who was the architect of the agreement, and by Brigadier Omar Tayib, the northern commander of the southern corps. Brigadier Tayib has already started the process of trying to turn his troops' minds away from a shooting war to the civil role the army can play in rebuilding the battered south ; next week construction should begin on the first macadam road for Juba, the future regional capital.

Vietnam

Has the big attack been called off?

FROM OUR SAIGON CORRESPONDENT

North Vietnam's leaders, bereft of Uncle Ho's unifying influence since 1969, are believed to be in disarray about how to win the war. The crux of the problem is whether to mount a general military offensive fairly soon—

Le Duan controls the see-saw

maybe this autumn, before the American presidential election, or perhaps early next year—or to adopt a long-haul strategy of smaller-scale warfare while rebuilding and consolidating the communist north. The argument is not new, but some of the ingredients are of more recent vintage, and it may even be that individual members of the politburo in Hanoi have switched sides because of changes in the situation.

The progressive American withdrawal from South Vietnam poses a curious dilemma for North Vietnam. To some extent it strengthens the argument of those who want to deploy the north's slender resources for internal development, while merely keeping the pot boiling in the south until such time as the war may perhaps be won there more easily. This argument gained strength after last year's disastrous floods in the Red river delta, which not only caused economic havoc but placed added strain on the morale and discipline of people in North Vietnam.

On the other hand there are evidently those who hold that the risks of delay are too great. What if President Thieu continues to gain strength in the south ? Besides, can China, Russia and other communist countries be relied upon to continue their substantial level of support ?

Despite recent assurances of unwavering solidarity from Moscow and Peking, the Vietnam war has lost some of its glamour for the communist world after all these years. Soviet aid to North Vietnam during 1971 has been estimated at about £210m ; China's contribution was approximately half that figure. Much of the aid is required simply to feed North Vietnam and keep its economy afloat. But a large proportion is directly earmarked for the war effort, which would collapse without it. If, as is widely believed, the Soviet Union intends to ask President Nixon for technological help during his Moscow visit in May, he might suggest that the Russians should stop sending so many resources to Vietnam.

The group in Hanoi which advocates a quick crack at victory is thought to be led by Truong Chinh, the party's chief theoretician. The defence minister, General Vo Nguyen Giap, has also been associated with talk about main-force warfare and decisive leaps forward—a contingency for which the North Vietnamese army has recently shown signs of preparation along the borders of South Vietnam.

The opposing school, which favours a long-drawn-out preparation for victory while rebuilding the north, seems to be led by the party secretary, Le Duan. It may well be that this view currently prevails. It is interesting that the North Vietnamese did not in the end launch the offensive they were expected to make in February, even though they completed the necessary preparations. The obvious explanation at the time was that the leaders in Hanoi realised that the attack would probably fail. But it is equally plausible that in a see-saw debate within the politburo the advocates of the long haul had it called off because it would have been too expensive. In South Vietnam this week President Thieu ordered his troops to put more stress on smaller-unit guerrilla warfare. He believes the communist command has decided to revert to guerrilla tactics.

Pakistan

Two steps forward, one step back

The prospect of a second civil war in Pakistan is now receding. In a last-minute compromise President Bhutto announced on Monday that the national assembly would meet in April to appoint a constitutional committee and that martial law would be lifted on August 14th. A fairly staggered timetable. But the important thing is that it has the support of the National Awami party (NAP) and the Jamaat-i-Ulema, which have majorities in the North-West Frontier Province and Baluchistan respectively. Both parties have been vociferously demanding the lifting of martial law and Wali Khan, the ebullient Pathan leader of the NAP, had been threatening direct action—Bengali style—if nothing was done by March 23rd.

Old grievances in Baluchistan and the frontier were aggravated by Mr Bhutto's recent appointments of provincial governors without consulting either majority party. There have been revolts in Baluchistan in the past, and since the end of the December war Wali Khan has been raising his own armed militia, the Red Caps. Mr Bhutto showed himself alive to the dangers of secession when he said last week, "The Pathans have always carried guns, but now they carry them with a little bit of temper."

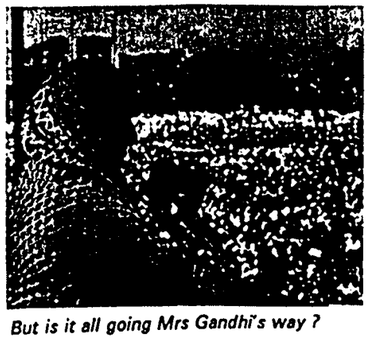
The constitutional timetable does two other useful things. On the one hand it gives Mr Bhutto the cover of martial law for long enough to make a start on the sweeping land reforms he announced last week (see page 91). On these measures he would almost certainly find a national assembly obstructive, even if it did not turn its attention to his own large estates in Sind. And the timetable also pushes Mr Bhutto a step farther towards accepting the fact of Bangladesh. One of his arguments for keeping martial law was that the national assembly could not meet without the Bengali delegates. Now it is to frame a constitution without them.

Pakistan is already facing the economic facts of separation, in particular the lack of jute and tea from Bangladesh. An attempt is being made to cultivate 2,000 acres of jute this year, and a commission has been given the thankless task of finding somewhere in Pakistan wet enough to grow tea. Political realism may soon follow.

But on Friday Mr Bhutto did something to make it harder for India and Bangladesh to accept Pakistan. He made General Tikka Khan—who led the onslaught against the Bengalis last spring—head of the army. Mr Bhutto complained of "Bonapartism" and the meddling of soldiers in politics. It may be that General Tikka Khan has been put in a position where his job is to stop the army leaning too hard on the president. But the army has always thought Pakistani politics too important to leave to politicians, and it is unlikely that Mr Bhutto can reverse a 25-year-old trend now. Certainly Tikka Khan is something of an insurance policy for Mr Bhutto if he fails to conciliate Baluchistan and the frontier. Before his command in East Pakistan, he had already earned himself the title of "Butcher of Baluchistan."

Whatever Mr Bhutto's motives for the services reshuffle, Tikka Khan's appointment will please neither the Indians nor the Bangladeshis. The Indians will not welcome the idea of Tikka Khan at the head of what Mr Bhutto has promised to rebuild as "the finest fighting force in Asia." And Bangladesh will not want any link with a country whose army commander is high on its list of "war criminals."

India



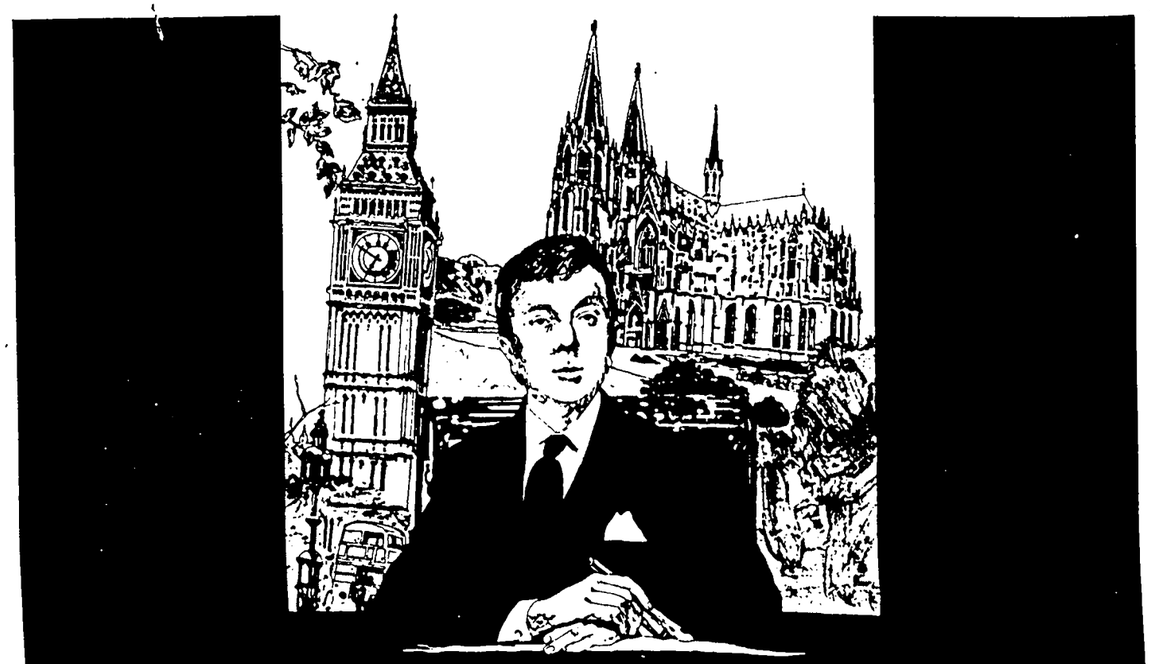
Unclean sweep?

Mrs Gandhi has almost everything working for her—the recent victory over Pakistan, the disorganisation of the opposition to her in India, and her own overwhelming popularity. Yet her Congress party may still fall short of the clean sweep it is hoping for when the results come out on Monday of this week's elections for 16 out of 21 state assemblies.

Bangladesh will undoubtedly be a big help. But in some areas this issue may backfire on the Congress party because of unhappiness among its traditional Moslem supporters at the break-up of Pakistan. In Bihar, Moslem discontent has spawned an extraordinary alliance between the Hindu communalist party, the Jana Sangh, and several extremist Moslem groups, all of them calling for repatriation of the Bihari Moslems in Bangladesh. Mrs Gandhi's firm rejection of such a move will certainly cost her votes in Bihar. However, Moslems will scarcely want to strengthen the Jana Sangh, which is the only alternative to Congress in much of north India, so they may decide to abstain.

Another handicap for Congress is the factional quarrelling which has broken out in the party as a result of Mrs Gandhi's recent party purge. Four chief ministers have lost their jobs, local party committees in 10 states have been dissolved and up to a third of the sitting members in each state (including 50 state ministers) have been refused party endorsements for this week's elections. The Congress committee in New Delhi which carried out the shake-up explained it as an effort to replace corrupt and unpopular politicians by a more representative lot. But in spite of such claims the official Congress list contains the usual number of princes, rich landlords and moneylenders.

About 300 of the rejected nominees stood this week as independents ; others worked against official candidates on the quiet. The revolt was strongest in the four states where the local party was hardest hit—Andhra Pradesh, Gujarat, Rajasthan and Maharashtra. In Rajasthan and another unsettled state, Madhya Pradesh, internal squabbles may give the Jana Sangh a slight edge. Several other states, including Bihar, Gujarat and West Bengal, may well end up with no clear winners.



But is it all going Mrs Gandhi's way ?

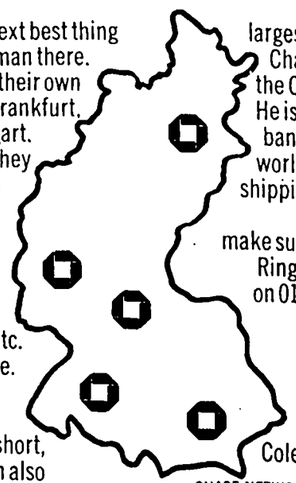
Islam

Politics of piety

Having been host last week to the delegates of 30 Moslem countries, King Faisal of Saudi Arabia is this week receiving Egypt's President Sadat. Half a dozen years, and two wars, ago this tramp of august feet to Saudi Arabia might have been represented as a stage in the fulfilment of the king's plans to present an alternative to revolutionary Arab nationalism. The confusion caused by the Arab-Israeli war in 1967 and the Indian-Pakistani war last December has stripped the gloss from these plans; the king may bask in his new authority but he is at least as anxious to evade the concurrent responsibility. The Islamic world, having no more, or no less, unity than one might expect from 300m diverse people, is at a loss what to do about Bangladesh; it is possibly more unified over the Arab-Israeli conflict but only in the sense that the greater part of it has every intention of doing nothing at all.

The Islamic jamboree has become an annual event; the one last week was the third. Officially it is at foreign minister level but about half the countries, including Egypt, found other representatives more suitable, or more dispensable. A handful of Moslem states maintain relations with Israel but they could all join together in condemning the judaising of Jerusalem and proclaiming the rights of the Palestinians. A decision was made to start some kind of fund—the Saudi radio calls it a *jihad* or holy war fund—but the channelling of any money that might be paid into this fund would apparently be the responsibility of individual governments. The slightly more tangible plans for an Islamic bank, which to avoid the Koranic sin of usury would have to issue interest-free loans, were passed back to a committee of experts; the Egyptians, who for obvious reasons had a keen interest in this bank, suspect this to be as good a way of killing it as any other.

When you get a Chaseman in London, you get a Chaseman in Germany too...



wherever there's a market, there's a Chaseman.

When you're doing business abroad the next best thing to being there yourself is to have a Chaseman there. Chasemen in Germany, are Chasemen in their own elements – with full service branches in Frankfurt, Düsseldorf, Hamburg, Munich and Stuttgart. Together they cover all of Germany, and they are very much counterparts of Chasemen in London.

Think what competitive edge this can give you in your overseas business. You will be in close touch with all the banking and financial aspects, made aware of credit conditions, exchange restrictions etc. by an expert in the German financial scene.

As the leading international bank in Germany, Chase Manhattan can help you with arranging local currency credits for short, medium or long term needs. The bank can also provide you with immediate access to one of the largest foreign exchange markets in the world. And your Chaseman in either London or Germany can mobilise the Chase network for international transfers anywhere. He is an experienced, knowledgeable international banker with the backing of the Chase Manhattan Bank world-wide and all the specialist divisions in petroleum, shipping, aerospace, metals, textiles etc.

So if you're looking to Germany, or anywhere else, make sure of the financial side of the business first. Ring Steve Mueller at Chase Manhattan in London, on 01-600 6141.

You have a friend at Chase Manhattan.

The Chase Manhattan Bank, N.A. Woolgate House, Coleman Street, London EC2 and 1 Mount St. W1.

A cold start for Muskie, a warm one for McGovern

ELECTION '72

In Muskie's back yard

FROM A CORRESPONDENT IN NEW HAMPSHIRE

When Senator George McGovern of South Dakota came to the alien corn of New Hampshire 14 months ago as a candidate for the Democratic presidential nomination in next November's election, his face and name were known to few of the state's citizens. But by Tuesday night he had racked up 37 per cent of the votes cast in the intraparty primary election and had established himself as a credible candidate for nomination at the Democratic party's national convention in July. Mr McGovern finished second to Senator Edmund Muskie, who was able to remind the voters that he was "born just 25 miles from New Hampshire and I have visited here every year of my life." He collected 48 per cent of the vote.

But it was not only regional loyalties that made him a difficult opponent for Senator McGovern to challenge. It was also Mr Muskie's reputation as a man of solid accomplishment in the Senate and his vice presidential candidacy in 1968 when his restrained "down-east" style made a powerful and lasting impression. Because of these assets, and even more because his best chance of the presidential nomination rests on his being able to establish and maintain his position as a front runner at an early stage, it was desirable for Senator Muskie to do better than he did in New Hampshire. There may be only 740,000 people in the state and only 100,000 Democratic voters but the primary elections there are the official opening of the presidential season and psychologically it is important to do well at the start.

The Senator from Maine has long been recognised as the Democratic candidate who will have to be beaten if any challenger hopes to secure the presidential nomination this year. Mr McGovern set out to do just that, beginning bravely in New Hampshire in spite of his disadvantages there, with a classy well-run organisation that included many of those veteran workers for John and Robert Kennedy who backed Mr McGovern's brief chase after the presidential nomination in 1968, after Robert Kennedy was assassinated.

On Tuesday Mr Muskie did well where he was expected to do well—among members of trade unions in the gritty industrial cities along the Fall Line of New Hampshire's picturesque if polluted rivers and in the seacoast towns, where the political and social life is closely linked to his home state of Maine. Mr McGovern did well in the university towns where his end-the-war platform had special appeal. But it was in the suburban communities in the southern part of the state, where the professional and managerial classes are concentrated, that Mr McGovern made his strongest showing. And these were the areas where Mr Muskie had hoped to do better than he did. The two candidates will not meet again in a clear cut contest until early in April, in the Wisconsin primary, where it will be Mr McGovern's turn to call on regional loyalties ; he comes from a nearby state.

In the Republican primary in New Hampshire President Nixon, as was expected, demonstrated solid support in what his strategists called "Nixon country." He won 70 per cent of the vote, an impressive vindication of most of his policies, including his recent trip to China. But two challengers—one on the right, the other on the left—demonstrated that Mr Nixon may not have entirely clear sailing among rank-and-file Republicans. Congressman John Ashbrook, a conservative from Ohio, campaigning on Mr Nixon's "sell-out" of Taiwan and on the President's "disastrous" economic policies, won 10 per cent of the vote. This is not highly impressive but it is enough to encourage Mr Ashbrook to fight in several more primaries. On the liberal side Congressman Paul McCloskey from California called for an end to the bombing in Indochina and for "truth in government." He did not score a startling victory either but he obtained the 20 per cent of the vote

which he considered essential if he was to continue his challenge to Mr Nixon. *Our Washington correspondent comments :*

Now that the New Hampshire primary has left Mr Muskie with his leading position not yet established unequivocally, there appears to be no way in which he can achieve when Florida votes next week what he did not quite manage in New England this week. With 11 candidates on the Democratic ballot in Florida the field is much more crowded there. Whether Governor George Wallace finishes first in Florida, as most people seem to expect, or not, he will certainly take a substantial slice of the vote. So the real Democrats seem likely to be crowded closely together, with little glory to be won by anyone.

Senator Humphrey, who was busy in Florida, greeted the early returns from New Hampshire with the remark : "I will sleep well tonight." His hope is that if Mr Muskie does not show himself able to win votes in the successive primary elections in the next month or two, Mr Humphrey's old sources of strength in the local party organisations, the cities and the trade unions will eventually assert themselves. He has had some encouragement.

Senator McGovern's standing with the party establishment is, of course, weaker than either Mr Humphrey's or Mr Muskie's. He has to prove that he can win popular support or he is lost. His campaign is not well-financed but it is intelligently run and he is showing himself a better candidate than people gave him credit for. In the first stage he has succeeded brilliantly ; his 37 per cent of the vote in New Hampshire is, in the circumstances, an excellent achievement. He gave Mr Muskie a jolt and obliterated the other Democratic contenders there.

What Mr McGovern has to show next is that he is the chief of Senator Muskie's rivals. In Florida, where Mr McGovern went this week after the New Hampshire results were out, he will find this hard to demonstrate. With his limited resources he could make the effort that he did in New Hampshire only by neglecting Florida. Not only is Senator Humphrey's campaign well established in the Miami area and one or two other towns, but Mayor Lindsay of New York has been campaigning stridently and spending heavily in Florida to collect the liberal vote which Mr McGovern could otherwise have hoped to get. Now he is trying to make up lost ground in Florida. But it may be too late.

The Weather — Sunny, Cold

MANCHESTER NEW HAMPSHIRE UNION LEADER

"There is nothing so powerful as truth" — Daniel Webster

State Edition

NEW HAMPSHIRE'S LARGEST DAILY NEWSPAPER

Another Manchester's guardian

FROM A CORRESPONDENT IN NEW HAMPSHIRE

Once every four years, when presidential aspirants come to New Hampshire for the first test in the series of intra-party elections called primaries, the ultra-conservative Mr William Loeb, the cantankerous publisher of Manchester's right-wing newspaper, the Union Leader, surfaces as a national figure. Sometimes he surfaces in between, but most of the time interest in him is confined to the Granite State where he is loathed, feared or loved—and always read—by vote-seekers and office holders alike.

His newspaper, with a circulation of 63,000, is the largest and most influential in the state; it reaches about 9 per cent of New Hampshire's population, mainly in the south-eastern quadrant where nearly half the total number of citizens lives. Stinging leading articles on the front page, venomous cartoons and willingness to print practically every letter that comes in make him a power to be reckoned with. "He can't create a candidate all by himself," said President Nixon's campaign manager in this week's primary in the state, "but he can break one if he wants to." Miss Maria Carrier, a strategist for Senator Muskie's campaign in New Hampshire this year, claims to be one who was indeed "broken" by Mr Loeb when she ran for the State Senate in 1970.

> I was doing well until I had lunch one day with one of Mr Loeb's editors. He told me that, if the election were held tomorrow, I would win and went on to say that the Union Leader intended to see to it that I didn't. They did, too. They attacked me from then on and my major political backer publicly withdrew his support after the Union Leader's attacks.

Mr Loeb's approach is Danton's—*l'audace, encore l'audace, toujours l'audace*. His invective is beyond compare in American journalism. President Eisenhower was "Dopey Dwight, that stumbling hypocrite in the White House." President Kennedy was "the number one liar in the United States of America" and "tricky Jack." Other Kennedys have been labelled "copperhead Bobby" (a pejorative tag seldom used since the Civil War) and "stupid Ted." Mr Nixon is "a doublecrosser and stupid to boot"; his trip to Peking was "a sell-out" of the Chinese on Taiwan. There is also "Moscow Muskie."

Senator Muskie was the most recent target of Mr Loeb's wrath and he responded to an article in the Union Leader on Mrs Muskie by calling the publisher a "gutless coward" and a man who "doesn't walk, he crawls." Mr Loeb, said Mr Muskie, "likes to attack women. This says something about his own manhood, I guess." Mr Loeb's personal response to the Muskie emotion was unrestrained glee. He has never been one to shun controversy and publicity, although he tried to give another view when he assessed himself in a recent interview. "I'm a very gentle person," he said; "I'm not one of those publishers who takes himself seriously."

Mr Loeb believes that everyone should "carry a loaded gun at all times"—and is ready to produce his own as he demonstrated to three reporters recently. At 66 years of age he runs the Union Leader with an iron hand and the long-distance telephone. "I go there very seldom," he said over coffee in his house in Pride's Crossing, an affluent suburb north of Boston. "I operate from wherever I am. It might be a fishing camp in New Brunswick, or it might be my ranch in the west." But wherever it is he keeps an eye on the country's welfare, according to his own lights. Liberals in power—and to him they include most office holders—spend too much money trying to right wrongs—"not their own, but somebody else's. And this just hasn't worked, that's all." He argued forcefully for the parole which Mr Nixon recently gave to Mr James Hoffa, the imprisoned boss of the lorry-drivers' trade union; its pension fund once eased a financial crisis for the Union Leader.

New Hampshire's liberals, both Democratic and Republican, think that they are chipping away at Mr Loeb's influence in the state. But it is still strong. A recent poll by the Boston Globe, for example, examined the support among voters for Mr Sam Yorty, the mayor of Los Angeles who has been conducting a small-scale campaign for the Democratic presidential nomination with Mr Loeb's enthusiastic support. Among the Union Leader's subscribers, 13 per cent favoured Mr Yorty, while only 2 per cent of those who did not read that newspaper were in his corner. Facts like these make Mr Loeb something more than just another newspaper publisher

Compagnie de Saint-Gobain-Pont-à-Mousson

and

INA Corporation

have committed to make a substantial investment in Certain-teed Products Corporation. Such transaction will be consummated prior to December 31, 1973.

Compagnie de Saint-Gobain-Pont-à-Mousson

has entered into technology agreements in the field of fiberglass operations with

Certain-teed Products Corporation

and has exchanged its minority interest in Certain-teed Saint-Gobain Insulation Corporation for shares of Certain-teed Common Stock.

The undersigned assisted Compagnie de Saint-Gobain-Pont-à-Mousson and INA Corporation in the negotiations leading to this transaction.

Arms and the colonels

The ban which Congress placed on aid to Greece has been set aside almost as soon as it came into force. The prohibition was part of the bill authorising this year's foreign aid and last month, 10 days after he signed it, President Nixon decided to use the loophole which Congress had provided: that the ban could be ignored in the overriding interest of the security of the United States. The continuing Soviet military build-up in the Mediterranean was the reason given for continuing to arm Greece, on the eastern flank of the North Atlantic Treaty Organisation. Preliminary negotiations over the arms which will be provided—including, it is expected, Phantom jet aircraft, tanks and other ground equipment—began in January.

To Representative Rosenthal, whose subcommittee held the hearings which led to the ban, the continuance of aid to Greece shows just how impotent Congress is when it tries to restrict help to authoritarian regimes. His subcommittee may come back to the attack; it was due to hold hearings this week on the agreement to make Piraeus a home port for the Sixth Fleet. The advantage to the navy is that ships could stay on station for two or three years instead of returning to the United States every six months to give officers and men a chance to see their families; this would save money and might raise enlistments, which have been falling. The risk that Nato forces might no longer enjoy Maltese facilities is probably also in the navy's mind. To Mr Rosenthal, however, there are considerable strategic and political implications in the agreement; moreover, it does not require the assent of Congress and Congress has been complaining recently about agreements on bases in which it has no say.

The Greeks will not be getting the $118m in aid for which the Administration asked originally; the total for the remaining four months of this financial year must not exceed what was granted last year, about $70m. But in this the Greeks are suffering a common disappointment. The foreign aid appropriation which Congress finally approved last week gives the President substantially less than he had requested in almost every category and satisfies practically no one. Development assistance has been granted about the same small amount of money as it won last year, but the Senate's attempt to move away from bilateral to multilateral aid was frustrated by the determination of the House of Representatives to keep control in its own hands. Had matters been left to the House, the World Bank would have been cut off without a penny; as it is, it gets only half of the President's request. Another victim, on a smaller scale, is the Peace Corps; its appropriation falls from $92m last year to $72m this year. Since it has been spending at a higher rate, harsh economies must be undertaken.

Democrats against Nixon: 7

ELECTION '72

Populist Wallace

Washington, DC

When asked to comment on the latest campaign for the Presidency by Governor George Wallace of Alabama, Republican leaders invariably reply with a smile that now he has become a problem for the Democrats. Indeed he has. Democratic leaders fear that he will run well enough in the southern states in the primary elections to bring more than 100 delegates pledged to him to the nominating convention at Miami Beach in August. This would be hardly enough to make him a contender for the nomination but sufficient to embarrass the party on the nationwide television programmes. At the same time Democratic leaders fear that he will decide not to run in the general election campaign as nominee of his American Independent party and that thus he will provide President Nixon with the clear field in the south that could ensure his re-election.

Yet the three years after 1968, when he collected 13 per cent of the national vote as nominee of his own American Independent party, were obscure ones for Mr Wallace. His public pronouncements on national issues were infrequent and scarcely worthy of attention. He was barely elected governor in 1970 after resorting to overt racist demagogy of a type that he had not used since his first election as governor in 1962. Outside Alabama, Democratic politicians and trade union leaders forecast hopefully that Mr Wallace's attraction for the white working man was no more. For his part, Mr Wallace hinted to visitors that he would be the American Independent nominee for President once again in 1972, but would campaign largely in the southern and border states, harming Mr Nixon far more than the Democrats.

But within the past six months, two developments have radically changed this pleasing outlook for the Democrats. The first, ironically, was the democratisation of the internal procedures of their party dictated by the McGovern commission. This has resulted in a less firm grip over selection of delegates to the Democratic national convention by the new centrist, anti-Wallace governors of the south and also in the introduction of direct primary elections in Florida, Tennessee and North Carolina. Thus, Mr Wallace saw the road open to bringing a fair-sized body of delegates to Miami Beach, generating the national attention that he covets so much.

The second, more important development, still shrouded in mystery, is that somewhere along the line Mr Nixon and Mr Wallace seem to have reached an understanding of sorts. In contrast to 1970, when it was intervening in Alabama to try to prevent Mr Wallace becoming governor again, the White House is now impeccably correct in its dealings with him. While making no promises, Mr Wallace shows increasingly less inclination to run as an independent candidate in November. He has virtually abandoned his own creation, the American Independent party, to the far right lunatic fringe.

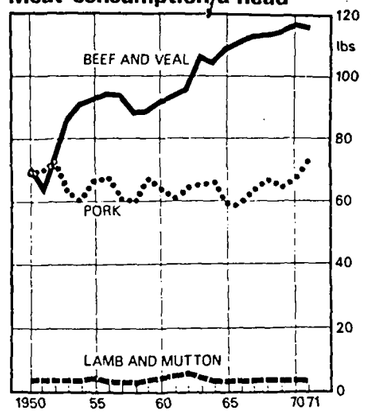
In the meantime, Mr Wallace is set to disrupt Democratic primary elections, north and south. Having first concentrated on campaigning in Florida for its balloting on March 14th, he will thereafter move on to Wisconsin, Pennsylvania, Tennessee, North Carolina and Maryland. His campaign technique is indistinguishable from that of 1968. The dawn-to-dusk days of multiple speeches, hand-shaking and conferences that so exhaust the ordinary candidate are not for Mr Wallace. As a master demagogue, he would much rather confront the voters in the mass than individually. After rising rather late, he lolls about in his hotel suite much of the day, readily accessible for interviews, sometimes highly combative, with the press. The only real campaigning is the monster rally in the evening in the biggest auditorium in town, a setting shunned these days by most candidates who fear that they cannot lure the apathetic voter away from his living room. Mr Wallace, perhaps the best stump speaker in America today, has no trouble in doing so.

But the differences from 1968 are more significant than the similarities. Superficially, Mr Wallace has been prettied up a little under the tutelage of his handsome, young, new wife, wearing suits that fit and ties that match and letting his hair grow longer. Beyond that, Mr Wallace's basic half-hour speech is the most coherent, most tightly organised and least crudely rabble-rousing that he has ever developed for a campaign. He omits overtly racist strains. Also gone are the habitual thigh-slappers of 1968, bound to evoke roars of laughter from his admirers, such as his denunciation of "pointy-headed intellectuals who can't even park a bicycle straight."

In their place, Governor Wallace has linked the issues that most concern and frighten the white working man. "Big government," he shouts, "go home where you belong!" He excoriates "the rich" for taking advantage of tax loopholes, promises to end sending money "down the foreign aid rathole," pledges that American troops "never again will be sent 10,000 miles away to a no-win war" and, of course, denounces school busing. Unemployment, inflation, the return of isolationist sentiment, fear of intellectuals and racial minorities and a desire to return to the old virtues are played upon by Mr Wallace in virtuoso fashion. He is not fussy about his facts and the formulae are repeated time and time again.

Still, their impact on the white working man in Florida has been profound. Mrs Shirley Chisholm, the black Congresswoman from Brooklyn who is also entered in the Florida primary and is the Democratic aspirant for President who is farthest to the left, returned last week from Florida to tell her colleagues in the House of Representatives that Governor Wallace and Governor Wallace alone was getting to the core of the issues that really concern people, however thoroughly she disagreed with his positions. At a moment when it is chic for upper class Democratic liberals to refer to themselves as "populists," Mr Wallace's vigorous brand of demagogy is closer to the populist tradition than the warmed-over liberalism of his rivals.

The result is that Mr Wallace will probably win the Florida primary on Tuesday by a comfortable margin and the polls show him running first in both the Tennessee and North Carolina primaries as well. But, say the leaders of the Democratic party, these are southern states; when he gets up north, he will be humiliated. But that is precisely what the party leaders said of Florida two months ago.



One man's meat

The housewife is up in arms over the price of meat, which accounts for nearly a third of her spending on food. Beef is what Americans like to eat and the price of beef has been rising steadily from the low point which it reached in 1965. To Europeans steak may not seem outrageously expensive at $1.45 a pound, but a year ago it cost $1.35 and the year before that $1.23. Even humble hamburger has gone up from 58 cents a pound to 70 cents. Wholesale prices of beef and pork are now higher than they have been for nearly a generation. The sensible advice of the head of the Price Commission to eat less meat (eggs are almost being given away) has little appeal. Instead, spokesmen for the consumer are demanding the extension of price controls to agricultural products, particularly meat.

The Administration appreciates that the whole stabilisation programme may be undermined if food prices continue to climb. But the producers of livestock contend that they are just beginning to get a fair price after 20 lean years of subsidising the consumer. They admit that productivity has soared but they emphasise that the costs which they have to pay are up by 50 per cent since 1951 and that last year's severe drought reduced their herds.

In an election year neither the Administration nor Congress can turn a deaf ear to the farmers' arguments. Mr Earl Butz, the new Secretary of Agriculture, has been scouring the farm states, calling for even higher prices for food and promising to "fight like a wounded steer" against any attempt to impose price controls on farm produce. There is, however, another way to tackle high prices, at least for meat, although it is easy to understand why the Administration hesitates to take it. The "voluntary" quotas on imports of meat could be relaxed; this would please foreign suppliers such as Australia and New Zealand as well as the housewife.

Meat consumption/a head

But there would be a roar of protest from the producers, who enjoy considerable political power; in the mid-1960s they got Congress to put statutory quotas on imports of meat. These were turned into "voluntary" arrangements four years ago. In the negotiations to renew these agreements, the Administration is said to have offered, so far, only a niggardly 1 per cent increase over last year's imports of about 1.13 billion pounds.

Jobs in court

The white man's hold on the job market is slipping bit by bit but not without a battle. After a long struggle Congress has now passed a bill giving women and minority groups more protection against discrimination. For the first time the Equal Employment Opportunity Commission would have the power to take employers accused of discrimination to court: until now it has only been able to use its powers of reason and moral persuasion to stop unfair treatment. The bill also extends coverage to 16m more people: it includes employers and trade unions that control more than 15 persons (the present minimum is 25) and employees of state and local governments.

At one stage liberals in the Senate had hoped to give the EEOC more power by granting it the authority to issue its own cease and desist orders against those accused of job discrimination. But a filibuster by southern Sena-

tors, the disapproval of the White House and the absence of Democratic members who were out campaigning prevented the supporters of this stronger bill from mustering the two-thirds vote needed to cut off the debate. In order to save something of the legislation and to prevent further delays to other pressing business in the Senate the advocates of a stiff measure were forced to back down.

Old habits die hard even when stiff penalties are enforced. At the moment the federal government, pressed on by women's groups, is coming down hard on universities which offer fewer openings for women than for men. But it has run straight into the old question of academic freedom. When the Department of Health, Education and Welfare threatened to cut off research funds from Columbia University the independently-minded arts departments deeply resented what might become interference with their freedom to make their own academic appointments. Nevertheless, women are making headway. The Senate voted last week to deny federal funds to public colleges and universities which do not give women opportunities equal to those offered to men for education and academic careers. The House of Representatives approved a similar, but less far-reaching, measure last year.

Elusive violence

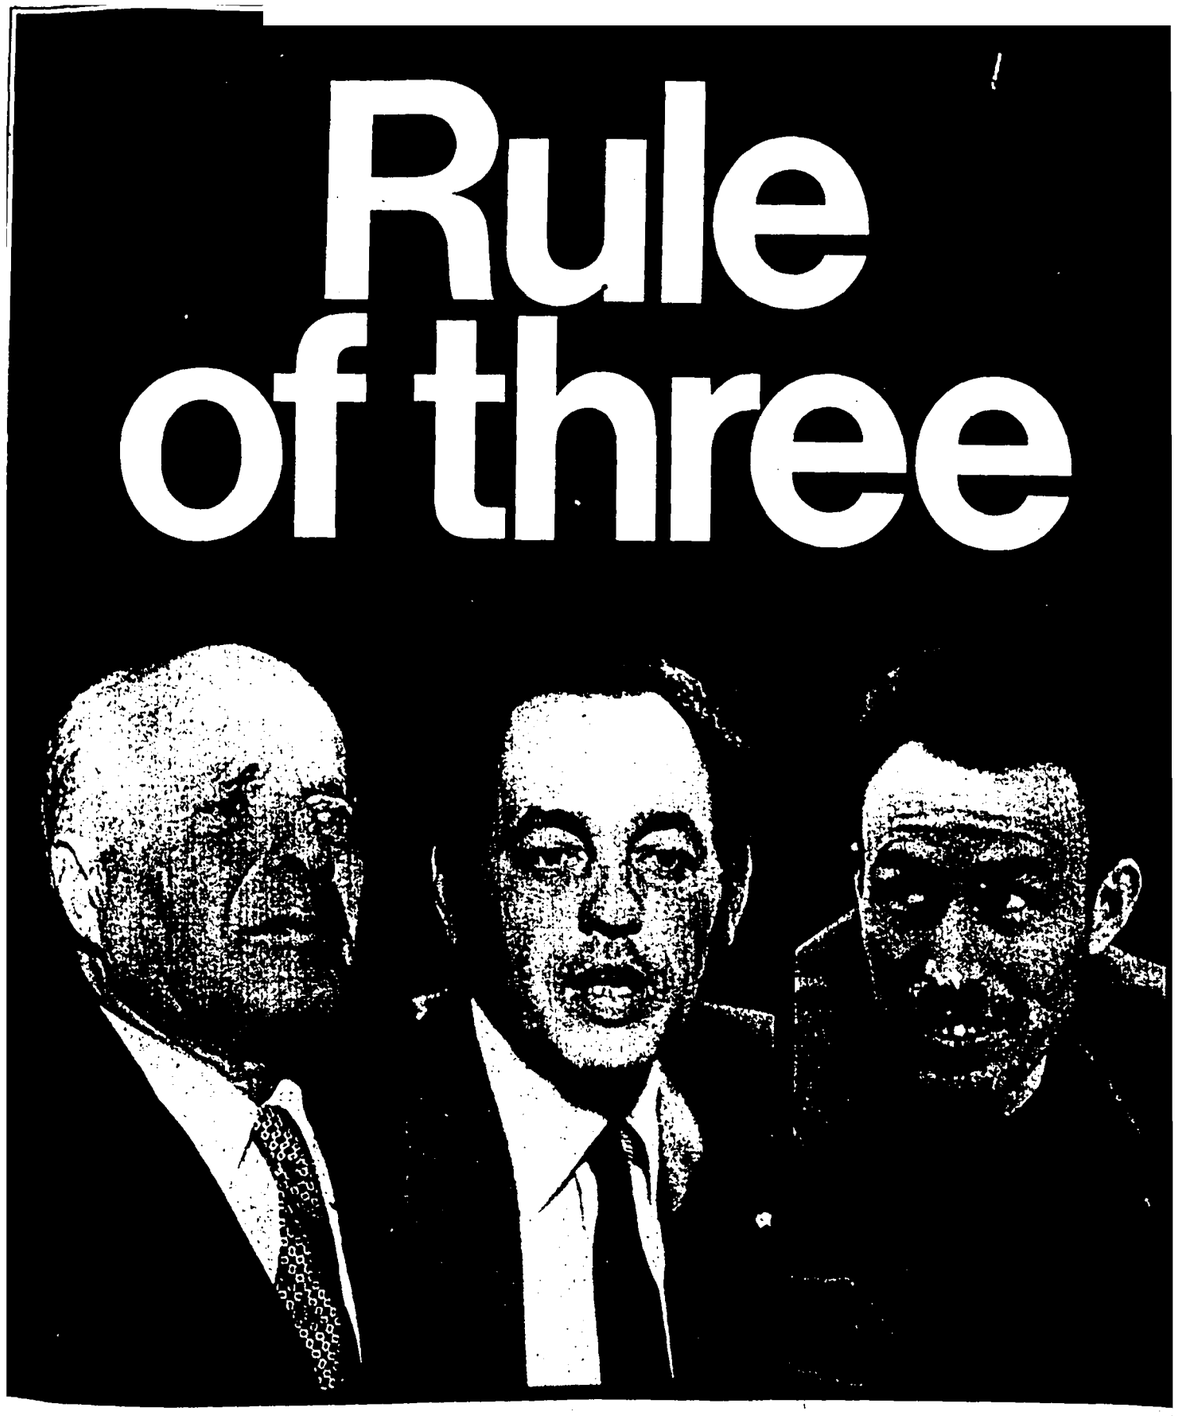
Some children may be made more aggressive by seeing violence on television—but only if they are violence-prone already. Is that tentative finding worth $1m? The report of the Surgeon General's scientific advisory committee on television and social behaviour will be given a hard going-over by Senator John Pastore's communications subcommittee at hearings later this month. Senator Pastore, the stern little moralist from Rhode Island, had expected something much more definite when he asked for the advisory committee to be set up three years ago.

Even among behavioural scientists, however, who are accustomed to ambiguous and qualified conclusions, the television report is controversial. The Surgeon General, Dr Jesse Steinfeld, admitted when releasing it that the major television networks had been allowed to veto prospective members of the committee who had been thought to be anti-industry. Moreover, some of the researchers who did the experiments have complained that the committee's final report dilutes and distorts the evidence actually obtained.

Steinfeld offers no remedies

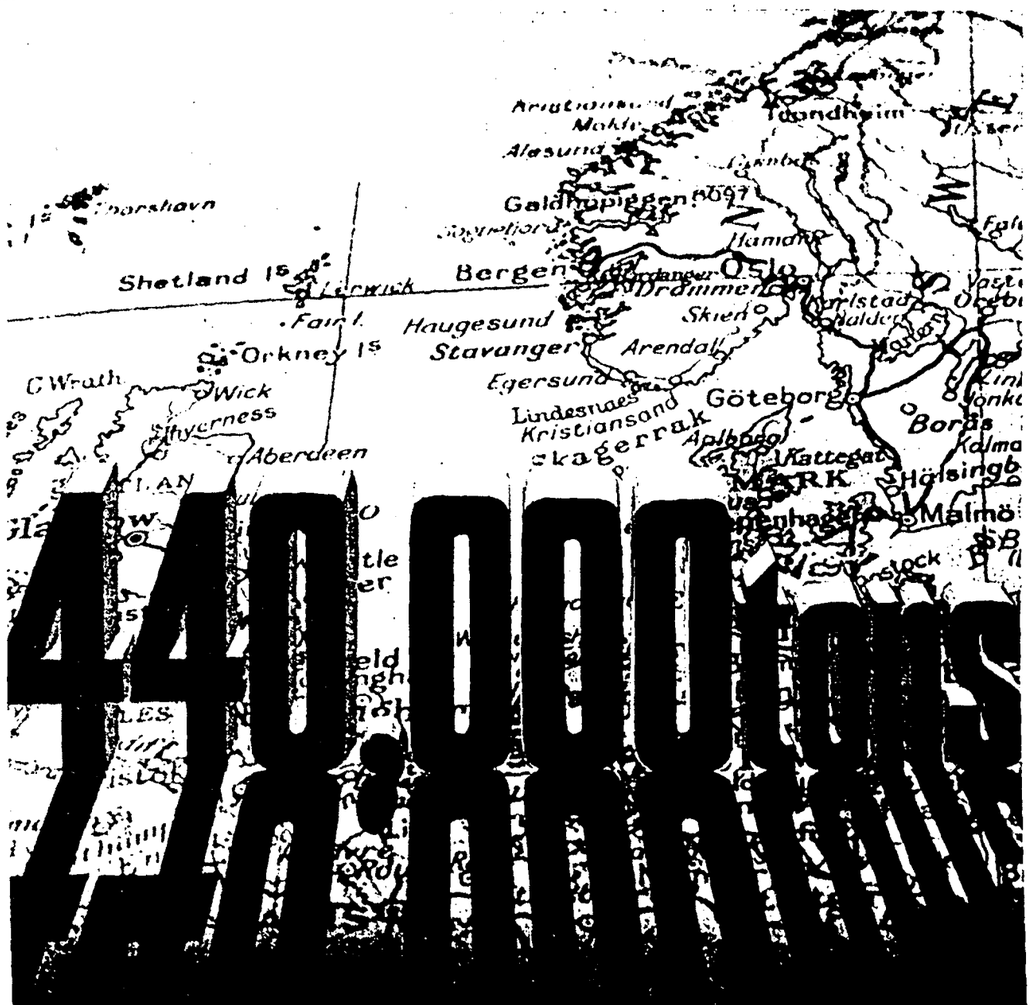
There is no doubt that the general conclusion—that most children are not harmed by what they see on television—is a comfort to the industry.

But the Surgeon General claimed that the report had come up with something new: the first evidence that under certain circumstances television can cause an increase in aggression among certain kinds of children. Just how large a proportion of the total child audience these children are or whether there are common elements in their family backgrounds are questions for future research. Much depends on parents' attitudes toward violence and punishment.



Some hard facts did appear, however. The average American television set is on six hours a day. There are about eight violent incidents an hour in entertainment programmes; violence is popular with adult audiences. American children tend to watch television at least two hours a day, beginning at the age of two or three. The violent content of programmes did not alter substantially between 1967 and 1969 (the years in which the networks became sensitive to criticism and switched from the "Batman" to the "Dr Doolittle" strain of children's cartoon series) but fewer characters were involved and there were fewer deaths. The proportion of violence in American television was greater than in Britain, Israel and Sweden. These and other observations are merely the distillate of the five volumes of research reports now being published. These, the Surgeon General believes, have yielded much new information and constitute a major contribution towards understanding of the effect of televised violence.

ITT's convention?



That any Administration could be stupid enough to barter favours in a huge anti-trust case for a piffling contribution to election expenses strains belief. Yet that is the allegation which is now holding up, perhaps endangering, Senate confirmation of Mr Richard Kleindienst as Attorney General. San Diego, California, the city where President Nixon was determined that this year's Republican convention should be held, was far from enthusiastic about the honour; it had to rake up about $600,000. A good part of this was pledged by the Sheraton hotel chain, a subsidiary of the International Telephone and Telegraph Company, only a fortnight or so before the Department of Justice agreed to abandon its suits against ITT and let the conglomerate retain one big acquisition—the Hartford Fire Insurance Company, a wonderful well of cash—if it would divest itself of several smaller acquisitions.

The Democrats, looking for any stick to beat the Republicans, were immediately suspicious but only last week did their suspicions receive some confirmation in a memorandum published by Mr Jack Anderson, who inherited Mr Drew Pearson's muckraking column. The memorandum, apparently written by Mrs Dita Beard, a lobbyist for ITT, to her immediate superior, clearly implied that the "noble" contribution to San Diego was smoothing the way to a favourable settlement of the anti-trust suit. Mrs Beard is now incommunicado in hospital. But lobbyists have been known to exaggerate their own importance.

More disturbingly, the testimony given to Congress so far suggests a veritable epidemic of absent-mindedness in the Justice Department about the ITT settlement itself. Mr McLaren, the former head of the anti-trust division who is now a federal judge, concedes, but cannot recall, that he asked the White House to procure outside advice on a settlement and ignored his own economists. Mr Kleindienst, who said at first that he had nothing to do with the agreement, turns out to have discussed it with men from ITT and sent one of its directors, Mr Rohatyn, to impress on Mr McLaren the risks of an unfavourable settlement to ITT's liquidity, to the economy and to the balance of international payments. Political intervention in anti-trust suits is nothing new but no one wants to be accused of countenancing it in an election year.

The Maghreb The Economist A survey

440,000 tons

440,000 tons puts us on top in Europe

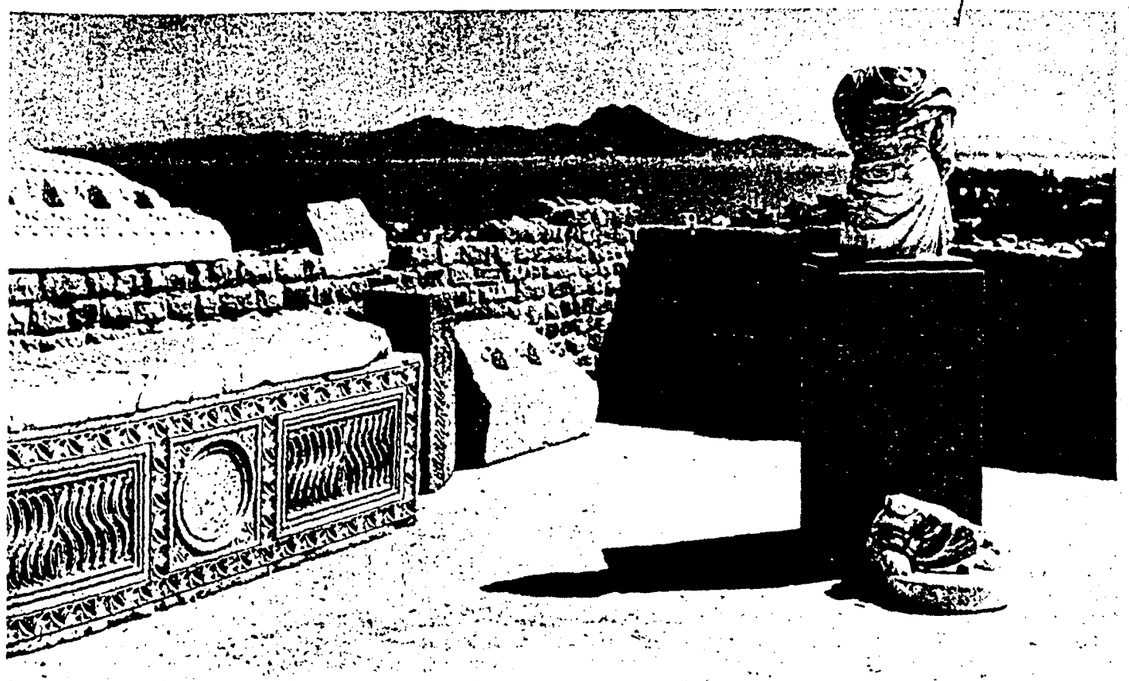
And lets us see the world

Fourteen years ago, with one plant (in Hythe, Southampton) we produced 50,000 tons of solid rubber polymer a year.

Now we produce nearly nine times that amount, with two plants and a production capacity of some 440,000 tons a year of polymers, monomers and carbon black.

Which makes I.S.R. the largest producer of synthetic rubber polymers in Europe.

Exporting 35% of our rubber output.



To the world.

Out of the past

A girl walks down a street in Algiers. She wears, like millions of others throughout the world, a maxi-coat, a mini dress and a headscarf tied under her chin. But she is different. The lower part of her face is hidden by a fine, beige veil. She is followed by stares and smiles, for the women of North Africa either retain their traditional dress or blossom out in the latest European styles. But this girl's idiosyncrasy illustrates two features which distinguish the countries of the Maghreb—Morocco, Algeria and Tunisia—from the remainder of North Africa and the rest of the Arab world.

The Arab word "maghreb" means west and the term has long been used to denote the western wing of the Arab-speaking world. But it is applicable in another sense. On the northern shores of the western Mediterranean the people and the cultures of the east and west have met and mingled. The Europeans may feel that the east begins at Tangier, just nine miles from the tip of Spain. But Tangier is as near the United States as London is and it might be argued that Europe's southernmost boundary is not its Mediterranean shore but the Middle Atlas mountains.

The cover: (from left to right) President Bourguiba of Tunisia. King Hassan of Morocco. President Boumedienne of Algeria.

The fruits of the Maghreb's geographical closeness to Europe and its historical ties with France, Spain and Italy are very much in evidence in the urban societies of the Maghreb today. In Tunis, Algiers and Casablanca it is easy to imagine that one is in a French provincial city complete with its traffic-jams, café life and language. Yet the influences of the Arab world and Islam are there too, and the pull of east and west, especially on the younger generations, creates unavoidable tensions. To which world do they belong?

After years of colonial occupation the Maghreb is now on its own. In each country there are forces pulling its people both ways at once. There are those who believe that to establish their own national identity the links with the east must be strengthened—that now the colonialists are gone the future must lie with the Arab world and its religion, language and culture. There are others who feel that the ties with Paris are stronger than those with Cairo or Damascus and they regard efforts to make their society Arab as a step back into a dead past. And in each of the countries which today make up the Maghreb there are voices, admittedly not as yet very strong, who say that Morocco, Algeria and Tunisia have a unique opportunity to forge ahead through closer co-operation and eventual unity among themselves. A united Maghreb could, they argue, blend the best from east and west and need not turn away from either.

The affinity between the three countries goes far deeper than the inescapable geographical fact that they are neighbours on the southern shores of the western Mediterranean. That affinity has its real roots in the people themselves. Perhaps as long as 30 centuries ago the whole area was populated by the Berbers—a people who came from no one quite knows where. And the Berbers, who spread from Morocco's Atlantic coast, across the Atlas mountains, along the coastal plain and into the Saharan oases, were subjected to successive waves of conquerors. They were ruled for a thousand years

by the Carthaginians—Phoenicians who established themselves at Carthage, where President Bourguiba of Tunisia now has his home. They were brought into the Roman Empire, giving Christianity St Augustine of Hippo and Rome the Emperor Septimus Severus. They had a taste of the Vandals before the Byzantines returned.

Then in the seventh century the Arabs came. The new invaders brought with them a new language and a new faith. They did what their predecessors failed to do: they assimilated the Berbers who adopted Arabic and Islam. And the Arabs took Berber wives. So, the western wing of the expanding Arab empire assumed its own distinctive character. Although welded into the Arab world by language and faith the people of the Maghreb remained basically Berbers, tenacious, individualistic and independent. Those traits have lasted until today.

When the Arabs and Berbers swept across the Straits of Gibraltar, Spain became the centre of the western part of the Arab world and the most civilised area of western Europe. Spanish and Arab-Berber blood mingled as did the cultures of Moslem, Jew and Christian. In the fifteenth century the Christian-Moslem war was brought to the North African shores as the Spanish and Portuguese followed up their victories in Spain and captured the coastal cities from Tangier to Tripoli. The Moslem response was to call on the Turks for help.

For the next four centuries the eastern part of the Maghreb was under Turkish rule. Morocco alone somehow managed to preserve its independence by shutting itself off from the rest of the world. It paid a heavy price, for while western influences continued to grow elsewhere in the Maghreb Morocco was bypassed by the renaissance and humanist movements and its people degenerated in medieval gloom. Meanwhile Algeria, Tunisia and the now Libyan province of Tripolitania began to emerge as separate states. The Turks appointed three distinct regencies: those in Tunis and Tripoli became hereditary, and Algeria became a republic with a Bey elected for life. The main claim of these feudal states to fame in the world was the activity of the Barbary pirates.

Piracy in the Mediterranean was effectively dead after the Napoleonic wars and Lord Exmouth's bombardment of Algiers in 1816. It provided only the barest sliver of an excuse for the French invasion of Algeria in 1830. It was not long before France's aim broadened out from the protection of French trading interests to the colonisation of the whole of Algeria through the mass settlement of Europeans. The early colonisers may have seen themselves as latter-day Crusaders reimposing western civilisation and values; but the deliberate uprooting of the country's economic and social structure sowed the seeds of discord and hatred which bore their bitter fruit in the war of 1954.

After Algeria it was Tunisia's turn; it became a French protectorate in 1881. Officially the French ruled through the Bey's administration but in fact they took over the entire direction of the country. In 1911 the Italians occupied Libya and, a year later, Morocco was occupied by the French and Spanish with the agreement of the reigning Sultan. So all of the Maghreb came under the domination of Europe only fleetingly but still decisively.

The French connection

Although the legal status of the French in Tunisia and Morocco, which were protectorates, differed from their status in Algeria, which became part of France, French objectives in each country were the same. They were to encourage European settlers to colonise the land and to build French towns for administration and commerce. The crops that were needed in France formed the basis of agriculture: wine and cereals and later citrus fruits and vegetables. As French capitalism developed, the industrial companies, and big financial houses moved in to develop and control the mining enterprises, light industries, electricity, railways and the bigger farms.

Officially in Morocco and Tunisia the French governed through traditional channels: but in fact their control was as direct and tight as it was in Algeria. They filled all the administrative and technical posts from senior civil servants to postmen. The Moslems retained their small holdings on the poorer land and provided the cheap labour for the French farmers and the French industries. They had no political rights. The settlers' economic system was based simply and squarely on their own self-interest. Profits from their enterprises which they did not repatriate were used to import French goods for themselves. Yet, despite this common pattern of French domination, each country has developed differently since independence. This is due in part to the differing length of the French occupation—they were in Algeria for 120 years, Tunisia for 80 and Morocco for 44—and in part to the different histories of each nationalist movement. In Algeria more than a century was to pass between the peasants' insurrection led by Emir Abdel Kader (who brought Arab and Berber tribes together to resist the French military occupation in the 1840s) and the formation of the National Liberation Front and the general uprising in 1954. Between these dates nationalist demands were much more moderate: the demand then was for French citizenship and for equal rights for Moslems.

It was not until 1934 that a more radical nationalism made itself felt in Tunisia when a young lawyer, Habib Bourguiba, broke away from the moderate nationalist movement centred around the Bey to found the Neo-Destour party. He was imprisoned, went into exile and was imprisoned again before France finally agreed to grant Tunisia internal autonomy in 1955 after 12 months of insurrection in the countryside. A year later Tunisia was given its independence.

In contrast to Tunisia the French military occupation of Morocco was a long, bloody affair, which was completed only in 1934. The standard of revolt was raised first in 1920—only nine years after the establishment of the protectorate—by a remarkable political and military leader, Abdel Krim. At the head of Berber tribesmen he inflicted a humiliating defeat on the Spanish army and in 1926 led his forces in a march on Fez. His revolt was crushed but the fire of nationalism had been lit and it spread quickly into the urban areas. But unlike the movements in Tunisia and Algeria, Moroccan nationalism came to centre around the sultan, Mohammed V, and the country's traditional leaders. It was the sultan the French had to depose and send into exile after he openly made common cause with the Istiqlal (independence) party; and it was the sultan who returned in triumph in November, 1955, after France and Spain had promised Morocco its independence.

France's relations with both Morocco and Tunisia have gone up and down like a yo-yo since 1956. The French held both governments responsible for giving sanctuary to Algerian partisans and for the fighting along the borders. And France, at one time, drastically cut down financial aid to Tunisia in an attempt to bring it to heel.

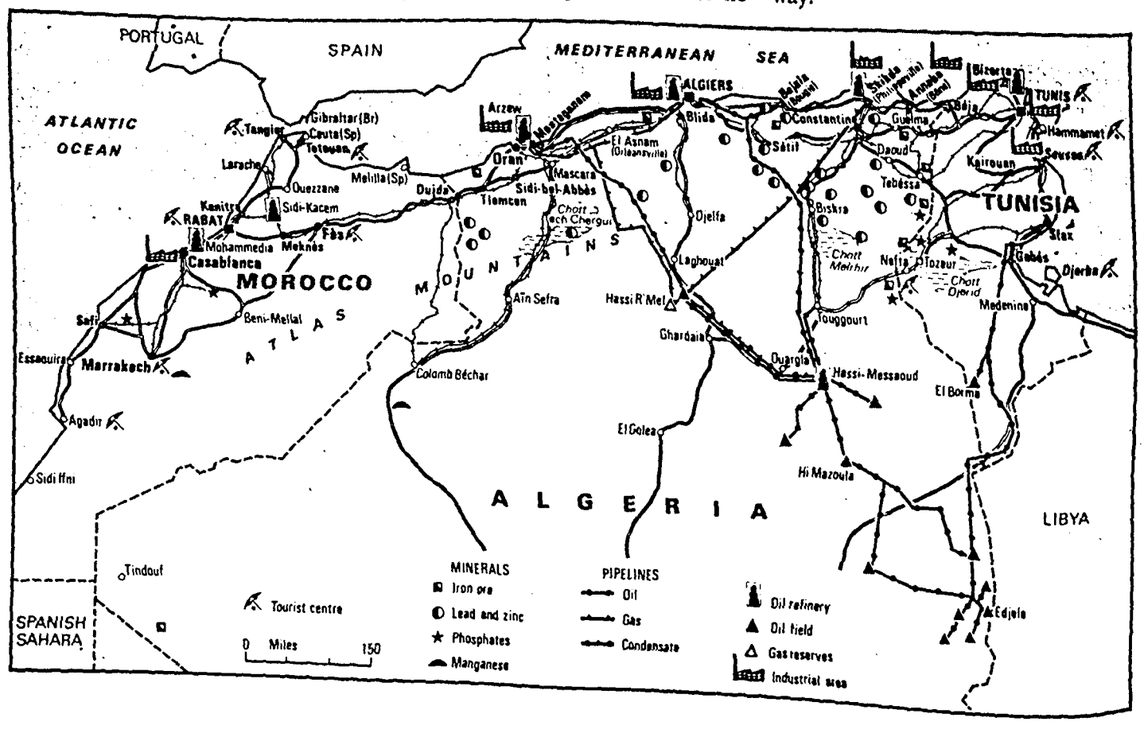
In 1962 Franco-Tunisian relations took another knock when, after trying in vain to get the French to evacuate the naval base at Bizerta, the Tunisians attacked it and lost 1,200 troops. The French cut down aid again in 1964 when the Tunisian government nationalised all land still in settlers' hands. Aid was not fully restored until 1971.



The Moroccans were gentler with the French, leaving the majority of the farmers and businesses alone. There were no Bizertas. But when the French granted Mauretania independence in 1962 the Moroccans were furious. The low point in their relationship came in 1965, when a Moroccan opposition leader, Mehdi Ben Barka, was abducted in Paris. He has never been seen again. Moroccan security agents, working with the French police, were held to be responsible. The French government demanded that King Hassan should hand over his security chief, General Oufkir, for trial. The king refused and France reduced economic aid until 1970. But in both Morocco and Tunisia when France tightened its purse strings the Americans loosened theirs. The United States was not prepared to give Moscow the opportunity of getting in first.

Eight years of war in Algeria, a million people dead, wanton, indiscriminate destruction and the frenzied flight of over a million French settlers should have been enough to rupture French-Algerian relations for good. But the Evian agreements promised massive economic aid and a French-Algerian partnership in developing the Sahara oilfields. A sharp reduction in the amount of Algerian wine taken by France and Algeria's construction of its own oil pipeline strained relations at the time. But it was not until the dispute over oil and gas royalties in 1971 and the subsequent nationalisation of part of the French oil interests that relations between the two countries were seriously damaged.

For some reason, the French leave a more indelible mark than other colonisers. In the Maghreb it has gone right down to the roots. In each country the French set out to educate a Moslem elite. A few Moslems were taken into French schools, attended French universities and trained in French methods of administration. The young radicals were more influenced by the left wing in Paris than in Cairo, Baghdad or Damascus. When independence came, many educated Moslems spoke French better than Arabic ; even today French prevails as a diplomatic and commercial language. The link between language and trade is strong : a Moroccan businessman will ignore a letter in English. If he has a choice he will opt for a French product because he understands French business methods and can get on the telephone and rattle off in French. And because of the language it is easier to employ French-speaking technicians, advisers and teachers.

Education still follows a basic French pattern and France left a valuable legacy in the modern cities it built, the network of roads, the ports, electricity and telephone services and the provision of medical services.

But the Maghreb countries were also left with massive problems. They were confronted with rapidly rising populations (a result of the progress made in preventive medicine) and enormous numbers of urban unemployed people —the peasants who had flocked to the cities when the settlers took their lands. They faced a terrifying shortage of educated people in the administration and in the professions, a lack of skilled workers and an aching need for financial and technical aid to develop natural resources. Moreover, they received their independence when the communists in the west vied with each other to draw the developing countries into their own spheres of influence and at a time when the Arab world was becoming increasingly obsessed about Israel. These problems and tensions remain, but each country has sought to resolve them in its own way.

Morocco

Palace and people

Morocco is a land of strong and strange contrasts. Its shores are pounded by the Atlantic ocean and lapped by the Mediterranean sea. Its Atlas mountains, snow-covered and savagely beautiful, are often bitterly cold but in the summer its deserts and plains dance in the searing heat. There are the moon-like, grey, bare hills of the Rif, and below the vividly red soil and grey-green eucalyptus trees of the plains. The wide, tree-lined boulevards of the French-built modern cities surround the walls of maze-like medinas. There are neat French country towns as well as clusters of square, mud houses which dignify themselves with the name of villages. The peasants, making up over 65 per cent of the population, are often desperately poor. So are those who have left the land to seek work in the cities and finding neither work nor houses live in squalor in "bidonville" shacks. Over a quarter of the urban work-force is totally unemployed and more than a quarter of the agricultural work-force is unemployed for the greater part of the year. Yet there are families of great riches.

The Moroccan character is deceptive. An open friendliness, a quality of gaiety and a capacity to enjoy life conceals a tough ruthlessness which, once demonstrated, shocks because it surprises. The tension between a puritanical Islamic code and the more permissive way of life imported by the French and the Moroccans who have been educated in Europe is more evident in Morocco than elsewhere in the Maghreb. Officially, Moroccans may not drink alcohol. Yet the bars in Tangier and Rabat are full. Elsewhere the young men will drink only Coca-Cola in public for fear of being arrested. The young, attractive secretary in a Rabat ministry gives the impression of leading much the same sort of life as her counterpart in Europe, but it would be more than her life was worth to be seen in public with a young man to whom she was not officially engaged.

King Hassan himself illustrates the same uneasy attempt to marry the traditional way of life with the more liberal and sophisticated style of the west. An intelligent, shrewd and able man, educated at Bordeaux university, he is just as "European" as the next man when he is with foreigners ; and when he chairs ministerial meetings he seems no different from his cabinet ministers. But he moves with his court to his numerous palaces in an aura of privilege, wealth and luxury. There, it is generally believed, his private life-style is nearer that of a medieval sultan than a twentieth century head of state. His wife or wives are never seen and few know even their names. It is argued that this way of life is demanded of him by the mass of the people who regard him first and foremost as their religious leader and who expect him to preserve his aloofness and to remain the symbol of traditional customs. But the absence of any great manifestations of public joy when the king survived the attempted coup d'état last July at least raises a question of how much they revere this particular emblem.

Does this fortune-teller know Morocco's future ?

Today Morocco is troubled, even turbulent. The repercussions from the events of July 10th, when a handful of senior army officers attempted to seize power by killing or capturing the king, his senior service chiefs, his ministers and advisers while they celebrated the king's birthday at his palace at Skirat, have not ended. King Hasaan was badly shaken. The sole base of his power, the loyalty of his army, came in question. The full story behind the attempted coup may never be known : the leaders were either killed in the fighting or executed on the king's orders. But in part it was certainly a revulsion against the degree to which corruption and bribery were infecting the whole of Moroccan life. The subsequent purge of a number of highly placed businessmen, officials, former ministers and many lesser officials in the public services was welcomed by most people, caused consternation among the wealthy and has been greeted with a good deal of scepticism in intellectual circles.

In August the king appointed a new government under Mr Karim Lamrani, a former businessman. It embarked on a two-year programme of reform. Immediate measures were taken to rally popular support. Bicycle and radio taxes were removed ; the special sugar tax imposed to pay for the construction of dams was lifted (sugar being the most important item in the poor man's diet) ; the minimum agricultural and industrial wage was raised ; civil servants had their salaries increased by 15 per cent and the pay of the forces was raised. The king started discussions with the leaders of the two main political parties, Istiqlal and the National Union of Popular Forces (UNFP). At the same time, General Oufkir, who until last July was the powerful head of the security services and was then appointed chief of staff, purged the army of officers whose loyalty to the king was in doubt. Last month the king announced amendments to the constitution which were put to the people in a referendum on March 1st. They give more power to the government and parliament but leave the king the right to appoint the ministers and to dismiss the government and parliament. Istiqlal and the UNFP still refused to co-operate.

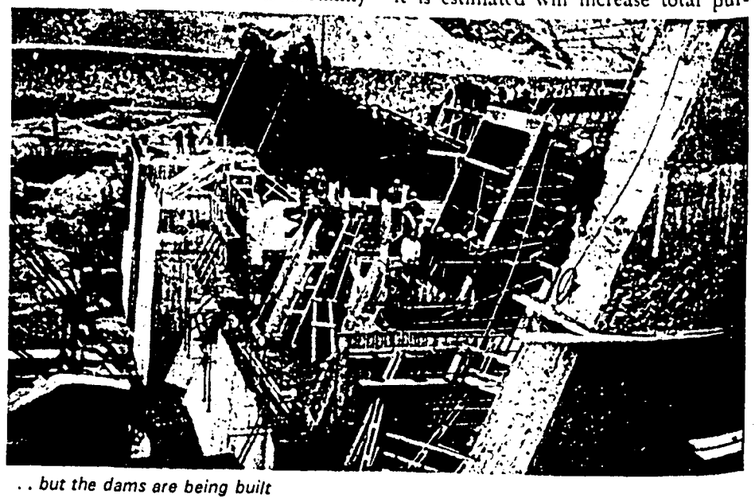
By joining forces with and in fact leading the nationalist forces the present king's father, Mohammed V, was the country's unchallenged leader after independence. For two years a coalition government served under him but in 1958 he appointed an Istiqlal administration without, however, relinquishing any real power. In 1959 the Istiqlal split when Mehdi Ben Barka formed the left-wing UNFP with the support of the powerful trade union federation. But, before he died in February, 1961, Mohammed V had dismissed his government and appointed his son, Hassan, to head the administration. Since King Hassan's accession, Moroccan political life has been a continuing conflict between the more liberal political elements and the monarchy and its aristocratic allies.

A new constitution in 1962 made a gesture towards democracy in establishing two elected chambers. But it was violently opposed by the UNFP. The next year the king dismissed the government headed by the Istiqlal leader, Alal al Fasi, and reverted to personal rule through "courtier" governments. In March, 1965, students and workers joined forces in serious riots in Casablanca. They were ruthlessly suppressed. The 1962 constitution was abandoned and a "state of exception" declared. This lasted until 1970. Since then, the abduction of Ben Barka in Paris, the arrest and trial of the trade union leader, Mahjoub Ben Seddik, the tough measures against numerous student demonstrations, the closing of newspapers that criticised the regime, regular sentences of detention for opposition leaders and the arrest and mass trial of 194 people last year on charges of plotting against the regime are a stark witness of the depth of unrest in Morocco.

In 1970 the king's second constitution, which confirmed his power, was strongly opposed by both Istiqlal and the UNFP. They banded together to form the National Front. They allege that the overwhelming support given the constitution in a referendum and the results of the subsequent elections (which they boycotted) were both rigged. Then on July 10th came Skirat.

The opposition leaders, Alal al Fassi of Istiqlal and Abdel Rahim Bouabid of UNFP, disagree about future economic policy and about the touchy question of Morocco's frontiers (for Istiqlal has never accepted the independence of Mauretania, nor the frontier settlement with Algeria and says firmly that the Spanish Sahara should belong to Morocco). But they united in a demand for immediate free elections to a new national assembly and a revision of the constitution. They accept that in Morocco the king must play a greater role than being a mere figurehead of the country's unity, but they insist that real reforms can only come when the government is responsible to the people through their elected representatives. The latest constitutional reforms show that the king has learnt a lesson from the events of July 10th. But it seems he has ceded too little and held on to too much to gain the confidence of the major opposition parties. This is a poor augury for the future.

In need of aid



Since July, potential investors of private capital, both domestic and foreign, have been extremely cautious in their attitude towards the Moroccan economy. This is doubly unfortunate, because after years of near stagnation the Moroccan economy was just beginning to look distinctly healthier. The apparent stability of the country and a seemingly docile labour force were strong inducements to invest in private concerns in Morocco. Now, the businessmen prefer to wait and see.

The events of last July will have a strong effect on the 1973-77 plan which is now being prepared. No details of this plan have yet been disclosed; but though it appears that the current priorities for agriculture, tourism and education and training will be retained there will certainly be more emphasis on projects which will have an immediate social impact (such as clearing the bidonvilles, medical services and improvements in living conditions in the rural areas). There is also likely to be more public investment in the industrial sector, which up to now the government has largely left to private enterprise. Labour-intensive industry will also be encouraged, in an overdue attempt to do something to reduce unemployment in the cities, and further inducements will be offered to exporting industries.

After Skirat the king said that the new government would seek to make the poor richer without making the rich poorer. The most important immediate step was an 18 per cent reduction in the price of sugar, which it is estimated will increase total pur-

The land is dry

. . but the dams are being built

SOCIETE INDUSTRIELLE D'ACIDE PHOSPHORIQUE ET D'ENGRAIS (S.I.A.P.E.)

INDUSTRIES CHIMIQUES MAGREBINES (I.C.M.)

Address : 22, Rue Pierre de Coubertin TUNIS—TUNISIA—
Telephone : 249.600 (4 lines).
Telex : CHIMAG . 399—
Cable : ACIPHOS—Tunis.

Factory :	Sfax	**Factory :**	GABES
Production :	250.000 tons of triple Superphosphate 45% of P205 under granular form	**Production :**	120.000 tons of P205 as liquid concentrated acid at 54 per cent. The whole production is for exports.
Exports :	90 per cent of the production are exported.	**Transport :**	ICM has her own tanker of 4.500 tons of capacity for transport. Unloading capacity is 450 tons per hour.
	The factory is located by the main port of exports of Tunisia. Deliveries are either in bulk or in bags.	**Storage :**	ICM has her own terminals in many ports.

SIAPE and ICM use the SIAPE process for production of phosphoric acid and use phosphate of Tunisian origin. SIAPE process is used by factories in many countries.

COMPAGNIE DES PHOSPHATES ET DU CHEMIN DE FER DE GAFSA

Société Anonyme au Capital de 9350.000 Dinars, 9, Rue Mazagran—Tunis—

Registre de Commerce : Sousse 36
Telegraphie address : GAFSAX-TUNIS
Telex : 474 TUNIS
Telephonne : 283 522

Paris Office

41, Avenue Hoche
PARIS 8ème
FRANCE

The Compagnie des Phosphates et du Chemin de Fer de Gafsa is the 4th producer of phosphate rock in the world. It is now exploiting four mines in the Gafsa region (Moulares, Metlaoui, M'dilla and Redeyef) and a fifth mine at Kalaa Djerda. We plan the opening of three new mines and the extension of the existing mines during the next five years.
With its development programmes, the yearly production will reach 5 000 000 T in 1975. The Compagnie des Phosphates et du Chemin de Fer de Gafsa exports phosphate rock to more than 20 countries of Europe, Latin America and Asia.

Hereafter rock phosphate exports figures since 1960.

YEARS	Total Sales	EXPORT	Local Sales
1960	1.927.000	1.639.000	288.000
1965	2.968.000	2.307.000	661.000
1966	3.000.000	2.394.000	606.000
1967	2.858.000	2.235.000	623.000
1968	3.241.000	2.460.000	771.000
1969	2.532.000	1.855.000	677.000
1970	2.864.000	2.109.000	755.000
1971 Forecast	3.380.000	2.480.000	900.000

The Tunisian phosphate rocks are very soft and friable and remarkable for their good reactivity to acids. They show a high solubility in organic acids and the most qualified agronomists are unanimous about this superiority.
The Compagnie des Phosphates et du Chemin de Fer de Gafsa employ more than 12000 workers in its mines and plants. It has very important economic and social activities to the south and to the country as well. In fact phosphate rock is one of the most valuable resources of Tunisia representing in 1968 60% of the production of mining industries of the country, 30% of its foreign exchange earning and 5% of its G.N.P.

chasing power in the country by 2-3 per cent. The loss in revenue will be partly recouped by the introduction for the first time of a tax on high incomes. This is not expected to affect more than 100,000 people, but it is a step of some significance. Another overdue innovation is a plan for regional development, under which the seven regions will be invited to co-operate with the ministries in determining their needs and priorities.

The target set for the annual growth of the gnp between 1973 and 1977 is expected to be about 6.5 per cent. The target of the current plan, 4.3 per cent, has so far been exceeded and between 1968 and 1971 has averaged 5 per cent. This is a substantial improvement on the 2.7 per cent growth rate averaged from 1961 to 1966 when it failed to keep in line with the 3.2 per cent annual increase in population. These, however, were years of poor harvests. The turning point came with the bumper crops of 1968 when the cereal harvest amounted to 6.5m tons and the gnp rose by 12 per cent. Cereal production has continued to be good.

Agricultural production was responsible for 31 per cent of the gnp in 1970 and industrial production 28 per cent. Even so, Morocco is not self-sufficient in foodstuffs. Cereals and raw sugar figure prominently in its imports. So there has to be a continuing emphasis on the development of agriculture. Investments already made in sugar beet factories and sugar refineries are now paying off. Before 1965 all sugar was imported. By 1971 home-grown sugar provided over 60 per cent of the country's needs. Foreign exchange is thus being saved.

Morocco's balance of trade, however, remains in serious deficit though the gap was narrowed in 1971 when exports rose by 7 per cent and imports by only 3 per cent. But the unfavourable trade balance is more than covered by receipts from tourism, remittances from 240,000 Moroccan workers abroad, foreign aid in the form of long-term credits and the flow of foreign capital investments.

Minerals, especially phosphates, which are mined under a state monopoly, account for 30 per cent of the country's exports. The depressed price for phosphates has meant that, although production of Moroccan phosphates rose in 1970 by 10 per cent to 11.4m tons and by over 20 per cent to almost 14m tons in 1971, foreign exchange earnings from this source did not rise proportionately. The government is hoping that new incentives will encourage foreign firms to take part in mineral exploration in partnership with the state organisation, the Bureau of Mineral Research and Participation (BRPM). Iron ore production from the Rif mines has risen over the past two years but it remains under 1m tons a year. A pelletisation plant is being constructed but plans to build a steelworks at Nador, producing 240,000 tons a year, still hang fire. The idea is that these steelworks should use pelletised ore and Algerian natural gas. A new steel rolling mill using smelted scrap steel is expected to produce a quarter of the country's requirements for reinforcing bars and steel wire this year.

Marrakesh waits for change

Domestic demand for oil products has justified the expansion of the two refineries at Sidi Kacem and Mohammedia. The production of local crude oil is falling. In 1970 it was only 45,700 tons but exploration by foreign companies has been stepped up. A major supplier of crude oil to Morocco is the Soviet Union which contracted to ship 800,000 tons in 1971, as well as 100,000 tons of refined products.

Manufacturing industries still account for a relatively small proportion of the gnp—less than 20 per cent. A sizeable construction programme, both public and private, has encouraged the three major cement factories to expand. The textile industry has pushed ahead since independence but if it is to grow any further it must look for export markets. The chemical industry, centred on Maroc-Chemie's complex at Safi, which produces phosphate-based fertilisers, will be expanded with the construction of a phosphoric acid plant.

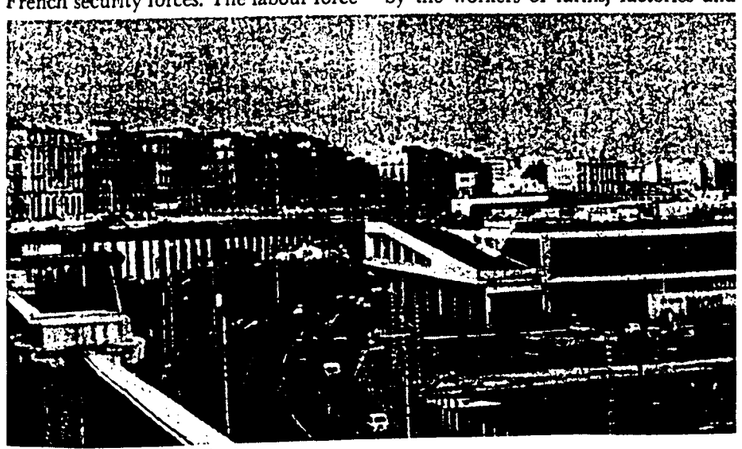
The three major vehicle assembly plants are working at full capacity. The largest is Somaca, in which the government has a 30 per cent stake. It produces well over 20,000 vehicles a year, most of them Renaults and the rest Fiats and Simcas. A new Renault assembly plant is to be built and in it the government will have a 50 per cent shareholding. British Ford trucks, assembled in Casablanca, account for, it is claimed, 60 per cent of the commercial vehicle market, while Massey-Ferguson tractors, put together there, account for 55 per cent of the tractors sold. Some 500 Land-Rovers are also assembled each year. The local tyre industry is also expanding. Goodyear Tyre is planning to build a plant near Casablanca and this will provide some competition for General Tire's factory.

The Moroccan agreement with the EEC (which gives many Moroccan products preferential entry to common market countries) is paraded by the Moroccans as a powerful inducement for manufacturers in non-member countries to establish factories in Morocco, where labour is both plentiful and cheap. Like many developing countries, Morocco would like to see local capital, private and public, playing a bigger part in the economy. In 1971, for instance, the plan was to increase local participation in the banks, insurance companies, export-import agencies and the like. But, in the event, nothing much was achieved. There is the perpetual fear that, if the Moroccans press too hard for local participation in industry, foreign capital will be frightened away. Yet one of the political lessons of Skirat is that the Moroccans themselves want to have a greater stake and say in the development of industry.

They still remain generally optimistic that there will be no difficulty in negotiating long-term credits and loans to cover the investment projects in the next plan. The Moroccans can and do cite last year's agreement with France, which doubled French aid and eased credit terms, as a good augury. The United States is providing $81m in grants and credits in the financial year and west Germany runs a close third in the aid stakes. The sheer abundance of foreign aid has tended to overwhelm the Moroccan administration. Too many ministries get involved and decisions on how and where the foreign grants and loans should be spent take far too long. The Moroccan government has promised to do something about it.

Algeria

The years of austerity



Algeria's chosen name with its ideological overtones, the Democratic and Popular Algerian Republic, sets it apart from its Maghrebi neighbours. But the differences go deeper. The Algerians themselves are more serious, more austere and more withdrawn than the Moroccans or Tunisians. They do not laugh much—and never at themselves. With foreigners they are polite but reserved. With one another they are cautious. Their personal and national pride is more highly developed and, to their credit, this results in a greater degree of honesty and a more dedicated attitude to their work.

The Algerian character and the post-independence political development in the country are in large measure the result of France's policy of attempting to destroy the Algerians' own traditional social structure. When the eight-year war for independence finally ended in Algerian victory just under ten years ago and one million French settlers fled from their homes, their land and their businesses, the Algerians were left to pick up the pieces. In Tunisia and Morocco, where the social set-up had not been radically altered, French civil servants simply handed over their offices and jobs and those businessmen and landowners who decided to return to France did so after selling their properties. In Algeria the French left overnight, leaving chaos and destruction behind them.

Millions of Algerians had been uprooted from their homes either through their lands being expropriated or through being "regrouped" by the French security forces. The labour force on the land and in the towns was left without bosses or skilled operators. There were no plumbers, postmen, police, electricians or telephone operators. Out of 2,000 civil servants in the Algiers palais du gouvernement only eight were Moslems. Moreover, the Algerian leaders who led the fight for independence were divided among themselves. So, when the members of the government-in-exile, others who had been imprisoned in France and in Algeria, the army officers heading Algerian forces in Morocco and Tunisia and the FLN leaders who had led the fighting in Algeria itself all came together in July, 1962, they had no clear and agreed ideas on the sort of country they wanted to build. They had only a vague commitment to socialism, as agreed at the Tripoli conference in 1961.

An inevitable struggle for power, complicated by ideological differences and regional loyalties, followed. For nearly three years, from September 20, 1962, the Algerian government was headed by Ahmed Ben Bella, one of the leaders held prisoner in France, who achieved supremacy through the support of the Algerian Liberation Army headed by Colonel Houari Boumedienne. Ben Bella's style of leadership was erratic and demagogic. He surrounded himself with foreign trotskyist advisers, courted personal popularity and ruthlessly eliminated potential rivals.

While their leaders fought for power, the Algerian people fought to keep food in their mouths. The takeover by the workers of farms, factories and shops vacated by the French was dictated less by political theories than by an instinct for self-preservation. The endorsement of the system of self-management by the March, 1963, decrees legitimised and gave political form to a situation born of necessity. Massive French aid—cheaper for the French than a civil war and balanced, in any case, by royalties from Saharan oil—gave the Ben Bella regime a false sense of financial stability. But agricultural and industrial production fell alarmingly. The frontier war with Morocco in 1963 served to divert attention from Algeria's own problems; but when Ben Bella attempted to interfere with the army's command, Colonel Houari Boumedienne struck. On June 19, 1965, Ben Bella was arrested and the army assumed power.

Algiers is a handsome inheritance

Colonel Boumedienne, who quickly emerged as the undisputed boss, is the complete antithesis to Ahmed Ben Bella, who remains under house arrest. Austere, retiring, a dull speaker and eschewing any personal publicity or mass popularity, Colonel Boumedienne has completely changed Algeria's style of government. The foreign political ideologists were dismissed; left-wing supporters of Ben Bella arrested; and all manifestations of opposition were suppressed. As an ardent nationalist but with a pragmatic rather than doctrinaire approach, Colonel Boumedienne hastened the policy of nationalising the country's basic industries, insurance companies and all vacant land and properties. Tighter state control was imposed on the undertakings which had developed self-management systems. Technocrats who had not been FLN leaders were brought into the government. The FLN party itself and the worker and student unions, which alone had voiced some protest at Ben Bella's overthrow, were brought under tight government control.

But the new leader's greatest achievement was to give the country a clear idea of where it was heading. The goal was to be rapid and full industrialisation and Algeria's natural resources were to be utilised to this end. This had to be accompanied by a massive effort to educate the people so as to produce the necessary administrators and technicians. The countryside was to be revitalised through both regional development and agrarian reform. The aim was the betterment of life for all the Algerian people. But meanwhile, there was, the colonel decreed, no alternative to hard work and austere living.

One of the most striking aspects

of Algeria today is the extent to which this has been understood and accepted by the Algerians. Although the days of government by slogan went with Ben Bella, one idea is continuously drummed into their minds. The revolution is not over; independence has been won but the battle for Algerian development continues. Few people are unaware of the objectives of the present four-year plan. Few complain of the shortage of luxury goods or grumble too loudly when they cannot buy butter or radio batteries. Today the country's mood is confident and expectant. But what of tomorrow?

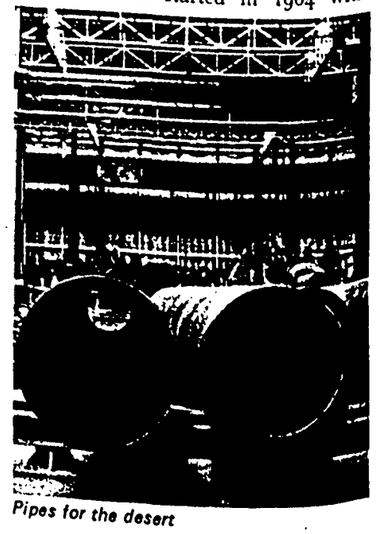
Algeria's investment in technically advanced plants and equipment in all sectors of industry creates relatively few jobs immediately. Life for the ordinary Algerian will not be so different in 1974—when the current plan ends—as most of them have been led to expect. The planners are thinking in terms of the 1980s. But that is a long time for the people to wait for their jam, especially when up to a quarter of the urban population is unemployed.

The government's principal line of contact with the people is through the FLN party; which retains its all-embracing structure down to the smallest village cells. The government controls the party, which has no independent voice. The current flows from head to base—not from base to head. A start has been made in letting the common voice be heard through elected communal and regional chambers. But in these communes all representatives have to be party members. In a deliberate attempt to decentralise the bureaucracy, regional governments and regional assemblies are being given more authority and a greater voice in development plans in their own areas. But a national assembly and a party with its own voice are still considered as luxuries which Algeria cannot yet afford. Development, the colonel believes, needs security, stability and single-mindedness.

The students have learnt by experience that overt protests are not tolerated. Their strikes and demonstrations for greater freedom to run their own affairs and for their union to be freed from the party's shackles have been put down ruthlessly. Nor is much notice taken of their view that Algeria's "state capitalism" has little relation to their own brand of revolutionary socialism. The government accepts that students will be students but it sharply reminds them that it is the state which pays for their studies.

For the most part the class which assumed power and responsibility in the new state was the small, French-educated Moslem elite. Today it is being rapidly enlarged by young men who have received their training in Algerian institutions, but the civil servants, the managers in state-owned concerns and the technicians still remain elitist. They work hard, but they dress well and enjoy themselves too. The night-clubs in Algiers where whisky is £2.50 a slug and beer £2 a bottle are packed at weekends with young Algerians. Although the highest salary in the civil service is £2,000 a year, and in state-run enterprises a third higher—a differential which leads to some grumbling—official perks, such as free accommodation, telephone, gas, light and a car, allow the young official to spend a good deal on his clothes and entertainment. But how does anyone keep relatively well-heeled bureaucrats burning with revolutionary fervour and at the same time prevent the ordinary people from feeling themselves to be an underprivileged majority?

Oil is the base



Algeria has gone all out for industrialisation on a centrally controlled socialist pattern. The aim is to achieve complete economic independence, as the government firmly rejects the idea that Algeria should remain a supplier of cheap raw materials and labour for the developed countries and an importer of their manufactured goods. The government has also rejected the theory that light industries should be developed first so as to provide a ready market for the products of heavy industries. After taking power in 1965, the Boumedienne government drew up two development plans covering 1966-69 and 1970-74. These were tied to the establishment and expansion of heavy and basic industries.

The government further reasoned that this policy could not be carried out unless the state controlled all sectors of economic activity by holding all the levers of capital investment. And, following an orthodox socialist line, the planners went on to argue that as the development of heavy industry had to be on a large scale to be at all viable, the country's economy had to be geared to compete in foreign markets. So all industrial processes had to be of the kind that makes the maximum use of capital and the minimum use of labour. The manufacture of consumer goods, the expansion of the service industries and the revival of the agricultural sector through the use of fertilisers, tractors and machinery was thus firmly put into second place. From such reasoning has flowed the doctrine of nationalisation.

Algeria's hydrocarbons, oil and natural gas, are the base on which the economy is being built. Their control by the state at all stages from exploration to marketing was, therefore, seen as essential to the government's policy. But this required trained personnel. The task of training Algerians to run their own industries started in 1964 with

Gas for Britain

Pipes for the desert

the establishment of the African Centre for Hydrocarbons and Textiles for training engineers and technicians. By next year it will have 3,000 pupils. In 1965 the Algerian Petroleum Institute was opened for training skilled workers and foremen and since then technical institutes have been set up in several large towns. By the end of 1973 it is estimated that there will be over 10,700 trained Algerians at work in the hydrocarbon industries.

The first major step in gaining control of oil resources was the government's decision to construct a third oil pipeline from Haoud el Hamra to Arzew. This led to a rise in production from 26m to 33m tons within a year. The government's next step was to take over the distribution and marketing of petroleum products and derivatives from BP, Esso and Mobil—and this was then followed by the nationalisation of the fertiliser industry. By the end of 1969 the state controlled 57.5 per cent of the pipeline network, 56 per cent of exploration and refining and all domestic distribution facilities. But, at that time, it controlled only 25 per cent of production. This latter figure was raised in June, 1970, by the nationalisation of the non-French foreign companies. Even then, two-thirds of production remained in the hands of French corporations.

The story of Franco-Algerian relations between the signing of agreements on the exploitation of Algerian oil and gas in July, 1965, and the crisis of February, 1971, is long, complicated and punctuated by accusations and recriminations. In brief, the Algerians came to believe that the French were not spending enough on exploration and were limiting production to suit the economic interests of France while at the same time they were benefiting from financial concessions on royalties and taxes. Negotiations to modify the 1965 agreements dragged on for almost two years until on February 24, 1971, the Algerian government lost patience and announced that it had raised its participation in all French oil companies to 51 per cent and had nationalised the natural gas fields and all pipelines on national territory. On April 12, 1971, the government raised the posted prices of Algerian oil to the level agreed at the Tripoli conference of April 2nd and brought the tax system into line with that operated by the Organisation of Petroleum Exporting Countries.

The French accused the Algerians of breaking the 1965 agreement by acting while negotiations were going on. They placed an embargo on Algerian oil. It was met by an Algerian embargo on French imports. In order to preserve foreign exchange and offset the effects of the oil embargo the Algerians were called upon by the government to face a year of austerity. The import of a great deal of the capital equipment needed for the industrialisation programme was delayed and for once the inefficiency and obstinacy of the Algerian customs department, served some purpose, if only a political one. Algerian oil production fell by two-thirds and it was not until the end of last year when agreement with the second of the two major French groups was finally reached, that the former production rate of 50m tons a year was fully restored. The Algerians claim that the financial loss incurred has been made up by the higher prices.

The pattern of 51 per cent Algerian participation now having been established (it was the basis of an agreement with Getty for exploration and production signed in 1968), the Algerian government, through the state-owned company Sonatrach, is hoping to attract other foreign partners. One of the snags is Sonatrach's own organisation. It is both large and over-centralised. So it places too much responsibility over too wide a field on the men at the top—young and able as some of them are. This problem may be eventually overcome as more administrators of high calibre fill the lower echelons, but foreign contractors and technicians are being driven crazy by avoidable delays in decision-making.

Sonatrach's expansion programme is breathtakingly ambitious. In 1971 its investment costs amounted to around 2.5 billion dinar ($580m, £214m) and are expected to rise by 30 per cent this year if the American Federal Power Commission approves the Sonatrach-El Paso deal, which in its first stages involves the import of 10 billion cubic metres of Algerian natural gas a year. This will call for the construction of another liquefaction plant and terminal at Arzew, and five compressor stations to boost the capacity of the new gas pipeline. The present Arzew liquefaction plant, the world's first, supplies Great Britain and France. Another liquefaction plant which will have an ultimate capacity of 6 billion cubic metres is being built at Skikda. The Hassi R'Mel gas pipeline is already completed. A liquid petroleum gas line is being laid from Hassi Massaoud through Hassi R'Mel to Arzew and two extraction plants for propane and butane are under construction at Hassi Massaoud. A gas separation plant and terminal at Arzew should be ready this year.

The 2.5m-ton refinery at Arzew should be producing in September and tenders have been requested for a refinery twice its size at Skikda. In 1975 the Skikda petrochemical complex is expected to be operating and this will supply the raw materials for a plastics industry at Sifta. The Arzew fertiliser plant comes into full production this year. A phosphate fertiliser plant is planned for Annaba. In all, Algeria has an abundance of oil and natural gas to exploit. It has the will to do so. But has it, as yet, enough administrators and technicians to make the best use of its chances?

Headlong development

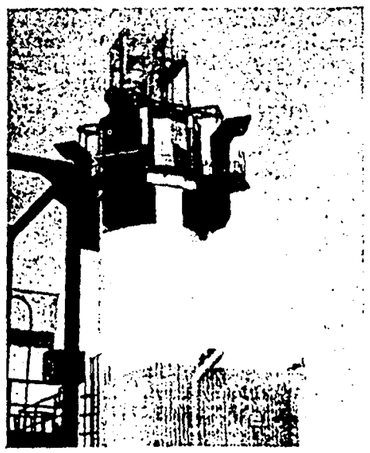
The dispute between Algeria and France over oil has thrown the current four-year development plan awry. The 9 per cent cumulative annual increase in gnp envisaged in this plan was not reached last year: it was nearer 6 per cent. Nevertheless, the Algerians still hope that this year 94 development projects will come into production. Of the 28 billion dinars ($6.2 billion) devoted to development investment between 1969 and 1973, 45 per cent is allotted to industry, excluding the hydrocarbon industries, and 15 per cent is going to agriculture and 12 per cent to education and training.

Obviously, such an investment programme calls for the import of materials and equipment on a vast scale, but even during the French embargo on Algerian oil last year the government claims its foreign exchange reserves never fell below $300m. Although exports—and hydrocarbons make up 75 per cent of their value—are expected to rise by 55 per cent from 1969 to the end of 1973, the trade gap will still be about $1,000m at the end of this period. But it should be covered by the remittances of the 700,000 Algerians working abroad (600,000 of them in France) and the credits extended by the exporting countries.

The largest, most ambitious and most controversial industrial project is the El Hadjar steelworks. It was originally conceived on a fairly modest scale but when it was realised that the investment outlay per ton of steel produced would be double that of any other

comparable steelworks it was decided that the works should be greatly increased in size and capacity. This has meant delay. The foundry started in 1969 but the two oxygen-converters and the hot-rolling mill will not be functioning until later this year. At the first stage 400,000 tons of crude steel will be produced a year but eventually, with a third converter, a production of 1.4m tons is envisaged. Domestic consumption of steel has risen from 120,000 tons in 1965 to 550,000 tons last year, a third of which was needed for oil and gas pipelines. But if steel production approaches capacity export markets will have to be found—and this may be difficult. Studies have been made on the feasibility of processing alloy steel, a product needed among other things for vehicle engines.

The Algerians are determined to establish their own car industry. Negotiations with Renault fell through during the oil crisis but the Algerian government says that both west German and Italian firms are interested in setting up a plant. Some observers believe this exhibition of national pride to be foolhardy and doubt whether Algeria will be able to produce enough components to make an all-Algerian car. At Constantine the west German firm, Deutz, is building a tractor and small engine factory and a motorcycle and bicycle plant is going up at Guelma. The Renault assembly plant closed down last year amid mutual recriminations: the Algerians accused Renault of not paying the agreed import duties and Renault said that the plant was impossible to operate as the Algerians refused to give the necessary import licences. However, Berliet continues to assemble its own trucks at the rate of 4,500 a year.



The construction and building material industries are growing rapidly and cement, which was exported until 1969, now has to be imported. Two cement works are under construction and by the end of 1973 the industry should be able to supply the 2m tons required. A great deal of money is also being invested in mining. Several mines closed by the French have been reopened, and a systematic survey is being carried out of the whole country. Hope still lingers that there will be a uranium find. Zinc, copper, lead, phosphate and koalic as well as iron ore are now being mined and a new zinc plant is under construction at Ghazaout. The textile and food processing industries are expected to get a higher investment priority in the next plan, but in both these fields private enterprise still predominates.

The private industrialist is the most nervous individual in Algeria today. He fears that even if the government does not nationalise his enterprise he will be squeezed out by other means so as to leave the field open for publicly owned concerns. The government maintains that there is a place for private enterprise in the non-basic industries and indeed recognises that competition does something to keep the public sector on its toes. But there are occasional barbed comments in the controlled press, for instance about the private sector being able to manufacture at lower prices because it does not spend so much on research. Such comments do nothing to encourage the private investor to extend his operations. In all, the private sector is small: 80 per cent of the non-hydrocarbon industry is owned and managed by the government.

Foreign firms are deeply involved in the development programme. Their operations are, in the main, on a turnkey basis. They plan, build and equip the plant, factory or pipeline and help train the Algerians to operate it. They pull out when the operation can be left entirely to the Algerians. Apart from the El Hadjar steelworks, which is being constructed by the Russians (the Italians are putting in the hot-rolling mills and the Austrians the cold), the major contracts have gone to Japanese, American, German, British, Italian, French and Austrian firms, for advanced technology carries greater weight in Algeria than any political considerations.

The 1971 row with France has opened the door further for foreign exporters. In 1967 80 per cent of Algerian trade was with France. It had been reduced to about 45 per cent by 1970 and next year may be down to about 30 per cent. Although the British share in the industrialisation programme is far below that taken by the Americans, Germans and Italians, trade between Britain and Algeria has expanded rapidly since 1968 and in 1971 it was 70 per cent up on the previous year.

Foreign contractors, including British ones, cannot but be interested in the pace of economic development that the Algerians are hoping to achieve. But, like some Algerians themselves, they must wonder whether too much is being planned and done too quickly. It is easy to trip over one's own feet if one runs at a headlong pace, particularly when the whole economic apparatus is so rigidly controlled.

Tunisia

One man's country

Modern Tunisia is the creation of one man—its president, Habib Bourguiba. He remains, as he has been since the days of independence almost 15 years ago, both the centre of power and the source of his people's inspiration. He has literally talked the Tunisians into becoming the most socially advanced people in north Africa. He may no longer storm through the towns and villages as he once did, inveighing against archaic customs, and, by sheer force of oratory, persuading the people to change their habits and attitudes ; but despite two long and serious illnesses he has retained the reins of power firmly in his own hands.

Bourguiba's ideas and policies are not easily pinned down. His approach to both internal and international problems is usually realistic and pragmatic. He defied the entire Arab world by withdrawing from the Arab League for five years: He risked a total break with France in attacking Bizerta in 1961 and nationalising all French-owned land in 1964. Overnight, in 1969, he switched the country's economic policy from state intervention and forcible collectivisation to the encouragement of the private sector. He has doggedly refused to listen to some of his closest colleagues, who believe the time has come for more democratic procedures in his Destour Socialist party and the country. At the last party congress he flouted majority opinion by appointing his own yes-men to the party's executive committee rather than the more liberal choices of the congress.

So the nagging worry at the back of many Tunisian minds is whether the country's stability will survive when the president is eventually forced to step down. Mr Bourguiba has made it known that he wants the present prime minister, Mr Hedi Nouira, to be his successor. The party has shown that it prefers either the former prime minister, Mr Bahi Ladgham, whom the president sacked in November, 1970, or Mr Ahmed Mestiri, a former minister, who has now been suspended from the party for daring to challenge the president at the congress.

The European visitor to Tunisia may feel more at home there than in any other Arab country—with the possible exception of Lebanon. Tunisians have a natural charm, a relaxed attitude to foreigners and an easy-going approach to life. The effects of one of the early presidential reforms, which gave women equal status with men, and the president's own personal dedication to the aim of allowing Tunisian women to play a full part in the country's life are very noticeable. Few women in the towns are veiled. Almost as many girls as boys are at school ; and the girls no longer hesitate to be trained as teachers, nurses, secretaries and machine-operators. This is part and parcel of the plan to educate all Tunisian children, which has involved massive expenditures on school-building and teacher-training. Over half the Tunisian population is under 20 years old. A third of the state budget is devoted to education and a deliberate decision has been taken to save on military expenditure. Mr Bourguiba's aim is to give Tunisia a fully literate population with skills enough to raise both agricultural and industrial production. He decided that this could be done only through a strong government and a single political party devoted to the task. Through the strength of his personality Mr Bourguiba persuaded the mass of his people that his aim of "human betterment" could be fulfilled only by sacrificing such luxuries as a multi-party system, western-style democracy and a liberal economic policy. But two years ago the people showed that there was a point beyond which they could not be persuaded to go.

Bourguiba's children's crusade

The man at the centre of this particular storm was the exceptionally able Ahmed Ben Salah, who held the ministries of planning, economics, finance and education. Since 1961 he had been the most forceful and powerful of Mr Bourguiba's ministers. He convinced the president that the country's productivity could be greatly increased by "rationalising" the economy through collectivisation of both farming and commerce. The president agreed and the party apparatus took in hand the task of persuading farmers and shopkeepers to join state co-operatives. Any resistance was met by strong-arm methods. This in turn was met by farmers killing their stock and ceasing to cultivate their land rather than give up their property and become state-paid labourers. There were many ugly incidents throughout the country and the mood of revolt became so strong that the government's nerve cracked. In 1969, Mr Ahmed Ben Salah was sacked, arrested, tried and sentenced to 10 years' imprisonment for misleading the president and putting the country on the road to ruin. While that possibly unfortunate minister paid the price of the president's and, indeed, the whole government's error, Mr Bourguiba agreed that the process towards state ownership should be reversed and that private enterprise should be given a greater freedom than at any time since independence. State marketing monopolies were disbanded ; farms, shops and cafés were returned to their owners ; and private investors, both Tunisian and foreign, are now being encouraged to take a stake in Tunisian enterprises, especially in light industry and the tourist business. But the government continues to control the major industries, land taken over from foreign owners and about 40 per cent of the banking and insurance business.

With a population of just over 5m, of whom 1.2m are at school, Tunisia has a limited domestic market. The population keeps on growing even though an energetic family planning campaign—which, thanks to the president, has the support of religious leaders—has reduced the increase in the birth-rate from 3.4 per cent to a more modest 2.6 per cent. (Emigration brought down the actual increase last year to 2.2 per cent.) Out of the working force of 1.1m men and 300,000 women, of whom over half work on the land, more than 350,000 are either without work or underemployed. Yet, in contrast with Morocco, agriculture provides only 10 per cent of the gnp. But with only one all-year-round river, the Medjerda in the north, agriculture is constrained for lack of easily obtainable water. Collectivisation gave it a severe knock and the floods of 1969 another. Up to 1968 Tunisia could export both meat and wheat. Today it has to import both.

Tunisia has never had difficulty in getting foreign aid. It receives more per head than any other country, but annual repayments now absorb more than a quarter of its own export earnings. In all its undertakings Tunisia has somehow to balance the need for efficiency and viability—the watchwords of Mr Nouira—and the social needs of its people. State industries are lavishly overstaffed ; but to prune the labour force would be to swell the ranks of the unemployed. Tunisia's planners accept that the country must live with a higher percentage of unemployed than could be tolerated in Europe—the extended family system of the Arab world ensures that few actually go hungry—and estimate that 23 per cent of the gnp would have to be invested just to provide work for the new arrivals on the labour market. Even so, the provision of more jobs is the basis of all future planning.

Beating a retreat

Apart from the mining of phosphates and mineral ores, the French established little industry in Tunisia in the years of their rule. The country was regarded as a colonial sub-region, destined to export its raw materials and to import its manufactured goods from France. In the first flush of independence, an enthusiastic determination to change this image swamped careful economic calculations. The state set to with a will to create major industries—a steel plant, oil refinery, a phosphate complex, a paper factory and sugar refineries. It also set up textile, cement and foodstuff industries and car assembly plants. More sensibly, perhaps, it began to lay the foundations for tourism.

The weakness of the Tunisian industrial sector, now freely admitted by the government, is that it has been designed to satisfy the home market by providing substitutes for imported products. Protected by tariffs and enjoying a near monopoly in each field, the new industries have been cosseted. No spur has been applied to improve efficiency and to cut production costs. The point has now been reached where the small domestic market is saturated with Tunisian manufactured products and if there is to be any further expansion it will have to be into markets overseas. So the government is relaxing its formerly tight exchange controls and import restrictions and it is preparing new investment codes so as to encourage domestic industries to look abroad for custom and to induce foreign companies to enter Tunisia to manufacture or assemble products entirely for export. At the same time, it is disengaging itself from the textile and tourist industries, which it wants to leave to private enterprise. Its apparent intention is to own and manage only the basic industries connected with mining and energy. It is, in fact, retreating from state socialism with drums beating and colours flying.

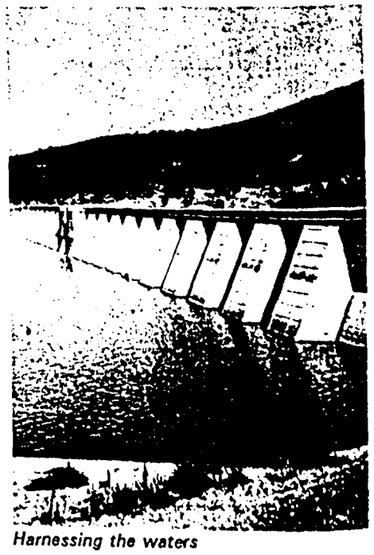
The government does not even intend to ask for a shareholding in new industrial ventures. There has already been some response from overseas investors, with American and German companies setting up clothing factories. Like the Moroccans, the Tunisians hope that their association with the EEC countries will act as an inducement for manufacturers to take advantage of the low cost of Tunisian labour for manufacturing and assembling products which require a big force of workers. They foresee possibilities in this direction, for example, for the electronics industry.

Future plans for extending Tunisian industry are limited to the expansion of what already exists—oil refining, chemicals and cement. Oil was first found in 1964 at El Borma on the Algerian frontier. Production started two years later and this field and another small field at Douleb now produce 4.1m tons a year. The El Borma find created some difficulties with Algeria, which claimed the field as its own, but finally the matter was settled in January, 1970, with an agreement that each country should exploit that part of the field within its own frontiers. The Algerian oil is taken by the French-owned La Trapsa pipeline to the Tunisian port of Skirra, but the Algerians plan to construct their own pipeline and take it through Hassi Messaoud to Skikda.

The Tunisian refinery at Bizerta is jointly owned with Eni, the Italian company which is also involved at El Borma. It was originally constructed in 1961 to refine oil from the Gulf but it now processes 1m tons of Tunisian crude oil, just sufficient to meet domestic demand. The rest of the crude oil is Tunisia's largest export. But it has now been decided to build a second refinery with a capacity of 1.3m tons. Its products will be exported and negotiations have already begun with French and Italian oil companies. At the same time, new explorations have yielded encouraging results. An off-shore field in the south promises to produce between 1m and 2m tons and 500,000 tons are likely to come from a land strike near Sfax. These finds should eventually make an important contribution to Tunisia's foreign exchange earnings.

Heavy investment in equipment for the phosphate mines is expected to

Textiles : one of the substitutes



raise production from the current 3m tons a year to 5in tons in 1975. The Tunisian phosphate is inferior in quality to the Moroccan and export markets are therefore easier if the phosphates are transformed into other chemicals. The chemical industry, now centred at Sfax with a phosphoric acid plant and superphosphate plant, is to be expanded, with another superphosphate plant being built at Gabes. When it comes into operation, Tunisia will transform 1.3m tons of its own phosphates.

The two cement factories, which until 1971 provided a good quantity of cement for export, are now only just meeting the domestic requirement of 600,000 tons a year. So a third is to be constructed with a capacity of 400,000 tons. The El Fouladh steelworks at Menzel-Bourguiba outside Bizerta is still a cause of pride among Tunisians, as it was the first integrated steel plant in the Maghreb ; but the planners now admit that it might have been better had it never been built. Using Tunisian ore it turns out about 80,000 tons of reinforcing steel bars a year, more than Tunisia needs and at a greater cost than European products. All the coke for the furnaces has to be imported. One day, it might become part of an integrated steel industry in the Maghreb ; but until that day does dawn it will remain a white elephant.

Olive oil exports are third in importance to the Tunisian economy after crude oil and phosphates, and the 1972 crop is expected to reach a record 140,000 tons. The tourist industry, which is discussed elsewhere, offers great promise and allied to it are local craft industries. A national craft bureau has helped restore the old high standards of Tunisian craftwork and to revive private workshops throughout the country. About 112,000 people are now employed in various forms of craftwork from carpet-weaving, ceramics and leatherwork to basket-making and silverwork. Sales would be higher if prices were lower but these crafts are still subject to a special tax designed to cover the cost of the original investment in setting up the local craft centres.

This year's prospects look good. Last year Tunisia's gnp rose by 7.9 per cent, after a rate of less than 4 per cent a year in the previous decade, and the hope now is that it will rise by 8-11 per cent. The about turn in government policy from a tightly controlled economy to a more liberal approach has begun to pay off. The lines of state intervention have been drawn anew and the farmer, the businessman and the potential investor can be easier in their minds about the future.

Investment plans for the next decade will call for a mounting figure of foreign loans and credits. Tunisian charm, the persuasiveness of the itinerant foreign minister, the country's stability and the retreat from state socialism make it unlikely that Tunisia will experience all that much difficulty in getting what it needs.

Harnessing the waters

Agriculture

A long, slow job

When the Maghreb countries became independent the first thing they had to do was to reorganise their agriculture. Each, to some degree, had been treated as a French kitchen garden. French settlers took over the best land and they grew the crops that France needed—cereals, wine and, later, citrus fruits. Over 75 per cent of the population lived in the rural areas and depended on the land for their living. The peasants were poor and illiterate. The majority of them owned no land of their own. When the French left, agricultural production fell and the increase in population outpaced any improvement in output. Yet agricultural products were the base of each country's exports. Most of the land was unirrigated and the crops were dependent on rainfall. So a year of drought was a body-blow to the whole economy.

Each country is aiming to increase production and to change over to crops suitable for home consumption and for export. So natural water resources have to be harnessed for irrigation ; sugar-beet and soft-grain cereals for bread have to be grown. It also means that the dairy industry has to be developed and that advantage has to be taken of the early spring and warm autumns to grow vegetables and soft fruits for export. All this requires massive investment in dams and irrigation schemes, in fertilisers and agricultural machinery, in research and above all in educating the farmer to use new methods of working his land.

Morocco's current four-year plan gives top priority to agriculture with investments totalling more than 2.5 billion dirhams ($540m ; £200m). The bulk of the money is going on dam-building and the construction of hundreds of miles of concrete piping to carry the water to previously dry sectors. By the end of this year 22 dams should have been completed. It will take time before the fruits of this investment are ripe, but there has already been an impressive increase in sugar-beet production. It is, however, easier to build a dam than to teach farmers how to use irrigated land. There is a good deal of criticism in Morocco about the fact that the land being irrigated is largely owned by the big landowners who acquired their farms from the French. The distribution of formerly French-owned land among the peasant farmers is one of the government's declared aims, but it has come to little in practice. Last year troops were called out to quell a riot by peasants in the Gharb valley when land which they thought was being allotted to them went to an absentee landlord instead.

One of the first promises made by the Ben Bella government in Algeria was that there would be a radical agrarian reform. It took nine years for it to appear—in January, 1972. The Boumedienne government's proposals are grandly entitled the Agrarian Revolution. They envisage substantial investments not only directly in agriculture but in the improvement of the standard of living throughout the countryside. But, undoubtedly, its most important proposal concerns land reform. The basic idea is a somewhat surprising one for a country so wedded to socialism. It is that the land should be given to the families which work it.

The Economist employs an expert corps of foreign affairs writers, in London and abroad; but some stories produced by the paper's foreign department cannot be published in The Economist itself. Instead, they appear in a separate, confidential bulletin published each week and called *Foreign Report*. Such stories are of two kinds. There is the information that reaches The Economist on a confidential basis, and therefore can be passed on only to readers willing to respect the confidential nature of *Foreign Report*. And there is the article that focuses attention on an apparently minor, but pivotal, event that could lead to major changes. In this kind of forecast *Foreign Report* has a record of often being startlingly right. The annual subscription rate, which includes a biannual 8-page index, is: United Kingdom £15.50: Europe £16.50: Rest of world £17.70 (US $47.50). The *Foreign Report binder* (10½" × 6¾"), covered in black leather cloth with a reinforced spine embossed in gold and red, costs £1.25 (US $3.50) including surface mail postage.

The oases, too, are being developed

To provide the small farmers with land, the big landlords, the absentee landowners and the state itself will give up what they now own. The new, small landowners will be organised into co-operatives through which they will purchase machinery, seeds and fertilisers and sell their produce. The self-managed farms, which were taken over by the workers when the French left, will remain as they are.

The Algerian government is embarking on several research programmes for which it hopes to get the benefit of American, Canadian and Australian experience. It wants to find out what seeds, fertilisers and cattle will do best on the dry Algerian soil. It is also developing vegetable-growing in the Saharan oases. Over the past two years 15m tons of vegetables were grown in the Sahara for export and the effects of this new source of income on the lives of the inhabitants have been more important than the foreign currency earned. Mexican-type wheat seed is now being widely used and it is estimated that the country will be self-supporting in cereals by 1982. Many of the vineyards are being turned over to cereals now the French have stopped their huge purchases of Algerian wine. However, the development of a dairy industry is at a very early stage.

Tunisia, by contrast, has first-class dairy herds in the valley of the river Medjerda and makes butter and cheeses of the camembert type indistinguishable from what can be got in France. The valley is the main irrigated area, given over to model farming of all kinds. Elsewhere much energy and money has been devoted to sinking wells. Agricultural production has been rising since 1969 when the experiment in forcing farmers to join co-operatives was abandoned. But other factors such as the wider use of fertilisers, credits for small farmers, better seed and the growth of the agricultural advisory service, which now has 70 engineers and 500 technicians touring the country, have played their part. But the Tunisians face the same basic problem as the Moroccans—and the Algerians will have to face it too. This is the inborn resistance of the small farmer to any change in his traditional methods. It will be a long, slow job to get the farmers of the Maghreb to go in for intensive cultivation.

Both Morocco and Algeria have unusual schemes to help the countryside. In Morocco roadbuilding and irrigation work is offered to unemployed or underemployed men, who are then paid half in cash and half in flour supplied by the United States for the purpose. In Algeria all army conscripts, after six months' military training, spend 18 months doing work to benefit the countryside. The majority, who are unskilled, work on construction projects with picks and shovels, but the skilled and professional men are sent to work where they are most needed. So doctors and dentists spend 18 months in the country villages ; university graduates may find themselves in local administration offices or at desks in one of the state companies ; and technicians may go back to the job they were doing before—but at army rates of pay. One motive behind the scheme is to make every Algerian feel he is involved in the country's race for development.

Education

Tomorrow's men

In their development plans all three countries of the Maghreb place tremendous emphasis on education and vocational training. They all take pride in their successes and they all like to cite figures to show how much they are spending on their young people. Both Tunisia and Algeria claim to spend a third of their budgets on education and Morocco a quarter. Tunisia prides itself on devoting 55 per cent of its development budget to education, health and social affairs and the Algerians think that they are doing well in allocating 40 per cent to education and welfare. In fact, as developing countries, they had no alternative but to allot a high proportion of their national resources to these purposes.

Morocco, with a population of 15.5m, now has 1.2m children in primary schools, 300,000 at secondary schools, 7,000 in technical schools and 14,000 at the university. Tunisia, with a population of only just over 5m, has 1.2m young people at school, college or university, which represents 80 per cent of the 6 to 20 age group. Algeria, with a population of 14.7m, started later and with less on which to build. But it now has about 2m children in primary schools, 300,000 in secondary schools and 22,000 in its three universities and higher education centres. Ten years ago the figures were 300,000, 35,000 and 1,000 respectively.

The construction of new schools and the like has always been a heavy task (Algeria, for example, is still building 11 secondary schools a year at the cost of £1m each) ; but the most crucial problem is to provide enough teachers. The French have waded in to help, so that today in Morocco there are 7,500 French teachers, in Tunisia 3,500 and in Algeria 4,300. Algeria alone has looked farther afield and employs about 5,000 teachers from Middle Eastern countries. Morocco and Tunisia have preferred to keep the education of their young out of the hands of their fellow Arabs. But all three countries are intent on providing their own national teachers as quickly as possible and students who go in for teacher-training receive bigger grants.

For the moment, however, education still turns on the presence of French teachers. This gets in the way of another aim : to make Arabic the language of the schools in all three countries. The Moroccans set about this process far too hastily by teaching only Arabic in the primary schools. They then found that pupils had to begin to learn French when they entered secondary school. Now it has become an established practice in each country that primary school pupils begin to learn French after two years at school so that they are equipped to study under French teachers when they move on to the secondary schools. Certain secondary school and university subjects are already being taught in Arabic and eventually the hope is that the whole curriculum will be.

In each country there is now an unsatisfied thirst for learning English. The classes that are available are booked out well in advance. The Algerian government, particularly, is keen to encourage young people to learn a language other than French, and some ministers openly express their wish to see English become Algeria's second language. It hopes that the British Government will give help to establish a large English language institute in Algiers. Since trade to some extent follows language it could be a worthwhile investment.

As well as inheriting French as a second language, all three countries have inherited the French baccalaureat educational system. The emphasis this philosophy of education places on building up a "whole man" and its requirement that university entrants pass the baccalaureat before specialising may be admirable for France ; and it certainly was in tune with the original idea of creating a small Moslem elite in the North African protectorates. But this system is a luxury the Maghreb countries cannot yet afford. They do need professional men with a wide general education but they also need technicians for industry and agriculture who need to specialise early in their educational career.

The Algerians already allow certain students to enter the scientific faculties at the universities by special examination and in each country there are technical institutes and trade schools in which boys specialise before they have completed the full secondary school cycle and passed the baccalaureat. The Algerian government offers higher grants to students entering the scientific faculties and already half the Algerian university students are studying the sciences. The eventual aim is to raise this proportion to 75 per cent. The Moroccan government, less generous with grants than the others, offers scholarships only to science students and those training to be teachers. But higher education will get a boost when the American university to be established at Tangier starts up.

The drop-out rate from the educational system is highest in Morocco. The reason is largely financial, for, although attendance at classes is free, all books have to be paid for and this is too great a burden for many families when their children get to secondary school. In Algeria books are hired at the cost of one dinar (8½p) per book per year and grants are also made for school clothing. If a boy has the ability to carry on, the state will provide the means. It needs every trained man it can produce. All those at university are supported. Tunisia, too, is generous. It grants some form of financial help to 30,000 schoolchildren and students and 65 per cent of the students at university are there on scholarships. As a result, Tunisia can now claim that 30 per cent of its population is literate.

Tunisia has done more than the others in providing education for women. It has a higher proportion of girls in the schools than either Morocco or Algeria and it is making rapid strides in teaching the country's women about home hygiene and child care. This is linked to a family planning campaign that has the full backing of the religious leaders in Tunisia. Advice, contraceptive devices and, in certain cases, abortions are free.

The Moroccan government also officially supports family planning and it fully recognises the need to limit the rise in the birth-rate. But religious leaders in Morocco are still reluctant to lend their support. The Algerians alone have hesitated to make family planning a matter of policy. President Boumedienne, a bachelor and, reputedly, a staunch believer, has given no lead. It must be left, he says, to each individual. In fact, the Algerians seem to be clinging to the belief that their economic programme of full-scale industrialisation will require further growth in the population. All Algerian girls can attend school as freely as their brothers ; but when there are not enough places it is the girls who have to give way to the boys. Eventually, Algerian women will play as full a part in the national life as Tunisian women do now, but the process will be slower. Today, they still largely confine themselves to their houses and hide behind their veils. That has something to do with Moslem conservatism and a natural desire, strengthened during the French occupation, to retain Moslem culture and customs ; but it is also a fact that President Boumedienne has not shown the same active interest in the future role of women as has President Bourguiba of Tunisia.

It all begins in the kindergarten

Tourism

Space in the sun

The countries of the Maghreb have one invaluable asset—space in the sun. Two of them, Morocco and Tunisia, are putting a lot of effort and cash into exploiting it. They want the foreign tourists because they so badly need the foreign exchange they bring. The tourists also create abundant work. For every two new hotel beds one extra pair of hands is needed. Algeria wants tourists too but is not pushing so hard for them because its need for foreign currency is less.

Yet despite everything that has been done in Morocco and Tunisia in building hotels and tourist villages the tourist centres are no more than a few specks on the Maghreb's 2,300-mile coastline. There is room for infinite expansion and no fear—as there is in Europe—of the supply of waiters, cooks, counter-clerks and bellboys drying up. And the Maghreb has a lot more to offer than sun, sea and beaches for the summer visitors. For the winter there are warm desert regions with luxury oasis hotels ; skiing in the High Atlas ; hunting and shooting ; even swimming in southern Morocco. In each country there are fine Islamic cities and Roman sites well worth visiting. But the national tourist offices should stamp firmly on foreign travel agents who promise winter sun in the Mediterranean resorts from Tangiers to Tunis. These resorts, it is true, have their warm, sunny days in the winter but it is just as likely to be wet and windy.

While all three governments are keen in differing degrees to attract the tourists, they are also anxious to preserve the character of their ancient cities. Western tourists out to enjoy themselves tend to import a way of life that is perhaps even more permissive than they would live at home. Inevitably, this creates tensions in a society with different customs and a more rigid code of conduct. One Moroccan eye is on the tourists' pockets : the other is on the morals of its own youth.

The Moroccans and Tunisians work hard to provide the sort of entertainment that Europeans expect—discotheques, night-clubs and cabarets featuring national dancing and singing. But café life sometimes lacks colour because the evening turn-out is almost exclusively male. The young men in the tourist areas mix readily with the visitors because they find that certain European women—even some twice their age—are not averse to their company and favours. They also know that some western men can be similarly enticed by youthful charm. What these young men have still to learn is that the majority of the tourists are not particularly interested in their physical attributes and greatly dislike being pestered on the beaches and in the streets.

Bargaining over price in the Arab souks is part of the way of life, but

Still-life in Morocco

Strong-arm tactics

the traders in Morocco and Tunisia who clamour to sell their craftware to the tourists are in danger of killing the goose. It has become an almost established practice for them to ask about three times the real value for any article and many a tourist turns away empty-handed, wearied by the long, hot process of haggling. Even when he gives in and hands over the money, he goes away with an uneasy feeling that he has been cheated. More government-run craft shops in the main tourist centres with clearly marked, non-negotiable and reasonable prices might deter the stallholders from gross profiteering.

Morocco and Tunisia can claim to have succeeded in putting themselves on the world's tourist map. In both countries the state led the way by providing the necessary infrastructure and by building and managing hotels. Both governments are now attempting to induce both domestic and foreign concerns to take the lead in investment by offering them grants and favourable credits. In Tunisia the government, together with international and foreign banking and commercial interests, has created a company, Cofitour, which aims to expand the tourist industry by giving investors financial and technical help. In Morocco the government acts in much the same way through the investment banks.

The Moroccans hope to reach the magic figure of 1m tourists in a year at the end of this year. The 2m figure they reckon should be reached in 1977. The cholera scare in Spain and the July events at Skirat plainly had some effect

on the 1971 figures as the increase over the previous year was nowhere near the 20 per cent recorded in 1970. Nevertheless, total tourist receipts were appreciably higher, amounting to nearly $70m. The present four-year plan calls for a total investment of $360m and the addition of nearly 15,000 beds.

The Tunisians have set themselves a more modest target—1.5m tourists by 1980, which is just 1m more than came last year. Although in both Morocco and Tunisia the majority of the hotels are in the luxury class, the bulk of the tourists arrive on cut-price package tours. (In Tunisia only 20 per cent pay the full rate for bed and board.) Although the hotel owners welcome the chance to keep their hotels open during the winter the extremely low winter rates forced on them by tour-operators are worrying the governments, for unless the hotels have a reasonable profit potential investors will be scared away. The future trend will almost certainly be to build more hotels in the middle price range, coupled with greater efforts to encourage individual tourists by emphasising that Morocco and Tunisia have more to offer than the beaches frequented by the package crowd. The Tunisians should also consider some tax concessions for car-hire firms (hire-cars are now prohibitively expensive) and some relaxation in currency restrictions for tourists.

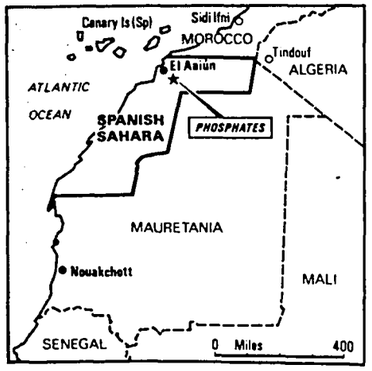
The Algerians have not entirely ignored their tourist industry, but it comes well below pipelines, factories, schools and hospitals in their planning priorities. In 1967 it was decided to create 16,000 beds by 1970 and a further 9,000 by the end of 1973, giving a total of 35,000. The seaside tourist centres are near Algiers and on the Tunisian and Moroccan frontiers (which gives tourists in either of the neighbouring countries the chance to sample Algeria as well). But prices are very high. Algerian wages and social security contributions are far higher than in Tunisia and Morocco and imported food and drink are extremely expensive. Some Algerians take the moral view that tourists from developed countries should not expect to holiday in underdeveloped countries at far less expense than they could at home. But they may possibly be underestimating the general usefulness of welcoming foreign visitors to their shores. It is only through such visitors that a country gets itself known as a place with nothing to hide—and an attractive place to be in.

Not quite in step

The countries of the Maghreb do not speak with a common voice either on the Arab-Israeli conflict or on broader matters of foreign policy. Although their distant and recent pasts have been so much alike, the differences in their political structures and in the personalities of their heads of state make it impossible for them to do so.

King Hassan of Morocco, as a descendant of the Prophet and the religious leader of his people, is deeply committed to the Arab cause since, in his eyes, it is the cause of Islam. Yet, of all the Arab countries, Morocco has taken the most care to observe the Islamic tradition of protecting minorities. In the second world war Mohammed V, for example, refused to implement the anti-Jewish policies of the Vichy government and it may be no coincidence that when an anti-corruption drive got under way in Morocco last September the Jews alleged to be involved were out of the country. Naturally enough, King Hassan feels closest to his fellow Arab monarchs and his sympathies in the struggle between the Palestinians and Jordan lie firmly with King Hussein. Inevitably, too, he sides with the more traditional, conservative regimes in inter-Arab quarrels.

President Bourguiba has refused to let himself and his countrymen be blinded to reality by being part of the Arab world. Consistently he has told his fellow Arabs that Israel exists and that it will continue to do so. So he has urged them to come to terms with



Which way will Morocco march ?

the facts. He refused to follow meekly in President Nasser's wake, taking Tunisia out of the Arab League for five years. Both the Tunisian president and King Hassan are bound to keep a weather-eye on their relations with the United States, for they both depend greatly on its aid. But President Bourguiba took the risk of offending his patron by refusing to support the Americans in the United Nations vote on China.

From the day of their independence the Algerians have deliberately put themselves, and consciously seen themselves as being, in the vanguard of the world's "liberation" movements. Ben Bella appeared to see himself as the Fidel Castro of Africa, touring the socialist countries to receive their acclaim and elicit their aid while feeding his people with revolutionary slogans. President Boumedienne's style is different but Algeria's proclaimed desire to help all people struggling for independence against colonialist powers remains unaltered. In that, the Algerians are the creatures of their own bitter past,

So they see the Palestinians as fighting for the liberation of their homeland. This is the crux of the Algerian attitude to the Middle East crisis : unless Egypt, and Israel's other Arab neighbours, are to support the Palestinians to the hilt, the Algerians want no part in what they regard as half-measures, such as getting the Israelis out of Sinai. This attitude does not go down well in Cairo or Damascus. Nor is it entirely accepted at its face value by the Palestinians themselves, for they suspect it is a device for the Algerians to do nothing while they concentrate on their own economic development programme. The Algerian government's support for Pakistan over the Bangladesh issue is another example of where its priorities lie. The Algerians saw the dispute as a matter of altering a state's accepted frontiers and not as an issue of 10m refugees wanting to return to their homes. The Palestinians will have noted this.

Above all else, the Algerians wish to preserve stability in the Maghreb. So it comes as no surprise that President Boumedienne was among the first to congratulate King Hassan on his escape from assassination. The Algerian government is determined to prevent any repetition of the 1963 frontier war with Morocco, though it is uneasily aware that the seeds for further dis-

agreement with that country already lie scattered on the soil of the Spanish Sahara. Morocco claims this territory as its own. It does not want to see the phosphate deposits there—a potential source of keen competition with its own phosphate industry—in any other hands. At the same time, the Mauretanians do not want to see the Spanish Sahara incorporated into Morocco, thus bringing the Moroccan army down along their own border. The Algerians are also anxious that Morocco should be kept out and suggest the 40,000 nomads living there should determine their own future. The Spanish indicated in 1967 that they agreed to a UN proposal that a referendum should be held, but since then they have said nothing and have continued to develop the phosphate mines. But in January the Spanish foreign minister, Sr Lopéz Bravo, made a sudden visit to the Mauretanian president. The Algerians, who have ideas of gas pipelines running from their gasfields through Morocco and Spain into Europe, want to offend no one and are determined to play it cool.

Despite all the signs that President Boumedienne's foreign policy is primarily directed to keeping Algeria clear of entanglements while it concentrates on economic development, the Moroccans remain suspicious and wary of their neighbour. They were particularly worried when Algeria turned to the Soviet Union to equip and train its armed forces after their poor showing in the 1963 frontier war. In turn, King Hassan looked to the French and Americans to strengthen his armed forces. Today, it is estimated the Moroccan and Algerian forces are roughly on a par. About 1,000 Russian advisers are attached to the Algerian forces while the Moroccans are helped by about 800 American and 800 French instructors (who, quite deliberately, keep well in the background). The Moroccans are particulary sensitive about the American communications centre at Kenitra. It is now guarded by Moroccans and the American service personnel never appear in uniform. In Algeria the Russians enjoy certain port facilities but they have to get Algerian permission before bringing naval vessels in. The Algerians always, in fact, keep a close eye on Russian activities.

The young officers in both the Moroccan and Algerian armies are well-trained (with a large number of the Algerians having had a four-year spell in Russia). The forces in both countries depend on highly trained non-commissioned officers ; the bulk of men are conscripts. After six months' intensive military training the conscripts spend the next year doing other jobs. In Morocco many learn to work in hotels ; in Algeria they work in the countryside. The Algerians spend about 10 per cent of their budget on their armed forces, which total about 57,000 men, and the Moroccans somewhat more on theirs, which number around 50,000 men.

For the Tunisians it is a matter of pride that they spend under 8 per cent of their budget on their armed forces, which total only about 25,000 men. The Tunisian army plays a smaller role in the nation's life than the Moroccan and Algerian armies do. So, whatever takes place after President Bourguiba, there is little likelihood that any group of Tunisian officers will intervene. In Algeria the armed forces are under the direct control of the president who is also minister of defence and secretary-general of the ministry too. Army officers are on the Revolutionary Council, the country's highest authority, and although the national and regional governments are run by civilians the army provides the basis of power for President Boumedienne and his administration. Whatever happens in the future in Algeria, the army cannot but have a powerful say.

In Morocco, the role of the army could well be even more decisive. Although the senior officers are believed to have settled down again after the events of last July, when the armed forces were left with only three generals, the attitude of the younger officers towards the regime is uncertain and unpredictable. They may have been mollified by the recent increases in pay ; but it is known that many are of the opinion that they have become too cut off from the Moroccan people and that they should be playing a more active role in the country's development. If this feeling becomes more widespread in the officer corps, King Hassan can never be certain how much he dare rely on the army's continuing support. Over 1,000 officers and nco's were tried for their part in the Skirat affair. The accused claimed they acted on orders from senior officers and on March 2nd all but 73 were acquitted. The result of the trial will have done something towards raising the army's morale.

Mr Kosygin is interested in more than steel in Algeria

This survey was written by Michael Wall in collaboration with Sue Dearden.

Uneasy trio

When they were struggling for independence, many Moroccan, Algerian and Tunisian leaders cherished the belief that when the French left they would be able to co-operate closely with one another in the fight to develop their countries. Some went so far as to envisage a united Maghreb in which the member-countries would be joined in some form of federation. This idea was discussed in 1958 by representatives of the Moroccan and Tunisian governments and the Algerian government-in-exile. But four years passed before the Algerians won their independence and by that time it was obvious that Algeria's political structure was going to be so unlike its neighbours' that any form of political union was out of the question.

Even so, it was also clear to many that it would make much more sense to plan each country's economic development within the broad framework of the whole Maghreb. In 1964 the economic ministers of Morocco, Algeria, Tunisia and Libya met to discuss the possibilities of co-operation and left behind them a Permanent Consultative Committee on the Maghreb (CPCM) which has operated in Tunis since then. Its job is to make studies of projects proposed by the ministers. The office shelves bulge with its reports ; but very little notice has been taken of them. The sad fact is that although everyone pays lip-service to Maghreb co-operation and ministers express pious expectations about how close it will become one day, the current national development plans and the ones now being drawn up are completely unrelated to one another.

In 1970, Libya officially dissociated itself from the Maghreb by pulling out of the CPCM. Colonel Qaddafi had decided that Libya's future lay in co-operation with the Arab countries to its east. This has not caused much distress to the other members and, indeed, it has brightened the prospects for closer ties between them. Colonel Qaddafi rashly supported the officers who tried to overthrow King Hassan. As a result Morocco broke off diplomatic relations with Libya. There are indications that President Ould Daddah of Mauretania is trying to draw his country into the Maghreb club, but until the problem of the Spanish Sahara is cleared up it is doubtful whether Mauretania will identify itself fully with the Maghreb.

The CPCM is continuing to make its studies and its members from all three countries are optimistic that one day their governments will decide to act. The reports being prepared cover the possibilities of co-ordinating the planning and construction of roads, railways and airports so that this infrastructure can be laid out to facilitate the movement of goods and people among the three countries. Co-operation in the tourist business is also on the list. There has been an agreement in principle that a new airline, Air Maghreb, should be established to fly the international routes, but no one quite knows where the money is going to come from to buy its aircraft.

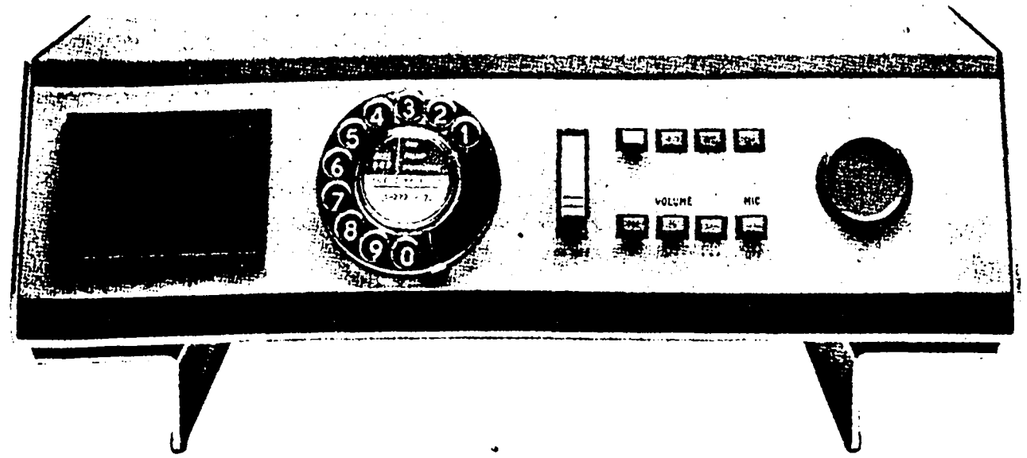
One of the most important studies is how to co-ordinate the infrastructure of energy. Electricity, oil and gas could be supplied more rationally across national frontiers. Both Tunisia and Morocco need Algerian gas for their industries and Algeria may need to run its gas pipes over Morocco and Tunisia to supply Europe. These are complex problems but solutions could be found in an atmosphere of complete trust. There are also possibilities for the three countries to develop a common export policy for their agricultural produce, olives and wine rather than competing against one another in the foreign markets. They have agreed on an export price for esparto grass (alfa) and the committee is trying to work out how this could be extended to other products.

Morocco and Tunisia have special agreements with the EEC which have to be renewed—and, they hope, expanded—this year, and Algeria, which has secured a complicated interim agreement, is still pressing the EEC to reach long-term agreement with it. There seems to be a strong case for the three countries to act in concert and attempt to negotiate similar terms. Each country would benefit if they could agree to share one another's facilities for training certain specialists. They could also act together in negotiations with foreign countries on the numbers of Maghrebi workers who can be employed abroad.

Let bygones be bygones

Action on some of these ideas, which are being worked on by the CPCM, could be taken without prejudice to the outcome of discussions on the thorniest problem of all—a common market for the Maghreb. Here the difficulties appear insurmountable. The Algerians are adamant that they are not prepared to jeopardise their plans for their own industries by allowing in cheaper products from Morocco or Tunisia. Their point is that such products are Moroccan and Tunisian in name only—they are really foreign products which have been assembled in these countries. There is no question but that Algeria's own products will be more expensive and possibly, in the early stages at least, inferior in quality. A common market for manufactured products in the Maghreb would in one blow, in the Algerians' view, undermine their industrialisation programme.

But the Moroccans and Tunisians, who are encouraging foreign firms to make use of their cheap labour to assemble their products, are naturally anxious to see the home market extended to the 34m inhabitants of the Maghreb. When Algeria's industries are fully developed and it is seeking wider markets it may feel confident enough to face the competition that a common market would bring. But that is a good number of years away. And when Algeria feels strong enough to open its frontiers to foreign products will the Tunisians and Moroccans then fear that a common market would open the way for complete Algerian economic domination ?



Perhaps it is far too soon to think in terms of Maghrebi unity, whether political or economic. All three countries are desperately poor. Much can be done to prepare the ground ; mutual trust and respect can be strengthened ; bilateral agreements can be multiplied. But until each country is standing firmly on its own feet the Maghreb's unity will remain an ideal for the future.

Good heavens, yes!

There's only one Towelmaster. Advance

Head Office: 77/83 Upper Richmond Road, Putney, London SW15 2TD Telephone 01-789 6571 Telex

The 'no hands' phone

This is the phone that leaves you with both hands free to take notes, search through papers or refer to plans and drawings while you're using it. It's called the Loudspeaking Telephone 4 and can be connected to exchange lines and many extension systems. It sits a foot or two away from you on your desk and you simply talk towards it.

For conferences
Its loudspeaker and microphone are powerful and sensitive enough for others around you to hear easily what is said and to add their comments in normal tones. You can cut off the microphone too, for confidential asides that the other end should not hear.

For privacy
Lifting the built-in ordinary handset automatically cuts off the loudspeaker and sensitive microphone and leaves you with a normal phone.

Expensive?
Not as expensive as it looks. The additional charge for connecting it to direct lines or a wide variety of extension systems is only £3 and the extra rental (minimum term one year only) works out at less than 60p a week.

For further information
Ask your secretary to send for our colour brochure. All she has to do is ring the operator, ask for Freefone 888 and speak to Telephone Sales. Or fill in this coupon.

Post Office Telecommunications

ACCOUNTANT

I am the fellow who does the accounts
Writing out cheques for colossal amounts.
Investing our surplus—now we're in profit
Millions and millions, I think nothing of it.
Counting the shillings instead of the pence*
Now that we're not paying high London rents.
We moved up to Washington two years ago
We should have come sooner, but we didn't know
How pleasant it is to be out of the murk
And not to be worn out in just getting to work
Or training new staff how to write a good letter
Here they stay longer—efficiency's better.
And they live in good houses—quite close by the path
Not in rooms or bedsitters or sharing a bath.
Some come in by car—there's parking to spare
And some of them walk for a breath of fresh air.
We keep a good garden—the roses are splendid
And we potter about when the day's work has ended.
And as weekend approaches my wife never fails
To suggest that we go to the Lakes or the Dales.
And one of the things that we like to do most
Is to amble along the Northumbria coast.
So you in the City in black bowler hat
Crowding for this and queuing for that
Tell your Board to pack up and get out of the mess
Come up to Washington—here's the address.
Mr. W. S. Holley, General Manager, Washington Development Corporation, Usworth Hall, Washington, County Durham. Telephone: Washington 463591.
** Pre decimal term for five new pence.*

BRITAIN

Just what kind of Ireland do the gunmen want?

The warfare in Northern Ireland has not lost its capacity to shock and horrify, but the incidents are now so frequent they have become the perishable stuff of daily headlines. Last Saturday's lunchtime explosion in a Belfast restaurant, in which two girls died and 136 people were injured, was followed by one on Monday, near a cinema in the city, which produced another 50-odd casualties. Such bombings are everyday events in the province. So are the murders of security men and civilians. These are the evidence that, six months after the return of internment, the IRA is far from crushed. Nor has its hold over the Catholic community declined.

Even though both wings of the movement oppose each other with bitterness, the IRA Officials and Provisionals are now almost indistinguishable, both in tactics and in objectives. So, too, with their satellites. The Northern Ireland Civil Rights Association is now almost wholly a mouthpiece of the Officials, while its rival in civil disobedience, the Northern Ireland Resistance Committee, is a quixotic alliance of Provisionals and marxist theoreticians from People's Democracy.

Few IRA leaders are political sophisticates. Fashionable talk of an Irish workers' republic provides a thin disguise for a movement which is inherently reactionary. The Provisionals have not won recruits by propagating their half-baked idea of four regional Dáils for the future Ireland, but because they can appeal to anti-British popular prejudice and to the Irish tradition of violent rebellion. The black berets, the dark glasses, the funeral processions, the paramilitary uniforms, may excite the younger generation and provide the IRA with a romantic image. But they are more reminiscent of prewar European fascist movements than the "democratic socialism" to which the IRA professes attachment.

The Provisional programme, "Eire Nua," is imbued with nationalist populism. Its call for "a reign of social justice based on Christian principles by a just distribution and effective control of the nation's wealth and resources" might evoke more recognition in Spain and Portugal than in Jugoslavia and Switzerland—the two countries which the Provisionals claim inspire their political ideas. Bigness would not be tolerated. Companies would be nationalised on co-operative lines. Large farms would be divided up among the smaller peasants. A strict moral code would be practised.

Above all, Gaelic would be enforced as the "principal community language of the Irish people." A ministry of national rehabilitation would be set up to supervise the restoration of the Gaelic language and culture. Gaelic-speaking districts would get special economic and social privileges. All government officials would write and speak the language, which would also be enforced in the schools as the primary teaching language. The media would be under Gaelic control.

Mr Lynch's Ireland may hold few attractions for Ulster's 1m Protestants. But what the IRA offers is an authoritarian and conservative dictatorship in both north and south. Very few of the IRA's followers appear to ask themselves where they might end up.

Wales

Labour changes another tune

All 27 Welsh Labour MPs appear to have become champions of an elected assembly for Wales, a cause that the last Labour government spent much time and energy in resisting back in the heyday of the Welsh Nationalist challenge in the late 1960s. Their amendments, seeking the Government's com-

Ritz cinema, Belfast: violence off the screen

mitment to the principle of an elected all-Wales Council, came up for debate this week when the standing committee on the Local Government Bill at last reached the three schedules and 30 clauses which carry the Government's proposals for the reform of Welsh local government. Sixteen Labour MPs, including two ex-secretaries of state, Mr Cledwyn Hughes and Mr George Thomas, signed a highly detailed amendment which sought to spell out the kind of elected body they want for Wales. It would apparently take over a wide range of activities, at present carried out by statutory organisations, such as tourism, consumer protection, hospital management, the preservation of ancient monuments and civil aviation. The secretary of state would decide the council's membership, size of constituencies, and its financing.

It has taken a long time for all Welsh Labour MPs to come around to supporting an idea which has been floating around in Welsh Labour circles since 1962. The Welsh Council of Labour first came out for an all-Wales Council as long ago as its May, 1966, annual conference. But it never found much support in the Labour cabinet. When Mr Cledwyn Hughes used to push the question he was unable to overcome the stolid resistance of Mr Callaghan. The formation of Lord Crowther's royal commission on the constitution provided a handy excuse for inaction, though Labour's abortive 1967 white paper on Welsh local government reorganisation made a milk-and-water reference to the idea of a future all-Welsh authority.

The Welsh Tories boycotted the commission and there is certainly no political dividend for them in reform for Wales, even though Welsh Labour MPs are quite ready to suggest that the carving out of a new county council for South Glamorgan owed much to the astute campaigning of Cardiff Tories. The Tories are only too conscious that they hold a mere seven out of the 34 Welsh seats and that the present secretary of state, Mr Peter Thomas, has to sit for a London suburban seat, Hendon South, and double up as chairman of the Tory party. But it is this very lack of political influence in Wales which makes the Tories more able to push through a local government reform which has been in the pipeline for over 20 years. Noisy local interests paralysed Labour's efforts through six dreary years of proposal and counter-proposal. And a late conversion to a major proposal for Welsh devolution cannot gloss over that sorry record.

By-election

A touch of democracy

It would be an alarming and improbable disaster for the Tories if they succeeded in losing the by-election at Kingston-upon-Thames, which will be caused by the appointment of Mr John Boyd-Carpenter as chairman of the Civil Aviation Authority from April 1st. The Labour party has never come within a stone's throw of the seat ; even in the nadir of 1945 Mr Boyd-Carpenter achieved a safe majority of 13 per cent, and in 1970 it was 25 per cent. So the real political dog-fight there ended last Saturday, after Kingston's Tory committeemen had nerved themselves for the daring innovation of a direct vote on the three shortlisted candidates by a general meeting of the association.

The original list of applicants for the seat was at least as large as the turnout at Saturday's association meeting—around 300. But it cannot be said that the quality was generally very high, and it was further reduced by the Eastbourne Tories' selection of Mr Ian Gow as their new candidate. On Saturday, Mr Norman Lamont, a 29-year-old merchant banker and chairman of the Bow Group, won an easy victory over his nearest rival, Dr Rhodes Boyson, the maverick educationalist and "black paper" editor.

Mr Lamont's selection was not altogether tranquil, since Kingston has a rough gang of anti-marketeers and he had courageously shown himself as an unequivocating pro-European. The net result has been that Mr Edgar Scruby, a local baker and an anti-marketeer of bizarre views, has resurfaced with the intention to contest Kingston as an independent Conservative. Mr Scruby took the surprisingly high total of 1,700 votes off Mr Nigel Fisher in the neighbouring constituency of Surbiton at the general election ; but Mr Fisher has a stormy relationship with his constituency and Mr Lamont will be unlucky if Mr Scruby milks him of as many. He will, however, have a particularly strong new Labour opponent in Mr Anthony Judge, who has been squeezing Mr Anthony Grant's majority in Harrow for the past two elections ; he will also have a Liberal opponent who made no great headway in 1970. The Liberals have been contesting Kingston since 1964, and in that year achieved 17 per cent of the vote. They are a continuing force in Kingston ; but it is more than unlikely to provide them with a saving triumph.

Lamont : already elected ?

Bristol

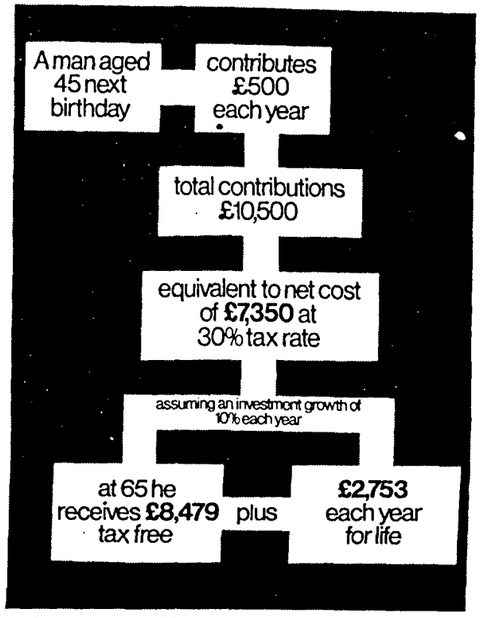
Enjoy it while they may

Labour, after five years in the cold, should not have much trouble in regaining control of Bristol Council House in the May elections. The Citizen party —formed in 1924 by the fusion of Tories, Liberals and Independents—is hanging on to power only because of its preponderance on the aldermanic bench, where it holds 19 seats to Labour's nine. Both parties have 42 elected councillors after Labour's sweep of 16 gains last year. In May, the Citizens have to defend 22 of the city's 28 wards.

But Labour's victory will prove hollow. In April, 1973, Bristol will find itself a mere district council in the new Avon county authority which is to be carved out of South Gloucestershire and North Somerset. The city is to have only 34 out of the 73 seats on the county council which is not to have metropolitan status. Even Labour leaders concede that their party cannot hope to win power over an authority which also includes much of the rural west country as well as Bath and Weston-super-Mare. The Citizens are reconciled to Mr Walker's proposals, even though this means that Bristol will lose control of such important functions as education, health and social services and strategic and area planning.

If you're self-employed, this pension plan will save you an awful lot of tax.

Working for yourself has its rewards.



But it has its penalties, too.

Tax concessions, for example, seem to be few and far between.

And while your employees are covered by the firm's pension scheme, you aren't.

So a pension plan that contains enormous built-in tax concessions and has been created specifically for anyone ineligible for a company pension scheme should command your interest.

The Abbey Investment Annuity Bond is just such a plan, providing not only security with tax free growth but also a hedge against inflation.

You can invest up to 15% of your earnings each year, to a maximum of £1,500, in the scheme. Your entire contribution will be eligible for full tax relief, and therefore comes off your income before Income Tax or Surtax is calculated. Which means that if you're paying tax at no more than 30p in the pound the real cost to you of an annual contribution of £500 would be £350.

But the tax savings don't stop with your contributions.

Your investment will accumulate completely free of Income Tax, Surtax and Capital Gains Tax, and when you decide to take the benefit of your investment, which may be at any age between 60 and 70, you will receive a tax free cash lump sum and a pension, which will be taxed as earned income.

An added attraction of the Abbey Investment Annuity Bond is its flexibility.

For example, although the minimum total contribution for the first year is £100, from then on how much you put in is up to you. You can contribute more some years, less in others. You can even pay nothing one year and start again the next.

There is a unique flexibility about where your contributions are invested, too.

You may choose whether they are allocated to units of the Abbey Pensions Property Fund or the Abbey Pensions Selective Bond Fund, or to any combination of both.

And you can convert all or part of the accumulated investment at any time from one Fund to the other.

Again, there is a flexibility about how you take your pension, which may be fixed, escalating or unit-linked.

In addition there is a guarantee that the value of the benefits payable to you on retirement, or to your family if you should die before retirement, will never be less than the contributions you have made.

To find out more, fill in the coupon and mail it to us. No stamp is required—we pay the postage.

I'm self-employed and interested in the Abbey Investment Annuity Bond. Please let me have details.

Abbey Investment Annuity Bond.

There is a good deal of bipartisanship on the council. The Citizens began offering council houses for sale to sitting tenants as long ago as 1960 and Labour continued the practice when in power after 1963. But, last November, the Citizens were attacked for their decision to offer council houses for sale at 30 per cent below their market price. After May, there is likely to be a serious clash between Labour and the Government over the Housing Finance Bill. Bristol already has an economic rents scheme for its 47,000 council tenants, but the local housing department predicts that rents may eventually rise by £2 under Mr Walker's proposal. Labour threatens to practise non-co-operation, which would mean the intervention of the housing commissioner.

On planning matters, though, the Bristol parties are in almost complete agreement. Both backed the 1966 development programme. Both supported the Avon Gorge hotel scheme which the Government recently turned down. And both oppose the planned 225ft post office tower for the city. There is even common support for the outer ring road scheme, which would tear up parts of Clifton and Cotham. Labour has welcomed the appointment of Sir Hugh Casson as architect adviser for the docks area renovation plan.

The Labour party is in a better shape than most borough Labour parties nowadays and can boast two agents for Bristol's five constituencies. Its Citizen opponents are now very much the local Tory party, even if two Citizen councillors claim to be "Liberal at heart." The Citizens use the Tory machine at election times and their policies are similar to those of Tory parties in Britain's other big cities. Next year, however, the Citizens will disappear from the scene. Alderman Walker's party intends to fight for Avon county as Tories, pure if not so simple.

Drugs

Different dangers

Two recent alarms have shown up the hazards of modern medicine. The latest might have caused five deaths: the contamination of a batch of dextrose solution used for drip feeding. Clearly, if a nutrient of this sort is good for feeding humans it is good for bacteria too, and what seems to have been at fault is the autoclave used for sterilisation. As a precautionary solution the Government has temporarily banned the use of dextrose solution from the firm concerned. The second risk concerns imipramine, used in treating the mentally ill.

The new policy for the mental health services is based on the so-called chemo-therapy revolution. The phenothiazine drugs for schizophrenia and the tricyclic ones for "depressive illness" have reduced the median length of stay in hospital to about six weeks for schizophrenic patients and a month for depressed ones and have quite often enabled patients to avoid admission to hospital altogether.

Of the tricyclic anti-depressant drugs the imipramine group is the largest and most commonly prescribed. Its importance can be gauged from the fact that, of the 175,000 admissions to mental illness hospitals and psychiatric units in 1969, 66,000 were patients suffering from depression—nearly twice as many women as men. By comparison only 36,000 were diagnosed as schizophrenic. (These figures refer to total admissions and therefore include patients who are admitted more than once.) But, if imipramine drugs are found to be responsible for deformities in newborn babies, as an Australian doctor warned the world at large last week, the effect on treatment would not be calamitous. Depressive illness, in contrast to depressive reaction, is more common in older people than in those of childbearing years; other tricyclic drugs can be prescribed for younger women; and for severe cases there remains ECI (electro-convulsive therapy).

At present, the risk from this drug does not appear great. Tofranil, the first of these drugs, was first marketed (by Geigy) in 1959; it is unlikely that had foetal damage occurred during the 13 years it and its successors have been prescribed, reports of it would not already have been published. The potentially disastrous effects of thalidomide, on the other hand, were realised within five years. In addition, because of the thalidomide tragedy, the Committee on Safety of Drugs was set up in 1964 to collate and investigate reports of adverse reactions. If imipramine had produced side-effects similar to thalidomide it is strange that there has been no warning.

Monsters

Who'll laugh last?

Teresa Cameron saw it when she was coming home from school last winter; so, on another day, did her father, Angus, at the power station. Young John Gillies saw it last spring and called his father, the postman. Sween MacDonald, the boatman, saw its wake one day in August, travelling at something like 10 knots, and on at least 18 other occasions in the past 10 years people have reported a big, black beast swimming in Loch Morar. The small committee that makes up the Loch Morar Survey now, after its second year's investigation, has a dossier of 33 reports where people have seen either the head, the snake-like humps or the wake of something very big, moving fairly fast. The difference, compared with a few years ago, is that fewer people make flip jokes about it.

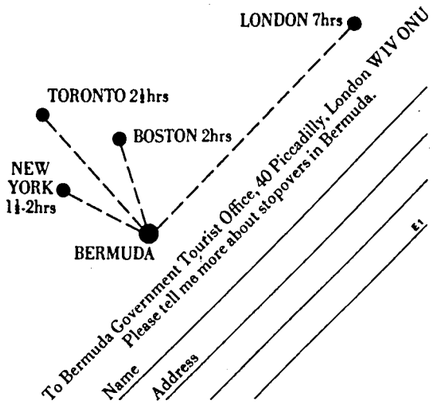
Only Dr George Cooper, sketching what he thought was a log, until it vanished in a swirl of water, has any permanent record of the Loch Morar monster, but for 900 years the locals have been reporting occasional appearances of "beistes" not only in Loch Morar but in innumerable Loch na Beistes up and down the Highlands. Nearly all these lochs have been at one time or another linked with the sea. When the last glacier retreated 10,000 years ago, Loch Morar was 10 ft above sea level at low spring tide, so it would not have been difficult for big sea creatures to travel up into the loch on the high spring tides, especially with a westerly gale behind them. It is deeper, at points, than the continental shelf, touching 1,000 ft in places and at 12 miles long and more than a mile wide is large enough to house the sort of long-necked creatures reported.

This is the most typical shape for the big, unidentified sea beasts that are reported with increasing frequency and growing detail. There are too many of them now to be dismissed as sailors' stories—as the giant squids were until some were actually caught. Scientists are increasingly conscious that few of them would have believed anything as huge as a blue whale could still be living if whales were not mammals obliged to come up for air. Deep-water beasts could exist that have rarely, if ever, been seen by man.

The Scots have worked to get rid of their monsters. One that inhabited a sea loch on the Isle of Skye has not been seen since a minelayer sunk there and its mines were exploded underwater. Near Loch Ewe, a monster was blamed for the sheep that disappeared at night and a load of quicklime was dumped in the water to kill it, since when the fishing has improved spectacularly; but the sheep continue to disappear. It is not a place the locals go near after dark.

After you've driven yourself in New York, try driving yourself in Bermuda.

Call in at Bermuda on your way back from the USA or Canada.



Unwind in a world where you can hire a moped. Or a bicycle. But not a car. A world of warmth and colour and tranquillity. Where the most plentiful thing is time.

This delightful little cluster of coral islands is a mere 2 hours or less from New York and Boston, and 2½ hours from Toronto.

There are daily flights. And the extra fare is surprisingly small – a mere £7·50 on a first-class return from New York, for instance.

Relax awhile. Then continue on to London – little more than 7 hours away.

Bermuda. Another world.

At your pleasure . . .

The 121mph BMW 2500 'executive express'

For those who like power, *all sorts of power*, the BMW 2500 reflects unbeatable performance with an individuality of style. Its perfectly balanced 170 bhp overhead camshaft engine is complemented by the hand-finished coachwork.

A car for the forward *looking* company with an international approach. For the man who can really appreciate the true meaning of performance. Like 0 – 50 in a mere 7 seconds. 26 miles to the gallon when touring.

Twin servo braking system combined with 'anti-dive' all independent suspension to make doubly sure you stop when you want to, and take the cornering out of cornering.

Plus the option of power steering and special ZF Sports Automatic Transmission to cut out the leg-work without losing performance. And a sumptuously upholstered interior with heated rear screen. Alternatively, you may consider the 127 mph BMW 3.0S with 0–50 mph acceleration in 6.2 secs, and even higher specifications including built-in headrests and ventilated disc brakes as standard equipment.

Take a test drive today and rediscover the kind of driving pleasure you *thought* had ceased to exist. And remember there's *no waiting* for delivery.

Prices of the BMW range: 102mph (Autocar test report) BMW 1602: £1845 · 113mph (Autosport) BMW 2002: £1999 · 108mph (Safer Motoring) BMW 2000: £2199 106mph (Motor) BMW 2000 Touring: £2248 · 119mph (Autosport) BMW 2002 tii: £2399 · 121mph (Autocar) BMW 2500: £2999 · 127mph (Autocar) BMW 3.0S: £3899 132mph (Autocar) BMW 3.0Si: £3999 · 131mph (Autocar) BMW 3.0CS: £5299. ZF Sports Automatic Transmission optional on the BMW 2000 and 2002 models at £199 and the BMW 2500, 3.0S and 3.0CS models at £239. Prices shown are recommended retail prices including P.T.

Unbeatable BMW present *a range* of Sports Saloons starting at £1845

ROBECO

VIGOROUS GROWTH

The Washington agreement by which new parities were fixed has cleared the air and has put an end to prevailing uncertainties. A fresh starting point has been created. However, time will be needed to show if the measures taken are adequate.

VERY ACTIVE INVESTMENT POLICY

In our latest interim reports we have expressed our concern about the economic developments that were taking place. We have also reported how we tried to ward off imminent trouble and how we sometimes managed to turn it to our advantage. The changes in economic prospects resulted in changes in our portfolio, which were greater than ever before. In 1971 our sales and purchases totalled more than fl.1,500 million.

SHIFT FROM EUROPE

The main feature of our investment policy was a shift from Europe to America and Japan. Thus in Europe sales exceeded purchases by more than fl.91 million, whereas in America our purchases were fl.236 million on balance and in Japan fl.113 million.

As at 1st January 1972 about 38% was invested in America against 32% in the previous year, and our interests in Japan rose from 10% to more than 17%. Our investments in Europe, were reduced from 44% to 38%. Great Britain, Switzerland and Belgium were the only European countries that were more prominent in our portfolio at the end of the year than at the beginning.

GREAT INTEREST IN SHARES

In the past financial year the Company has again shown a vigorous growth. At the beginning of the year 13,310,000 shares had been issued, amounting to fl.665,500,000. Following the final dividend distribution of 2½% in stock 331,723 new shares were issued. Throughout the year investors showed a great interest in ROBECO shares. In order to meet the demand 465,277 new shares were issued. In consequence the issued share capital as at the end of the year rose to fl.705,400,000, corresponding to 14,108,000 shares of fl.50 nominal.

At the end of the year under review the Company's net assets amounted to fl.3,035,981,082; the value of a ROBECO share, increased by the cost of issuing new shares, was fl.226, compared with fl.220 at the beginning of the year. By 1st March, 1972, the share price had risen to fl.245.

NEW BASIS FOR CALCULATING INCOME

Until now the income accounted for in the profit and loss account comprised income in cash (dividends and interest) and the income elements of the stock dividends received. For 1971 we have departed from this procedure by having the income in cash accounted for in the profit and loss account, whereas the value of the above stock dividends is apparent from the realised and unrealised appreciation reserve. This change in profit accounting is in compliance with the new fiscal legislation, which stipulates distribution of cash income. It is also in conformity with our dividend policy, in which cash income is distributed by way of interim dividend and in which a stock distribution from the share premium reserve will enable shareholders to take their part of the value of stock dividends received. Although shareholders hardly ever opt for a final dividend in cash, we will continue to offer them this alternative. In 1971 income amounted to fl.102·7 million. Income for 1970 calculated by the same procedure as in 1971 would have been fl.97·6 million; under the previous profit presentation it amounted to fl.158·8 million.

DIVIDEND PROPOSAL

By way of final dividend for 1971 we recommend a distribution of 2½% in stock from the premium reserve. (This distribution is free of U.K. Income Tax). For those shareholders who prefer a distribution in cash (subject to U.K. Income Tax) to one in stock, we recommend that until 27th October 1972 a final dividend of fl.4·80 be offered as an alternative. If cash is taken, the total dividend for 1971, including the interim dividend of fl.7 made payable in November 1971, has gone up to fl.11·80 (1970 fl.11·60).

If you would like a copy of the full Report and Accounts in English and of our descriptive booklet, please write to the Secretary:

A tale of two countries

WAR COMES TO LONG AN
By Jeffrey Race.
University of California Press. 322 pages. £5.70.

VIETNAM INC.
By Philip Jones Griffiths.
Collier-Macmillan. 223 pages. £1.25 paperbound.

There are two Vietnams. There is the country in south-east Asia, where two great forces are at war and where otherwise normal people do the best they can with the conditions of war, fighting or keeping their heads down, growing food in the country or camping in swollen cities, surviving or dying. And there is the Vietnam of the mind, a conveniently tidy place constructed by those who cannot or do not want to come to terms with the million pieces of the jigsaw of the real Vietnam. No map contains both these countries, and what sort of book you write about Vietnam will depend on which of them you have been living in.

These two books are about two different places. "War Comes to Long An" is by a young American who first went to Vietnam with the American army, and then went back on his own account to try to find out what had gone wrong with the campaign the Americans thought they had gone there to fight. It is about a single province, Long An, just south of Saigon, which he thinks represents in miniature the problems of South Vietnam as a whole. Between 1960 and 1965 the communist-led revolutionaries had virtually won their war in Long An. The arrival of the American army in 1965, and the creation of a stable government in Saigon, pushed them back by 1970 almost to where they were in 1959. By 1972, with the Americans gone, the outcome depends on whether the South Vietnamese government has really learned the lessons it had been ignoring through most of the 1960s.

Mr Race's theme no longer seems very novel. He argues that the Americans and the South Vietnamese army never understood, and perhaps still do not understand, the way guerrillas work among the population: that they went charging around looking for an *identifiable enemy force that declined* to identify itself; and that it took them until 1970 to recognise the one or two very simple things—above all, the reallocation of land—that gave the communists most of their support. The strength of his book is that it supports this now generally accepted argument, that the Americans were fighting the war the wrong way, with a wealth of first-hand detail. He knows almost everything that happened in Long An in the 1960s, every skirmish, every assassination, the relative efficiency measured in casualty ratios of each of the different kinds of military unit involved. He gives us extracts from the long interviews he had with men who fought on both sides. He managed to conduct a scientific study in the middle of a war, and that is quite an achievement.

It does not make pleasant reading for the supporters of American policy. Mr Race finds the Americans incompetent. He also believes that this was essentially a war between Vietnam's haves and have-nots. But he is even-handed. He destroys some of the myths of the anti-war faction, such as the belief that the revolutionary forces were not directed from Hanoi throughout. If he has a hero, it is Colonel Be, one of the few South Vietnamese officers (and an ex-Vietminh man) who understood how a guerrilla war should be fought. He found the former communists he talked to, "like their government counterparts, simply good people who had done what they believed to be right." This is a remarkably compassionate and honest book, which tells what it was like at the grass roots.

Vietnam: reality is harsh enough

"Vietnam Inc." is something else again. Mr Griffiths is a Welsh photographer who spent three years in Vietnam. He took a lot of good pictures, including some horrifying ones; there is never a lack of those in a war. But his camera seems to have got in the way of his looking. This is a book on the other Vietnam. For Mr Griffiths, Vietnam is a place where the great majority of people want a communist government, and were frustrated because the Americans sent in "2,000,000 military men," with the result that "the depopulation of the countryside is almost complete." It is a place where "the only industry . . . is the 'servicing' of Americans," and "motorcyclists are regularly victimised" by the police in Saigon and "any who try to get away are shot at." Oh, yes, and those 3,000 bodies found in mass graves near Hué after *the communists occupied it in 1968* were really killed by the Americans. Anyone who has been in Vietnam will wonder whether Mr Griffiths is talking about the same country. He is not, of course. He is talking about a country of his mind.

Pitt prop

CHARLES JAMES FOX
By John W. Derry.
Batsford. 454 pages. £5.

After having passed through an initial phase in the nineteenth century of Whig hagiography and Tory denigration, Fox's reputation with biographers and historians has stood very high. The temptation to which most students of his career succumb is to enjoy Fox: that is to say, they allow Fox to set the tone and choose the themes. The broad pattern, as old as Fox himself, is to set him up as the raffish idle apprentice by contrast with the goody-goody industrious apprentice Pitt. This in fact is all to Fox's advantage. Unbending rectitude is neither good tragedy nor good comedy: Figaro or Falstaff or Antony is always better theatre

" excellent biography . . . Mr Prittie has made a closer, more careful and more sensitive analysis of Adenauer's policies than has ever been done . . . should be made mandatory reading for all officials and politicians engaged in present-day East-West diplomatic negotiations."
The Daily Telegraph

" the most informative, perceptive and balanced study of the subject available . . . likely to be relied on for many years as the standard biography."
Times Literary Supplement
" scrupulously fair and highly interesting."
The Economist

" We are fortunate indeed to have a major biography from such a hand as Mr Prittie's."
The Sunday Telegraph
" a notable biography . . . a model of fairness."
The Sunday Times

Fox: charm resisted

than Almaviva or Prince Hal or Octavius. Dr Derry has hit on the novel idea of producing Fox, as it were, in a role designed for Pittite classic drama adhering strictly to all the rules of the Chathamite political unities. The results, as might be expected, are curious and quite revealing.

The temptation to enjoy Fox Dr Derry most rigorously resists. This is a stern book. Its author is stiffly determined not to be charmed, cajoled, or cozened by so absolute a rogue. Even Gibbon, as starchy as a man of the polite world could readily be, confessed that in spite of everything one could not help loving the dog. Dr Derry is made of sterner stuff. In his preface he gives fair warning :

> If I have been more critical than many biographers I hope I have not been guilty of mere denigration. But it is time that Fox was portrayed for what he was, and not for what later apologists wanted him to be.

This is perfectly unexceptionable. The glib identification, stemming from the Victorian apostles of progress, of Fox with causes like free trade, democracy, and pacifism with which he had no sympathy has gone on far too long, and needs just the sort of short shrift so expertly given here by Dr Derry. But as an essential part of his procedure Dr Derry has "deliberately limited" the amount of "personal, domestic, and circumstantial detail" in a biography of perhaps the most personable, domesticated, and circumstantially directed and influenced statesman who ever lived. There are thus the elements of possible confusion here. Does one necessarily rescue Fox from his ideological apologists by denying him the means to be his true self and not some bloodless entity defined on the basis of Pittite criteria ? Dr Derry has assuredly not been the biographer of Pitt in this Batsford series for nothing.

What, precisely, was Fox ? This book, for all its solid virtues, its thoroughness and awareness of the findings of the latest research, does not satisfactorily answer the question ; but by insisting that Fox be judged on Pittite criteria it opens the issue up in a most interesting way. Dr Derry's defence of those criteria is very simple : Pitt was more often than not correct, Fox more often than not incorrect, about everything from trade to war, from Ireland to reform. Dr Derry's criticisms are formidable.

The cross-examination is remorseless and extremely damaging to Fox's reputation. It would be unfair to Dr Derry's industry and skill to urge that much of his advocacy has a touch of the "Have you stopped beating your wife ?" logic about it. Nevertheless, one cannot help feeling that Fox is being made to appear worse than he was.

The Pittite requirements for political success included calculation, cunning, subtlety, tactical skill and strategic foresight. Fox possessed none of these. For that reason he was in office only for a few months. Yet undoubtedly he deserved better. His tragedy is that it is impossible to demonstrate how or why he might have deserved better. Dr Derry does not make allowance for the very real and important element of pathos involved here. He is too busy demonstrating Fox's inadequate grasp of "realities." The qualities Fox did abundantly possess are not easily demonstrated. Like Wilde, he might have claimed that he put his genius into his life and only his talent into his career. Yet the historian's task is to do justice to the whole man, not just the political fiction. Pitt had no life outside political activity based on principles laid down by his father. He was the celibate priest of a paternal revelation. Fox had no chance. It is only fair to let him have the last word (not quoted by Dr Derry) :

> I love idleness so much and so dearly that I have hardly the heart to say a word against it ; but something is due to one's station in life, something to friendship, something to the country.

Life under Father

A BED OF FLOWERS
By Auberon Waugh.
Michael Joseph. 254 pages. £2.20.

Strange that Shakespeare never ("Henry IV, Part I" excepted) concerned himself with what must have been, even in his day, a common enough predicament, the withering into malice or dilettantism or intrigue of brilliant sons in their gifted fathers' shadows. With the Dudleys and the Cecils under his nose, he seems to have preferred the myth of Eteocles and Polyneices, brothers-at-war, to that of Phoebus and Phaeton. Of course, Don John, Antonio, Duke of Milan, and Duke Frederick are in situations analogous to that of the blighted son ; and one cannot help feeling that more than sheer laziness about plot-making lies behind Mr Waugh's choice of "As You Like It" as a framework on which to drape his modern instances. For the point of "As You Like It" is the angry brother's ultimate reconciliation with the magical or merely popular figure whose image he has tried so hard and deviously to blot out. One suspects that more meaning lies for Mr Waugh in these relationships than for the rest of us whose fathers were not Apollo.

But, perhaps, this is to import too much depth to a shallow, bright tale of the richest man in England ("The Duke"), his machinating brother Frederick, his fool Police-Sergeant Touchstone, his hippy mentor Jaques, daughter Rosalind, niece Celia, and so on. It tells, after all, no better a story than Shakespeare did, in spite of a fashionable maculation of Anglo-Saxonisms and the substitution, wherever heightened or mellow or celebratory feelings are needed, of cannabis for alcohol. The real interest of Mr Waugh's fifth novel lies not in this thin reworking but in what has been tacked on to it. One cannot believe in his dutiful identification with the drop-outs of an agricultural Arden, wittily as it is often expressed ; nor can one take very seriously the rousing plug for a kind of medieval Catholicism that justifies the existence of a couple of non-essential characters. What one can believe in, and should take seriously, are the splenetic attacks on targets that really do need the satirist's vitriol—smooth ambitious priests and journalists making headway through ecumenism and the city pages ; Commonwealth Office counsellors with hive-humming bonnets, and elected defectives who uncritically accept their advice ; everybody's complicity in the disaster of Biafra, about which Mr Waugh is still very angry.

It is no good saying these excrescences mar his story : the story is only there as a hook from which Mr Waugh can trail his coat. And very well he does it : will he believe it is meant as praise if one says that Phaeton's treatment of Mr (later Sir) Titus Burns-Oates would have done credit to Phoebus himself ?

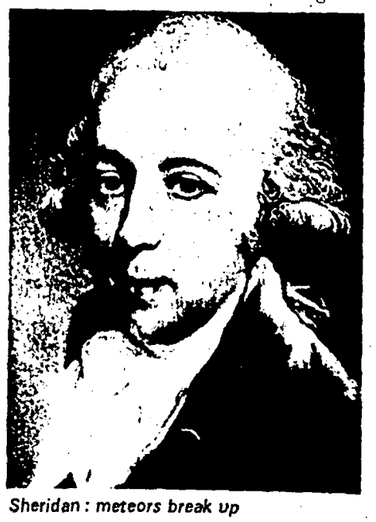
Ugly customers

THE ANCIENT AND RIGHTFUL CUSTOMS
By Edward Carson.
Faber. 336 pages. £4.

The Customs and Excise has played Cinderella to its big ugly sister, the Inland Revenue (although many a taxpayer must be inclined to cast them both as ugly sisters with himself as Cinderella). But this will change in 1973 with the introduction of value added tax, to be administered by the Customs. So now is a good time to be reminded, by this enthusiastic history from Mr Edward Carson, its librarian, that the Customs is also the older government department. He details the collection of customs duties in Britain from Saxon times, when the King had the "custom" of "prising" a certain proportion of the wine entering the country for his own use. Payment in cash, rather than kind, started as a method of buying the right not to suffer "prisage."

Until 1671, the entire customs revenue was provided by farming out the collection to private individuals in return for a steady fee. This could be a remunerative sinecure for the "farmers" ; Chaucer managed to find time for other activities in the Customs service (and so, at a later date, did Congreve and Burns). But some aspects of Customs life must have been frustrating : Charles II, who first set up a permanent administration, ordered the direct payment of £500 a year to Mistress Eleanor Gwyn, although reserving for himself the services rendered.

There are some gaps in this account. In the discussion of tonnage and poundage under Charles I, no mention is made of the names Pym and Hampden ; nor is sufficient emphasis given to the central importance of the Customs revenue in the constitutional struggle. But worst of all, in a chapter on Scottish Customs, there is an inordinate amount of talk about brandy, and no mention at all of the fine tradition of illicit whisky stills. Some of these are in action today, and it is probably shame that prevents Mr Carson from relating the case of the still that used to reveal itself to the Customs department when the equipment was getting old and in need of replacement. The reward thus obtained was just about the sum required to equip a new still.



Easy pickings

SHERIDAN: THE TRACK OF A COMET
By Madeleine Bingham.
Allen and Unwin. 382 pages. £5.95.

The Right Hon. Richard Brinsley Sheridan died in squalor but was given a magnificent funeral. He was buried in Westminster Abbey, but not among the statesmen, not near his friend Fox. Instead, and appropriately enough as far as posterity is concerned, he was interred near Garrick, though he hated to think of himself as a man of the theatre. This final episode is not more bizarre than many which punctuated Sheridan's life, and its implicit irony, too, is in keeping with the general trend of his development.

His rise to fame was meteoric, first as a dramatist, then as a political orator. His parliamentary exploits have been dimmed by time, whereas his comedies are perennially fresh and amusing. He did, however, achieve front rank as a politician, living as he did in an age when the House of Commons could vie with the theatre in displays of sustained eloquence. Sheridan's irresponsibility was his undoing. As a public figure, he did not inspire trust; as a private person, his spendthrift habits and reckless self-indulgence almost ruined his marriage with Elizabeth Linley, which had begun so romantically, and finally reduced him to a bloated sot.

Obviously it is the kind of life-story to attract a not-too-serious biographer, and Mrs Bingham has made the most of the opportunities it affords. She conveys Sheridan's charm and brilliance of mind, and sets his career against

Sheridan: meteors break up

a carefully depicted family background. The world of rank and fashion and high politics into which Sheridan moved with such alacrity is also well sketched in. The book does not pretend to be more than "a rounded, colourful portrait." Other chatty studies of Sheridan exist, and this is an improvement on its predecessors. (Oddly enough, there is no mention in the select bibliography of Kenelm Foss's comparable, lightweight memoir, published in 1939.) What does seem odd is that so versatile and gifted a man, with a double claim to fame, should not yet have been accorded a far more substantial and scholarly biography. Incidentally, the number of careless misprints in this highly-priced volume is deplorable.

Library trap

HISTORICAL MEMOIRS OF THE DUC DE SAINT-SIMON: VOLUME III, 1715-1723
Edited and translated by Lucy Norton.
Hamish Hamilton. 522 pages. £6.

The French novelist M. Michel Butor is accustomed to use Saint-Simon as a test for the libraries he visits. Should Saint-Simon be placed with history or with literature? Then, should he be classified in the eighteenth or seventeenth century? (The greater part of his writing was done in the eighteenth, but some of the more famous passages refer to Louis XIV and the previous century.)

These questions are only easy to answer when we come to the last of Saint-Simon's memoirs. This is the third volume of Miss Lucy Norton's English edition and abridgement and it begins in 1715, after the death of Louis XIV. From this moment the 40-year-old Saint-Simon became politically important. He was a life-long friend of the regent, the Duc d'Orléans, and he acted both as a respected adviser and as a special emissary. The end comes after the death of the Duc d'Orléans, who fell into the arms of his mistress at a time when Versailles was deserted. It was fully half an hour before Madame de Falari could find either valet or doctor.

Here we have history written by a participant, and history as a catalogue of events, policies and weighty conversations rather than as a series of literary portraits. This is not to say that Saint-Simon has lost any of his wit or passion for anecdote. He is delighted to describe the life of the king and queen of Spain (and in most of his stories they seem to be in bed). He is determined to find out all he can about scandalous incidents, such as the occasion when the Marquis de Villena beat Cardinal Alberoni with his cane and the king (in bed) did not notice. Saint-Simon also tells how amused the king and queen were at the revelation that Cardinal de Rohan was not greatly respected in Rome because he went to such lengths to preserve his complexion: the story that he washed in asses' milk in order to make it whiter and softer shocked the pious and made everyone else laugh. Saint-Simon assures us that he has taken the greatest care in recording conversations exactly as they occurred. His only thought, he says, was for accuracy and truth and he admits to many defects of style. But it must be said that these are neither striking nor important, neither in the original nor in this translation.

Commoner cause

THE CLOSING CIRCLE
By Barry Commoner.
Cape. 336 pages. £2.50.

There is no doubt that Dr Barry Commoner is a card-carrying doomsayer but, unlike many of the others, his words deserve close reading. Dr Commoner is a serious scientist, the father of the environmental movement, to whom much of the credit for raising the alarm about the fallout from the nuclear tests, and the subsequent test ban, must be given. He was right then. Is he right now?

What Dr Commoner argues in effect is that industry and technology have made their achievements, and their profits since the second world war, at the expense of the environment. They have drawn on the planet's natural capital for their own gain, and they have introduced new products—such as agricultural fertilisers and detergents and polyvinyl plastics—that have caused harm, perhaps irreversible, to human health, the soil and the waters. Unless their practices are changed drastically, unless governments and public opinion compel industry to forgo profits and economic growth and to reorient itself in the direction of technologies which are ecologically harmless, then the natural balance of the earth will be upset, the capital will be used up and catastrophe will occur.

The most interesting, and perhaps the most important, part of Dr Commoner's book concerns population. He does not climb on the "people are pollution" bandwagon. In his view, the United States could in fact support a much larger population were its agriculture, industry and natural resources managed with greater attention to the interdependence of all elements in the environment. What is more, he is eloquent and scathing against those who would force developing countries to limit their population before they have achieved that natural drop in the birth rate that accompanies a drop in infant mortality. A basic human urge is to be survived by one's children. To Dr Commoner, those who argue that parents in poorer countries should surrender this aspiration, which they now pursue by producing a great many children in the hope that some at least will reach adulthood, are cruel and inhuman. Population is not the pollutant, he insists; modern industry is.

It is at this point that his argument becomes more polemical than reasoned. Dr Commoner seems to believe that profits are bad, the product of greed, and that the overwhelming motive for industry to offer the public synthetic substitutes for natural materials has been to rake in more money. Yet detergents, for example, owed their rapid success not only to industry's salesmanship but to the fact that women find them easier to wash with than ordinary soap—detergents leave less scum and they work better in automatic machines.

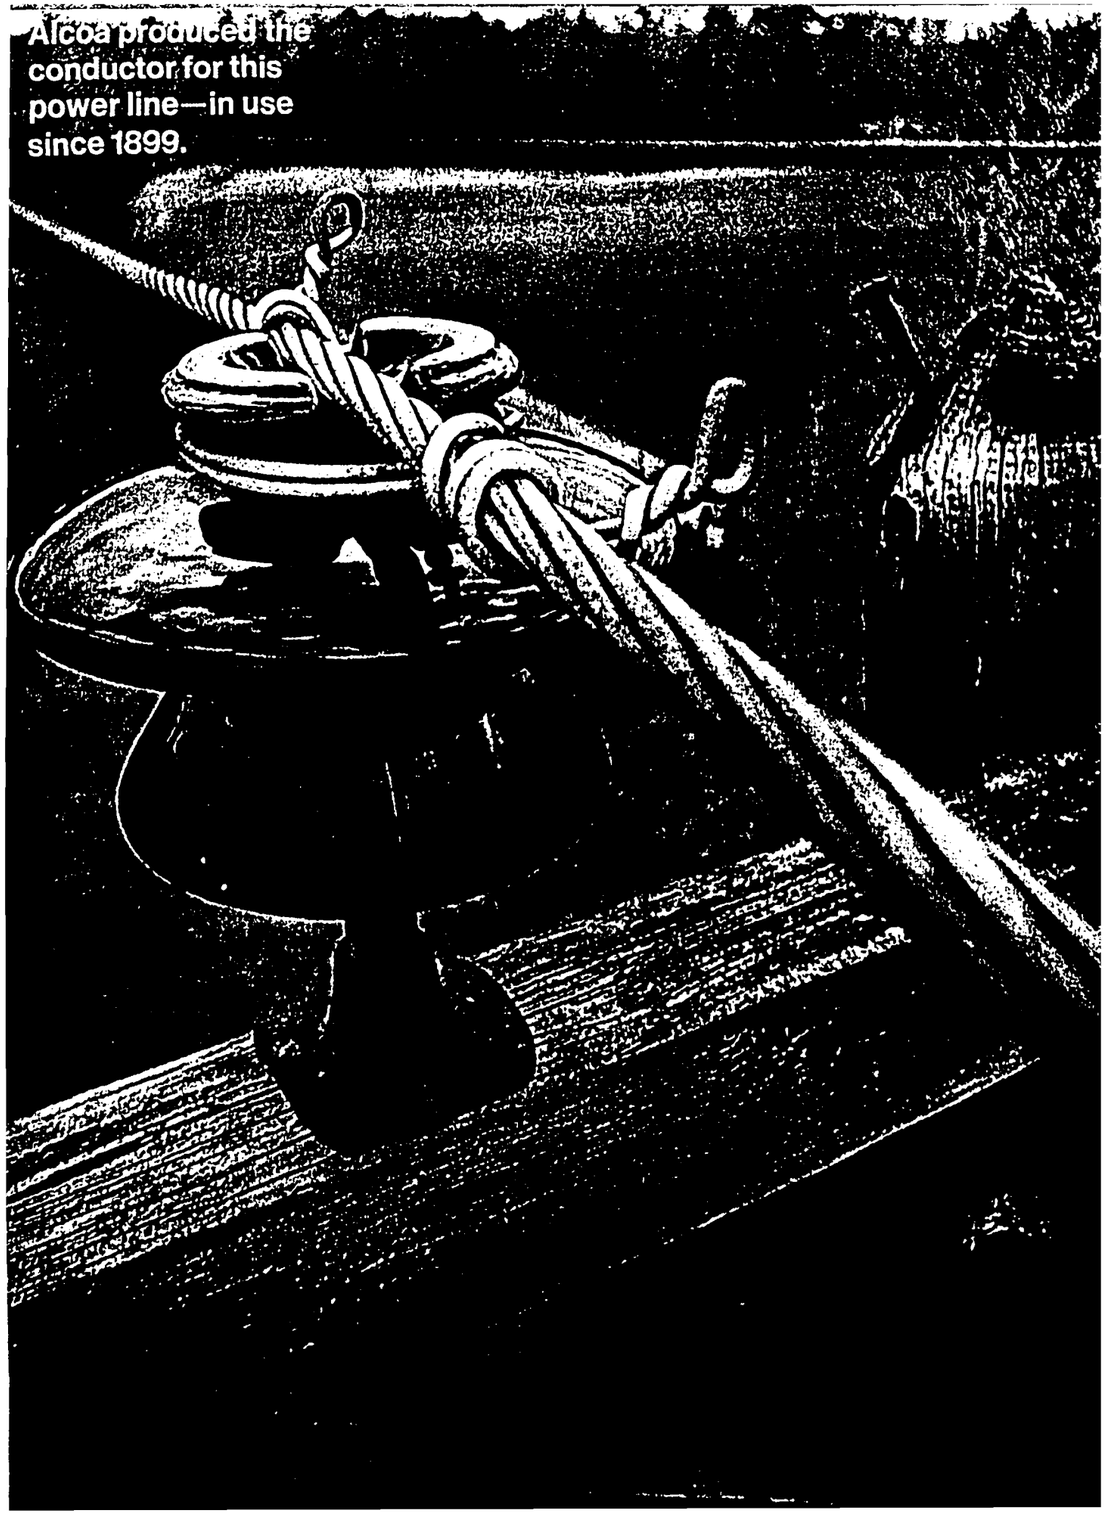
There is no doubt that governments and industries must become more alert to the infinite possibilities of disrupting the status quo presented by new compounds and new processes. But what they must not do, and Dr Commoner seems to suggest that it is possible, is to believe that there is an ultimate measuring stick for sorting out which technologies are ecologically sound and which damaging. Every potential advance will always carry some penalty. Over and over again the decision will have to be made whether a particular gain outweighs the possible losses. Sometimes hindsight will prove the decisions to have been wrong or at least the disadvantages to have been greater than anticipated. Priorities will change constantly. Dr Commoner has done a disservice, however, in suggesting that technology has been on balance inhumane. The harm done by thalidomide and thermal pollution, to take two examples, is outweighed by the social contributions made by improvements in medicine and by civilian nuclear power. It is a most old-fashioned and pernicious idea that there is a clear right way of doing things in future if evil ways can be abandoned.

NISSHO-IWAI: Ubiquitous Jack-of-All-Trade

Center picture is a shot of the earth taken from a synchronous satellite over South America in November 1967.

Whether you're looking for new markets to sell in or new products to buy, Nissho-Iwai's world-wide trading network is at your service. As one of Japan's leading general trading firms, or *sogo-shosha*, we act as a partner of buyers and sellers around the globe.

Our operations are fast and efficient because our offices in the world's leading trading centers are connected by leased channel, telex, and telegraph, and more recently by our own on-line real-time information system.



Although based in Japan, we are increasingly active in trade not involving Japan at all. Such as selling American coal to Brazil, American steel to Italy, American and Brazilian raw cotton to Southeast Asia and Europe, Filipino sugar to the U.S., African marine products to various countries in Europe, and Brazilian vegetable oil seed meals to European countries.

Whether you're interested in buying, selling, commodity transactions, or cooperative ventures, let's get together. Contact the nearest office of Nissho-Iwai, the action-oriented, ubiquitous Jack-of-All-Trade.

Business Brief

Hands across the Irish Sea

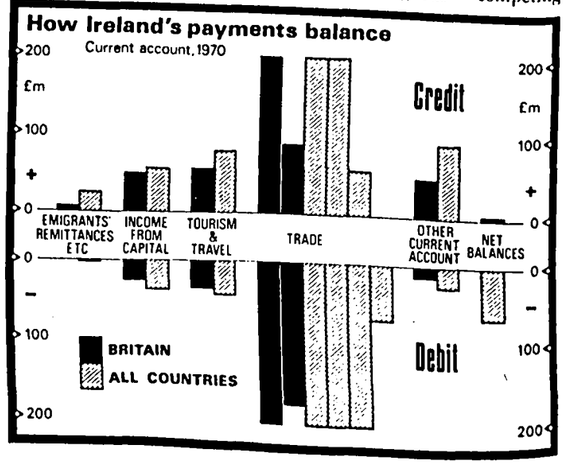
A Russian delegation was in Dublin discussing trade last week, not very seriously, as it turned out, for Irish trade with the whole of Eastern Europe came to less than £30m last year. But Dublin is prepared to look almost anywhere to reduce its economic dependence on the British market. And since the Russians are determined that any trade deal must go hand in hand with full diplomatic relations with Dublin, there is the added piquancy that Russians based in Dublin, and therefore free to move in and out of Britain at will, would considerably upset the British counter-intelligence services.

Since the Londonderry shootings a month ago there has been talk in Dublin about a retaliatory boycott of British goods in Irish shops. For a short while, it was difficult to buy British newspapers because the airport workers refused to handle them, and some British biscuits were withdrawn from sale in Dublin; otherwise, the boycott seems to have found no popular support. Mr Jack Lynch, the Irish prime minister, lost no time in spelling out the reasons at the Fianna Fáil conference last month: a trade war between Britain and Ireland might produce some mild discomfort in Britain, but would mean economic and social disaster for Ireland. This is certainly what happened between 1932 and 1938 when Mr de Valera stopped paying land annuities to the British Exchequer, and London retaliated by slapping import duties and quotas on exports of Irish livestock, meat and dairy products to Britain.

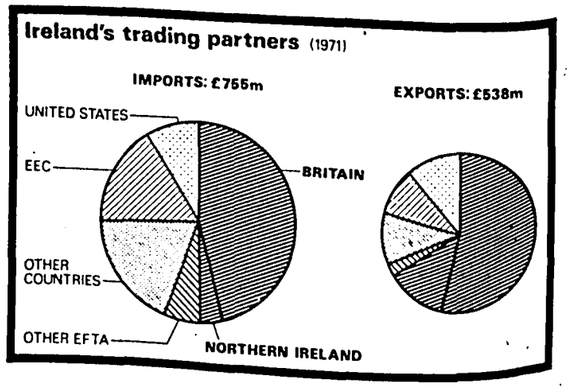
Already there are ominous signs of history about to repeat itself: Britain's share of new Irish investment plummeted last year to only 3% of all grants taken up and jobs created.

The Irish economy remains inextricably bound up with Britain's. But because the Republic only has 3m people, against Britain's 56m, and because Britain's national output is 30 times greater than Ireland's £1.71 billion (in 1970), the impact of a boycott would hit Ireland incalculably harder. British exports to the Republic, worth about £350m last year, only amounted to 5% of Britain's total exports even though that made Ireland Britain's third biggest market. Most of these were manufactured goods, such as cars and trucks, machine tools and agricultural machinery. The Irish also imported £25m worth from Northern Ireland, largely livestock for fattening and storage. Together the United Kingdom's exports made up nearly half of the Republic's total imports.

On the export side Ireland's dependence on Britain is even greater. Last year its combined exports to Britain itself (£260m) and Northern Ireland (£60m) added up to around two-thirds of its total export trade. The Irish marketeers will be using this overdependence as one of their main arguments in the coming campaign over the referendum on common market entry. Mr Lynch has claimed that Irish membership should bring the country's "first real chance" since political freedom from Britain in 1922 to achieve economic independence as well.



This is an attractive and a popular argument, but the facts suggest that such independence could be some time in arriving. Last year Irish exports to the common market countries were worth only £40m; imports topped £110m. Even assuming a great boost from Irish entry, it would take years to build this up to the dimensions of Ireland's trade with Britain. And some Irish economists are now suggesting that because of the common market's rules on agriculture, Ireland will become even more dependent on its agricultural exports to Britain once both have joined.



Despite Ireland's strenuous efforts at industrialisation, agriculture is still its biggest industry by a long way. It employs 27% of the country's labour force (280,000 people) and produces nearly half of its exports. Of this half, the lion's share—some 80%—goes to the British market. Britain, in effect, takes around 40% of Ireland's entire agricultural output, worth £120m last year. Irish farm exports have been helped considerably by the Anglo-Irish Free Trade Agreement of 1965. Under this agreement, Britain dropped most of its import restrictions on Irish goods, while Ireland in return committed itself to cutting its high tariffs (averaging 25% ad valorem in 1966, and built up in the protectionist 1930s) by an annual 10%, with the aim of completely free trade between the two countries by July, 1975.

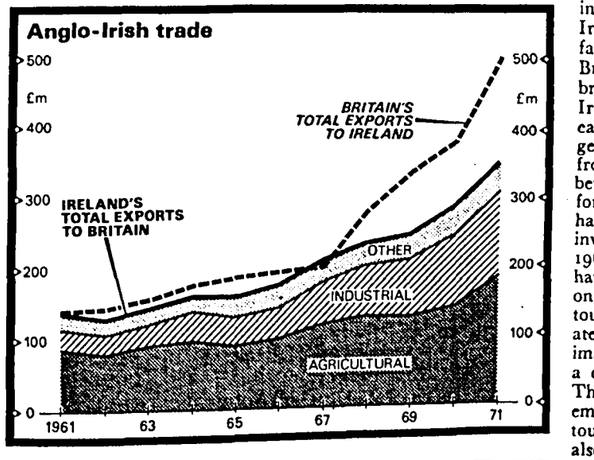
Beefing about

This arrangement brought immediate unrestricted access for Irish livestock exports to Britain. These are still Ireland's biggest agricultural export earner; they brought in £60m last year, £34m of which was Irish beef that usually acquires Scottish nationality by the time it reaches the butcher's counter. Butter, too, has been helped both by the initial increase in the British butter import quota from Ireland and its final lifting in April last year. Because of last year's shortage and the way it put butter prices up in Britain, Irish dairy farmers managed to push the value of their butter exports to Britain up by a third, to £14m.

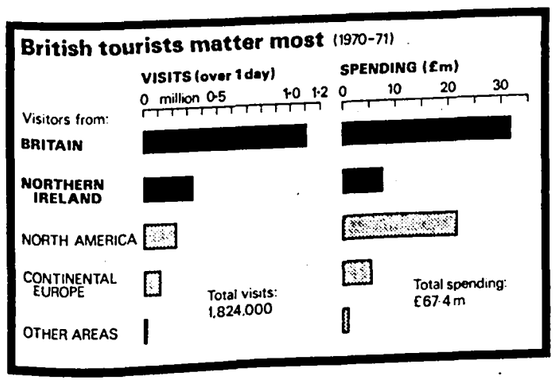
But in the Irish view there is another, less cheerful side to the 1965 agreement. About 40% of Irish industry will eventually be affected by the abolition of import controls on manufactured goods by 1975, and some of the less efficient ones are already grumbling at the thought of unrestricted competition from Britain. The shoe industry is only one example: in the past three years the removal of quota restrictions has increased shoe imports from 7% to 20% of the home market. It is estimated that between 1965 and 1970 imports of industrial goods competing

with Irish products have risen from 14% to 20% of the domestic market, whereas in the previous five years there was hardly any rise at all.

This could be very bad news for Ireland's persistent trade deficit (estimated at around £85m last year), were it not for the fact that Irish exports seem to be putting in a very buoyant performance (mostly to Britain) at the same time. While domestic industrial output went up by 35% between 1965 and 1970, the volume of Ireland's industrial exports grew by 80% over the same period. So perhaps free trade will not necessarily spell economic ruin for the Republic. All the same, the Irish economy will have to try harder to combat its high unit costs. Last year, prices rose by 9% and earnings by 13%, and there is little evidence as yet that the national wages agreement and the national price commission which started work last October have made any impact on the rate of inflation.



Like Britain's, Ireland's industry needs more capital investment, but again the country is heavily dependent on cash injections from abroad, and particularly from Britain. The bulk of Ireland's industrialisation since 1959, when its incentive programme for foreign investment was started, has come from British and multinational companies. Ireland offers non-repayable cash grants of up to 50% of fixed assets and extended tax holidays to foreign companies.

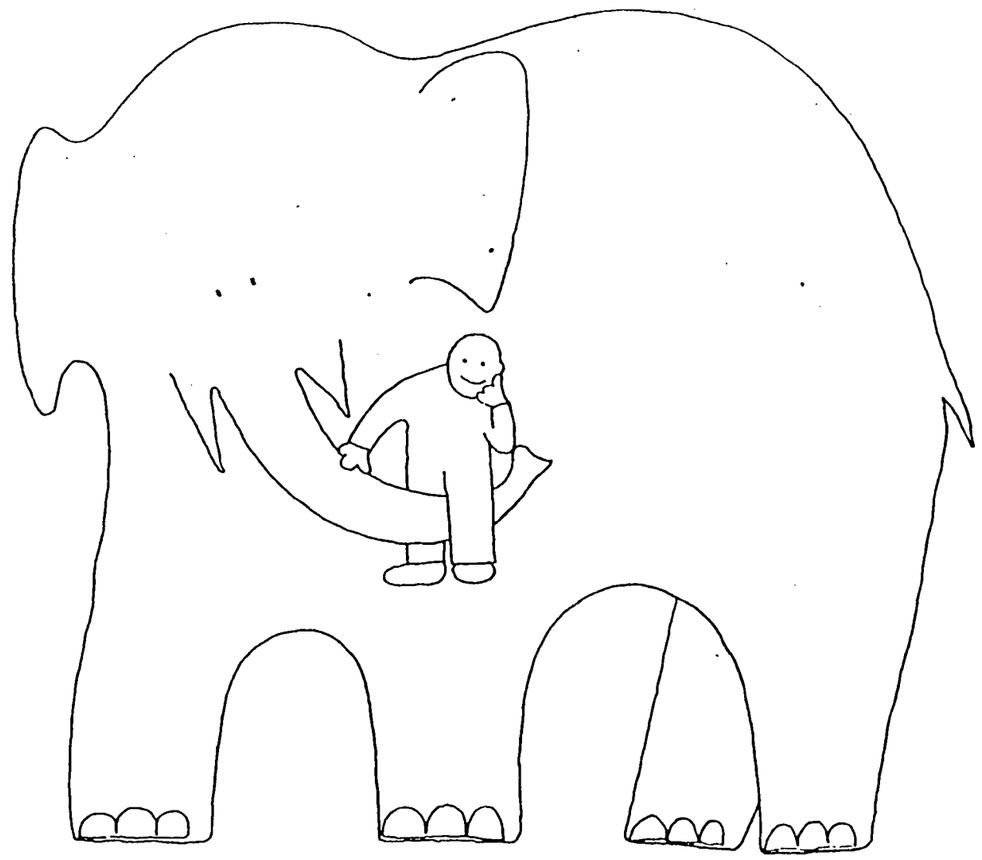


Around 40% of industry attracted to Ireland by these concessions is British. But the proportion has been falling. In the year to March, 1971, Britain accounted for only 163 out of 576 new projects (28%) and only £35m of the £161m capital employed (21%). Conversely there is a massive stock of Irish private investment in Britain, worth over £800m in stocks and shares, property, company holdings and unit trusts. This brings in an annual return of around £48m. If Ireland joins the proposed united stock exchange for the whole of the United Kingdom and the Irish Republic, British investment in Irish shares will be made easier still. Another symptom of the interlocking between the two economies is the 56% stake Britain has in Irish life assurance and the solid 86% share of the general insurance market there.

As in almost everything else, in the tourist market Britain is Ireland's biggest customer by far. Last year there were 1.1m British visitors to the Republic, bringing in £33m out of Ireland's £103m total tourist earnings. In addition, Ireland gets 13m day trippers a year from Ulster who spend £10m between them. Tourism accounts for 5½% of Ireland's gnp and had become a growing source of invisible earnings during the 1960s, but the Ulster troubles have now put a severe damper on it. Some of the overseas tourists do not readily appreciate the facts of partition and imagine bomb incidents to be a daily occurence in the south. The burning of the British embassy in Dublin has damaged tourism too. British tourists may also be staying away in protest against the IRA.

Since 1969, when the Ulster troubles erupted, tourist spending in the Republic has dropped by 12% in real terms when in normal times a healthy increase would have been expected. Last year alone saw an 8% drop. Now Bord Failte, the state tourist organisation, predicts even more gloom for this year. British Rail last week cancelled some of the cross-Channel services to Ireland this summer; on the route between Fishguard and Rosslare bookings are an estimated 70% down.

Even if there is not a fall-off among business visitors or British people going to see friends and relatives in Ireland, there seems very little chance this year of attracting new holiday visitors. On the most pessimistic assumptions, tourist earnings from Britain could drop by as much as one-third. And if there is a corresponding exodus of Irishmen in search of a little peace abroad, this could lop a full percentage point off Ireland's already unimpressive growth rate.



You'd be surprised where some of us end up

Emigration

Whether the present Irish setback will induce more emigration is another question. Although Britain remains an attraction for Irish emigrants, the flow had slowed to a comparative trickle in recent years. Back in the 1950s, Ireland suffered a net loss of at least 40,000 people a year; by the late 1960s the annual total had dropped to around 12,000, and in 1970 only 7,000 workers left to settle in Britain. But there are already roughly 1m Irish people working in Britain, who between them send back £8m to their families at home (remittances to Ireland from the United States and Canada are twice as high). And there is a large—although, because of the absence of immigration controls, unspecified—seasonal influx of Irish workers into Britain at harvest time. Ireland now has the highest unemployment rate in western Europe (10%), and has felt the draught, even at one remove, from Britain's relatively high unemployment. For a long time to come, whatever happens in the north, Ireland is likely to catch a heavy cold whenever Britain sneezes.

If your business is with Africa the mountain will come to you

And save you a lot of time and trouble.

Standard Bank is big in Africa, with over 1,200 offices in 19 countries of that big continent. Each office has an intimate understanding of local conditions and regulations and is ready, at a word from us in London, to help speed up whatever operations your business plans involve.

And you don't have to 'go to the mountain'. The mountain will come to you. Just drop the word to our Marketing Department at Head Office, 10 Clements Lane, London, EC4N 7AB (Telephone 01-623 7500). We will call on you, help formulate your plans and then get the strength of our local organisation working for you.

There are great advantages in having Standard Bank at both ends of your African operations. For a start, you don't need to get up from your desk.

BUSINESS

Subsidies all round, chaps

The big handout the Government gave the coal industry on Monday is going to be the first of a raft of subsidies to the nationalised industries this year. Mr Davies seems to have no other ideas about what to do

The way coal was treated has set a pattern. Within 24 hours of the news that the Government was giving the coal industry nearly £200m in various forms of cash and a further £60m in higher prices, the steel industry was letting it be known that its losses were running at £120m this year and called for special treatment too. Within 48 hours, the rail unions had turned down offers from British Rail of 8 per cent and then 10 per cent on their earnings and persisted in their own demand for 16 per cent. This, after the 25 per cent rise that the miners won, acknowledges that the railways are already receiving heavy subsidies (which the coal industry was not, at the time of the miners' strike). But it will be extraordinarily hard now for British Rail to convince the men that the cash will not be there for them in the end.

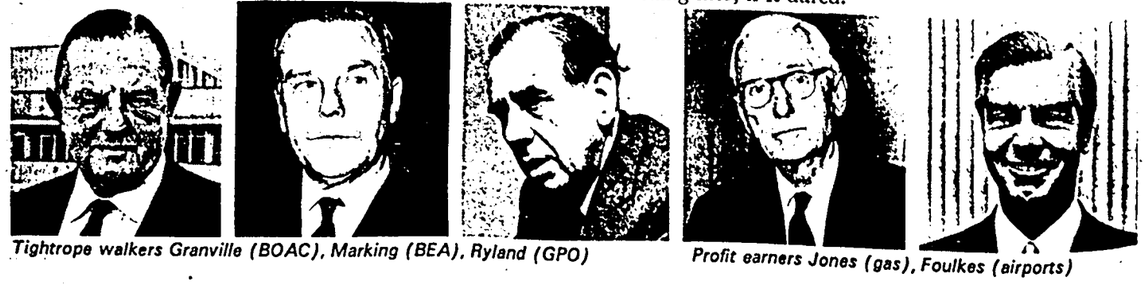
The Government is moving to a position in which it will soon be spending 1 per cent of the country's gross national product to shore the nationalised industries up, and the industries will be receiving 10 per cent of their revenues in the form of subsidies. An attempt will be made to gull the public that this is all the miners' fault, but the rot had set in long before. The nationalised industries have been prevented from putting up prices to pay for higher wages partly because demand for many of their products is waning and partly because it would have conflicted with the Government's undertaking to the Confederation of British Industry to make the nationalised industries conform to the 5 per cent price freeze. Now, to put coal prices up by much more than the 7½ per cent, or £1 a ton, just approved, would lose the National Coal Board a third of its business.

This extra 7½ per cent will bring in £60m a year at most, but the new pay scales are going to require at least £117m when all the costs are counted in. The most effective way to raise the missing £57m would be by shutting the pits making the biggest losses, so that the miners still at work would be producing coal at a rate closer to justifying their high wages. But that is not how the Government sees it. There was no hint in Mr John Davies's statement in the Commons on Monday that he was thinking of anything more constructive for the long term than another rejigging of the coal board's accounts, no hint that the Government is thinking of doing anything but set its face against rationalisations that are likely to lead to heavy redundancies, however overmanned or unprofitable the industry.

Mr Davies and the Department of Trade and Industry have had plenty of time to plan for the coal industry, and for the combination of fuels that Britain should be using in the 1970s now that there is indigenous oil and natural gas—and now that nuclear power, for all its immediate shortcomings, is emerging as a serious commercial source of electricity. There is no sign that they have used the time for any purpose other than the designing of new crutches for coal. The pits are getting an immediate grant of £100m to meet the immediate losses caused by the strike, the full cost of which will not be known with any accuracy until the extent of the damage underground is known. There is more than a hint that the figure could be increased if necessary. Then the industry's borrowing powers have been raised by £50m to £950m although it is far from the borrowing limit. Its permitted deficit has been increased, too, by £25m to £100m. In other words, the coal board is free to claim its subsidies in whatever way it finds most convenient, provided always that this does not involve loss of jobs. If the Government had the efficiency of the industry at heart, it would be encouraging Mr Derek Ezra to use his subsidies as golden handshakes large enough to make miners actually glad to close the worst pits. Then there might be some hope for the other nationalised industries.

Only a handful are still breaking even. There is the gas industry which might even marginally improve the £2m net profit that it made in its last financial year. There are the nationalised airports, whose earnings were 10 per cent down last year but are still comfortably above break-even. And there is the British Overseas Airways Corporation which is staying out of the red only by drawing heavily on reserves accumulated in past years and which will probably not be able to pay a dividend on that part of its Treasury capital not borrowed at a fixed rate. For the rest, the steel industry expects to lose £120m this year, and the electricity supply industry probably around £40m. The postal service could be running at a loss of £40m. British European Airways only

Money losers: Ezra (coal), Melchett (steel), Marsh (rail), Elliott (power), Price (waterways)



squared its accounts last year by drawing on a special government fund set up to compensate it for buying British aircraft, and that fund is nearly exhausted. Even the waterways, although their last published losses were just £2m, have costs almost exactly twice their receipts. Not so long ago, most of these industries were at least breaking even, and some of them were earning good profits. The start of their downfall was under the Wilson government, but the collapse has been precipitated under the Tories.

When the chairmen of the nationalised industries meet Mr Davies on Monday, he may ask them what they are going to do about prices, but they will ask him what he is going to do about these losses. The most anxious will be British Rail's relatively new chairman, Mr Richard Marsh, facing his first major financial showdown. The union's must be assuming now that they can get from him an offer of at least 12 per cent without having to take any very serious moves towards a strike. They know that a strike would upset commuters a great deal but have few visible effects on any of the country's freight traffic other than coal, 80 per cent of which goes by rail. And here, for the moment, the unions have the Government over a barrel. The militant train drivers might, perhaps, have one of their work-to-rules on the Southern Region just to test morale all round.

British Rail now gets £27m to compensate it for not putting up fares while the CBI's freeze was on, £40m for modernisation schemes in the London area and £60m for subsidising a batch of loss-making lines—yet it is still likely to show a £20m loss this year. The 10 per cent wage offer on Wednesday would cost £27m a year, which could point to losses of £50m next year, unless something is done. Lord Beeching started to do the necessary but was not allowed to finish. The railways are not, as it happens, the responsibility of Mr John Davies at the Department of Trade and Industry but of Mr Peter Walker at the Department of the Environment, but Mr Walker has given no indication that he will take any tougher a line. He has been even more ready with the subsidies than Mr Davies, if that were possible. Adding the losses of all the nationalised industries together comes to a sum not far short of £500m needed for subsidies this year.

The CBI's price freeze would not have got off the ground without the Government's assurance that the nationalised industries would observe it too. But the country is now beginning to see how dearly that co-operation has been bought. If it had curbed wage demands, or if it were likely even now to win effective action by the TUC in curbing them for the future, the price might seem worthwhile. But only a blind optimist would expect the TUC to give the Prime Minister such an undertaking at this juncture in time, or Mr Vic Feather to have the authority to make it stick. The mere fact that British Rail's offer to the unions was pushed so quickly above the old 8 per cent guideline shows that the miners' breakthrough will not be stopped in a hurry. The CBI will itself have the greatest difficulty in getting industry to agree to another year of 5 per cent and then only if the Chancellor makes very considerable tax concessions to industry in the budget. The CBI's decision has been postponed until after Mr Barber has uttered.

The nationalised industries now account for 10 per cent of gnp and private industry for the remaining 90 per cent. It is, however, the 10 per cent that represents some of industry's most basic services, like fuel, steel, transport and communications. The fact that industry still finds it cheaper to buy much of its fuel and transport, and at times its steel, from unsubsidised, private enterprise suppliers whenever it has the choice suggests that, in spite of their massive subsidies, there is still something basically unsatisfactory about the way these basic industries are run, and the simple justification for appointing an ex-director of industry like Mr Davies, otherwise lacking in political experience, to the hot seat in DTI was to do something about it. A restructuring of the whole policy of nationalisation is what the Government should be looking into, if it dared.

A budget for bulls?

What shares will be worth buying next week? Mr Barber seems to have given a lot of tips

There is now just over a week in which investors can rearrange their shareholdings in anticipation of the budget on March 21st. Here are some considerations, bets, hunches and guesses to bear in mind.

The market seems to be expecting tax reliefs of between £300m and £600m. In order to lift the growth rate of gross national product between the first halves of 1972 and 1973 to 5 per cent, *The Economist's* guess is that Mr Barber would have to give about £1,000m of tax reliefs. On Thursday, the National Institute of Economic and Social Research came out with the remarkable recommendation that he should give £2,500m (equivalent to halving earned income tax) instead. We do not expect that Mr Barber will go to anything like that; but obviously—compared with what was being anticipated until Thursday—there seems more chance of the market being pleasurably than unpleasantly surprised.

This is the main general bull factor. The main general bear factor is that the Government is trying to fix up a deal with the Confederation of British Industry to continue its price restraint, in return for some vague promise about wage claims which the Trades Union Congress would not keep. Any deal about price restraint announced on March 21st would keep profits down by more than it would be intended to do. Also, profits have been hit by more during the coal strike than is realised, and this will affect annual profits statements published even as late as the spring of 1973. However, any giveaway budget will presumably include some special fruits to investors. Quite a few of them were presaged in Mr Barber's budget speech last year. They deserve to be looked at closely now.

First, under the combined income-tax-cum-surtax that is due to come into effect in April, 1973, the tax deducted from dividends at source will be reduced to the earned income rate (at present fractionally over 30 per cent), and an investment income surchage will then be put on top of that in order to bring the tax on some investment income up to the unearned income rate (at present 38.75 per cent). However, Mr Barber said quite specifically in last year's budget speech:

> It will be an essential feature of the new system that this surcharge will only apply above a certain level of investment income, so that the first slice of such income will be taxed at the rate applicable to earned income. I regard the discrimination against investment income in its present form as a serious discouragement to saving, and I am sure that this must be changed.

Although this system will not come into effect until April 6, 1973, it would be logical for Mr Barber to give earned income relief on the "first slice" of investment income in this year's budget. There are some people who argue that this "first slice" could be very liberally interpreted, even up to £2,000 of investment income a year. Their argument is that age relief for retired small investors was increased in the last Finance Act so that it gave full relief for those getting less than £1,200 a year, but was simultaneously abolished as from 1973. With tapered relief above £1,200, this age relief now helps retired people with investment incomes up to well over £1,500 though below £2,000. Presumably Mr Barber in 1973 is not going to make small and aged investors worse off. We do not ourselves bet that he will grant earned income relief to all investment incomes up to £2,000 a year, but, either in 1973 or this month, he is almost certainly going to take the present 8½ per cent extra investment income tax off more peoples' investment income than the market at present realises. When this point sinks in, there will be rejoicing on the market, and the benefit should go especially towards high yielding shares and undated gilts.

The second big change promised last year was that a new system of corporation tax will be announced in this month's budget, which (to quote Mr Barber again) will end the present "substantial discrimination . . . in favour of retained as opposed to distributed profits." In other words, the new system is going to encourage dividend distributions. This new system will come into force from April, 1973, but it is not clear whether it will be for tax assessments that have to be paid on January 1, 1974, or just for assessments on profits earned in and after 1973-74. If the former, then profits earned in years ending in 1972-73 will be liable to the new system, so that dividend policies might be adjusted immediately.

We do not ourselves believe that boards of directors will pay out larger dividends to the extent that the new system might indicate that they logically should. But the market may think that they will do so, and start celebrating—with a panache that will depend on the level of corporation tax. As was argued in *The Economist* last week (page 87), a 50 per cent rate of corporation tax in the post-1973 system would increase the net income of companies by 11 per cent. It is at least conceivable that Mr Barber will want to cut corporation tax during the last year of the old system by an amount that will increase companies' net income by about that amount. But note that under the post-1973 system the gain will be higher for those that distribute more than the present company average of 65 per cent of earnings as dividends, and less for those that distribute less.

To summarise on these first two promised changes. The promised income-tax change is an argument in favour of buying high income shares this week rather than shares that have previously been supposed to promise capital gains, whereas the corporation tax change is an argument for going for companies with insecure cover for their dividends. There are quite a lot of ordinary shares in both categories, especially among small engineering firms with uncovered dividends that investors have hitherto avoided like the plague.

The third tax change that is due to come into effect in 1973 is the substitution of Vat for purchase tax. This

should be greatly to the advantage of goods now suffering the so-called luxury purchase tax rate (including cameras, records, and cosmetics) and Mr Barber could well make some preliminary tax cuts for them this year. Maybe the markets have already discounted these. If you don't think they have, possible buys are Dixon's Photographic, BSR, and the Gala cosmetics group.

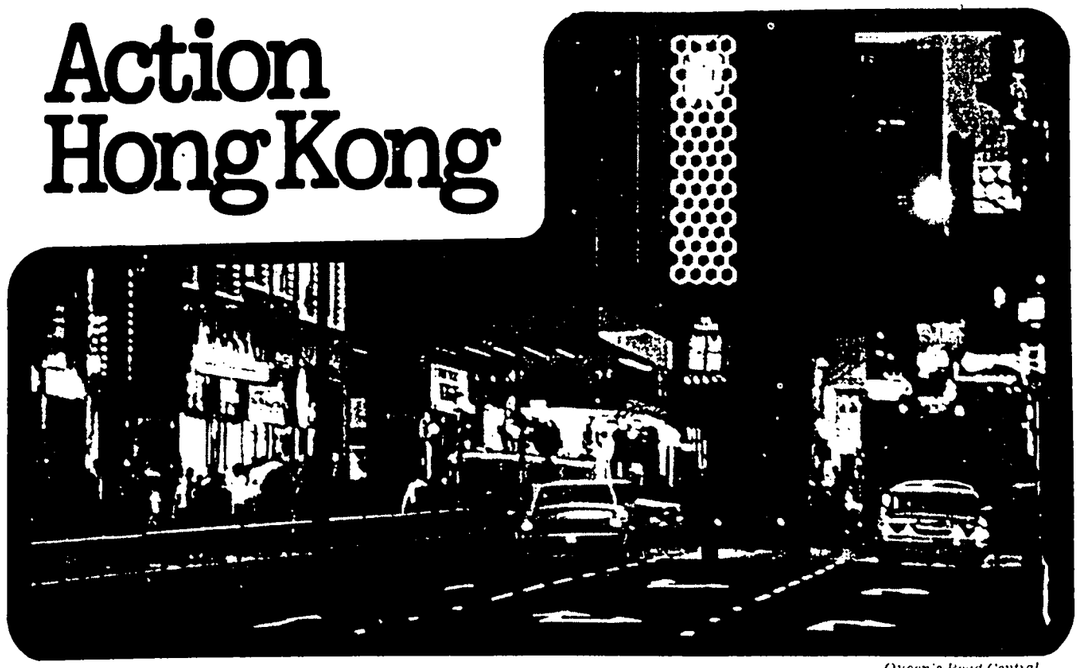
Next come two tax changes that are possible because of previous Conservative political statements. In speeches while in opposition, but not in the eventual Tory election manifesto, Mr Heath expressed support for relieving capital gains tax from unit trusts and investment trusts. Junior Treasury ministers made sympathetic noises about this in last year's debates on the Finance Bill. This could actually be an immediate bear point for some shares that have made large capital gains in the past year ; because some unit trusts and investment trusts have in anticipation been delaying sales of such shares, and could celebrate the relief (if it comes) by rushing out to sell them on the first day of the new tax year. More generally, however, the granting of relief from capital gains tax to unit trusts and investment trusts might lead to a surge of investment into them, and thus a rise in the share price of investment trusts. But if Mr Barber announces that he is going on to only the "Canadian system" of giving relief to the trusts, then any large post-budget rise in investment trust prices would be wrong (and you should then probably sell). Under the Canadian system trusts wanting to escape capital gains tax must form a "capital dividend account," which blocks the main advantage.

One "reform" promised in the Conservatives' election manifesto was the repeal of Mr Jenkins's disallowance in 1969 of tax reliefs on any interest paid out on loans. There is a case for allowing this relief against unearned income (because the allowance then occurs when the person has income bearing assets which could be sold as an alternative to borrowing, and the non-allowance of tax reliefs on borrowing charges is then a distortion in the capital market). There is no case for allowing the relief against earned income, because then you are giving relief for people who buy things out of borrowed money instead of their own money. But, since it is also obviously politically impossible for the Government to give the relief against unearned income only, any relief will be given against earned income as well. This is why *The Economist*—and probably Mr Barber's advisers at the Treasury—are against giving the relief ; but the Conservative Government may feel it is politically committed. If the relief comes, it will be good for life assurance business, which is a traditional form of collateral for borrowing. Theoretically, the general effect on the stock market should be only slightly favourable. But disallowance in 1969 caused a bigger fall than expected.

Some prophets believe the Chancellor might do something about the "dollar premium," under which Britons who buy foreign shares have to buy them from other Britons at a premium which this week stood at 32 per cent. Since Britain now has exchange controls both against dollars coming into the country and against them going out, it would theoretically be logical to say that all Britons could henceforth be allowed to buy shares directly in Wall Street (especially as before the end of the 1970s Britain will have to do this under European Economic Community rules). In this event, each £132 worth of British-held foreign shares would become worth £100 on March 22nd, which would be disastrous for investment trusts and other holders of these shares. A move of this kind therefore seems very unlikely ; and an alternative, smaller and more likely step is the removal of the so-called "25 per cent surrender rule," which would actually cause British-held foreign shares to rise a bit. Under the surrender rule a quarter of each £132 worth of foreign shares that you sell has to be converted at the non-premium price of £100, so that this is the equivalent of a small indirect tax on selling foreign shares. The removal of this tax might initially cause foreign shares in Britain to be marked up by about 2-3 per cent, but in practice this would soon be lost by a fall in the premium itself. Because of the very outside chance of something being done to start to whittle away the premium regulations themselves, it would be better not to buy foreign shares this week.

Key indicators: British economy

Retail trade
Sales by food shops slipped back in January after a good December. Other sectors showed gains.



Consumer credit
New credit extended in January was £192m, continuing the average level since the July measures.

Balance of payments
Further £240m added to current account in fourth quarter giving a record surplus of £952m in 1971.

Action Hong Kong

Queen's Road Central

Biggest boom in the smallest area. Find out about your opportunities with the Hongkong Bank Group.

Hong Kong offers the most astonishing economic story in the world. A minute colony with no raw materials to speak of, an obvious shortage of land, and a population that has more than doubled in the last twenty years. Yet their budgets have been in surplus for most of the last decade. Per capita income is third only to Japan in Asia.

Industrialisation is just over 20 years old and is expanding rapidly. The opportunities for foreign companies are there. By the end of 1970 there were 696 foreign companies registered in Hong Kong.

Have *you* looked at your company's prospects in the Colony?

The Hongkong Bank Group can offer you the authoritative and expert advice that you will need in this and 35 other countries. A 16 page booklet has been prepared, summarising the economic conditions in Hong Kong. Send for a free copy now—and be briefed by the experts.

1. The Balance Sheet and Profit and Loss Account have not been drawn up in accordance with Schedule C of the Rules appertaining to Law No. 15 of the year 1960 for Commercial Companies, but in accordance with accepted banking practice.
2. Assets and Liabilities in foreign currencies have been expressed in these accounts at middle market rates of exchange ruling at 31st December 1971.

BUSINESS *Britain*

Cut all taxes by one-sixth ?

The National Institute of Economic and Social Research believes that Britain's real gross domestic product was growing at an annual rate of 4¾ per cent until very recently, but that the country is now going into an export-led recession. Partly because of an unsurprisingly gloomy forecast for exports, but also because it believes that the post-last-July boom in consumers' hire purchase expenditure will be subject to a massive fading effect, it now estimates that real gdp between the first halves of 1972 and 1973 is on track to rise by only about 1.9 per cent. Since, like *The Economist*, it believes that a rise in real gdp of 5 per cent will be needed to make any inroad into unemployment, it advocates that Mr Barber should seek to re-stimulate total demand in his budget by a full 3 per cent. After allowing for fiscal drag and a rather high estimate of the total proportion of tax cuts that might go into saving rather than spending, this leads it to say that an almost incredible tax cut of £2½ billion will be needed.

That would mean an average cut in all of Britain's tax rates of something like 15½ per cent. Although the institute believes that a continuing improvement in Britain's overseas terms of trade should at present keep a recession-hit Britain in balance of payments surplus during 1973, it agrees that reflation on the scale that it wants would cause balance of payments trouble during that first year of Britain's entry to Europe. But if "a clear conflict does emerge between maintaining employment and maintaining a fixed exchange rate, it is now widely accepted that it is no longer employment which must necessarily give way."

The publication of these recommendations is liable to be greeted in Whitehall with a manic screaming. The whole tone of recent official comment has been to emphasise how the economy was picking up in the second half of 1971 ; the Bank of England's "Quarterly Bulletin" this week twangs almost exclusively on this string. The institute does not deny this recovery in the months that are past, but it says that it will fade dramatically from now on. *The Economist* had also expected some fading, but we had frankly only been bracing ourselves to say that perhaps the Chancellor should give away up to £1 billion. It had also seemed possible to us that the Chancellor, probably with opposition from his advisors, might conceivably go as high as this. If he had decided to dare to do so, he was no doubt anticipating until this Thursday that he would be hailed on March 21st as the boldest tax-cutter of all time ; he must have had visions of a great volume of grateful cheers swelling up to meet him then.

Bolshy buyers

Now the national institute has told Mr Barber that unless he gives away two-and-a-half times as much as anybody had previously thought possible, unemployment will probably increase. And the awkward fact is that the institute, although we and others have often criticised some of its detailed views, does have the best recent record among British institutions for its macro-economic forecasts—certainly far better than the Treasury. This chastening thought might now conceivably cause the Chancellor to lift his tax reliefs above even £1 billion on March 21st. But he might then have to lift them over and above a lot of dead bodies in the Treasury and the Bank of England on the way. He would be wise to cut taxes a lot, but tell the Bank to stop reflating the money supply by the present (October through January) annual 23 per cent.

The latest retail spending figures, for January, go some way to confirm the national institute's view that the economy could be slowing. The volume of retail sales edged marginally down in January. During the latest three months, November to January, it therefore managed only a meagre ½ per cent increase over the previous three months. Last October's astonishing shopping spree turned out to be a flash in the pan.

Officialdom can parade lots of arguments why these retail figures could be misleading. Shopping takes rather less than half of all consumer spending. The main reason for January's disappointing outcome was a 3 per cent dip in the business of food shops, an erratic element at the best of times and an increasingly poor reflection of British eating habits ; this part of the index does not take account of food sales in department and chain stores, which have been growing rapidly in recent years.

Food shops apart, most other trades seemed to be holding up reasonably well. Durables picked up again after Christmas, mainly because of colour television. Clothes and shoe sales were still coasting along.

The power cuts will have cut sales in February, but not by as much as they cut production. Shops are probably restocking now, sometimes with supplies diverted from exports. During the power cuts many British businesses naturally failed to meet export deliveries on time. These are the sales that they regard as permanently lost.

Pollution

In the dumps

Strictly as a short-term measure, the bill that the Government published on Wednesday, with its tough penalties for littering the country with poisonous wastes, will do well enough. It has taken public opinion an inordinately

long time to wake up to the scale and spread of cyanide dumping. Whitehall had even been advised to dismiss some of the early reports as malicious gossip. But the more poison was found on widely separated dumps, the less could the Government allow the situation to drift until the bill for local government reform, which is Mr Peter Walker's chosen instrument for pollution control, takes effect in 1974.

With the wisdom of hindsight, it is easy to see why Parliament and the public remained in the dark for so long. On a dump one bit of rubbish looks much like another, and people who did start talking about what came out of industry's drains ran the risk of prosecution. This nonsense has persisted for more than a decade, ever since a well-intended private member's bill was introduced in 1961 to control the discharge of waste into rivers. It was one of the more complicated private member's bills to get on to the statute book ; and, while it obliged industry to give the river boards full details of what was in the waste and in what quantities, a clause was slipped in that made it illegal to pass this information on to anyone else. This ban has been held to apply to waste dumped on land too, and the Royal Commission on Environmental Pollution protested forcefully about it in its second annual report published on Tuesday (Cmnd 4894) :

> It is in the public interest that information about wastes should be available not only to the statutory bodies which have a right to demand it but to research workers and others who can make use of it to improve the environment. It is common knowledge that some industries have to dispose of . . . pollutants. Unless adequate information is available about these discharges, it is impossible to say whether or not they constitute an ecological hazard.

Children got at this lot

The gag on revelations was originally thought necessary to safeguard the secrecy of ultra-secret industrial processes. The commission dismisses this, a decade later, as eyewash. Many industries are still coy about their use of many pollutants. Imperial Chemical Industries, the main supplier of cyanide in this country, does not say how much it sells. The oil companies do not say how much lead goes into their petrol, although (or, could it be because) its use will probably be banned on health grounds. This creates an uncertainty about the size of the problem that can only encourage the ecologists' despondent belief that we are being poisoned in our beds. Sensible discussion is hardly likely while only one side knows the facts.

The Government has to legislate for two quite separate hazards. Waste can be dealt with by first deciding how much pollution nature can cope with, and banning the rest. If industry is then made to pay heavily for discharging untreated waste, it will have an overriding motive for building expensive treatment plants. The best suggestion yet for finding the right scale of charges is to put licences to pollute up to auction, and see how much industry is prepared to bid for them. But this system requires that the Government has a register of the tonnage of poisonous materials used in industry.

The bigger hazard is that industry will come up with another DDT before anyone realises it. New chemical compounds and new combinations of metals carry risks that range from the skin rashes caused by enzyme detergents to more serious and long-term side effects. The royal commission suggests in all seriousness that they should be treated and tested with the same caution applied to drugs, lest we release a new product into the environment that we could later have cause to regret. This really is a much bigger danger than cyanide on municipal tips.

Computers

Spreading it round

Government departments are going to start purchasing computer software separately from computer hardware. This is something of a revolution. The change should save the Government money as contracts flow to firms with greater software expertise than the hardware manufacturers possess. The new policy will not only bring more business directly to the independent software houses ; in some cases the independents should be able to re-sell particular knowledge gained on Government contracts.

The change is a victory for the Software Houses Association, which has been trying to educate Government about software for some time, and a defeat for International Computers as the only British-owned hardware manufacturer. ICL receives a great deal of the Government's business and automatically gets the software end of the contract passed to its software subsidiary, Dataskil, even if it is not the best available software house. The same has happened when one of the other mainframe manufacturers won a government order. The independents, some of which rank among the world's best software companies, were virtually excluded from government business.

Trade unions

Not even Lord Cooper

It is an unexpected bit of bad news for Mr Robert Carr, the Secretary for Employment, that the National Union of General and Municipal Workers has decided not to defy the Trades Union Congress. It is going to be an unregistered union under the new Industrial Relations Act. The move will be made official in the next fortnight. The NUGMW is one of the most right-wing unions in the TUC, and it is no secret that it regards the TUC line on not registering as absurd. Last year, its general secretary, Lord Cooper, openly supported registration. Many other unions, like the Transport and General Workers, led by Mr Jack Jones, privately hoped that the NUGMW would be as good as its word, stay on the register and giving them a chance to follow suit on the grounds that when one big union had sold out, the rest had no alternative.

But the NUGMW did not relish playing the scapegoat. It also realised that Mr Carr was not encouraging employers to use the act to sue strike leaders. Of course, if no employers use the act, the drawbacks of not being on the register are reduced. The NUGMW was also afraid that, if it registered, other unions might try to poach its members. This was not a very real fear. So long as it was not thrown out of the TUC, the 1939 Bridlington agreement would make this impossible.

Deregistration will cost the NUGMW around £150,000 a year in lost tax relief. The union is going to make it plain to Mr Vic Feather that it still regards the TUC policy as silly, and will go on pressing for a change. Although other unions, including Mr Clive Jenkins's Association of Scientific, Technical and Managerial Staffs, are anxious that the TUC should haul itself back from the edge of the cliff, it is hard to see how common sense will be made to prevail.

The odds now must be that the TUC will be able to uphold the deregistration policy at this summer's conference, although there may not be enough support to expel those rebel unions, like the seamen and bank staff, who have already registered. The Government does not stand to lose anything if the unions will not stay on the register, but Mr Carr is anxious that the unions should be seen to be co-operating. Predictably, his "softly, softly," approach has led unions like the NUGMW to reckon that deregistration involves less risks than it should.

Hovercraft

Why did it?

A 50 mph wind was blowing last Saturday evening against the ebb tide, raising short, steep waves of up to 6ft off Clarence Pier when the Isle of Wight to Southsea hovercraft, with 27 people on board, came in to land. Eyewitnesses say that it was attempting to turn across the tide towards the pier and, as it did so, the downwind side of the 48ft-long machine dipped sharply and the hovercraft capsized with 27 people on board. This makes it the sixth hovercraft of the SRN5/6 type known to have overturned. In an ordinary boat with an enclosed cabin there would have been few survivors. But hovercraft are built to aircraft safety standards, where windows are designed to be kicked out, and all but five of those on board on Saturday got out alive.

Inspectors sent to Southsea by the Department of Trade and Industry should have completed their report by the weekend. Hovercraft engineers have tended to discount the possibility of mechanical failure, or that routine repairs to the hovercraft skirt carried out before it left the Isle of Wight could have had to do with the accident. They also argue that this particular type of 10-ton hovercraft has made 117,000 crossings of the Solent since it went into service, many in much worse weather, and has survived 12ft high waves in the open sea.

Not the way they went before

The previous accidents have shown that hovercraft can capsize even in calm water, and two trainee pilots have capsized one (so has an experienced pilot). Another two overturned while attempting to beach through surf. The machine appears to go into a skid much as a car does, with its skirt dragging and pulling one side down until the hovercraft rolls gently on to its back. After these somersaults, and a great deal of work in test tanks to see how fast a hovercraft should manoeuvre in what height of wave, a whole new set of piloting instructions was worked out and a number of changes were made, the most important of which was to give the hovercraft a more flexible skirt that doubled as a shock-absorber and stopped the craft rattling over the waves like a tea-tray. Some American designs show rather more radical modifications to the shape of the hull.

But there are obviously gaps in knowledge about hovercraft behaviour. Last Saturday, the hovercraft did not roll over gently, as others have done, but flipped upside down almost without warning. The statement put out by the British Hovercraft Corporation immediately after the accident about

> technical investigations . . . being instituted to reproduce the precise conditions of the incident

suggests a combination of weather conditions that had not been foreseen, either in the test tanks or the pilots' operating manuals.

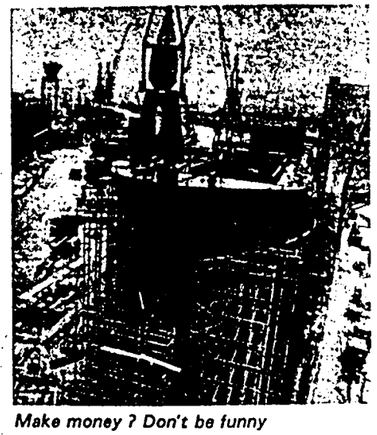
Nuclear power

It wasn't invented here

Round and round go the arguments over what kind of nuclear power station Britain should build next. But the issues are better defined than they were a few months ago. Almost everyone agrees that the advanced gas-cooled reactor, the kind Britain is now building, is unlikely ever to be ordered again. The AGR was probably dead anyhow, but recent suspicions that corrosion will reduce its eventual output of power have reduced its chances of surviving to virtually zero.

The main fight is now between the British-developed steam generating heavy water reactor and the American-developed pressurised water reactor. The SGHWR's advantages mostly boil down to nationalism and bureaucracy ; the PWR's to commercial profits. The SGHWR would need considerably more development work before a commercial version could be built, which may be one of its virtues in the eyes of the overmanned Atomic Energy Authority. Moreover, switching from the AGR to another British reactor would offend the AEA's sensibilities much less than adoption of the American system, after all that has been spent on developing atomic power here.

The main supporter of the American reactor is Sir Arnold Weinstock of the General Electric Company. He is well known for liking to see a return on his money. If Britain should buy PWR know-how from the Americans or the Germans, a deal would undoubtedly be made to give British industry in general, and his group in particular, an increased share of PWR component business in other countries. There are arguments over how much this business might be worth, but it would almost certainly run into hundreds of millions of pounds during the next decade. GEC's main ally is a certain faction of the Central Electricity Generating Board which is tired of constructing pioneer reactors and would like to build something tried and true for once. However, if a PWR is ever ordered, the CEGB will have to curb its tendency to swamp the construction company with suggestions for changes in its design. CEGB engineers should soon have their hands full overseeing the construction of the first commercial-size fast breeder reactor. So should the AEA, for that matter.



Shipbuilding

Now they all want cake

The Government's £35m handout to a selling plater like Upper Clyde has started the rest of the British shipbuilding industry racing for its share. The shipbuilders' national association put in a four-point claim on Wednesday for between £100m and £150m. No one could blame them after Hill Samuel's report to the Government made it clear just how little chance there is of the three yards on the Upper Clyde ever making money.

The queue does not end with British shipbuilders. Both the American companies that have shown an interest in picking up the fourth yard at Clydebank want comparable concessions. The Government's six-man team that arrived in Texas on Wednesday found both Marathon and Breaksea Tankers waiting with their hands out. If there is no injection of around £12m to help with capital investment (put by Breaksea at £18m in all) there will be no deal with either.

The whole basis of the Hill Samuel report turns on more than doubling productivity at Govan and Scotstoun over the next five years, with Linthouse being phased out over the first two years. Assuming that the new company will be able to persuade customers to buy double the number of ships at economic prices, this would give a marginal return by the fourth year. But, as the report makes plain, the rate of return would be far short of what would be commercially acceptable. By the fifth year, provided the market for ships had recovered from its present gloom, UCS should be producing a 10 per cent return on capital before tax and interest. At that time, says Hill Samuel, it might be possible to involve commercial interests in the company.

Make money ? Don't be funny

Even as dismal a performance as that depends on there being no increase in the wage bill, except to pay for increases in productivity. But that hope is already doomed : the unions even threw out wage rises of £6 a week over two years. There is no possibility of wages being contained even at that level. The men have had clear proof that what matters to the Government is saving jobs, nothing else. Of course the managers suffer the Government's displeasure. They get the sack, which will make it doubly difficult for UCS to meet yet another of the Hill Samuel assumptions : finding and keeping adequate middle management to run the yards.

Industrial relations

Bathgate blunder

The management of British Leyland's Bathgate plant should learn some new tactics. Threatening to close plants has had little effect on its workers' attitudes, neither in the past nor in the recent strike, which ended on Wednesday when 3,500 men agreed to go back with a 12.5 per cent wage increase in their pockets. After nine weeks on the picket line, they had gained half the £8 they sought to bring them closer to parity with the Midlands. The £4 increase lifts the basic weekly rate to £36.30 for skilled production workers, which is good going in Scotland.

Once again, it fell to BLMC's industrial relations director, Mr Pat Lowry, to straighten out the situation. Besides the cash, he had to concede better layoff pay and agree to consider the parity question yet again. One of Mr Lowry's main problems, it seems, is that he lacks authority to deal with local directors. He is not on the main board, even though industrial relations should have top priority in BLMC if any job has. It is not as if there is a problem about finding him a place : there are two vacancies following the retirements of Sir William Lyons and Mr Lewis Whyte.

The 380,000 teachers have turned down a 7 per cent offer, and their claim has gone to arbitration. The outcome of the arbitration is binding, so at least there seems to be no threat of a strike. There is also little danger of a strike on the farms, though the farmworkers' claim for an £18 minimum wage has been turned down flat. Last October, the farmworkers got a 9 per cent rise, which gave them a minimum wage of £16.20.

The farmworkers will formulate another claim in May at their annual conference in Weymouth, and this may be as high as 54 per cent. But only half are union members.

Monopolies

Wake up

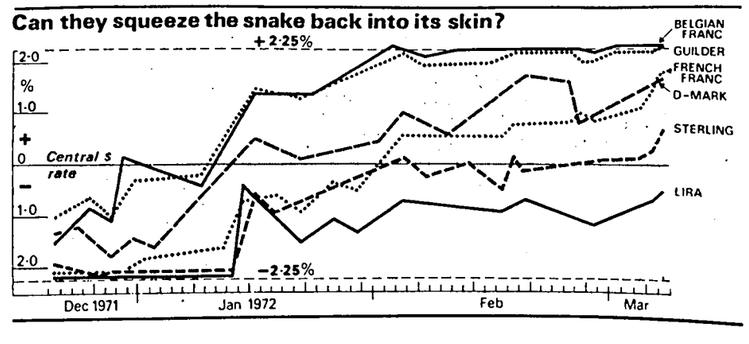
The Government really must get on with its promised facelift of Whitehall's anti-monopoly machinery, because the proceedings of the present Monopolies Commission are turning into a joke. After all that has been said about the need to introduce some sense of urgency into its investigations, it is still able to report this week, without visible trace of embarrassment (House of Commons paper 149), that it has not finished investigating one industry referred to it five years ago, in 1968, or another referred to it in 1969. This is after the Government has strengthened its staff and authority.

There is no excuse for the commission to treat its work as if it was of so little public importance that it hardly matters whether a report is completed or not. The fire insurance industry, which it has apparently found so baffling ever since 1968, operates a number of well-known, and not too serious, restrictive practices, and the commission should have been able to make up its mind about them long ago. Likewise asbestos, which has been on its books since 1969. If these were isolated references, it might be argued that they present special difficulties, but the commission has taken five years to report on an industry before now and three is still about par for its course.

Mr Nicholas Ridley, of the Department of Trade and Industry, has assured the Commons that all outstanding inquiries should be completed before the end of this year. But only when a bomb is lighted beneath it does the commission act with anything approaching speed, and, even then, it can chew over mergers for months. The Government asked it last November to look into the price that the Roche company was charging the National Health Service for two widely used tranquillisers. This is the kind of urgent small-scale inquiry that the Government is increasingly likely to want the commission to carry out. Four months later, there is still no sign of its report.

BUSINESS *International*

Yes, they hatched a snake



A rare current of agreement ran through Brussels on Monday and Tuesday, as the finance ministers of the Six charged towards a goal that only three months ago seemed well beyond their reach. The Six are once again about to embark on their first experimental try at narrowing the margins between their currencies, a step seen by Eurobugs as only the first towards creating a single European currency sometime during the 1980s. It is planned that a bumper session of foreign, farm and finance ministers in 10 days' time will put the official imprimatur of EEC members on it.

The Six's present intentions are :

1. The dollar rates of the five currencies of the common market (Luxemburg barely has one) plus sterling will be held by central bank intervention to within 2.25 per cent of one another, compared with the 4.5 per cent dollar spread allowed by the Washington agreement in December. This will probably start in the spring or early summer when "natural market forces" are expected to have brought these dollar rates to somewhere within the 2.25 per cent range compared with the more than 3 per cent spread which was separating the Italian lira at the bottom from the Belgian franc at the top until this agreement (see chart). What market forces mostly mean is central bank nudging. Obediently, the lira moved, in anticipation, close to its central rate on Wednesday. Disobediently, the stronger currencies tried to move over their top dollar rates. It is quite clear that the next dollar exchange rate "crisis" will come very soon indeed.
2. Europe's currencies will try to be held inside the celebrated "snake" wriggling within the overall 4.5 per cent dollar "tunnel." When the top of the snake hits the top of the tunnel, then the central bank of the top currency will intervene in dollars in the usual way to stop it going through the top. When the snake hits the floor, it will be up to the central bank of the bottom currency, with help from its mates and $4 billion worth of short- and medium-term credits, to stop it falling right through.
3. Anywhere between these extremes the Six will intervene in each other's currencies (not in the dollar) to keep the snake inside its 2.25 per cent skin. Since the market in European currencies against one another (for instance in the Belgian franc and the lira) is pretty thin, this aspect of the scheme should give rise to some nice anomalies in the dollar cross-rates.
4. A system of central bank swaps in one another's currencies will be set up by the central bankers to help this.
5. Every month the central banks will settle up with one another. First thoughts follow the British and German preference that debtor countries should settle up in gold, SDRs and hard currencies in proportion to the composition of their total reserves.
6. Members will control speculative inflows of dollar capital, in their many different ways.
7. Germany gets the European economic committee it wants, with few powers initially to vet national economic policies, but with procedures that might one day bite if some countries find themselves heavily in hock.
8. It is now agreed by one and all (even publicly by the commission) that individual states will be allowed to change their dollar parities as they wish.

The scheme is well designed for calm times. When the markets get rough it simply may not work. In typical common market style the scheme means different things to different people. Herr Schiller is only going along with it because of the pressure on him by Herr Brandt to do so. The French are only being nice to the Germans about the economic committee because Herr Schiller is toeing the line. Britain and the Scandinavians have told the Six in a private political meeting what their pound of flesh for co-operating would be. At the European summit in October they will specify that a real community regional policy (on which Signor Colombo of Italy also insisted on Tuesday with some success) and a community industrial policy should be set under way. But it remains to be seen whether even this quid pro quo will prove sufficient compensation to Britain for the unfortunate new elements of rigidity in rates which the agreement at least intends to introduce.

Can they squeeze the snake back into its skin?

French prices

Lies, and . . .

Paris

Did consumer prices in France last year rise by 5.7 per cent or 9.5 per cent? According to the Insée (Institut National de la Statistique et des Études Economiques), they rose by 5.7 per cent. But according to the communist trade union, the CGT (Confédération Générale du Travail), which has started to publish its own index, Insée's calculations—which are used in negotiating labour contracts—are rigged.

The CGT claims that the shopkeepers questioned by Insée's investigators, well aware of which 295 items go into its index, raise the prices of index items less than others; and that Insée is unduly quick to exclude price increases that are due to improvement in quality. For example, if the price of a pair of socks goes up from Fr6 to Fr7, and the manufacturer has added reinforcing in the toes and heels, Insée argues that the price has not risen, because the socks are now better. Under the CGT's calculations the price is deemed to have risen because the consumer has no choice but to pay more. The CGT bases its index on 363 articles that would be needed by a working class man with a wife and two children living in rented quarters in the Paris area. According to the official index, the French as a whole spend only 4.1 per cent of their income on their housing. The CGT's index lists the typical family as spending 16.8 per cent of its budget on housing.

Insée is indignant about the new index. Its investigators make 160,000 price-checks each month, whereas the CGT makes only 15,000. The government has been congratulating itself because the latest official figures, which showed a very low rise for January, seemed to indicate that its price control contracts, signed last autumn, have worked rather well. If the public believes the CGT rather than Insée, the economic consequences could be dire. French incomes policy, such as it is, is based on wage contracts between unions and the government and other employers that incorporate the threshold principle—under which the award is scaled up by agreed amounts if the cost of living rises by more than an agreed percentage. The government is already running into heavy weather in renegotiating the current batch of public sector contracts. Thursday's annual report on the French economy from the OECD rightly argues that "price tensions emanating from agriculture and other protected sectors of the economy like private and public services and construction have been more permanent and insidious sources of inflation" than demand pressures, rising import prices and the like. Partly because it sees no present signs of demand-pull inflation, the OECD thinks that France is well placed to achieve its growth target of 6 per cent a year over 1971-75. But a further quickening of cost-push inflation—measured by any index—would slow this down.

Pakistan

Peasants' revolution

Karachi

President Bhutto's replacement of his military chiefs has attracted most attention in Pakistan this week (see page 46); but his land reform proposals, announced two days earlier, will make a much bigger impact on the country's political and social balance in the years to come. To end "the oppressive and iniquitous agrarian system under which the people have suffered in silence for centuries," he has slapped a stiff ceiling on the extent of agricultural acreage that may be held by any one family. The maximum has been lowered from 500 to 150 irrigated acres, and from 1,000 to 300 unirrigated acres. Special indices will take account of the varying productivity of different land.

The surplus holdings of land are to be seized without compensation. Under ex-president Ayub Khan's efforts at land reform in 1959, the peasants paid for the land, got into debt and often had to sell their farms back to the former landowners in consequence.

This time the land is free

President Bhutto is also imposing more stringent rules against evasion—by preventing landholdings from being split among the numerous members of each landowning family.

The success of the reforms will hinge on the economic survival of the new farmers and the impact on total agricultural output. The land transferred will mostly be of below average quality. Landowners will naturally tend to keep the best farms for themselves, the indices notwithstanding. The new farmers will be short of working capital for seed, fertilisers, machinery and tractors, and the reservoir of know-how that the big farmers now have. Mr Bhutto has therefore promised £80om to the farmers over five years, from sources yet to be revealed.

With 45 per cent of Pakistan's gnp coming from agriculture, his political survival could be at stake. The reform will hit hard at the feudal chiefs and landlords who exert powerful influence in Pakistan, especially the tribal "sardars" in the restless provinces of the North-West Frontier region and Baluchistan. Army generals are being placated: agricultural land given to them will be exempted from the reforms, but not that belonging to government officials who own more than 100 acres; holdings of this sort have been regarded as a normal benefit of office hitherto. Tenants who are not given land under the reforms will be spared land taxes, water rates and the cost of seed. If the reforms are implemented in a silly way, they could stop the green revolution, which has depended mostly on sizeable farms hitherto. But if they are implemented intelligently then, despite their confiscatory philosophy, they could be the most valuable piece of social legislation in Pakistan's short history.

Swiss housing

Modesty first

Lugano

Swiss democracy has been in action again. The Swiss people voted down a proposal last weekend that would have compelled the federal government in Berne to set up a fund for low-cost housing, financed by a £50-a-head annual tax on the entire labour force and an 8 per cent levy on exports. This was the second referendum on housing accommodation in little over a year. The controversy induced the government to introduce infinitely more modest proposals of its own which favour the building of low-cost housing and give tenants

Who'll get the flats at those rents ?

greater protection.

The housing shortage is most acute in the big cities like Zurich, Basle and Lausanne, and popular retirement areas like Geneva and Lugano. Despite the revaluation of the Swiss franc last May and continued price rises, the influx of wealthy foreigners, who can outbid the locals, continues. So, too, does that of less affluent ones—mainly Italian workers.

The non-Swiss population now numbers over half a million, or 17 per cent of the resident population of 6.2m. Naturally the proportion is much higher in some cantons: 1 in 3 in Geneva, for instance, where various United Nations and other international organisations have headquarters as well as many multinational companies; and 1 in 4 in the Italian-speaking region of the Ticino, which is a favourite for wealthy retired Germans and for Italians, who consider a piece of Swiss real estate a useful insurance against uncertainties at home. Even in the Ticino, where foreign residents have been generally tolerated because of the boost they give the local economy, irritation is mounting. Low-price accommodation is scarce, while new luxury apartments blossom on all sides. In a startling piece of non-Swiss behaviour, the occupants of two blocks of flats recently staged a rent-strike.

Fiat's spies

Whatever.for ?

Rome

Italians have always known that Turin is really a cover name for Fiatville. They have therefore been less surprised than many foreigners to learn that Fiat does indeed run its own secret service. What has come as a surprise is that charges have been brought against those in charge of it: 77 people are being indicted for illegal private investigations, including Signor Gaudenzio Bono (deputy chairman of Fiat), Signor Niccolo Gioia (co-director-general), Signor Umberto Cuttica (personnel director and responsible also for the counter-espionage bureau), and three top police officials. It is alleged that several policemen were on the company payroll, and corruption charges have therefore also been laid.

Fiat's troubles began when it sacked a former carabiniere who had been employed to spy on his workmates. He demanded termination pay not as a blue collar worker, but at the conspicuously generous rates that apply to white collar workers in Italy. Then, last August, a junior magistrate ordered the confiscation of Fiat's secret files on employees. These apparently revealed that dossiers were kept on employees' private lives and political convictions, as well as a list of police officials on the company payroll and their remuneration.

Past history makes this a very hot political potato. In the 1950s the American ambassador, Mrs Clare Booth Luce, threatened to take away defence contracts from Italian firms unless they weeded out their reds. Political sackings were common up to the 1960s. Only recently has Fiat learnt to live with the official communist unions. Pressure is still directed against extreme left-wing groups like Lotta Continua, whose disruptive tactics are aimed at both unions and management. Fiat could assume that the authorities would vet those working on military projects, such as the assembly of F104 fighters and the construction of Fiat's own G91 jets. But why the vast majority of Fiat workers—making lorries, cars and tractors—had to be scrutinised too is not immediately explicable, except as a survival of the class-war attitudes that still pervade Italian labour relations. The left is boiling with righteous indignation.

Suez pipeline

Fixed—nearly

Any day now, the financing agreement for the Suez-Mediterranean pipeline ought to be signed and sealed at last. The talks had run into so many technical problems four weeks ago that the consortium of European bankers, led by two French banks, were on the point of giving up the whole £100m deal, on which talks with Egypt have now dragged on for nearly a year. But a visit to Cairo by the French representatives a fortnight ago miraculously cleared up all the outstanding technicalities except one—the legal means by which the crucial contracts with the customer oil companies will be tied into the agreement with the bankers. When the banks have settled this, their weary representative will fly back to Cairo, as he was due to do last weekend, and the deal will be signed amid much fanfare. But the Egyptians will still not be out of the wood.

They will have to renegotiate the terms for using the pipe: the original contracts with the oil companies have now lapsed because of the delays. This could lose more time still if the oil companies now try to exploit their bargaining position to screw down the terms.

Key indicators: world commodity prices

Sweeter news

Sugar prices soared to £90 a ton this week after heavy Chinese buying from an already depleted world market; they fell back later. It was the highest price for eight years and has prompted the British Government to subsidise the ex refinery price.

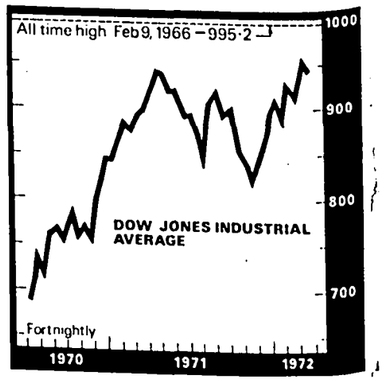
BUSINESS

Investment

Bully ! It's spring in Manhattan

New York



Signs have been multiplying that Wall Street is caught up in a good old fashioned bull market. In the wake of a sudden spate of encouraging reports on economic activity and the outlook for corporate profits in 1972, several indices surged to record highs in unusually heavy trading in recent days ; they included Standard and Poor's broad-gauged index of 500 industrial, utility and railroad shares, its narrower index of 425 industrials, and the New York Stock Exchange's own comprehensive industrial index. Even the more closely watched Dow Jones industrial index of 30 blue chips on the New York exchange lumbered to a close on Monday at a level just under its 1971 high of 950.82 reached last April, though falling to 945.6 by Wednesday.

The current rally in American stock prices got under way in November, when America decided that it loved its dollar crisis after all. Since then the major stock yardsticks have each risen about 20%. The only laggard until about 10 days ago was the Dow, whose sluggishness is due mainly to the large companies in it whose fortunes swoop up and down with the business cycle. The news that one of these, **Du Pont**, was investigating the possibilities for a soft contact lens helped the Dow finally to join in the rejoicing.

The latest rises have taken place against a background of towering daily volume and a late-running tape, characteristic of maturing bull markets. Turnover on the big board has been exceeding 20m shares daily, as individual investors have begun flooding the market with smaller orders. Business has picked up even faster on the American Exchange and the over-the-counter market than on the NYSE.

Since late November the American Exchange's price index has moved up more than 20%, while the Nasdaq over-the-counter composite index is 25% ahead. Volume gains have been equally impressive, with the American Exchange turnover running at more than 7m shares daily against last year's average 4.2m. Volume on the over-the-counter market, computed systematically only since late last year, has been running between 10m and 11m shares daily.

The frenetic pace has brought out the worry-mongers, digging back through past history. They reckon that a continuingly high volume of trading on the more speculative markets, and not only the more sober New York stock market, is a danger sign.

Business failures

Business may be bucking up in America, but business failures are still running strong. Indeed, in mid-February, more business casualties were recorded than in any week during the second half of 1970. Already this year two spectacular bankruptcies have jolted the American business community : those of Lennen & Newell, which for some time ranked as one of the nation's larger advertising agencies, and FAS International, formerly known as Famous Artists Schools.

Both companies petitioned federal courts for the protection of chapter 11 of the Bankruptcy Act. This provision will enable them to continue to operate while they try to work out arrangements for repayment with their creditors. In the meantime, proceedings were initiated for the liquidation of S. J. Salmon, the small New York investment banking concern accused by the regulatory authorities of operating since the start of 1972 with insufficient capital.

The privately held Lennen & Newell agency, which in the past year is said to have lost some 75% of its billings, listed assets with the court of some $6.4m and $11m of liabilities owed chiefly to advertising media. The three TV networks are the largest creditors. The agency blames its predicament for most part on the poorer economy, which resulted in a shrinkage of billings that subsequently snowballed ; and on over-expansion of its foreign and domestic operations. The last straw was its loss in February of a sizeable account with the Florida Citrus Commission.

In its petition, the long-troubled FAS International listed total liabilities of nearly $40.7m and assets of $27.8m. The diversified correspondence school operator told the court its financial difficulties could be attributed in part to its failing to recognise quickly enough a sharp drop-off in student interest in its art, photograph and writing courses, long the school's standby. FAS's simmering troubles surfaced last May when it requested suspension of trading in its shares on the New York stock exchange. The suspension continued until last December when it stock was de-listed from the Big Board and trading switched to the over-the counter market.

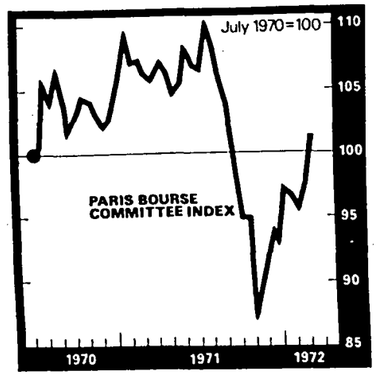
The fate of these companies, once much favoured by investors, shows the danger of the kind of indiscriminate speculation that a wild bull market encourages.

Comparing incentive programs?

Remember that British Columbia offers Canada's lowest tax structure

Lower taxes are a solid, long-lasting financial incentive for any industry. And British Columbia offers the lowest provincial tax structure in all of Canada. The lowest income tax rate for individuals and corporations. The lowest tax on motor fuel. No poll tax or amusement tax. No premium charges on Hospital Insurance for provincial residents.

But lower taxes are only one advantage industry enjoys in Canada's booming Pacific province. British Columbia also offers abundant fresh water and low-cost hydroelectric power. A reliable pool of skilled and semi-skilled labor. A wide choice of industrial sites, in every type of setting. And first-rate shipping links with major markets in western North America and the expanding nations of the Pacific Rim.



A new plant in British Columbia could be the most profitable move ever for your company. Write today and we'll send you our new brochure entitled Outlook for Industry in British Columbia, Canada.

Paris bourse

Breaking out

The French themselves have been taken by surprise at the spurt of interest in their formerly morose stock market. This had creaked along at its usual tortoise pace through January and most of February. Then, on February 23rd, money started flowing in from abroad : largely from Germany (as a result of the German government's restrictive measures against hot money), but also from Switzerland and Britain. Both Germany and Switzerland have a right to the "avoir fiscal," or dividend tax credit, given by the French government. Suddenly, the French stock market was worth looking at.

The two-week spurt of foreign buying has nearly wiped out last year's loss of 8.7% in equity prices. The volume of transactions has almost tripled, with well over Fr250m (£19m) a day changing hands. Chemicals have done particularly well. **Saint-Gobain-Pont-à-Mousson** shares rose by 14% in less than two weeks, and **Rhône-Poulenc** up by over 11%. A lot of foreign buying has been concentrated on the large and best-known French companies: **Pechiney-Ugine Kuhlmann, BSN, Roussel-Uclaf, L'Oréal, Suez.** Despite rather neutral forecasts about French exports and the state of the French economy for the next quarter, outsiders feel that French equities are undervalued. Rhône-Poulenc, for example, which is now selling for about Fr180, is still a long way below its 1971 high of Fr243.

Whether Paris will turn into a real bourse depends not only on whether it continues to attract overseas money, but whether the sudden interest of foreigners can shake French investors out of their long sleep.

Textiles

Not knits

Another knitter is coming to market. Simon and Coates, the stockbrokers, is offering shares in **Levex** at 53p, which will raise a total of £556,500 (of which 10% will be gobbled up by the expenses of the issue). If the issue is not a flop, then the market is looking at the knitting industry through bull-blood tinted spectacles.

The knitting industry is entering a period of substantial overcapacity. The American market, which was such a boon in 1971, will not be in 1972 ; the devaluation of the dollar is one deterrent, the build-up of capacity in the United States another. Levex's prospectus tells the story effectively: in 1971 exports to the United States made up 70% of turnover ; in 1972, they are expected to be around 10%. And in Britain fashion changes weigh slightly against the double jersey look. A more fundamental reason is the way the profit bulge has been moving down the man-made fibre route. First, the man-made fibre producers were profitable, and then came overcapacity, and they went ex-profit ; then there were the yarn texturisers, which hit the highs as glamour stocks in the last bull market, and then collapsed into losses and the arms of **Imperial Chemical Industries** ; and now come the knitters.

	Prices p				
	Issue	High/low 1971/72		Current	p/e
Fairfax Jersey	85	111	65	90	9.0
Levex	53	—	—	—	11.3*
Nova Knit	70	280	140	175	9.0
Textured Jer	62½	138	52½	84	12.0
Vita-Tex	70	110	45	106	12.6

**Prospective on issue price*

Levex's balance sheet is not one to inspire confidence. The £½m being raised is 2½ times existing net assets, but falls well short of the £900,000 worth of knitting machinery to be installed by 1974. Cash flow on the profit forecast of £235,000, after tax and dividends, is only about £100,000. Levex trades—admittedly at arm's length—to an undisclosed extent with a private company in which the chairman of Levex, Mr Bernard Levy, is a substantial shareholder. However the crossholding of shares with **Raybeck** will ensure a continuity of orders.

The signs of a downturn are not in the reported profits yet. **Fairfax Jersey** is expected to produce increases for the year. **Nova (Jersey) Knit's** profit for the half-year to last September was 62% up, though **Textured Jersey's** results were only 10% better for the six months to October last. **Vita-Tex**, with a wider range of activities, has also produced good results and is another optimist about the current year. The survival factor is design—everyone can get hold of the machinery and the yarn (at knock-down prices). But design is the most difficult factor for the shareholder to assess. He should sell, unless he can feel the quality.

The machinery suppliers have similarly benefited from the boom: **G. Stibbe** turned in better than expected profits of £1.3m, up an impressive tenfold, but now fully reflected in the share price of 162p and a p/e of 11. Now is the time to sell ; the backlog of orders was worked through double-quick, but the level of new orders has not improved much. The only share in the knitting sector to hang on to is **Nottingham Manufacturing,** which effortlessly rides through everyone else's cycles.

New York and London zigzag. Japan reaches new high in feverish market. Canada and Australia strong. Most European bourses like the monetary union accord.

Stock prices and yields are on pages 103 and 104

Commercial Union

Promises fulfilled

Commercial Union's results were almost as good as everyone was expecting : investment income up £6m to £38.6m, and a turnaround in underwriting from a loss of £4m to a small profit of £700,000—making an overall profit rise of 31% to £33½m. Not quite so good as the **Royal Insurance's** 35%, but enough to justify the market's faith in the composite insurance sector. It has risen by 120% since May, 1970, against an increase of 85% in the Financial Times all-share index.

Is there much more to come ? CU's shares are now standing at 496p on a p/e of 19.8. The general argument for them is that insurance is still a growth industry ; the particular one is that CU is now a very good insurance company, which is getting even better. Underwriting in the United States, where CU does half its business, went from a £7m loss to a tiny profit ; now that the worst risks have been shed, its American business could start chipping in substantially. In Britain, even more massive leaps in motor premiums should eradicate the CU's £2m loss in car insurance. But Europe—where CU has just bought 25% of the Italian company Milano—turned in underwriting losses of £3.5m. The CU remains a serious European ; it has $85m in Eurodollars for further acquisitions, and has shown the necessary skills in reducing expense ratios and turning underwriting losses into profits.

North Sea oil

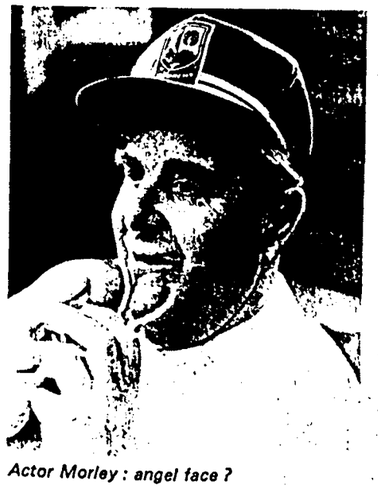
Several ways in

Scotland could become not just the Texas of the North but the Texas of Europe. According to Sir David Barran of Shell, the oil companies could be spending £150m a year on exploration and development and another £100m on operating expenses. At least one small part of Scotland's community has sat up and taken notice. Ivory and Sime, the investment trust advisers, and Edward Bates, the merchant bank owned by one of its trusts, **Atlantic Assets,** took just four weeks to bring **Viking Resources Trust** from conception to the market. Of the £10m being raised, 65% was placed in firm hands before the public was able, on Friday, to subscribe for the rest. The trust will probably rise rapidly to a large premium, and then fall back when it looks like just another investment trust. That will be the time to buy.

The managers are quiet about where exactly the money will be put, but a few shrewd guesses can be made. The market has not yet accorded the oil shares any of the North Sea glamour, and **Shell's** poor results last week have left them looking cheap to those who reckon that Britain's contribution to their profits could be substantial, so Shell and **British Petroleum** look like obvious choices. Since the trust is going for long term capital gains, the dull performance of oils over the next year will not be a deterrent. Participations in exploration consortia will probably account for most of the 15% of the trust in unquoted shares.

Then there are the ancillary services. **Schlumberger,** which does the measurement of the boreholes and geological surveys, is the key company in that activity. Other North American companies have been benefiting too from the offshore finds in the North Sea, as well as in the Gulf of Mexico, and off Nigeria and Indonesia. **J. Ray McDermot,** in exploration, and **Haliburton,** in engineering services, are among the better known ; **Zetco** and **Vetco Offshore Industries,** which service the offshore rigs and organise the drilling, are more speculative and are on even higher p/es—around 40 on prospective earnings. But since the world offshore boom is likely to continue for another two years at least, as companies make desperate attempts to loosen their dependence on unreliable Middle East oil, they may soon be looking cheap. Viking has a back-to-back loan of £2m to invest in any foreign companies it fancies without paying the dollar premium.

Once the oil is found, it has to be piped ashore, and some of the people who turned up at the recent Aviemore forum on oil and Scotland's future did so out of more than curiousity. **The Weir Group,** which makes pumps and valves and is involved with a lot of the specialised engineering needed, was represented, as was **John Brown,** an engineering group that could get involved in pipe construction, and **Hewden-Stuart Plant,** which is in equipment hire. All are, or were, Scottish names, all are on reasonable p/es in the mid 'teens and the Weir Group looks exceptionally cheap. **William Press** and **O. C. Summers** are two of the civil engineering companies that might do some of the pipe-laying.



Presentangels

Fear to tread?

The latest twist in trusts is to turn the small investor into an angel—the kind that backs plays. Mr David Missen, a sort of broker between big backers and impresarios, has launched the Presentangels Ltd Collective Investment Portfolio, as a £50,000 closed-ended fund for the smaller playful punter. He is planning for 100 of them to take seats in the circle.

Unfortunately, they will not know what they are going to watch. Theatrical financial deals are highly secretive affairs, and the investors will not be told whether they are in tragedy or comedy until well after their money has been committed. Even then, the portfolio will not be public knowledge, and the investors will not get the play-by-play detailed profit and loss statement that the managements will be sending to Presentangels. Once the portfolio has recouped the £50,000, the money will be distributed back to the fundholders, together with a continuing share of the profits. So if Mr Missen finds enough hits to wipe out the flops, the angels (perhaps they had better be called cherubs) stand to make a killing. If not, their liability will be limited to what they have put up, as the fund will be keeping back the 17½% that managements can call on if things ain't what they're meant to be.

If this fund works, and the six West End productions in which it is investing most of the money produce a net profit, Mr Missen might start some others. Investors in "How the other half loves" have so far made 300% on their money.

Actor Morley : angel face ?

COMPANY STATEMENT

TRANSPORT AND CHEMICAL ENGINEERING
LIMITED

- Profits before tax for the year ended 30th September 1971 amounted to £320,000 (£283,000 for 15 months ended 30th September 1970 excluding Vending Cent.e).
- Final Dividend of 11% making total of 17% for the year (5% for 15 months ended 30th September 1970).
- Liquid position substantially improved and acquisitions now being actively sought.
- Board look forward to being able to report further progress and see no reason why the dividends of the Company should not be increased for the current year.

Annual General Meeting, 27th March, 11.15, Essex Hall, Essex Street, Strand, W.C.2. Copies of the Chairman's Statement and Annual Report available from this address.

TENDER

ABU DHABI

Refinery Project Tender

The Ministry of Petroleum & Industry invites internationally reputed companies – specialised in the construction of refineries – that are interested in participating in the Abu Dhabi Refinery Project Tender covering the engineering, procurement, construction and Test Operation of the project, to apply to the Ministry of Petroleum & Industry, PO Box 9, Abu Dhabi, Arabian Gulf, for the relevant tender documents, bearing the following points in mind:–

1. The tender documents will be obtainable with effect from the date of this notice and until the end of March, 1972.
2. The tender documents will be supplied to interested companies against a non-refundable cash payment of 500 B D (Five Hundred Bahraini Dinars) per set.
3. The tender documents will be supplied only to companies that are able to prove their technical competence and which have had previous experience in the execution of similar projects.
4. Offers should be submitted, in a sealed cover marked 'Tender – Abu Dhabi Refinery Project', to the Temporary Secretariat at the Directorate General of Planning & Co-ordination, PO Box 12, Abu Dhabi, Arabian Gulf before 11.00 a.m. on Wednesday 5th July, 1972.

(Signed) MANA SAEED AL-OTAIBA
MINISTER OF PETROLEUM & INDUSTRY
Dated 9/2/1972

CHAIRMAN'S STATEMENT

TRUST & AGENCY COMPANY OF AUSTRALASIA

SIR DENYS LOWSON
ON
A FAVOURABLE OUTLOOK

The Annual General Meeting of Trust & Agency Company of Australasia Limited, will be held on 5th April, at Estates House, Gresham Street, E.C.2. The following is the statement by the Chairman, Sir Denys Lowson, Bt., which is being circulated to shareholders.

Dividends and interest for the year ended 31st December, 1971 amounted to £464,552 compared with £465,171 in the previous year. However, with net profit on realisation of investments showing an increase from £143,347 to £279,834 the consolidated revenue has increased from £608,734 to £744,517. After deducting taxation, expenses and the preference dividend the amount available for the Ordinary shareholders is £522,140 which is equivalent to 26.1 per cent on the ordinary share capital. An interim dividend of 6 per cent has already been paid and the Directors now recommend the payment of a second interim dividend of 11¼ per cent (in lieu of a final dividend); this makes a total of 17¼ per cent which is the same as was paid last year. An amount of £172,140 has been added to the Group revenue reserve.

Following our usual policy the amount paid by the Company as dividends does not exceed the total of its net investment income and has consequently not included any part of the profits arising from the realisation of investments. Whether this austere policy can be maintained under the new tax system shortly to be introduced remains to be seen.

Disregarding taxation on the profit which would have arisen if the Group's investments had been realised at their valuation, and including the full dollar premium, the net asset value per 25p ordinary share at 31st December last was 180p, a rise of just over 24 per cent from the previous year.

The geographical distribution of the investments was as follows:— Great Britain 70.0 per cent; U.S.A. and Canada 18.4 per cent; Australasia 3.3 per cent; Europe 0.7 per cent and other countries 7.6 per cent: while as regards categories 0.4 per cent was in fixed interest stocks and shares and the balance of 99.6 per cent was in ordinary and deferred ordinary stocks and shares.

On page 13 of the Report and Accounts there appears a ten year record of the Group's affairs which shows progress both from the capital and from the income angles. In addition, shareholders will find on page 15 a list of the Group's largest holdings which represent approximately half our total investments.

Since the end of the Company's financial year there has been a marked improvement in sentiment and share prices have responded accordingly. There are however still many problems to be faced, not least the high level of unemployment which exists today. Already steps have been taken to stimulate the economy, and it may be necessary in the current year to take further action. Meanwhile we have a well spread list of investments which include both companies operating at home and others operating overseas and this should take care of any exigencies which may arise.

CHAIRMAN'S STATEMENT

Clydesdale Bank Limited

Statement by the Chairman Mr. William Thyne, O.B.E. on the Report and Accounts of the Bank for the year to 31st Dec. 1971

We welcome the freedom in lending which has been restored to the banking industry . . .

The 134th Annual General Meeting of Shareholders of Clydesdale Bank Limited will be held on Wednesday, 22nd March, 1972, at the Head Office, St. Vincent Place, Glasgow. The following is an extract from the circulated statement by Mr. William Thyne, O.B.E., the Chairman:

At £2,379,000, the year's profit after taxation was maintained at the level reached in 1970. This was achieved despite the difficult conditions under which we had to operate and ever mounting costs.

Our Current, Deposit and Other Accounts at £308,821,000 show an increase of £20,000,000, reflecting a gratifying expansion in the Bank's business over a period of particularly keen competition. The continued growth in our overseas business finds reflection in the figures for Foreign Currency Transactions and Acceptances and Engagements. Both items show a substantial increase on the year.

The total Assets of the Bank and its subsidiaries have risen to an all time high of £376,165,000 which is an increase of around £25,000,000 on the preceeding year.

Our Advances totalling £149,068,000 show a substantial and satisfactory increase of £25,920,000 on the previous year. The figure for Advances again includes considerable sums lent for exports under ECGD arrangements.

I am very pleased to say that despite a year of lower interest rates we were able to increase our income, largely as a result of the higher level of advances. Over the year, however, we had to absorb a considerable increase in overheads due mainly to the steep rise in Staff salaries. The Board recommend a Final Dividend of 9½% making a total of 16% for the year (same).

SUBSIDIARY COMPANIES

The business of Clydesdale Bank Finance Corporation Limited showed further profitable growth and Clydesdale Bank Insurance Services Limited has confirmed our assessment of it being a successful venture.

In the latter part of 1971 we set up a new computer bureau, Scottish Computer Services Limited, in association with Y-ARD Limited and McLintock Moores & Murray Limited. We have a controlling interest in this new company and we are now able to provide computer services with the widest range of commercial and technical applications.

EVER EXPANDING RANGE OF SERVICES

This new venture is, of course, in line with our policy of keeping constantly under review the range of services we provide to ensure that in scope and in nature they meet our customers' changing needs. That range is already vast and there is, for example, scarcely an aspect of company finance on which we cannot offer advice and assistance through our own resources or as a result of our membership of the Midland Bank Group. I would add that our very close association with leading Banks in all the EEC countries places us in a favourable position to help our customers in the international field.

GENERAL BANKING DEVELOPMENTS

In September last year the Bank of England announced measures designed to stimulate competition among the Banks and to control the volume of credit. We welcome the freedom which has been restored to us to judge every lending proposition solely on its merits and we have adopted a flexible attitude to advances which enables us to provide the type of loan best suited to the customer's particular needs.

THE ECONOMY

For the banking industry, 1971 can be described as an eventful year in terms of competitive freedom conferred on it. As far as the national economy is concerned it was a disappointing twelve months which, apart from yielding another handsome balance of payments surplus, only echoed the stagnation in output and investment and the steadily mounting unemployment of the preceding year despite the introduction of a succession of reflationary measures by the Government from April onwards.

On the other hand, while overshadowed by the deteriorating employment situation, there were features holding promise for the future and, more recently, industry has shown signs of returning confidence. Nevertheless, the short-term outlook in Scotland is still uncertain although there can be little doubt that the longer-term prospects are bright. But the translation of prospects into realities depends, as the Scottish Council (Development and Industry) have pointed out, on a new attitude by Government to regional development policies.

CHAIRMAN'S STATEMENT

THE MERCANTILE INVESTMENT TRUST LIMITED

Points from the Statement by the Chairman, Mr. J. A. V. Binny, in the Report and Accounts for the year to 31st January, 1972.

Year to 31st January	1972	1971
Gross Revenue	£4,309,786	£4,072,287
Ordinary Earnings	8.75%	8.40%
Ordinary Dividend	8¼%	8¼%
Net Assets	£119.75m	£89.98m
Assets per Ordinary Share	70½p	52½p

- The aim of the Board is to try and increase the return on the Company's investments year by year while at the same time employing a considerable proportion of its funds in areas of above-average growth.
- The U.S. dollar content has been increased through a "back-to-back" loan of U.S.$11m at 4½% over ten years.
- The modest stake in Japan has been increased as have our interests in companies involved in oil and gas exploration in the North Sea.
- The London market rose by some 45% and in the United States the Dow Jones index by only 4% during the year under review. The increase of 39% in the asset value of the Ordinary Shares (or 34% assuming full conversion of the 4½% Debenture Stock) is considered satisfactory bearing in mind that 16% of the Company's assets are in equities quoted in London and 26% overseas including those purchased with U.S. dollars where the improvement has been almost 20% after making all the necessary allowances for new money and the changes in the dollar premium and exchange rates.

Copies of the Report and Accounts may be obtained from the Secretary at Winchester House, 77 London Wall, London EC2N 1BY where the Annual General Meeting will be held on Thursday, 30th March, 1972 at noon.

University of Dundee

Applications are invited for a LECTURESHIP or SENIOR LECTURESHIP IN ACCOUNTANCY in the Department of Accountancy in the Faculty of Law. Closing date for applications 12th April 1972.

The University of Lancaster

International Centre for Research in Accounting

RESEARCH STUDENTSHIPS

The International Centre for Research in Accounting (ICRA) is an independently financed unit within the University of Lancaster. It has been established to engage in research into accounting principles and their application to the problems currently facing the profession.

Two research projects which are being given priority are :
(a) A comparative study of the similarities and differences between accounting reporting principles and practices in major industrial countries, with particular reference to problems which may arise when Britain becomes a member of the E.E.C.

(b) An investigation into the nature, purposes and objectives of published financial accounts, with particular reference to the needs of users and potential users. This project is aimed at defining the fundamental concepts and principles which should underlie the preparation of company financial reports.

One year and two year Studentships are available to suitably qualified persons interested in pursuing full-time research into either of the above projects. The one year Studentships will normally lead to an M.Sc. degree, while the two year Studentships will lead to the Ph.D. degree in appropriate circumstances it is possible to convert from the M.Sc. to the Ph.D. programme.

These Studentships form part of a general Ph.D. programme in accountancy within the University of Lancaster, and there will be ample opportunity for contact with other post-graduate students attached to ICRA and to the Department of Accounting and Finance.

The annual stipend of the Studentships will be set in the range £1000-£1500, depending upon a candidate's qualifications and circumstances.

For further details, and application forms, please write to the Director of ICRA, Professor Edward Stamp, Furness College, Bailrigg, Lancaster, quoting reference Number L.653/C.

COMPANY STATEMENT

BEAVERBROOK NEWSPAPERS LTD.

& Subsidiary Companies

Half Year to 31st December, 1971—Consolidated Profit Statement (unaudited)

1970		1971
£964,085	Trading Profit	£1,480,978
£564,838	*Less* Depreciation on Buildings, Plant, etc.	£539,190
£399,247		£941,788
£101,368	Investment Income	£104,220
£500,615	Group Profit before Tax	£1,046,008

Trading conditions as forecast in the six months to 31st December, 1971 showed an improvement compared with last year.

The cover price increases for all our newspapers which we were forced to make around the middle of 1971 contributed to increased earnings.

Industrial disputes took their toll, the stoppage in September costing over £400,000.

The trading profit of £1,480,978 is reached after making a special provision to meet costs expected to arise from improved retirement benefits and staff reductions.

The improvement in these figures is being maintained, but is subject to the unavoidable fluctuations in newspaper trading capable of arising at very short notice.

10th March, 1972. MAX AITKEN, *Chairman.*

APPOINTMENTS

Dated 13th February, 1972

ASHBY PEARCE
PERSONNEL SELECTION LIMITED

GENERAL MANAGER

KENYA TOURIST DEVELOPMENT CORPORATION

Are you the man to guide one of Kenya's most important National Corporations : The KENYA TOURIST DEVELOPMENT CORPORATION.

The Corporation which is responsible for the development of Tourism, one of Kenya's major industries, needs a General Manager, a man of enterprise, integrity, imagination and senior administrative experience.

You must be able to show the Selection Board that you have already proved your quality in the hard school of practical experience ; that you have the character and personality to enable you to negotiate with Ministers of the Government, senior Civil Servants, and leading entrepreneurs in the private sector both in Kenya and abroad ; that you have the authority, training and experience necessary to ensure unfailing administrative disciplines through Departmental Heads, and in the Corporation as a whole ; that you have the qualities to create and lead an enthusiastic and hard-working management team.

A Kenyan, or a person having experience of senior management in Kenya will be preferred. You will need a good command of languages : English, perhaps French or German : a knowledge of Swahili will be an added advantage. Experience in business management and financial control will be valuable qualifications.

If you can show that you can generate confidence in the public and private sectors and have a successful record of getting results as a responsible administrator ; if you have the education and experience, the personal qualities a man needs to hold down a job like this, you will be offered a salary of £4,000 a year with gratuity, house and car. If an expatriate is appointed, supplementary emoluments for overseas service will be offered. References will be called for. Your contract will be for 4 years, with a probation period of 6 months ; and it will be renewable for further periods at the discretion of the Corporation.

Closing date : 20th March, 1972. Ref. No. 0101/A/ECO
***Write our reference number in the top left-hand corner of your envelope and on your letter. *State how soon you would be available. *Applications should be posted to Ashby Pearce (Personnel Selection) Limited, P.O. Box 30681, Nairobi.**

APPOINTMENTS

WORLD BANK

FINANCIAL ANALYST—TOURISM

The World Bank, an international organisation working in the field of development finance, has a vacancy for a Financial Analyst in the Tourism Projects Department.
The position entails the study, preparation and appraisal of projects involving the financing of hotel and resort development. The incumbent will be based in Washington, D.C., with frequent opportunity for international travel.
Required qualifications include a degree in Economics, Business Administration, or Finance, coupled with practical experience either in a company or with consultants operating in the field of hotel development. Age 30-45; good knowledge of English essential; French and/or Spanish desirable.
Entrance salary is normally in the $12,000 to $19,000 range depending upon qualifications and experience and, except in the case of American citizens, is usually free of income tax. The Bank reimburses any income tax payable on its salaries. There are good prospects for advancement based on merit. Fringe benefits include health and life insurance; 25 days annual leave with transportation to home country every two years; pension plan and relocation expenses on appointment.
Further particulars and forms of application in the case of British Nationals can be obtained from:
Foreign and Commonwealth Office,
Overseas Development Administration, International Recruitment Unit,
Room 304, Eland House, Stag Place, London, SW1E 1PH.

NATIONALS OF OTHER COUNTRIES SHOULD SUBMIT A DETAILED RESUME TO:
Personnel Department,
International Bank for Reconstruction and Development,
1818 H Street, N.W., Washington, D.C. 20433, U.S.A.

Accountants

to advise top management

Deloitte, Robson, Morrow & Co. require men who have the experience to enable them to advise senior client management over the range of:

profitability analysis – identification of factors and key decision areas

corporate planning – internal and external environment analysis and development of alternative strategies

organisation – defining current and revised structures and identifying people requirements

systems – management accounting, production control and economic analysis.

Clients are in UK, Continental Europe and Africa and cover government, industrial and commercial activities, giving many opportunities for accountants in their early 30's rapidly to increase the scope and depth of their experience.

Successful development depends entirely on the capabilities of the individual. There are attractive career opportunities within the firm and salaries are at competitive levels.

Please write briefly, stating why you consider you are suitable, quoting reference 324/S, to:

J. Bullock, 17th Floor, St. Alphage House,
2 Fore Street, London, EC2Y 5DT.

University of Glasgow

Lectureships in Sociology

Applications are invited for two Lectureships in the Department of Sociology, tenable from 1st October, 1972. The salary will be within the range £1641 to £1935 per annum of the Lecturers' scale of £1641 to £3852 per annum. Placement will be according to qualifications and experience. F.S.S.U.

Applications (six copies) should be lodged, not later than 14th April, 1972, with the undersigned from whom further particulars may be obtained.

In reply please quote Ref. No. 3165U.

ROBT. T. HUTCHESON
Secretary of the University Court.

Oxford University

Institute of Economics and Statistics

The Institute has vacancies in the grades of Research Officer and Assistant Research Officer. Candidates should have a good degree in economics or statistics, and some post-graduate experience. The salary scales (currently being revised) are: Research Officer £1,902-£2,727, Assistant Research Officer £1,446-£2,454.

Members of the research staff are permitted to do a limited amount of teaching for colleges without deduction from their stipend.

Applications, giving personal details, academic qualifications and experience, together with the names of two referees, should reach the Secretary, Institute of Economics and Statistics, Manor Road, Oxford by 15th March 1972. Telephone 49631.

University College of London

Department of Political Economy

(Economics research and pollution research)

RESEARCH FELLOW required for research project on air pollution under the direction of the Head of the Department, Professor Wilfred Beckerman, on behalf of the Royal Commission on Environmental Pollution. The post will require a sound knowledge of micro-economic theory, some training in the use of numerical data, willingness to track down primary data, and ability to deal with probable sources of primary data such as local authorities and equipment contractors. Prior interest in economic problems of pollution an advantage, but not essential, and by no means sufficient. A senior person is required, with some previous experience of research carried out independently or with minimal supervision. Salary range £2633-£3117 plus £162 London Allowance, FSSU. Appointment as soon as possible.

RESEARCH ASSISTANT to assist two or three members of staff with miscellaneous research mainly of a statistical character. Applicants should have a good first degree, some experience with simple statistical operation requiring a desk calculating machine, and a willingness to undertake work involving painstaking attention to detail and accuracy.
Salary £1641-£1935 plus £162 London Allowance. FSSU. Appointment from 1 October 1972.
Applications, indicating particular post, giving full details of qualifications and names of referees should be sent to Assistant Secretary (Personnel E/4) University College London, Gower Street, London WC1E 6BT by March 20 1972.

APPOINTMENTS

New Zealand

UNIVERSITY OF CANTERBURY, Christchurch

Chair of Economics

The Council of the University invites applications for a Chair of Economics, which is the second established in the Department. The successful applicant will be a research scholar interested in the promotion and development of research in the Department. He may have qualifications in any of the main areas of economics, but some preference will be given to applicants qualified in mathematical economics, econometrics or operations research.

At present the salary for a Professor is within the range of $NZ10,722 to $NZ13,700 per annum.

Particulars, including information on travel and removal allowances, study leave, housing and superannuation may be obtained from the Secretary-General, Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF (Tel: 01-387 8572).

Applications close on *1 May 1972*.

The Polytechnic of North London

DEPARTMENT OF SOCIOLOGY AND LAW, 62-66 HIGHBURY GROVE, N5.

RE-ADVERTISEMENT

Principal Lecturer in Sociology

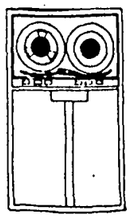
Translations by telex...

We've got it taped



Our service is acknowledged to be speedy. Quite simply it abolishes the barrier of distance. It means that if you are in Halifax, Nova Scotia, or Halifax, Yorkshire, you enjoy the same fast service as if you were in London – possibly even faster. You transmit the translation material to us by telex and usually within the hour, depending on the length of the material, the translation appears on your own telex. Generally, of course, this service is suitable for shorter translations such as letters and telegrams, press releases and press advertisements, though we have translated as many as 5,000 words at a time on the telex. Isn't this the sort of translation service you could use?

Free with every plot of land.

Lansing Bagnall

– Europe's largest maker of electric lift trucks

1969 1970 1971
THE QUEEN'S AWARD TO INDUSTRY

Blue sky doesn't cost you a penny. It's as well to remember that when you build a warehouse.

Instead of growing outwards and needing more land, grow upwards where the cost is less.

But having decided to put your products one on top of the other, you'll need a handling system.

After all it's no good economizing on space unless you have the best, most efficient equipment to stack, store and retrieve the goods.

Here at Lansing Bagnall we've spent a lot of time studying problems which could very well be the same as yours. Our experience has led to such revolutionary developments as the Turret Truck.

Imagine a gangway only five feet wide and pallets thirty feet above the ground. That's the sort of high density storage turret trucks achieve.

Perhaps Lansing Bagnall have already solved your problem. Post the coupon and find out.

To: D.G. Caswell, Home Sales Division, Lansing Bagnall Ltd., Kingsclere Road, Basingstoke, Hants. Tel: Basingstoke 3131.
Please send me more details.

Changing history

In a mauling week for his Government, and for the country, Mr Heath just got a majority in the Commons for going on into Europe, but public opinion had enabled the miners to use illegal methods to overrun many of his hopes for real economic expansion. Although the miners are having to be bought expensively off, Mr Heath has no option but to carry on, and to see that Mr Barber's budget still aims for 5 per cent growth. But what does the country want for itself?, page 15.

How the economy will have to live now, the damage to industry, the law on picketing, power supplies, coal imports, householders' troubles and how the miners see things, pages 61-71.

The stock market fell, but not far, page 80.

He likes Ted, anyway

President Pompidou is at Chequers this weekend to tell Mr Heath how much he depends on him, page 17.

That affair

The verdict on the V and G insurance scandal raises the right questions, which the Government should act on, page 25.

The Chinese connection

In Peking next week Mr Nixon will be hoping to win Chou En-lai round to the idea that the Russian threat makes an American presence in Asia tolerable—and Europe could benefit from the spin-off, page 19. The Tet that went quietly in Vietnam, page 33. The electronic war, page 34.

The kites fly

The Heath Government let it be known that it was considering a new political initiative in Northern Ireland, but the ideas that were fed out got the thumbs-down from orange and green alike—and not surprisingly, page 21.

Franco's Spain

A special survey on a country caught between past and present, after page 50.

Geoffrey Crowther

SIR—Your perceptive tribute (February 12th) to Lord Crowther referred to the "Crowther report on secondary education." In fact this report (1959) dealt with education for the 15 to 18 age-group, in all its aspects. It set out what is still the best and fullest statement of the case for raising the school-leaving age to 16. It made important recommendations, accepted by the Government, for the further expansion of teacher supply. And it put forward new and important proposals for the expansion of courses in technical colleges; these proposals were the basis for the 1961 white paper, "Better Opportunities in Technical Education."

It is very doubtful whether the polytechnics, and other colleges of technology, would today be making so great a contribution to higher education, but for the "lift" given to technical education by the Crowther recommendations more than 10 years ago. In my opinion the significance of the Crowther report has been seriously underrated in comparison with that of the other major educational reports —Robbins, Newsom and Plowden—which succeeded it. Lord Crowther was a most consistent advocate of the policy of levelling-up educational opportunity—a tradition of advocacy which, happily, *The Economist* has strongly maintained—and, always the most generous-minded of men, I know he would have wished a tribute of this kind to couple with his name that of Lord Eccles who, as minister at the time, fought so hard and so successfully to match Lord Crowther's ideas with a notable rate of increase in available resources.—Yours faithfully,

University of Leeds EDWARD BOYLE

Rhodesia

SIR—Mr A. N. Goodfellow is incorrect in stating (Letters, February 5th) that the choice before the people of Rhodesia is, in effect, "Do you want this settlement?" or "Would you rather Britain continued . . . to maintain existing pressures . . . with a view to obtaining . . . a better state of affairs than that which exists at present?"

Having attended a meeting of the commission, I can assure you that the choice "in effect" and "in practice" is simply this: "Do you want this settlement?" or "Would you rather continue as you are under the 1969 constitution?"—Yours faithfully, R. ALDWORTH COWAN

Salisbury, Rhodesia

SIR—It would appear that Lord Pearce's commission has little option but to announce the rejection of the terms of settlement at the end of its mission in Rhodesia. You suggest (January 29th) that the best course of action for Britain to take then would be to forget about the black Rhodesians as quickly and as quietly as possible, and tacitly recognise Mr Smith's regime with the withdrawal of sanctions. You base this reasoning on the possibility of the use of force being ruled out because of Mr Wilson's decision in 1965. I was of the opinion that Mr Wilson ruled out the use of force in favour of sanctions in the belief that this would bring Rhodesia to its knees in the course of a few years. Sanctions have failed, and it appears that force is going to be the only way to make Mr Smith end his racist policies and enfranchise black Rhodesians. However, it is becoming increasingly evident that Britain only has the "power" to use force in dealing with a black secessionist island (Anguilla) and not when dealing with a white minority regime.—Yours faithfully,

SIMON OWENS

University of the West Indies, Kingston

SIR—Your articles on Rhodesia (January 22nd) seem completely to ignore the main issues of the, as yet, hypothetical settlement. The qualifications of the commission are quite clearly in doubt, since no realistic thinker can suggest that a body of men who are typical of the short-sighted and naive attitude that Whitehall has always displayed towards African states can truly assess the opinions of one of the most primitive peoples of the world. This fact is admitted by your special correspondent, who pointed out the difficulties of explaining modern politics to African elders. This in itself implies that if these gentlemen take nearly a whole day to comprehend uncomplicated procedures, how would they possibly cope when faced with the government of 5¼m people and 150,000 square miles?

It is widely accepted that less than 1m Africans are "economically active," and it follows that the remainder live outside urban areas. This is certainly true from my own fairly broad knowledge of urban and rural Rhodesia. How, therefore, is it possible that the rioters throughout the country in relatively densely-populated areas can be typical of the entire population? Rural Africans, and they number around 4m, are simply not concerned with who rules the country, for such matters have no possible relevance to their way of life. Any Rhodesian farmer will tell you that and assume the questioner to be very stupid if it were not already clear.

Obviously, the people must be ruled, and the form of government that has been highly successful by most criteria should surely continue, albeit with minor constitutional changes to improve the opportunity for Africans to become more competitive. There will always be a dissident minority against any government the world over, and it is absurd to suggest that the most violent and vociferous are, in this case, the majority.—Yours faithfully,

Hongkong GEORGE G. M. JUDD

The miners' strike

SIR—You perpetuate (February 12th) the mischievous piece of nonsense that a coal miner's life is dirty and dangerous.

A quick glance at the Registrar-General's returns over the past 50 years (probably 100 for all I know) shows that miners are well up in the expectancy-of-life league. Many other industries are far more dangerous, even if they attract less attention.

I can speak from experience of the medical profession and 40 years of surgery and, later, of pathology. We are well below the miners in expectancy of life and our life is passed in a milieu of a constant host of malignant germs. Here the hours worked are probably more than twice those of the miners. There is no absenteeism and we still belong to the working, rather than the striking, classes. More than 10 years of large-scale farming has shown me the constant risk to life and limb from heavy machinery in difficult conditions and health risks from animals, faced unstintingly in weather conditions never faced by miners. These workers do not share the same expectancy of life of the miner, but neither do they strike, nor absent themselves from work.

Naturally, if you compare a miner's conditions with those of the pen-pushing fraternity, an uncomfortable gap in health and working conditions will appear, but it remains true that few forms of valuable work are free from more than marginal risk or occupational hazard.—Yours faithfully, J. G. C. SPENCER BERNARD

Aylesbury, Bucks

SIR—According to the miners' leaders, they are striking as much against the Government as the coal board. Yet the strikers are getting no strike pay and it is mainly the Government that is financing the strike. This situation is worthy of "Alice in Wonderland," and has already cost the taxpayer well over £2m.

Surely, in principle, it is up to the unions concerned to finance strikes. If they can't or, as in the case of the miners, won't do so, it is clear that women and children cannot be allowed to starve. That is, however, no reason why they should get the generous payments available to people suffering hardship through no fault of their own. Any payments made should be based on proved and urgent need. These should be in the form of loans repayable by the unions. These latter could collect the money from the individual concerned or pay it out of a levy on all its members after they go back to work. The latter would appear to be the fairest method as it would not impose an undue burden on families.—Yours faithfully, THOMAS HUTTON

MANAGEMENT APPOINTMENTS £7000 PA AND OVER

Group Managing Director

for a British group of engineering and trading companies, based in the UK, which has interests overseas, especially in Southern Africa and now in Australia. The group has a record of steady growth and turnover now exceeds £12m.

• TOP management experience in a large company or group with overseas trading subsidiaries is required, preferably with some association with engineering.

• AGE under 50. Remuneration is negotiable – it is unlikely to be less than £10,000 – with equity participation. Considerable overseas travel is envisaged.

Write in complete confidence to Sir Hilary Biggs as adviser to the group.

JOHN TYZACK & PARTNERS LIMITED
10 HALLAM STREET · LONDON W1N 6DJ

National Freight Corporation Comptroller

• THE Corporation, with an annual revenue of over £200m. and some 56,000 employees, operates in a highly competitive field.

• THE present Comptroller is shortly to move into another role and a successor is to be appointed.

• RESPONSIBILITY is to the Chairman for the direction of the financial affairs of the corporation. There is a major role in corporate decision making.

• HIGH financial ability and commercial enterprise at top level are essentials.

• A STARTING salary in five figures is envisaged, with other attractive conditions. Location is in London.

Write in complete confidence to P.A.R. Lindsay as adviser to the corporation.

When the umbrella goes

SIR—What are the essential functions of government? To create welfare? To build roads? To provide education? None of these, nor a host of others that people seem, wrongly, to regard as important—wrongly, because although there may be the resources for all these governmental activities, and although government may perform them as well as, if not better than, private organisations, they can be jeopardised in a matter of days, even hours, if government does not first attend to two functions which are more important still. These two are: the maintenance of peace within the country's territory; and its defence against attack from without.

The communist countries, incidentally, give these two functions their priority. Can one conceive an Ulster situation anywhere within the communist block? The Hungarian revolution was over in a couple of weeks; the Czechoslovak in a matter of days; the disturbances in Poland and east Germany in a matter of hours. Russia, much less developed than the United States, and with a far, far lower standard of living, can challenge the United States in defensive and offensive capacity; and I am not sure that east Germany could not hold its own against west Germany, if the two were ever allowed to fight it out.

Throughout history, rich empires have been overthrown by nations that were poorer, but that got their priorities right. We western Europeans—with the honourable exception of the Swedes and the Swiss—are luxuriating in a fools' paradise. We are entirely dependent for our safety on the American defence "umbrella," assuming, quite wrongly, that America will indefinitely have the resources and the will to provide it; and we must use the resources this dependence allows us to buy, not enforce, peace within our borders, because public opinion is so bemused that it would not allow our governments to do otherwise. I am fortunately old enough probably not to live to see the collapse of this fools' paradise; but I dread for the future of my children.—Yours faithfully, G. H. G. NORMAN
London, W14

SIR—During recent years we have become accustomed to the misuse of words, and their distortion into grotesque parodies of their original meanings. Commander Young's letter (February 5th) is, however, an extreme example.

My dictionary defines independence as "not dependent on others, not subordinate, completely self-governing, thinking or acting for oneself." It does not define security but I suggest that "the ability to pursue a state's own political, social and economic policies without outside interference" is as good a definition as most. Can anyone believe that either of these expressions applies to Czechoslovakia today?

Every current debate becomes confounded by the use of the same words, such as independence, freedom, democracy and civil rights, to imply totally differing concepts. Public information and discussion are two of the most valuable rights of our political system; both are nullified if the words used are meaningless. Can any of your readers suggest how we can halt this misuse of our language, and return to honesty in debate?—Yours faithfully, D. J. MILTON
Little Chalfont, Bucks

Nationalism and communism

SIR—I wonder whether you fully appreciate the ambivalence of some of your analogies in "The only ally" (January 22nd)? This ambivalence arises because you see clearly enough that nationalists are only incidentally liberal, but will have it that, generally speaking, nationalism does service to the liberal cause in the communist world. It would be truer to say that there, as in the west, nationalism and liberalism may be transiently linked by the circumstance of crisis, but in the longer term one nationalism merely encourages another.

Slovak nationalism may have come briefly to the aid of Czech liberalism in 1968—but was not Dr Husak also a Slovak nationalist? In the Soviet Union, the reaction to nationalism in the Ukraine and elsewhere has been a resurgence of Great Russian nationalism. In Jugoslavia, Croatian nationalism was never likely to have a liberalising effect; indeed, until it really came into the open early in 1970, support for decentralisation came from many quarters—not all of them nationalist—throughout the country.—Yours faithfully, R. K. KINDERSLEY
Oxford

The air and the sea

SIR—I trust it will not seem churlish of a recently-retired naval officer, while welcoming your support for sea power ("The unending war," January 8th), to point out a certain inconsistency in your remarks about air power. While air power has a useful generic meaning, in its functional sense it has long been considered an essential component of sea power, ie, navy, as of land power, ie, army.

You say, "It is too easy for ships to be sunk by aircraft, unless they have aircraft of their own to protect them": and this is precisely why aircraft-carriers are indispensable. For, as the Air League has made plain in commenting on the recent Royal Navy-Royal Air Force maritime exercise, "Highwood," in northern waters, four times as many fighters (not to mention airborne early-warning aircraft and air-refuelling tankers) were needed to provide the same coverage from shore bases as from a carrier. Thus, both military and economic factors support the continuing need for carriers, whether in home or overseas waters.—Yours faithfully,
Meonstoke, Hants EDWARD ARCHDALE

Multinational business

SIR—May I offer first my congratulations upon your survey of the future of international business (January 22nd) and, secondly, a few comments and reservations. The idea that the future will in general be just the opposite of what decision-influencing people are predicting is another way of saying that the world tends to overcorrect for disturbances to its economic equilibrium. This is not such a new idea. But is it even generally true? Let us take inflation. It took the London stock exchange, which many regard as the most developed and sophisticated international capital market in the world, more than a quarter of a century of constantly and significantly rising prices before it (the stock exchange) recognised the fact and consequences of inflation by quoting fixed interest stocks on a higher yield basis than ordinary shares. There was no overcorrection here. There was a persistent refusal to recognise a new situation that stood out a mile.

What of our raw materials? I remember prewar textbooks of economic geography that predicted exhaustion of the world's oil in 20 years and of the world's coal within the century. Which supports your confidence that the world will find new supplies or substitutes. But should we not distinguish between the short term and the long term? The short-term forecasts may have been wrong, hilariously wrong. But can we get around the hard facts that: (1) The world's mineral wealth is a wasting asset? (2) During the previous 10 millennia of human life on this planet, our mineral wealth was hardly scratched, whereas during the past two centuries it has been consumed at a phenomenal and rapidly increasing rate?

New sources of energy will be developed, but can we count upon their being self-regenerative?

My own feeling is that our society is constantly overcorrecting in the short-term cyclical sense but chronically under-aware of the long-term secular trends, indeed purblind to them.—Yours faithfully,
Kuala Lumpur PETER A. TOWSEY

SIR—It is a little disappointing to find, on page xxi of your survey of multinational business (January 22nd), the authority of *The Economist* in support of the idea that it is reasonable to compare the turnover of a giant multinational corporation with the gross national product of a country.

It is my belief that such comparisons mislead. But it would be meaningful to compare the value added of a corporation with the gnp of a country. The gnp of a country is essentially the sum of all the values added in the different sectors of its economy. The turnover of a corporation comprises its value added plus its purchases of materials and fuel. Let me take a simple practical example. According to "The Times 1,000 for 1971-72," the total turnover of the 1,000 largest

for a UK manufacturer in this buoyant market whose present investment programme will take turnover well into eight figures. The company employs 1,000 in this country and carries out its own research in parallel with the parent, a major American group with interests worldwide. After familiarisation here and in the USA the new man will be involved in all areas of the business – in general rather than functional management. Given success he can expect to join the Board within the year, where he will be a candidate for the eventual MD-ship. Candidates, from age 35, will be graduates or qualified professionals who have had post-graduate marketing or business training in some depth. Their current responsibilities should provide clear evidence of general management competence in an environment where the market is the determining influence. Location Home Counties; car, pension and removal assistance. Please write – in confidence – stating how each requirement is met to Dr. J. D. Jones reference S.61023.

at least £7000

☐ BIRMINGHAM ☐ GLASGOW ☐ MANCHESTER

EUROCURRENCY PROFESSIONAL

who wants to be more than a broker

London

Our clients are seeking a professional experienced in dealing in Eurocurrencies and in negotiating with UK and Continental banks. Currently he may be a foreign currency dealer or money broker, or he may be in the finance department of a merchant bank, discount house, commercial bank or large industrial company. The essence of the appointment is that he should have the capacity to use his experience to develop new ways of financing European trade not covered by traditional methods. This opportunity, part of the planned expansion into Europe of a well recognised UK and US group, offers exceptional prospects for an imaginative professional who has ambitions as an entrepreneurial businessman. It is unlikely that the successful candidate will be under 28 or over 45. Nationality is not material, but languages, especially German, would be a decided asset.

Whilst it is not possible to define the salary bracket precisely, as the range of individuals who might be suitable is so wide, attractive remuneration is negotiable and will match the age, experience and potential of the man appointed.

(Ref. A1023/TE Professional)

Replies will be forwarded direct, unopened and in confidence to the client unless addressed to our Security Manager listing companies to which they may not be sent. They should include comprehensive career details, not refer to previous correspondence with PA and quote the reference on the envelope.

PA ADVERTISING LIMITED,

industrial companies was £63 billion, which is greater than the United Kingdom's gnp for 1970 of £42 billion. There are, of course, other companies and other contributors to the gnp. Does that not suggest that your comparison, as it stands, is invalid?—Yours faithfully,

Liverpool P. G. L. PARKINSON

CAP

SIR—A few short months ago, the British public was authoritatively assured that joining the common market and embracing the CAP would lead at most to a 15 per cent increase in our food prices. A widely-fêted economist of your persuasion scored a great coup by demonstrating that it would actually be beneficial to our balance of payments on the rational assumptions that (a) world food prices went on rising, (b) EEC prices increased at no more than 1 per cent per annum and (c) our population ate less or worse, or possibly both.

Since then world grain prices have fallen like a stone, the "butter mountain" has begun rearing its greasy peak again, and Dr Sicco Mansholt has recommended immediate price increases around 7 per cent (a fact which you coyly tucked away on page 82 of your latest issue [February 5th]). On the other hand, the British people have selflessly begun their adaptation to European standards by eating less/worse already (see National Food Survey figures to date for 1971).

Only last week we had it from the horse's (ie, Dr Mansholt's) mouth that market prices for agricultural produce here would actually rise 25-30 per cent after we joined the EEC. To that will be added (or, rather, multiplied) the effects of revaluing the unit of account, probable devaluation of sterling and, ultimately, Vat on food. No wonder M. Pierre Uri wrote, in an essay much praised by your reviewer, "The community, if it applies the CAP in unmodified form to Britain, is likely to find that Britain will require sustained economic assistance" (!), and "Within the community of Six the CAP is already an embarrassment. In an enlarged community it threatens to be a disaster."

As the absurd preconceptions of the Josling school are shattered by events, as the evidence mounts of the injury that we are about to inflict on ourselves, your continuation in the bland assumption that the "debate" has been conclusively won by the Europhiles is one of the journalistic mysteries of our time: a triumph of dogma over rationality.—Yours faithfully,

London, SW3 DEREK BLOOM

European Trends

The enlarged EEC will immediately have about 40 per cent more consumers' spending and imports, and 30 per cent more investment, than the Community of Six.

European Trends thus becomes commensurately more valuable for its analytical appraisal of European integration plus reports in depth, which in the new issue cover supra-national cooperation in R & D, and policies towards Western Europe's problem regions.

An annual subscription (four issues and an Annual Reference Supplement) is £20 (US$55). Airmail postage £1.75 (US$5) extra. Single copies £6 (US$15). Details from the Subscription Dept.

Vat

SIR—It is not generally realised that a multi-rate value-added tax system with a large range of products exempt is impossible for the taxation authority to police. It may be that HM Customs do not realise it yet.

With a single-rate system with no exemptions, such as the Danish, the Vat payable should be, in fact, the Vat rate on the gross profits. If it is not, the authorities would have reason to inquire. When, however, you have more than one rate and exemptions or zero rating, the Vat payable will bear no standard relationship to gross profits at all, and will depend primarily on the three following factors:

(1) The product mix dealt in (ie, the ratio of goods in tax classes 1, 2, 3 and 4 making up the total turnover).

(2) The competence and skill of the businessmen concerned in analysing their "inputs" and "outputs" of Vat in each category.

(3) The honesty of the business or individual submitting the returns.

Up to now we have been a reasonably law-abiding nation, not I suspect because we are born more honest than the Italians or French, but because our tax laws have been reasonably sensible and easy to administer. How long will this happy state continue?—Yours faithfully, C. J. FELL

Newport, Essex

The June war

SIR—Mr Terence Prittie (Letters, January 29th) misses the point of my question: "Was the blockade (of the Straits of Tiran) ever enforced?" No one disputes that President Nasser reoccupied Sharm-el-Sheikh. (It was, and still is, Egyptian territory.) And no one disputes that he reasserted Egypt's claim that the straits were Egyptian territorial waters. (On that Egypt has an arguable case which has never been properly heard.) But after taking these two actions, President Nasser then, at the end of May, gave to Ambassador Charles Yost (who had been sent to Cairo by President Johnson) an undertaking: (1) not to be the first to attack; (2) not physically to blockade the Gulf of Aqaba pending a decision on its status by the World Court; (3) to effect a partial withdrawal of Egyptian forces from Sinai; (4) to co-operate in the reinstatement of a military mixed armistice commission on both sides of the UAR-Israeli border; and (5) to send his Vice-President Zakaria Mohieddin to Washington on June 7th to tie up these assurances in a more formal agreement.

Vice-President Mohieddin never made the trip, because Israel attacked Egypt in the early morning hours of June 5th. Meanwhile, no Israeli ships had actually been molested or stopped in the Gulf. The authority for these statements is Mr David Nes, who was the American chargé d'affaires in Cairo at that time. There is corroborative evidence in the assurance which President Nasser gave at the same time to the Secretary-General of the United Nations that Egypt would not initiate offensive action against Israel. It was Israel who then chose to go to war, rather than to law, to assert its claim to freedom of navigation through the straits. Afterwards General Dayan himself admitted that, but for this, war could have been avoided.—Yours faithfully,

London, SE26 JOHN REDDAWAY

Eighteenth-century spelling

SIR—I should like to thank you for the reasoned review which you gave of my book, "James" (January 8th). But I think that it is only fair to point out that with regard to the "oddly spelt Scottish names" mentioned in your last paragraph, I have in most cases retained the contemporary spelling in the various letters and documents I have used. In the eighteenth century there were often considerable variations in the spelling of surnames, particularly when used in letters from the exiled Stuart court in Europe. I am probably at fault for not having stated this specifically, but I had hoped (wrongly, it seems!) that this would have been clear.—Yours faithfully,

London, W6 PEGGY MILLER

We are sorry

SIR—It is a pity that Professor Kirschen (Letters, December 25th) thinks we are a "lazy, selfish and/or inefficient lot." I seem to recall that we expended a considerable amount of effort between 1939 and 1945 rescuing his lot (and others) from such efficiency experts as Herr Hitler and Signor Mussolini.—Yours faithfully,

Charlottetown, Canada MICHAEL LANE

Racketty-Packetty House

SIR—Could I add a small correction to your review of our children's classic, "Racketty-Packetty House"? The correct price is, in fact, £1.30, not £1.70 as quoted in your review.—Yours faithfully,

JOHN TURNER

London, WC2 Tom Stacey, Ltd

Together, we chose a Rover 3½ litre.

"The governor thinks I like to get my head under a bonnet that means business.

But the truth is, I never even have to think about her.

Power-assisted steering so I can park in the city with one finger on the wheel.

Thick leather armchair, which makes long waits something to look forward to.

And she's so quiet I can hear him snore at top speed.

He doesn't know it, but we got it to prove that a chauffeur's lot is an easy one."

"Forbes, interested as ever in my image, must have thought she'd be a suitable symbol of my promotion.

Well, it is the finest bit of four-wheeled prestige I've sat in what with its wood-panelled interior and noiseless grace.

But he doesn't know about my weekend secret.

Just let me get at that wheel and a 184 bhp engine with servo assisted brakes to show that this company can impress all sorts of company.

Besides, it must be pretty good value for money, for the firm to let me have a chauffeur."

THE 12-WEEK MONEY-MAKING COURSE

Many people are making money from stocks and shares. So can you. You don't have to be well-connected or even rich (a mere £50 capital is enough to start with). The secret is in knowing the whole art of investment; what to do and when to do it. This you can learn quickly and simply.

How?

A group of successful, qualified accountants, stockbrokers, professional investors and financial writers have pooled their knowledge to produce a highly recommended correspondence course "The Art of Investment". They show you, simply and practically, how to deal confidently in stocks and shares, how to build your own portfolio, how to buy and sell so that you come out ahead of 2 million other investors. A course so practical that you can almost earn as you learn. No single text book or even combination of text books can give you the expert guidance of this unique home-study course. Send for the free full details in order that you may judge for yourself.

In 12 weeks time you can be profitably dealing in stocks and shares.

The land of make-believe

The Government got a grudging majority of 8 on the second reading of the European Communities Bill on Thursday night, a margin that marketeers said stoutly would be enough to carry the legislation, but which anti-marketeers greeted as confirmation of their stubborn belief that Mr Heath will never make it into Europe. It is certainly a dwindling and precarious majority for a Prime Minister who means to change the course of the country's history. But precarious majorities are sometimes the easiest to defend, if the will is there.

Mr Heath is a man for whom one vote is enough. But his Government has been mauled this week. It now has to carry its European policy through on a margin that would look very narrow indeed if there were not the little band of Liberals and Mr Gunters to call on. It will have to do this when the hopes of real economic growth have receded and with the prospect of large balance-of-payments difficulties during 1973, which the anti-marketeers will say, quite wrongly, are due to Britain's entry into the EEC next January. Mr Barber's budget next month will have to concentrate even more now on direct encouragement to capital investment; it should still go for 5 per cent growth this year, but as that will be read in the City and elsewhere as inviting balance-of-payments troubles he may decide to be too cautious. The new round of wage inflation that the miners have started will send prices up, despite the restraint the Confederation of British Industry managed to impose last summer, and, of course, will add to unemployment. And the Government will have to cope with all this while the crisis in Northern Ireland looks intractable.

The Government is fighting for its chief policy, and its life, when its reputation and its grip on the economy are slipping. Britain has been telling itself that it is foundering in a welter of political incompetence, industrial anarchy and mob violence. It is not. But there have been political mistakes, there has been a serious economic setback, and the law on picketing badly needs revision. There are many culprits, but the real start of the trouble with the miners was that a year ago Lord Wilberforce told the electricity workers that they should be rewarded with a big wage increase for their illegal action which cut off electric power across the country. This gave the miners every incentive to resort to illegal picketing to cut off electrical power again this year. On cue, Lord Wilberforce has been wheeled out once more. So it is already certain, as night follows night, that some other union will decide that it will be highly rewarded by some judge if it takes illegal action against the nation's throat next year.

Even so, much of the country has pretty well willed the miners to win from the beginning, and has been blaming the Government for not caving in much sooner. It is another chapter in the Dead Sea scroll of British make-believe. Britain, therefore, has become an unnecessarily uncomfortable place to live and work in at the moment, and is in danger of becoming an unnecessarily seedier and more selfish place in the future. It need not, of course, become seedier and more selfish, but it will if it goes on running away from its battles.

It is Mr Heath who has to face the political consequences. He is still very much in control of those consequences, which means that he is unlikely to change his mind about the need for, or workability of, a statutory incomes policy; perhaps that is why Mr Maudling has been looking so glum this week. He might be willing, however, to reconsider a proposal, which has long been in favour with senior officials at the Treasury, designed to end the state subsidy of official strikes. This could be

The strike

How the miners' strike, and the Wilberforce court, will affect the economy; the damage so far; the law on picketing; what Mr Barber should do; the next wage claims; power supplies; coal imports; how the miners see it themselves, pages 61-71.

done by making all supplementary benefits that are paid to strikers' families during an official strike (and no one is arguing that the payments should be stopped) a charge on the union's funds. If such a scheme had been in operation this year the miners' strike might never have taken place, for it gives the moderates in the unions a powerful—and badly needed—argument against their militants.

But Mr Heath has also got to do something about his Government's total political performance. Lately, it has not been so much inept as non-existent. Admittedly, the Government is short of outstanding political talent, and the miners' strike hit it at a time when he and his senior colleagues were already burdened with Europe, Northern Ireland and Rhodesia. They are problems that would test any government's political resources, and it is hardly surprising, as Mr John Davies disarmingly confessed to Tory MPs on Tuesday evening, that the Government's case went very largely by default during the whole course of the dispute. If that was the result of a deliberate policy decision not to appear to be intervening in what was obviously going to be an extremely serious strike it is a policy which ought to be changed ; as Mr Heath has spurned an incomes policy, public opinion is one of the very few weapons he has to fight the unions. If it was because ministers were too overburdened to put the Government's case then the structure of government must be reconsidered. It may be that the very job of Secretary of State for Trade and Industry is too ramshackle for any one man to maintain an adequate two-way flow of information between the Government and the country ; and certainly even Mr Maudling's immense capacities seem strained by his responsibilities for Ulster, the Home Office and the state of emergency.

The country wanted it this way

The most serious setback for the country is not the production lost, and to be lost, in the power cuts ; it is that wage inflation now looks utterly endemic. Although many people may sense that it is a setback, that it will have the most serious economic consequences on everything from the balance of payments to unemployment, and can only add to the existing hardships of the pensioned and the poor, it happens to be the country itself that has given every sign of willing this outcome. Ministers were wrong, as it turned out, not to have raised the alarm earlier. Those, like this newspaper, who were reassured by the estimates of coal stocks, were too complacent. But much of the press and the broadcasting intelligentsia was on the miners' side from the beginning anyway ; so even the behaviour of some of the pickets was excused ; much of the country felt it had a bad conscience about the miners and believed they had a special claim. So it was not until the blackouts started in earnest this week, and Mr Gormley and Mr Daly began to talk as if they insisted on unconditional surrender, that the more realistic in the Labour party and the media began to tell the miners not to go too far. If, by any chance, Lord Wilberforce were to be less than his generous self, and Mr Gormley and Mr Daly began to believe they could actually bring the Government down, then a real revulsion might begin, so that it would be popular to use troops to ensure the movement of coal and other fuel in the country and at the docks.

The Economist

Mr Evelyn de Rothschild has been appointed chairman of The Economist Newspaper Ltd in succession to the late Lord Crowther. Mr de Rothschild has been a director of the company since 1964.

It has been, of course, the practice of successive governments to treat the miners as if they really were special. That is why there are still so many uneconomic pits in operation, why power station decisions were rigged for so long to favour coal, and why coal and oil imports have been restricted. That is why, indeed, there are still as many miners as there are today, and why—although it would have been inconceivable in any other winter for industry to get by for five weeks without coal moving—they have eventually, and by breaking the law, got the upper hand. To the miners and their friends it is a great victory, a vindication of the mining community's strength and notice to Mr Heath of their contempt for him. But there will be a price for them, too, one day.

To many people, on reflection, it is going to look much less of an heroic fight for what Mr Daly calls justice, and much more an old-fashioned bit of smash and grab: the miners put their minority of face-workers and subsistence-wage earners in the forefront to pick off the public, and used the public to pick off the Government. Since the miners have used their industrial power so vigorously, they can hardly expect any government in the future to think of them as particularly deserving the special treatment they have had in the past. There will be a further switch in industry away from coal, especially as North Sea oil comes on shore. There will be more pits closed sooner than they would have been. There will be more unemployment among miners. And when that happens Mr Daly and the militants will raise the cry of the right to work and there may be stay-ins and work-ins. And many people will again feel sorry for the miners. But others may look at them rather differently.

Mr Daly told the Wilberforce tribunal that the miners wanted the rewards of their productivity (which, in fact, has been achieved by enormous capital investment, an investment that has made the miners' job much less onerous than it was), and a reassertion of their status among the best-paid workers. Any argument will do in front of a tribunal whose purpose is to buy off a strike that the country wants bought off, but Mr Daly may actually have told the country rather more than was wise about his special pay claim. Until 1957 the miners got appreciably more than the average workers in manufacturing industry ; since 1958 the miners have been slipping as coal has declined. Therefore, according to Mr Daly, the clock must be put back to 1957 and, apparently, always kept there, telling a false time. If it were a matter of adjusting productivity and shift-work payments, or even a claim based on the cost of living (although the miners' last rise was above the average), it could have been dealt with in bargaining on the basis of the coal board's original inflationary offer of 12 per cent on January 5th. But it has turned out not to be that. It is a gouging, politically-motivated claim, based on no reasoned argument that would stand up outside a miners' pub, for which governments and everyone else will do their best to be better prepared in future. It is also one that will be remembered by unions that were much weaker and poorer than the miners in 1957, and still are.

The stronger unions (that is, those whose industrial action can both kill people and cause wide economic disruption) will naturally put the miners' success beside the power workers' 22 per cent on earnings from Lord Wilberforce a year ago. So there has been created once more a predisposition to strike to secure more than bargaining or arbitration would give ; and inside unions the balance of advantage and influence has been pushed once more towards those who want strikes, and not just strikes for wages. Much well-meaning persuasion will be tried now to get other unions to accept, in more than words, that the miners are an exception. Lord Wilberforce is quite likely to say this, without realising that if his argument was accepted (that is, if there was a large and discriminate rise in wages and prices in this labour-intensive industry that is already declining anyway) then the rise in miners' unemployment would be discriminately large too. But the rise will not be a discriminate one because every union regards itself as an exception, just as every union regards itself, in one way or another, as doing a dirty or underpaid or difficult job that other people either would make a mess of or do not much care to do. It is not the disruption that the miners' strike has caused that is the total disruptive cost to the economy: it is the disruption of the strikes to come that will matter more. It is not the cost of the miners' award that will matter most to the economy or unemployment: it is the cost of the awards that are just coming along.

It now needs much faith to suppose that the country just does not connect today's price rise with yesterday's wage award, that it just does not understand that, when the Government or a tribunal or public opinion itself acquiesces in wage rises that bear no conceivable relation to the national economic performance or to that industry's own productivity, then price rises for the consumer and unemployment for the men must follow. The presumption must be that the country does understand this, and at present prefers such a state of affairs to anything that promises to be temporary hardship. Often enough, this preference is not a selfish one: the British public does still have more time for a hard-luck story than most. But this will not last if special interests insist by force that the world must be stopped for them.

He has to go on

Nothing is more certain than that many of those who voted for Mr Heath in June, 1970, did not vote to go into Europe, did not vote for change, and did not want to alter the course of history if it meant anything painful. That was why it was a surprise that the country voted for Mr Heath at all. But that, of course, is now at the root of Mr Heath's problem with the country, and its with him. It is only minorities that actively want change, so that most of Mr Heath's policies seem to many people to be only minority policies. And also starting from the upset of June, 1970, the Labour party, which is no longer a party of change and is not even very adept at talking about change, has both been nettled at being out of power and ever-hopeful of bringing the Government down at each half-opportunity it sees. So the political fight is all, and there is no prospect of any real sense of common cause between the parties on any of the great issues that face the country. Mr Heath has to go on. It is not a new experience for him. In the weeks before the last general election he had to go on campaigning although everyone thought him a loser ; now he has to go on governing although everyone tells him the country is becoming ungovernable. And he will. It just might have been worse.

The man who does like Ted

This weekend President Pompidou is talking to a British Prime Minister whose alternative he dreads

At Chequers this weekend President Pompidou of France meets again one of the only two British politicians with whom he would gladly spend two days in conversation. The French view of British politics is as brutal and as unsophisticated as that. In French eyes, Mr Heath and Mr Roy Jenkins are Britain's goodies. Mr Wilson, Mr Callaghan and Mr Healey are the other sort : they importuned General de Gaulle to let Britain into the common market, pulled the rug from under him in the Soames affair after he refused, and now, when France has spent three years standing on its head to ask Britain in, have done the same themselves in an attempt to hold Britain out.

Europe is witnessing the still uncertain early stages of a diplomatic love-affair. For Mr Heath conveniently thinks as well of M. Pompidou as the French president thinks of him. The object of the Chequers meeting is to nurture this personal respect with as much common policy as possible—for political romances usually collapse when the thinking behind them turns out to be muddled. Through all its storms, the relationship between Roosevelt and Churchill was condemned by mutual interest to endure. By contrast, those seeming friendships between de Gaulle and Macmillan, or between President Johnson and Mr Kosygin, were never likely to last long beyond the initial embrace ; the countries were not ready for them even if (which is doubtful) the men were.

The French side of the present Franco-British friend-

ship is not completely reassuring. Since M. Pompidou met Mr Heath in Paris last May, a number of his assistants and ministers have visited Downing Street. The judgment they have made of Mr Heath is uniformly like that made by their president. Mr Heath is not someone people warm to. But the dead certainty of his way of doing things is the one fact in British political life to which the French president and the men around him, who are accustomed to governing this way themselves, feel able to respond. And this is the snag. France's present foreign policy, now that the decisive change of letting Britain in has been made, rests perilously on its accord with Britain. And that accord with Britain relies perilously in turn on Mr Heath's ability not to step under a British political bus. This weekend at Chequers, as the candles are lit, there must seem to be an awful lot of buses around.

In contrast with its even-handed dealings with the political parties in Germany, the French government has no lines whatever open to an alternative British government in London—unless by some chance the leader of that alternative British government chanced to be Mr Roy Jenkins. Mr Wilson is disliked, not just at the top, but down to much lower levels in French administrative life. The political pressures which have caused him to turn his back on Europe are acknowledged by few people in Paris. Even the notably pragmatic M. Pompidou would change his view of a Mr Wilson moved suddenly back into Downing Street only if Mr Wilson were to rediscover somewhere in his baggage the commitment he once had to Europe.

What Pompidou wants

So President Pompidou has three separate aims in his meeting with Mr Heath. He is meeting, first, a British Prime Minister whom M. Pompidou implicitly trusts. He wants to cement this trust. The approach of the two men to diplomatic business is alike. For both, decisions on foreign policy are based on volumes of homework and are expected to be made, on all major matters, exclusively at the top. The right to disagree on some issues is accepted, provided there are not too many of them. All this was true last May, when the Franco-British baby was conceived. What is different this time, nine months on, is that M. Pompidou has begun to stake out the more European foreign policy for France which private observers of the French president long expected him to stake out once Britain was safely inside the market as France's ally. And he has done this at a time when Mr Wilson has been promising to renegotiate the entry terms to withdraw Britain from common market membership if he gets back into power. So M. Pompidou's second and third aims are to find out how truly Britain under Mr Heath is France's ally, and how safely Mr Heath now reckons Britain to be inside.

M. Pompidou has been accused with some justice by the communists in France of re-engaging France with the Atlantic alliance. Indeed, M. Pompidou no longer pretends, even to his gaullist audiences, that he is anti-American. And he knows that this will eventually mean some form of open reintegration of France's defence effort with that of its European partners. At the same time, M. Pompidou is coaxing his party away from the purely obstructive aspects of the rest of its policy towards Europe. In meeting Herr Brandt half way last week on plans for monetary union in the common market, President Pompidou has knowingly put the French economy on a road which might eventually lead deep into European confederal territory. In return for Herr Brandt's promise to hold the opposing views of Herr Schiller in check, M. Pompidou has also offered to open the French official mind slowly to the attractions of co-operating in Brussels, and to the possibility of more authority for the European "parliament" in Strasbourg.

Several times already this year France has staked out its usual cussed position over a whole range of common market disputes only to give way conspicuously soon afterwards. It threatened to hold up the trade agreement with America, but then fell back on merely ticking off the Brussels commission, which had done the negotiating, for getting too little out of Washington in return. In a procedural test-case, France blocked a demand to make the commission responsible for negotiating an association agreement with Mauritius, but then gave way. After a year of saying no, President Pompidou has now apparently gratified the German desire to equip the Davignon committee (which discusses foreign policy among the Six) with a permanent secretariat.

Even such cautious concessions by France are being made on the strength of having Britain next to it in Brussels and on a gut judgment that American predominance in Europe has somehow, in no very carefully quantified way, been cut down to size since last August. This last is a judgment that Mr Heath shares. But that will not prevent him pressing M. Pompidou in directions which, if M. Pompidou lost faith in Mr Heath or in his ability to survive, would quickly raise in the French mind all its old fears of Britain in Europe as an anti-French trojan horse.

What Heath will hint at

In particular, Mr Heath goes to Chequers as heavily briefed on the need to reform the international monetary system as he was briefed about the sterling balances when he set about convincing M. Pompidou in Paris last May to be rational about what to do with those balances. Fortunately, M. Pompidou is a most rational man, leagues ahead on monetary matters, for example, of his own finance minister; but this has not stopped him speaking of the need for America to put its economic house in order before France will agree to monetary reform, rather as M. Couve de Murville used to lecture Britain in 1967 to gets its economy right before it could join Europe. Mr Heath will also be saying, though at this stage in a muted voice, that there is a need for some sort of eventual reform of Europe's common agricultural policy, on Britain's own account as much as America's. Mr Heath, therefore, has to express regret about the proposed farm price increases in Europe, in an attempt to stiffen the weakening French resolve to hold these price rises down as much as possible. And Mr Heath will explore a little further than he did last May what France's attitude to Nato and nuclear co-operation might be when M. Pompidou removes M. Michel Debré from the French ministry of defence after next year's French elections.

The pressure Mr Heath can exert on France over such matters, almost a year before Britain is signed and sealed into Brussels, is not yet very great. But his patience is going to have to be great. Under pressure from his supporters and from newspapers in France, M. Pompidou is certain to raise the questions of Ireland and industrial conflict in Britain, knowing well that France can do precious little about either except make a nuisance of itself. But he will raise them not just for those reasons. In a real political way, Ireland and anything else which might bring Mr Heath down have become Europe's business. For in the year since M. Pompidou decided irrevocably to let Britain into Brussels, the question which would once have been marginal in a French president's political calculations, the survival of Mr Heath as Britain's Prime Minister, has come to loom very large.

The Chinese connection

If Mr Nixon's trip to Peking next week goes well Europe stands to benefit from it too

For a lot of people in Europe, the arrival of President Nixon in Peking on Monday will seem a remote event, of no particular concern to Europeans. After all, Mr Nixon himself has been saying over and over again that he does not expect anything spectacular to happen in his meetings next week with Chairman Mao and Chou En-lai. To one kind of European the explanation comes readily enough: Mr Nixon has gone to China for the sake of the television coverage, which may help him to get re-elected in November, and at the very most to open up some sort of diplomatic link between Washington and Peking which will probably not even go as far as a full exchange of ambassadors. That is the danger of Eurocentrism, of the failure to realise that until Europe reorganises itself the real movers of events in the world will lie outside the familiar borders of the European peninsula. The importance of next week's meeting is that it could be the beginning of a major realignment between today's three great movers of events; and that a still largely passive Europe could be one of the beneficiaries of what happens.

The great American switch

To understand what has made it possible for Mr Nixon to go to Peking it is necessary to recognise the great change of direction that American policy has taken in the past two years, which is itself the result of changes in what the Russians and the Chinese have been doing. The main reason for the switch in American policy is neither the weakness of the dollar, nor the disruption the Vietnam war has caused in America, although both of those things have added to the arguments for trying something different. It is the change in what the Americans think they can usefully do in their dealings with each of the other two superpowers.

For most of the 1960s, under President Kennedy and President Johnson alike, the United States seemed to be hoping that it could come to a wide-ranging understanding with the Soviet Union, covering as many as possible of the places where they were at loggerheads with one another, in order that they could both be freer to deal with what then looked like the explosive influence of a revolutionary China. Mr Johnson made that clear in October, 1966—five months after the cultural revolution broke out in China—when he offered the Russians the sort of settlement in Europe which has since become the basis of Herr Brandt's Ostpolitik. But the world has moved on since 1966; and two things have happened which have made the Americans turn their approach to the two communist great powers inside out.

The first is the discovery that the Russians are apparently not interested, after all, in anything more than a very limited accommodation with the United States. Of course, they want to prevent the arguments in central Europe and along the Suez canal from turning into wars. They were happy to sign the non-proliferation treaty, because neither they nor the Americans want any more countries to get hold of nuclear weapons. They may be willing to settle for nuclear equality with the United States itself; although even that is not quite clear; the Russians already have almost half as many land-based missiles again as the Americans have, and they still seem to be refusing to set a limit on their production of missile submarines, in which they will overtake the United States next year. But that seems to be about the limit of Mr Brezhnev's definition of coexistence with the United States.

The main aim of Soviet policy in Europe, it seems likely, is still to remove the protection that American troops give to western Europe, and thereby make western Europe more pliable to Soviet wishes. The expansion of Soviet power in the Mediterranean serves the same end. And the past year, culminating in the Bengal war, has seen a major extension of the Soviet sphere of influence in southern Asia. Unlike Mr Khrushchev, Mr Brezhnev is apparently not worried enough about China to call a truce with the United States. He has sent something like a quarter of his army to the Chinese border, and reckons that that will take care of that. It looks as if the Soviet Union has come to the conclusion that it is strong enough to pursue its own interests against both of its major rivals at the same time. It can go it alone, it believes, and

do well out of it.

The other development since 1966, which has gone side by side with this, is the near-reversal of Chinese policy. The universal revolution against the "cities of the world" that Lin Piao claimed to be preaching six years ago has vanished along with Lin Piao himself. The cultural revolution itself has come nearly full circle: the Red Guards purged the party, and then the army purged the Red Guards, and now the top men in the army have been removed while the old party cadres sidle back into the work for which they have been found indispensable. It will be the historians' business to say how much this return to earth from the revolutionary fervour of 1966 is due to the American government's refusal to give up the fight in Vietnam; certainly Lin Piao would have had a powerful argument on his side if Ho Chi Minh's men had fought their way into power in Saigon and Vientiane within a couple of years of the start of the cultural revolution. Anyway, it has happened. The Chinese government is now being run by chastened and practical men who do not believe either in the instant transformation of Chinese society or in the imminent convulsion of the world. They are men who are prepared to believe that, when you have two enemies, it is sometimes advisable to decide which of them presents the worse threat to you.

It is necessary to dig back that far into history, because that is where the roots of Mr Nixon's Peking trip lie. It would be wrong to believe that the United States has given up the attempt to "contain" either Russia or China, to use an unfashionable word, if containment means trying to limit the extension of Soviet or Chinese power, or the installation of politicians dependent on Soviet or Chinese power, in places outside the present boundaries of the communist world. There is no evidence that the American government, or Mr Nixon himself, have abandoned their convictions about that. But it would be a fundamental mistake to think that Mr Nixon's "era of negotiation" is the same as the end of the competition for influence in the world. The most that is happening is that the cold war, which is the struggle between political ideas fought by means short of open and general conflict, is seeing the emergence of a new alliance of convenience. In a world of three superpowers it has come to seem possible that number one and number three might usefully combine, for certain limited purposes, against number two.

The lesser of two evils

For the Americans themselves, the process that Mr Nixon's trip to Peking is hoped to set in motion is plain enough. They want Chou En-lai to recognise that the growth of Soviet power in Asia is so much the biggest problem for China that he will be prepared to tolerate a limited American sphere of influence in south-east Asia. Possibly the Chinese are already beginning to see things this way. After all, they have a nuclear-armed Soviet army standing along their northern frontier; they have just seen the advance of a Soviet sphere of influence along their southern flank into India and Bangladesh; and they know that if the North Vietnamese army creates a communist Indochina the odds are that this new power to their south will be more an ally of Russia's than of theirs. That is why the prospect of a North Vietnamese victory is no longer as attractive to China as it was in 1966. Of course, Chou En-lai is not about to throw North Vietnam overboard. The Chinese are thought to provide only about a fifth of the aid that enables the North Vietnamese to keep the war going, and they can imagine what their admirers abroad would say if they suddenly cut that off. But if the North Vietnamese can be kept bottled up in the hills until November, and if Mr Nixon is re-elected then, and if he can persuade Mr Chou that he does not want to station any American soldiers or bombers in south-east Asia when the war is over, the calculations in Peking might begin to change. It is a lot of ifs; but it may offer Mr Nixon just enough hope of easing himself off the Vietnam hook to be the one main thought he wants to leave behind in Peking.

The squeeze on Russia helps Europe

But the possibility of a Chinese-American understanding also has something to offer to the two wallflowers who have been sitting on the edge of the dance of the three superpowers. That means Japan, with its hopes of recovering some of the territory it lost to the Soviet Union in 1945, and of taking a hand in the development of Siberia. And it means western Europe, with its hopes of breaking down the barriers that have lain across Europe since 1945. It is not just that Britain and the Six do 7 per cent of their trade with the non-communist countries of southern Asia between Israel and Singapore, and that they are still overwhelmingly dependent on the oil that comes to them from the Gulf through the Indian Ocean. That gives them a powerful interest in the political stability of the region, and the probability is that a three-way balance of power is more likely to keep southern Asia stable than a two-way tug of war between Russia and China. But the Europeans stand to gain even more from what the sight of Mr Nixon and Mr Chou getting friendly with one another may do to Soviet policy in Europe itself.

For the past half-dozen years the Russians have been simultaneously engaged on a policy of expansion in Asia and of sitting tight on their half of Europe. It has stretched their army, and it has imposed an additional strain on their already very inefficient economy. If Mr Nixon's trip helps to reinforce the Chinese in their opposition to Russian policy in Asia, Mr Brezhnev will have to decide how long his country can afford to bear this strain. Who knows, he may even start to feel a little lonely; it is not pleasant to be the odd man out, even when you are a superpower. The result may be a Russia more willing to look for an accommodation with western Europe on the Europeans' terms, rather than its own. That could be important if the conference on European security meets next year, and the west Europeans insist on talking about things like freer movement of people and ideas into and out of eastern Europe. What happens in Peking next week is not an event in a far-away continent about which most Europeans need know little and care less. They have a stake in it as well.

The kites above Stormont

But is there anything that a British government can offer Ireland's nationalists except the united Ireland that they are fighting to get, and the Protestants of the north will fight to stop?

Mr Heath and his ministers seemed to be set (before the Europe vote and the miners occupied their minds) on giving the impression that another political initiative in Northern Ireland was in the offing. This, after all, was what everyone, or nearly everyone, had told them to do. Perhaps they were just trying out ideas that had been put up, but, whatever they had in mind, much of Ulster decided in advance to have nothing to do with whatever might be said. This should have been no surprise to anyone, certainly not to Mr Heath. It meant one obvious thing: that precious little in Northern Ireland is negotiable. From this there follows an equally obvious consequence: that whatever a British government does, it must be something that can be carried through against the dissent of one or other of the communities in Northern Ireland. If a British government has that sort of power in Ulster it has yet to show it.

The word was put about that the cabinet did not mean to abolish the Stormont system as an entity. Instead, there were hopes of setting up a community coalition government, presumably on the Lebanese or Cyprus models (which tend to go wrong and always start major international crises whenever they do). A Catholic deputy prime minister would apparently serve under Mr Faulkner with perhaps four other Catholics to keep him company. These men would not be nominated worthies with few political roots in the Catholic community: they would be popular representatives (which must mean men like Mr Gerry Fitt and Mr John Hume). No idea about Northern Ireland is worth turning down at sight, or half-sight. But this one has much to overcome.

The leaders of the Social Democratic and Labour party have declared that nothing will satisfy them now short of talks to bring an end to the partition of Ireland. This may be only a temporary hardening after the Derry shootings, but it is a formidable new obstacle. No Catholic politician can probably stay in business at the moment if he speaks the language of conciliation. On the Unionist side, Mr Brian Faulkner has been sceptical of community government in the past; some of his colleagues are even more openly scathing now.

The Government could observe the Catholic community's reaction to Lord Chief Justice Widgery's tribunal, which opened in Coleraine on Monday. Mr Hume promptly denounced the inquiry's terms of reference and repeated the demand for an international tribunal, which he assumed would be impartial. Catholic witnesses are clearly reluctant to give evidence. Politically, too, many Catholics who were once moderates and prepared to work at Stormont now seem almost indistinguishable from IRA Provisional sympathisers. Some SDLP leaders turned up to back the militant Northern Resistance movement's illegal march in Enniskillen last weekend. It seemed very doubtful that such men would agree to serve in a well-meaning coalition.

Most Catholic Irishmen now believe that the ultimate goal of their country's reunification is close at hand. The government in Dublin may not be ready for it, but it cannot admit that. So Irish nationalism is not going to be stilled by Whitehall thoughts of holding referendums on the border issue every decade. On the Unionist side there are now some pronounced ideas on redrawing the present border to allow predominantly Catholic districts to join up with the Irish Republic. Even the hawkish Mr Bill Craig seems ready to write off the Bogside and Creggan in Londonderry. This is certainly something that the British Government could announce unilaterally, if it dares to. But it would still leave over 120,000 Catholics hemmed into their strongholds in Belfast, and any talk of a financially-assisted passage for Catholics out of the north seems fanciful. The central fact is that Irish nationalism requires one nation, not just bits and pieces of it. Certainly the IRA Provisionals, encouraged by a republican court's release of Messrs Dutch Docherty and Martin Meehan, will settle for nothing less.

Trouble for Lynch

The Irish premier, Mr Lynch, faces an angry Fianna Fáil party conference this weekend. He and his government have a fight on their hands to survive, a fight that appears to prohibit even mild gestures towards the Protestant majority in the north. Fianna Fáil voted down Mr Noel Browne's tightly drawn bill to legalise the medical use of contraceptives in almost a jocular mood, irrespective of appeals to think of what a united Ireland would need to do (see page 37). Moreover, Mr Lynch has made it up with the alternative assembly in the north—that Catholic parliament for a Catholic people—and it looks as though he intends to provide between £50,000 and £150,000 for its financial upkeep.

The British Government's thoughts about a modification of internment which would allow the release of the small fry and the trial of the hard men would be a calculated risk, and might take some of the international pressure off. But the murder of Mr Sidney Agnew, a key witness in a recent trial in Belfast, shows that intimidation is very much more than a matter of words. It is certainly doubtful if such a change would be enough for the SDLP, which wants an unconditional end to internment.

These kites flying over Whitehall have been looked upon with natural suspicion by many Ulster Protestants, but they are not the real problem for a British government. Mr Heath said in his speech at Harrogate a fortnight ago that no initiative, however ingenious, would

force Ulster's majority out of the United Kingdom. And yet anything less is now unlikely to satisfy the Catholics. There are few takers for Mr Heath's promise that the minority should have a "real and meaningful part in the taking of decisions which shape their future." There are no panaceas for Ulster that can be written out at ease in either London or Dublin. Much of the talk of commissions, proportional representation, United Nations troops and the rest seems an exercise in escapism. The Ulster struggle still promises to be long and bitter.

Tito tries to unscramble things

Having overreacted against the Croats in December, President Tito is calling for moderation now. But the hardliners are growing stronger

President Tito has changed his tune. In December he was giving the impression that a nationalist counter-revolution in Croatia had brought the country to the brink of civil war and foreign intervention. Now he and his associates say that there has been no more than a little local difficulty, grossly exaggerated by the foreign press. But, if so, what was the December rumpus in Croatia all about? The leaders of Jugoslavia's second biggest republic and hundreds of their followers have been thrown out of their party and government posts, and the purge still goes on. What had they really tried to do?

In the orchestrated campaign of denunciation that has been launched against them, they are being branded as separatists who were conniving at a plot to form a Croat state outside Jugoslavia. But all the available evidence suggests that they were not separatists. What they disliked was the kind of centralised Jugoslav state system, federal only in outward form, that the more conservative Jugoslav communists want. Last May Mrs Dabcevic-Kucar, then president of the party in Croatia, summarised their views thus:

> The unitarists and pan-Serbian chauvinists offer us a kind of Jugoslavia we do not want. The Croatian chauvinists want to destroy the kind of Jugoslavia we do want.

The ousted Croat leaders cannot now explain what they hoped to be allowed to do, for they have been silenced. And even while they were still in office they were obliged—like all would-be reformers in communist countries—to use very guarded language. But it is clear that, if they had got their way, contending factions would now be legally and openly permitted in the Croat communist party. One group of leaders would contest another group's views publicly, almost like a government and opposition. Nothing like this has been permitted in any ruling communist party since Lenin's time (though the Jugoslavs have gone a long way towards tolerating the existence of factions in practice).

Mr Tripalo and his Croat colleagues had already made certain moves in the direction of pluralism. The conservatives in their own party's ranks particularly resented their toleration, since early 1971, of a semi-autonomous student movement that was not under the direct tutelage of the party. They planned to permit the formation of bigger farms—another move long opposed by the party's conservatives—and they would have used the new freedom provided by last summer's constitutional reforms to allow artisans to open their own small businesses with money saved during periods of work in western countries.

One reason why they sought more autonomy for their republic within the Jugoslav federation was that many of their attempts to make liberal moves had been blocked by conservatives in the other republics acting in league with those inside Croatia. Now these conservatives are levelling against them a charge of "nationalism" that is more damaging, in the eyes of Jugoslavs outside Croatia, than the charge of excessive liberalism which President Tito made against the Croat leaders at the beginning of December. But the accusation of liberalism is the true one. The Croat leaders' critics had been infuriated by their reluctance to silence "opposition" journals like Hrvatski Tjednik, published in Zagreb. The last straw was their refusal to send the police into action against the striking Zagreb students in November. When a police officer asked the student leaders to hand over a tape recording of the meeting at which the strike had been called, he was told that this would be a violation of the university's autonomy, and he gave up.

A stumble, or an about-turn?

A policeman on a similar mission would not be so easily deterred now. This does not mean that Jugoslavia, or even Croatia, has reverted to being run as a mere police state in the Russian style—though the purge in Croatia has already exceeded the one that followed the fall in 1966 of Mr Rankovic, the federal vice-president and security police chief. But the new strengthening of illiberal influences in the ruling party has gone far enough to lead the Belgrade weekly Nin to give warning against "the growing and open pressure of neo-stalinism." It meant the increasing power of the very conservative ex-partisan and reserve officers' associations.

President Tito himself has now asked the Croatian comrades not to indulge in witch hunts. If the deposed leaders are not brought to trial, and if the Croatian intellectuals and students who have been jailed are given a fair trial, there may yet be hope for moderation, and the Croat affair may prove to be only one of the kind of lapses, like the repeated arrests and trials of Mr Djilas, that need not in the end halt the march towards a more liberal form of communism. But the very fact that all this is still in doubt is a measure of the seriousness of President Tito's overreaction to the Croat challenge in December.

Until you can hold your meetings on the runway, you're going to need an Avis car.

A plane will fly you from one airport to another. But no further.

That's when you're going to need an Avis car. Just give your nearest Avis office a call before you go. Your car will be waiting when you land there. Thoroughly checked 43 ways and ready to go.

A smart new Hillman or any other car you choose from our wide range. It will take you straight to your meeting. All the way.

Then use your Avis car for as long as you like. And before you fly back call at the Avis desk in the airport and drop the keys in.

It's as easy as that.

And no other car rental company offers service as good as ours, or tries as hard as we do.

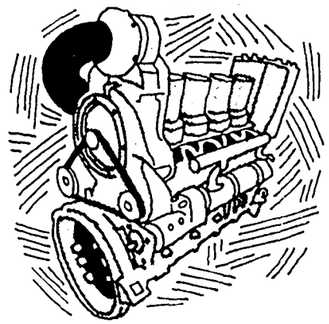
TKM can usually help. For TKM is the world's largest organisation specialising in the providing of short and extended term credit for the international movement of goods.

The period between the goods leaving the factory and the importer receiving payment from his customers is often a long one and locks up resources which could be more

Money for the big import export deals



profitably employed. TKM overcomes this problem by providing substantial lines of credit. Close analysis and a flexible approach enable TKM to solve most financing problems. The aim is to provide credit in line with the

commercial and cash flow requirements of a client's business.

The knowledge which TKM has gained in the financing of international business has given the Group a very special understanding of the needs of importers and exporters. It is knowledge based on over a century's practical experience. Today, with a turnover exceeding £330 million, TKM has 22 offices in fifteen countries and works closely with more than a hundred banks throughout the world.

If you have need of advice involving the financing of goods – whether as buyer or seller – you should contact TKM.

A booklet describing the many services offered by the TKM Group will be gladly sent to you on request.

The V and G crash: why no dog barked

James: pertinent questions

On Wednesday—while the public mind was conveniently preoccupied with thoughts of miners, power cuts and the coming vote on the common market—Mr Justice James's tribunal produced its report* on the affair of the Vehicle and General Insurance Company. And a pretty flat dénouement it was too. For the pitiful and trivial affair of the leak of information on the Department of Trade and Industry's doubts about the V and G had already been fully revealed to view in the tribunal's public hearings. So had the internal workings of the Board of Trade, as it then was. What the tribunal has done is to summarise the affair in convenient form, say firmly where the blame should lie, and, with undue tentativeness, hint at necessary reforms.

Why then did V and G crash? Because the company was run with a breakneck recklessness in its early and middle years. And in its later years, say from 1967 on, it was in trouble to a degree that was only intensified by its continued growth, but which was not apparently recognised by its directors until 1970, or only a matter of months before its collapse in March, 1971—when 10 per cent of the country's motorists woke up to find themselves without motor cover. Why did the DTI let it happen?

The simple answer is this: the Board of Trade realised—in the years from 1963 to 1966—that the company had not provided enough for its outstanding claims. The extent of this shortfall was impossible to estimate largely because of the difficulty in comparing the figures of a then small and untypical company with those of the market as a whole, and because the company persistently refused to provide run-off statements. What was fairly sure was that the company was solvent, and under the rules that then applied the BoT was powerless to act further. But it was growing fast and clearly, as officials uneasily recognised, was approaching the point when the underprovision, however much it was, would be so big as to bring its solvency down below the prescribed level.

But then several things happened. First the V and G got a windfall of £1m cash from an American insurance company in exchange for a share stake. Secondly, the British Insurance Association grudgingly admitted it to membership, partly on the strength of this windfall and partly in the belief that the BoT was in fact getting run-off statements. Thirdly, new and tighter supervisory rules for insurance companies came into force.

The introduction of these rules diverted some of officials' attention temporarily. But with the growth of the V and G, the general deterioration in underwriting results everywhere, the fact that the V and G had dissipated much of its £1m in buying other companies, the board soon recognised that the V and G was in trouble. From the spring of 1968 to the eventual crash BoT officials prevaricated, waiting for the next set of half-yearly accounts, fearing that the V and G was probably insolvent, yet certain that intervention would kill it (for which they would then be blamed), hoping it would pull round. For this inactivity, the tribunal firmly lays the blame on the under-secretary in charge of the companies and insurance division, and criticises the assistant secretary in charge of the insurance branch up to 1969, and his successor.

But the real lesson here lies deeper. The procrastination did not occur because of a succession of mistaken decisions by three men, but for a complex of factors. Among these were the fear that precipitate action would spark off a row and be stigmatised as a political blunder; changes in personnel and the tendency for the more aggressive, creative type of civil servant to find his way into politically more exciting jobs. Many insurance brokers could have told the BoT quite a lot unofficially about the V and G, whether its underwriting methods were sound, whether it was paying claims promptly and so forth. They, unlike the BIA companies, could not be suspected of trying to dish a troublesome rival, yet they had no contact with the board whatever.

What this report constitutes, therefore, is a catalogue of the inadequacies of a traditional civil service department for policing fast-moving and fast-talking businessmen, whose companies are supposed to be providing the public with the crucial commodity of security. By way of remedy, the tribunal merely poses a succession of questions. But the drift is clear enough. Although the tribunal does not say so, what is needed is a semi-official regulatory body armed with wide discretionary powers, staffed by mixed teams of seconded civil servants and insurance men, outside the civil service machinery altogether and supervised only loosely by Whitehall; and a mutual guarantee system for at least some insurance companies.

Mental hospital

Rotten apples

Leaked in at least two places (how it came to be is to be a subject of a separate inquiry) the report (Cmnd 4861) of the committee of inquiry into Whittingham Hospital has few surprises now that it has been published. The pilfering of patients' money ; the ill-treatment found to have occurred on four long-stay wards ; the neglect and lack of positive treatment that characterised all the long-stay wards ; the attempts by those in authority to suppress complaints about abuses—on all these matters the public had been pretty well informed already.

For this deplorable state of affairs almost everyone is rapped by the committee : the Department of Health for the weak audit inspections that failed to discover the complete breakdown in the recording of patients' money and for permitting, without questioning, the shortage of doctors and nurses ; the regional hospital board for its lack of a positive policy for long-stay mentally ill patients ; the hospital management committee for its utter failure to manage ; the senior doctors for their virtual abdication from the care of long-stay patients, and the senior nurses for their rigidity and failure to accept modern methods of care ; the General Nursing Council for not having inspected the hospital since 1961 ; and the local authorities for the absence of any facilities for community care (nor did they, though asked to, give evidence before the committee).

As usual, once the inquiry got under way reforms began to take place, and more are promised. It should be added, too, that some parts of the hospital were found to be of a high standard and its unit for the deaf is unique. Nevertheless, Whittingham highlights the dangers inherent in basing the services for the mentally ill on general hospitals, backed up by local authority services. To some extent, the Manchester regional board has been a pioneer in this respect ; but it has tended to content itself with encouraging general hospital psychiatry, while leaving the old mental hospitals to run themselves down on their own without any guidance. Whittingham's beds have been reduced from 3,200 to under 2,000 in 20 years, but it still cares for 1,600-1,700 long-stay patients and admits large numbers of them every year. That sort of half-baked policy, as the committee points out, could lead to a two-tier system

Joseph : no mental dumps

of psychiatry : well-staffed acute units and long-stay dumps.

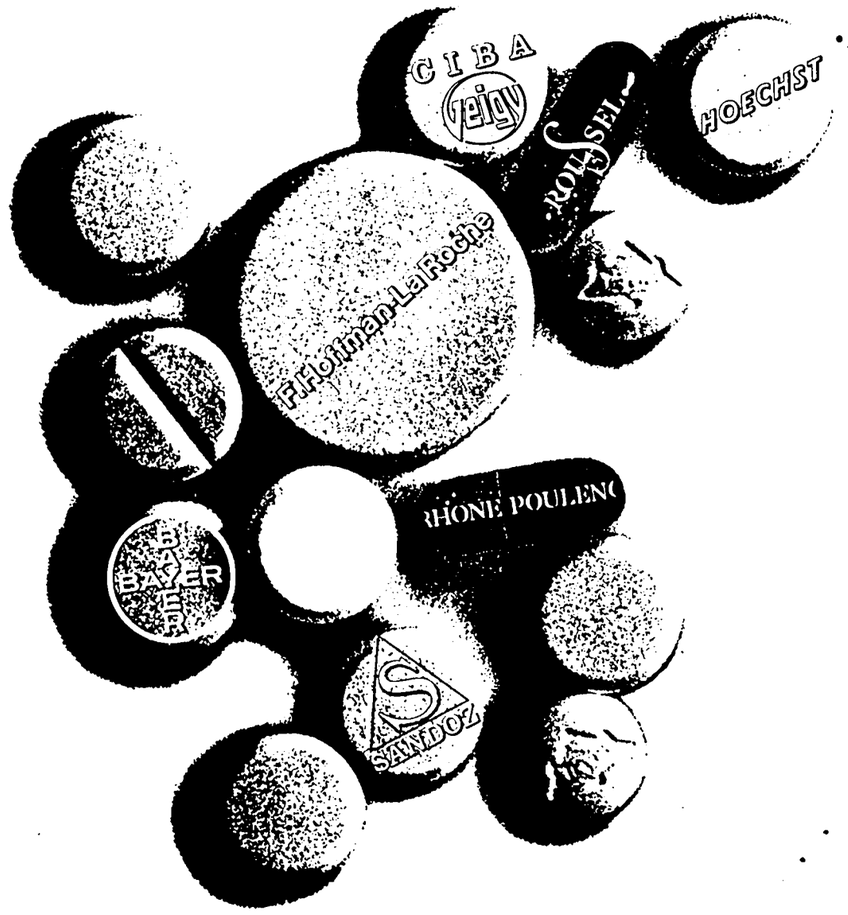
Sir Keith Joseph has declared that his department's plan for the future mental health services, announced last December, avoids this danger. Senior doctors and their supporting staffs will continue to work in the old mental hospitals while they are run down as well as in the general hospitals. But the whole policy will need constant monitoring and evaluation, if the "one or two rotten apples," which Whittingham's chairman at one time suspected might be found there, are not to turn up in back wards up and down the country.

Defence

A chance to quit

Under Mr Heath, the annual defence white papers are no longer the dramatic events that they were when Mr Wilson was continually chopping and changing his concept of the imperial commitment. Nor do they embody the alarming and expensive changes in nuclear weaponry which were so popular with the succession of defence ministers in the previous Tory administration. They now read as much like industrial pay and conditions agreements as blueprints of fighting services. Lord Carrington, the Secretary of State for Defence, has not even allowed Ulster to make much of a splash in his latest white paper (Cmnd 4891), which was published on Wednesday. For all the millions of words written elsewhere about the army in Ulster, it gets just a few sparse, obligatory paragraphs from Lord Carrington. Yet Ulster has coloured—and, indeed, conditioned—much of current thinking on defence matters.

It has, above all, driven home the old lesson that when it comes to the moment of action the first need is for an infantryman on patrol. That is reflected both in the earlier decision to restore four infantry battalions to the army list, and in the emphasis that the white paper gives to the problems of recruitment.



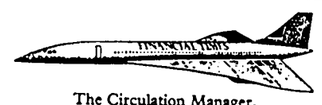
Recruiting has been going well ; last year, nearly 46,000 men joined up, the highest total for any calendar year since 1962. How much this was due to Ulster (a campaign always brings in more recruits) and how much to unemployment (which affects the attitudes of school-leavers towards job security) cannot be calculated precisely. But, plainly, the defence planners are not taking anything for granted. They recognise that the manpower pool from which recruits can be attracted has shrunk and, with the school-leaving age being raised to 16 in 1972-73, will for this decade at least remain smaller.

Young men are naturally reluctant to commit themselves irrevocably to six- or nine-year engagements. The growing popularity of three-year enlistments to the army has demonstrated this. The conclusion was unmistakable : men in the armed forces had to be given the right to quit by handing in their notice. And this, in a guarded fashion, is what the latest white paper duly proclaims.

New recruits will be given the basic right, on completion of their training and after a further 1½ years' service, to give 18 months' notice of leaving. Or, if they so wish, they can alter their contracts and, in return for higher pay, guarantee to serve for a greater number of years. At the same time, all who have served for nine years or more will be granted a similar right to leave the armed services at 18 months' notice.

Circumscribed and complicated though this scheme is, it is a step in the right direction. It reduces the disparity between the contractual obligations of a serviceman and a civilian employee. But that will encourage recruiting only if, at the same time, the pay looks reasonably comparable. There was an interim pay increase last year and pay scales will again be reviewed this April. Another increase is probably unavoidable.

On these two counts—terms of service and pay—Lord Carrington, treading a path pioneered by his predecessor, Mr Denis Healey, is acting correctly. But he needs to consider a third : the amount of time and money that should be devoted to training a serviceman for a civilian job when he



Who will cure most European headaches in 1980?

Even if you are not directly interested in the pharmaceutical industry, the prospect of intense competition within a given industry on an international basis, is a prospect of general interest to the business man. More and more, as Europe integrates, we shall see such battles, while the national giants of various industries integrate amongst themselves. And it is important for the European-minded businessman to be able to predict the outcome of such contests. They affect his future, directly or indirectly.

Within national boundaries the detailed information which a man needs, to form his business decisions, may be found in his chosen daily newspaper. But how about the *international* information – the birdseye view of a particular industry, taking in the whole of Europe and the world ? The Financial Times does not claim to be able to tell you more about your own country's business than your country's own leading journals. It does claim, however, to tell you more about other countries' businesses – from pharmaceuticals to steel, from cars to crops – than you may find in any other daily newspaper. It also claims a very high degree of accuracy, detail and political impartiality.

Perhaps these are some of the reasons why, according to a recent survey*, 41% of senior management throughout Europe already rate it essential reading, and why more and more international companies find it an important advertising medium. **If you would like to judge the Financial Times for yourself by letting us send you or any of your executives free copies each day for two weeks, †please complete the coupon and send it to us.**

SIDLAW INDUSTRIES LIMITED

(formerly Jute Industries (Holdings) Limited)

Extracts from Sir John Carmichael's Statement

Accounting Changes

The principal objectives of the changes were first to present a profit and loss account in a form which reflects the actual trading for the year excluding abnormal transactions and with a taxation charge no longer subject to large fluctuations because of the manner in which the Tax Equalisation Account was previously operated; secondly, to ensure that asset values entered in the Balance Sheet are realistic having regard to future prospects.

The main changes were the writing down of plant and machinery by £495,000 and the charging of the cost of redundancies to Reserves rather than to Profit and Loss Account. As a result of these changes, depreciation for the year was lowered by £32,000 to £375,000, the existing surplus on Tax Equalisation Account was increased to £369,000 and the charge to the Reserves for the cost of redundancies was £39,000.

With the release of the Tax Equalisation Account surplus to the Reserves, Reserves of the Company and Subsidiaries at the end of the year were still £20,000 higher than at the end of the previous year, after the charging of £534,000 for the writing-down of plant and machinery and the cost of redundancies. In other words, these changes have been effected with no diminution in the net worth of the shareholders' interest in the Company.

Because of these changes, direct comparisons with the results of the previous year are not straightforward, particularly at the taxation level. There is, however, no doubt that the performance was better.

The Past Year

The Company is in a difficult stage of transition. On the one hand, it is not easy to earn a satisfactory level of profits on jute manufacturing when competitive products are becoming increasingly penetrative because of price advantages. On the other hand, profits from the expansion of other activities and entry into new activities have to bear not only development charges but also finance charges until new installations become commissioned and profitable.

This is illustrated in the results of our associate companies for the past year for which profits overall were slightly lower than in the previous year. In fact, the profits of the associate companies, Polytape Ltd. and Synthetic Fabrics (Scotland) Ltd., would have been much higher than in the previous year had it not been for quiet heavy expense, not only in successful development work but also in the establishment of a substantial additional factory on a separate site. The associate company in the United States, Cordova Spinners Inc., improved to a break-even position while further capacity was being created. A similar situation occurred within activities which now come under the General Textiles Division: a major increase in the productive capacity for spinning man-made fibres was commissioned by the middle of the year at a time when the market had become depressed an is only now showing some modest signs of improvement.

These instances I have quoted indicate some of the inevitable brakes on the rapid expansion of profits in building up diversifications from small beginnings. I am confident, however, that the considerable sums of money invested in them in recent years will contribute an ever-increasing proportion of the Company's profits in years ahead.

I must add that trading profits from jute manufacture, while still substantial, were lower than in the previous year: the volume was also lower and this necessitated closure of plants, more intensive use of modern machinery and, inevitably, redundancies: merchanting activities achieved higher trading profits, the previous year's loss in Jute Industries Ltd, of New York Inc. having been turned into a satisfactory profit. The subsidiary, Thos. Gill & Sons Ltd., improved its position but was still not able to contribute to profits.

The Company's total Cash Inflow of £1,074,000 exceeded by £146,000 the sum required to cover £413,000 for the interest on Loan Stock and dividends to shareholders, £39,000 for the net cost of redundancies, and £591,000 (relieved to the extent of £115,000 by investment grants) on the purchase of fixed assets, together with further investments in, and loans to, associate companies, patents and goodwill. It is gratifying that the financing of this considerable expansion, almost entirely in new activities, was accommodated well within the available Cash Inflow. There was also an improvement of £1,402,000 in our liquid funds in the course of the year and this came mainly from decreases in stocks and debtors and an increase in creditors.

Summarising, there was much to be regarded with satisfaction: it was possible to continue the policy of investing further in diversifying activities within the cash flow generated; the liquid position of the Company improved substantially; the Balance Sheet values were revised so that they are realistic having regard to future prospects and this with no reduction in the net worth of the shareholders' interest; and overall profits did improve. Nevertheless, there must be a more adequate return on the capital employed in the business.

Employees and Trade Unions

I must pay tribute to the employees of the company at all levels. It was not an easy year, but they have responded well to all calls made on them in changing circumstances. I am pleased to record the continuance of good relations with Trade Unions who have been understanding of the problems which have forced a reduction in the numbers employed. We are proud of these good relations which allow consultation to take place in an objective manner.

The Current Year

The budget for the current year, prepared some months ago, had made allowance for disturbed conditions in East Bengal but had not envisaged a complete breakdown in supplies of raw jute for any lengthy period. This unfortunately, has happened and, at the time of writing, there is still no indication of when supplies will resume a normal flow: as jute manufacturing was still the major contributor to profits in the budget and as the merchanting of jute goods is also affected by the East Bengal situation, it is improbable that the budget, which showed an improvement over last year, will be achieved. Moreover, until some of the present uncertainties in regard to jute supplies are removed, there is no basis for quantifying the effect on profits overall. I intend to make a supplementary statement at the Annual General Meeting in the light of the circumstances then prevailing.

Regional Policy

I have referred on several occasions to the state of transition in which this Company and others in the Dundee and district jute industry find themselves at the present time. There is surely a case for special assistance as they endeavour to diversify within this area where their headquarters are situated and where their concern for the employment situation is deep. It has been well illustrated within the last eighteen months in various parts of the country that, when there is an economic recession, it is the peripheral factories of newcomers in development areas that suffer rather than their longer-established factories at the main bases. It seems to me that, in the particular circumstances of Dundee and district where the jute industry has been contracting progressively over a period of years, there is a special case for local companies to be given more rather than less assistance in new developments than for incomers because they are more likely to provide greater continuity of employment. I hope the Government will take such arguments into consideration in their current review of regional policy.

finally quits the armed forces. How much should this resettlement training depend on his length of service and the branch of the armed forces in which he served? For many young men, the armed forces are simply a first job. More of them might be willing to take it on if they felt certain that, at the end of their time, they would be properly trained for a second career.

Scottish assembly

United for devolution

FROM OUR SCOTTISH CORRESPONDENT

The Scottish assembly on unemployment, which the Scottish TUC sponsored in Edinburgh on Monday, decided to appoint a standing commission of 17 members to review and present to the Government an agreed programme designed to achieve Scotland's economic rehabilitation. The commission will have seven local authority nominees, four from the CBI and Scottish chambers of commerce, two each from the Scottish Council (Development and Industry) and the STUC, and one apiece from the Church of Scotland and the Roman Catholic Church.

The STUC had assembled a set of proposals which escaped serious challenge from the 1,500 delegates, who included 37 Scottish MPs of all parties. Its aim was to unite Scottish interests and represent Scotland's needs more powerfully in London by speaking with a single voice. The commission will demand still heavier Treasury spending on public works, authorisation for the Hunterston steel and Oceanspan projects, exploitation within Scotland of the North Sea oil finds, further fiscal stimulation for private industrial and research development, the creation of a Scottish development authority and a Scottish holding company, and massive manpower retraining.

But the discussion on Monday went beyond that. Its dominant message was an overwhelming consensus about Scotland's need for firm measures of economic devolution—and it did not flinch from recognising that more Scottish control of Scottish affairs might have to extend to politics as well. The Scottish Nationalists' Mrs Winifred Ewing (displaying statesmanlike qualities her party does not always possess) quietly likened the assembly to a candle lit on a long, dark night. But it was the assembly's left wing which made the most startling confessions. Mr John Body, Scotland's member on the engineering union's executive (a particularly British union hitherto) even declared his increasing, if slightly painful, conclusion that the only answer to Scotland's economic problems was a Scottish government.

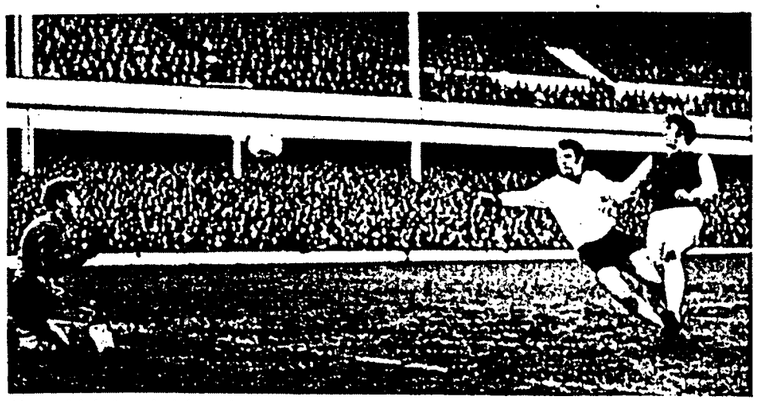
Many, perhaps most, on the left will still feel this is pitching things a bit high, and Conservative reaction could be much the same. But if some Tories at the assembly were roughed up, there was a hearing for the constructive contributions from others like Sir William McEwan Younger, the Tories' Scottish chairman, and Mr Teddy Taylor. Sir William thought Scotland's endless quest for foreign investment was splendid, but that the real need was to encourage native industry.

Voluntary workers

All together now

Mr Heath's appointment last week of a special minister, Lord Windlesham, Minister of State at the Home Office, to co-ordinate the Government's interests in voluntary social service, is a shot in the arm to the voluntary movement. The Tory manifesto committed the Government to creating more opportunities for co-operation between local authorities and volunteers and, only last December, Mr Heath announced that by 1975-76 an extra £1m would be added to the £2.5m the Government reckons to spend via various departments in grants to voluntary organisations. He also said that over and above this another £3.5m would be available over the next four years.

Three years ago, the Seebohm committee stressed that volunteers should play an important part in the work of the new social services departments. While some socialists may be wary of such strong emphasis being placed on using free labour, last week's House of Lords debate showed there is substantial bipartisan agreement that a great deal more use could be made of volunteers to supplement and complement the existing social services.



Windlesham: organising volunteers

A lot of voluntary work goes on already. Hundreds of thousands of people—nobody knows just how many—regularly give up time to help in hospitals, bring meals-on-wheels, work with old people and former prisoners and, more recently, to become involved in community action groups. The Women's Royal Voluntary Service alone provides meals to 91,500 people two or three times a week and has 27,000 workers in hospitals. But the voluntary movement is, almost by definition, rather chaotic and uncentralised, and it is high time that more was known about it in order to make more effective use of all resources.

In 1969, a committee, set up by the National Council of Social Service (itself an umbrella organisation for numerous groups including the Citizens Advice Bureaus) and the National Institute for Social Work Training to study volunteers in the social services, recommended that a Volunteer Foundation be set up "to be a focus for all aspects of the work of volunteers." Lord Windlesham's appointment is plainly a step in that centralised direction. The committee also recommended a network of volunteer bureaus to provide advice and information to volunteers.

This more professional approach is being encouraged by the Government. Recently, the Department of Health sent a circular to all hospitals suggesting that as part of a drive to get more voluntary help they should employ a voluntary help organiser—two years ago, 40 hospitals employed such organisers; now 120 do so. The Government also wishes to encourage more people to take up voluntary work on retirement. There is ample evidence to show that many retired people would like to do full or part-time voluntary work if they knew where it was needed. The Institute of Directors latched on to this five years ago when it set up a retirement advisory bureau to place retiring directors—all with useful business and financial experience—in positions of responsibility in charities and voluntary organisations. Last year about 60 appointments were made this way.

Hurst (right) ends fairy tale

Football

Westward, oh!

A fairy tale of sport ended on Monday with the death of the hero—but no one went into mourning. Hereford, this year's giant-killers in the Football Association Cup, went down at last, defeated by West Ham, a first division side of superior experience, style and skill, a team containing both England's captain and centre-forward.

For the football fan the special attraction of the FA Cup is that, in theory, it could be won by the team that plays in the local park, because the competition is an open one. For a club like Hereford United the attraction is not only the honour and the glory of toppling its big brothers; more important is the cash it can pick up on the way. Hereford played 10 cup games before being beaten, knocking out one first division team, Newcastle, and forcing West Ham to a replay: its aggregate earnings were around £25,000.

Yet even the money was only a supplementary reward. What Hereford really wants is to be elected to the fourth division of the Football League. That might seem a small enough ambition, for the quality of play in the game's bottom division is generally shabby and dispiriting, attended by crowds amounting to a few thousand at best. But Hereford, with prosperous support and a wide catchment area, wants to get into that fourth division, because that is the foot of the long ladder.

Pessimists say that even if Hereford did get in, the glamour would soon wear off and the crowds would fall away when confronted with the realities of playing teams like Barrow and Crewe. The recent precedent of Oxford United, however, who climbed to the second division within seven seasons of being elected to division four, is more to Hereford's taste. The one obstacle is that of election. Curiously enough, the teams already in the fourth division do not want to leave it to make room for newcomers. At the end of this season, as of last, Hereford will have to hope to get a majority of votes cast by the league sides. Up for re-election will be the sides ending up at the deep end of the fourth division. League sides have a habit of looking after their own. Hartlepool, the team that has scraped back in the past two years and has been trailing division four again much of the season, has just recorded a pop disc with the title, "Never Say Die." No doubt the 11 men of Hartlepool make a beautiful noise and are full of courage, but only their mothers could love the way they play football. Those at Hereford have rather more to commend them.

European studies

Continental drift

The British education system has been clearing its throat at the prospect of entry into Europe, but no one could pretend that it is ready to burst into multicultural speech. Increasing language studies (see *The Economist*, May 29, 1971) is a comparatively simple matter of swimming with the tide and training more good teachers: but encouraging European studies—which means dragging history, geography, social studies and literature out of national boxes—is a different matter. Periodic meetings do take place now of EEC education ministers. The rather propagandist exercise to establish a "Euroversity" came further down to earth last week, with the presentation of a report to the European Parliament which recommended that it should be modestly established as a university institute at Florence. But the moving spirit in the education field has been the Council of Europe.

In December, the council, which has linked up with the Oxford School of Education Studies to encourage study of the upper secondary school curriculum, passed a resolution calling for the creation of working parties and of five experimental syllabuses in European studies. This is likely to have rather earlier repercussions in countries such as France, where a ministerial fiat can cause an entirely centralised schools system to change gear, than in Britain. But there is not all that much agreement anyway on what European studies should consist of, or even whether they are a good thing. The Scandinavians (as against the British, French and Germans) tend to argue that any framework for general studies which is less than worldwide must be parochial. Discussion in Britain has tended to polarise on the issue of European studies for the past few months, but is really only the smallest part of an upheaval of curriculum reappraisal which has been going on since the early 1960s.

There is, so far, not much to show for it in European terms. Sussex university is doing a lot of the essential preliminary donkeywork, on book lists and source materials, at its Centre for European Studies. There are some Europe-flavoured courses for the Certificate of Secondary Education, the General Certificate of Education "O" level, and even in sixth forms: and general studies for the less able 13-to 16-year-olds are quite likely to get more European-minded. But teachers are loth to risk their able pupils on experimental courses—supposing they have had the initiative to ask the examining boards to provide suitable exams. Even in the universities, though traditional course straitjackets have been considerably unbuttoned, some topics (notably European law) get woefully short shrift.

Essex County Council has made the most spectacular step in the schools arena, with its proposal to set up a new comprehensive at Ingatestone (halfway between Chelmsford and Brentwood) specifically dedicated to European studies. If all goes well, this will open in September, 1973.

The Areas for Expansion have the right chemistry for your company's growth

If your company is now planning for growth you should consider the financial incentives open to you in the Areas for Expansion.

These Areas consist of the Development Areas (including the Special Development Areas), the Intermediate Areas and Northern Ireland. They offer many cash benefits to companies in return for providing new employment.

Consider how many of the financial benefits could help your company formulate its plans for growth.

The following apply in the Development Areas.

1. Building Grants Grants towards the building of new factories can be as high as 45% of the building costs.

2. Tax Allowances These include a special first-year allowance of 100% of expenditure on new immobile machinery and plant and 44% of the construction costs of industrial buildings (after deducting any grant).

3. Loans General capital expenditure can qualify for loans at moderate rates of interest.

4. Removal Grants Substantial contributions are available to meet some of a firm's major costs of moving into an Area.

5. Training Grants These amount to £10 per week for each man (£7 per week for each woman) during the period of their basic training for additional jobs provided in the Area. Various forms of direct help with training are also available.

6. Advance Factories For those unable to build their own factories, it may be possible to buy or lease a suitable ready-built Government factory – in some cases rent-free for 2 years (for 5 years in the SPECIAL DEVELOPMENT AREAS).

7. Operational Grants Grants are available of up to 30% of eligible wage and salary costs during the first three years of operation for new incoming industry in the SPECIAL DEVELOPMENT AREAS.

In the INTERMEDIATE AREAS a more limited range of benefits is available.

There are other important benefits. For example in the Development Areas (including the Special Development Areas), Regional Employment Premiums are payable to manufacturers at £1.50 per week for each male adult employee (75p for each female) until September 1974. And in all the Areas there is plenty of room for future expansion with some of the most attractive countryside on your doorstep.

To obtain more information on the Areas for Expansion, contact us at "Industrial Expansion" at the Department of Trade and Industry.

We aim to provide industrialists with the impartial help they need in finding the right location for a successful project. Filling in the coupon is the first step towards getting all the facts. Do it now – or telephone 01-834 2255, Ext. 88.

What can we save the baffled businessman who is trying to trade worldwide?

Time.

Our help can save a lot of time.

It's available on demand from our London office. Or from any of the hundred or so other Sumitomo Shoji offices located throughout the world.

Our seven thousand staffers speak the specialized language of licensing agreements, finance, joint investment, technological collaboration and triangular trade.

We can help you find a lucrative market for your product or service. We can help you locate a local labour force and/or supplies.

We can help you learn the law (and the lore) as it applies to these trading activities not just in Japan. But also in Europe, Africa, America, the Middle East and Asia.

Help yourself to a share of our trading experience. Utilise our worldwide facilities. It could save you a lot of money. And a lot of time.

Call or write us.

London Office: P. & O. Bldg., Leadenhall Street, London, E.C.3, England. Telephone: (01) 283-4931

THE WORLD *International Report*

They had a holiday while they waited

FROM OUR SAIGON CORRESPONDENT

A volley of fireworks lit up the Saigon sky on Monday night, but it was not the much-rumoured Tet offensive. People were just trying to frighten away evil spirits at the start of the Year of the Rat. With both sides having declared a ceasefire for the lunar new year—the communists for four days, and the South Vietnamese and the Americans for 24 hours—the fighting had stopped.

Well, not quite. A few minor guerrilla attacks were reported in various parts of South Vietnam, and the Americans' B-52 bombers were diverted to Laos for an intensified bombardment of the Ho Chi Minh trails. But despite all the recent speculation about a major communist offensive, officials in Saigon were not expecting trouble before the end of the week. The phrase "Tet offensive" has stuck in people's minds ever since the bloody events of 1968, but the hopeful guess is that the communists have little to gain from an onslaught during Vietnam's main family reunion of the year except the element of surprise. And this year, unlike 1968, South Vietnam's army was on full alert all week.

At the beginning of the week American and South Vietnamese officers were picking Sunday, February 20th, as the likelier date for an attack; that is the day before President Nixon's arrival in Peking. North Vietnam has not concealed its anxiety about the shift of Chinese policy towards the United States last year, and the uneasiness persists in Hanoi despite assurances of undiminished support from Peking. It is now becoming quite clear that China considers Russia, not the United States, as the greatest threat to its security. And Russia is the chief arms supplier to North Vietnam, and currently the most active supporter of its persistent search for total military victory.

The fear in Hanoi is that Chinese suspicions of Soviet intentions in Indo-china could provide the ground for a narrowing of the gap between Chinese and American ideas about how to end the war. So it is highly desirable for North Vietnam to provide an unfavourable backdrop for Mr Nixon's talks in Peking: an offensive that calls into question the success of Vietnamisation, sets off a new wave of breast-beating and defeatism in America, and tells Chou En-lai that victory is close and therefore not to be compromised.

An offensive which coincides with the Nixon visit might achieve these aims, and also spoil some of Mr Nixon's favourable publicity at home. But if it started too early the Saigon government might have time to get on top of it while Mr Nixon is still in Peking, thus proving his contention that vietnamisation is working. At any rate, that is the reasoning used in Saigon to explain the fact that things were still so quiet on Thursday morning.

North Vietnam's other main target, of course, is vietnamisation itself. The communists' concern over this programme is revealed in their policy statements, including their refusal to negotiate a political settlement unless vietnamisation is stopped. A really successful attack now could have a decisive demoralising effect on Saigon's forces before what is expected to be a final all-out communist campaign a year from now.

As the Tet holiday drew towards its close this week, the men in the military planning offices conceded that the North Vietnamese might be strong enough to launch spectacular assaults in three regions: just south of the demilitarised zone, in the central highlands around Pleiku and Kontum, and in the provinces around Saigon. But they were still waiting, with fingers crossed, to see when it would start, how rough it would be—and even whether the big thing might be put off until the autumn.

Ready for every contingency in Kontum

The electronic war

The gadgets take over

Ever since the 1968 Tet offensive the Americans have got anxious at about this time of year. But this year their precautions have gone to unusual lengths. They have brought another aircraft-carrier to the Vietnam coast ; more B-52s have been put into Guam ; and the bombing of what are believed to be jumping-off points for the predicted communist offensive has been uncommonly well advertised. Above all, the American command now has more sophisticated methods of assessing enemy activities than relying on hunches and anniversaries. The electronic war along the Ho Chi Minh trails is in full swing.

Since 1968 the Americans have laid a $3,000m electronic network along the communists' supply route from North Vietnam. The development of electronic warfare for Vietnam began earlier, under Mr McNamara. But it was the successful use of electronic sensors to detect enemy troops during the siege of Khe Sanh in 1968 that converted General Westmoreland to the idea of their wider use.

The most common form of sensor is shaped like a torpedo, with antennae made of green plastic which blend in with the Laotian jungle. When dropped from the air, the torpedo part of the sensor is buried and then records the movement of men or vehicles passing by. There are also acoustic sensors, which pick up noises above ground, and a host of other devices implanted on the trail : metal detectors to distinguish people carrying guns, magnetic devices to tell whether a truck is coming or going, gadgets which pick up trucks' ignition, and the notorious "people-sniffers." These eerie devices are said to detect the ammonia in human urine.

The sensors and their like are laid in patterns parallel with the Ho Chi Minh trails. Their signals are relayed back to computers in Thailand which can then calculate the number of men or vehicles, their speed, distance apart and direction. The patterns of signals built up by the computers can reveal other subtleties. For instance, a convoy which takes an unexpectedly long time to pass a set of sensors may reveal that there is a truck park in the area ; a southbound convoy which stops and then heads back towards the north may indicate a dump ; and silence from the sensors may mean that the North Vietnamese have constructed another bypass.

Once the targets are identified, it is up to the bombers from the four American bases in Thailand and the jets flying off the Seventh Fleet's aircraft-carriers to attack them. The most common bomb is the 750 lb blockbuster. But there are other bombs, as ingenious as the sensors : bombs with radar, TV, and laser guidance built in. There is also the particularly destructive "mother" bomb which rains smaller bombs over a wide area. One form of bombing is "geological bombing." Geological faults are surveyed and then bombed in the hope of causing landslides across part of the trails.

Airborne gunships have been fitted up with computers which relate automatic-sighting devices, such as infra-red radar for night work, to the actual firing. In all, it makes up a much more precise system of bombing than anything the Americans had four years ago. As General Westmoreland once mused, "I see combat areas under 24-hour surveillance where we can destroy anything we locate through instant communications and almost instantaneous application of firepower."

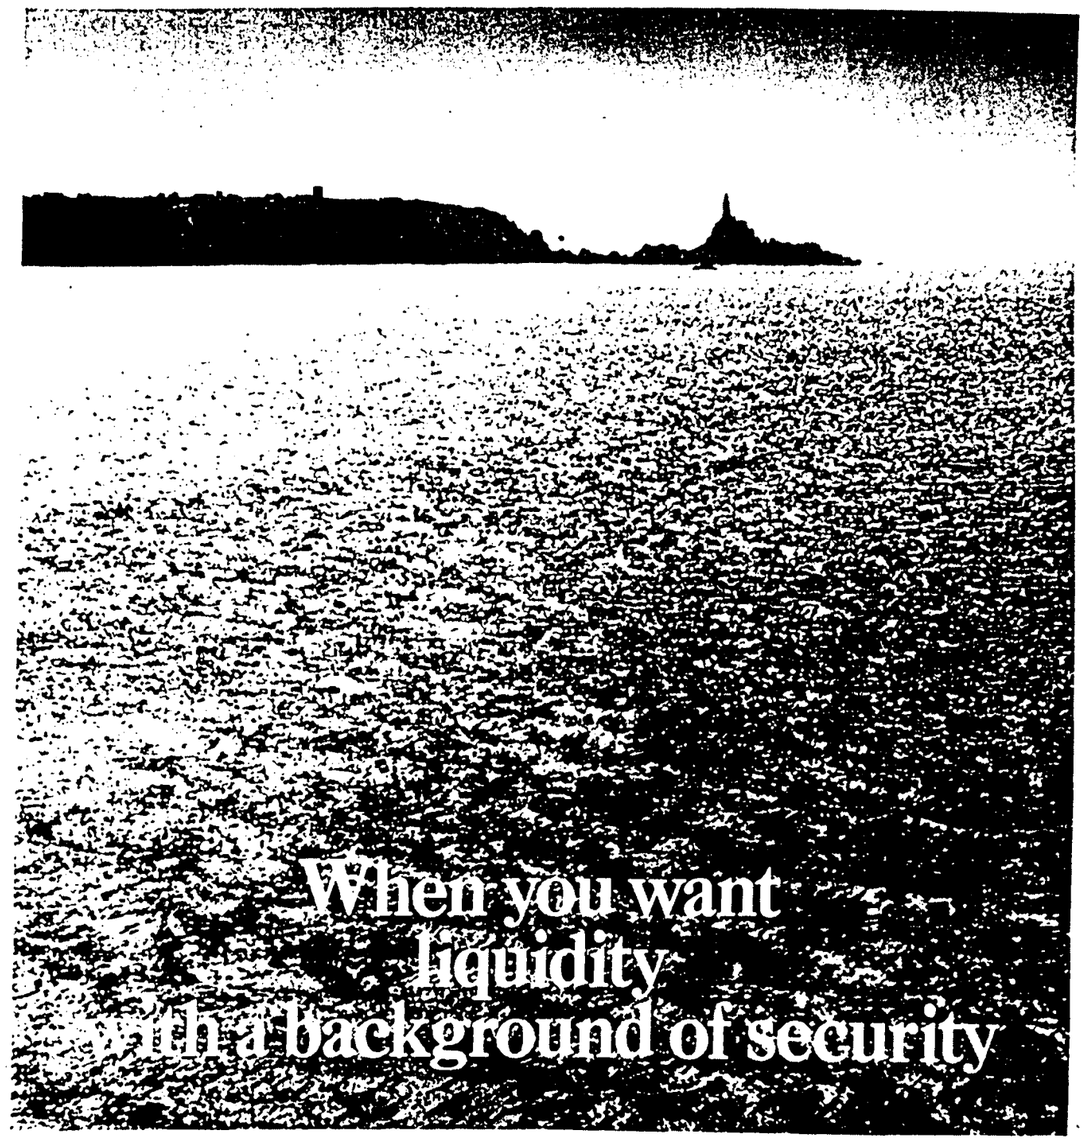
That, at least, is the theory. Whether it works in practice is another matter. The United States Air Force claims that it destroys almost 85 per cent of all war material coming down from North Vietnam. Even more impartial observers estimate that the flow along the Ho Chi Minh trails is 40 per cent less than in previous years. But there is a cost.

Probably the number of non-combatants killed and wounded is small ; there have never been many people living in the tangled hills through which the trails run, and most of them fled from the fighting some time ago. But the damage to the countryside is great. Large parts of eastern Laos, north-eastern Cambodia and the north-west of South Vietnam are now virtually free-fire zones. The days when targets in Laos and Cambodia had to be carefully checked out with the authorities in Phnom Penh and Vientiane have pretty well gone. Now the computers in Thailand do it all.

Yet it seems likely that the new capital-intensive war will go on for some time. The Americans' casualties in this aerial war are tiny. And is any politician going to campaign on a "bring back the sensors" platform in the United States ?

North Vietnam's allies

We're right behind you



FROM OUR EAST EUROPE CORRESPONDENT

The Hungarian prime minister, Mr Fock, had barely touched down in Budapest last weekend after a long trip to North Vietnam when his party leader, Mr Kadar, was taking off for Moscow to report on the result of the mission. Like many similar recent visits by east Europeans to Hanoi, this Hungarian one was intended to keep up the North Vietnamese leaders' morale on the eve of President Nixon's visit to China. Since President Podgorny dropped in on Hanoi in October to tell North Vietnam's leaders that they will not be left out in the cold, almost all the east Europeans have followed suit.

The press in various east European countries has become increasingly hostile towards the Chinese. Clearly Russia is trying to mobilise support for Hanoi just in case there is a measure of agreement in Peking between Mr Nixon and Chou En-lai. And the east Europeans continue to help North Vietnam with economic aid and arms. All the recent visitors to Hanoi have renewed their agreements for trade and military assistance.

This aid has been costing eastern Europe a good deal. Poland, which had run up credits of £30m in its trade with North Vietnam between 1966 and 1970, was allowed to cut its shipments there by 30 per cent in 1970 to help it with its own economic difficulties. Czechoslovakia built up credits of £28m with North Vietnam over 15 years, but this figure does not include non-repayable economic and military assistance. Czechoslovakia and east Germany are Hanoi's main arms suppliers, but Poland, Hungary and Bulgaria also make an important defence contribution. People in all these countries are asked to donate substantial "voluntary" contributions. East German trade unionists are said to have contributed no less than £43m. But all this is small stuff compared with Russia's estimated annual aid bill of £208m.

North Vietnam is still getting Chinese aid ; an agreement for new—and free—deliveries of military equipment and economic materials was signed in Peking on January 22nd. But Le Duan and his colleagues are clearly determined not to be caught out by anything that happens in Peking next week.

When you want to put your money to work with top security as well as complete liquidity, there's nowhere better to go than the London Discount Market.

Gerrard & National is one of the largest companies in that Market, and for well over a century we have been engaged in the traditional discount business.

But our range is wide. Modern developments have opened up new opportunities for the most effective handling of clients' short term funds, and interesting new investment facilities now on offer include Sterling Certificates of Deposit and Local Authority Bills and Bonds.

Germany and Poland

They'd hoped for more than that

FROM OUR BONN CORRESPONDENT

At a carnival in Cologne this week an accordion player answered questions with the opening bars of some appropriate song. Whenever he was asked who was going to pay for something or other he raised the roof with the merest hint of *Deutschland, Deutschland, über Alles*. The clown asking the questions was too tactful to allude to the bill for Herr Brandt's Ostpolitik. Had he done so the response would have been the same. West Germans feel they have been given little in return for their own contribution towards a detente in Europe. The Russians and the east Germans have been slow to demonstrate their genuine intention to "normalise" relations with west Germany ; so too have been the Poles.

With this default in mind, Herr Brandt sent Herr Herbert Wehner (the Social Democrats' leader in the Bundestag and probably the chancellor's closest political colleague) to Poland in the hope of discovering how some of the persisting chilliness and disparagement might be overcome. Herr Wehner was in Poland from February 5th to 10th ; he had a series of talks with senior officials, including Mr Gierek, and was shown the restoration of Gdansk on lines that would be approved by all who knew the city when it was called Danzig.

But when he reported back to Herr Brandt last Saturday, Herr Wehner could not promise any substantial improvement in German-Polish dealings in the near future. He had found much mutual suspicion still alive, particularly concerning economic collaboration and the resettlement of Polish subjects of German origin who want to join their relatives in west Germany. Yet he did have one bit of encouraging news. Mr Gierek had intimated that he would like to discuss these matters with Herr Brandt himself, either in Bonn or Warsaw, if possible this year. It had been suggested, too, that it was high time that the two foreign ministers, Herr Walter Scheel and Mr Stefan Olszowski, should get to know each other and a meeting may be arranged after the Bundestag ratifies the Bonn-Warsaw treaty. The Bundestag is due to begin its first readings of the Moscow and Warsaw treaties next Wednesday.

The Germans are particularly disappointed by the delay in resettling would-be emigrants from Poland. Herr Wehner received only the vaguest assurances from Mr Gierek that the process would be expedited. The Germans are unsure whether the delay is deliberate or merely bureaucratic. Last year nearly 16,000 immigrants arrived ; over the previous 12 years they came at an average rate of just under 10,000 a year. According to the Polish authorities only 10,000 candidates are left. But officials at the Hamburg headquarters of the Red Cross say they know of some 300,000 pending applications. A Christian Democrat deputy reproached the government this week for not having specified numbers and a timetable in the Warsaw treaty.

Herr Wehner received the impression that Germany's acceptance of the permanence of the Oder-Neisse frontier is considered by the Poles to be too low a price to ensure favours. Everywhere he sensed disappointment that west Germany had not yet begun the promised intensification of trade and economic and technical collaboration, on the basis, naturally, of generous credits. But in Bonn it is held that west Germany is already doing a good deal to help Poland commercially; for instance, it takes 45 per cent of all Polish exports to the European Economic Community. Possibly when the two leaders meet they will be able to reduce the friction generated by unfulfilled expectation.

Amid the mutual suspicion Wehner got some encouragement from Gierek

France and Germany

It doesn't reach far enough

If President Pompidou and Herr Brandt had strayed off economic and monetary matters into defence, their meeting in Paris last week might have been less happy. The unhappiness is about the positioning of the new French tactical nuclear missile, Pluton. The French have recently been putting out feelers about equipping their two divisions in west Germany with Pluton ; the Germans, not surprisingly, have stamped rather heavily on those feelers.

The French divisions are based just over the frontier, with headquarters at Baden-Baden ; from there Pluton, even if fired to its maximum range of 75 miles, could not possibly make it over into eastern Europe. The west Germans are touchy enough about becoming a nuclear battlefield even when they have a measure of control, as they do over American and British weapons, through Nato's Nuclear Planning Group. They would want this sort of control over French weapons—as, indeed, they had over the Honest John missiles with which French troops in Germany were equipped before they were withdrawn from Nato supervision in 1966.

Possibly all this could be settled by a bilateral French-German agreement which gave the Germans a say in their targeting and use without exposing President Pompidou to domestic criticism about reinvolving himself with Nato. But the problems would not end there. The French are becoming aware of the need to make their tactical weapons look credible by putting their troops in the front line. So even if Pluton were deployed in the Baden area, French troops would have to go farther forward, nearer the British, American and German troops. This raises the old French fear that being in the Nato front line might mean automatic involvement of French troops in Nato operations and the loss of control over what would happen to French troops if fighting broke out.

Another difficulty is Russian hostility to the idea of French control over nuclear weapons on German territory. The Russians have already complained to the Americans, and may raise the matter in the Salt talks—thereby further entangling the already complicated question of "forward-based systems" in Europe. Nor, in all probability, would the Russians accept a shared system of French-German control as a solution.

The talks between France and Germany about Pluton have so far been very private. The French do not like to ask publicly for something unless they are sure they will get it. Now the matter remains stuck, with the Germans being unco-operative. But then perhaps there is no need for an immediate decision; problems with the miniaturisation of Pluton's warhead mean that the weapon will probably not be operational until 1974.

France

Yes, but should it be like that?

FROM OUR PARIS CORRESPONDENT

Six weeks ago, Jacques Chaban-Delmas was a happy prime minister. This week, as he went on television to defend himself in the great tax—or rather no-tax—scandal, he was fighting for his political life. The latest opinion poll showed that his standing had taken a nose-dive since the Canard Enchaîné last month published his income tax returns showing that he had, quite legally, paid no income tax for several years while he was president of the national assembly. Although President Pompidou and his party, the Union of Democrats for the Republic, were standing by the prime minister, they were doing so with no visible enthusiasm.

Their zeal was hardly increased by some documents more recently published by the Canard: a letter to a tax inspector now awaiting trial, and another letter, 11 years old, signed by an ambitious young man called Valéry Giscard d'Estaing, revealing that the finance ministry had been happy to accede to M. Chaban-Delmas's pleas on behalf of a company charged with "grave" tax frauds. Yet the prime minister and his party have been right in thinking that it is essentially the system, not the man, that has been under attack. The accident of M. Chaban-Delmas's tax returns has focused attention on that most basic of political questions : who gets what ?

Not much enthusiasm for Chaban

The avoir-fiscal system which enabled M. Chaban-Delmas not actually to write a cheque to his tax collector can perfectly well be defended —M. Giscard d'Estaing did the job admirably on television last week—as a form of tax deduction at source. But it has become the symbol of a tax structure, and therefore of a society, which favours the influential and the rich. The split between direct and indirect taxes in total government revenue suggests the nineteenth century more than a modern industrial state. And France is within a year or so of elections. Little wonder that the prime minister on Tuesday found it necessary to follow his defence of his personal probity with one of the social ideals of his government.

Neither attempt was strikingly effective. But the task might have been easier if he had first gagged the zealots of his party. For its general secretary, M. René Tomasini, the Spiro Agnew of French politics, the whole affair has been got up "by the communists and their accomplices." Other UDR members and the party propaganda sheet have spoken of deliberate subversion, of attempts to discredit democratic politicians such as those used by Hitler and Mussolini. Not the tax system, in short, but the republic in danger.

Possibly: but, if so, from whom ? No reaction—and M. Chaban-Delmas, to his discredit, reflected these charges in a muted form on Tuesday—could have done more to confirm the suggestion of the Canard and other critics that there is something dangerous in having a ruling party which has exercised 14 uninterrupted years of gaullist power. One small detail of this affair is worth recording. When the government, which has an ample pro-government press at its disposal, decided that its defence required extensive television time as well, it appears to have occurred to no one, not even in the opposition, that its critics might conceivably be given a similar privilege.

Ireland

Durex politics

FROM OUR DUBLIN CORRESPONDENT

If sex is a subject for sniggers in Ireland (a typical joke defines an Irish queer as a man who prefers women to drink) contraception is practically unmentionable. But it is a matter which is forcing itself into discussion as the republic considers the implications of a reunification of the whole island, a possibility which to Irishmen south of the border no longer seems so remote.

Last week in the Dáil the curtain of the future was for a brief moment pulled aside—and then speedily pulled back again. The view of a secular united Ireland had no appeal for the Dáil's deputies. The occasion was the introduction of the first stage of a private members' bill in the name of two Labour MPs, Mr Noel Browne and Mr John O'Connell. The bill would have permitted the sale of contraceptives by chemists and doctors in clinics and in other places decided by the minister, as well as the circulation of advice on family planning.

It was not the first time an attempt had been made to introduce such legislation in Ireland. On two previous occasions similar bills were refused a reading in the senate. Mr Browne said his bill was an attempt to establish the rights of a religious minority in a secular state whose constitution, laws and statutes on education and child adoption all betrayed the Dáil's hostility to such rights. But the minister for transport and power, Mr Brian Lenihan (standing in for the minister for justice), was insistent that the bill was outside the ambit of sectarianism and Irish unity. He argued that to permit the free availability of contraceptives would have "significant social implications." He did not spell

out what these would be, but the clear reference was to the dangers of a permissive society with divorce, abortion and all the other horrors calculated to affright the average Irish voter. Anyway, the minister said, the government hoped "ultimately" to devise a bill that would meet the concepts of private morality and at the same time avoid the difficulty of unrestricted availability of contraceptives (which, of course, was not what Mr Browne's bill envisaged).

Mr O'Connell pointed out that the bill merely upheld the right to private family planning granted by the United Nations convention of 1958 to which Ireland had given its support. Few other speakers made any contribution to the debate. The house divided with 75 members against the motion and 44 in favour, the government benches being solidly against the bill. But the two opposition parties split. Clearly the majority of the members were thinking of their own safety and not of the rights of minorities. "Durex politics," as it is called in Ireland, is simply not a serious issue, at least at present.

Cyprus

Ulster in the Mediterranean

If a flurry of twelfth-hour diplomatic activity can resolve an international crisis, Cyprus should be safely defused once again in the next few days. But the island is not given to such happy and speedy consummations, and at midweek President Makarios seemed to be bent on giving the world another cliff-hanger as he pondered his formal reply to the Greek government's virtual ultimatum of February 11th: to hand over the recently imported consignment of Czech arms either to the custody of Greek officers on the island or to the United Nations peacekeeping force, and to form a government of "national unity."

Archbishop Makarios has always relished brinkmanship; this time the Czech arms might just carry him over the edge. In angry exchanges in Nicosia with the Greek ambassador, Mr Panayotakos, he flatly rejected the Greek government's demands—and the majority of Greek Cypriots certainly support him. He does not want to surrender the arms to the Greek officers of the National Guard, for some of them are almost certainly involved in plans for his own overthrow. Handing the weapons over to the United

Papadopoulos has his eye on Makarios

Nations might be a different matter. But as head of a sovereign state he can argue that it is his business, and his alone, whom he includes in his cabinet or uses as advisers.

In fact, most of his ministers are politically colourless figures and at least one, Mr Komodromos, the minister of the interior, has long been depicted as an enotist—that is, a supporter of union with Greece—at heart. The archbishop can also cite the fact that, a few months ago, he invited the flamboyant General Grivas to become minister of defence, and the elusive former leader of the Cypriot rebellion against British rule, who is believed to be staying with Greek officers on the outskirts of Nicosia, failed to respond. President Makarios therefore seems bound to say no to the Greeks' demands, but he will probably do so in characteristically byzantine terms.

When the formal reply comes, what will the Greek government do? Everything depends on whether its objective is to carry through a final solution of the Cyprus question, or merely to halt the growing left-wing influence in the island, which Archbishop Makarios has wittingly or unwittingly fostered. If that is all the Greeks are after, some formula which provided for the surrender of the arms to the United Nations might allow the crisis to simmer down. But the peremptory manner in which the Greeks have handled the affair (despite a slightly mollifying statement by Mr Panayotakos on Tuesday) has increased the belief that Mr Papadopoulos's government has come to some understanding with the Turks.

Behind the scenes the Turkish government has been making furious diplomatic protests. It argues that, although the Czech arms may on the face of it be primarily intended to protect President Makarios against an attempted coup by General Grivas, they could be equally handy one day in suppressing the Turkish Cypriots. The Turks (both in Ankara and Nicosia) have long argued that the removal of the archbishop would ensure a settlement; the Czech arms episode has made the Greek government more inclined to see their point.

So far both Greece and Turkey have agreed in principle that Cyprus should continue to be an independent sovereign state. The question now is whether the arms imports have persuaded the Greek and Turkish governments to force a settlement along the lines of "double enosis," which the Turks would call partition. This would find favour with the American government, which is increasingly worried about the growth of Soviet power in the Mediterranean.

From the Greek standpoint, the obvious instrument to cut through the knot would seem to be General Grivas, who wants to go down in history as the man who united his native island with Greece. But it is hard to see the Turks really trusting the general, even though he has given indications that he would be prepared to allow them to take over some small sector of the island under the double enosis formula. Equally uncertain is the exact relationship between General Grivas and Mr Papadopoulos. There is little evidence to suggest that General Grivas returned to the island secretly as Mr Papadopoulos's man; but there is a lot of evidence that six months ago the Greek prime minister knew of the general's plans—and let them unfold, in the expectation that General Grivas would put pressure on the archbishop.

At 73, the general is said to be as volatile as ever, and with armed groups of his loyal followers deployed around the island he is quite capable of striking out on his own. Reports from Nicosia this week suggest that President Makarios may make the removal of General Grivas the quid pro quo for some deal with the Greeks on the Czech weapons. From the archbishop's point of view this would make some sense; but ejecting General Grivas at this juncture will be a hazardous operation, to say the least.

It is a situation of considerable complexity, and one which augurs ill for the five-sided talks which are still

Protests in London, if not in Iran

extracted during months of imprisonment. The defence lawyers provided for the accused are elderly and, for the most part, retired military officers clearly lacking the confidence of those they represent. The tribunal gives the defendants the opportunity to state their case. They have all stuck to their beliefs.

But the charges are couched in such general language—for instance, plotting to overthrow the government—that on occasion even the timid defence lawyers have protested at the lack of concrete charges or evidence. No firm distinction is made between those who actually carried out guerrilla operations and those who participated in the planning or were members of the same group or held the same beliefs. In each trial, so far, the pattern has been to include some guerrillas together with others whose offence is being a member of an outlawed political party or professing communist ideology. Not unintentionally, they are tarred with the same brush.

The sentences in the first two trials are an indicator of the balance between active guerrillas and those the government would prefer to tuck out of the way. Of the 43 people sentenced, six were condemned to death and 13 to life imprisonment; two got 15 years' imprisonment and 22 got 3-10 years. In Iran membership of the communist party or propagating communist ideology (which in effect means any ideology the government finds unpalatable) risks 3 to 10 years.

A new departure is the amount of publicity given to the trials in the local press. Iranians have been able to read, for instance, of the attacks made by Mr Abbas Meftahi, one of those sentenced to death, on the "fraudulent" character of land reform and profit-sharing schemes in industry—both major parts of the Shah's white revolution. Although the trials are officially described as open, and relatives of the accused attend them, no other Iranians apparently dare risk Savak's displeasure by going to the court. The increase in publicity probably reflects both the government's belief in the growing mood of public antagonism towards the guerrillas and Savak's confidence that it has broken the movement's back. But the guerrillas, to show they have not been cowed, have mounted several fresh incidents in the past few weeks.

Rumania

Lest they forget

Unless General Ion Serb shows his face in public very soon most of his fellow-Rumanians will assume that western rumours about his death by firing squad are true. General Serb, who was a deputy chief of staff of the Rumanian army, is said to have been shot last December for giving away Rumania's military secrets to the Russians. What gives the rumours some basis is the news of the demotion of General Serb's political boss, Mr Vasile Patilinet. Mr Patilinet, who was a central committee secretary in charge of the army and security services, has just been made minister of forests and building materials—a result, perhaps, of his failure to control the general.

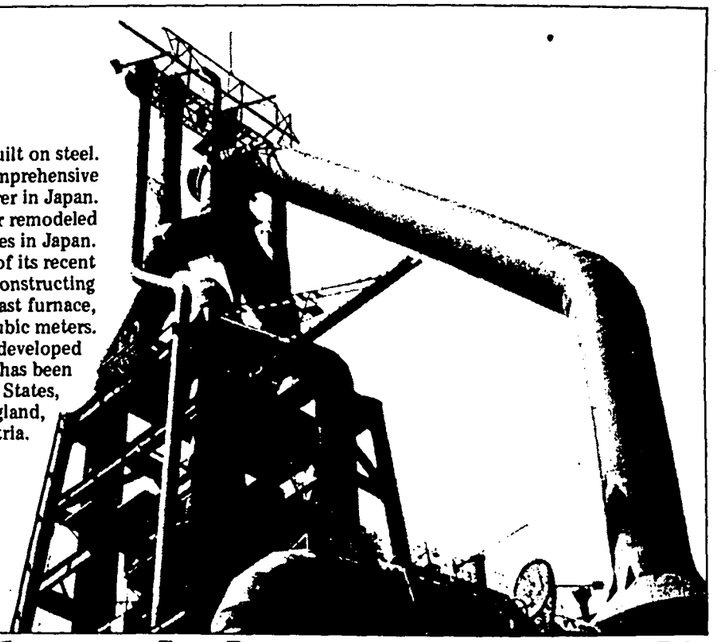
In theory Rumania should not have any military secrets from Russia, a fellow-member of the Warsaw pact. In practice, the Rumanians have been trying to keep the Russians at arm's length ever since Russian troops left Rumania in 1958. Rumania's refusal to allow Warsaw pact manoeuvres on its soil last summer led to a slanging match with other Warsaw pact countries, though President Ceausescu in fact carried the day. More recently Rumania has given the impression of moving closer towards its old allies, who have refrained from open criticism of President Ceausescu's policy of friendship with China.

But trenchant criticisms of Rumania made in a secret speech last October (just leaked to the western press) by the ultra-conservative Czechoslovak leader, Mr Vasil Bilak, suggest that Rumania's relations with the rest of the Soviet block in fact remain at a low ebb. Perhaps Mr Ceausescu is now shooting Soviet spies to show that he is not budging from his position of independence.

Austria

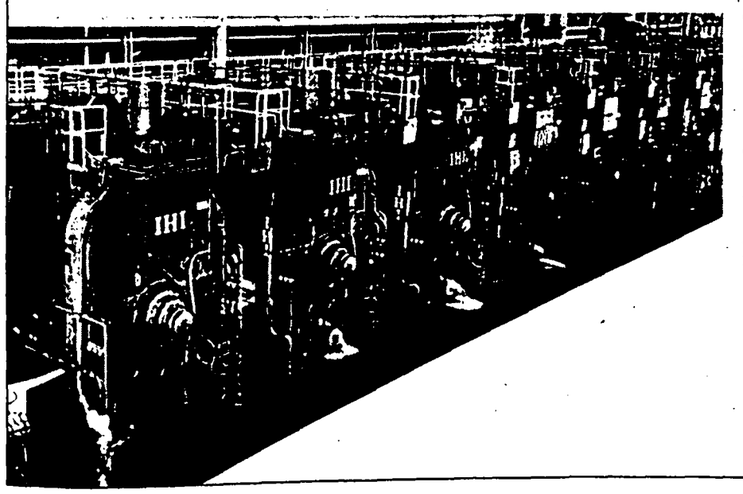
Karli is their darling

FROM OUR VIENNA CORRESPONDENT



The Austrians have just given themselves a nasty turn. Disqualified from the winter Olympics in Japan for compromising his amateur status, Herr Karl Schranz, the embodiment of injured national pride, has come home to face a "Schranz-psychosis" which rated a column and a half of close analysis in neighbouring Switzerland's Neue Zürcher Zeitung.

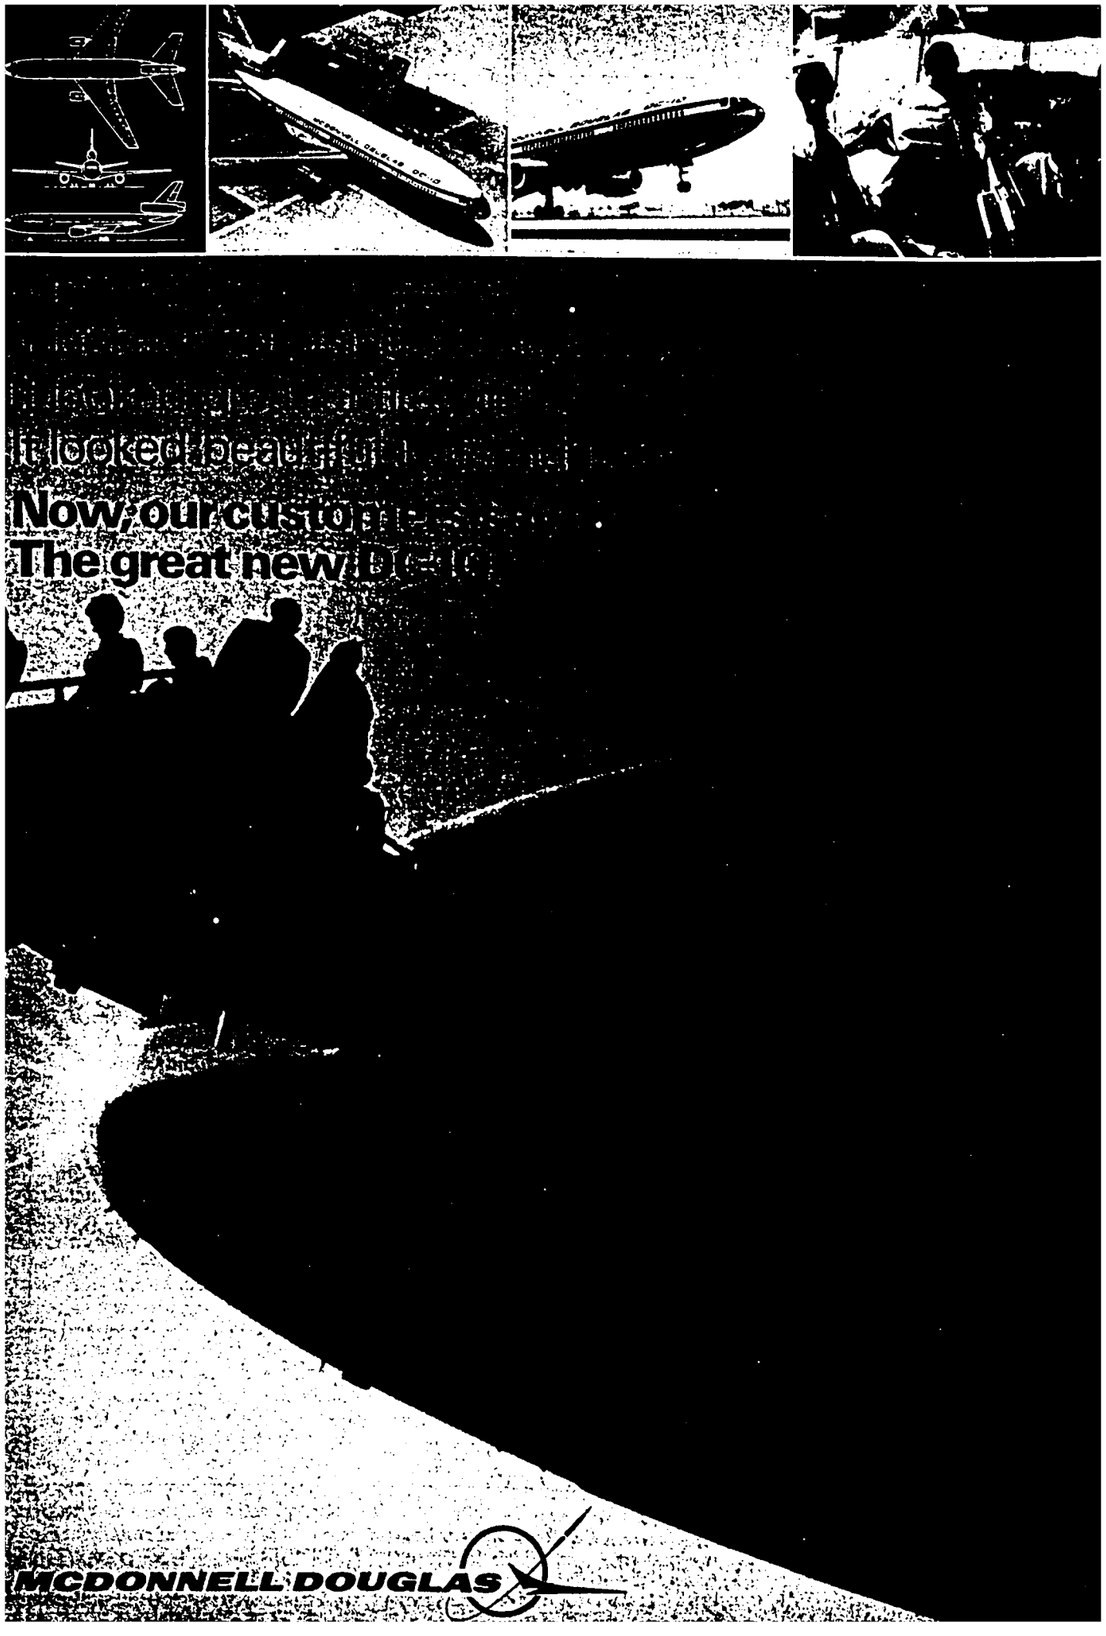
Some of the symptoms are unpleasant. The grandchildren of Herr Mauthner-Markhof, the chairman of a family-owned brewery, were beaten up by their schoolmates because their grandfather, a well-known patron of sport and the arts, had sent a congratulatory telegram to Mr Avery Brundage, the man who excluded Herr Schranz from the games. Although the telegram had been sent before Mr Brundage had acted, sales of Schwechat beer are rumoured to have plummeted, and Mauthner-Markhof mustard is being spurned at hot dog stands.



Not since the signing of the treaty that got the Russians out of Austria in 1955 has emotion run so high. And not since 1938 have there been such scenes of welcome. Herr Schranz stepped out of the aeroplane which took him from Japan to find thousands of people lining the streets of Vienna, just to welcome a man who had not won a medal because he had not been in the race. A photograph captured him on the balcony of the chancellery, his right arm raised in greeting, a sea of faces below. The roar of the crowd—"Karli! Karli!"—sounded unnervingly like "Heil! Heil!"

Serious leader-writers and commentators have thought the comparison worth making, but the similarity with 1938 should not be exaggerated. The bewildered Herr Schranz, assailed by reporters, is certainly innocent. Less so are the members of the press, radio and television who have delivered a casebook example of rabble-rousing. But the chancellor, Herr Bruno Kreisky, summed up the situation well. He said, "So long as it's a sportsman they're yelling for and not a politician, all is well."

The modern world is built on steel.
And IHI is the most comprehensive iron and steel plant manufacturer in Japan.
IHI has either made or remodeled more than half of the blast furnaces in Japan.
And as a typical example of its recent assignments, IHI is now constructing the world's largest blast furnace, with an inner volume of 4,000 cubic meters.
Also, the technology of the IHI-developed blast furnace top-charging system has been exported to the United States, West Germany, England, South Africa and Austria.



The Earth. Whatever helps people span it, develop it, live on it, IHI is involved in it.

The land gives us metals.
And IHI breathes life into them.
By constructing various rolling mills.
Slabbing mills, blooming mills, hot and cold strip mills. And others.
IHI's hydraulic mill is especially commanding keen interest.
One of its notable completions is a 4-high, 5-stand full-continuous tandem cold mill for the NKK's Fukuyama Works.
All the way. For top manufacturer of rolling mills worldwide, it's IHI.

A pat on the shoulder for Haack of the NYSE from Casey of the SEC

Towards a twentieth-century stock market

FROM A CORRESPONDENT IN WASHINGTON, DC

The Securities and Exchange Commission has made known its programme for restructuring the markets in which stocks are traded. The plan, while short of revolutionary, is radical enough ; like President Nixon's trip to China, it could probably not have been attempted under the Democrats. For the SEC's plan will modify drastically the old procedures for trading stocks, the places where the trading is done and the identity of the participants in the trading. What is more important, or in any event more politically sensitive, it will change the arithmetic of the securities business—who makes what money out of buying and selling shares for others.

Since there is little that shakes the stock markets more than uncertainty on the part of professional traders concerning the future profitability of their own business, it was probably necessary, if a major decline in the market was to be avoided on the heels of the announcement of the scheme for reorganisation, that the plan come from a Republican-led SEC, supposed to be sympathetic to business.

The need for some restructuring of the securities markets has been undisputed for several years. It has arisen mainly from the simple fact that proportionately less and less stock is owned and traded in small amounts by individual investors and more and more is owned and traded in large blocks by institutional investors—mutual funds, banks, insurance companies and pension funds. This "institutionalisation" of the stock markets has brought with it complex consequences which were made the more so by the system of fixing prices for the fees charged for trading securities, which has existed for more than 200 years. Since huge profits for stockbrokers were not only possible on large institutional orders but actually mandatory under the price-fixing rules, a number of subterfuges grew up over the years aimed at spreading the profit around.

These subterfuges led to changes in the fundamental structure of the stock markets—basically, to their fragmentation. For example, a major technique for rebating a part of the fixed-price fees involved the trading of large blocks of shares on the smaller stock exchanges located in places like Chicago, Los Angeles, Philadelphia and Boston, where the public at large never knew of the trade, or of the price at which the block was sold. Most of these regional stock exchanges had little business other than that which arose from the need for subterfuge, to provide a legal means for splitting the high fixed brokerage fees.

Now the SEC has said that much of this has got to stop. The fragmented markets, which kept the ordinary investor in the dark concerning where he might actually get the best price for his shares, will have to be unified. A consolidated stock tape, which will show all trades instantly, wherever they are made, is to be set up. What is actually more important, a unified system of information that will show all the bids and offers for a given stock that any dealer in the country is making will also be set up. Thus any broker, by pushing a button, will be able to determine for his customer where in the country the best price is to be had for a given security. No longer will this knowledge be the exclusive possession of the professional traders and the institutional investors. The technology for the creation of such a market—unified through a communications system though still scattered geographically—is said to exist already.

Among the commission's many other major plans for reform was a proposal to continue reducing the incentives for subterfuges and fee-splitting by moving further toward competition as the force that sets the fees. Price-fixing had previously been outlawed on that portion of any trade that exceeded $500,000 in value and the commission is going to move that figure down to $300,000 in April. There has been considerable support, in Congress and in a few places in the securities industry, for eliminating price-fixing entirely. But the commission chose to go slow on this point, waiting to see whether the dire consequences predicted by the opponents actually materialise.

In another area, the consequences of the fixed-fee system are to be outlawed by fiat. Mutual funds (unit trusts in Britain) have been in the habit of directing their portfolio transactions —their sales and purchases—to brokers who are also selling shares in the funds themselves; the fat fixed fees constituted additional compensation for the sale of fund shares. Now mutual funds will be forbidden to continue this practice. There are some who believe that this will reduce salesmen's efforts and the sales of shares in mutual funds by one-third or more. It will certainly increase the pressure on the SEC to allow mutual funds to advertise and sell their wares more directly.

Mutual funds themselves and other institutional investors are to be permitted to have brokerage firms as affiliates, however, and these affiliates will be permitted to be members of stock exchanges, provided that they live up to one very stringent rule. The vast majority of the business of the brokerage firm, perhaps as much as 80 per cent, will have to be done for customers other than its affiliates. This is the issue of "institutional membership" on the New York Stock Exchange, which has terrified so many of the exchange's members; they feared a disastrous loss of their own business if institutions could come on to the exchange and do their own trading and pocket the profit.

The commission decided to admit institutions because of the strength that they would bring to exchange memberships through their large resources of capital which could be used to back up their brokerage affiliates. The commission also decided that it simply could not yield to the entreaties of those who wanted to keep the New York Stock Exchange a private preserve of their own. Among those who wanted the private club continued and institutions barred from membership was Mr William McChesney Martin, the former chairman of the Federal Reserve Board, who did a study last spring and summer of many of the same problems that are covered by the SEC's new report.

Mr Martin undertook the study at the request of the New York Stock Exchange and, though he refused any pay for his work, his conclusions could hardly have been more to the liking of the most change-resistant elements of the exchange's membership. He flatly opposed institutional membership, for example, and also opposed any further reduction in the $500,000 cut-off point for fee-fixing. But his report, which saddened many who had admired his stewardship of the Federal Reserve, is only history now. The SEC has been considerably bolder.

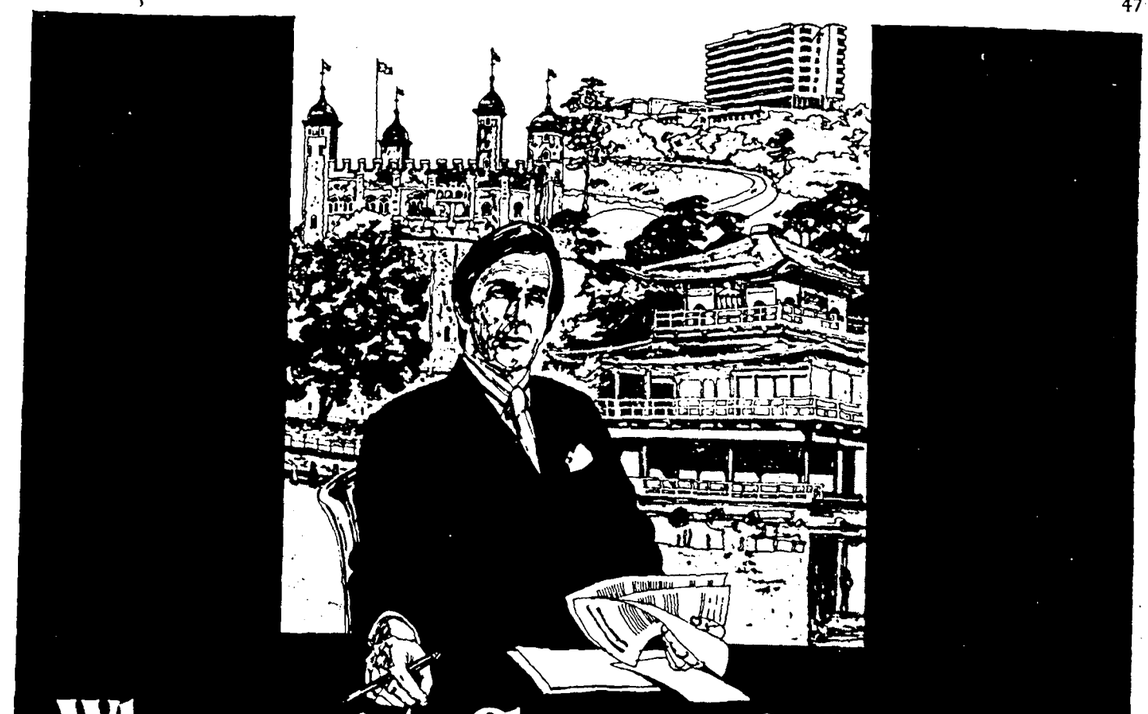
The present ignorance of most investors of what is happening on the regional stock exchanges brings with it an insulation from the consequences. If a huge block of stock is dumped in Chicago at a significantly depressed price, neither the trader nor the ordinary investor in New York is affected by that price reduction. The insulation will no longer exist when all the markets are tied into one. Should some degree of insulation continue? If so, how? Should the size of a block that can be sold at one time be limited? Or does not the individual investor, who might want to buy a stock, have a right to take advantage of the fall in price that results from the sale of a big block? The SEC's report raised all of these questions but answered none of them.

How rapidly the SEC will be able to implement its major proposals remains to be seen. The small stock exchange in Philadelphia has announced that it will undertake a legal fight against the commission's plan to bar from membership on any exchange any broker affiliated with an institution who does not do the bulk of his business with non-affiliates. The exchange has many such members, who do nothing but trade shares for their parent corporations, including such giants as the Prudential Insurance Company. Such a legal challenge, if actually undertaken, could delay implementation of the rules for institutional membership for two years or more.

There are many elsewhere who would be happy enough to see such delay. Their number includes key Democrats in Congress with responsibility for legislation involving the securities industry. In spite of the complaints from those who wanted no change at all, these men, along with a scattering of individuals in the industry itself, believe that the commission's reform programme is really a palliative that will thwart the fundamental change which they would like to see. For this reason they may launch their own delaying actions.

Hoax unravelled

The hoax of the century at least made a good "man of the year" cover story for Time magazine. This is little enough to rescue from the shaming discovery that Life, Time, Inc's picture

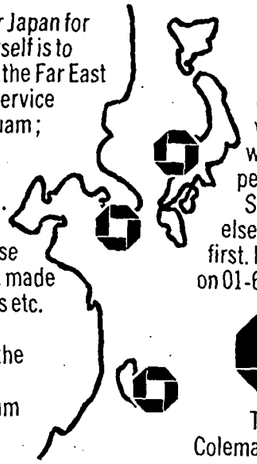


The Irvings: two innocent, at least

magazine, had been taken for such a ride (along with the hard-headed publishers, McGraw-Hill, Inc), by the ingenious Mr Irving and his alleged autobiography of the billionaire recluse, Mr Howard Hughes. Life may have lost face, but at least it has not lost any money: McGraw-Hill has returned an instalment of $100,000, paid for the first serial rights. McGraw-Hill, however, may suffer in its pocket as well as in its pride. Not all of the $700,000 which it gave to Mr Irving has been recovered. Of this, $650,000 was supposed to go to Mr Hughes. Impudently, Mr Irving, who agreed originally to settle for $500,000, pushed the price up, saying that Mr Hughes wanted more.

Mr Irving, it is reported, has now admitted to the federal authorities that his tale of meetings with the elusive Mr Hughes was pure fabrication. He will tell the whole story if his wife Edith (who deposited the cheques in a Swiss bank and then withdrew the money) is guaranteed immunity from prosecution. Perhaps Mr Irving is thinking of his two small sons; perhaps, some speculate, he is afraid of what might be said by a wife angered by the testimony of the Ninas and Annes who accompanied him on his supposed trips to see Mr Hughes. There are two obstacles to immunity for Mrs Irving. One is the Swiss demand that she be extradited; a warrant for her arrest has been issued. (She is a Swiss subject.) The other is the state inquiry which has been started because, it is said, the state disapproves of offers of immunity. The possible charges include grand larceny, perjury and fraud.

Mr Irving maintains that there is



When you get a Chaseman in London, you get a Chaseman in the Far East too...

Wherever there's a market there's a Chaseman.

When you're looking to Taiwan, Guam, Korea or Japan for business the next best thing to being there yourself is to have a Chaseman there. Chasemen throughout the Far East are Chasemen in their own elements with full-service branches in Seoul, Tokyo, Osaka and Agana, Guam; and representative offices in Taipei and Pusan. Together they cover the Far East and they are very much counterparts of Chasemen in London.

Think what competitive edge this can give you in your overseas business. You will be in close touch with all the banking and financial aspects, made aware of credit conditions, exchange restrictions etc. by an expert in the Far Eastern financial scene.

As one of the leading international banks in the Far East, Chase Manhattan can help you with arranging local currency credits for short, medium or long term needs. The bank can also provide you with immediate access to one of the largest foreign exchange markets in the world. And your Chaseman in either London or Taiwan or Korea or Japan or Guam can mobilise the Chase network for international transfers anywhere. He is an experienced, knowledgeable international banker with the backing of the Chase Manhattan Bank world-wide and all the specialist divisions in petroleum, shipping, aerospace, metals, textiles etc. So, if you're looking to the Far East, or anywhere else, make sure of the financial side of the business first. Ring Alan Brauner at Chase Manhattan in London, on 01-600 6141.

You have a friend at Chase Manhattan.

The Chase Manhattan Bank, N.A. Woolgate House, Coleman Street, London EC2 and 1 Mount Street, W1.

CHASE NETWORK EUROPE: AUSTRIA, BELGIUM, DENMARK, FRANCE, GERMANY, GREECE, IRELAND, ITALY, THE NETHERLANDS, SPAIN, SWITZERLAND, UNITED KINGDOM.

a surprise ending yet to come. But the real puzzle which remains is how such sophisticated businessmen were taken in. It was weeks after denials came from the Hughes organisation before they got on the trail. Mr Irving, of course, excelled himself in telling them that Mr Hughes demanded complete secrecy and would back out if any attempt was made to check the book's authenticity with him. Another factor must have been the skill with which Mr Hughes's handwriting was forged ; it took in, for quite a time, highly skilled analysts in this field. Time's explanation is that the internal evidence of the Irving manuscript was so strong: there was a wealth of detail about a complex life which lent a " smack of authenticity." That convincing detail, it now appears, owed something to a draft of a book prepared by a ghost-writer, Mr Bob Phelan, for Mr Noah Dietrich, Mr Hughes's right-hand man for over 30 years. So there is some excuse. But if Life and McGraw-Hill had not been so excessively secretive about their hoped-for scoop—keeping any hint from their well-informed staffs—they might not have had so hard a fall.

Democrats against Nixon : 6

ELECTION '72

Modest McGovern

Washington, DC

Probably the American Senate does not contain a better senator than Mr George McGovern of South Dakota. He is thoughtful, well informed, enlightened, quick and orderly of mind and speech, hard-working, free of self-seeking or self-indulgence, intellectually and morally consistent, and yet possessed of the habit of moderation that a politician needs if he is to be effective in a system that works by alliance and compromise. Besides being an estimable senator he is a sound man whose life has been well organised and whose first intuitive reactions to an event are usually right for him: thus he is spared the need to mumble, temporise, back away or revise his position after second thoughts. Put together, his characteristics make up something close to the picture of an ideal President.

When other politicians acknowledge this fact, as they sometimes do, they shake their heads or murmur that it is a pity, as if to say that nomination, let alone election, is naturally not for such as he. And indeed the course of Mr McGovern's presidential effort up to the moment does seem to confirm that this is so. Having announced his candidacy first of the Democratic contenders, he has been campaigning fairly hard for a full year (and is campaigning really hard now). But measured by the opinion polls his advance has been small, from 3 or 4 per cent to 5 or 6 per of Democratic voters.

There are some mundane political explanations for this relative and, as yet, inconclusive failure, such as lack of money or of any big organised source of political strength. South Dakota does not count for much: but then, neither does Senator Muskie's state, Maine, and Senator Muskie is far away in the lead in the race for the Democratic nomination. More weighty is the fact that Senator McGovern was an insurgent in 1968 and therefore the support of the regular party notables in the states and localities does not come to him naturally. Nor does the support of organised labour, which is dividing between Mr Humphrey and Mr Muskie.

Something lacking in Mr McGovern's visible personality is the explanation most commonly encountered for his failure to make more of an impact. He does not dominate, he does not suggest strength or radiate a sense of power. His voice, though not weak, is soft, his manner is unassuming, quiet and civilised. He is a former professor of political science at a small university in the great plains and the son of a Methodist preacher in a small town, and he is completely authentic. He is not showy.

The other explanation is that Mr McGovern is still generally thought of as a one-issue candidate. He was a consistent opponent of President Johnson's policy in Vietnam and was briefly a presidential contender in 1968 as an opponent of the war. He refuses now to believe President Nixon's assurances that the present policy on Vietnam is aimed at a negotiated peace. Mr McGovern's speeches often include a pledge to resign the presidency if, having been elected, he fails to bring the war to an end within a few months.

Whatever the truth of the matter may be, there is manifestly no simple issue of peace or war that is perceived clearly enough, or is the subject of feelings deep and widespread enough, to unite a party around a candidate at present. Senator McGovern knows this. He has other policies to talk about. His small organisation has produced a workmanlike study of defence problems, on the basis of which he proposes selective cuts in the defence budget. He has an interesting programme for a combined reform of direct taxation and the welfare system and another for relieving the schools of their reliance on local property taxes. But it is probably true that most of the voters (those who have heard of him at all, that is) still think of him as an anti-war candidate.

Although some rival candidates for the support of the liberal wing of the Democratic party dropped out last year, the gap was filled quickly by Mr Eugene McCarthy and by Mr John Lindsay. The Democrats' new rules for selecting delegates to the nominating convention give Mr McGovern chances to win support where four years ago the entrenched local party officials would have prevented it. But in each case he encounters liberal competitors for these newly liberated sources of convention strength.

The liberal wing, in short, has not yet united conclusively around Senator McGovern and he is aware that this fact may prevent him arriving at the party's national convention in July with the volume of delegate support that would make him a force to be reckoned with. The party's wounds of 1968 are also not fully healed. Mr McGovern, as a decided liberal but also a loyal party man curiously innocent of factionalism, might be the natural beneficiary of a reconciliation between the party's liberals and its centre ; but this also has not happened yet.

Off to China

Experts on China have been much in demand in the past weeks before President Nixon and his party departed for Peking on Thursday. The President has been doing a crash course on the politics, economics, history and geography of the People's Republic of China. Even M. André Malraux, a former French minister of culture who has known Mao Tse-tung for years, has been called in to give advice. Newsmen—in all, 87 will go to Peking—have also been very diligent with their homework. Judging by the elaborate preparations some journalists have made, China would appear to be as remote and strange to them as the moon. They at least should benefit from the expedition.

Whether anyone else will is less certain: the occasional announcements that have come from the White House have been cautious. President Nixon has hopes of establishing some sort of high level diplomatic contact. He also wants more trade between the two countries. This week he relaxed restrictions on American exports to China still further ; last June he had lifted the embargo on trade with China which had been in force for 21 years. But the optimistic American exporters now pouring into Hongkong may have to wait a long time for much business.

The administrative preparations for the visit of the first incumbent President to China have gone very smoothly considering that there is no American diplomatic corps in Peking to deal with the chores of a state visit. The President's party has been kept to a minimum ; only 300 people will go to China, about half his usual entourage. Thanks to the co-operation and the efficiency of the Chinese the American security and medical services are satisfied with the arrangements that have been made to protect the health and safety of the President. The rudimentary communications system in China was also a worry, but a new station to broadcast by satellite has been set up with such speed that over 600m people, almost all of them outside China, will be able to see the historic event on television.

So far the only grumbles have come from newsmen. The newspapers and magazines complain of unfair treatment, but the television people are also unhappy: because of the time difference (Peking is 13 hours ahead of New York) only one live transmission—that of the President's arrival—will be seen in America at a peak viewing time. Correspondents may also find that they have to battle for the news. A combination of White House secrecy and Chinese inscrutability has kept all but the most rudimentary agenda of the visit under lock and key.

ELECTION '72

Cold candidates

FROM A CORRESPONDENT IN NEW HAMPSHIRE

Of the more than 73m votes cast in the 1968 presidential election, fewer than 300,000 came from New Hampshire. The proportion did not vary greatly from earlier voting patterns, nor is there any reason to suspect that it will this year. But it has always been true that candidates flood the state during the winter months of the quadrennial presidential election years, to be photographed striding about in arctic clothing, patting cows and greeting the oldest inhabitant of some snowbanked village or the white-haired postmistress who was inevitably appointed by President Coolidge or by President Wilson, depending on whether the candidate is a Republican or a Democrat.

The reason for these frozen rites of spring is obviously not the Granite State's direct influence in choosing party nominees or electing Presidents. Rather it is that New Hampshire, one of the 13 original colonies, represents something still important in American politics—the last glimmer of the yeoman dream. New Hampshiremen are said to be " rugged individualists," citizens of " native wit and shrewdness," hard workers made thrifty by long winters and a New England way of life that admits neither frolic nor defeat.

If much of this is belied by a proliferation of the trappings of suburbia, particularly in the populated south-eastern quadrant where most of the voters live, it is still good copy for the news media. By the time the late intraparty elections—primaries—roll around in June, news editors and the public will be tired of the stock stories and pictures but, for the moment, New Hampshire is a place of pilgrimage for those on the quest for election stories and will remain so until March 7th—primary day.

The major Democratic contenders for the presidency have been in and out for some time, but the state is far from neglected by those with less chance to win the nomination. Mr Sam Yorty, the mayor of Los Angeles, for example, is far from his native heath as he visits the farms and grimy mill towns, trying to make his name familiar. He is little known in the United States outside of Los Angeles, where he has been the target of criticism for a lackadaisical attitude in dealing with urban problems, particularly as they affect the poor and the black and the Mexican Chicanos. But in New Hampshire and other early testing grounds, he has won some support for his expressed opinions on expanded social legislation (he is against it) and the war in Indochina (" We should get in there and win ").

These and other views have won for him the support of Mr William Loeb, the fractious owner of the state's most powerful newspaper, the Manchester Union Leader. But its plaudits are not expected to carry Mr Yorty very far. He is not regarded as a serious candidate by the Democratic hierarchy, but apparently he hopes to make enough of a name for himself in primaries so that he and his views will be taken seriously at the party's national convention. As the comedian, Mr Bob Hope, put it when Mr Yorty announced his candidacy: " What's he running for President for ? He hasn't even been mayor of Los Angeles yet."

Another Democrat who has hit the early campaign trail in an effort to build national recognition is Senator Vance Hartke of Indiana. His views on the war in Vietnam are in direct contrast to Mr Yorty's " bomb-'em-into-the-stone-age " approach. But Mr Hartke has a few more credentials. He is a protectionist on foreign trade, which appeals to New Hampshire's factory workers constantly under the threat of competition from Europe and Japan. Mr Hartke has sat in the Senate for 13 years and won his three election victories by attracting votes from Indiana's smallholder farmers and small businessmen, with a healthy dollop of trade union support thrown in. It is this kind of campaign which could help him in New Hampshire, but he is not regarded as a serious threat either to Senator Edmund Muskie of neighbouring Maine or to Senator George McGovern, who has been wooing votes among university people and young professional men and women.

Yorty tries to make his name

Germ of a plot

FROM A CORRESPONDENT IN CHICAGO

For two giddy midwinter days last month Chicagoans fully believed that they were in on the greatest story since the St Valentine's Day massacre. All the elements seemed to be there—political extremists who were seeking to create a "master race," millions threatened with imminent death, Mayor Daley urging calm in the midst of crisis, teenage "freaks" and, last but by no means least, a fearless prosecuting attorney.

Over their breakfast coffee on January 18th citizens learned that two filtration plants which supply drinkable water to the city had been put under heavy guard following the arrest of two youths, in an alleged "plot" to introduce cultures of botulism, typhoid, anthrax, cholera and meningitis into the water supply. During the day details of the plot continued to unfold, thanks to breathless reporting on the air and in part of the press.

Mrs Byrne shows it's safe

The culprits were said to have conspired to poison the water supply after they and other members of an "extremist" group called Rise had inoculated themselves against all the diseases that, they hoped, others would catch. In this way, they would ensure their own survival and the genesis of their "master race." Mayor Daley and other city officials held press conferences and issued statements, assuring the community that nothing had happened and that the water was perfectly safe to drink. Mrs Jane Byrne, the blonde, well-proportioned commissioner of weights and measures, was even photographed drinking a glass of it, demonstrating that when Mayor Daley calls everyone rallies to the colours.

By the next day, there were stories that the "plot" was only the beginning of an attempt to poison the world. But the journalistic cultures were already developing anaemia. It was pointed out, for example, that the announcement of the arrests and the deployment of police to guard the filtration plants had come from the state's attorney, Mr Edward Hanrahan, who is seeking re-election over such obstacles as criminal charges of malfeasance in office. It was also pointed out that no one had actually done anything to poison the water. Indeed, one investigator said that Rise was having recruiting difficulties and that some potential postulants withdrew when they were told that they would have to be inoculated.

Limited Scope

FROM A CORRESPONDENT IN CALIFORNIA

This week the banking industry in California plans to take a somewhat fearful step into the electronic future, by opening the country's first automated clearing houses comparable with the Interbank Computer Bureau in London. These will make it possible for banks to exchange entries and to balance accounts with each other by means of magnetic tape, rather than by sorting and distributing cheques and other paper documents.

The technology has long been available, since American banks are well supplied with computers and the practice of automatic deposits and debits is established abroad. But because of the problems of organisation in the fragmented American banking industry, automation has almost all been internal. And while the benefits of further computerisation—indeed, the necessity for it—are clear enough to the banks, they are not clear to the banking public which is suspicious of computers and disinclined to change its money-handling habits.

It has taken almost four years for California's joint-bank Special Committee on Paperless Entries (whose acronym Scope is, unhappily, also the name of a widely advertised mouthwash) to organise its pilot project for San Francisco and Los Angeles. Similar groups have been organised in 18 other centres in the United States, but will await the results of the Californian experiment—especially the public reaction—before going ahead. The group has obtained promises of participation from almost all of California's 150 banking firms and has worked closely with the Federal Reserve Bank of San Francisco, which will operate the clearing houses. Co-operation is easier to achieve in California, where branch banking is permitted, so that there are comparatively few banking firms, than in some other states. But the Californian group is nervous about the possibility of public disapproval and is undertaking a $250,000 publicity campaign designed to emphasise that the new system relies entirely on advance permission being given by the customer—and that he need not give it if he does not want to.

Scope's approach, based on Giro systems and the direct-debiting schemes of foreign banks, is not entirely new to America. Automatic transfers are already widely used within individual banks when transferring money for repayment of loans or additions to savings accounts. Insurance companies also use pre-authorised drafts to collect monthly premiums from customers' current accounts. What is new about Scope is that it will extend to inter-bank transactions and will do them electronically, without supporting paper.

The easiest application of Scope will be to the direct deposit of payrolls to employees' accounts in their various banks. Since payrolls produce nearly one-sixth of all cheques in circulation, to reduce their volume by only one-third would dispense with more than 5 per cent of the total flow of cheques, or more than 11om cheques annually in California alone. Such fixed-amount monthly bills as loan repayments, insurance dues, rents and cable television fees are other likely uses.

Unfortunately, the few opinion surveys that have been held suggest that the public strongly opposes pre-authorised payments and that businessmen do so even more strongly. There are some deep feelings involved in the possession of a paypacket and supposed control over bill-paying activities. Many consumers value cancelled cheques as proof of payment and they like to be able to withhold payment as a means of putting pressure on vendors. What is more, individuals and corporations alike make extensive use of "float," the continued possession of money between the time a cheque is written and when, after the clearing procedure, it is actually deducted from one's account. For some companies, float provides as much as half their working capital and they will part with the practice very reluctantly. The Federal Reserve Board, however, is working to speed up cheque clearance and will be watching Scope with interest.

It may seem contradictory that banks are aggressively promoting the use of chequing accounts while at the same time, through systems like Scope, discouraging the use of cheques. Their reasoning is that if they are to maintain their control of the country's payments system, free from incursions by building societies and intervention by government agencies, they must reduce the cost and improve the efficiency of the flow of cheques which, by 1980, will probably double, to over 44 billion annually.

Between past and future

The Economist A survey of Spain

Sport under a blue sky. On the Costa del Sol there is the Golf Coast and more...

There is also the beautiful scenery.

Enjoy it between holes. Here, you are close to the sea, caressed by the breeze, under a uniquely blue sky... where the climate is marvellous throughout the year.

Go on with your game.

Afterwards, the nearby sea will be an invitation to bathe. Yet another attraction for your holiday.

Fly to Spain by *Iberia International Airlines of Spain* where only the plane gets more attention than you.

Between past and future

"I have never expected," says the hero of a recent novel about the Spanish civil war by José-Luis de Vilallonga*, "that a foreigner could understand Spain." It is true. The Pyrenees are no longer a physical barrier to the millions of tourists and French couples out for the weekend who stream through the customs posts every year. But they remain a psychological barrier between Iberia and Europe. Perhaps this is why the men who have ruled Spain throughout its modern history have so often seemed to be tilting at windmills to westerners who find their causes and political credos remote. And there is that special problem.

Thirty-three years after General Franco's soldiers captured Madrid, it is still difficult to write about Spain for a literate western audience without cutting into old wounds and reviving the emotions of the 1930s. Those emotions are less and less relevant to modern Spain. More than half of the Spanish population has been born since the civil war; the rhetoric of the *cruzada* ("the crusade") has become unfashionable and perhaps a bit embarrassing to the younger, more outward-looking men who run the civil administration and the economy; and most of the Nationalist generals have died or gone into retirement.

It is true that the blue-shirted Falange (expelled from the council of ministers in 1969) is still a force to be reckoned with. It can still muster a crowd of tens of thousands in Madrid's Plaza del Oriente, and is particularly strong in the Cortes and the government-run *sindicatos*, or trade unions. There are still gangs of right-wing extremists like the "Warriors of Christ the King" who are capable of chucking acid over a visiting exhibition of Picasso prints. But, for the moment, these forces are on the fringe of Spanish politics. And the man who has put them there, defying any outsiders' expectations, is General Franco himself.

The basic motivation of that sober Galician general, the least ideological of autocrats, remains a mystery even to many of those who know him well. One by one, he has cut down the political factions that helped him to win the civil war—perhaps in accordance with the advice once offered to Polycrates, the classical tyrant, by the philosopher who lopped off the tallest ears of corn as they walked together in a field. General Franco disappointed the falangists, the carlists, the Christian Democrats, and the monarchists who were not sufficiently ready to switch their allegiance to Prince Juan Carlos, the heir-apparent. He held the ring while a new group of technocrats—parvenus in the eyes of the civil war veterans—set about modernising the economy and opening Spain to foreign investment and a closer relationship with the European Economic Community.

And that is something for which he deserves to be remembered. Thanks to General Franco's tolerance, the extreme right-wing elements have been restrained while the technocrats have got on with the job of sorting out the economy. For those who understand neither the peculiar history, nor the political climate of Spain, nor the limits of the system within which the reformers have to work, it is easy enough to dismiss their achievement as a partial one. But politics is the art of the possible, and what has always been hard to achieve in Spain has been some kind of genuine consensus that would make the free play of political factions possible. In the absence of that consensus, the reformers have at least been able to find a patron.

What General Franco was not prepared to tolerate, at the end of the day, was a real measure of political liberalisation. He shocked some outsiders late last year by making it plain that he will remain head of state "so long as God gives me life." Like many other strong men in history, General Franco has never learned how to loosen his grip. Or, some people might argue, how to change his style.

The Burgos trial against Basque terrorists at the end of 1970, the suppression of the strike at the Seat car plant in Barcelona and of the newspaper Madrid at the end of last year and the treatment of student rioters at the university of Madrid last month were all cases of the government applying methods better suited to the civil war than to a modern, pluralistic society. But then in Spain history goes on repeating itself. The country's political life is sometimes like a film interrupted again and again by flashbacks.

To appreciate the very tangible and far-reaching process of change that is taking place within Spanish society and the economy, one must understand the limits within which the reformers have to work. In Spain, when past and future do battle, the past has often emerged the victor. As a young technocrat close to the centre of government puts it: "Our survival after Franco depends on continuity. We must be protected by a man in uniform, because the right wing does not trust us. And we have to accomplish two things: continued economic growth, to justify curselves as a government, and social order, without which the army will move in."

In Spain, as in other authoritarian societies, it is easier to shift policy to the right than to the left. Within the limits of the system, under the protection of Admiral Carrero Blanco, the vice-president, and with the tolerance of

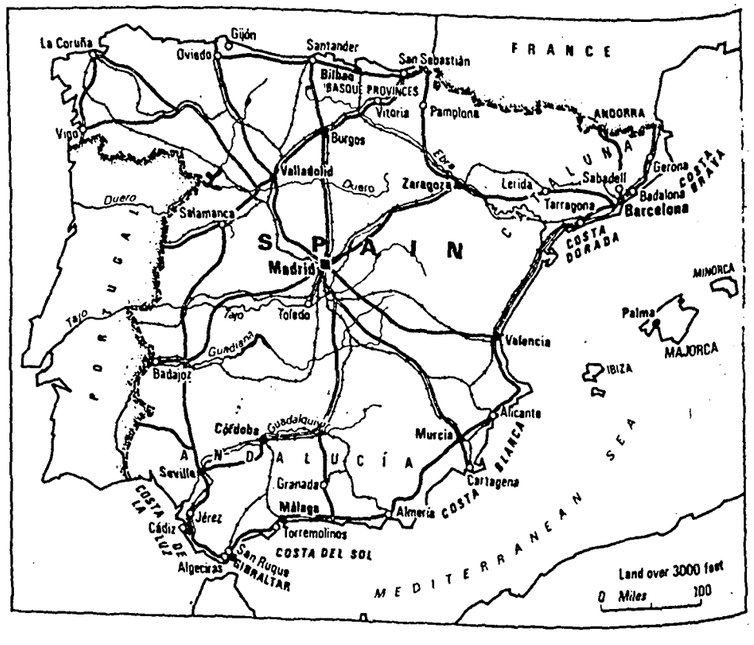
*"Fiesta." By José-Luis de Vilallonga. *Seuil*. Paris. 1971.

General Franco, the technocrats have been slowly transforming Spain into a, modern consumer society with a national income of $1,000 per head. Over the past two years, they have run up against economic as well as political obstacles : stagflation, a slump in local investment and the problem of selling to an enlarged common market. The great strength of the Spanish economy over this difficult period has been that it has retained foreign confidence. It has to do so, because it is so hugely dependent on the outside world for tourist earnings and new capital investment.

But there are still formidable structural problems to be confronted. This survey sets out to examine the two faces of Spain in the 1970s : its byzantine politics and an economic miracle that has developed some serious flaws.

The voice of the Pardo

Any casual visitor who takes the road from Madrid to the Pardo Palace where General Franco lives will sense at once that he is approaching the true source of power as he passes the *Guardia Civil* in their back-to-front hats and wide, flapping cloaks spaced out like telegraph poles every hundred metres or so along the way. As he approaches his eightieth birthday, General Franco is as much the master of Spain today as he was in 1939, when his troops entered Madrid. That is one reason why Spain often appears to outsiders, in the words of Sr José de Areilza, the Count of Motrico, " like a boy who has grown to adulthood still wearing the cap and short pants he put on to go to school." The country has changed, but not the principles by which it is governed.



It is true that at the end of 1966 the general brought in the " organic laws," or *Ley Orgánica del Estado*. This was the closest thing to a constitution that Spain has seen since the civil war. But although the organic laws make some attempt to define the functions of the chief of state, they hardly serve to limit them. While it is now laid down, for example, that the chief of state needs the approval of the Cortes in order to proclaim war or peace, even this minor restriction will apply only to General Franco's successors. And although the organic laws provide for a separate head of government, the general has been in no hurry to equip himself with a prime minister who might serve as a focus for factional intrigue.

In fact as in theory, Spain remains a personal autocracy. In the language of official rhetoric, the *caudillo* is responsible only to God and to history. When General Franco spoke to the Cortes last November in his even, slightly high-pitched voice, he shattered any illusions that he has grown tired of office. He would remain chief of state, he declared, so long as God gave him life. He reminded the members of parliament that their right to discuss new laws could not be used as a pretext to trespass on his own special prerogatives, and that the role of the council of ministers was merely " to assist the chief of state." General Franco also brushed aside the idea that there will be any basic changes in the system so long as he holds office. Yet again, he insisted that Spain will never have political parties in the western sense. Confident of his own place in history, he concluded in characteristically lofty terms that " a people does not invent its destiny. It serves it."

The underlying question, perhaps, is to what extent Spain is pursuing a European future. Has it managed to catch what Senhor Xavier Pintado, the Portuguese secretary of state for commerce, calls in a charming phrase " the technocratic train to Europe ? " Some of the more ardent pro-Europeans in Madrid would argue that, in the process of forging closer economic ties with the EEC, and as Spaniards become more like their northern neighbours as they travel abroad and their standards of living rise, the country's social and political institutions will also come to resemble those of western Europe. That is a dream worth clinging to. But it has always proved dangerous to try to clamp alien models on to the Iberian reality. To understand Spain, the first requirement is that one should put aside one's preconceptions.

But of course age has taken its toll, and today General Franco is content to leave the routine of administration to others while he spends half his year hunting and fishing in the company of relatives and old military cronies who are sometimes, not inaccurately, described as " the Spanish court." But the general is still the man who hires and fires senior officials, and the final arbiter on all major policy decisions. One senior official told this correspondent that the definition of a political leader in Spain is " someone appointed by Franco." That is what makes it so hard to determine the relative weight of individual ministers.

For the moment, Spanish politics are terribly byzantine : what tends to make or break a man's political career is how he gets on with those closest to the *caudillo*, and how he survives the battle of rumours that is waged in the corridors of the Pardo. Perhaps this is only further proof of what Sr Salvador de Madariaga has lamented as the incurably subjective politics of the Spanish people : their obsession with " who's who," rather than the work in hand. Spain is also byzantine in the pattern of political infighting. Just as, under the Emperor Justinian, political factions not permitted to organise openly found different ways of banding themselves together (so that the colours worn by the charioteers, for example, became the symbols of different tendencies) so in Spain the rival parties within the regime have organised themselves in subtle ways.

The secret of General Franco's survival over the 33 years since the civil war has been that he has never allowed one faction to grow too strong. Franco is a realist. In the civil war, he enlisted the support of all sorts of political causes. Afterwards, he dispensed with them one by one as it became apparent that they had outlived their moment or had come to pose a challenge to his own conception of how Spain should be governed. Today, a new force has achieved political ascendency in Spain. Many of those aligned with it are too young to remember the civil war. Some call them simply the technocrats ; to others, they are the disciplined militants of Opus Dei.

The technocratic order

Since the Matesa scandal broke in 1969, Spain has been governed by what has been called a " *monocolour* " government. Matesa was the Barcelona textile machinery firm that got hold of some $140m in official export credits and was later charged with having diverted all but $60m of it into private hands. The truth was first discovered by an army lieutenant-colonel serving with the Spanish customs. At once it became clear that the scandal had important political undertones. According to some Madrid sources, the scandal was first exposed at a cabinet meeting in San Sebastian by Sr José Solís and Sr Fraga Iribarne, both then associated with the falangists and jealous of the hold of the Opus Dei ministers over the government.

Ironically, what they saw as a weapon to destroy Opus Dei was turned back against themselves. Although, in the investigations that followed, four ministers or ex-ministers were removed from office and an Italian newspaper, Avanti, claimed that Sr Vila Reyes, the president of Matesa, had contributed no less than $35m to Opus Dei, the " López Rodó group " emerged from the crisis stronger than ever. And when General Franco proclaimed his amnesty for prisoners late last year, he effectively closed the books on the Matesa case for good, although it is still raised like a chorus in private conversations. The striking thing was that, when compelled to make a clear choice on whether or not to keep the *opus deistas* in government, General Franco threw his support behind them.

To its enemies, the lay catholic organisation is " Octopus Dei," a sinister conspiracy aiming for a monopoly of political power. To some observers, it is a kind of catholic calvinism, which exalts the importance of worldly works and which through its members has brought a degree of competence and rationality to the management of the Spanish economy. To its apologists, Opus Dei is nothing more than a fraternity of catholics devoted to spiritual ends. In an interview with the Madrid newspaper ABC last year, the founder of the order, Monseñor Escrivá y Balaguer, insisted that the society is devoted to " exclusively spiritual goals " and that the " conspiracy theory " about Opus has stemmed from " the religious jealousy of some people, the political fanaticism of a few, and the superficiality of those who pass on what they hear because it amuses them." One does not have to take all the allegations of a polemicist like Sr Jesús Ynfante* seriously to realise that there is a bit more to it than that.

In Spain, you need a military friend : Admiral Carrero and López Rodó

Although Opus can claim only three full-fledged ministers in government at the moment, including the planning minister and the foreign minister, its members are very influential in banking and private business and in the universities. Although Opus Dei claims to be open to all, to outsiders it often looks like a hand-picked elite, many of whose members are first selected as undergraduates (especially at the university of Navarra, which was founded by the order). No doubt many of the recent recruits are essentially opportunist. The magazine Indice put it well when it suggested that " Opus Dei is not a political party, nor an economic pressure group, but a sort of religious insurance company providing security against all economic and political risks."

It is from this order that the leaders of Spain's new breed of technocrats have sprung. Sr Laureano López Rodó, the minister for planning, has been the prime minister of Spain in all but name since 1969, the man charged with the administration of the economy. On first acquaintance, one is struck by his polished manner. His practised turn of phrase conceals both a very subtle politician and a basically shy and retiring personality. He is pro-European, but he is also a gradualist. Spain's integration with the common market area, he told this correspondent, must happen in gradual stages— " it is not a matter of flipping over the *tortilla* all at once." He also insists that the opening to Europe will not require political concessions from Spain : " The Europeans should not all put on the same uniform like schoolchildren." Central to his political philosophy is the idea that social change and social order follow in the wake of economic growth. He rejects the

*" La prodigiosa aventura del Opus Dei." By Jesús Ynfante. *Ruedo Ibérico*. Paris. 1970.

phrase often attributed to him that "when Spain achieves a per capita income of $1,000, political development will begin" as apocryphal (possibly because Spain had just about reached that figure at the end of last year) and argues that there is already greater room for debate within institutions like the Cortes.

Sr López Rodó is a man who is clearly too cautious to take unnecessary risks, and very much alive to the hostile forces that have been ranging themselves against him. On the other hand, he is widely respected for his integrity. His own definition of politics is that "like tennis, it is one of the activities that is legitimate *(lícito)* for a man of religion—and it is my ruling passion."

The economic sections of this survey discuss how Sr López Rodó and his entourage have set about rationalising the Spanish economy. It would be foolish to label them technocrats without also bearing in mind that at the same time they are conservatives and strongly influenced by religion. A measure of their conservatism, and their sensitivity to the prevailing balance of political forces, is their approach to the problem of taxation in Spain, which has one of the most antiquated and inequitable systems in Europe. Sr López Rodó's formula is simply for an annual increase in tax revenues of 0.5 per cent, to be raised by enforcing the existing legislation.

Is Sr López Rodó securely in the saddle? One of the dissident members of Opus Dei told this correspondent that there are three political groups that matter in Spain: the establishment; "the opposition that can be put in jail"; and "the opposition that cannot be put in jail." The last category really consists of two groups: the liberal opposition and the right-wing opposition (which, numerically at least, is probably stronger and poses a greater immediate threat to the technocrats).

Opposition voices

Madrid is in some ways a very small town. Six months of inquisitive residence is long enough to get to know most of the members of the establishment opposition. It is hard to classify Spanish politicians. The Count of Motrico, one supposes, would be a Tory in Britain, Sr Ruiz-Gimenez a Christian Democrat in Germany. Many of the most prominent members of the liberal opposition have evolved from fairly right-wing positions: Sr Rafael Calvo Serer, now in exile in Paris, began his political career as a right-wing catholic polemicist in the immediate aftermath of the civil war, Sr Dionisio Ridruejo as an ardent falangist.

But one has not begun to understand Spanish politics unless one recognises that it is the personal factor that is all-important. The members of the establishment opposition could all be members of future governments. They might even be thought of as a kind of shadow cabinet whose members will only ever be summoned one or two at a time. Paradoxically, it is a man traditionally regarded as of the right, Sr Manuel Fraga Iribarne, who has recently been doing more of the things that an opposition politician in a western country would be expected to do than most other Spaniards outside government would attempt. He has been touring the country, making speeches, giving interviews.

Sr Fraga is in a way the supreme example of hispanic individualism. He is often called a "force of nature" *(fuerza de la naturaleza)* and one can see why. He is a man of tremendous nervous energy, who can hardly manage to hold himself still in a chair and whose thoughts race ahead of his words. Removed from his job as minister of information in 1969, he lost his last official post late last year, when General Franco summoned him personally to tell him he had been dropped from the National Council of the Movement. That was a considerable blow, but maybe it is one he can get over in time. In the long run, the politicians with a future in Spain will be those who can fulfil two essential preconditions: they must enlist the confidence of the armed forces, and guarantee continued economic growth.

Then there is that other group—the opposition that could go to jail. The two most important groups among the clandestine opposition in Spain are the communists and the regional militants. Today, the Communist party *(Partido Comunista Español)* has split into two major factions in the wake of the Russian invasion of Czechoslovakia and widespread disillusionment at the "normalisation" of relations between the Spanish government and the Soviet block. A majority of the party remains loyal to Sr Santiago Carrillo, the secretary-general, and Dolores Ibbarruri (the famous "La Pasionaria" of the civil war) who have become increasingly outspoken in their rejection of the Brezhnev doctrine and the internal repression practised in Russia. A second group, led by the former Republican general Enrique Lister, Sr Eduardo Garcia and Sr Agustín Gomez, has broken away and organised a second party pledged to unconditional support for the Soviet line.

The irony in the split is that it was precisely because, under Sr Carrillo's leadership, the Spanish party had remained a rigidly monolithic organisation, uncritical towards the Soviet Union and distinctly parochial in its theoretical attitudes, that many party militants were unready to accept Sr Carrillo's gradual about-face after 1966, when he publicly expressed his disgust at the Russian treatment of Sinyavsky and Daniel*. Sr Carrillo has been able to enlist considerable support for his independent stand among European communist parties, notably the Italian, Jugoslav and Rumanian parties. His party's secret radio transmitters have been moved from Dr Husak's Czechoslovakia to Rumania—the only Warsaw pact country that did not join in the Russian invasion of Czechoslovakia. For their part, the pro-Moscow group have resorted to increasingly sordid marketing techniques, printing fake copies of Mundo Obrero, the underground newsheet.

There is no doubt that the Spanish communists have been weakened by the rift. Sr Carrillo's prime tactic today seems to be to gain control of the underground *comisiones obreras* (which are discussed later) and to infiltrate the legal trade unions so as to exploit and foment labour unrest in the country.

There are, of course, other opposition groups outside the communist ranks. The battle between the centre and the periphery is as old as Spain itself. There have been recent signs of the survival of regional chauvinism in Spain. Late last year, a clandestine assembly was held in Barcelona under the very noses of the authorities, in which more than 300 delegates of varied political tendencies called for a restitution of the 1930 statute of autonomy for Cataluña. The Basque terrorists called attention to themselves again last month, by kid-

This survey was written by Robert Moss.

Cardinal Enrique : for God, not Caesar

napping a private businessman. The three factions of the *Euzkadi Ta Azkatasuna* ("Freedom for the Basque Homeland") are still active despite tough police measures, but their separatist goals are irrelevant to modern Spain and could never be tolerated by a government in Madrid.

In Spain, as in Latin America, the progressive wing of the catholic church represents one of the most powerful and certainly the most influential, of the opposition groups. On the last day of December, General Franco levelled an unprecedented warning at his critics in the church that suggested how wide the rift between church and state has become. An assembly of priests and bishops last September engaged in some unheard-of self-criticism concerning the role of the church in the civil war (though the resolution on this failed to get a two-thirds majority and the assembly itself was rejected by catholic conservatives as unrepresentative). And not long afterwards a church study group run by the liberal bishop of Huelva issued a remarkably outspoken manifesto in which it was claimed that General Franco had subjected Spain to a "false peace" characterised by official repression and social injustice.

The bishop of Huelva is only one of a clutch of "radical prelates" who seem to be steering a course towards head-on collision with the regime. The bishop of Las Palmas in the Canaries has organised collections in aid of striking workers, and the auxiliary bishop of Madrid, Mgr Echarrén, has also come out strongly on the side of strikers. One of the older church-state conflicts involves the Basque clergy. (A Basque bishop, for instance, was one of the few men in the church hierarchy who withheld support from General Franco during the civil war, and Mgr Cirarda, the bishop of Santander who has just been transferred, took a critical stand at the time of the Burgos trial of Basque terrorists in 1970.) There are still powerful conservative elements in the hierarchy, championed by Mgr Guerra Campos, another Madrid bishop, and Mgr Cantero, the bishop of Zaragoza. Mgr Cantero recently defended his decision to accept nomination to the Cortes in the face of mounting liberal criticism of bishops who accept political appointments on the ground that he was discharging "an elementary debt of gratitude to a chief of state who has rendered such great services to Spain."

But, for the moment at least, it is the liberals (with Vatican support) who seem to have won the battle within the church. The old conflict between the government and the Vatican over new church appointments that resulted in the nomination of "apostolic administrators" (who did not have to be approved by General Franco) was resolved at the end of last year when seven new bishops were confirmed. Notably, Mgr Enrique y Tarancón, the archbishop of Toledo and "apostolic administrator of Madrid," was at last confirmed as archbishop of Madrid. That showed up the increasing importance of the Madrid see (Cardinal Enrique gave up the Primacy of Spain in order to have it) and placed the catholics of the capital in the charge of a relatively liberal-minded man.

The wrangling over the terms of a new concordat between General Franco and the Vatican is still going on. He has one card up his sleeve that could still turn out to be a trump : with little property of its own since the pre-civil war expropriations, the Spanish church is an economic hostage of the state, and the government has threatened to slash subsidies and take away tax exemptions and legal privileges if the church insists on unpalatable terms. Meanwhile, it is the catholic progressives, as much as any political group, who pose a serious problem for General Franco.

The man on horseback

One of General Franco's more singular achievements, as a military *caudillo,* has been to cut back on defence spending and construct a professional, apolitical army. Spain belies its military image. The Spaniards spend less on defence, in proportion to their gross national product, than any country in the Nato area—with the lone exception of Luxemburg. Defence spending per head of population is only about $19, compared with an average of about $90 for Europe as a whole and $143 for Sweden, a country that is no one's idea of a militarist state. Of course, the Spaniards are helped out by the Americans, who supply military credits and surplus equipment under the treaty that gives them the right to fly their planes from Torrejón de Ardoz, near Madrid, and Morón de la Frontera, near Seville, and to sail their Polaris submarines from Rota.

There are about 300,000 men in the Spanish armed forces, two-thirds of them conscripts serving for 18 months. In the town square at San Roque just north of Algeciras, one can see the new recruits, awkward and lanky in their uniforms, showing off to the local girls on a Sunday afternoon before trooping off to the bullring.

One sees less of their officers. The Spanish officer corps is curiously isolated from the rest of society. That explains the phenomenon that Julio Busquets, one of the ablest students of the armed forces,* calls "auto-recruitment." Between 1961 and 1963, for example, it was discovered that about 70 per cent of serving officers were the sons of professional soldiers. The Spanish officer corps has come to resemble a separate social caste, interbreeding within the narrow confines of the cantonments. It has been discouraged from taking part in politics.

But the history of Spain throughout much of the nineteenth century (the so-called "era of pronunciamientos") was a record of coups and counter-coups. Between 1815 and 1875, the "man on horseback" frequently emerged as the champion of the 1812 constitution against monarchical excesses. It was a liberal general, Espartero, who hounded the despotic regent, Maria Cristina, into exile (though his motives proved to be not entirely altruistic and he was later pushed out in his turn). Similarly, it was a much greater soldier, General Prim y Prats, who threw out Queen Isabella II in 1868.

Today, the army leaders who are most outspoken conform to a rather different image. The controversy that blew up around the Burgos trial of Basque terrorists at the end of 1970

*Julio Busquets, "El Militar de Carrera en España." *Ariel.* Barcelona, 1971.

Diez Alegría, an intellectual in uniform—but he has rivals amongst his men

revealed the depth of right-wing dissent in the junior ranks of the officer corps. The 5,000-odd young officers who banded together in "committees of captains" were as much concerned with professional grievances as with political issues. In attacking Opus Dei and the Carrero Blanco government, they were also protesting about low pay, slow promotion and declining social status.

But it was significant that they tended to look for leadership to the *azules,* the hard-line generals who took part in the military rising in 1936 and later served in the Blue Brigade on the Russian front. The *azules,* many of whom are closely identified with the Falange, have not all shared in the falangists' fall from grace. It is true that General Rodrigo Cifuentes, the captain-general of Granada, was sacked by General Franco at the beginning of last year after he made a fiery speech to civil war veterans in which he obliquely attacked Opus Dei and the liberal priests who opposed the Burgos trial. He referred to Opus Dei in veiled terms as "the new white masonry that is trying to sow discord in the heart of the national institutions that are still in good moral health."

But in the reshuffle of army chiefs that followed, General Garcia Rebúll, another leader of the *azules,* was given the crucial command of Madrid, and General Muñoz Grandes, the wartime leader of the Blue Brigade which served on the Russian front, remained very close to the *caudillo* until his death in 1971. Other prominent army chiefs associated with the *azules* are the captains-general Garcia Valiño and Perez Vineta, while General Iniesta, a younger man who is currently ambassador in Tunisia, is also popular with the extreme right. The *azules* are all getting long in the tooth (most of them are septuagenarians or octogenarians by now) but it is important to bear in mind the continuing strength of the right-wing faction within the army.

It is worth remembering that in 1961, when General Franco was injured in one arm and there were serious fears for his life, he summoned only one of the three men who compose the Council of Regency to his bedside—General Muñoz Grandes. General Franco's action then showed where the real power lies in Spain. After his death, the army will once again serve as the arbiter of Spanish politics.

Direct intervention by the army might prove a national disaster, since it could damage the country's image in the outside world and might well affect the tourist trade and relations with the common market. As one senior minister put it to this correspondent, army rule "would drag Spain back into the era of pronunciamientos." But, in the absence of organised political parties or a highly developed political consciousness among the Spanish people, the country will depend upon its institutions for continuity of government.

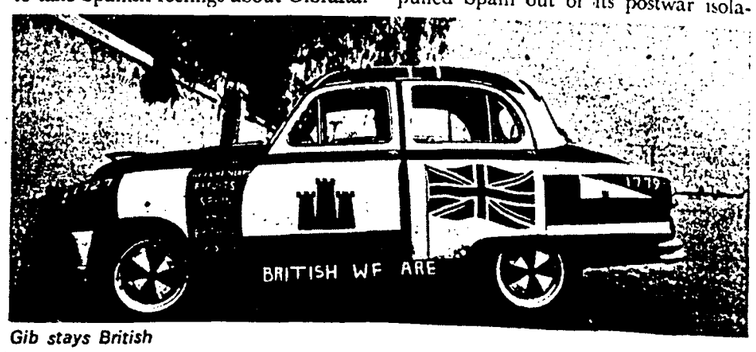
The hopeful thing is that the army is currently commanded by one of the most impressive figures in the Spanish administration. Lieutenant-General Manuel Diez Alegría, the chief of staff, is one of the champions of professionalism in the Spanish armed forces. On many occasions, he has insisted that the army should remain subordinate to the civil power, although it can play a leading part in national development. By temperament and by family connections, he is a liberal conservative (liberal about freedom of conscience and expression, conservative on the law and order issue). His brother, a Jesuit, has been active within the "social movement" in the Catholic church.

It is rather startling to come face-to-face with General Diez Alegría for the first time. He is an intellectual in uniform: small and wiry, with cropped hair and large, liquid brown eyes, more like a professor than a man of war. He has a simplicity of manner that inspires immediate confidence. He speaks fluent French and English and travels frequently to Europe (his critics are quick to point out that he has tended to be out of the country every time a major political crisis blows up in Madrid—he was in Brussels at the time of the Burgos trial). Like most soldiers in most places, General Diez Alegría believes in the need for discipline in social life and insists that the one thing that might induce the army to attempt a "Greek solution" after Franco would be a wave of political strikes or a sustained campaign of urban terrorism. But he is also a very humane man, alive to the need for social change and greater freedom of expression.

Most important, General Diez Alegría is a convinced European: he believes that Spain has embarked upon a course of gradual integration with the common market area that will help to bring about the liberalisation of political life within the country. The problem is that the general is a pretty isolated figure, at odds with many of the regional commanders.

Last year's debate about how to deal with conscientious objectors demonstrated the continuing strength of the far right in Spain, both inside and outside the barracks. General Diez

Alegría was one of those who wanted to revise the antiquated legislation that decrees that a man who refuses to join up can be sentenced to successive prison terms until he passes the maximum age for military call-up. On the face of it, the proposal for reform was hardly radical: to substitute a single prison term for repeated sentences. And it hardly seemed the kind of issue that could provoke controversy, since there are currently only about 180 conscientious objectors in Spanish jails —most of them Jehovah's Witnesses. But the government bill was bitterly attacked by the right (and notably by that faithful spokesman of the ultras, Sr Blas Piñar) and it was finally turned down by the Cortes. It was an important test of strength. If General Diez Alegría can keep control of his troops after Franco, he might be able to hold the ring while a broader group of politicians organise a more liberal government. But the future is rarely predictable in Spanish politics.



Club méditerranée

Gaullism is not something peculiar to France, and you don't have to wear a képi to practise it. Gaullism was more or less what Sr Castiella, Spain's former foreign minister, was trying out during his last couple of years in office. The fastidious might call it the *stratégie tous azimuts*—that is, that singular form of nationalism that claimed to view both superpowers as potential enemies. To his credit, Sr Castiella helped to get his country on the road to Europe by making approaches to the EEC back in 1962. He also helped to get Spain out of Ifni and Equatorial Guinea by classic methods of decolonisation—the kind of tactful withdrawal that has made Spain many lasting friends in North Africa and the Middle East.

But Sr Castiella is best remembered abroad for his highly emotional campaign against the British presence in Gibraltar (a diplomatic offensive that culminated in the severing of communications between Gibraltar and the mainland and some resolutions hostile to Britain passed in the United Nations) and for his denunciation of Spain's military accords with the United States. Both those issues, of course, are still very much alive in Madrid, and woe betide the unwary visitor to the foreign ministry who fails to take Spanish feelings about Gibraltar seriously enough.

This is not the place to discuss possible solutions for the Gibraltar problem. For the moment, both Britain and Spain have taken up positions diametrically opposed in principle. The British say it is the will of the people on the Rock that counts; the Spaniards that national integrity comes first and the territory must be handed over regardless. Whether the final answer is a condominium, or a series of referenda spaced out over a decade to allow for any change in Gibraltarian attitudes, or some other compromise must be hammered out elsewhere. The hopeful change in Spanish policy since Sr Castiella stepped down in 1969 has been that his successor, Sr Gregorio López Bravo, has defused the issue without altering his government's basic stance. In a speech to the UN General Assembly last October, he reiterated that "it is necessary to end a colonial situation that gravely prejudices the territorial integrity of Spain; safeguarding, at the same time, the interests of the population of Gibraltar."

As for Spain's relations with the United States, that involves a long-standing grievance. In 1953, when an agreement providing for the establishment of American bases was first signed, this was one of the things that pulled Spain out of its postwar isolation. It was the Americans (followed by the Vatican, which sealed a concordat with General Franco later the same year) who started to break down the wall of suspicion surrounding a regime that was still identified in many parts of the west as a wartime ally of the Axis powers—a partial distortion of the truth, since when it came to the crunch Franco kept Spain out of the war.

Gib stays British

In the first 10 years that the agreement with the Americans was in force, it was financially profitable for the Spaniards; between 1953 and 1961 alone, Spain received $618m in direct aid and a further $404m in loans from the United States. But the level of American aid sagged later on. Between 1962 and 1968, direct aid amounted to only about $60m, while most of the $420m worth of credits was channelled through the Export-Import Bank (Eximbank) and tied to purchases from the United States. The aid provided under the new Spanish-American agreement patched together in 1970 also fell far below Spanish expectations: $25m as aid, $115m on Eximbank terms, mostly tied to the purchase of secondhand Phantoms. In return for this aid, the Americans have been flying Strategic Air Command bombers from Torrejón, and using Spain as the base for the XVI airforce, one of the four components of US Air Force Europe, which also maintains squadrons in Britain and west Germany as well as a logistic group in Turkey. The Rota naval facilities, like Holy Loch in Scotland, are an important base for the American Polaris submarines in Europe.

There has been a growing feeling among some Spanish politicians that their country has been getting the worst of the bargain. It is not just that the financial dividends for providing bases for the Americans have been shrinking. The difference between Spain and the other European countries that accommodate American forces is that Spain is not a member of Nato and has no formal security treaty with the United States—although back in 1963 both countries signed a declaration that: "A menace to either country or to the installations that each provides for mutual defence would be considered something of concern to both countries, and each country would take the action it considered appropriate within the framework of its constitutional procedures." But this can hardly be considered a formal defence commitment.

It is worth noting, however, that in a subtle, almost surreptitious manner,

BANCO URQUIJO

Established 1870

The leading Merchant Bank in Spain

CAPITAL and RESERVES: 12.056.203.000 Ptas. (£71.763.113)

announces the opening of its Representative Office in London:

López Bravo flies off in all directions

Spain has been drawing closer to Nato. Many Spanish army officers would like Spain to be a full member, and the advantages in terms of the exchange of intelligence and defence technology are obvious enough. If Portugal can be a member of Nato, many Spaniards ask, why exclude Spain? In June, 1970, the Spaniards signed an agreement for military co-operation with the French, and since then there have been joint manoeuvres as well as important defence contracts: Spain is, for example, manufacturing Mirage fighters under licence from France.

The special relationship between the France of President Pompidou and Spain has become one of the key elements in Spanish foreign policy. When M. Schumann, the French foreign minister, visited Madrid late last year, his Spanish counterpart made an important speech in which he declared that "Spain is ready to join Europe" and that it looked to France as its advocate. Despite some economic differences, France and Spain share an obvious community of interest in the Mediterranean. They have pursued similar policies towards the Arab countries (and Spain's approach to the Middle East has been strongly conditioned by the fact that the domestic demand for oil is rising at an alarming rate as the economy develops).

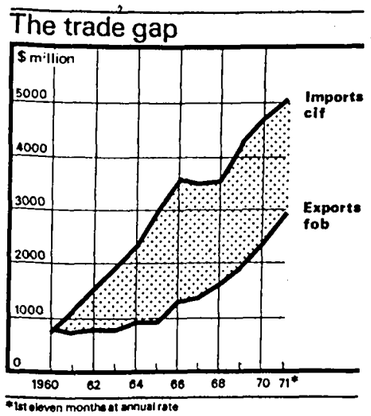
It is worth quoting a Spanish commentator on the geopolitics of the Franco-Spanish connection:

> The Mediterranean and Atlantic coasts of Spain and France from two distinct fronts that are more easily defended if they are thought of as continuous lines. . . . Each country's defences along the Mediterranean coast are dangerously distant from its defences along the Atlantic; but joint defence of the two lines would double the defensive capacity of each country. . . . The strategic conceptions of France and Spain should be fitted into a regional policy with its centre of gravity in the straits of Gibraltar.*

That is fair enough if one is thinking only about naval defence. The more important point is that France and Spain share a common fear of Russian naval encroachments in the Mediterranean and both are making overtures to the countries of North Africa. From the gallic viewpoint, a Spain more closely associated with the EEC could also be seen as a sort of southern counterweight to the influx of northern countries that will come about when the Six become ten.

But the interests of Sr López Bravo range far beyond Europe. He has also pursued a policy of detente towards the Soviet block that has resulted in some ironic successes. It was coal from Poland, for example, that enabled the state-run mining company Hunosa to sit out several big strikes in Asturias. Russia maintains a "maritime bureau" in Madrid, and the Spaniards have opened diplomatic relations with a number of east European countries. The Spanish Ostpolitik is popular even with some of the most traditionally hardline anti-communist elements; the falangist newspaper Arriba has commented, for example, that "business is business" and that the government should pursue "every chance of diversifying markets." A more traditional sphere for Spanish diplomacy is Latin America. Sr López Bravo has made a series of Latin American tours over the past year, distributing credits and cultural agreements and picking up business for Spanish firms. Exports of cars and lorries to countries like Colombia are rising fast. But the most immediate problem for Spanish diplomacy is the EEC. The present government has put its shoulder to the wheel, but that wheel has only just begun to turn.

*"Ensayo sobre política exterior." By Antonio Sánchez Gijón. *Colección los Suplementos.* Cuadernos para el diálogo. Madrid. 1971.



The challenge of Europe

There are two commonly held views of "the opening to Europe" in Spain. The first is that this will be primarily a political and psychological process and that there is no chance of Spain achieving economic integration within the common market area without basic changes in its political and social structures—and an equally fundamental change in attitudes in northern capitals like Brussels and The Hague. This is the view generally held by the liberal opposition in Madrid, and Sr José de Areilza has made himself one of its most eloquent exponents. "The real transformation," he insists, "will have to take place within ourselves." He argues that many of the basic principles common to the European democracies are still alien to Spain.

The second view is that the opening to Europe is primarily an economic process; that Europe is about as far away from political integration as it ever was; and that the real problem for Spain is to adapt its industry to bear the brunt of European competition. The present government has worked within this narrower focus, and there is no question but that this is the more realistic approach. If full integration with the EEC would be politically impossible for Spain in the near future, it is arguable that it would also be economically undesirable. As Sr José Luis Cerón, the director of international economic relations in the foreign ministry, puts it, Spain would face the threat of economic "colonisation" unless integration takes place in carefully graduated phases.

At the same time, the potential for a Spain more closely allied to the EEC is enormous. There are already signs that Spain could become a production base for many of the big multinational companies in Europe. Fiat has plans, for example, to turn the Seat works into the sixth largest car producer in Europe by 1975. Spain can offer, after all, relatively cheap labour, a very liberal attitude to foreign investors and comparative freedom from strikes.

"So we go on picking off daisy petals," the Barcelona newspaper La Vanguardia said recently, "common market, yes. Common market, no." Spanish businessmen are much more undecided (and much worse informed) about the pros and cons of joining the EEC than British businessmen tended to be at the beginning of last year. A glance at the Spanish trade figures for last year might have some persuasive effect. In the year after the preferential trade agreement with the EEC came into force in October, 1970, Spanish exports to the Six rose by 30

per cent, while imports remained static (partly no doubt, because of the low level of industrial investment in Spain over the same period).

Spain's first advances to the EEC came in 1962, when the then foreign minister, Sr Castiella, wrote to M. Couve de Murville (then president of the council of ministers of the Six) to ask for discussions on "possible links between Spain and the community, in the form that would be most beneficial to both sides." The Spaniards were originally thinking in terms of some form of association. The Six took their time in making a reply; serious discussion of Spain's tentative approaches were delayed, first by the crisis over British entry in 1963, and later by the wrangling over agricultural policy inside the community.

The trend of Spain's foreign trade over the past decade has made it increasingly dependent on the common market area as an export market and a source of manufactured goods. By 1970, just under a third of Spain's imports (and half of its industrial imports) came from the EEC, and just over a third of its exports (and a quarter of its manufactured goods sent abroad) went to the Six. There was also a trade deficit with the Six amounting to some $700m. The agreement signed in 1970 lowered EEC tariffs on many Spanish exports by between 40 and 60 per cent over a six-year period. In return, Spain made more limited concessions—a reduction of between 25 and 30 per cent on industrial goods from the EEC, also phased out over a six-year period.

The treaty left many economic problems unresolved—in particular, the impact on Spanish exports of the enlargement of the common market. British tariffs on agricultural imports tend to be lower than those of the EEC, whose industrial tariffs tend to be higher, so that Spanish primary producers will be the first to feel the pinch when Britain goes in. Tomato exporters will be especially hard hit unless special provisions are made for them, since Britain is the prime importer of Spanish tomato products. From January, 1973, all EEC regulations affecting tomatoes will be applied to Spain's tomato exports to Britain. Five years later, Spanish tomato products would have to do battle for the British market with Italian exports not confronted with a tariff.

The impact of British entry is the main reason why the Spaniards are now asking for the first phase of their preferential trade agreement to end with the enlargement of the EEC next year. There are also a host of specialised problems to be ironed out, involving competition between French and Italian agricultural products (and also North African produce) and Spanish exports.

French wine producers, for example, have been kicking up a great fuss about imports of wine from Mediterranean countries—despite the fact that the EEC did not produce a surplus of wine last year. Spanish wine exports to the EEC were up by 27.5 per cent in 1970, and the Spaniards are very concerned to obtain some reduction on tariffs to help them unload some of their chronic surplus. Nearly 400,000 Spaniards, directly or indirectly, make their living from the fruit of the vine, and the government is heavily involved in subsidising the industry by buying up the surplus and then trying to sell some of it abroad or to local restauranteurs who are currently being urged to serve free wine with "tourist menus."

Towards the consumer society

If you measure happiness by the percentage of the population who drive cars or look at television, Spain can afford to crack a grin. The fact that one Spaniard in 13 has a car may not sound dramatic when you remember that the ratio for Britain is one in five. What is dramatic is the rate at which Spain has been catching up. According to government statistics, the number of cars per 1,000 people jumped from 9 to 70 between 1960 and 1970. Over the same decade, the number of telephones for every 1,000 rose from 59 to 135 and the number of television sets went up from 5 to 70.

Joining the acquisitive society, of course, means inheriting some of its congenital maladies. All those drivers who cannot quite manage to keep in one lane are no longer a joke in Madrid, recently proclaimed "the city of 700,000 cars," and there are signs along the pavements warning you not to breathe in too many exhaust fumes. But life is probably better than it ever was for the ordinary Spaniard. People are eating better, for one thing. How much meat a society devours is sometimes a good index of changing living standards, since among low-income groups consumption of meat is very closely related to relative earnings. Consumption of meat per capita more than doubled in the course of the past decade, from 19 kilogrammes in 1960

Madrid moves on four wheels, but more often there's a jam

to 44.7 kilogrammes in 1970.

The technocrats within the Spanish government tend to argue that it is by producing statistics like these that they are ensuring future social stability, just as their enemies sometimes accuse them (in the words of a liberal bishop) of providing "more and more material goods" in place of political and intellectual freedom. It might be more charitable to use the bon mot of Sr López Rodó: "A people that enjoys a decent standard of living becomes less extremist." So long as rapid economic growth can be sustained, the technocrats are probably right. Unemployment under General Franco has never risen above 2 per cent for the country as a whole (the official figure was 1.9 per cent last year) and the state offers a comprehensive system of social insurance.

This correspondent had the privilege of being invited to share a simple Sunday meal with a worker's family in Corabanchel, the workers' suburb of Madrid, in a street not far from the prison that was named after a football club. It was a rare chance to probe the truth of the argument that "95 per cent of the Spaniards are non-political." As a driver for a hire-car firm, "Mario" was earning more than most skilled workers, but also working longer hours. With his wife and three children, he occupied a flat with three small rooms and a kitchen, owned a television set and was paying his HP instalments on his little Fiat. Prices obsessed Mario and his wife.

But their greatest complaint was the cost of educating their children. They were indifferent to political issues. Mario claimed that neither he nor his friends were concerned who Gibraltar belonged to. His personal view was that: "It's like this. If I build a shack and then abandon it and someone comes along and builds a palace in its place, I've got no right to ask to have it back."

Mario, it might be argued, was a relatively lucky man. Labour militancy is by no means a thing of the past in Spain, although it is held in check by the police and the official trade union apparatus. It has been estimated that more than a million man-days were lost through work stoppages and labour disputes in 1970, a disquieting figure for a society where until recently all strikes were illegal. And some people would argue that behind the statistics that show that Spain has now attained that magic figure—a per capita national income of $1,000—dangerous social frustrations have been building up.

Unions above and below ground

The way that Spanish labour is organised is sometimes regarded as one of the stumbling-blocks in the path of those Spaniards who would like to move towards eventual integration with the EEC. A committee from the International Labour Organisation toured Spain in 1969 to report on the labour situation and to suggest how the trade union legislation might be altered to bring Spain more closely into line with European practice.* The ILO group did not attack the principle of a monolithic union movement, on the grounds that "unity brought about by the freely expressed wish of all concerned—a unity ensuring that every member can exercise his rights to the full—should represent a most desirable objective." The committee did call, on the other hand, for election of all union officials, separation of the union movement both from government and political parties, freedom of assembly and discussion within the movement and "the complete autonomy and effective practical equality of trade unions of workers and trade unions of employers."

The new Spanish trade union law, or *Ley Sindical*, that was approved by the Cortes early last year implemented some, but not all, of these recommendations. Under the new law, Spanish workers are given the right for the first time to hold meetings on the factory floor and to form associations within individual enterprises. They are also permitted "to exercise the right of taking legal action and making appeals that may be necessary for the defence of their union rights"—a rather vague liberty that does, when taken together with recent amendments to the penal code, entitle Spanish workers to go on strike for professional reasons. This was a considerable advance, but in practice, of course, the freedom to strike in Spain very much hinges on the temperament of individual employers. For many years, de facto strikes and stoppages have been tolerated by employers who have preferred to come to terms rather than call in the police. On the other hand, it is still easy enough—especially since the influence of the illegal *comisiones obreras* (or "workers' commissions"), which contain a strong communist element, is so pervasive—to label any strike "political" and repress it by brute force.

The *Ley Sindical* was criticised by a series of speakers in the Cortes for perpetuating the "vertical" system that has its origins in the theory of the corporate state and the ideas of José Antonio Primo de Rivera, the founder of the Falange. Certainly, the *sindicatos* remain firmly under the control of appointed officials, and the union apparatus is closely interwoven with

*"The Labour and Trade Union situation in Spain." *International Labour Office*. Geneva. 1969.

The factories are kept open, one way or another . . .

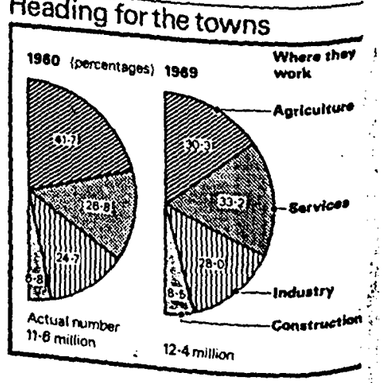
. . . but car workers gossip about the next strike

the instruments of government. Sr Rodolfo Martín Villa, the new secretary-general of the *sindicatos*, justified the lack of union autonomy to this correspondent on the grounds that "the prime aim of the unions is to assure the co-operation of labour with government in promoting economic growth."

He also argued that the *sindicatos* are more than a passive tool of the regime and that they are a major political force in their own right. For one thing, the unions provide 150 of the 564 members of the Cortes, and there are more than 18,000 trade union representatives in the provincial and local corporations. The *sindicatos*, largely through deployment of the compulsory union levy (payable automatically by all employees), have also built up sizeable economic interests. The value of real estate held by the unions in 1969 was estimated at $93m by the ILO, and the annual budget amounts to more than $65m. Some of these resources are used to provide cheap holidays for workers, modestly-priced housing and other social services.

Sr Martín Villa is a new kind of trade union organiser in Spain. Intelligent, sensitive to western opinion and above all young for the job at 35, he is regarded by some of his enemies within the *sindicatos* as too close to the technocratic group. He is clearly not ready to contemplate free trade unions in Spain, although he is conscious that this could prove to be a sticking-point in his country's future relations with the EEC. He also points out that free unions are impossible without freedom to organise political parties—something that still seems very remote in Spain. Under Sr Martín Villa, younger men are coming to the fore in the syndical apparatus—like Sr Surcillo, the union boss in Barcelona, who is 34 and a Catalan to boot. Ideologically, many of these younger union bureaucrats remain *José Antonistas*, which means that they cling to the ideal of the corporate state although they are by no means ready to interpret this concept in favour of the employers. Sr Surcillo, for example, believes ardently in the "vertical" union system as a model for other societies. The problem is whether these men are capable of containing the visible manifestations of labour unrest by persuasion.



Spanish employers are very conscious that there are parallel clandestine trade unions in Spain. The *comisiones obreras* derive their name from a strike committee that was set up in the La Camucha mine in Asturias back in 1956. How powerful they are today and whether they have a central organisation are hotly debated questions in Madrid. One representative of the *comisiones*, a man from the Pegaso truck factory, told this correspondent in a sleazy cafe on the outskirts of Madrid that the underground union movement had a nationwide apparatus, including 11 provincial councils and a central secretariat. He also claimed that the *comisiones* maintain close links with the major opposition parties, and that their delegates meet regularly with opposition leaders ranging from carlists to communists in an assembly known as the *mesa democratica*. He said that the "progressive catholic" groups had been particularly active in focusing public attention on workers' grievances, and quoted the case of the collection organised on behalf of the widow of Pedro Patiño Toledo, the construction worker killed by the *Guardia Civil* last September while distributing leaflets.

The political tendencies of the *comisiones* and their capacity to bring about serious disruption of the economy worry the rulers of Spain. Santiago Carrillo's Communist party (*Partido Comunista Español*) is undoubtedly very active among the *comisiones*, and this has led to local rifts where Socialist party militants (as in Pamplona and Asturias) have quarrelled over tactics and broken away to form their own clandestine workers' associations.

Certainly, most of the *comisiones* seem to be following the tactic favoured by the communists: to infiltrate the lower levels of the legal trade union apparatus. The man from the Pegaso plant claimed that the workers' committees captured 50 per cent of the union jobs in the metal sectors (cars, engineering and so on) at the syndical elections held last year. The figure is probably an exaggeration, but penetration of the union apparatus places the *comisiones* in a much stronger position when it comes to organising or influencing the outcome of a strike. It also enables individual militants to move freely around a plant, making new recruits.

The strikes where the *comisiones* have been most active have increasingly tended to follow a standard pattern, illustrated by what happened during a 45-day strike at a spare parts manufacturing plant in Pamplona in Navarra last year. The director of the company told this correspondent that the strike was organised by the local workers' committee and that the local representatives of the *sindicatos*, under

What do the big oil companies have that CEPSA doesn't have?

Nothing.

Let's be frank - there are small differences, just shades. For instance, they are 10 or 30 times bigger than we are. Although we have been in the oil business for 43 years (CEPSA prospects, extracts, transports, refines and distributes) and our business has grown 4,000%, they are still bigger.

But only bigger.

If it were not so, how could we sell 44% of our output in their own markets and in other markets the world over? (Europe, America, Africa, Australasia).

The consumer wants quality and not statistics. And our refined and petrochemical products have always offered quality. And at the level of the highest international standards.

Though, we also have our spectacular figures - the first oil company to be incorporated in Spain; the first company to start petrochemical production in Spain; the first Spanish oil company from the point of view of production; the first Spanish oil company from the point of view of its export volume; the first Spanish oil company from the point of view of bunker supplies.

But, frankly, we have never liked boasting.

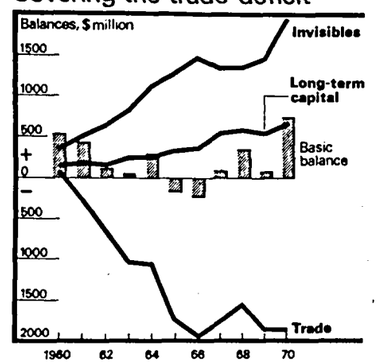
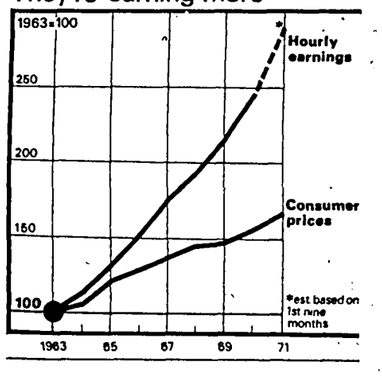
pressure from within, agreed to let the management negotiate directly with the *comisiones*. The strike leaders proceeded to present an impossible wage claim for a 60 per cent rise. Although a settlement was finally hammered out after 20 days, it was cancelled "on instructions from the national secretariat of the workers' committees." The strike finally petered out for lack of funds ; it had lasted for an exceptionally long period, considering the very limited resources of the *comisiones*.

The prime centres of labour unrest in Spain are, as always, in the car plants of Catàluña and the coal mines of Asturias, and the two most important strikes late last year were staged by workers at the Seat plant in Barcelona (the Dagenham or Renault-Billancourt of Spain) and by miners in the Hunosa state mines around Oviedo. In both cases, the management (directly responsible to the government) adopted a very tough response: police moved in with helicopters and fired on workers—after some initial hesitation, according to one eye-witness account—in Barcelona, and the miners were locked out in Asturias.



The causes of labour unrest vary from sector to sector. Coal mining is a dying industry, where profits depend upon cheap labour and state subsidies. Car manufacturing has been subject to dramatic seasonal swings in the level of production and employment. The plight of construction workers has also given rise to some very tangible stirrings of unrest. Official statistics show that 60 per cent of construction workers, employed in one of the boom sectors of Spanish industry, which has chalked up a rapid rise in productivity over the past few years, are earning less than 6,000 pesetas ($93) a month. On top of this, the slump in the rate of new construction last year led to serious unemployment on the building lots—some sources placed the figure for mid-1971 as high as 8 per cent.

But it is the pressure on prices that is the most serious and most universal source of labour unrest in Spain. Wages as a proportion of the gnp have been stagnant over the past decade at the relatively low level of around 55 per cent. Recent estimates show that, over the past year, wages barely kept ahead of the rise in the cost of living. The official figures show a rise in wages of over 13 per cent in 1971, compared with a rise in the cost-of-living index of over 8 per cent ; some unofficial observers put the rise in prices much higher. Future trouble on the factory floor is likely to be bound up with that common malady of western economies—stagflation.



Slowing down

Covering the trade deficit

They're earning more

Dissecting the miracle

The 1960s were the decade of the Spanish miracle. It was a period in which Spain achieved one of the highest growth rates in Europe—an average of 7.6 per cent across the decade, compared with the annual average of 4.8 per cent for the OECD countries in general. Steel output went up from 2.2m tons in 1960 to 7.4m tons in 1970. The number of cars being turned out by Spanish plants increased more than tenfold over the same period. The expansion of Spanish industry at this breakneck speed meant vastly increased imports and produced a yawning trade deficit. In 1960, Spain earned a modest trade surplus of some $40m. By 1970, this had been turned into a whopping deficit of nearly $2 billion.

What turned this into a positive balance of payments was a combination of three factors: the extraordinary boom in the tourist trade, the transfer of foreign capital and remittances from Spaniards who had gone to work abroad. Spain was not only able to cover its trade deficit ; it accumulated huge (perhaps uneconomically huge) foreign reserves that amounted to more than $1.8 billion by 1970. In the last analysis, the Spanish economy depends on foreign confidence, and the triumph of the governments that have administered the country since 1959 is that they created the climate for massive foreign investment and an unrestricted stream of foreign tourists.

In the changed conditions of the 1970s, in the face of the sluggish performance of industry last year, and that all-European malady known as stagflation, it is questionable whether the laisser-faire policies of the past are still enough. The Spanish economy is confronted with huge and hitherto intractable structural problems. There is a glaring need for a comprehensive prices and wages policy and for prompter use of monetary policy measures to avert the "stop-go" cycle of the past. Above all, perhaps, there is the urgent need to siphon off some of the excess liquidity in the economy and persuade Spanish businessmen to invest. Money has been steadily piling up in the banks that no one is ready to draw upon. Merchant bankers who are accustomed to having 80 per cent of their reserves out on loan were talking late last year of having lent only 60 per cent.

Sr López Rodó ascribed the sluggishness of Spanish industry over the past year to "the excessive timidity" of local businessmen and points out, with absolute justice, that there has been no noticeable falling back in the levels

dependency on foreign technology. Now some readers will be quick to point out that some of the most notorious "importers of technology," countries like Japan and Italy, have thrived on their technological dependence. All the same, it is striking that while Spain spends about as much on the import of technology as Japan (the figure for both was just over $133m in 1968) it spends only an insignificant fraction of what Japan spends on research and development—$25m in the same year, compared with $576m.

Technological dependence has already had some alarming social effects—including a continuing brain-drain of bright graduates. The newspaper La Vanguardia Español conducted a survey at the end of 1969 that showed that three-quarters of all recent physics graduates were working abroad, and that fewer than 2 per cent of those employed in Spain had jobs that related to their professional qualifications. The banner-headline of a recent issue of the student newspaper Avanzada, "The Future—Emigration" is not exactly a joke for many of those emerging from technical faculties in Spain. It is true that the tremendous cost of research and development in sophisticated industries like aeronautics and software makes it simply unprofitable for a medium-size economy like Spain's. But Spanish business has still been far too laggardly in experimenting more modestly. This is going to be one of the major tasks for the government planners.

The government stake

Like the French, the Spaniards practice indicative planning. Although local businessmen have rarely been visibly enthusiastic about the mountain of paper emerging from Sr López Rodó's planning commission, the planners' forecasts have not been so far out as some of their critics claim. The growth rate of individual sectors of the economy over the period of the Second Development Plan (1968-71) was slightly higher than the forecast : 7 per cent for industry (compared with a forecast of 6.7 per cent) 6.1 per cent for services (forecast : 5 per cent) 3.3 per cent for agriculture (forecast : 2.7 per cent). If, as one of Sr López Rodó's younger colleagues puts it, indicative planning has an element of glorified market research, the researchers have not done badly. And the Third Development Plan (1972-75), made public at the end of last year, has silenced some of the critics.

Even Sr Ramón Tamames, the brilliant socialist economist who has been one of the most outspoken critics of the Spanish system of planning, praised the Third Plan for "mapping out a list of concrete projects" and placing greater emphasis on social development and the environment. What is the role of state planning in a mixed economy ? In Spain, the planners' recommendations are mandatory for the government corporations and holding companies, but merely advisory for private enterprise—which is as it should be in an advanced capitalist society. But then Spain is not France or Holland, and the planners have so far failed to make a frontal attack on some of the structural problems of the Spanish economy, such as the fragmentation of industry, the low productivity of agriculture and the antiquated tax system. The "stop-go" cycle of the past few years also suggests that the government has not been aggressive enough in controlling the monetary supply and in managing demand.

On the other hand, the Third Plan provides for much greater state participation in the economy. The level of public spending under the Third Plan will rise by more than 63 per cent over the figure for public investment under the Second Development Plan (1968-71). This means that the state itself will be taking over a much greater proportion of the new investment required to achieve the growth rates it has prescribed. State spending on this scale should encourage private firms to expand, but may bring inflationary pressures.

The Third Plan projects a brave new world of the 1980s, in which Spain will have taken its place as the "tenth industrial nation in the world," with a per capita national income of more than $2,000 and an annual growth rate of between 6.7 and 8.3 per cent. It envisages a rise in steel production from 7m tons in 1970 to 10m tons in 1980 and the establishment of new regional "development poles." Above all, Spain will move closer towards welfare state institutions ; free education—available for only about 60 per cent of the children in the 6-14 age group in 1969—will be extended to all. The state will also assist in the construction of 3m new dwellings between 1972 and 1980, which will mean a tremendous stimulus for the construction industry, which was flagging in the earlier part of last year. But there are glaring omissions in the plan. The most notable is the failure to make any assessment of the impact of the preferential trade agreement with the EEC on Spanish exports or to study the adjustments that Spanish industry and agriculture will have to make to equip themselves for a closer relationship with the EEC.

Under the Third Plan, the National

Spain, like others, is many countries

"In the drive to raise efficiency and cut costs, the lead has been taken by Etasa of Alicante, which, as Spain's largest tomato exporter, accounts for more than 10% of all mainland sales abroad.

The company's example is influencing standards elsewhere in the industry, and could lead eventually to a revolution in Spanish tomato-growing."

THE FINANCIAL TIMES, 26th OCTOBER, 1971.

And not only tomatoes

Etasa also handle the pick of Spain's best produce—Oranges, Canary Bananas, Grapes, Melons, Potatoes, Lettuce, Salad Onions, Celery, Peaches, you name it and they probably export it.
Etasa, as always, setting the pace for the rest.

provides some clues to the motives and performance of foreign investors. By the end of 1969, the total book value of American investments had risen to $611m, more than half the total being invested in manufacturing industries and about 20 per cent in petroleum. The proportion of reinvested earnings on the other hand has dropped over the past few years. The results of an opinion poll showed that 70 per cent of American investors had come to Spain on the initiative of their parent companies ; 28 per cent on the initiative of Spanish partners ; and only 2 per cent in response to official approaches. This suggests that there is a great deal more that the government can do to encourage the kind of foreign investment that is in keeping with its development goals.

American affiliates in Spain have achieved a much higher level of self-financing than is normal in Spanish industry—the level is about 36 per cent entirely self-financed companies amongst the American concerns, but only 8 per cent among the top 100 Spanish companies. Most of the American companies are selling almost exclusively to the Spanish market, although the value of their exports over the period 1965-69 covered about half the cost of their imports from abroad. But a single commodity—petroleum—dominated their export trade and contributed nearly 70 per cent of the value of exports.

Clearly, if Spain achieves a closer relationship with the EEC, it will be more attractive as a European production base for the multinational companies. The things that American investors tended to complain about were the amount of red tape involved in getting the necessary licence to take up a majority holding in certain industries ; the restrictions on importing machinery and materials not readily available in Spain ; and a tradition of tax evasion among Spanish concerns that gave them a profit-making edge unless foreign investors resorted to the same practices.

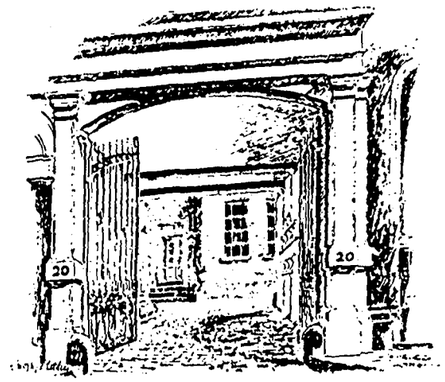
The growth rate of industry was down last year, but averaged out at 7 per cent over the period 1968-71. Some of the fastest-growing industries have been :

Automobiles. In the first half of the 1960s, the Spanish car industry achieved growth rates second only to those of Japan. With foreign companies (notably Fiat, Chrysler, Renault, Mercedes Benz and Massey-Ferguson) jostling with one another to claim a share of the market, Spain started turning out a bewildering

Don't make up your mind till you've looked at the 50,000 other styles

variety of makes and models. Today, the figure is just under four dozen. The car industry in Spain is closely interwoven with the major western producers, and the industry is concentrated in a handful of towns: Pamplona, Barcelona, Madrid and Zaragoza. By the end of 1970, Spain was producing more than 450,000 cars a year, and sending a tenth of them abroad. Total productive capacity is expected to be up to the million mark by 1977, which means that the Spaniards are going to have to sell abroad on a much bigger scale.

Seat has plans to spend more than £95m in new investments by 1975. It is already the giant among the Spanish car manufacturers, accounting for 60 per cent of the local market and employing 24,000 men. Seat already exports to Holland, Finland (where Seat models have become the most popular cars), west Germany, Belgium and other places in Europe. Fiat is increasingly turning the Seat plant into a European and Latin American production base. Seat has been granted exclusive production rights for the Fiat 600, and Chrysler has delegated the manufacture of the Simca 1000 to its subsidiary, Chrysler España. Fasa-Renault and Citroen-Hispanica, the two big French concessionaries, also have big expansion programmes. So far, west German and British manufacturers have held back. The big Japanese producers for the moment seem more interested in Portugal.



Consumer goods. Shoes are one of Spain's biggest exports. Although nearly three-quarters of the shoes exported go to the United States, the trade was not visibly affected by the American restrictions on textile imports last year. The structure of the shoe manufacturing industry in Spain is a microcosm of the problems for Spanish industry as a whole. When Spain took part in a world footwear exhibition in March last year, some 50,000 different Spanish models were on display. Anyone who has gone shopping in the streets off the Avenida José Antonio in Madrid will have been baffled by the sheer variety of choice, and the lack of predominant brand names. Government tax incentives for mergers have so far had little impact on the shoe manufacturers, who continue to turn out their excellent products in more than 2,000 backyard factories, nearly half of which employ only two or three workmen. As the barter trade with the Soviet block continues to grow, Spanish shoes may find a bigger market in the east. Italian competition is the main obstacle to selling to the EEC under present conditions.

The other interesting growth sector in the textile industry is Spanish *haute couture.* The big Spanish couteuriers (Pedro Rodriguez, Pertegaz, Lino and so on) are starting to advertise abroad for their seasonal fashion shows. If people are prepared to go to Paris for the big fashion shows, some of them can surely be persuaded to stop off in Madrid on the way home, where prices are much cheaper and styles are increasingly original.

Chemical products. These represent one of the fastest growing sectors of the Spanish economy. Total production rose by about 16 per cent in 1970, and the rise in exports was slightly higher. The planners are giving a special push to petrochemicals. Ini will set up a sub-

20–23 HOLBORN—LONDON E.C.1.

sidiary comany to take out a 60 per cent holding in a new oil refinery at Tarragona, which will feed neighbouring chloride, ethylene and polyethylene plants. There are also plans for the expansion of the state-run Calvo Sotelo petrochemicals complex at Puertollano, which has been the traditional hub of the industry in Spain. There will be scope for foreign participation in the new styrene, benzene and polyethylene plants that will be constructed around the Calvo Sotelo refinery between 1972 and 1975. Some of the big corporations (including Phillips, ICI and Montecatini) have already joined with Calvo Sotelo in mixed enterprises.

Steel. Spain is heading towards self-sufficiency in steel production, although there were marked rises in the imports of some specialised steel products (such as laminated sheets and steel coils) over the past two years. Although private investors have been reluctant to put money into an industry that is subject to close state supervision as a "key sector," the government has an ambitious programme designed to double steel output by the end of the decade. Official projections for steel production in 1980 set a target of 16.7m tons for crude steel, compared with 6.9m tons in 1970, and 1.4m tons for special steel products, compared with 500,000 tons in 1970. The plans for a fourth steel complex at Sagunto to develop an annual production capacity of 5m-6m tons are now complete. The government is to provide port and water facilities, and US Steel is to take out a large minority shareholding. The main Spanish company involved is Altos Hornos de Vizcaga. The doubt that remains is whether the planners are setting their sights too high. Demand for steel has been fairly slack over the past two years, because of the slowing-down in local industrial investment.

Shipbuilding. Shipbuilding and ship-repairing is one of the most promising industries in Spain, and the country may be second only to Japan in this field by the end of the 1980s. Half the production is in the hands of Astilleros Españoles, which gets half of its capital from Ini and the other half from private investors. It is already Europe's biggest producer of marine diesel engines, and it notched up a growth rate of 60 per cent in 1970. The government is encouraging the expansion of new shipyards with credits, and in 1970 the industry was contributing $140m to export revenues. Ini is going to contribute some $500m to the Astano shipyard in Galicia which has run short of funds. There may be room for collaboration with the big Japanese shipbuilders.

Construction. If you want to make money fast in Spain, become a man of property. Construction is one of the boom industries in Spain, and finished units were being turned out at the rate of 15,400 a month in 1970, although production slowed down in the first half of last year. The construction industry suffers more than most from fraud and land speculation and from the fragmentation of businesses (there are about 15,000 rival firms, most of them tiny). For the foreign investor with a bit of loose cash, there are hundreds of property companies offering a guaranteed income of 12 per cent or so a year. Lots of them, of course, are fly-by-night concerns selling off unfinished apartments to the unwary, and anyone who proposes to invest would be well advised to check on the progress of construction and "hidden costs" such as furnishing and the supply of water and electricity.

But there are a number of companies like Sofico with a proven track record and while property values go on rising at an average rate of 20 per cent a year along the Costa del Sol, anyone who takes the basic precautions can hardly go wrong. At the same time, land speculation has become one of the most serious problems for urban developers and industrialists, and some economists argue that the government should either take over property sites in the big cities or do something to keep prices in check.

The flight from the land

The Spaniards, like most people, are becoming a nation of townsmen. The flight from the land—and especially from the arid central tablelands towards the coast—has created tremendous problems for the urban planners. It is also a measure of the diminishing importance of Spanish agriculture to the economy as a whole. Between 1950 and 1970, the proportion of the active population employed in agriculture dropped from over 47 per cent to under 30 per cent.

Today, agriculture contributes only about 15 per cent of the gnp, a figure that also suggests the low level of productivity when taken together with the proportion of people still actively employed on the land. Sr López Rodó argues that "we have gone from the agriculture of the ox-cart to motorised agriculture." True enough, but farming in Spain is still very backward in comparison with other European countries. This may be partly due to the structure of landholding—the tiny, fragmented *minifundios* of Old Castille where men cast their grains of wheat over the barren soil; the rolling *latifundios* of Andalucia, sometimes forgotten by masters who have gone off to the bright life of the towns.

The two biggest obstacles to the modernisation of agriculture have probably been absenteeism (which often means land left uncultivated) and the complex system of subsidies and tariff buffers behind which the wheat farmers and olive growers have been able to go on farming in the old way, insulated against the chill blast of outside competition. The state is

In the Andalucian sun, no one's in a hurry

spending 8 billion pesetas a year in subsidies at present, and it is often used in defence of regional interests rather than those of the economy as a whole. The level of investment is strikingly lower in agriculture than in industry—the figure for agricultural investment in 1970 represented only a trifling 7 per cent of total investment in the Spanish economy.

The minister for agriculture, Sr Allende y Garcia Baxter, brought in an agrarian reform law last year that makes some attempt to tackle the problem of under-utilisation of land. Under the new law, landowners who

fail to meet official production quotas can have their properties taken away from them. The idea is to bring in a form of temporary confiscation that will enable the authorities to see that necessary improvements are made (and paid for). There is a certain amount of scepticism in the south, however, about whether the law is really practical. Any measures designed at sweeping agrarian reform in Spain are clearly out of the question, although the government must be given credit for providing a certain amount of cash and encouragement for the "regrouping" of the patchwork quilt that is Old Castille.

It is the system of state protection that explains why some 60 per cent of Spain's cultivated land is given over to cereal crops, some of which are produced under the worst imaginable conditions on scraggy patches of rocky upland. Spain has traditionally pursued a policy of self-sufficiency in wheat; the second most important cereal crop is barley; and rice is produced around Albufera for export to the Far East. The government clearly has social motives for continuing to guarantee high prices to Spanish wheat-growers. What else could many of those small farmers do?

But it is increasingly necessary to divert production towards what the economists call "high elasticity" foodstuffs like meat. Consumption of cereals has been steadily declining in Spain as standards of living rise. The figure stood at about 150 kilogrammes per head of population back in 1920; now it has dropped back to 110 kilogrammes. Yet last year wheat production was up by 33 per cent after the bad harvests of 1970, and a record 4.6m tons of barley were harvested.

Fruits, like cereals, contribute about 13 per cent of the total value of agricultural production, and a much higher proportion of the export revenue from primary products. The oranges of Valencia and Murcia are one of the pillars of Spain's export trade and bring in about $150m a year in foreign exchange. Three-quarters of the oranges sent abroad go to the EEC, where increasingly Spain is feeling the pressure of competition from countries like Italy, Israel and Algeria. One of Spain's disadvantages is that its oranges come in so many shapes and sizes and that, in place of a central exporting agency, there are upwards of a thousand competing private firms. Last year's citrus crop was disappointing, mainly because of bad weather and early frosts. The worst natural disaster, perhaps, was the onslaught of mildew among the vines of La Rioja, Aragon and Castille. Wine production sank to its lowest level since 1960.

The tomatoes of the Canary Islands and the south are another export staple, although the Spaniards are learning to their cost that growing the fruit in the open air has its disadvantages. Tomato growers, rapidly exhausting the soil they are using and suffering the inroads of malignant fungi, are leading more and more nomadic lives, moving on from one plot to another every 12 months or so. This obviously disrupts transport arrangements and discourages any substantial investment in plant and equipment. There is also that other problem of competing with the Italians for the British market when the EEC is enlarged next year.

Olives are another of the traditional crops of Spain, and there are still provinces in the south that practise something verging on monoculture. In Jaén, for example, 28 per cent of the land surface is given over to the olive.

Lleva azahar, lleva olivas,
Andalucia, a tus mares.

"Andalucia, take olives, take orange blossom, to your shores," wrote Lorca, the poet of Granada. Spain is still the world's foremost producer of olive oil (it produces two-fifths of the world total) but local consumption is so high that the government has been trying to encourage the home production of other vegetable oils in order to provide a larger surplus for export. Production of sunflower seeds was up by 20 per cent in 1970, and it is a popular crop in languid, passionate Andalucia, since it requires so little labour.

As one noted Spanish economist puts it, cattle-raising is "the most forgotten branch of the economy. We have protected industry inordinately, we have encouraged certain types of cultivation (wheat, industrial crops and so on) and there has been a tremendous effort towards reafforestation, but we have done little or nothing to promote cattle-raising."* The figures prove his point. The numbers of cattle, sheep and pigs in Spain remained fairly static over the past decade. Given the high price and increasing demand for meat in Spain, there is no justification for state passivity in this area. And there are all those foreigners to feed.

*"Introducción a la economía española." By Ramón Tamames. *Alianza Editorial*. Madrid. Sixth edition. 1971.

Cuando caliente el sol

The sun, they tell you, is to Spain what the Ruhr valley is to Germany. Despite the cholera scare, the luxury hotels depicted in the tourist brochures that were never finished and those that collapsed, a record 26½m foreign visitors came to Spain last year. In the jaundiced eye of an old-time English resident sunning himself on the palmy terrace of the Reina Cristina hotel at Algeciras, the "cultured hordes of the mass democracies" have inflicted a new barbarism on Spain, tearing up the coast to plant a concrete jungle of apartment blocks, night clubs and fish-and-chip cafes. Torremolinos, that alien enclave a few miles down the road from Málaga, is the symbol of the invasion that the man at the Reina Cristina can evade, but not turn back.

Torremolinos is what happens when avaricious contractors and property sharks are given their heads. It is a chaos of ugly hotels and "apartotels," interspersed with bars and discotheques (the new "Barbarela" night club—its name spelled eccentrically—glowers balefully in the sun on the outskirts of town) and streets of little shops where you can buy English kippers, German liver sausage and French cheese. But if you speak to the shop assistants in Spanish they are likely to look at you as if you are broke or crazy. For those who think a good holiday is food, vino and sex in the

The Economist, Publications Department, 25 St. James's Street, London SW1A 1HG

sun, Torremolinos is perhaps not all that bad—at least if you can forget about the drug-pushers and pick-pockets, the chronic water shortage that means that your taps are likely to cut off when you have just finished soaping yourself in the shower, and the sewage that enterprising swimmers have found floating out in Málaga bay on a calm day.

Torremolinos is unplanned and probably now unplannable, although the government has moved in to construct a new reservoir and to do something about the bumper-to-bumper traffic jams and the shortage of parking space. This, of course, is bound to mean more pneumatic drills, more bulldozers, more noise. To be fair, Torremolinos has suffered more than most of the resort towns along the Costa del Sol because it is run by the authorities in Málaga, who are often charged with diverting local tourist income to do up their own town.

The real point is that Torremolinos, with all its drawbacks, is actually the kind of Spain that lots of tourists want. It is a kind of cosmopolitan Blackpool, laid out under a hotter (and more reliable) sun. "Spain is different," certainly. But what many of the big tour operators are selling very profitably is Blackpool fun transplanted to the Spanish sun. The formula has worked astonishingly well. The danger of adopting an overly aesthetic view of the Spanish tourist boom is that one can lose sight of just how much it matters to the Spanish economy. It is by capturing the mass market, by turning on common pleasures for the common man, that Spain has made itself the second most profitable tourist mecca in the world. Only the United States makes more money out of tourism, and that is largely offset by what American tourists spend abroad. More than a third of the people who take their holidays in Spain belong to the categories pompously described as "skilled artisans" and "office workers." More than 80 per cent of them come from western Europe.

This means that Spain, ahead of any other country, has been cashing in on the new affluence of today's Europeans. It is the prime beneficiary of the change in popular psychology (drilled into our subconsciousness every night during the run-up to the summer season by the travel companies' television commercials) that has persuaded most of us to regard a holiday abroad as a right instead of a luxury, and maybe even as a duty, in our competitive consumer society.

That one's for real . . .

Why choose Spain? Most of the holidaymakers who were asked that question by public opinion pollsters just over a year ago said: "Climate." But of course there is more to it than that. The sustained and very intelligent advertising campaign waged by the Spanish government itself over the past few years has had considerable effect—and the spate of posters and travel brochures shows what lies behind the sun and sand. Those brave names thought up by the blurb-writers—Costa Brava, Costa del Azahar, Costa Blanca, Costa del Sol, Costa de la Luz—are only the doormat to the other Spain beyond the mountains, lifted up like a fortress above valleys of the south and the outside world. But, to be practical, the tourist inundation is partly a matter of logistics.

Hoteliers and tour operators in Spain, spurred on by the government (which has set a target of 50,000 new hotel beds a year up to 1980 have jumped in where other countries were only starting to test the water. France and Italy, the most-visited countries within the EEC, have been slower to respond to the needs of a booming mass industry, although there is now a danger that the Spaniards are not doing enough to attract the richer tourists who stay longer and spend more.

The state-run *paradores* and *albergues* (often set up in splendid old mansions like the Enrique II in Ciudad Rodrigo or the San Francisco in Granada) provide some of the best value for money in Spain, if you are mobile and prepared to forsake the beach for a few days. But prices in general are still comparatively low (and carefully supervised by government inspectors). One factor that may have encouraged hoteliers to skimp on food and services is the tremendous hold of the package tour-operators over the airborne tourist traffic. This has compelled many hoteliers to work on narrow margins in order to compete for a slice of the trade, and to try to make up their profits in other ways.

Certainly, the cut-throat competition to snaffle up the summer holiday-seekers has led to dubious promotion methods. The artist's impression in a travel brochure of what may be only a hole in the ground when the holiday-maker goes to make his booking is one of the more notorious abuses. Some tour operators have produced summer brochures without artists' impressions to overcome the suspicion that lingers on in many people's minds. But a recent investigation by The Times disclosed that on Majorca and Minorca alone only three out of 14 hotels depicted in this year's batch of brochures had actually been completed when the promotion material went to press, and that there were serious doubts about whether several of them would be finished by the time the first tourists arrived at the end of March or the beginning of April.

The OECD figures for 1970 showed that Spain earned just under $1.7 billion from tourism, compared with America's $3.2 billion. Although there was some suspicion that the Spanish figure included capital transfers of up to $100m, provisional figures for last year show that the upward movement in tourist earnings has been sustained. According to the Spanish ministry of information, tourist earnings between January and October last year totalled more than $1.75 billion, an increase of 22.5 per cent over 1970.

One of the central questions for the economy is how long the country can sustain the remarkable growth rates that have been chalked up by the tourist industry over the past decade. Between 1960 and 1970, the number of foreign visitors arriving in Spain rose from 4.2m to over 24m. Most of them are Europeans; more than a third are Frenchmen whipping across the Pyrenees in their Renaults and Citroens; just over a tenth are British, mostly stepping off planes. So far, there is no sign of a levelling-off, and in fact the Third Development Plan projects a still more spectacular increase in the 1970s.

According to the planners, there will be more tourists than Spaniards in the country by 1980. Their guesstimate is for 50m foreign visitors a decade from now, producing earnings of $3.7 billion for Spain. It is an extraordinary prospect. Will there be room for all these people? Tiny, cosmopolitan Ibiza, with a population of 40,000, already plays host to 1m tourists a year. If the tourist population really expands as fast as the planners predict there will be very few corners of southern Spain, Majorca or the Canaries that will be left untouched. The new motorways mapped out on the drawing boards will help to open up the less-frequented parts of Murcia and Almeria. But unless precautions are taken now, the result could be a tremendous muddle. No one wants to see a wall-to-wall Torremolinos rolled out along the coast from Estepona to Alicante.

But is it not more likely, as the hotel-builders in new places like Greece, north Africa and Portugal are hoping, that Spain will become increasingly expensive and over-crowded, so that a new generation of holidaymakers will move on down the Mediterranean? The answer will partly depend on how successful the Spaniards prove to be in conserving the tremendous natural beauty and variety of their country in the face of the onslaught and in opening up new tourist attractions like winter sports, game reserves, marinas and excursions into the interior.

There is no earthly reason why Spain should continue to be thought of by a majority of those 26m-plus foreign visitors as just sun and sand with a bit of flamenco or the odd bull-fight thrown in. For one thing, Spain is after Switzerland the most mountainous country in Europe, and it abounds in winter resorts. It is even possible, along the Costa del Sol, to slip up into the Sierra Nevada, 70 kilometres away, and get back in time to go ski-ing and swimming on the same day. Navacerrada, the magnificent ski resort in the central highlands, is less than an hour's drive from Madrid along the main highway, and once you get there, there are plenty of chair-lifts and ski-lifts to make life easy. La Molina and Nuria, in the Cantabrian Pyrenees, are within easy striking distance of Barcelona.

There are, moreover, plenty of other ways of diversifying the tourist industry. Parties of Americans are now coming to Spain prepared to pay $3,000 a week to hunt deer and wild boar. Spain is a huntsman's paradise. The Pyrenees and the Cantabrian mountains teem with deer, roebuck, and the long-horned *capra hispanica*—and there are still a few bears. In the remoter parts of Castille and Estramadura you can shoot red partridge or chase hares on horseback. If you like standing up to your waist in a swamp waiting for wild duck to break cover, there are the famous marshes around Valencia and the *marismas* of the Guadalquivir river. And then there is the year-round fishing—trout, salmon and pike—in rivers that are mostly open to the public.

. . . but he must be kidding

In Spain, sensibly, organised hunting and the cause of conservation have often gone hand-in-hand. Perhaps you have to be affluent to start worrying about the environment. Perhaps, on the other hand, this is one of the characteristics of a mature society. The Third Development Plan moralises that "man has exploited nature too much, without restoring what he has taken away." In Spain, control of the pollution coughed out by all those car exhaust-pipes, and of all that refuse spewed out into the Mediterranean that the doom-sayers claim could one day help to turn it into a gigantic Dead Sea is essential for both social and economic reasons. The new oil refinery being built at Tarragona presents a special problem for the Costa Dorada—as a local hotelier puts it: "You can't sell sun with smog."

An encouraging sign is that something is at last being done to conserve the countryside. The work of Adena (The Society for the Defence of Nature), set up as the Spanish branch of the World Wildlife Fund in 1968, is at least a beginning. One of the special aims of the society has been to preserve swamps and marshlands, and it scored something of a triumph last year when it helped to block a project that would have turned the Tablas de Daimiel, a natural beauty-spot and shooting reserve in La Mancha, into farmlands.

The real issue, perhaps, is the survival of tradition. That is not just a matter of saving churches and historic squares from the flattening progress of the bulldozers, but of something less tangible. The Third Plan calls for the construction of new tourist enclaves, or *burgos turísticos*, on the outskirts of the coastal towns. More care will have to be taken to stop these new developments turning into concrete sprawls by choosing architecture in harmony with the surrounding landscape, by providing proper roads and services and by leaving open spaces where people can breathe. Perhaps one of the most astonishing things about Spain, given the tourist invasion, is that its basic character has changed so little. Open to the outside world, Spain retains its indifference to imported systems of values and that curious, inbuilt xenophobia that has walled it off psychologically from the countries to the north for most of its history.

The open question

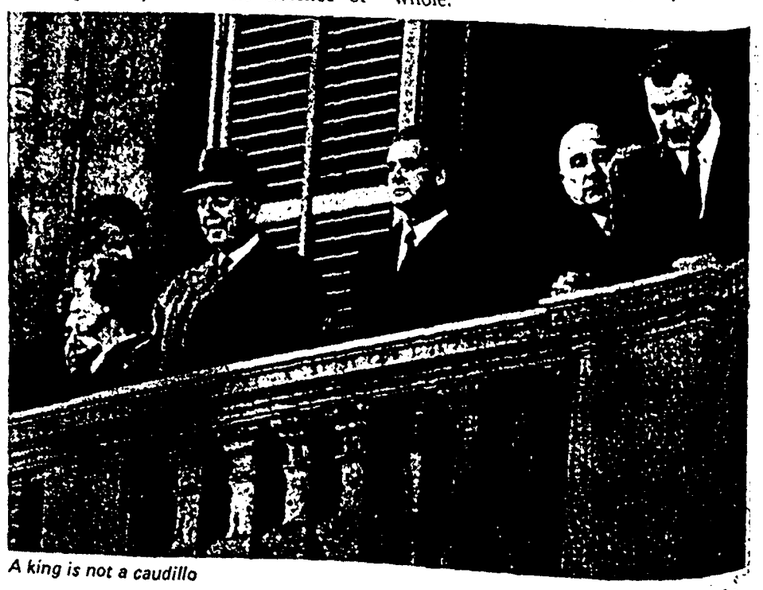
A *caudillo* is always hard to replace. The question that many Spaniards are putting to themselves now, more than ever, is: What follows Franco? In theory, the problem is already solved. The *madrileños* are more charitable now about Prince Juan Carlos than they used to be. There are fewer jokes about how long he is likely to reign and a general agreement that the prince has matured considerably since General Franco appointed him his political heir in 1969. He has been given a king's education in public schools, academies and army camps.

But he has not been allowed to cultivate an independent political image—perhaps because General Franco was worried that he would follow in the footsteps of his father, Don Juan, the Count of Barcelona, the advocate of a constitutional monarchy, who lives

in gilded exile in Estoril outside Lisbon. The prince's movements are closely circumscribed, and the recent betrothal of his cousin, Prince Alfonso de Borbón y Dampierre, to General Franco's granddaughter, the beautiful and vivacious Señorita Maria-Carmen de Bordiu-Martinez, has given Prince Juan Carlos further grounds for extreme caution.

Prince Alfonso is about the same age, is currently ambassador in Stockholm, is also a direct descendant of Alfonso XIII, the last reigning monarch of Spain, and is said to be very popular with the Falange. Above all, he is now a blood-relation of General Franco. There is many a slip . . . and Prince Juan Carlos's advisers must have told him that he can hardly afford to provoke his patron in any way.

Assuming that Prince Juan Carlos does succeed to the vacant throne, it is clear that he would be a much weaker head of state than General Franco. That is as it should be. The role of the monarchy will be to provide a neutral symbol of national unity. Sr Manuel Fraga describes himself as "a monarchist for functional reasons, because at this moment this is the most viable of the possible solutions for our county . . . a cold, theoretical monarchist." Maybe that is the right approach. The problem is going to be to find the right man to take over effective power as head of government.



Every *madrileño* has his own candidate (if indeed he is not reading himself into the job). But it is commonly agreed that if General Franco appoints a head of government in his own lifetime, it is likely to be Admiral Carrero Blanco. This is argued on the grounds that General Franco and Admiral Carrero are old civil war comrades and that the *caudillo* believes that the country will need a "man in uniform" to guarantee political stability after his death. The appointment of Admiral Carrero might suit the technocrats in government at present, since he has acted as their protector, and, as one of them put it to this correspondent, has "staked his political career" on their survival. But Admiral Carrero is no more enthusiastic about political liberalisation than General Franco.

Other candidates for the prime ministership include Sr López Rodó, Sr López Bravo, and the chief of staff, General Diez Alegría, as well as opposition figures like the Count of Motrico who might hope to grasp the reins of power after a transitional period following General Franco's death. Sr López Bravo would certainly be popular abroad. He has even been described as the John F. Kennedy of Spanish politics and is certainly one of the few men in the Spanish government with a real understanding of how west Europeans think and of how to confront the news media. But he is a controversial figure in Madrid, both because of his associations with Opus Dei and because of rumours of his involvement in the Matesa scandal.

General Diez Alegría is sometimes seen as a prime minister, although his appointment (even if he were ready to accept it) could probably come only after Franco's death. Whoever takes over, the name matters less than the cause he pursues. The aim of a future government should be twofold: to ensure political continuity (without which the far right might be tempted to move in) and to broaden the cabinet to enlist the talents of some of the intelligent men who currently figure among the "establishment opposition" —men like the Count of Motrico, Sr Federico Silva Muñoz, the Christian Democrat currently at the head of the state petroleum concern, Campsa, and possibly even Sr Manuel Fraga Iribarne.

The time may be approaching when Spain can move, step by step, towards the creation of political associations that may form the basis for political parties. The Spaniards have had a brief and disenchanting experience of western democracy; but the key to the uncertainty and doubt that surrounds the question "what follows Franco?" stems precisely from the absence of western-style political institutions. The gradual introduction of a form of political democracy suited to Spanish conditions might prevent the degeneration of Spanish politics after General Franco into a series of palace coups in which the army would be likely to play a praetorian role. But it is futile to write out prescriptions. The way all this will come about, if it comes about at all, will be determined by the balance of forces and aspirations in Madrid, not by outsiders' systems of value.

It would be short-sighted, in any case, for the outside world to trouble itself overmuch with the political future of Spain. There will not be chaos after General Franco. No reasonable Spaniard could welcome the prospect of a second civil war, and there is no likelihood that it could come about. So far, the technocrats' recipe for economic growth has worked, and it has brought levels of material prosperity to the Spanish people unprecedented in their history. In the long run, continued economic development is a better formula for social stability than any outsider's constitutional daydreams. None of the economic problems discussed in this survey is insuperable, and Spain will continue to be one of the most attractive prospects in Europe for foreign investment. It is also one of the central arguments of this survey that it is high time that the west accepts Spain for what it is: a corner of Europe with a part to play in the security and prosperity of the whole.

A king is not a caudillo

Continued growth by SOFICO

Broadening of base in tourism

SOFICO, Spain's largest tourist property developers and managers on the Costa del Sol, with assets of almost £8,000,000, have opened offices in London.

The story of SOFICO is one of vision, enterprise and sound judgement. A long established firm with its origins in heavy industry, SOFICO recognised at an early stage the immense opportunity presented by the rapid growth of tourism in Spain.

Sustaining this realisation was the certain knowledge that the natural resources of sunshine, beaches, breath-taking scenery, crusading history, low cost of living and hospitable people could all be combined to convert Spain into a tourist paradise.

The corollary was equally promising! That Spain could provide large numbers of investors with a second home, with guaranteed annual revenue, and eventually, the opportunity of retirement in the sun. In so doing they would attract vital foreign exchange.

The plan, as SOFICO finally formulated it, was ingenious.

Guaranteed return

Build large numbers of luxury apartments, sell them to clients, then lease the apartments back from the clients and manage them on their behalf for a guaranteed annual return from ten up to twenty five years. And finally, block-rent the leased-back apartments to the world's package tour operators.

SOFICO were the first Spanish firm to introduce real estate investment with a fixed interest rate. SOFICO have been so successful that they now offer clients a guaranteed return of 12% per annum on their lease-back contract, and virtually boom capital appreciation on their investment. Over the last nine years, for example, property prices have rocketed by 20-25% per annum.

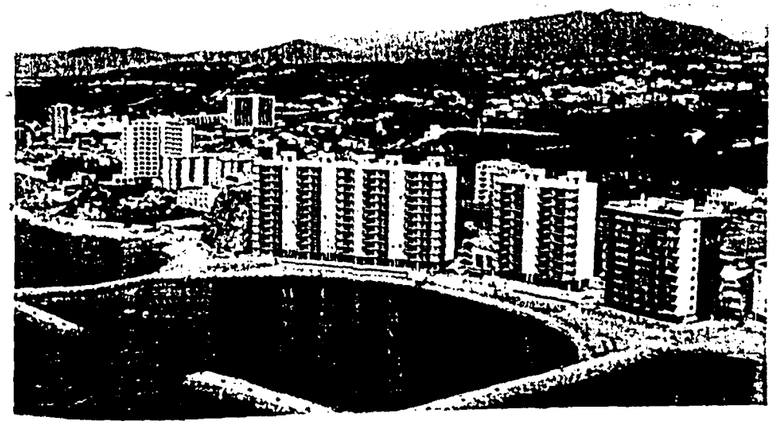
Today, SOFICO have 9,000 beds in 34 blocks along the Costa del Sol which currently accommodate more than 200,000 tourists a year. SOFICO's projected total of luxury beds for 1980 is 25,000!

The plan went into action only after careful study of high tourist potential areas and SOFICO took the decision to develop the Costa del Sol, to concentrate on this prime area and not to allow themselves to be diverted.

Concentration meant they could confine their management expertise to a comparatively small area, but an area which today accommodates one fifth of Spain's 23,000,000 tourists.

All the best places

They rapidly acquired many of the best sites on this coast, many of them fronting on to the sea. On these sites they raised blocks of apartments, each comprising one, two, three or more bedrooms; a lounge, kitchen, bathroom, balcony and with a full maid service. Most existing blocks and all new blocks now have integral restaurants, swimming pools, snack bars and beach facilities. Thus, the apartments combine the advantage of a private home with all the services of a hotel. Additionally, SOFICO clients automatically become members of a special club which entitles them to a generous discount from local shops, stores, car hire firms, etc.



SOFICO's development has more than kept pace with the increasing sophistication of today's tourist industry. Although the company has frequently not had a single bed available, there has never been a case of overbooking or double-booking. Reservations on sales (and such is the success on the sales side that apartments are normally sold before they are built) are computerised. The head office is in Madrid, but a substantial office is based in Malaga and directs local operations from there. SOFICO now have subsidiaries whose jobs range from furnishing and decorating to the provision of restaurants. Daily visits are made by senior executives to each block, which in any case, is staffed by SOFICO personnel. Should a complaint arise, it is dealt with in minutes. The company is aided in this in its independence from other contractors, which makes it a good example of a vertically integrated group concentrating on the tourist market.

Telex communications link the offices across the world. So communications are good: reservations and enquiries can be dealt with promptly. Airline-like sell and report facilities enable SOFICO'S offices to confirm bookings on the spot.

Finally, armed with this very attractive marketing proposition, SOFICO went out and established a customer-orientated network of offices across Europe and North America. Today, the international network of 9 offices, which now includes London, are working hand in hand with most of the world's leading tour operators.

Pursuing a successful sales policy aimed at raising occupancy levels to a very high figure, SOFICO are able to quote highly competitive prices and still enjoy a good profit record. And that must be the secret of success in any business.

As their main agents for the sale of apartments in Britain, SOFICO have retained Lodge Sheridan Holdings Limited. For general enquiries and for details of rental arrangements write or 'phone:

Three into one won't go

INDIA AND EAST AFRICA
By Robert G. Gregory.
Clarendon Press : Oxford University Press. 573 pages. £7.

THE IMPERIAL DREAM
By Edward Grierson.
Collins. 320 pages. £2.50.

In the spring of 1923, the Indian politician V. S. Srinivasa Sastri, who was in London as a delegate from the Indian legislature, had an interview with the permanent under-secretary at the Colonial Office, Sir James Masterton-Smith. Speaking, as Sastri afterwards put it, "in the hard, cold, pseudo-scientific language characteristic of the 'Round Table'," Masterton-Smith told Sastri that there was a "struggle going on at present between the two rival ideals of the British Empire—the one tending towards the equalities of races and communities, the other insisting on the maintenance of white supremacy." The particular issue that had provoked these reflections, and brought Sastri to London, was the question of the future of Kenya.

The dispute in which the Colonial Office had to arbitrate arose from a conflict of interests between the Indian settlers in east Africa, first on the scene, still in greater numbers, and determined to protect their substantial economic stake, and the Europeans, concerned to ensure that Kenya became a white man's country. Between the two antagonists, the Colonial Office had vacillated, according to the personality and beliefs of the colonial secretary of the day—or, when that post was occupied by Winston Churchill, had attempted to please both sides and satisfy their irreconcilable demands. But eventually, as a result of the deliberations of 1923, the Colonial Office settled for a third policy, in which the interests of the native population were paramount. The Duke of Devonshire's decision, confirmed by his Labour successor, Sidney Webb, did not prevent the white settlers' interests from prevailing in the short run. But in the long term it was to prove decisive for the future of the country.

Mr Gregory's workmanlike new study explores all the complexities of the issue in the minutest detail. He is by no means the first in the field—and Mr J. S. Mangat, among his predecessors, still provides the most concise and accessible guide to the subject. Mr Gregory's claim to originality lies in his exploration of the ramifications of the issue outside east Africa, in India and in Britain. He does better with the first than the second, perhaps because there is more to get his teeth into. For many Indian nationalists, the Kenya issue was a test case: did the British government's promises, going back to Queen Victoria's proclamation, mean what they said? Those who, like the Aga Khan, had allowed themselves to dream of the pleasing possibility of an Indian colony in Tanganyika, as a reward for services rendered during the first world war, were disillusioned. But to a later generation of nationalists, for all Gandhi's past involvement in the South African question, the overseas Indians were largely an irrelevance. "Our countrymen abroad must realise," said Nehru, "that the key to their problems lies in India."

Ultimately, the decision depended, like most such decisions, on the distribution of power. The Indians were unable to mobilise sufficient resources to secure equality of treatment; but with the aid of pressure from the government of India and the humanitarian lobby in Britain, they were able to prevent white settlers from achieving their goal of another South Africa. The eventual result was that both immigrant groups succumbed, in turn, to the pressures generated by the rise of African nationalism. Whether this represents the triumph of the first of the two opposing ideals outlined by Masterton-Smith remains a moot point.

Mr Grierson's concern is with the broader context of the accumulation of imperial power and its dissipation. He makes no pretence to originality and his organisation of the material is conventional—once again, we are invited to survey the empire from the perspective of 1914, marvel at the complacency of those in power and shudder at the catastrophe that is about to overwhelm them. But his style is light and easy; and some of his set-pieces are deftly mounted—the prelude to the Boer war and the decline of the raj, in particular. There are omissions, of course; the Caribbean gets very short shrift and Britain's relations with Latin America are totally neglected. But the reader looking for a general introduction to the history of the empire could do a lot worse.

Asians in Kenya: staking out the economy

Top twenty

THE DOUBLE-CROSS SYSTEM
By J. C. Masterman.
Yale University Press. 223 pages. £2.95.

Written, for the record, in 1945 and destined for government archives, this report tells how British Intelligence achieved complete control of German wartime espionage in this country. As official historian of the Twenty (XX)

Masterman : XX masked the plot

Committee, which was responsible for this remarkable achievement, Sir John Masterman wrote up the story with clarity and justifiable pride. Publicity is a delicate business. British Intelligence has taken a severe public knocking in recent years and it is well that its critics should now be given the chance to read of an undoubted British success. This book is rewarding reading.

There is, naturally, not much room for personal drama in the appraisal of a system. There is "Fido," whose task was to steal a plane and fly it back to Germany ; "Zigzag," who was dropped twice by parachute near Cambridge—and whose exploits justified all that confusing demolition of British road signs. But personalities, however colourful, tend to remain just names —or rather cover names—and their exploits, a trifle dampingly, just examples of operational ploys. This account shows, however, how one by one the German agents were picked up, "turned" and built up as reliable sources in the eyes of their masters until such time as they could be used to mislead the enemy about allied invasion plans in the Mediterranean and across the Channel.

The build-up period was not just a question of marking time ; it, too, paid a dividend. Daily radio contact was maintained between agent and German spy master and it was from the instructions the agent received that the Twenty Committee was able to deduce with considerable accuracy the enemy's projects and doubts, and to discover the gaps in German Intelligence. If you ask your agents to tell you how many balloon sites there are in Kent, it is reasonable to presume that you don't know.

The double agents undoubtedly played a useful part in the invasion, but, as Sir John allows, they were only small cogs in the gigantic deception machine which was brought into action in the months preceding the landings. A whole network of spoof radio traffic, for example, convinced the German monitoring services of the presence in Kent of completely fictitious divisions, all ready to launch themselves across the Channel in the direction of Calais. Even after D-Day, the Germans were afraid to redeploy their forces in case the main thrust was still to be made farther east by the phantom divisions.

Surprisingly, the agents' credibility survived the Normandy landings. Most stayed in contact, and under British control, until the end of the war. In these last months they were notably successful in passing misleading information to the German high command about the targets hit by the V1 and V2 bombers. The resulting readjustments made at the launching pads ensured that the missiles fell farther and farther away from the centre of London —which was, no doubt, good for SW1, but bad luck on Balham, Tooting and all suburbs south. We are not told where the headquarters of the Twenty Committee was located.

Sceptical brinkmanship

PROBABILITY AND EVIDENCE
By A. J. Ayer.
Macmillan. 154 pages. £3.50.

In this new book, as in his many earlier contributions to the theory of knowledge and metaphysics, Professor Ayer states his theses with admirable clarity and argues forcefully and straightforwardly in support of them. Four of these essays re-examine David Hume's problem of induction: how can a limited set of observations give rational support to predictions and generalisations that go beyond what has been observed? The fifth gives an enterprising account of conditional, and consequently also of causal, statements. Both, Ayer claims, involve imaginative projections beyond the facts, and he does not shrink from the surprising consequence that "causes are what we choose them to be." Savages who think that an eclipse would not end if they did not beat gongs are not making any factual error. It is simply that we build a different imaginative projection on the same factual basis. Ours is not truer than theirs ; Ayer seems to agree that ours is better, but it is not clear how he would explain its superiority.

The other essays likewise lead by plausible reasoning to the brink of scepticism. Restating and defending Hume's case, and using the paradoxes of Hempel and Goodman to show how hard it is to formulate satisfactory principles for the confirmation of hypotheses, Ayer argues that any attempted proof that our actual methods of projection are the most rational is going to beg the question. Ayer himself does not see this as a reason for scepticism, but almost everyone, if convinced by Ayer's arguments, would do so. At the end of his discussion he outlines a positive theory of "good reasons" ; but it does not escape his own criticisms. As in a Greek tragedy, when the natural development of the action has yielded the wrong outcome, a *deus ex machina* is introduced to restore the desired one. But Ayer, as a good humanist, has to be his own god, and the effect is unconvincing.

It is fortunate, therefore, that his arguments are not watertight. Though on one issue after another he examines, persistently and fairly, a number of possible views, some further important possibilities are not considered. And below the surface lucidity the structure of some of the arguments is obscure. Is the second step in Hume's argument meant to follow from the first, or to be an additional premise ? This uncertainty helps Hume's case, and Ayer does not expose it. Can inductive conclusions be shown to be probable in any interesting sense? Hume does not really consider this possibility, though, if we misinterpret his use of the word "probability," he appears to do so.

Of particular interest is Ayer's careful examination of an attempt by the economist Sir Roy Harrod to answer Hume in a book which, as Ayer says, has not attracted the attention it deserves. Harrod tries to prove that a limited projection of an observed continuity can have a reasonably high probability. Ayer shows that Harrod needs to appeal to some form of the principle of indifference. This is an effective *argumentum ad hominem*, since Harrod repudiates this principle. But a fuller investigation of logical probability might vindicate it, and so show that Harrod's approach at least helps to explain the rationality of induction.

Ayer : the humanist is his own god

Victorian Yankee

GEORGE PEABODY
By Franklin Parker.
Vanderbilt University Press. 243 pages. $8.95.

When the boy who has made good leaves explicit instructions in his will that his body is to be interred in the home town cemetery and when the country to which he has emigrated wants to bury him in Westminster Abbey, how do we resolve the clash of pieties ? This was the problem which George Peabody, of Danvers, Massachusetts, and the City of London, presented to his executors. It was solved by a characteristic Victorian compromise—a "temporary burial" in the abbey before translation across the Atlantic to the final resting place in New England.

The symbolism was appropriate. Deeply American, an Horatio Alger if ever there was one, the New England grocer's apprentice to the fingertips, George Peabody, like many a self-made man, found his true realisation in a country other than, yet intimately associated with, his own. Yet he did not go native. His London triumphs were attributable to his being, not just another local Dombey, but a Yankee at the Court of St James's. Here his inhibitions and reticences were accepted as foreign idiosyncrasies, while his lavish social assertions (those Fourth of July banquets for 800 guests) incurred no republican envy but only a very ready monarchical and ducal patronage. Small wonder that he gave his largest single charitable endowment to Britain rather than to the United States. And yet New England puritanism never ceased to haunt him. He might keep a mistress in Brighton and certainly, at 68, enjoy "the gaiety and sociability" of Nice, but he retained American citizenship even at the cost of a baronetcy. Moreover, he repeatedly avowed his intention to resume his residence on American soil and, at the end by testamentary

Peabody : a clash of pieties

definition, he kept his word.

No rich philanthropist's life can be wholly uninteresting to the student of society. No self-made founder of a banking fortune can be wholly uninteresting to the economic historian. On both these counts George Peabody deserves a biography. Yet while Mr Parker has faithfully chronicled the biographic facts he does less than justice to the subject. Those remarkable benefactions (100 years after his death Peabody housing is still going up in London) are thinly set in the context of the age of improvement. The business activities that sustained them and which survive in the house of Morgan, Grenfell are not related to the great growth of Anglo-American capitalism of which they were a significant part. Above all, it is left to the reader to explore by guess and imagination the Dickensian undercurrents and the Jamesian ambiguities of a character as complex as he was considerable.

Board school

ECONOMIC ANALYSIS AND PUBLIC ENTERPRISE
By Ralph Turvey.
Allen and Unwin. 150 pages. £2.50.

Governments struggling with cost inflation often find it politically necessary to talk about "productivity, prices and incomes" when they mean wages. The last Labour government did this so effectively that it was taken in by its own smokescreen, and referrals to the National Board for Prices and Incomes, instead of being part of a serious effort to check the inflationary spiral, became just a familiar delaying tactic or piece of buck-passing. Nevertheless, the board's time was not wasted. Thanks largely to the presence on it of Dr Ralph Turvey, one of the most outstanding applied economists of today, the board made a series of major contributions to the analysis of pricing and investment decisions in public industry. The first seven chapters of Dr Turvey's new book pull together some of this analysis, while the remaining six, which are taken from NBPI reports, apply it to various aspects of the transport, gas and coal industries, thus complementing the author's earlier study of the electricity industry. Considerable teamwork was involved, and Dr Turvey emphasises the part played by his collaborators, notably Messrs Herbert Christie and Steven Littlechild.

The subject is of general public interest ; but the book itself is technical, and assumes a fair knowledge of economic theory and operations analysis. Moreover, the author's presentation, though snappy and professedly eschewing elegance in favour of usefulness, is still very compact, occasionally to the point of ambiguity. What the book does, in essence, is to examine and illustrate how the concept of "marginal-cost pricing" can be made operational. This means tackling problems such as "second-best" analysis (what to do if other products in the economy are not priced at marginal cost), the optimal complexity of the price structure (bearing in mind that complexity has a cost and also that consumers may not bother to make a considered choice if the alternatives look bewildering) and the optimum product quality or range of qualities to be offered. Two central chapters explain the meaning of system marginal costs and the relationship between pricing and investment decisions in a multi-period model.

In his brief discussion of financial criteria, Dr Turvey surprisingly defends the imposition of a required accounting rate of return on a public enterprise's total assets. Such a requirement is a form of taxation and has little to do with the economic efficiency of the enterprise. Dr Turvey justifies it on the grounds that governments attach value to any source of revenue which enables them to increase expenditure or lower other taxes ; and that other products are taxed, making it sensible on "second-best" grounds to tax the output of public enterprises also. But to do so by calling

for some rate of return on assets is needlessly hit-and-miss. And his first justification seems a rather sophisticated defence of election budgets. These points are, however, peripheral to Dr Turvey's main story, and the calibre and expertise of the author make it compulsory reading for any serious student of public enterprise.

Plucked eyebrows

GEORGE ROBEY
By Peter Cotes.
Cassell. 226 pages. £3.25.

The eyebrows, the vaguely clerical dress, the red nose, the air of shocked rebuke as he faced, and dominated, the audience are what memory holds of George Robey. It must add up to an unsatisfactory impression for those who are too young ever to have seen him in action. He was not the sort of comedian to be associated with a number of particular hits, yet the ways of paradox insist that Robey should be remembered above all by the song he sang with Violet Loraine in "The Byng Boys." It was, to the generation that suffered in the first world war, the comic, sentimental side of the coin that had Rupert Brooke's sonnets engraved on the other. The huge insanity and ugliness of events did their best to wipe the grin off the one and the romantic idealism from the other, but somehow their spirit has survived.

Yet Robey was not, as Mr Peter Cotes makes clear in a somewhat uneasy biography, altogether happy within the comparative discipline of the musical revue. He was essentially a music-hall comedian, one of the last and greatest. It is curious, incidentally, that Mr Cotes, who brings in many names, omits to mention Max Miller; there was a close resemblance between the two in the manner in which they entered into collaboration with the audience, daring it, as it were, to read even more into the jokes than their obvious blueness and then reproaching it for such outrageous temerity. Robey, like Miller, made his act out of his personality, not his real personality, but the one he assumed for stage purposes; it was strong and positive in its own right. He was also, of course, a glorious pantomime dame; but pantomime, like the music-hall, was in its decline when Robey conjured comic glory out of the part of Mother Goose.

Robey conformed to the comedian's traditional (and often mythical) desire to play Hamlet, and he did indeed make something moving and memorable out of the scene of the dying

Robey: on the sentimental side

Falstaff that was interpolated into Sir Laurence Olivier's production of "Henry V." It was not altogether his fault that his Sancho Panza in Pabst's "Don Quixote" was something less than a triumph; that film was dogged by misfortune from the start. In any case, Robey found the cinema, and, later, television, distasteful to him. They cut him off from that direct confrontation with the audience which was the life-blood of his performances.

When it comes to his private life and character, Mr Cotes is not unnaturally hesitant. It is easy to deal with Robey's love of cricket and to credit his craftsman's skill as a violin maker. But there was something devious in him which led to mystifications and self-deceptions. The word "Rabelasian" of course makes its appearance; it does not adequately describe that bent in Robey's mind. Mr Cotes's book is an uneven affair. At moments he can write passages that imaginatively reflect Robey's art and the age and climate in which it flourished. And yet he can bring himself to describe Falstaff, that universe of a man, as a "tubby courtier." Curious.

Scientific sausage

THE EXTENSION OF MAN
By J. D. Bernal.
Weidenfeld and Nicolson. 317 pages. £2.95.

Tape-recording is both a blessing and a snare. At Birkbeck College, shortly after the second world war, Professor Bernal began to give an annual series of lectures to first-year students on the history and nature of experimental physics. He continued to do so until 1962. These lectures were tape-recorded and this book is based on these tapes, supplemented by an introduction which may or may not have been part of the lectures, and a final chapter which certainly was not.

The freshness of the colloquial chat is engaging. Of Alexander, Professor Bernal observes that "he could not stand the drink and the climate of Babylon and died at the age of 33." Boyle's law "was good enough for school but not for university" and his Cambridge contemporary Kapitza "a nasty kind of experimental physicist," although in what sense "nasty" is not clear. On the other hand, off-the-top-of-the-head lecturing (as one suspects this was) may reveal serious defects of perspective when set down in print. Professor Bernal recognises this, and in a postscript to the lectures tries to apply corrections. But he could not take into account historical research since the lectures were last given in 1962—on, for example, the Black-Watt relationship concerning latent heat. Moreover, facts which in Professor Bernal's own other writings are put correctly are here stated incorrectly.

These blemishes do not detract from the quality of the introduction and conclusion. There is a German saying that "All good things have an end except the sausage; it has two." Professor Bernal's book should be added to the exceptions. One is filled with regret that he was not spared to expand topics neglected in the text. Who better than the author of "The Social Function of Science" to guide us from Bolton and Watt and "the duty" of their engines through the nineteenth-century gropings to a full understanding of the concept of energy?

On course

THE LURE OF GOLF
By Herbert Warren Wind.
Heinemann. 316 pages. £2.75.
MY LIFE AND SOFT TIMES
By Henry Longhurst.
Cassell. 373 pages. £3.75.
THE GOLFER'S BEDSIDE BOOK
Edited by Donald Steel.
Batsford. 240 pages. £2.

For some inexplicable reason the sport of golf has always been blessed with exceptionally talented writers. The master in Britain was, of course, the late Bernard Darwin; and now a British publisher is presenting a selection of pieces by the man generally thought to be the best golf writer America has yet produced, Mr Herbert Warren Wind. Readers familiar with Darwin will have fun comparing the two, but deciding which is the better writer will not be an easy task since "The Lure of Golf" easily matches up to Wind's reputation.

The pieces are notable for their smoothness, lightness and fullness of presentation. Mr Wind has a talent for telling the reader everything he could possibly want to know about an event without ever telling him too much.

"My Life and Soft Times" is an evocative personal history by the man who is currently Britain's best-known golf writer and television commentator. Longhurst fans are likely to find the detail fascinating but the general reader may think the book heavy going. "The Golfer's Bedside Book" is much better than its title might lead you to believe. Mr Donald Steel, golf correspondent of the Sunday Telegraph, has somehow persuaded 24 generally outstanding writers to contribute. One of the best pieces is by a man who usually writes on other subjects, Mr Alistair Cook of the Guardian. His account of one of his own rounds in which almost everything went perfectly captures that hushed, magical feeling every golfer knows when he is playing well above his usual game.

The right to redeploy

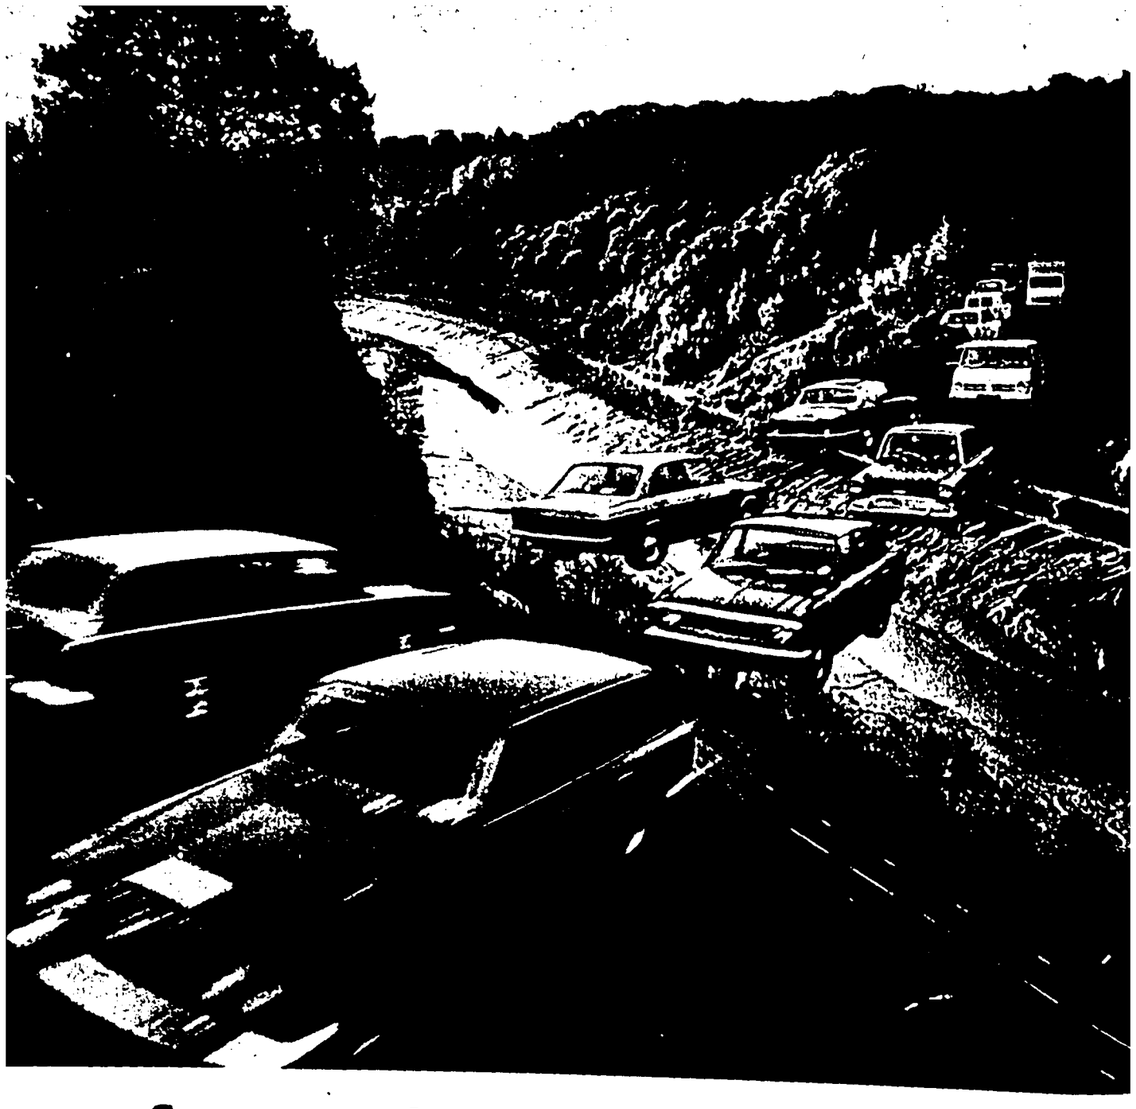
THE RIGHT TO WORK
By Alasdair Buchan.
Calder and Boyars. 160 pages. £2.10 cloth, 65p paperbound.

Most reporting of the work-in at Upper Clyde Shipbuilders has taken the emotional romantics and class-struggle antics of the shop stewards at their face value, and this book is no exception. Its naivety is sometimes breathtaking, as when, the author says of one rather dour steward: "In any case true revolutionaries don't smile."

He accepts uncritically the illusions floating around Clydeside. The very title ignores the fact that the men at UCS refuse to commute down the river to where there is work, and that their work-in has seriously jeopardised the chances of finding employment for Clydeside by destroying the confidence of potential investors, suppliers, and customers alike. Indeed, Mr Harold Wilson, who writes an introduction to the book, once admitted this, then saw his tactical error and corrected himself.

Mr Buchan believes that the chief success of the campaign has been in reversing the Government's lame duck policy. But what alternative is there? The country wants a rising standard of living, and that means a continual redeployment of resources. Despite all the statements by interested parties, swallowed eagerly by Mr Buchan and others, nearly everyone who has done a serious international comparison of UCS and its competitors has concluded that the company is streets away from viability. But the pressures on governments make it impracticable for them to take on the task of deciding which parts of an economy to discontinue, as UCS has shown only too well. The only practical solution is for governments to stay out of industry.

This is not the harsh policy it would have been in the 1930s, as is shown by Mr Buchan's contention that it would have cost the taxpayer less to keep the company going than to close it. If work-ins are to become fashionable, and everyone is to stick obstinately to the job he has done for generations, Britain will become steadily less and less competitive, its standard of living will fall, and discontent will spread by leaps and bounds. That has always been the dream of the Communist party.



UCS demo: work-in rather than work it out

Short list

The Correspondence of Edward Young, 1683-1765 edited by Henry Pettit (Clarendon Press: Oxford University Press, £10). Any account of pre-romanticism is likely to mention Young, but his satires and plays are strewn with the dust of oblivion, and his major poem remains virtually unread. Some 50 years after its first appearance, Blake was commissioned to do a series of engravings for a sumptuous edition of the "Night Thoughts." Ironically, the existence of his designs has served to bring Young's name back into circulation. The editor of this fine edition, who has produced a meticulous transcript and admirably informative footnotes, admits that the chief value of the letters is "the panorama of English familiar life" that they display. But the deferential or arch tone Young so frequently employed becomes slightly sickening after a while.

Samuel Taylor Coleridge by Basil Willey (Chatto and Windus, £3). Coleridge, the son of an Anglican clergyman whom he likened to Parson Adams for his unworldliness, adopted in his youth the current philosophical ideas deriving from Locke and Hartley, the utilitarianism of the Benthamites and the cold creed of the Unitarians. But emotional as well as intellectual dissatisfaction drove him to question all the assumptions of these basically secular positions. Fortified by his reading of Kant, he set about establishing the claims of religion. These endeavours were prolonged and strenuous, and of paramount importance to him. Not all Coleridge's present-day admirers take serious cognisance of this. But no one who associates Professor Willey's name with the Cambridge tripos course on the English moralists, and with the "background" studies that have traditionally strengthened the Cambridge approach to literature, will be surprised that he has now chosen to focus his attention on the religious aspects of Coleridge's thinking.

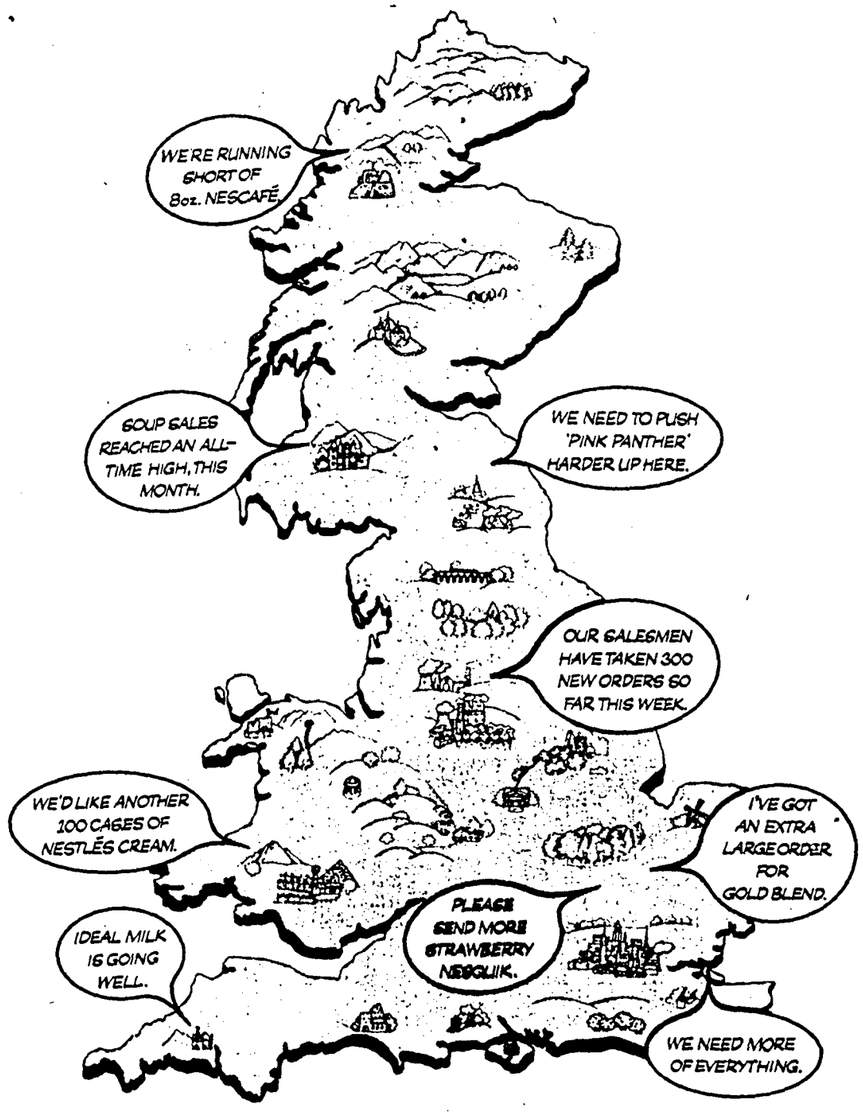
Some people never notice our bridges.

We take it as a kind of compliment.

Behind us we have major bridges of every kind of design; in hand we have some of the biggest projects in the world – bridges across the Bosporus and Rio Bay to mention but two.

It all adds up to an awful lot of people happily ignoring us every day.

It also adds up to a sizeable number of people who *have* noticed us.



The people – at every level – who make the vital decisions on bridge building.

We like to think our experience and expertise have a lot to do with getting noticed and getting contracts. After all we've been bridge building and fabricating structural steelwork of every type for over 90 years.

That adds up, too. To the fact that you can rely on Cleveland to help you cross your bridges before you come to them.

CLEVELAND

The Cleveland Bridge & Engineering Company Limited
PO Box 27 Darlington, Co. Durham, England
Telephone: Darlington 65335

Thanks to Datel, Nestlés can mind their own business.

Nestlés have over 600 salesmen working round the country in 9 sales regions.

At any one time, they're active on about 150 of Nestlés' products.

As you can imagine, there's a lot of business going on. And the company has to keep track of it all.

So they have a central computer, linked, via the Post Office Datel 200 data transmission service, to each of their sales offices.

Datel passes data rapidly between the offices and the computer, and Nestlés always know the up-to-date stock position and the sales record of all their products and salesmen.

'Processing the orders and preparing the invoices is speeded up. Out-of-stock situations are minimised. And we can make immediate plans to give individual brands or sales regions extra help', say Nestlés.

Datel has worked out so well that they also use the midnight line service now.

Data is transmitted to the sales offices between 12 midnight and 6.30 am so that it's available as soon as business starts next day.

Datel 200 works at up to 200 bits per second, transmitting two ways simultaneously.

It's just one of a whole range of Datel services. All using public telephones, telex or leased lines.

Our free Datel Advisory Service can tell you which will suit your business best.

Ring your local Telephone Manager's office and ask the Special Services Sales Representative to fix up a meeting.

Or if you prefer to do some reading on the subject, write to Roger Gadd, THQ Datel Publicity, FREEPOST,* London EC2B 2TX. He'll send you a set of illustrated leaflets. (*FREEPOST – no stamp required.)

"Datel helps a business improve its business."

Business Brief

Building societies: mortgages galore

The building societies, those mortgage giants who provide 85% of Britain's private housing finance, look set for another record-breaking year. January saw an undiminished inflow of funds (which is apparently continuing this month); and lending is still running high.

The societies have almost ceased to be surprised at the way investors are queueing up with their money. Net new funds went up by as much as 36% last year, from £1,490m to £2,033m. The 11% rise in earnings in 1971, and the fact that a lot of fingers had been burned on the stock exchange (in spite of the London market's much better performance last year), may have had something to do with it. But what most influenced investors was that interest rates everywhere had fallen so much that the building societies' investment rate of 5%, income tax paid, looked very competitive.

Under pressure from a falling Bank rate, the societies did make a token cut to 4¾% last October which took effect at the beginning of this month. But first indications are that the reduction was not large enough to put investors off. The average building society investment is around the £1,000 mark a head.

The other side of this investment boom has been an enormous rise in mortgage lending—up, also, by 36% last year, to £2,741m. After years of mortgage rationing, there is now evidence of a positive glut in some quarters. The larger building societies (the Halifax, Abbey National, Nationwide and so on) still claim they are able to lend every penny they get in, but mortgage quotas have been quietly abandoned and lending policy has been eased considerably.

Societies are now more inclined to lend larger sums (up to three times the borrower's annual income instead of the more usual 2½ times), to lend them for longer periods (25 or even 30 years), to be more sympathetic towards requests from formerly unpopular categories of borrowers, such as single women, and to allow loans on the less orthodox types of property, such as older houses and flats. Some of the smaller, local societies have almost certainly found themselves with spare funds recently, but there is still great reluctance to advertise such surpluses because this usually attracts applications from the wrong kind of borrower. However, anyone with a reasonable proposition should be able to raise a mortgage now.

Paradoxically, the building societies have come under fire precisely because they now give mortgages to more or less all comers so long as the usual conditions are met. Easy finance, so the argument goes, aggravates the inflation of house prices because buyers will agree more readily to pay over the odds when they think they can get the money. Last year's easy mortgage policy coincided with a huge leap in house prices, averaging about 20% over the year, well above the usual annual 6-8%. Prices of modern houses rose 22%, and such areas of peak demand as London and the south east were well above the average too. So although mortgage lending rose by 36%, the number of new loans went up by only 21%, from 540,000 houses in 1970 to 654,000 last year.

Priced out

With the average price of a house now exceeding £6,000, there is an increasing danger that young couples will be kept out of the owner-occupier market. Although 60,000 of last year's new borrowers earned less than the average industrial wage of £1,600, this does not mean that the young are finding it universally easy to buy houses. Very few would be able to afford the average house in London and the south east at £8,000-plus. And on Wednesday Mr Stanley Morton, chairman of the Building Societies Association, warned that at present inflation rates this could rocket to £18,000 within five years.

The fact that mortgages are readily available has helped inflation but it is difficult to blame the building societies for this, or to see quite what they could do about it. All sorts of schemes have been proposed like restricting lending to 75% of valuation, with special exemptions for first-time borrowers to avoid hardship. But the inevitable result would be that fewer people would be able to buy houses, even if they then got them at a slightly lower price. And it would be politically unthinkable for the societies to be sitting on large funds while good applicants were unable to get mortgages.

A more promising approach is to build more private houses. A better supply might check the inflationary reflex which says that whatever a man pays for a house today he can be sure of getting more for it tomorrow. The economic doldrums of the past few years discouraged builders from making use of their full construction capacity; accordingly, only 157,000 and 179,000 new private houses were built in each of the past two years. Now the industry has woken up to the demand 225,000 new houses should be completed this year.

The new house shortage is clearly reflected in the dwindling number of building society loans on new property. Normally mortgages on new houses account for about a third of the total, but this has been dropping steadily over the past couple of years and now makes up only a quarter.

More new housing depends partly on finding suitable land, and land has been scarce for several years. Local authorities have been urged to release more building land but there are physical limits to this. Hence a 200-300% rise in the price of building land in the past eight years, and the fancy prices being paid now, the most recent being the £215,000 paid for three-fifths of an acre in Hampstead which had sold for only £107,000 a few months before.

It is clear that the advantages of owner-occupation are increasingly appreciated among the expanding middle classes. There is tax relief on mortgage interest; at the present mortgage rate of 8%, the borrower on full income tax effectively pays only 5.6%. Or he can go for the option mortgage scheme (10% of all borrowers do), which at the moment leaves him marginally better off, paying only 5½%. Profits on resale attract no capital gains, and at present rates of inflation these profits are quite hefty. Even at worst, houses offer absolute security of tenure as long as mortgage payments are kept up.

There is also the fact that the private market in unfurnished property to rent barely exists. And under present Tory plans council rents will over the next few years become increasingly unattractive to the better-off, releasing more hopefuls on to the housebuying market. Not surprisingly, the proportion of owner-occupiers in the total housing mix has steadily crept up, from a quarter after the war to just over the halfway mark now. In their more optimistic moods, the building societies reckon that this proportion could eventually go up to about 60%.

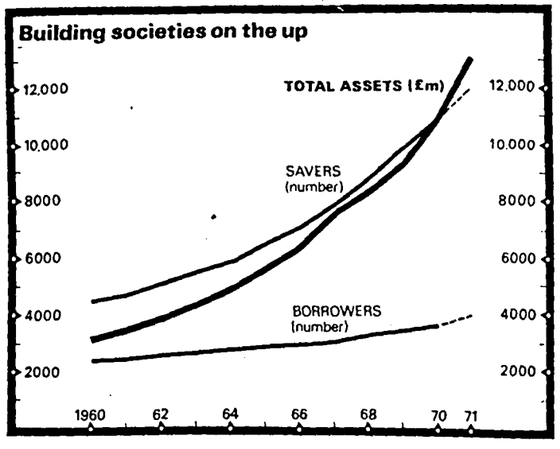
Innovations

To rustle up more funds, there have been several additions to the basic building society investment (the share account) in the past few years, although none has been conspicuously successful. The societies now run their own save-as-you-earn scheme. The rates of interest are very much more attractive than on an ordinary share account but the need to commit the money for five or even seven years to get the full benefit has meant that relatively very few people are using it; the total probably amounts to no more than 1-2% of all building society mortgages.

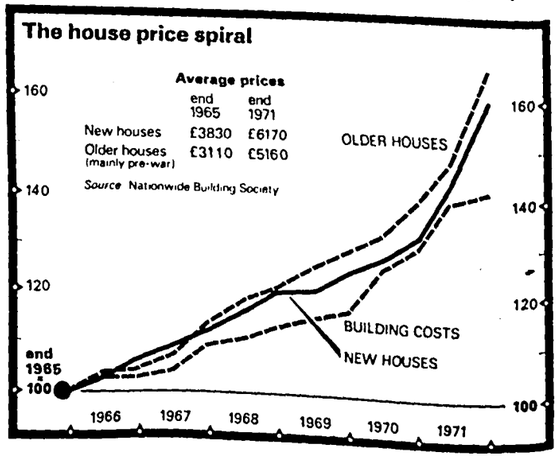
Another innovation is the insurance-linked building society investment, pioneered in 1969 by the Bristol and West and since taken up by a large number of other societies. Although this offers a very high rate of interest—sometimes over 11% gross—it is too complicated for the average investor; so the totals invested this way are even smaller than for Saye.

More exotic new outcrops—such as property-linked building society investment—have an even smaller following. The basic share account, blissfully simple with income tax paid by the society on behalf of the investor, still looks the winning formula, and there is no sign of any major new schemes in the offing in the foreseeable future.

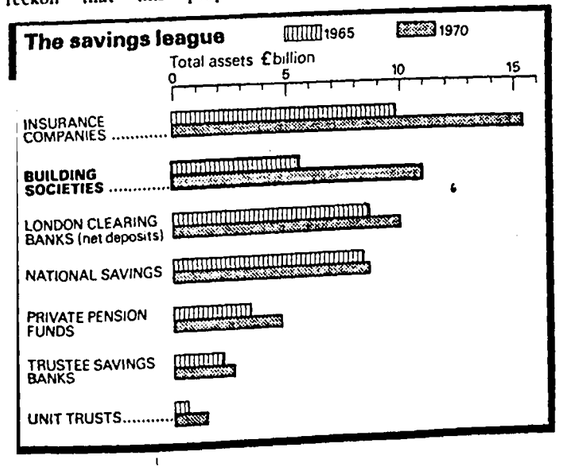
On the lending side, building societies are heavily circumscribed by legislation on what they may or may not lend on. Basically, only property is acceptable, although a few years back there was talk of going into consumer durables as a sideline. But the societies were sharply warned off any banking activity of that sort. They are now limiting themselves to house improvements (repairs, putting in central heating, etc) which have been rocketing recently and will keep on climbing.



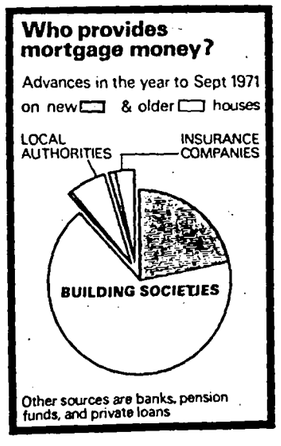
As for ordinary lending, the societies are plainly not expecting any cutbacks, at least for the rest of this year. Unofficial forecasts put this year's lending at £3.4 billion, against £2.7 billion last year. While funds are so abundant, the societies might perhaps relax a few regulations which have caused a lot of irritation in the past. One is their marked reluctance to advance the whole of a mortgage without insisting on additional security. Thus a man wanting a 90% mortgage usually finds he can only get 75% straight off, the rest having to be covered by a mortgage guarantee insurance. Its purpose is to protect the society from losses should the borrower default, but in fact the societies' mortgage losses are infinitesimal.



Other, minor, niggles include the rule that the report of the building society surveyor who looks over a house before a mortgage is given is confidential to the society even though the borrower has to pay for it. Another is the redemption charge borrowers meet if they want to pay off their mortgage prematurely. And there are the usual criticisms of the societies' still-strong conservatism about the type of property they will lend on and the type of person they will lend to.



Some people also feel the societies might adopt a more aggressively commercial attitude, perhaps lending on property for the private rented sector as well as for owner-occupiers, and developing their own considerable property assets (the larger societies have huge branch networks) more actively. But as building societies are non-profit-making organisations for which "profits" merely mean additions to their reserves, the incentive may be lacking.



There is certainly no need for them to be timid about lending policy, even if the inflow of investment funds does level off later this year. Their liquid reserves—cash and investments—at the end of last year exceeded 19% of total assets, compared with a legally required minimum of 7½%. Since the societies are restricted by legislation on what they may invest in (equities, out; local authorities, in) these funds are at the moment less profitable than mortgage lending, so there should be every incentive for this liquidity to be run down a little.

If there are spare funds, could they be shifted to Europe when Britain joins the common market? The societies are not at the moment allowed to operate outside the United Kingdom. Liberalisation will obviously have to come after EEC entry, but with little immediate practical impact. Among present EEC members, with their vastly different building society set-ups, there has been no perceptible moving together since the Treaty of Rome was signed.

BUSINESS *On strike*

Living with Wilberforce

Nobody in the Government is pretending that the miners' strike is ending in anything but a crushing defeat—with a court of inquiry that ministers had never intended and a settlement that they can hardly bear to contemplate

The miners have been saying, up at the pits, that they would go back to work for an extra £4.50, which would be 18 per cent and as big an award as anyone has had for a long time. But, whatever Lord Wilberforce advised the Government late on Thursday night, the miners are not going to accept now without a show of reluctance. They will not be over-anxious to go back to work next week. They mean to oblige the Government to watch helplessly while the power cuts get worse and the numbers laid off from the factories rocket. This is certainly not how ministers intended the strike to end.

The running down of stocks they were prepared for. It was known from the outset that, if the miners struck at all, they would be out for at least six weeks, which on anyone's arithmetic made power cuts probable towards the end of the strike. That the pickets have made it more difficult than expected to get at stocks makes only a week or so's difference to the calculations. The Government recognised from the beginning that it would be a close-run thing. But it had assumed that by now both sides would be talking to each other, so that a negotiated settlement could be seen, however dimly, at the end of the tunnel.

This would have made it possible to calculate how much longer coal stocks would have to last, and to ration them accordingly. But on Thursday last week precisely the opposite happened. Instead of talking, the miners and the coal board walked out on each other and broke off all communication. The end of the strike became unpredictable; the end of the coal stocks, only too predictable. The Government did what it had never wanted to do, but which was, in the circumstances, its last resort. It appointed a court of inquiry. And because it believed the essence of the inquiry was speed (others might say surrender) Lord Wilberforce was the one obvious man to appoint: he alone knew enough about the power industries already to push his hearings through in two days and have his report ready another two days later.

The settlement Lord Wilberforce will recommend is something that few ministers can bring themselves to contemplate; there is a fervent hope that it will not be as high as 20 per cent. But if Lord Wilberforce's idea of his job is to get the miners back to work quickly—and the way he conducted the public part of the inquiry suggests only too plainly that it is—he may not risk cutting his recommended offer much below that. But the end of the strike is, once again, dimly in sight. Which in turn means that rationing of stocks—of a sort—can again be planned.

Where the Government feels its calculations fell down was in believing that Mr Derek Ezra at the National Coal Board and Mr Joe Gormley at the National Union of Mineworkers were better negotiators, and in closer touch with each other, than they actually turned out to be. Mr Ezra is felt to have overestimated Mr Gormley's authority over the NUM executive. And Mr Gormley had Mr Lawrence Daly at his shoulder, pushing left where he wanted to go right, and probably overestimated his own power, too, to fulfil bargains struck with Mr Ezra. Not that there was much bargaining. An experienced negotiator like Mr Hugh Scanlon, ministers were telling themselves this week, would never have allowed such a breakdown to happen.

But happen it has, and the country has to live with it. The Government's immediate problem is to get coal into the power stations when the strike does end. There are said to be stocks above ground sufficient to keep up supplies for another four weeks, after which warmer weather may begin to reduce demand. In Germany there is a stockpile of 9m tons of coal that the Germans would be only too anxious to ship to Britain at cut prices in order to get rid of the stuff. The difficulty is moving it into this country fast enough; on paper there are not the ships, nor the port facilities, nor the handling capacity. In practice, it would be astonishing if the shipping industry found itself totally unable to cope.

The longer-term issue is that of the country's energy policy. Coal has been the one source of energy that successive British governments believed wholly reliable in a world where Arab governments come and go. The past six weeks have shown otherwise. Coal has been protected from imported fuel for strategic as much as balance of payments reasons, but the wisdom of basing three-quarters of the country's electricity supply on a fuel that can be wilfully cut off is from now on going to be seriously challenged. And this in turn throws doubts

on the plans the Government had to keep a larger coal industry than strictly necessary, simply as an insurance policy against overdependence on oil. There is usually more than one source of oil open at any one time. There is, for Britain, only one source of coal.

How big an industry should it now be ? That depends on how its financial problems are handled. Extraordinary measures will be needed to pay for any settlement above 12 per cent. Anything but a straight write-off of the industry's debts by the Government will mean a much-reduced industry, but this is probably on the cards anyhow. Mr Ezra would like to see coal stabilise its output at the present 140m tons a year, but whatever slim chance he had of bringing this off has probably been destroyed in the strike. With the Electricity Council already complaining about the high cost of coal, there is little doubt that coal's days of dominance are numbered. Mr Ezra might settle for the electricity market he has now, which would mean that additions to electrical capacity would go to other fuels.

Following this gradual policy, coal would probably account for only 40-50 per cent of electrical capacity by 1980 but such a rundown is now likely to be too slow for coal's numerous enemies. Mr Ezra has a point when he claims that it might be better for the nation to use North Sea oil and gas to run down its dependence on Middle East oil rather than domestic coal, but many people are probably going to want to do both. The North Sea will play a large part in this, but so should nuclear power stations. Despite nightmarish construction difficulties on the current generation of advanced gas-cooled reactors, orders for further nuclear stations must be placed soon or Britain's nuclear construction industry will suffer serious damage. The Government has still to announce which type of reactor it will build next, but after the coal strike any nuclear power decision is likely to be popular.

The slow growth of the economy in the 1960s—and the consequently slow growth in the demand for electricity —has thrown the electricity industry's investment plans badly out of gear. If the rate of new construction had gone according to plan, the switch out of coal and into atomic power would by now have proceeded much farther than it has. Nuclear power plants are also slow to build. But the conversion of stations to natural gas is something that can be done quickly, and the pressure is going to be on now for permission to buy North Sea gas at a price that the electricity industry can pay.

The Government and the coal board will spend the weekend figuring out how to pay for any settlement above 12 per cent. The Government is probably going to be stuck anyway for the £100m or more that the strike itself will cost the coal board, and this could limit its willingness to write off the industry's debts, as the union has suggested. Of course, the recent debt restructuring of the British Steel Corporation offers a precedent, but a more likely policy to emerge is some combination of pit closures and price increases. Closing down the 80 or 90 grossly unprofitable pits could save £50m and the coal board has stated that a price increase of 10 per cent would bring in roughly the same amount. When the men do decide to go back, at a rough count at least 4,000 will find that they no longer have jobs to go to because the faces that they worked have been damaged to the point where it is simply not worth the cost of reopening them. The tally of coal faces permanently closed had risen by Thursday to a total of 20, spread over 16 pits, and the number is growing all the time. Closing pits throws thousands of miners on an already depressed labour market, but the moral may be that if you play rough, as the miners have done in this strike, you can expect to be treated roughly in return.

Two days' Q and A

The court of inquiry's sittings on Tuesday and Wednesday were short and uneventful ; but the members, led by Lord Wilberforce, displayed their main concern with almost pornographic nakedness. They wanted to find in what way the National Coal Board might pay for rises over and above the 12 per cent already offered. In private conversation, the reference was to "very generous" extra rises that the court might recommend. The miners' arguments for more money were hardly questioned. The coal board's finances most certainly were.

By how much would the industry have to increase prices to pay the 25 per cent wage rise demanded by the miners ? Perhaps by as much as another 20 per cent, answered Mr Ezra. This would mean losing a substantial proportion of today's coal market.

It would mean closing pits at a faster rate than planned, and the blow would fall hardest on peripheral fields in Scotland, South Wales, the north east and the north west. The NCB estimated that it could raise prices by as much as 10 per cent without losing too many customers, but that would not permit it to offer the miners much more than 12 per cent.

Would the industry be more efficient if it were smaller ? Mr Ezra answered last year that only 148 of the NCB's 292 pits were profitable, and earned £71m ; 144 were unprofitable, losing £55m. The profitable pits employ 138,000 men and produced 80m tons of coal. The unprofitable pits employ 139,400 men and produced 52m tons of coal. This might seem to be a reason for giving a big rise and closing half the country's pits which would be highly popular with the 138,000 miners who would keep their jobs.

Mr Ezra, however, was probably being a little unfair to those pits that are only marginally unprofitable, and that could break even with only slight increases in productivity. The total of irretrievably unprofitable pits is probably more like 80 or 90. Closure of them would throw 80,000-90,000 men out of work, but the court did not go into the social consequences of slimming the industry.

After the miners

Ahead of the Wilberforce report, the fears being expressed this week were that the miners might get 18-20 per cent. Anything so way above the 7-8 per cent norm the Government has been aiming at would mean that millions of other workers in the wage queue would find reasons to demand as much for themselves. The Government will pretend that the miners are a special case, and Lord Wilberforce is experienced enough at this sort of thing to conceal the size of his award by wrapping it up in ploys like shift payments, bonuses, back payments and anything else he can dream up. But it is hard to see any unions being taken in by that.

The two big claims pending come from the 2¼m engineers and the 800,000 builders, who have politely asked for up to 40 per cent and 70 per cent, respectively. Both groups agreed to three-year deals last time. They will both argue that, as a result, they have suffered more than most from recent inflation, and so should get special treatment. Some 200,000 steelmen are likely to argue the same way when they put in their claim to the British Steel Corporation. Then the 280,000 railwaymen, who have already begun negotiations on their 15 per cent claim, will say they have had thousands of men made redundant, productivity has risen and their wages are below the industrial average. Like most unions, the railwaymen refer specifically to 20-30 recent wage deals in their evidence to British Rail.

The teachers, who now want an average 13.7 per cent rise, always make a point of referring to recent public settlements when they make their claim. Last month they were offered just 6 per cent : but can that line now be held ? London's busmen turned 7½ per cent down on Wednesday, specifically because they wanted to see what the miners would get. The 330,000 nurses will not have much trouble in arguing that they are special : when Mr Selwyn Lloyd tried to restrain public sector wages back in 1962, it was the nurses who turned the public against the policy.

Before the miners' strike, de-escalation seemed to be working, although not with enough bite to withstand another inflationary settlement in the public sector through a court of inquiry. According to figures published on Thursday, average earnings last December were rising at a rate equivalent to 9-10 per cent a year, compared with the 14 per cent of a year before. However, unemployment and cuts in overtime have helped a lot.

The CBI will play ball if . . .

It all adds up to a gloomy outlook of renewed cost inflation, unless Mr Heath decides to copy President Nixon and introduce a fully-fledged incomes policy. But this looks highly unlikely.

Well, well, here we are again

Very soon the CBI will have to decide whether to ask its members to sign a new pledge on prices when the current one runs out in July. Continued wage inflation, at an annual rate of over 10 per cent, would make it hard for even the most public-spirited company to agree to keep price rises under 5 per cent. The argument put to the Prime Minister on Wednesday was that the CBI will be helpless unless the Government gives it special help in the budget.

What could Mr Barber do ? The CBI told Mr Heath it would like the budget handouts to aim at helping investment. It wants a 2½ per cent cut in corporation tax, free depreciation everywhere (not just in the development regions) and capital allowances for such things as money spent on new offices, shops and schemes to fight pollution. It also wants restoration of investment allowances. These were abolished in 1966 ; they formed an additional allowance, in year one, of 15-40 per cent of investment spending, over and above the 100 per cent allowable under existing depreciation rules. The CBI wants development area investments to have a doubled rate, so preserving a regional incentive.

Ministers may agree to the CBI suggestions, but even if they do, will the CBI's members do their bit ? One argument for believing that they might is that their profits have not been slashed by the price freeze as much as some of them feared, at least not yet. In the evidence to the Wilberforce inquiry this week, the CBI said that gross profits in money terms were about 13½ per cent higher in 1971 than in 1970, although this represented only a slight reversal of the longer term decline in the share of profits in the gross national product.

On the other hand, there is the danger that CBI members might still not agree to a new pledge, arguing that the Government would have handed out these investment incentives anyhow. If that happened, prices would resume their upward spiral in pursuit of wages. Ministers would then have to turn their minds once again to possible incomes policies : a good one would be national insurance contributions related to earnings, and then a surcharge levied on employees' weekly contributions whenever their employers' wage bill per man increased by more than a fixed norm a year. But it may very well need another crisis to get Mr Heath thinking that way.

The budget as a whole will certainly have to be strongly reflationary. The buoyancy of tax revenue and the slowish growth of public spending suggested tax cuts anyway. Now there is a risk that consumers may be frightened by talks of layoffs into cutting spending, particularly on credits.

Who's hurt

If industry felt hard done by this week, there is worse to come. The measure of the effect of the cuts is the rate at which the numbers laid off were rising from under 1m on Monday, the first day, to approaching 2m by Thursday. Out of a working population of 26m, this is short of catastrophic, but it hurts. What had industries scratching their heads was a growing realisation that anyone laid off for more than four weeks immediately qualifies for redundancy pay, even if they are all re-employed the following week. This has made a number of large and power-hit industries hesitate for a long time before standing men off. Some

industries can get back into full swing when power is turned on again ; steel cannot. Some of its plants closing now could not easily reopen within four weeks.

The screw tightens from next Wednesday, with the possibility that it will put industry on a two-day week. Mr John Davies told the Commons that power station stocks of coal would be exhausted by the end of next week if things went on as they were, but then it is Lord Wilberforce's job to see that they do not. The presumption must be that picketed stocks would be moving by then. But industry's power would still need to be cut, for a while, to one-third of consumption.

The easiest form of cut is a two-day week. But no one would claim that the present attempt at a three-day week had had, after Monday, anything like the intended effect on consumption. It took managements 24 hours to realise that one way of maintaining output was to work 12-hour shifts on the three permitted days. They will not be able to by-pass a two-day week in quite the same way, but they will have a try.

The alternative is to reduce the levels where restrictions are imposed on industry from a power consumption of 100 kW to 50 kW, which would bring a further 10,000 companies into the net in addition to the 20,000 affected now. But the saving would be small, something like 350 MW, which is hardly worth the trouble.

Industries operating continuous processes have been the worst hit. The handful that have their own direct link with the national grid, like aluminium and steel, were a little better off. Even though they have cut consumption by half, and can be monitored to see that they do, they escape blackouts. Their problem has been to keep furnaces and smelting cells sufficiently hot to prevent the metal in them going solid, at which point it can only be dug out and the furnace rebuilt at considerable cost. Spare a tear for a company like Pilkington, which could be caught in a power cut with 200 tons of rapidly cooling glass in its tanks.

Some attempts were being made by the Department of Trade and Industry on Thursday to meet the special difficulties of the paper makers, whose plants take badly to sudden switching on and off. The industry had asked if it could be protected from cuts, provided it halved its power consumption. Somehow, no one was very hopeful that a way would be found.

Mass production industries like cars and textiles were immediately hit, but for the strike-crippled motor industry

I must get to work to find if I've been laid off

this is hardly a new experience. Companies that can keep up production, like Imperial Chemical Industries, have begun to worry for how long they can maintain present rates while so many of their customers are shut. There was a good deal of worry inside the Confederation of British Industry about the small companies that could be bankrupted by the shutdown. Those that hold on long enough can hope for a sharp revival of production, because industrial stocks have now run down to a point where it becomes no longer optional, but obligatory, to rebuild them.

Industry's own power

Ten years ago something like a quarter of all the electricity used in industry came from factories' own generators. Now the proportion is down to a fifth, most of it in oil, chemical and paper industries which use their power plants to do two jobs at once. When it is merely electricity they are after, most companies can buy it more cheaply from the national grid. Few consume so much electricity that they can afford to put up an economic size of power station to produce it. Imperial Chemical Industries and the big aluminium smelting plants are some of the exceptions ; and to them the Electricity Council has been offering increasingly tempting prices.

If a company wants process steam as well as power, the economics begin to look more attractive. In a diesel-powered generator about a third of the fuel burned goes to produce electricity; and the remaining two-thirds goes into the exhaust and the cooling water in roughly equal parts. That waste heat can produce steam at around 10 lb pressure per sq in and hot water at 160°F ; provided the plant has a use for the steam and the water, this gives the installation an efficiency of 80 per cent, which is well above that of the national grid. There are quite a lot of these installations round the country, including one at Aldershot which heats the baths for the camp.

The petroleum chemical industry, which uses huge quantities of process steam, is the only major industry that is steadily increasing the proportion of electricity that it generates. Most of its plants are linked to refineries and get their oil feedstock tax free. Petrochemical plants now generate nearly half their own electricity, against little more than a third in the mid-1950s. But even the oil industry considers generating all its own electricity hopelessly uneconomic—even in politically unstable parts of the world.

The paper industry once produced well over two-thirds of its own power, but is now down to less than half ; in the last eighteen months salesmen from the Electricity Council's new industrial marketing division have talked eight paper mills—with a total consumption of 11 MW—into buying their power from the national grid. The textile industry, which once produced a fifth of its electricity, is now down to 10 per cent.

However, industry is installing increasing numbers of stand-by generators. These are not a precaution against electricity blackouts, but a cost-saver. The bulk industrial electricity tariff is calculated on the maximum load a company takes at any one time from the national grid. So companies contract for sufficient electricity to meet base load demand, and trip in their own stand-by generators to meet the peak—spectacularly reducing their

NEW ZEALAND

The news travels

"Prime tourist target in Pacific area...greatest expansion potential..."

New Zealand's tourist industry is growing faster than the world rate ; with no doubt at all, tourism is quickly taking its place as a vital factor in the economic growth of the country.

Tourist amenities and services are expanding to meet the demand.

Annual tourist figures will reach well over half a million during the next eight years ; there was a 30% increase last year alone !

We know, because we are there, deeply involved in New Zealand's development—ready to help you too.

Meanwhile, why not study a copy of the latest edition of our 'Review of the Economic Situation in New Zealand' or our booklet 'Investing in New Zealand' ? They are yours for the asking.

Over 200 branches and agencies throughout New Zealand.

electricity bill. Hundreds of these small sets must have lighted boardrooms this week, as directors added up the damage.

Cat without a hell's chance

Much of the miners' strength has come from the reluctance of everyone else, including the Government, to tangle with their pickets and, said Mr Joe Gormley, with the scent of victory in the February rain:

> We don't think that there will be a cat in hell's chance of getting these men off the picket lines.

Later in the week, as public opinion began belatedly to swing against the strong-arm boys, he modified this to an undertaking to call the pickets off provided he and they approved Lord Wilberforce's award.

The effectiveness of the pickets is no longer in question, but the legality of a great deal that they have done in the past six weeks is. Most lawyers would say that thousands of them have broken the law on picketing and could have been successfully prosecuted. So why weren't they? Even the Home Secretary, using the least emotive words he could find, said during Monday's emergency debate that

> there have been enough examples of unlawful picketing . . . to give rise to considerable public disquiet. I should be failing in my duty as Home Secretary if I did not say that. . . . It is a difficult line to draw in law and the drawing of the line must be left to chief officers of police.

It is not a responsibility that the police are anxious to take on, particularly when so many of the miners that they have pulled in so far have frequently been let off with nothing worse than a conditional discharge. It was not until Tuesday that a group of 13 pickets found themselves in Dunfermline on the relatively serious charge of mobbing and rioting and were remanded in custody. But even they were let out on bail on Thursday.

Other miners have been put on the hoary old "threatening and abusive behaviour" charge rather than the two statutes that deal specifically with picketing. Admittedly, both statutes show signs of age; one dates from 1875 and was the first law to make picketing legal at all, provided that it was restricted to explaining why the men were on strike. In 1906 the legal concept of "peaceful picketing" was added to it, which seems to mean whatever individual police officers and magistrates take it to mean. But most experts agree that the pickets have to stop short of physically interfering with people who want to get to work. Jostling or threatening them usually means breaking the law, and when pickets lay down in the road to stop lorries delivering goods to the Savoy Hotel in 1947 they were arrested and convicted. But 1947 is not 1972; the police could scoop a handful of men off the road then but they can hardly arrest miners by the thousand now. And the mere threat, without a harsh word spoken, of miners assembling in their thousands has been enough, in the past two weeks, to frighten local police forces into closing whatever plants and depots the pickets wanted.

Just when does it stop being peaceful?

Under existing civil law, companies whose oil has been stopped by pickets at the power station gates could try taking them to court for inducing a breach of commercial contract. But none has so far thought it worth the try. And this could be one of the weaknesses of those clauses of the Industrial Relations Act which come into effect at the end of this month. They will affect pickets in three ways:

- Picketing of anyone's house will be illegal, even when peaceful, and quite a few of the homes of pit engineers have been picketed in this strike.
- The official of an unregistered union who induces anyone to go on strike without due notice will be guilty of an unfair industrial practice. Since most unions are likely to be unregistered for a while at least, employers could take their pickets to court for inducing a strike, likewise shop stewards who urge meetings to vote for a strike.
- It will also be an unfair industrial practice to induce outsiders like tanker drivers and others to break their contracts by not delivering to, or collecting from, the plant being picketed. The big change is that it will at last be possible to go after the individual organisers of the picketing instead of being faced with an anonymous crowd sharing more or less equal responsibility, in law, for the punch-up. This will not help the police on the spot, because only the employers can start the legal proceeding. But it might have helped the coal board this month.

Where's the Act?

Could Mr Carr have done anything under those parts of the Act now operating? Its emergency provisions were designed to deal with strikes "gravely injurious" to the national economy. Why have they not been put to the test?

There are two powers Mr Carr might have called upon; he could have applied to the National Industrial Relations Court for either a strike ballot or a cooling-off period of 60 days. The first provision is designed for strikes that might have been pushed through by a militant leadership against the wishes of the rank-and-file. However, the coal strike was called after a ballot, and there is nothing to suggest that the miners would not vote the same way again.

The cooling-off period is more attractive in the circumstances, but the problem this time is that there has already been a cooling-off period. The strike was called after long negotiations and with a month's warning. More time to talk might be useful at this stage, but if a cooling-off period were ordered, would the miners obey? Mr Carr may not want to put idly to the test his long-held belief that the British actually are a law-abiding people.

At the pits

Nottingham

Most Midlands miners would have been in the mood for a return to work by now had it not been for the sudden change in their fortunes this week. At the pits, the men are frankly amazed at the havoc they appear to have caused. None of them expected the strike to bite so deeply; they had believed that the damage to underground equipment would prove to be their bargaining counter. So surprised were they by the power cuts that several believed they were part of an elaborate Government plan to shift public sympathy away from them.

Most of the miners here are skint. The two-month ban on overtime before the strike began left some of them £80 the poorer. They have since lost six weeks' wages and their allowance of coal. There is no national strike pay, although in Derbyshire the local union branch is handing out the equivalent of £4 for each man. Otherwise, for married men the only other source of income is social security payments.

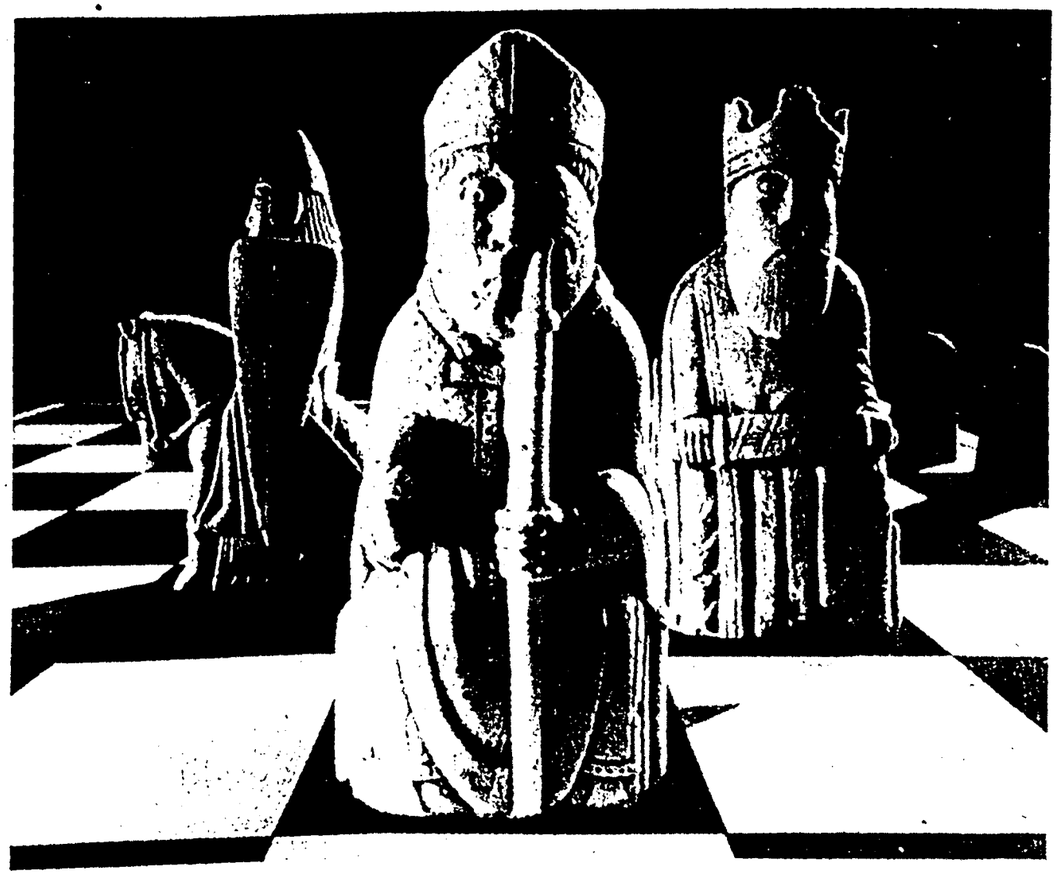
But many miners' wives work, and even if the average family income has more than halved, most households have been able to get by on the wife's wages. If, however, the wives are laid off as industry goes on a three-day week, this will turn the pressure on even though the strike still has total local support. Wives and shopkeepers are usually against strikes, but many women are very militant this time.

The least militant miners are found in the Midlands. They voted heavily against this strike. They are not as solidly Labour as most mining areas, and many constituencies, like Meriden, are marginal. What they do resent is living next door to car workers earning £40 a week for doing what often seems an easier and less-skilled job, knowing that their pits are profitable enough for them to be paid at least the same wage. Their wages have been held back in recent years while those of lower-paid miners in South Wales, Scotland and elsewhere have been catching up.

So the Midlands men are quite prepared to see more loss-making pits shut in order to increase their own wages. They are aware that a really big pay award would push coal prices up and lose markets, but are inclined to argue that as half the cost of coal to the consumer is distribution, more efficient distribution could absorb much of the increase. The rest could be made up, in their view, by savings from more pit closures. Very few pits in the Midlands would be affected, as it happens, but one or two are on the danger list. And if they shut? "So what?" said one miner, "we can always become bus conductors."

None of your blackleg foreign coal

Blockade runners



Coal imports have continued to trickle into Britain all through the strike, but they are now restricted mainly to what can be carried at 400-600-ton colliers that load at Emden and Rotterdam and slip into quiet wharfs, usually at night where a lorry or two wait to meet them with a powered grab. Many of these colliers had been unloading at west country ports, until the pickets finally caught up with them on Monday. But numbers have been coming into the Medway ports with coal for William Cory and also, on at least two occasions, shipments for the local Co-op. These ships are almost impossible to stop: they need so little water that they can float in on almost any high tide and whole flotillas of them will be out in the Channel the moment the strike is over. The bigger ships have been easier to picket.

By far the largest amount imported, put at 300,000 tons, was brought in by the Central Electricity Generating Board during the first two weeks of the strike and actually got into the power stations. Then the miners rumbled it, blacking a collier at Shoreham. Since then, the CEGB's shipments have come under increasing picket pressure and have now almost ceased. The coal is the remainder of 4m tons of Australian and American coal contracted for last year when supplies looked like running short. The British Steel Corporation also took advantage of the same Government licence under which the CEGB got its imports and placed contracts abroad for around 1m tons of coal, of which it took delivery of only 300,000 tons. But all its shipments since the strike started have been caught by the pickets, including its first coal from Australia, which is still tied up at Immingham. The corporation now has 100,000 tons of coal in store in Rotterdam and is also looking around for pig iron imports. It is not any solidarity for British miners that keeps the bigger blockade runners away, but the fear that their ships could be tied up for several weeks in British ports if the pickets catch them.

Home fires burning

Until now the combination of mild weather, particularly in the past three weeks, and surprisingly orderly rationing by small coal merchants up and down the country has maintained retail supplies of coal better than anyone imagined when the strike began and supplies were expected to last only four weeks. But stocks of household coal really are near exhaustion in most parts of the country, although there are still substitutes about, such as smokeless fuel and anthracite (for those willing to pay for it). The West Midlands Gas Board's coke mountain at Saltley also kept things going for a while, until the picketing got out of hand.

Hardest hit are households in the coalfields themselves. Here merchants, by tradition, maintained little by way of stocks and drew supplies direct from the pits. Consequently they have

BBA moves heaven and earth

If anything needs to be moved by means of a mechanical handling system, BBA can move it more efficiently. The Group designs, makes, installs and services conveyors, continuous elevators and lifts that carry everything from *earth* to documents, packages and production-line products. As for *heaven*, we handle luggage for jet airliners. And they fly pretty high these days. When it comes to heaven *and* earth, we move both to satisfy our customers.

Sovex Limited, a BBA subsidiary, specializes in tailor-made systems for unusually difficult demands. The Company has supplied equipment to the Post Office, the Central Electricity Generating Board, the British Transport Commission and New Scotland Yard as well as to many concerns in commerce and industry.

Another BBA Group member, Marshall Handling Equipment, complements Sovex. Marshall designs standardized systems and has built up one of the widest ranges in the country of fully-developed units. As these have all been well proved in service, costs are reduced and delivery and installation speeded up. Marshall customers include every type of organisation from Wills to Woolworths.

BBA is big business in many languages. The Group has subsidiary companies all over the world with total sales which have tripled over the past nine years and are now running at more than £36m a year.

BBA's activities are so diversified that it is well protected against big fluctuations in market demands. BBA products include brake and clutch liners, non-friction reinforced bearings and bushes, conveyor and drive belts and asbestos and glass fibre products for insulation and flame-resistant applications.

BBA *companies* are well known but the Group name may be less familiar. So we have produced this advertisement to help put that right.

little to fall back on, and are exposed anyway to the full brunt of the pickets. London merchants, anticipating trouble, kept their stocks much higher than their usual six-week supplies and, by rationing customers to 4-5 cwt apiece, expect to keep up deliveries for another two to three weeks. Priority cases, which means anything from old age to pregnancy, can get supplies, a loophole which merchants have probably used for all it is worth, however tightly the pickets claim to be policing the priority docket system. But in the South Wales coalfield, where even priority cases have rarely been getting more than 2 cwt, the elderly have now been without coal for some time, and merchants are searching as far afield as Birmingham for small bagloads.

Totting up the damage

Before the strike, Britain's gross domestic product (its output of goods and services) was rising in real terms at an annual rate of 4 per cent, or a little more. Simple arithmetic shows that if everything in the country came to a standstill for one week, this would reduce annual output by 1.9 per cent; and halve a potential 4 per cent growth rate to 2 per cent. Nothing like that, of course, has happened this week.

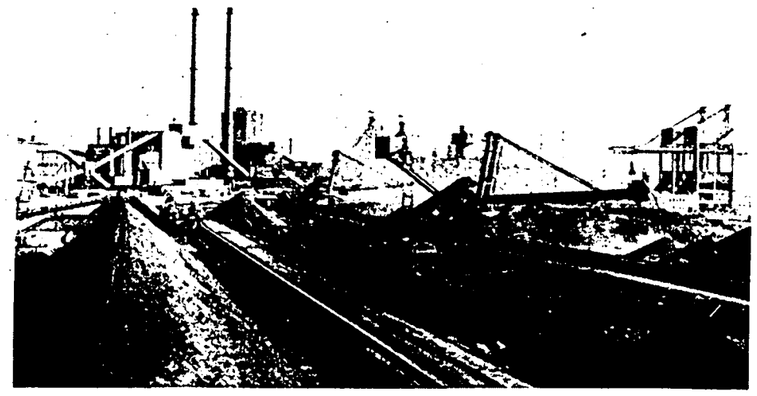
Manufacturing, obviously the most affected sector, accounts for only a third of Britain's national output. Between a tenth and an eighth is produced by each of four other groups: mining, construction and agriculture; public utilities, transport and communications; public administration, health and education; and distribution. The rest comes from private services (such as insurance, banking and property management) and personal services (such as launderettes, hairdressing and domestic service). Most of the services, agriculture and building will have been affected little. But taking the pessimistic view that all sectors have lost out and manufacturing industries have been at no more than two-thirds of their potential, then the first week of the emergency might have lost 0.4 per cent of the nation's annual output, bringing a 4 per cent growth rate down to 3.6 per cent. In money terms, such a loss would be of the order of £200m.

If one week is all we are talking about, such a loss (probably an overstatement anyway) could be made up quickly enough in view of all the existing spare capacity. All the same, the excess overtime involved in such a catch-up would do company profits no good. More important, there are the further dangers of impaired business confidence and the extra incentive to look to imports to close any temporary gap.

Where was who when the lights went out?

British industry was in none too good shape to fight off this emergency. All Mr Barber's boost to consumers' demand for goods was apparently being met from stocks and imports right up to the last of the old year. Industrial output in Britain in December was actually slightly less than a year before, when the electricity workers' go-slow had blacked out up to a third of the country for the best part of a week, with no apparent effect on industrial production that could be seen from the figures. Because construction did pick up last year, manufacturing industries by themselves produced 2 per cent less in December than they had done in January. Although declining steel output accounted for most of that 2 per cent fall, engineering has never repeated its performance of last May: only the chemical industry can be satisfied with 1971. So industry as a whole was glad to see the back of 1971, and all the more disheartened to run into trouble so soon.

The really tragic threat to British industry, however, has nothing to do with lost production: it is the possibility that it will face a new bout of inflationary pay claims. It cannot afford them. British export prices have been rising in the past months at an annual rate of 9-10 per cent: but British import prices by only 4-4½ per cent. Indeed, the average price of imported manufactured goods as a whole last November (the latest date for figures) was no higher than a year before. Nobody worries much that Britain's overseas trade was in a small deficit in January: but it could be the thin edge of the wedge.



Key indicators: British economy

	Month	Index 1963=100	Percentage change on previous month	three months	one year

BUSINESS *International*

Any more for North Sea steel?

The next one will bc nearly twice as big

Hoogovens (Holland) and Hoesch (Germany) have settled the details of the terms on which their merger is to take place. What remains now is for shareholders in both companies to rubber-stamp things and create a company with plants at Ijmuiden, near Amsterdam, and Dortmund capable of producing 13m tons of crude steel a year. Even so, both partners have confirmed that they are seriously looking for a third to join them in their projected new works.

One reason for the Hoesch-Hoogovens merger was the need to join forces to build a big new coastal plant. Hoogovens now has capacity for 6m tons at its largely postwar plant at Ijmuiden. This could be stretched to 7m-8m by adding capacity at some points in the process. But no more. Accordingly, Hoogovens has been planning a major greenfield development. The first plan was for 2m tons; later, as the economics of steel-making changed, 4½m tons was reckoned to be the minimum profitable size.

So big an addition to capacity would obviously raise marketing problems: hence the need to find another company willing to come in, and Hoesch, in which Hoogovens already held shares, was both an ideal and willing partner. Only now, thanks largely to further developments in blast furnaces and iron ore pelletising, the minimum size of plant is 10m tons. This would almost double the capacity of the new group, which, even with the elimination of some older and higher cost plant, would be an enormous jump. Hence the search for a third partner. Who? And where?

The two French companies both have major expansion projects on hand: Wendel-Sidélor, with its ambitious and troublesome greenfield project at Fos-sur-Mer, and Usinor, which is doubling its 4m tons capacity at Dunkirk. The two major Belgian producers both appear inextricably tied up with their controlling shareholders: the Société Générale in one firm and other Belgian, Luxemburg and Italian steel interests in the other. The German companies are now at their nadir of profitability. Krupp, the third biggest (Hoesch is second), is barely in a condition to launch into a big joint venture; still less are Klöckner, Peine-Salzgitter and the smaller fry. That leaves August Thyssen Hütte, the largest German producer, with an annual output around 12m tons, about half the size of the British Steel Corporation.

Thyssen is therefore the favourite, not just because it is the right size, but also because it is in better shape than the other German producers. Production has been concentrated at Duisburg, down the Rhine from Düsseldorf, where at least the iron ore can be got in by barge, but if Thyssen is to expand it will have to move down to the coast.

This leaves the question: where? Hoogovens's plans for expanding at Rotterdam have been put on ice by the local authorities, until pollution from the existing Europoort complex has been cut. There is no other suitable deep-water site in Holland, and only near Hamburg, on the Elbe, does the German coast offer anything suitable. Because many steelmen reckon that Hoogovens will never be able to build at Rotterdam, even if it can find the labour, there has been talk of building in Britain, where 11 out of the 20 or so possible deep-water sites for a steelworks in Europe happen to be. Hence, too, the talk of a possible joint venture with the BSC, with or without Thyssen. Although the BSC is now in the depths of another of its apparently endless planning reviews, the Government should be more than keen.

German shipyards

Shrinking

Hamburg

Just in time for his 60th birthday, Herr Hans Birnbaum, head of the state-owned steel firm of Salzgitter, pulled off a major coup on Monday by stitching up a deal for the state government of Schleswig-Holstein to take a 25 per cent share in Howaldtswerke/Deutsche Werft, Germany's biggest—but loss-making—shipyard, with slipways in Kiel and Hamburg.

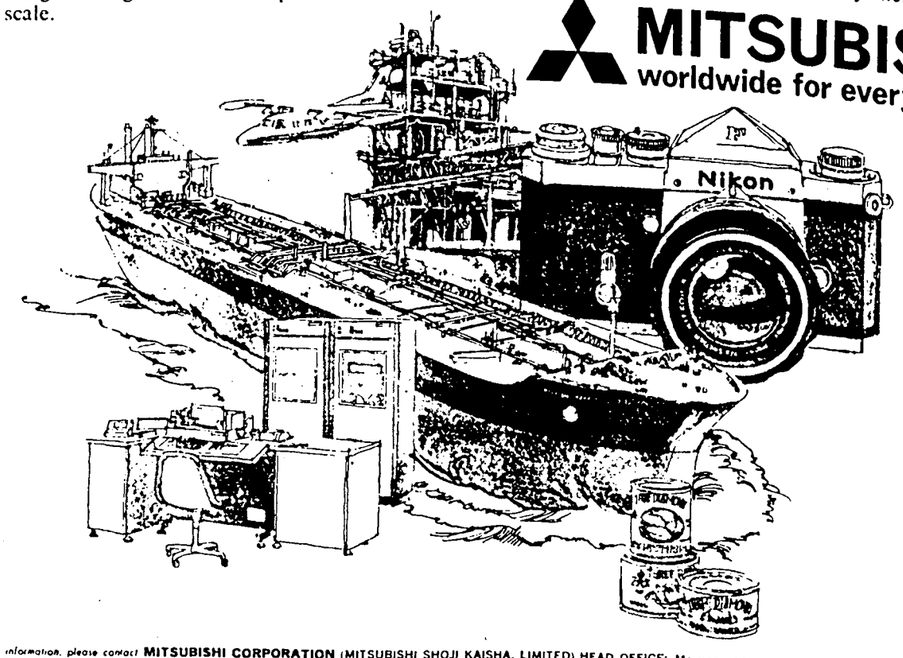
MITSUBISHI?

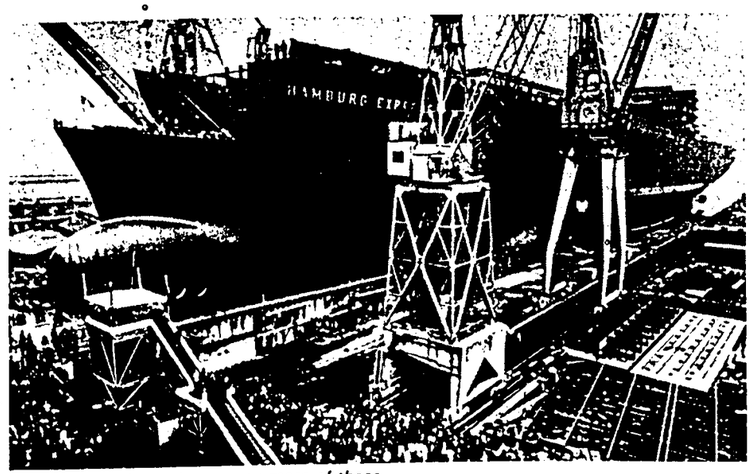
We're Not Exactly a European Household Name – Yet

Just within the past few years product brands like Johnnie Walker, Brooke Bond, Fiat and Coty have become familiar household names in Japan. Unfortunately, the same thing can't be said for Mitsubishi in Europe—yet. But we have high hopes that we're getting there. Perhaps you've already heard of the MU-2 businessman's plane, Melcom 84 (Melcom visible record computer), the Nikon camera, Three Diamonds canned foods, as well as Mitsubishi stereo and other household products. They have all been imported from one of the Japanese companies belonging to the Mitsubishi Group.



As Japan's largest complex of industrial enterprises with an employee roster of 350,000, the Mitsubishi Group is made up of 50 separate companies. Each one is a leader in its own particular field, yet all are united by what Mitsubishi people call "family" cooperation. Its diversity encompasses manufacturing, commerce, banking, insurance, shipping, engineering, construction, etc. Its rich supply of capital, technology and human resources plus 100 years of business experience have made it possible for the Mitsubishi Group to flourish as a multiple, integrated organization that operates on a worldwide scale.

Mitsubishi Group firms have worked on more than 100 projects covering 20-odd business fields in 30 nations. Typical of the new spirit of cooperation Mitsubishi is enjoying with European business enterprises is the LNG project partnership with Royal Dutch Shell and the Brunei government. The function of the joint-venture company is to liquefy natural gas extracted by Shell. The LNG will then be hauled by Shell Tankers, Ltd. of Britain for sale to Japanese customers. Begun in 1967, the $600 million project is now nearing the operational stage.



In Japan, Mitsubishi has cooperated in setting up such joint-venture companies as Kasei Hoechst Co., Ltd. with Farbwerke Hoechst A.G., Nippon Aerosil Co., Limited with DEGUSSA, A.G., Yuka Badische Co., Ltd. with BASF A.G., etc., to name a few.

With an overseas staff of 3,000 (2,000 are non-Japanese), Mitsubishi can offer valuable assistance when you deal in direct trade with us, when you operate a business in Japan or even when a third country is involved. By constantly demonstrating its diversity, reliability and emphasis on quality, Mitsubishi is winning new customers everywhere.

Hamburg won't produce many more of these

Salzgitter became the controlling shareholder in HDW last year, under a deal in which it swapped its lorry-manufacturing subsidiary, Büssing, for a controlling stake in Deutsche Werft, which in turn owns the 50 per cent holding in HDW that Salzgitter did not already hold. The other party to this deal, the steel manufacturer Gutehoffnungshütte, was then anxious to get out of shipbuilding and build up its lorry manufacturing instead.

For this interest in Deutsche Werft (and hence in HDW), however, Salzgitter had to give up not only Büssing but also £6m in cash. In addition, HDW faced the need for further heavy investment in modernisation, to the tune of £6m worth at Kiel and £3m at Hamburg. Since Salzgitter is itself in a bad patch because of the current slump in the German steel industry, Bonn pressed it to find another partner. The Schleswig-Holstein state government, naturally sensitive to the employment outlook at Kiel, was only too happy to oblige.

The unions—and Salzgitter—pressed the Hamburg city government to chip in too. But Senator Helmuth Kern, the minister in charge, has refused. The city government is concerned not only about jobs at HDW but also at Blohm and Voss, Hamburg's other big shipbuilder, which has full order books up to 1975 but little prospect of much beyond that. Herr Kern has therefore pressed for a more ambitious solution in which Blohm and Voss would be absorbed into HDW. But the company is itself owned by August Thyssen Hütte, Germany's biggest steelmaker. Its head, Herr Hans-Günther Sohl, shied away from the idea last summer, when losing a tied outlet for steel at the depth of the German steel slump was more than he could face. Now, with the modest improvement in the steel outlook and the ever-gloomy outlook for shipbuilding, he could once again be in a mood to get Thyssen out of shipbuilding.

Meanwhile the plan to rationalise HDW goes ahead, under which the Kiel yard will concentrate on building new vessels, which will absorb 85 per cent of its capacity, the other 15 per cent being devoted to ship-repair. Of the two Hamburg yards, one is to concentrate entirely on oil rig construction once the present order book is exhausted. The other will carry out ship-repair work only. Thus the first big moves are now under way to put German shipbuilding on to a sounder basis, in line with the recommendations of a report prepared by three consulting firms and due to be presented to the ministry of economics and finance at the end of the month. How Blohm and Voss will be fitted into such a set-up remains to be seen.

Luna 20

Try, try . . .

The Russians are never explicit about what they intend their spacecraft to do, but Luna 20, which was launched on Monday, looks as if it is meant to land on the moon rather than follow its predecessor, Luna 19, into orbit around it. The Russians have not had too happy an experience with unmanned landings of spacecraft recently. They sent Luna 18 into the moon's mountains in September, and it tumbled over on landing. Something similar happened to the capsule that touched down on the surface of Mars at the beginning of December and was then either blown over by the violent winds or buried under a duststorm.

Both times the Russians were attempting something fiendishly difficult; it is still far too risky to try to land men on the moon's mountain ridges because of the uncertainty of finding a sufficiently flat patch to get down and take off again. Even to have landed capsules where the Russians have is a major technical feat. But, considering the years of effort and skill needed to fit out the capsules with instruments, it is frustrating when all they do is land, and then go dumb. The robot tractor that was sent to the moon in Luna 17 operated and transmitted for nearly 11 months, which gives some idea of the life scientists expect from robot equipment.

The robots are still feeble. The Luna 16 mechanical digger, which scooped up and brought back the Russians' only samples of moon rock, collected a total of 4 oz, compared with the 170 lb that the Americans brought back on their last Apollo moon landing. Even the Lunokhod tractor traversed less than 100,000 square yards. Nevertheless, some scientists would have traded pounds of Apollo rocks for grammes from the mountains where Luna 18 went because the mountains represent the moon as it was at the time of its formation, and before the meteors and volcanoes had melted and remelted large tracts of the surfaces out of all recognition.

Currencies

Eureka, Europa

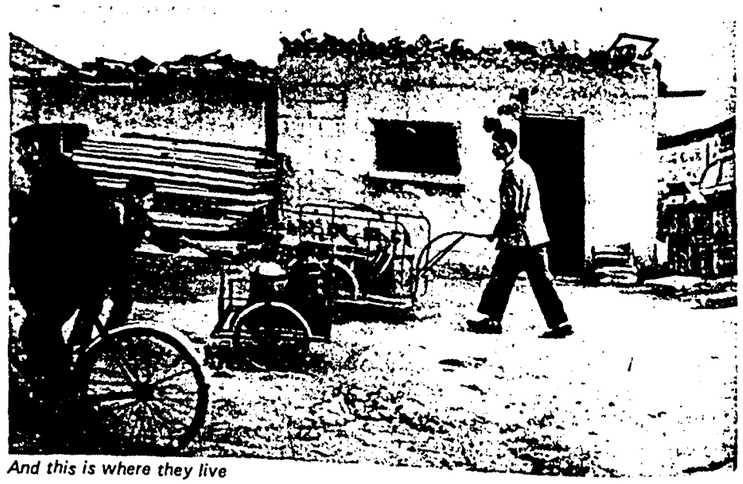
European bankers regard it as cut-and-dried that there will be a narrowing of the band between the currencies of the Six (what is called the "snake in the tunnel"), and that it will probably be to 2.25 per cent, compared with the 4.5 per cent permitted against the dollar. An announcement by the Six can be expected during the coming weeks.

But not everyone feels that the heads of government are being as imaginative in their ideas about money as they are in their diplomacy over it. A paper published this week by the Federal Trust* calls for the creation of a new currency, the Europa, circulating

*"European Monetary Integration." Main contributors: Dr Giovanni Magnifico (Bank of Italy in London) and Professor John Williamson (Warwick University). Federal Trust, 12a Maddox Street, London W1R 9PI.

alongside existing European currencies; and a new European Bank, into which member countries would pay a specified proportion of their reserves as well as a quota of domestic currency. In return, countries would receive deposits denominated in Europas. The new bank would intervene to stabilise the exchange rate between the Europa and the dollar, while the Europa would serve as the intervention currency between European currencies. One novelty is that the new currency would be held not only by monetary authorities but commercial banks as well.

But would the replacement of Eurodollars by Europas (which is what is envisaged) establish a better European control of this part of the community's money supply ? It is doubtful. Direct links between the dollar and individual European currencies would be maintained, still allowing speculative switching of funds as now, even though intervention policy might be strengthened by the use of the Europa.



The Europa is not for tomorrow, although much of the reasoning behind the plan deserves a full debate. Dr Rinaldo Ossola, of the Bank of Italy, who has his feet on the monetary ground more firmly than most, told the Financial Times conference in London on Tuesday, at which the Europa was discussed, that he thought the problems of adjustment between the United States and the European community could be solved through the free fluctuation of the dollar against the EEC currencies (on relatively fixed parities between themselves) as a whole. He also talked of the possibility of special drawing rights (SDRs) taking up the reserve role of the dollar as well as that of sterling, although his more immediate concern is simply to preserve the present SDR system, which is in danger of extinction. As their chairman, he will call together the deputies of the Group of Ten finance ministers and central bankers in April to discuss the new allocation of SDRs, due on January 1, 1973. He seems to be thinking modestly: perhaps $1.5 billion over a two-year period.

France

Equality please

Paris

The French government, confronted by unemployment that is now over the half million and still rising fast, is taking a look at the foreign workers in France. Of the total French population of 51.5m, immigrants number

And this is where they live

3.3m, and some 7 per cent of the work force. Among them Algerians, Spaniards, Portuguese and Italians predominate.

About a quarter of the immigrants have some qualifications. The rest are unskilled, underpaid, underhoused and willing to take jobs few Frenchmen want. More than a third of all building labourers are foreigners. Last week 100 workers at a Peñarroya plant in Lyons went on strike, asking for higher wages, better working conditions and a shorter work week. Big news ? The strikers were nearly all foreigners ; most were north Africans.

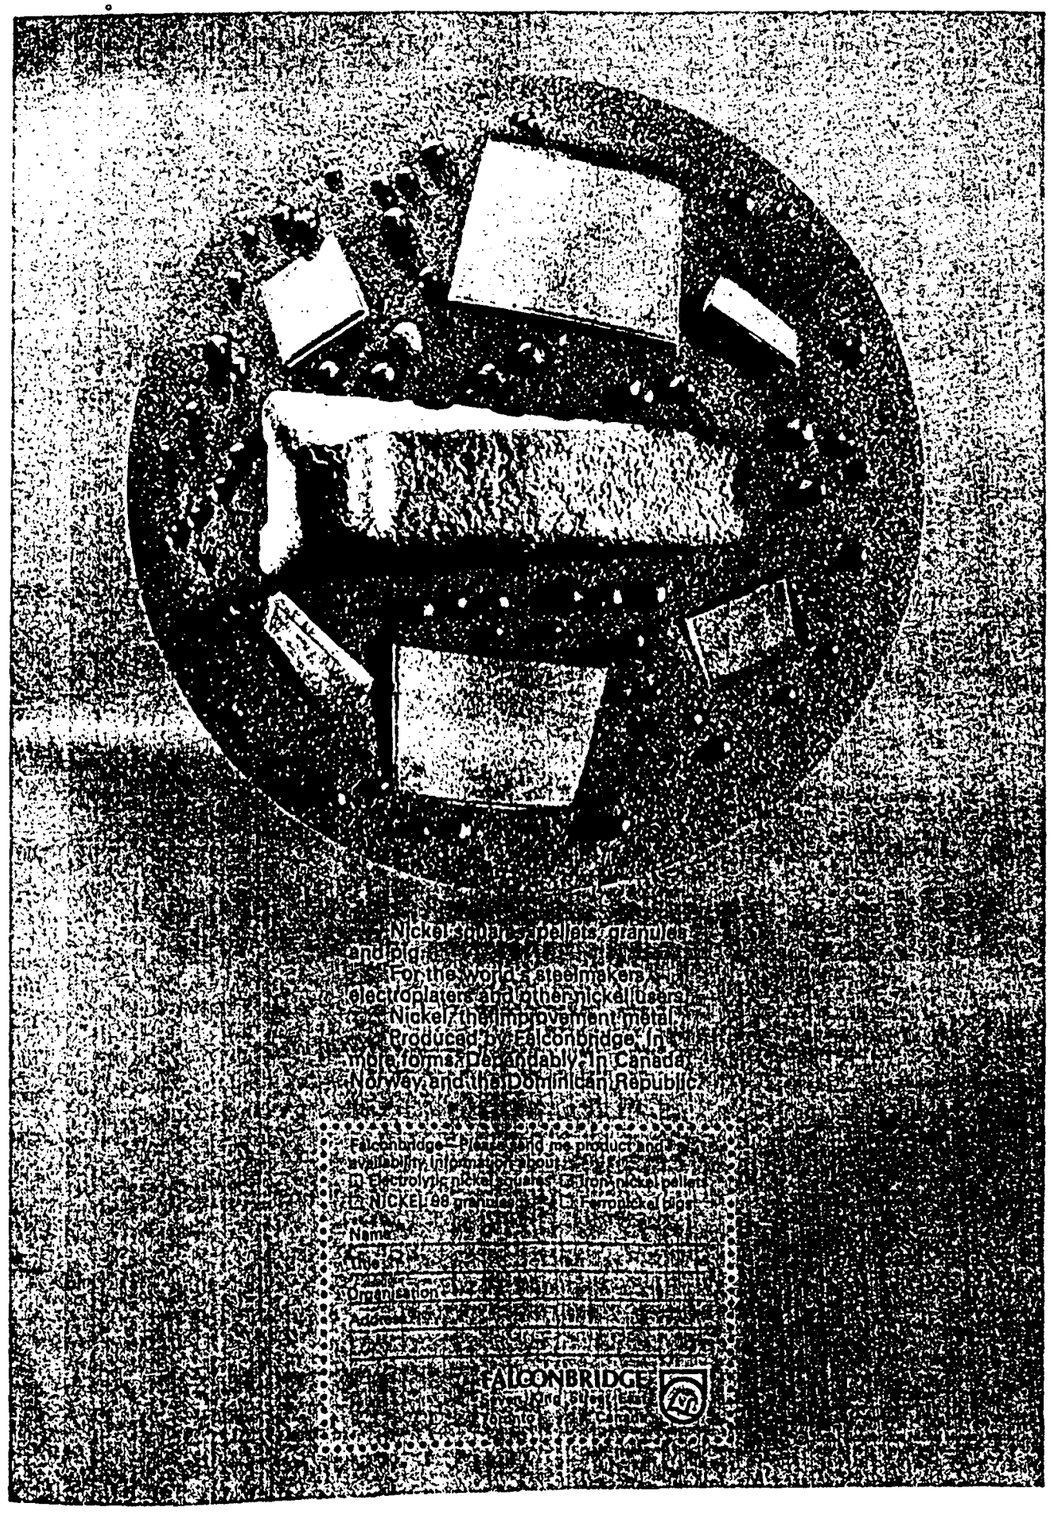
France, with its low birth rate and ambitious plans for industrialisation, used to need all the foreign workers it can get. But the government is putting on the brakes. According to the employment minister, M. Joseph Fontanet :

> too rapid an influx of foreign workers makes a satisfactory welcome impossible, and could provoke intolerance, because the integration of foreign workers into the French community is not yet carried out under good conditions.

So far Portugal and Algeria have been persuaded to cut the flow. Priority will be given to workers—foreign or not—already resident in France.

In this way the government hopes to solve one of the main problems for immigrants: housing. Most live in conditions the government admits are appalling. However, many are birds of passage, who repatriate most of their wages and do not want to pay high rents or buy property. More than a third of the immigrants wind up around Paris: those who work in industry collect in the ring of shanty towns around the city.

Cleaning up these "bidonvilles" has become a priority project. Action is also being taken against the racketeers, who deal in identity cards and labour permits, and against the "sleep-seller," who rents beds for three eight-hour shifts and reckons on 24-hour-a-day occupancy. And the unions strongly favour giving foreign workers rights and social benefits equal to those of French nationals, and equal job security.



Italy

Concentration grows

Rome

The two takeovers at the end of last week—of Snia Viscosa and the Banca Nazionale del' Agricoltura—vividly illustrate the growing power of the new Italian industrial establishment. Its four pillars are the state holding companies Eni and Iri, the Agnelli family (Fiat), and the Montedison chemicals/fibres empire. Montedison, which is the most active of the four, was the principal protagonist in the Snia bid and an indirect partner in the one for BNA.

Snia Viscosa is Italy's largest artificial fibres company. Montedison has increased its shareholding from 4.4 per cent to 30 per cent by acquiring shares owned by various French and Italian interests, and giving in exchange the Montedison shares owned by the SADE finance company, taken over by Montedison itself last summer. Together with the 8.9 per cent con-

Alles van die beste

In the South African language of warm hospitality, this means 'everything of the best'. It's also a friendly salutation.
But on South African Airways it means both.

So when one of our hostesses smiles at you, you see a little bit of sunshine.
And when she's helping you to a rock lobster tail or rich Cape liqueur, it really is everything of the best.
In every way it makes very good sense to fly SAA.

The Boeings we fly are right up to the minute. In fact, SAA is the first international airline to operate the new 747Bs later this year. What's more our new SAAFARI computer sorts out all your travel problems. Linked to our offices throughout the world, it instantly books your accommodation, arranges car-hire facilities, air/sea interchanges, tour itineraries . . . the works!

So, if you're thinking of flying to South Africa, whether it's from New York, Rio, Australia or Europe, look for a Boeing with a Springbok on its orange tail.
It's a sure sign of warm hospitality.

We fly your way

SAA
SOUTH AFRICAN AIRWAYS

SAA 8854/1

trolled by Eni and 3.1 per cent by Mediobanca (the Milan merchant bank owned in turn by the three major banks belonging to Iri), Montedison's 30 per cent stake means the establishment has gained firm control of Snia.

Montedison now has two major fibres companies: Snia and Chatillon-Polymer-Rhodiatoce, which together have a total turnover of £300m. Montedison thus becomes the second largest European fibres concern, after the Dutch AKZO. Italy will thus be better placed in the now intensifying competition in the European fibres industry, plagued as it is with over-capacity.

BNA is Italy's eleventh biggest bank but its largest private one. A series of unfortunate investments, however, meant that suitors could no longer be fended off. The Bank of Italy favoured Mediobanca. This brought in IFI (the Agnelli family holding-company) and Bastogi (the finance company recently acquired by Montedison) jointly to buy up a 50 per cent stake. Thus Fiat now remains the last of the privately owned Italian companies and banks of any major size.

Insurance

Afraid of us?

Squeaks are now being heard from some American state insurance commissioners about the growth of offshore insurance companies writing American risks. The commissioners license insurers who may write risks in each state, and fix the premium rates and other terms. Risks that cannnot be written on "bureau rates" are then designated "surplus line" risks and offered around.

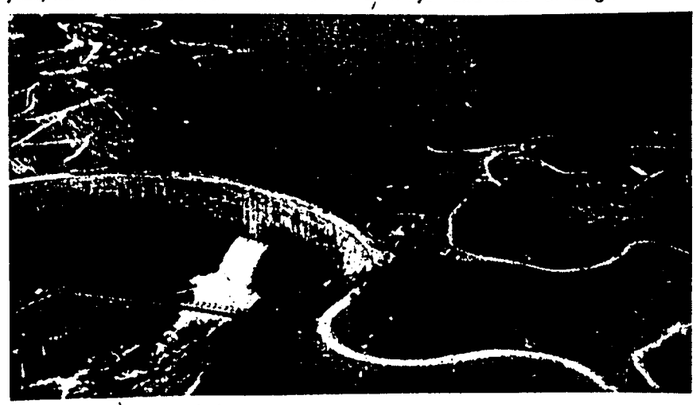
American insurance companies are now setting up in increasing numbers in London. Partly they have fanciful ideas that the common market will lead to a common insurance market with London as its centre. But London's "slip system" enables a risk to be split between any number of underwriting syndicates at Lloyd's and companies in the market. The traditional continental and American system is a much more clumsy one where one underwriter takes the whole risk and then reinsures what he does not want to carry himself. Brokers operating in America have long discovered that it is easier and quicker to place much of their surplus line business in London without bothering to hawk it round.

Consequently, some American companies that specialise in surplus line business notice that they never see much good quality surplus line business back home, and they have come to London in pursuit of it.

But some American commissioners are far from happy to see American business go to London, to be handled by American companies there. This may be a reasonable enough attitude to take over some companies set up in, say, Bermuda or the Bahamas, whose solvency may be less easy to investigate. But to be as sniffy about companies operating in their own name and authorised for surplus line business in all American states is really unnecessary. The exiles actually make more capacity available and bring rates down.

Dam-builders on the downswing

Milan



Ever since they astonished the competition in 1956 by winning the Kariba dam contract in Rhodesia, Italian civil engineering firms have been riding high. But now, ruefully, they admit that the lead is passing back to the British, French, west Germans and Swiss and even the Jugoslavs.

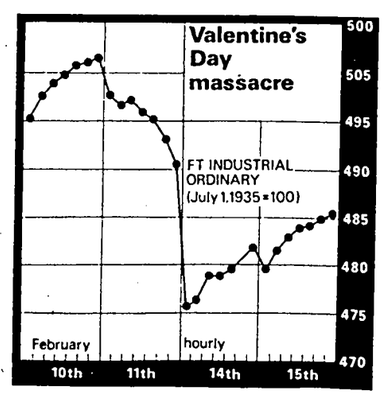
Italian contractors are still working on projects around the world. These include the £70m Mantaro dam in Peru, due to be finished this year; the £33m El Chocon dam in Argentina (completion in 1973); the £21m Tongariro power development project in New Zealand (1973); and above all the £300m Tarbela dam in Pakistan, one of the largest civil engineering projects of all time, involving also French, west German and Swiss contractors (1976).

But these are orders won in the late 1960s when Italy was still on the crest of the wave. New business averaged £175m a year in 1967-70, with a peak of £290m in 1968. But the 1970 total was only £45m, and last year may turn out to have been only marginally better. By the mid-1970s, therefore, Italian dam-builders look like running out of work and may have to disperse the teams built up in the boom years. New orders are needed now.

The contractors blame the unions, which have been driving labour costs up at the rate of 10-20 per cent a year, while the British and French have both been helped by devaluation. On contracts involving millions, only one or two percentage points on the costings are needed to swing the job. The developing countries have seen a continuous erosion of their terms of trade and a mounting debt-repayment burden, while such international agencies as the World Bank have switched their emphasis to projects that yield a more immediate return, like the green revolution, education and birth control. Yet in Africa, for instance, Italy had been scooping all the plum jobs.

Italian contractors are turning to the state for help. They argue that export credit facilities are better elsewhere: Rome sets a ceiling of £500m on total state-backed export credits while Germany goes up to £3.3 billion. Italians also complain that the Export-Import Bank (in America), the Export Credits Guarantee Department (Britain), Coface (France) and Hermes (west Germany) operate swiftly and can underwrite an entire contract, while Italians must deal with a range of agencies, each answerable to a different government department. They want more aid and less red tape. But whether any Italian government will listen to the overseas contractors is another matter. It will depend upon just how much value it places on having the Italian flag shown around the world by dams, power stations, irrigation projects, roads and railways—and their earnings.

Kariba: monument to Italy



BUSINESS *Investment*

Even the miners can't keep a good market down

There are few equities on the London market that give the investor a net income of more than 5% over the course of a year. But between the opening of the market on Friday of last week and the first hour of business on Monday this week the Financial Times ordinary index of 30 of the most bland blue chips fell by this amount ; a net capital loss in six hours' trading that an investor counting on income would take a year to recover. The explanations of the coal strike and the possible fall of the Government are already hackneyed ; the lesson is that the London market today is not one for the proverbial widow.

And yet the market has been surprisingly strong. It got the worst over quickly and the drop in the FT index of 13 points between last Friday's opening and this Thursday afternoon's 488.4 (following ICI's results) had not been caused by heavy selling. Jobbers had marked down prices earlier in the week so severely that few people were willing to sell.

London is the only stock market in the world (with the exception of Hongkong) to come close to a 50% improvement in its capital value over the past year—and in London that means approximately £15 billion. It might be thought that many an investor, having either made a full half of his capital investment or recouped the third that he had lost, could be persuaded to take his profit and sit back for a while. That the selling has been so slight is the strongest sign of a continuing bull market.

Chemicals

Not so bad

The London stock market was peculiarly inept at interpreting Thursday's results from **Imperial Chemical Industries**, although the company must be the most closely scrutinised on the exchange. Pre-tax profit for the group was £130m, £14m down on last year, with sales only improved marginally. The results for the final quarter, after deteriorating for the previous three, are not as bad as the pessimists had expected. But it was patently wrong to mark the shares up from 275p to 300p at one bound, adding over 10 per cent on the theoretical worth of Britain's biggest company stock. The market saw its error and brought the price back to 285p, before closing at 290p. ICI has plenty of difficulties ahead in swallowing its recent acquisitions of Atlas and fibre interests.

But ICI has shown itself better than many a marriage broker. The results of the first full year in which **Carrington Viyella** have been together are certainly up to scratch. Pre-tax profits were £5.8m as against £980,000 in 1970 ; not that the comparison means very much. But the company's difficult past is over. It has written off its losses, reorganised, and even managed to reduce its stocks during a difficult year for fibres. It is now in a reasonable position to make money for ICI and its public shareholders as soon as sales, and particularly margins, improve. Now might be the time for ICI to keep its promise and offload some of its 65% holding in the company. The prospect has already dampened the shares, at 56p.

Another company in the ICI stable, **Imperial Metal Industries**, has also been battling against falling prices and slimmer margins. Although sales were down to £180m with the lower world price of copper, the company's profits are marginally up, and fears that the collapse of Rolls-Royce would cause large losses have proved unfounded. At 89p IMI is fairly priced, though the share is a buy on any recovery of prices on the London Metal Exchange.

ICI's troubles have, of course, been largely shared by other European chemical companies. But it has been slower to turn the corner. The German company **BASF**, after two very dismal years when profits were squashed by the revaluation of the D-mark, has suddenly blossomed again. Although the 1971 dividend will have to be cut back, turnover is up about 7% in the final quarter and profits, unexpectedly, have outperformed 1970, though not on a level with 1969. Since **Bayer** and **Hoechst** are in much the same situation, the unusual optimism shown by BASF this week makes all three shares, which are already undervalued on an undervalued German bourse, a good buy, and a better bet than ICI.

Apart from the purchase of Atlas and Qualitex, ICI has had a year of retrenchment while its European rivals, like **Montedison**, have been bustling about, taking maximum advantage of the hard times in the industry to expand their empires on the cheap. But ICI is often out of step with Europe's chemical companies and for all the stock market's scrutiny it will not be until the first half of this year that the investor will be able to tell whether 290p is a fair price for the shares.

Why National Lead changed its name to N L Industries, Inc.

Last April, National Lead shareholders approved a resolution to change the company name to N L Industries, Inc. That's how we're listed now, that's the name on our product lines now.

Like many diversified companies these days, we had grown to the point that our old name no longer reflected current operations or future plans. With annual sales of over 900 million dollars, our operations have broadened to encompass a wide variety of products and services for today's essential industries.

For more information on what we're doing, write for our new corporate brochure.
N L Industries, Inc., Room 1523,
111 Broadway, New York, New York 10006.

NL INDUSTRIES

Industry just wouldn't be the same without us

Our New York Stock Exchange symbol has changed from LT to NL

1970 CONSOLIDATED SALES

Metals and Bearings
(33%—$301 million in sales.)

We supply many basic metals such as zinc, tin, antimony, cadmium and primary lead. Also a wide range of finished products and components. Among them: radiation shielding; screws, bolts and metal fasteners; railroad and other bearings; steel containers; and aluminum extrusions for aircraft. We also supply precious metals, and associated chemicals for photographic and other uses.

Titanium Pigments
(23%—$208 million in sales.)

These are the pigments that make and keep paint, paper and plastics white and bright. Employing both the sulphate and chloride manufacturing processes, we're a leading producer of titanium pigments.

Die Casting
(15%—$140 million in sales.)

We're the leading custom producer of die castings, working in aluminum, zinc, magnesium and brass—making parts and assemblies for appliances, business machines, aircraft, motor vehicles, lawn mowers and many other industrial and consumer needs.

Chemicals and Plastics
(11%—$104 million in sales.)

This area includes anticorrosive pigments, stabilizers, gellants, flame retardants, battery oxides, and extender pigments—for the paint, plastics, ink, electronic and adhesive industries. We also produce custom injection molded plastic products.

Oil Well Materials and Services
(10%—$90 million in sales.)

Oil is, of course, one of the most vital of today's products. We supply unique and essential drilling materials, chemicals and engineering services to the petroleum industry.

Other Products
(8%—$73 million in sales.)

Other products we make include Dutch Boy paints, electroceramic materials for electronics manufacturers and specialized high temperature refractory materials. One of our divisions provides special dies and tooling for Detroit's prototype cars. We also meet a broad range of nuclear fuel, shielding and shipping needs.

If you want a man to do a first-class job, give him a first-class ticket.

Economy class travel looks like sound company policy. On paper.

In practice, just how sound is it?

Think of what you're asking your man to do.

Make decisions that could affect the future of your company. Decisions that rely on clear thinking.

He'll need to be as rested and relaxed as possible. Ready to go into action as soon as he reaches his destination.

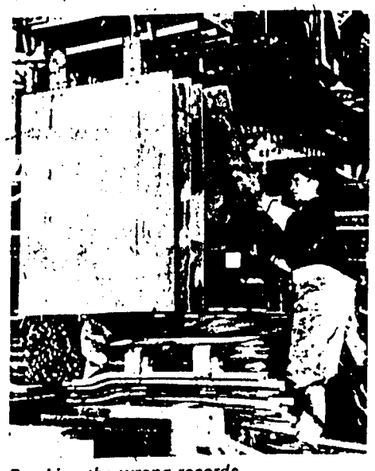
And that's how first class will get him there.

More relaxed, because he's travelling in greater space and comfort. More rested, because there are fewer people and fewer disturbances.

And, psychologically, that first class ticket does a lot for his image and yours. It tells him you think he's the best man for the job.

So give him a first class ticket. And he'll do the first class job.

BOAC
takes good care of you.



Anaconda

Write-off

The Anaconda copper company has chalked up a record: no corporation has ever reported so large a loss in a single set of accounts. The total for 1971 was $357m, or $15.30 for every share currently selling on Wall Street at $19. For a real record-breaker: $348m of this was slapped solely into the last quarter. Anaconda has managed this extraordinary feat by writing off the full $302m at which it values its copper mines in Chile, which have now been entirely nationalised without compensation by President Allende.

There is little chance that Anaconda will get any of its Chilean investment back although the company is sueing the Overseas Private Investment Corporation, which insures American foreign investment against expropriation, for $171m. But Anaconda knows that this would drive OPIC into bankruptcy and can hope for little more than the $12m that it is being offered as a sop. So watch out for another $171m write-off next year.

Anaconda, a lumbering giant, has been outpaced by its rivals, particularly **Kennecott** and **Cerro**, both of which also have large investments in Chile. Its labour relations are among the worst in America and in 1971 it made a net loss on home operations after a three months' strike at the company-owned townships in Montana—the third long and bitter dispute within a decade. Even in 1970, when the company enjoyed firm copper prices and a strike-free year as well as getting $28m from Chile, Anaconda's profits on a $1 billion turnover were only 6%.

Breaking the wrong records

At last, however, things are stirring, and Anaconda's accounts come with a charge of $52m towards reorganising its corporate structure and retrenching on almost every front. It might work. Anaconda can hardly hope for a take-over as an alternative solution, since any bidder already in copper would run into federal trust problems. One palliative for the shareholder is that it will be years before Anaconda has to pay any taxes. And the company is learning; this year it voluntarily sold 51% of its Mexican operation to local investors.

Kennecott is also in trouble. Chile claims that the company owes it $310m in "excessive" profits taken out of the country in the past decade. But one of Kennecott's subsidiaries has managed to block the funds held by the Chilean copper corporation in New York while suing for compensation.

Among the British-owned copper companies **Rio Tinto-Zinc** has the lowest risk of running into political problems as its two richest mines are in South Africa and the Australian-dominated territory of Papua and New Guinea. But if the copper price remains low and Zambia is faced with a worsening balance of payments deficit, as well as increasing political paranoia, there is a chance that President Kaunda might follow Chile's example and take over the 49% interest in the copper-belt not already owned by the Zambian government, although the share prices of **Roan Consolidated Mines, Zambian Anglo American** and **American Metal Climax** only fractionally discount the total nationalisation that could put these companies in much the same straits as Anaconda.

France

Maladroit

Paris

The Banque de Neuflize, Schlumberger, Mallet, one of France's oldest private banks, admitted this week that it had lost £2m on a single bad debt, a loss that had hit it so hard that an immediate takeover bid was put in by a group backed by the powerful **Banque de Paris et des Pays-bas** (Paribas). The bid has been rejected, although the disappearance of NSM into the larger fold of the public bank would be in line with the steady movement over the past five years drastically to reduce the number of small, old, private Paris money houses.

The bad debt is one more echo of last year's real estate scandal which saw the collapse of several property companies and the reputations of some politicians. One of the key figures was M. Claude Lipsky, the head of Patrimoine Foncier, who fled to Israel rather than face arrest in France, having borrowed the £2m from a personal friend in NSM. There was so little internal administration in the bank and so much was done by hearsay and trust that the loss has only recently been realised.

But NSM is among the most successful small banks in Paris. It runs one of the largest investment trust divisions of any French bank, and last year had assets of £160m, up 25% on 1970, and turned in a profit of £2.6m. The bad debt is being written off along with most of this year's dividends. Even so, that the scandal should have emerged from NSM has sent many smaller and less successful banks scampering to look more closely at their own accounts.

NSM is now looking round for new partners to keep Paribas at bay. A link-up with one of London's merchant banks, anxious to get into the common market, looked a possible solution. However, the latest news is that the fourth largest bank in Holland, Bank Mees & Hope, has taken "a substantial stake."

Eurobonds

Mongrel money

Eurobond managers have begun to dust off all those quaint ways of raising international capital at a time when nobody is particularly keen to take on the mass of dollar-denominated bonds that are lying on offer on the market's telex machines throughout Europe. This week they came up with a hybrid not seen since the first twinges of currency uncertainty last May: the European Currency Unit (ECU). The Brazilian government, making its first appearance in the Eurobond market, is raising $30m in ECUs, which are the one way of raising money that guarantees the borrower the worst of all possible worlds.

An investor purchasing an ECU bond can pay in any one of the currencies of the EEC but he can also choose in which currency he wishes to receive both his interest and capital repayments. This means that should any one of the currencies revalue over the life of the loan it is that currency the bondholder will choose; taking his exchange profit to the borrower's loss. For this reason ECUs have been generally spurned by corporations wishing

to be certain about their margins. At a time when one more dollar-denominated bond would have difficulty finding takers, the ECU issue is likely to be a success, especially as it offers an interest rate of 8%, a full percentage point over the current rate. The Brazilian government, which devalues as a matter of policy some four times a year, is hardly likely to notice the nicety of any revaluations within Europe.

It is unlikely, however, that the ECU will return at a time when currency parities are being questioned again. But the French franc that has emerged strongly from the recent realignments has suddenly become popular in the Eurobond market, and the Eurofranc, long distrusted, has been the source of £10m international capital in the past few weeks, putting pressure on sterling to join the Euromarkets at last.

Takeover panel

The little red bid battle book

Several large French, German and Dutch companies are negotiating for permission to be quoted on the London stock exchange. The surprising thing is that they are willing to disclose in their accounts the quality of information required by the stock exchange's quotations department and to have their accounts audited by independent accountants (the foreign branches of large British firms of accountants will often be working with the companies' own accountants). Their willingness to forgo their traditional secrecy in order to gain access to the London market is a tribute to the City. It is no less a warning to their own continental bourses that they are in danger of becoming regional outposts of a European market centred on London.

The takeover panel, whose revised code is out this week,* can take a great deal of credit for the City's ever-growing reputation. The panel is held out by continental bourse reformers as a model of intelligent regulation ; the code as the model for part of a shareholders' charter. Such reformers point enviously to one of the rules of the code concerning the transfer of effective control of a company (not necessarily the majority) : a bid has to be extended by the company gaining effective control, or at least 40%, to all other shareholders at the same price. Continental bourses are dominated by large holding companies that simply need to get hold of enough shares to boss around the rest of the shareholders, who are often left languishing and ill-informed.

*Issuing Houses Association, 20 Fenchurch Street, EC3. 30p.

Hull : new director, new code

The principle of equity among all shareholders is still a novel concept in some parts of Europe. It is further fortified in the revised code : if a takeover bidder buys in the market at over his formal bid price, the offer must be increased to that market price (previously it was the weighted average of market purchases).

The concept of equity does not require, in the panel's view, giving much more weight to minority shareholders than their numbers justify. A majority shareholder can still turn down an apparently generous offer (as happened in the Patiño affair), and that is just tough luck for the minority. The way to deal with that is to reform company law and give shareholders more power to pressure directors whose prime interest leans towards a particular group of shareholders.

The panel and its code (in a bright red cover) now go a very long way in ensuring equity for shareholders and participants in takeover bids within the existing framework of the securities market. The panel's new director-general, Mr John Hull, inherits a body to be copied. The next steps are to ensure fair play outside takeover bids too.

Investigations

Crook of gold

The interim report* on the mining ventures of E. J. Austin International was published by the Department of Trade and Industry on Monday. The former chairman of Austin, Mr James Howarth, once described the Californian mining operation as "a crock of gold." The inspectors sought "the early publication of this interim report so that warning can be given to prevent further heavy losses to investors." They go so far as declaring : "Howarth stole the following sums of Austin's money. . . ." Although Mr Howarth at one stage agreed to meet the inspectors, he has since disappeared without trace.

Mr Howarth and Mr Wayne Chambers "conspired together to defraud the E. J. Austin Group and such other persons as could be persuaded to part with their money to Howarth and Chambers" of £347,000 and tried to get a further £1m from Morgan Grenfell, among other people.

Central to the glamour of Austin was the possession of a secret mining process that would extract huge amounts of metals from ore. It had been concocted by Mr Chambers, and the patent says that copper was precipitated by nathis hydrogen. On a visit to California the investigators were

> invited by Chambers to inspect the "Chambers process." We found installed, in a corrugated iron shed, various containers, two mixers and electrical connection equipment all linked to a mechanical conveyor. To some degree the latter had been erected by the previous owners of the site. There were in the containers obvious electrodes immersed in a solution. This, together with another similar but smaller shed containing some similar equipment, constituted the mining complex of Austins in California.

As for nathis hydrogen, it is "entirely non-existent."

The representative of Morgan Grenfell had apparently been rather more gullible :

> He told us that he saw a grey sludge turned into silver and copper and was convinced of its [the process's] effectiveness. He was given to understand that crushed material from the stockpile had been introduced into the processing machinery, but never actually saw any transfer of material into the process.

This is lucky, as before the visit of Mr Gorrell Barnes to the site the following were delivered :

> 1,200 lb of cuprous chloride, 25 lb of silver nitrate, 1 oz of gold chloride, 100 sacks of half-ground salt, 4 lb of copper sulphate and 2 barrels of copper powder . . . we take the view that they were delivered so that they could

*E. J. Austin International Ltd. Interim report by John Lloyd Eley, QC, and Dennis Garrett, FCA. *HMSO*. £3.95.

Is your business prepared for 1980?

How successful will your business be eight years from now? Will it have stood up to the challenge of keener competition, larger markets, freer trade and increased automation? How clear is your picture of the economic climate in which it will be operating?

By specialising in studies of the business environment and in economic forecasting, the EIU has been able to answer these and similar questions for clients in over 90 countries.

Perhaps the EIU can help you.

be introduced into the tank and provide the copper which was to be extracted. Morgan Grenfell did, however, check on the Californian, Mr Hugh Whirry, who was involved with the metals evaluation. It then severed its connection with Austin, apart from retaining a holding of 180,000 shares.

Poor Spence, Veitch, brokers to Austin, stayed enthusiastic for a good long while. A bullish circular was put out by the company in July, 1969, and Mr C. Spence "saw and expressed no objection to any of its contents"; it has been found by the investigators to be wrong on 10 counts, including:

> the land was not commercially viable as a mining project . . . there was no prospect that the venture would become self-financing . . . no formal documents of purchase of land in California were in course of finalisation.

Just about every fact in the circular was wrong. Poor Spence, Veitch had lent Mr Howarth the money to buy shares in Austin, and Mr Spence borrowed money from his clients to make a further loan to Mr Chambers, part of which, for reasons unexplained, Mr Chambers had to collect from a pasteboard box at Heathrow Airport.

The end came in January, 1970, when Austin announced its intention to buy the El Sobrante Mining Corporation of California (owned by Mr Howarth and Mr Chambers) for 7m shares, then standing at 93p each. Fantastic assay values were thrown around, and pre-tax profits of £10m estimated. The quotation was suspended and three months later the inspectors were called in. However, "after the suspension of dealings in Austin shares, Chambers and Howarth obtained a loan of $70,000 by continuing to represent the commercial viability of their project" and there was "the continuance of the general deceit that the Californian ventures were commercially valuable." Never give a sucker an even break.

Gilts

Wilberforcing interest rates up or down?

Gilts are up 25% on the year—and a lot of people are now wondering whether the blackout is time to sell out. Early this week jobbers marked prices down and widened their spread as a precaution against a selling wave. They are worried that an expensive settlement of the miners' strike, and the strikes after that, will focus attention back on to inflation (bad for gilts) and away from economic recession (good for gilts).

The bear-inflationists lapse quickly into economic old-think. If the miners get an inflationary settlement, then so will all sorts of unlikely special cases, and so will the private sector at large. Mr Heath is not expected to introduce a real prices and incomes policy, and export prices will rise faster than those of our competitors. The January trade figures were far from hot, and the Cambridge economic boffins are predicting a devaluation next year. All that foreign money which has not yet flowed out will do so eventually, and high interest rates will again be used to stem it, and will be needed to give the holders of gilts a real rate of interest.

The other side argues that, at this stage of the economic merry-go-round, beating inflation is less important than reviving output. Even if the Heath stand collapses, a recovery in output to use some of that spare capacity will be quick (after a bout of overtime to make up the emergency losses), and

the Government will cut Bank rate and do whatever else it can to boost investment and consumer confidence. Assuming any continuance of normalcy, this is the more likely course of events. However, nervousness about inflation means that gradual rises in the market will be punctuated by steep falls; riding it profitably will require more professionalism than last year.

How much should a unit trust charge the customers?

The Department of Trade and Industry will probably soon be changing the rules on how much of people's savings a unit trust manager can take and use to run his fund and make his profit. At the moment the rules are arbitrary and obscure, put together over 10 years ago when the industry was still budding. But Tory policy is against such controls and the next months are likely to see unit trusts charging what they want and coming in for a rare bout of competition, where the old yardstick of performance will be at least partly replaced by the cost of management services.

There is little room for jostling within the current rules. When an investor buys a unit he is charged up to a maximum of 5%. An annual fee is then taken from the fund's income which may not exceed ½%, while the two charges together must be pitched so that over a theoretical 20 years in the trust the holder cannot have more than 13¼% taken off him in charges. In practice, most trusts have adopted either a 5% initial charge and ¾% as an annual fee, or else a full ½% annual fee and an entrance charge of 3¼%.

There has been no change in these rules since 1958 and the annual fee has been overtaken by rising management costs. If, therefore, the DTI does remove all these restrictions the cost of investing in a unit trust will almost certainly go higher, not least because unit trusts are anxious to make higher profits. At the present level of running costs it is hard for a trust to make money unless it has £2m under its control.

The existing controls over the industry have stopped it from developing as fast as it might. For example, it is not possible to offer special unit trusts that, tby charging more, give a better management service when everybody is in the same straitjacket. As a result unit trusts are increasingly demanding a high initial investment, so discouraging the small investor (who, of course, is the man who needs their professional management the most) because his account costs as much to service as a large depositor's. The average annual cost of an account works out at around 150p. But if charges were not controlled they could be varied for each unit trust saver, who could then shop around for the best deal.

But when the rules are changed it is new trusts that will benefit most. Most annual charges are incorporated in the trust deeds, which are difficult to alter. The initial charges could be pushed up, but when unit trusts are trying to attract new money these are the charges where, in time, competition might make the greatest impact.

APPOINTMENTS

SOLIHULL AND WARWICKSHIRE MAGISTRATES' COURTS COMMITTEES

Solihull County Borough and Henley-in-Arden petty sessional divisions.

WHOLE TIME CLERK TO THE JUSTICES

Applications for the above appointment are invited from barristers, solicitors and other persons qualified in accordance with section 20 of the Justices of the Peace Act, 1949.

Salary scale : £4,527 x £138(4) to £5,079 + £285 for two divisions.

Further particulars may be obtained from the clerk to the
Solihull Magistrates' Courts Committee,
Court House, Solihull,
to whom applications should be sent by 6th March, 1972.

HIGHLANDS AND ISLANDS DEVELOPMENT BOARD

Tourism Research Fellow

Applications are invited from recent graduates or final year students for the above post. The Research Fellow will be required to collate previous research and initiate new research into certain economic aspects of the tourism industry in the Highlands and Islands. It would be preferable if the Research Fellow worked in collaboration with a British University (e.g. a student working towards a higher degree) but applications will be considered from those with no present university connections. The appointment will be for two years at a salary to be negotiated between £1,500-£2,000.

Full particulars and application forms may be obtained from the Personnel Officer, Highlands and Islands Development Board, Bridge House, Bank Street, Inverness.

The closing date for applications is 12th March, 1972.

CHAIRMAN'S STATEMENT

Lindustries

Highlights from the statement of the Chairman, Mr. W. E. Luke, and from the 1971 accounts.

- Profits for the second half of the year were up by 25% compared with the same period in the previous year.
- In the Engineering division adequate provisions have been made against the Rolls-Royce debt and expected future losses on the thermal insulation contracts. Sales and profits have increased during the first three months of the new trading year to the highest level in recent years.
- The industrial section of the Polymer division suffered throughout the year from a reduction in volume and reduced profit margins. The medical and dispenser section is expanding rapidly.
- The two loss making subsidiaries in the Textile division were sold during the year. The other companies were all in profit and for the first three months of this year show an increase in turnover and profits.
- We have every reason to be satisfied with our overseas investments.
- I think Lindustries will make a very satisfactory profit in the current financial year.

Report from Secretary, Lindustries Ltd., 100 Brompton Road, London, SW3 1EL

University of Aberdeen

SCHOOL OF AGRICULTURE

Computer Programmer/ Analyst—Data and Computer Services

Applications are invited for above post. Applicants should have an Ordinary Degree, HNC, or equivalent in Mathematics, Statistics or Computer Science.

Salary on scale : £1842-£2487 with appropriate placing. Superannuation (F.S.S.U.) and removal allowance.

Further particulars from The Secretary, The University, Aberdeen, with whom applications (6 copies) should be lodged by 18 March, 1972.

The Open University

FACULTY OF TECHNOLOGY

Economist

The Systems Group in the Faculty of Technology is looking for an economist to join the group to write courses and develop teaching and research in the general financial area. The appointment is at Lecturer level and would be for 3 years in the first instance.

The work would involve the preparation of written material, radio and TV programmes in conjunction with other members of the University. Fields currently in preparation or being considered are : Modelling, Economic System Behaviour, Cost Benefit Analysis, Management Information Systems and other management science topics.

Applications are invited from economists with experience in any of the above or other relevant areas. The Faculty of Technology intends to produce courses with a strong environmental bias and it would therefore be an advantage if the applicants had particular interdisciplinary interests in this field.

Salary Scale : £1491-£2454 (Bar) -£3417 per annum.

Further particulars of the post and the Systems Group can be obtained from The Personnel Manager (TE2), The Open University, Walton Hall, Walton, Nr. Bletchley, Bucks. Closing date : Friday 3rd March, 1972.

APPOINTMENTS

MANAGEMENT CONSULTANTS—

Agriculture

Continued development of our services at home and overseas offers opportunities to experienced men seeking a consultancy career within the agricultural industry. Two posts are immediately available.

The senior post is within our General Consultancy Division based in Warwick. It could attract a man of about 30 with economics training, and some years experience in a marketing or development capacity in an agricultural business. Fluency in a second European language and readiness to accept overseas assignments are particularly desirable.

For the second appointment, we are seeking an agriculturalist with farm management training, to undertake appraisal and development work within our Farm Management Division. This post could attract a man aged 25-30 with farm business advisory experience and a strong interest in agricultural marketing and co-operative development.

Please apply in confidence, briefly detailing background, qualifications, previous carcer and present employment, to the Personnel Director. (M.E. 24.)

Management Consultants in Agriculture

economic analyst

c £2,500

Lex Service Group Limited is a rapidly growing organisation engaged principally in vehicle distribution and leasing, hotels and travel, personnel services and transportation.

The company now seeks to appoint an Economic Analyst who will report to the Planning Manager, based in the West End Head Office. Duties will include the preparation of quarterly and annual economic reviews and forecasts for the Company's markets in the U.K. and abroad; special studies will also be called for to cover existing businesses and prospective areas of diversification and growth.

Applicants should be aged 23-30 with a good degree in economics and at least one year's experience of economic research or forecasting, preferably in areas concerned with consumer marketing.

Benefits include a non-contributory pension and a generous sickness scheme. The Company's growth also provides excellent opportunities for promotion and development.

Send details of qualifications and career to :
Planning Manager, Lex Service Group,
18 Great Marlborough Street, London, W1V 2BL

Lex Service Group

ECONOMIST

£2,022—£2,433

The main duties of the Economics and Forecasting Section are to prepare short and long term forecasts of electricity requirements by all types of customers. As part of these duties the Section makes use of forecasts of national economic development. It also provides an economic advisory service covering a wide range of the commercial and technical aspects of the Electricity Supply industry's work.

The successful applicant will be placed in the group concerned with the economic forecast, and the provision of economic advice. Candidates should have a degree or equivalent in economics with mathematics and statistics. A knowledge of Government as an academic subject would be helpful.

Some practical business experience is essential and preference will be given to candidates who have previously been employed in economic forecasting.

Write, giving full personal and career details and quoting E/18/72 by 1st March to :-

Howard Bussey, Personnel Officer.

the electricity council 30 Millbank, London, SW1P 4RD.

Factors Chain International, FCI, is an association of leading Factoring companies throughout the world. Presently there are 36 member companies in Western Europe, North America and elsewhere, the majority of which are associated with leading banks and finance institutions. The principal functions of the Secretariat are to promote the growth of International Factoring, to direct the work of the technical committees in fields as standardization and communication, marketing and legal matters, to organize meetings with the members and in general to act as a point of contact and source of information for members, authorities and organizations. We are now to appoint an

ASSISTANT SECRETARY GENERAL

This is a new, challenging and rewarding position with very good career opportunities. Essential requirements are :

university degree in eg. business administration, law, economics ; 2-3 years of working experience in factoring, financing, banking or international business ; imagination and sound judgement.

The selected candidate is preferably a West European national between 25 and 35. He will speak English, which is the official language of the FCI, but French and German are also needed.

Terms are negotiable. The successful candidate will be required to assume duty during the first half of 1972, and to reside in Amsterdam, where the Secretariat is located. Applications, giving full details and the names of two referees are required by March 3, 1972.

Write in complete confidence to :

FCI

APPOINTMENTS

The University of Lancaster

Applications are invited for two or possibly three posts in the Economics Department. Any field of specialisation may be acceptable, but for one post an interest in wage theory could be an advantage. The present establishment of the Department is 22 and continued expansion is planned over the next few years. Salary (under review at present) will be in the range £1491-£3417.

Further particulars may be obtained (quoting reference L.647/B) from the Deputy Secretary and Establishment Officer, University House, Bailrigg, Lancaster, to whom applications (five copies) naming three referees, should be sent not later than 10 March 1972.

University of Oxford

INSTITUTE OF AGRICULTURAL ECONOMICS

Teaching and Research Appointment

Applications are invited from graduates with a good honours degree in Economics, Agricultural Economics, or associated fields for two Teaching/Research positions in the Institute of Agricultural Economics, which it is intended to fill before 1st September 1972. Salary between £1,446 and £1,815, with F.S.S.U. Further particulars may be obtained from the Administrator. A curriculum vitae and names of two referees to be addressed to the Administrator, Institute of Agricultural Economics, Dartington House, Little Clarendon Street, Oxford, OX1 2HP. (Telephone: Oxford 52921). The closing date for applications is 11th March 1972.

Overseas Development Institute

Research Officer

To undertake SSRC-financed study of British aid to Botswana, Lesotho and Swaziland. Project duration 18 months, of which up to 6 would be spent in the countries concerned. Opportunities to undertake further projects on successful completion.

A firm grasp of the economic issues involved in aid evaluation is required. The project would also demand an ability to analyse and assess political factors and relationships.

In addition to working on their own projects, ODI research staff are expected to participate in the Institute's co-operative work, such as the production of briefing papers and the ODI Reviews.

Salary, according to age, qualifications and experience, but likely to be in the range £2,000-£3,000. Applications, including curriculum vitae and the names of two referees, to the Director of Studies, Overseas Development Institute, 10-11 Percy Street, London W1P 0JB. Closing date: 13 March 1972.

Brunel University

DEPARTMENT OF ECONOMICS

Lectureships or Assistant Lectureships in Economics

Two Lecturers/Assistant Lecturers are required to join a growing department which teaches for both undergraduate and postgraduate economics degree courses and which actively participates in first degree teaching with many other disciplines. Applicants should be lively teachers and actively engaged in research. Brunel is in Greater London at Uxbridge, very near the tube on the Metropolitan line.

The posts are tenable from 1 September, 1972.

Salary according to qualifications and experience, within the scale £1591-£3517, including London Allowance, with F.S.S.U.

Postcard for application form and further particulars from Establishment Officer, Brunel University, Uxbridge, Middlesex. Closing date 3rd March, 1972.

The University of Sheffield

DIVISION OF ECONOMIC STUDIES

M.A. in Economics of Finance

Applications are invited from suitably qualified graduates in Economics or in Economics with a closely related subject for admission to the above course. This course aims to meet the needs of those wishing to pursue a career in a financial institution or to specialise in teaching financial economics. There are three main areas of study, namely, Quantitative Techniques (both Econometrics and Operational Research), Economic Theory, including Monetary Economics, and Finance. The examination will consist of 4 written papers and an essay/dissertation on a topic chosen from within these three areas. The course is recognised by the S.S.R.C. for quota awards. For further particulars and application forms write to Professor G. Clayton, Chairman, Division of Economic Studies, The University, Western Bank, Sheffield, S10 2TN. Quote ref: R.88/C.

The University of Sheffield

Division of Economic Studies

Applications are invited for the following posts, both tenable from a date to be arranged:

LECTURER in OPERATIONAL RESEARCH

Candidates will be expected to develop the teaching of operational research both to undergraduates and to students taking the Postgraduate Diploma/M.A. in Business Studies. Candidates with any appropriate background will be considered but preference may be given to those with qualifications in Economics and/or industrial experience. Salary in the range £1,491-£3,417 with F.S.S.U. provision.

DOUGLAS KNOOP RESEARCH FELLOWSHIP in ECONOMICS

Applicants may be graduates of any university and should be available for interview in Great Britain. Value £1,250 a year and normally tenable for three years.

Further particulars of the above posts can be obtained from the Registrar to whom applications (3 copies) should be sent by 6 March 1972. Quote ref: R.89/C.

GREATER LONDON TRANSPORTATION STUDY

Project Director

£5000

The Council is currently conducting, in conjunction with consultants, the second major transportation survey of London. This will produce a comprehensive set of data on which the Council's transportation policies for the next decade will be based.
A project manager is required in the Transport Studies division to supervise the next stages of this work. The tasks to be undertaken include: (a) taking over the survey data from the consultants, (b) preparation of preliminary tabulations, (c) the validation of the survey data, (d) co-ordination of the data obtained from surveys carried out by the Council's consultants with those concurrently undertaken by other authorities, (e) the preliminary analysis of results. The person appointed will be required to take charge of and co-ordinate work connected with this survey being carried out in several parts of the department, and will also be responsible for liaison with organisations inside and outside the department in data processing and analysis.
Candidates must have wide experience of all phases of large transportation studies and have demonstrated considerable technical and managerial capacity in this field. The appointment will be on a contract basis for a period of three years.

Application forms, returnable by 6th March, from the Joint Director, Department of Planning and Transportation (A/EO/684/—), County Hall, London SE1 7PB.

GLC GREATER LONDON COUNCIL
Department of Planning and Transportation

APPOINTMENTS

The University of Leeds

POST GRADUATE DIPLOMA
In Health Services Administration

This Diploma is offered to anyone considering a career in this field, or interested in research in Health Care. Entrants to the course will normally hold at least a second class degree—of any discipline—or, exceptionally, an approved professional qualification. The course which extends over one academic year is recognised by and has a bursary allocation from S.S.R.C.

Further details and application forms from: THE DIRECTOR, NUFFIELD CENTRE FOR HEALTH SERVICES STUDIES, UNIVERSITY OF LEEDS, CLARENDON ROAD, LEEDS LS2 9PL.

Institute of Geological Sciences

Research in Mineral Statistics and Economics

There is a vacancy for an Assistant Research Officer in the Institute's Mineral Resources Division, London, of particular interest to graduates with a strong aptitude for investigating the quantitative aspects of problems together with an interest in minerals and in their national and world-wide economic significance.

The work will include the intensive study of minerals production, trade and consumption; compiling and interpreting data from a variety of sources; preparing statistical information for publication; and liaison with government departments and industrial and commercial organisations.

Qualifications. Normally a degree with first or second class honours, or a post graduate degree, in Statistics, Economics, Commerce, Geography, Geology, Minerals Engineering, or other appropriate subject. Knowledge of mathematical techniques and an interest in minerals or mineral production essential. Experience of market research, economic surveys, information or publication work an advantage.

Final Year Students may apply.

Salary scale is £1435-£2325. Starting salary may be above the minimum. *Promotion prospects.*

For full details and an application form (to be returned by 8 March 1972), write to Civil Service Commission, Alencon Link, Basingstoke, Hants, or telephone BASINGSTOKE 29222 ext 500 or LONDON 01-839 1698 (24 hour "Ansafone" service). Please quote A/613(1).

Portsmouth Polytechnic

DEPARTMENT OF SURVEYING

Research Assistant

The Department of Surveying has instituted a programme of research into various aspects of land economics in the Common Market. An immediate vacancy arises for a Research Assistant.

The field of research includes an examination of forms of land tenure as well as land use. Applications are invited from graduates in an appropriate discipline who have a bias towards either law or economics. The Research Assistant will be encouraged to read for a higher degree.

The salary for the post is £1,120 x £50 to £1,220. The appointment is initially for one year but is likely to be extended to a maximum of three years. Portsmouth offers a very pleasant environment for academic work and leisure.

Application forms and further particulars may be obtained from the Staff Officer, Portsmouth Polytechnic, Ravelin House, Alexandra Road, Portsmouth PO1 2QQ, to whom completed applications should be returned by 8th March, 1972. Please quote reference U12.

Regional Adviser

Merchant Banking

Manchester

This is a position which could be of interest to men, retired or about to retire, from very senior positions in a professional practice or, possibly, from industry or banking, in the North West, which would have given them an intimate knowledge of the major commercial and industrial interests in the area. The position would, in the first instance, not initially be full-time, but terms would be for discussion. Those to whom the task would be of interest should write or telephone (01-493 3551) D.S.A.E. Jessop, reference S.28195.

☐ BIRMINGHAM ☐ GLASGOW ☐ MANCHESTER

Market Research Executive

I.T.I. Research requires a young Executive with 1 or 2 years' experience in Industrial Market Research — *preferably* in an Agency. A degree in Economics or Modern Languages —preferably German—and the ability to write a good report are essential. There are opportunities for travel in the UK and in Europe. Excellent prospects. Salary about £1,150 or higher for an outstanding candidate. Apply with detailed CV to:

I.T.I. (Europe) Ltd, 185 Piccadilly, London W.1.

The Queen's University of Belfast

Chair of Political Science

Applications are invited for the Chair of Political Science from 1st October 1972, or such other date as may be arranged. The salary is £6,337 with contributory pension rights under the F.S.S.U.

Applications should be received by 18th March 1972. Further particulars may be obtained from The Senior Assistant Secretary (Personnel), The Queen's University of Belfast, BT7 1NN, Northern Ireland. (Please quote Ref. 72/E.)

The University of Manchester Institute of Science and Technology

DEPARTMENT OF MANAGEMENT SCIENCES
INTERNATIONAL BUSINESS UNIT

Research Assistant

The UMIST Department of Management Sciences is one of the oldest and largest centres of Management education in the United Kingdom. Its research school includes the International Business Unit, financed jointly by the S.S.R.C. and Industrial Companies, to study a range of problems within International Business.

Applications are invited for the above vacancy from suitably qualified graduates in Economics, Statistics or Operational Research, with some research experience.

The successful candidate will be expected to become involved in all the detailed research projects and will provide a statistical evaluation service to the various research teams. He will also become an integral member of the International Business Unit and will be expected to read for a higher degree.

The appointment will be for two years and may be renewable. Salary will be £1,000 per annum, plus F.S.S.U., and expenses for international travel.

Requests for application forms, quoting Reference No. MS/16/AD, should be made to the Registrar, U.M.I.S.T., Sackville Street, Manchester, M60 1QD, to be returned not later than 17th March, 1972.

APPOINTMENTS

The University of Manchester

Lecturer in Government

Applications invited for this post tenable from a date to be arranged. Candidates in any field of Government (other than Political Theory) will be considered, but preference may be given to those whose interests lie in the fields of: Quantitative Methods, and/or Public Administration, and/or International Relations: and in the areas of either Western Europe, or North America. Salary scale p.a.: £1,491-£3,417 but initial appointment at not more than £1,902 per annum. F.S.S.U. Further particulars and application forms (returnable by March 6th) from The Registrar, The University, Manchester, M13 9PL. Quote ref: 22/72/E.

University of Sussex

Applications are invited for the fololwing posts with eect 1st October 1972:

Reader or Lecturer in POLITICS: an interest in systematic social science theory and a concern with teaching and research in the field of British politics would be appropriate.

Reader or Lecturer in SOCIOLOGY, with particular reference to sociological method.

Lecturer in ECONOMICS for one year only.

Lecturer in INTERNATIONAL RELATIONS for one year only.

Lecturer in LAW for one year only.

Salary scales (under review) £3,321-£4,401 per annum (Reader) and £1,491-£3,417 per annum (Lecturer). Appointments to the one year posts are likely to be in the lower half of the Lecturer scale.

Further particulars for each post and forms of application, returnable as soon as possible and preferably before the 18th MARCH 1972, are available from the Establishment Section, Arts Building, University of Sussex, Brighton BN1 9QN (telephone Brighton 66755, ext 663), quoting ref 882 and the title of the post.

HEAD OF ECONOMIC RESEARCH

We wish to recruit a Head of Economic Research in the Business Forecasting Unit of our Central Planning Department. This department plays a vital role in the planned development of Fisons worldwide activities in agrochemicals, fertilizers and pharmaceuticals.

He will be responsible for analysing the financial and commercial implications for the Fisons Group of changes in the economic environment. In addition he will have to carry out special ad hoc appraisals of investment projects. A large proportion of the work is undertaken for the Chief Executive.

Applicants should be economics graduates aged 25-30, with a minimum of five years' industrial experience, of which at least two have been spent working as an economist. He must be able to supervise the work of graduate assistants. We expect the successful applicant not only to be able to write lucidly, but also to have a numerate and analytical approach to his work. Knowledge of statistics would be useful. The position is based in Ipswich.

If you feel you match our requirements please write giving brief details of your education and experience to:

Michael Wellin (MW18), Group Personnel Department, Fisons Limited, Fison House, Princes Street, Ipswich, IP1 1QH.

FISONS

Graduate Market Analysis Executive

BEECHAM PRODUCTS is one of Britain's foremost Marketing Companies with a wide range of packaged goods which include such well known brands as Horlicks, Ribena, Macleans Toothpaste and Silvikrin. Our rapid rate of growth in an increasingly sophisticated commercial environment has created the need to recruit another executive to our recently established Market Analysis Unit.

The main function of this Unit is to analyse long and short term trends in the light of trade research, economic or other data and to assist the management in formulating corporate and market strategies in the light of company objectives.

We require a highly intelligent graduate, preferably in economics, who should have at least "A" level mathematics. A knowledge of programming would be an advantage. The successful candidate must be able to communicate fluently both verbally and in writing.

Salary and fringe benefits are very good for this London based appointment.

Please write, quoting RM 62, or telephone for an application form to:

R. J. Mantle, Personnel Manager, Beecham Products, Beecham House, Great West Road, Brentford, Middlesex. Tel: 01-560 5151 ext. 706.

SSRC SOCIAL SCIENCE RESEARCH COUNCIL RESEARCH UNIT ON ETHNIC RELATIONS

DEPUTY DIRECTOR

Applications are invited for this new post at the Unit, which is located at the University of Bristol.

Candidates should be qualified in one of the social sciences, have research experience and an understanding of work in disciplines other than their own. The successful candidate will be required to undertake research which fits in with the Unit's research programme. He or she will be required to deputise for the Director in supervising research; in implementing decisions concerning research policy; and to have certain liaison responsibilities between the Unit and other bodies, academic and governmental.

The salary is likely to be on the university Scale £3,252-£4,401. The Council is a recognised institution for FSSU.

Applications, together with a curriculum vitae and the names and addresses of three referees, should reach the Secretary, Room 1135, Social Science Research Council, State House, High Holborn, London WC1 as soon as possible but not later than 4 March 1972.

TENDER

GOVERNMENT OF KENYA

Design and feasibility study for tourist resort complex at Kongo/Diani

(approximately 25 km south of Mombasa)

Coast Province

The Ministry of Tourism and Wildlife proposes to call for tenders in the near future for a design and feasibility study to be prepared for a tourist resort within the area of land about 500 hectares situated north and south of the Mwachima River in the Coast Province, Kenya. The report will include the following:-

(a) A master plan for the development of the whole of the Diani resort area, and priorities for such development.

(b) An economic feasibility study and preliminary engineering studies for a first phase area comprising 2,000 beds within the Diani resort area.

(c) A comprehensive, economic and financial appraisal of the first phase and the economic/social justification for its individual items of infrastructure together with the proposed phasing of each of them.

(d) Identification of the optimum tourist capacity of the first phase area, the types of accommodation required, the rates to be charged, and the optimal phasing of the tourist facilities.

(e) Cost estimates of all infrastructure in the first phase area within 15% approximation, except for the access and interior roads for which final engineering estimates within 10% approximation is required.

(f) Estimates of the foreign exchange component of all the above-mentioned investment costs.

(g) Draft zoning regulations for the whole of the Diani resort area.

(h) Detailed schedule of implementation for the construction of all infrastructure and superstructure of the first phase area.

It is expected that the International Bank for Reconstruction and Development will be requested to provide a substantial proportion of the "Government" finance for the first phase of the project and probably subsequent phases in which Government probably through the Kenya Tourist Development Corporation will have a significant part in the ownership.

In order to prepare a selected list of tenderers all consultants interested in undertaking the study will be required to submit a detailed application which should include the following information:

(a) Name of firm and location of head office.

(b) General description of organization of firm and associates.

(c) Details of previous experience in design and/or feasibility studies of similar nature.

This application should be sent to—Permanent Secretary, Ministry of Tourism and Wildlife, P.O. Box 30027, Nairobi, with a copy to—Chairman, Coast Tourist Liaison Committee, P.O. Box 45025, Nairobi, Kenya, to arrive not later than the 4th March, 1972. (Applications should all be marked: "APPLICATION—DIANI RESORT COMPLEX").

(J. K. arap Koitie)

PERMANENT SECRETARY FOR TOURISM AND WILDLIFE

APPOINTMENTS

OFFICE OF MANPOWER ECONOMICS

Report Secretary

Applications are invited for a post as Report Secretary in the Office of Manpower Economics.

The Office provides the secretariat for a number of standing Review Bodies and ad hoc Committees set up by the Government to examine wages, salaries and related questions for certain classes of people in the public sector. It is also mounting its own research programme in the manpower area.

Report Secretaries co-ordinate all the work required for an enquiry, write background papers and draft reports; and interview senior management and Trades Union personnel. They work in close collaboration with their Review Body or Committee Members, senior administrative staff and the Office's Statisticians and Economic and Industrial Relations Advisers.

Applicants, who should be at least 28, should preferably hold a First or Second Class Degree or a higher degree awarded after post-graduate study or research. Some knowledge of recent developments in the industrial relations field would be an advantage. Ability to write clear, cogent English, to handle figures and to work under pressure is essential; experience in interviewing would be desirable. Applicants should also be able quickly to assimilate, analyse and interpret a varied range of facts and argument.

Starting salary will depend on age and qualifications, but will be in the range £3652 to £4883. Initial appointments, for two years, may be extended by agreement.

Letters of application, giving full particulars, should be sent to the Personnel Section, Room 502, Office of Manpower Economics, New Court, 48 Carey Street, London WC2 2JF. General enquiries about the post should be made to Mr. J. Strachan, telephone 01-405-5944 extension 234.

The closing date for receipt of applications will be 14 March 1972.

Please quote reference R628/2.

FOREIGN DEPARTMENT:
6, Tori 1-chome, Nihonbashi, Chuo-ku, Tokyo, Japan
Overseas Representative Offices:
80 Wall Street, New York, N.Y. 10005, U.S.A.
Ceveal House, 58 Mark Lane, London, E.C.3.

SUGAR

Recommendations of:

1. **January 1971** — Sell on near term advance. Weakness will follow.
2. **March-April 1971** — Broad downward trend. Buying opportunity around mid-year.
3. **July 1971** — Expect selling on approach to 4.5¢ spot.
4. **August-September 1971** — Only moderate further weakness followed by recovery to new highs. Add to purchases on weakness. Long term trend up. Maintain long positions.
5. **October-November 1971** — Long term trend up. Maintain long position.

For over a quarter of a century, our basic research has enabled us to anticipate well in advance a major reversal in the price trend. It is indicative of the commodity work performed by us for many large corporations in industrial and agricultural commodities.

Your inquiry on your corporation letterhead is requested addressed to:

A LOT OF LITTLE THINGS ADD UP TO THE FINEST HOTELS IN BRUSSELS AND PARIS.

A PLACE TO PARK WHEN YOU ARRIVE.

YEAR-ROUND CLIMATE CONTROL TO GIVE YOU COMFORT AND QUIET.

ROOM SERVICE AROUND THE CLOCK EVEN WHEN OTHER HOTELS CLOSE FOR THE NIGHT.

HILTON APPOINTMENTS SECRETARY TO HELP YOUR BUSINESS DAY RUN AS SMOOTHLY AS IT DOES IN YOUR OWN OFFICE.

FAST CHECK-IN AND CHECK-OUT SO THAT YOU ARE NEVER LATE FOR YOUR NEXT APPOINTMENT.

At the Brussels Hilton and the Paris Hilton a travelling businessman gets what a businessman needs, including things he may not expect, for less than he might expect to pay. For reservations call your travel agent, any Hilton International hotel, or Hilton Reservation Service. In London, call 493-8888; outside London, freefone 227.

BRUSSELS HILTON

Businessmen's services are so complete, many firms use the Brussels Hilton as their Brussels headquarters. So can you. A quiet location, only minutes from the city centre. From £7.00 single, £9.40 double.

PARIS HILTON

It's on the Left Bank in the shadow of the Eiffel Tower, a stroll from the Seine yet only five minutes from the city centre. Parisians love it for the American beef at Le Western restaurant. From £9.48 single, £11.88 double.

BRUSSELS HILTON · PARIS HILTON

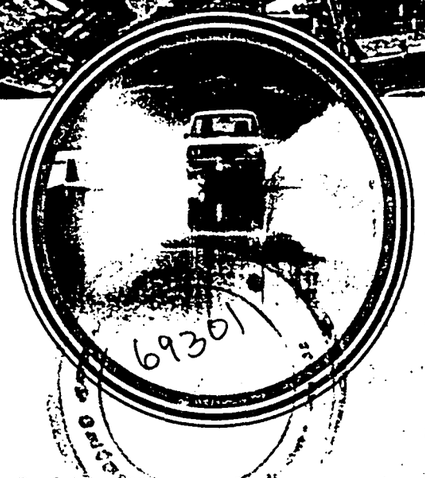
From blast furnace to blast-off— Kawasaki (space-age) Steel

de is further proof that for sheer versatility nothing beats good old steel:—

Japan's second space satellite was blasted into orbit on February 16, 1971. The outer shells of all three booster chambers were fabricated of Kawasaki's ultra-high-tensile-strength maraging steel, with a remarkable tensile strength of 200 kg/mm². They were formed at the company's Chiba Works from special alloy steel with 18% nickel content refined by electric-arc furnace at the Hyogo Works.

In order to form it into cylindrical shapes the steel in the first stage had to be soft and ductile. Then to be strong enough to withstand the tremendous pressure of blast-off, it had to be made as tough as possible. This was accomplished by a special aging—maraging—process that dramatically increases its tensile strength almost double.



Technology like that is what keeps Kawasaki ahead in steel.

Kawasaki: proud to produce some of the finest steels in the world for the space age.

the fastest growing name in steel

KAWASAKI STEEL CORPORATION
Tokyo, Japan

Note the red arrow.
That is our new expanding "Toyota Higashi-Fuji Technical Center."
Mt. Fuji is a sleeping volcano.
But active here, are four hundred (of our twenty-five hundred) scientists.
Here, as in our other test plants, they are in a never ending research effort.
Side wind, high speed, crash, air bag, pollution, skid control and other tests are tested.
You can see our skid control test in the small photo on the left.
A computer installed in the car keeps it on a straight course.
Because our goal is to make the woes of car and man . . . extinct.

TOYO

People in over 120 countries drive a Toyota thanks to our ultra-modern plants that are geared to make two million vehicles a year . . . carefully.
